# One easy platform to manage your passive RFID readers

Zebra Resonate™ RFID Reader Management enables you to easily deploy and manage a network of Zebra passive fixed RFID readers. Fully compatible with our current portfolio of devices in this category, RFID Reader Management allows you to configure and monitor the status of every cloud-ready Zebra reader in your system from one consolidated application, without requiring multiple tools to manage different types of readers—an industry-leading feature in the RFID field.

Zebra **Resonate**™ is a comprehensive software suite designed to help IT and operations managers deploy, configure, and manage a population of sensors and readers, gather data from them, and obtain meaningful information from that data. It provides a full set of capabilities, but not every customer requires its full functionality.

For businesses that already have RFID solutions or data integration capabilities and only need to acquire a specific, focused feature set, Zebra offers RFID Reader Management: a practical, streamlined application that scales to fit your needs.

1

Evaluate your workflows to determine the best way to implement an automated RFID solution.

2

Identify chokepoints, staging areas, and other strategic locations for passive RFID readers to capture RFID tag information.

3

Deploy RFID readers and integrate them into a functioning network with RFID Reader Management.
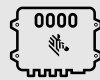

4

Use RFID Reader Management to configure your passive fixed RFID readers, organize them by zone or location, and direct their read data to appropriate applications.

5

Use RFID Reader Management to monitor the status and health of your readers and ensure that they continue to function properly.

Consolidated control and visibility

Deploy populations of readers easily at multiple sites across your global enterprise to meet the RFID solution design requirements.

Configure reader settings, use cases, RFID parameters, data endpoints, and more from a central console.

Monitor the health and status of your readers from a central dashboard, and forward health and status alerts to your existing IT case management system or partner.

Manage your reader population with the ability to update configurations and push firmware updates and security patches.
