About This Guide

The LS 1004 Product Reference Guide provides general instructions for setup, programming, operation, troubleshooting, and maintenance of the LS 1004 scanner.

Notational Conventions

The following conventions are used in this document:

- Bullets (✱) indicate:
  - action items
  - lists of alternatives
  - lists of required steps that are not necessarily sequential
- Sequential lists (e.g., those that describe step-by-step procedures) appear as numbered lists.

Service Information

If you have a problem with your equipment, contact the Symbol Support Center for your region. See page viii for contact information. Before calling, have the model number, serial number, and several of your bar code symbols at hand.

Call the Support Center from a phone near the scanning equipment so that the service person can try to talk you through your problem. If the equipment is found to be working properly and the problem is symbol readability, the Support Center will request samples of your bar codes for analysis at our plant.

If your problem cannot be solved over the phone, you may need to return your equipment for servicing. If that is necessary, you will be given specific directions.

Note: Symbol Technologies is not responsible for any damages incurred during shipment if the approved shipping container is not used. Shipping the units improperly can possibly void the warranty. If the original shipping container was not kept, contact Symbol to have another sent to you.

**Warranty**

Symbol Technologies, Inc (“Symbol”) manufactures its hardware products in accordance with industry-standard practices. Symbol warrants that for a period of five (5) years from date of shipment, products will be free from defects in materials and workmanship. This warranty is provided to the original owner only and is not transferable to any third party. It shall not apply to any product (i) which has been repaired or altered unless done or approved by Symbol, (ii) which has not been maintained in accordance with any operating or handling instructions supplied by Symbol, (iii) which has been subjected to unusual physical or electrical stress, misuse, abuse, power shortage, negligence or accident or (iv) which has been used other than in accordance with the product operating and handling instructions. Preventive maintenance is the responsibility of customer and is not covered under this warranty. Wear items and accessories having a Symbol serial number, will carry a 90-day limited warranty. Non-serialized items will carry a 30-day limited warranty.

**Warranty Coverage and Procedure**

During the warranty period, Symbol will repair or replace defective products returned to Symbol's manufacturing plant in the US. For warranty service in North America, call the Symbol Support Center at 1-800-653-5350. International customers should contact the local Symbol office or support center. If warranty service is required, Symbol will issue a Return Material Authorization Number. Products must be shipped in the original or comparable packaging, shipping and insurance charges prepaid. Symbol will ship the repaired or replacement product freight and insurance prepaid in North America. Shipments from the US or other locations will be made F.O.B. Symbol's manufacturing plant. Symbol will use new or refurbished parts at its discretion and will own all parts removed from repaired products. Customer will pay for the replacement product in case it does not return the replaced product to Symbol within 3 days of receipt of the replacement product. The process for return and customer's charges will be in accordance with Symbol's Exchange Policy in effect at the time of the exchange.

Customer accepts full responsibility for its software and data including the appropriate backup thereof. Repair or replacement of a product during warranty will not extend the original warranty term.

Symbol's Customer Service organization offers an array of service plans, such as on-site, depot, or phone support, that can be implemented to meet customer’s special operational requirements and are available at a substantial discount during warranty period.

**General**

Except for the warranties stated above, Symbol disclaims all warranties, express or implied, on products furnished hereunder, including without limitation implied warranties of merchantability and fitness for a particular purpose. The stated express warranties are in lieu of all obligations or liabilities on part of Symbol for damages, including without limitation, special, indirect, or consequential damages arising out of or in connection with the use or performance of the product. Seller’s liability for damages to buyer or others resulting from the use of any product, shall in no way exceed the purchase price of said product, except in instances of injury to persons or property. Some states (or jurisdictions) do not allow the exclusion or limitation of incidental or consequential damages, so the proceeding exclusion or limitation may not apply to you.

Introduction

Symbol Technologies Inc., the world leader in hand-held laser scanning now offers 21st century technology, while maintaining compatibility with today’s existing systems. The LS 1000 Series of hand-held laser scanners offers good performance in retail and light industrial applications. The ergonomic design ensures comfortable use for extended periods of time.

The LS 1004 hand-held scanner is based on the Visible Laser Diode (VLD). This state of the art technology gives the scanner a wider decode zone, greater depth of field, and a visible scan beam. This model reads color bar codes and symbols printed on all substrates. See the **LS 1004 Decode Zone** on page 3-6.

The LS 1004 is compatible with:

- RS 232C asynchronous terminals
- Synapse™ “Smart Cables”, which allow you to connect to:
  - Wand Emulation terminals
  - IBM 4683/4, 4693/4 series of terminals
  - All leading OCIA terminals, including NCR, Nixdorf, and ICL terminals.
  - Dual RS-232 hosts
  - Popular OCR terminals, such as Fujitsu and ICL.

The LS 1004 scans automatically at the rate of 36 scans per second. For decode capability, see **Technical Specifications** beginning on page 3-6.

Audience

The intended audience for this manual is personnel performing installation/setup and programming of LS 1004 scanners.

Set-Up

Unpacking

Remove the scanner from its packing and inspect it for damage. If the scanner was damaged in transit, call the **Symbol Support Center** at one of the telephone numbers listed in the front of this manual. KEEP THE PACKING. It is the approved shipping container and should be used if you ever need to return your equipment for servicing.
Installing the Cable

1. Insert the cable into the receptacle on the bottom of the scanner, as shown below:

![Figure 1-1. Installing the Cable](image)

2. Twist the cable to the left to lock in place, as shown below:

![Figure 1-2. Installing the Cable: Twistlock Mechanism](image)
Introduction and Setup

**Switching Cables**

Different cables are required for different hosts. To change the scanner cable:

1. “Unlock” the cable by twisting to the right.
2. Pull the cable out of the receptacle on the bottom of the scanner.

![Figure 1-3. Removing the Cable](image)

3. Insert a new cable in the receptacle.
4. Twist to the left to lock the new cable in place.

**Connecting to a Host**

With some terminal types, the LS 100x is unable to answer host terminal polls until the appropriate host type is selected. This may result in an error message generated by the host. To correct this situation, select proper parameter values and initialize the host terminal. See Chapter 4 for more information.

**RS-232C**

For external power operation with Synapse “Smart Cable”

1. Plug the Synapse adapter cable into the scanner.
2. Connect the Synapse “Smart Cable” with the host connector.
3. If required, connect the power supply to the input receptacle located on the Synapse cable.
Figure 1-4. External Power Connection using Synapse Cable

For RS-232C Operation External Power via Flying Lead Connector
1. Plug the cable into the scanner.
2. Plug the Power Supply into the receptacle on the Flying Lead connector.

Figure 1-5. RS-232C External Power Connection: Flying Lead Connector to a 9-pin Host Connector
For External Power Operation with 25-pin Host Connector

1. Plug the cable into the scanner.
2. Plug the Power Supply into the receptacle on the side of the 25-pin host connector.

For Battery Operation:

1. Insert a 9-volt battery into the battery box. See the Battery Box Operation section on page 3-3.
2. Plug the scanner’s 9-pin connector at the end of the cord into one end of the battery box.
3. An output cable from the battery box connects the LS 1004 to the RS-232C input device. Connect one end of this cable to the battery box and the other to the appropriate port on the host device.
Figure 1-7. RS-232C Operation

**IBM 468X/9X**

Plug the SDL modular connector at the end of the selected Synapse “Smart” cable into the appropriate port (5B, 9B, 9C, 9E, or 17). Check that the connection is secure. To install an LS 1004 on an IBM 468X/469X host:

1. Connect a synapse adapter cable to the scanner, using the procedure described in “Installing the Cable” on page 1-4.
2. Plug the other end of the adaptor cable into the synapse cable’s female connector.
3. Scan the appropriate port address (see your Synapse Guide for details).

**Wand Emulation, IBM 468x, IBM 469x, OCIA, and OCR**

A Synapse Adapter Cable is required when connecting the LS 1004 to any of these hosts using Synapse. See the instructions packed with the appropriate Synapse cable.

</tbody>
</table>
Introduction

This chapter covers the techniques involved in scanning bar codes. Included are specific instructions on how to hold the scanner at the appropriate angle to ensure an accurate decode.

Scanning with the LS 1004

1. Make sure all connections are secure.
2. Aim the scanner away from you and press the trigger. When you press the trigger, the scanning beam is energized for approximately 1 second (default).
3. Make sure the symbol you want to scan is within the scanning range. See the LS 1004 Decode Zone diagram on page 3-6.

Aim and press the trigger. On the LS 1004, if you use the scanner in default Low Power operating mode, the DECODE LED remains on until power down (maximum of 1 second). If the unit is programmed for Continuous power operating mode, the DECODE LED stays on until the next trigger pull.

The scanner has read the symbol when:

- You hear a short, high tone beep (if the beeper is enabled).
- The DECODE LED lights.
Aiming

**Scan the Entire Symbol**
- Your scan beam must cross every bar and space on the symbol.
- The larger the symbol, the farther away you should hold the scanner.
- Hold the scanner closer for symbols with bars that are close together.
- A short, high tone beep indicates a good decode.

![Right and Wrong Scans]

**Hold at an Angle**
Do not hold the scanner directly over the bar code. Laser light reflecting *directly* back into the scanner from the bar code is known as specular reflection. This strong light can “blind” the scanner and make decoding difficult. The area where specular reflection occurs is known as a “dead zone”.

---

*LS 1004 Product Reference Guide*
You can tilt the scanner up to 65° forward or back and achieve a successful decode. Simple practice quickly shows what tolerances to work within.

Introduction

This chapter covers the suggested maintenance of the LS 1004 scanner, as well as the technical specifications, available accessories, pinouts, and beeper definitions.

Maintaining the LS 1004 Scanner

Battery Box Operation

When using the LS 1000 Series with a battery box, you can use either an alkaline battery (recommended), or a nickel-cadmium rechargeable battery. Low power is signalled by 4 short, high-tone beeps, coupled with scanning interruptions. If this occurs, change or recharge the battery as soon as possible. For battery box operation:

1. Insert a 9-volt battery into the battery box.
2. Plug the scanner’s 9-pin connector at the end of the coil cord into the end of the battery box.
3. An output cable from the battery box connects the LS 1004 to the host device. Connect one end of this cable to the battery box and the other to the appropriate port on the host device.

Note: Not all applications require a power supply or battery box. The output cable depends on the wand being replaced.

Changing the Battery

1. Disconnect the battery box.
2. To open the battery box, push up on the flanges at one end of the pack.
3. Remove the old battery.
4. Insert the new or recharged 9-volt battery into the battery box. Match the positive (+) and negative (-) terminals on the battery with the corresponding terminals in the battery box.
Recharging a Nickel-Cadmium Battery

- Remove the battery from the battery box and place it in the recharging unit (not supplied by Symbol).
- To recharge the battery, follow the instructions supplied with the recharging unit.

Maintenance

Cleaning the exit window is the only maintenance required.

- Do not allow any abrasive material to touch the window.
- Remove any dirt particles with a damp cloth.
- Wipe the window using a damp cloth, and if necessary, a non-ammonia based detergent.
- Do not spray water or other cleaning liquids directly into the window.

Accessories

Required Accessories

Required accessories are listed below. Optional accessories are available at extra cost.

Optional Accessories

Optional accessories include various stands and holders, which are supplied at extra cost. Additional units of standard accessories may also be purchased at extra cost.
What If...

Nothing happens when you follow the operating instructions?

You Should

- Check the system power; is there a battery in the battery box?
- Be sure the scanner is programmed for the terminal in use.
- Make sure the scanner is programmed to read the type of bar code you are scanning.
- Check for loose cable connections.
- Check the symbol to make sure it is not defaced.
- Try scanning test symbols of the same code type.
- Be sure you are within the proper scanning range.

Symbol is decoded, but not transmitted to the host terminal?

You Should

- Be sure the proper host type is selected (See Chapter 4).

Scanned data is incorrectly displayed on the terminal?

You Should

- Make sure the system is programmed for the correct keyboard type.
- Make sure the CAPS LOCK key is off.
- Be sure the proper host is selected.
- Be sure editing options (e.g., UPC-E to UPC-A Conversion) are properly programmed.

If after performing these checks the symbol still does not scan, contact your distributor or call the Symbol Support Center. See page viii for the telephone number.

Introduction

This chapter provides information on how to program the LS 1004 scanner. Before programming the scanner, follow the instructions in Set-Up on page 1-3.

The Table 4-1 illustrates the default values with which the scanner is shipped. If the default values suit your requirements, scan the SET ALL DEFAULTS barcode. This will set the scanner to the default parameters. Changing the scanner’s programmable parameters is accomplished by scanning the bar codes provided in this section.

The following table lists the defaults for all parameters. If you wish to change any option, scan the appropriate bar code(s).

RS-232 Host Type Defaults

Three RS-232C hosts are set up with their own parameter default settings (See Table 4-2.). Selecting the ICL, Fujitsu, or Nixdorf RS-232C terminal sets the defaults listed below. These defaults take precedence over standard defaults. So if you select Fujitsu RS-232C, then select the standard defaults, the Fujitsu defaults still take precedence.

<table>

*In the Nixdorf Mode B, if CTS is Low, scanning is disabled. When CTS is High, the user can scan bar codes.*
RS-232C Code ID Characters

Selecting the ICL, Fujitsu, or Nixdorf RS-232C terminal enables the transmission of Code ID Characters listed in Table 4-3. These Code ID Characters are not programmable and are separate from the Transmit Code ID feature. The Transmit Code ID feature should not be enabled for these terminals.

Scanning Sequence

A scanning sequence establishes a value for one parameter type. During a scanning sequence, bar codes are scanned to select a parameter. All bar codes necessary for programming the scanner are provided in Parameter Menus, beginning on page 4-9.

Scanning Sequence Example

In this example, assume you want to program the scanner for all default settings except for two parameters, DECODE UPC ONLY and INTERCHARACTER DELAY.

Since you want to keep the majority of the default settings, scan the SET ALL DEFAULTS bar code. The default for DECODE UPC ONLY is DISABLED, but in this example, you need it
enabled. To do this, scan the DECODE UPC ONLY ENABLE bar code. You’ll hear hi/lo/hi/low warble. The warble sound indicates that the scanner has been successfully programmed for the selected parameter. Other beeper indications are listed in Chapter 3.

The default for INTERCHARACTER DELAY is 0 msec, but you need it set to 2 msec. To program the scanner for a 2 msec intercharacter delay, scan the bar codes listed below. This sequence includes a two-digit entry; single-digit entries require a leading zero.

You’ll hear...

1. Scan INTERCHARACTER DELAY        Short high tone
2. Scan 0                             Short high tone
3. Scan 2                             Hi/Lo/Hi/Lo warble

**Errors While Scanning**

Don’t worry if you make an error during a scanning sequence. If you’re scanning a multi-step sequence, scanning CANCEL removes you from that sequence so that you can start again.

Otherwise, simply scan the single correct bar code for the desired parameter.
Parameter Menus

Refer to the Default table in the front of this chapter for the default settings for each parameter type.

Set Parameter Defaults

Scanning the SET ALL DEFAULTS bar code returns all parameters to the default values listed in the Default Table.

Host Interface Select

Scan the bar code corresponding to your host type. You must select a host type when you first set up the scanner and whenever you change host type.
RS-232 Host Type

Use this option to select an RS-232 host type. Note: Synapse hosts are autodetected; no bar codes need to be scanned for hosts using Synapse.

1. Scan the bar code corresponding to the desired host type.
2. Scan ENTER.

- Standard RS-232 Host Type
- ICL Host Type
- Fujitsu Host Type
- Nixdorf Mode A Host Type
- Nixdorf Mode B Host Type
Programming the LS 1004

**Power On Beep Enable/Disable**

This option, if selected, causes the beeper to sound at power-up (in continuous power mode only).

- Power On Beep Enable
- Power On Beep Disable

**Beeper after Decode**

This option determines whether the beeper sounds during normal scanning. Usually, it is desirable to operate the unit with the beeper enabled. In all cases, the beeper operates during parameter menu scanning and indicates error conditions. See Table 3-4 on page 3-9.
**Beeper Tone**

Three options are available for beeper tone (frequency); low, middle, and high.

- Beeper Tone Low
- Beeper Tone Middle
- Beeper Tone High

**Beeper Volume**

Three options are available for beeper volume; low, middle, and high.

- Beeper Volume Low
- Beeper Volume Middle
- Beeper Volume High
**Decode Attempt Time**

This parameter sets the length of time the scanner laser beam remains on while attempting to scan a symbol.

<table>
<thead>
<tr>
<th>Time</th>
<th>Barcode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.5 seconds</td>
<td>![Barcode 0.5 seconds]</td>

</tr>
</tbody>
</table>
Decode Attempt Time (cont’d)

<table>
<thead>
<tr>
<th>Time</th>
<th>6.5 seconds</th>
<th>7.0 seconds</th>
</tr>
</thead>
</table>

Operating Mode

This parameter determines whether or not power remains on after a decode attempt. The LOW POWER option provides for power-down after each scan attempt, while the CONTINUOUS option provides for power to remain on after each scan attempt.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Continuous</th>
<th>Low Power</th>
</tr>
</thead>
</table>

Aggressive Scan Mode

This parameter is available in the continuous operation mode only. When you set this parameter to be enabled, the scanner scans the mirror continuously, even if it does not illuminate the laser diode.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Disable</th>
</tr>
</thead>
</table>
**Transmit “No Decode” Message**

This feature gives you the option to transmit “NR” when a symbol does not decode. Prefixes and suffixes enabled will be appended around this character.

![Transmit "NO DECODE" Message](image)

![Do Not Transmit “NO DECODE” Message](image)

**Decode Redundancy**

When you select **ENABLE CODABAR DECODE REDUNDANCY**, a Codabar symbol must be decoded in both directions before being accepted as a successful decode. If you select **ENABLE ALL CODE TYPES DECODE REDUNDANCY**, all bar code symbols must be decoded in both directions before being accepted as successful decodes.

![Enable CODABAR Decode Redundancy](image)

![Enable ALL CODE TYPES Decode Redundancy](image)

![Disable CODABAR Decode Redundancy](image)

![Disable ALL CODE TYPES Decode Redundancy](image)

**Code Types**

Selecting the **ENABLE ALL CODE TYPES** bar code below enables the following symbologies:

- UPC Versions A and E (EAN 8 and 13)
- Code 39
- Interleaved 2 of 5
The scanner autodiscriminates between all of the above symbologies, except for Code 39 and Code 39 Full ASCII.
**UPC/EAN**

**Enable/Disable UPC/EAN**

Enable UPC/EAN

Disable UPC/EAN

**Transmit UPC-E/UPC-A**

Select this option if decoded UPC-E or UPC-A symbols are transmitted with or without the check digit.

Transmit UPC-A check digit

Do Not Transmit UPC-A Check Digit

Transmit UPC-E check digit

Do Not Transmit UPC-E Check Digit

**Decode UPC Only (Not EAN)**

If selected, this option limits the scanner's capability to UPC versions only. It disables EAN decode capability.

Decode UPC Only Enable

Decode UPC Only Disable
**Convert UPC-E to UPC-A**
Select this option to convert UPC-E (zero suppressed) decode data to UPC-A format before transmission. After conversion, data follows UPC-A format and is affected by UPC-A programming selections (e.g., Preamble, Check Digit).

- **Convert UPC-E to UPC-A**
- **Do Not Convert UPC-E to UPC-A**

**EAN Zero Extend**
This parameter adds five leading zeros to decoded EAN-8 symbols to make them compatible in format to EAN-13 symbols.

- **Enable EAN Zero Extend**
- **Disable EAN Zero Extend**
Decode UPC/EAN Supplemental

This option is used to select whether UPC/EAN is decoded with or without supplemental characters, or whether the unit autodiscriminates between the two. Supplementals are additionally appended characters, according to specific code format conventions (e.g., UPC A+2, UPC E+2, EAN 8+5).

If UPC/EAN with supplemental characters 2-digit or 5-digit only is selected, UPC/EAN symbols without supplemental characters won’t be decoded. If UPC/EAN without supplemental characters is selected and the scanner is presented with a UPC/EAN plus supplemental symbol, the UPC/EAN is decoded and the supplemental characters are ignored. If autodiscrimination is chosen, the scanner will, after additional processing to ensure a good decode, transmit either. If UPC/EAN with supplemental characters is selected, UPC/EAN without supplemental characters is ignored.
UPC A and E Preamble(s)

Three options are available for the lead-in characters for decoded UPC-A or UPC-E symbols transmitted to the host device. Select one preamble for UPC-A decodes and one for UPC-E decodes. These lead-in characters are considered part of the symbol itself. The three options are:

- a system character only
- the country code and system character
- no preamble

The system character is the digit printed to the extreme left of a UPC symbol. The country code for UPC is always zero, and it cannot be transmitted without the system character.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
Programming the LS 1004

**UPC/EAN Security Level**

The scanner offers four levels of decode security for UPC/EAN bar codes. Increasing levels of security are provided for decreasing levels of bar code quality. There is an inverse relationship between security and scanner aggressiveness, so be sure to choose only that level of security necessary for any given application.

Security Level 0 - This is the default setting which allows the scanner to operate in its most aggressive state, while providing sufficient security in decoding in spec UPC/EAN bar codes.

Security Level 1 - As bar code quality levels diminish, certain characters become prone to mis-decodes before others (i.e., 1, 2, 7, 8). If you are experiencing mis-decodes of poorly printed bar codes, and the mis-decodes are limited to these characters, select this security level.

Security Level 2 - If you are experiencing mis-decodes on poorly printed bar codes, and the mis-decodes are not limited to characters 1, 2, 7 and 8, select this security level.
**Code 128**

**Enable/Disable Code 128**

- **Enable Code 128**
- **Disable Code 128**

**Send Code 128 Function Character**

If selected, Code 128 function characters are sent as:

- FN1=0X1D
- FN2=0X81
- FN3=0X82
- FN4=0X83

This option is enabled when data format is 8 bits. Even if this option is disabled or data format is 7 bits, FN1 is still set as 0X1D, unless FN1 is in the first or second character in a bar code message.

- **Transmit Code 128 Function Character Enabled**
- **Transmit Code 128 Function Character Disabled**
**Code 39**

**Enable/Disable Code 39**

Enable Code 39

Disable Code 39

**Code 39 Modulo 43 Check**

When enabled, this parameter checks the integrity of a Code 39 symbol to ensure it complies with specified algorithms.

Verify Code 39 Check Digit

Do Not Verify Code 39 Check Digit

**Transmit Code 39 Check Digit**

When enabled, Code 39 Check Digit will be sent to the host.

Transmit Code 39 Check Digit Enable

Transmit Code 39 Check Digit Disable
Enable/Disable Code 39 Full ASCII

Enable Code 39
Full ASCII

Disable Code 39
Full ASCII

Code 93

Enable/Disable Code 93

Enable Code 93

Disable Code 93

Interleaved 2 of 5

Enable/Disable Code I 2 of 5

Enable Code I 2 of 5

Disable Code I 2 of 5

Fixed Lengths for Code I 2 of 5

Select one or two lengths for the Interleaved 2 of 5 codes. If you set both Length 1 and Length 2 to 0, the scanner can read any length within 36 characters. It is recommended that you set the I 2 of 5 modulus 10 check to enabled when you set both Length 1 and Length 2 to 0. If any default setting is in effect and is an appropriate length, it need not be reset. Length 1 may range from 00-36 and Length 2 may range from 00-36.
Fixed Lengths for Code 2 of 5 (cont’d)
**I 2 of 5 Modulo 10 Check**

When enabled, this parameter checks the integrity of an Interleaved 2 of 5 symbol to ensure it complies with specific algorithms.

![Barcode: I 2 of 5 Modulo 10 Check Digit Enable](image)

![Barcode: I 2 of 5 Modulo 10 Check Digit Disable](image)

**ITF-14/EAN-13 Conversion**

This feature converts a 14-character I 2 of 5 code into EAN-13, and transmits to the host as EAN-13. In order to accomplish this, the I 2 of 5 code must be enabled, one length (either LENGTH 1 or LENGTH 2) must be set to 14, the code must have a leading zero and proper trailing check digit.

![Barcode: ITF-14/EAN-13 Conversion Enable](image)

![Barcode: ITF-14/EAN-13 Conversion Disable](image)
Discrete 2 of 5

Enable/Disable D 2 of 5

Enable Code D 2 of 5

Disable Code D 2 of 5

D 2 of 5 Modulo 10 Check

When enabled, this parameter checks the integrity of a Discrete 2 of 5 symbol to ensure it complies with specific algorithms.

D 2 of 5 Modulo 10
Check Digit Enable

D 2 of 5 Modulo 10 Check
Digit Disable

Fixed Lengths for Code 2 of 5

Select one or two lengths for the Discrete 2 of 5 codes. If you set the both of them (Length 1 and Length 2) to 0, the scanner can read any length within 36 characters. It is recommended that you set the D 2 of 5 modulus 10 check to enabled when you set both Length 1 and Length 2 to 0.

If any default setting is in effect and is an appropriate length, it need not be reset. Length 1 may range from 00-36 and Length 2 may range from 00-36.

D 2 of 5 Length 1
(Range 00-36)

D 2 of 5 Length 2
(Range 00-36)
Fixed Lengths for Code 2 of 5 (cont’d)
Programming the LS 1004

**Codabar**

**Enable/Disable Codabar**

Enable Codabar

Disable Codabar

**CLSI Editing**

Use this parameter to insert a space after the 1st, 5th, and 10th characters of a 14-character Codabar symbol. This symbol length includes start and stop characters.

Enable CLSI Editing

Disable CLSI Editing

**NOTIS Editing**

This option strips the start and stop characters from decoded Codabar symbols.

Enable NOTIS Editing

Disable NOTIS Editing
**Data Options**

**Transmit Code ID Character**

A code ID character identifies the code type of a scanned bar code. This may be useful when the scanner is decoding more than one code type. In addition to any single-character prefixes already selected, the code ID character is appended as a prefix to the decode. The code ID characters are:

<table>
<thead>
<tr>
<th>ID Character</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>UPC-A, UPC-E, EAN-13, EAN-8</td>
</tr>
<tr>
<td>B</td>
<td>Code 39</td>

<tr>
<td>G</td>
<td>Discrete 2 of 5 or Discrete 2 of 5 IATA</td>
</tr>
</tbody>
</table>

![Barcode Image](Transmit Code ID Character)

![Barcode Image](Do Not Transmit Code ID)
Prefix
The scanner adds one of the following start-of-text characters to transmitted data.

- None
- Start-of-text (STX)
- One user-defined prefix (can be any ASCII character). See Appendix A, ASCII Character Set for more information.

Suffix
Select one or two end-of-text characters to be added to transmitted data.

- None
- CR (Carriage Return) - Returns the cursor to the same position on the line after each decode.
- LF (Line Feed) - Moves the cursor down a line after each decode.
CR & LF - Allow you to select where the cursor on a display terminal returns to after it displays each decoded symbol. Selecting both CR and LF returns the cursor to the same position on successive lines after each decode. If you select no control code, the cursor remains where it stopped after the last transmission.

HT (Horizontal Tab) - Moves the cursor one tab space.

End of-text <ETX> - One or two characters, user-defined. Refer to Appendix A, ASCII Character Set for more information.

RS-232C

Baud Rate

Baud Rate is the number of bits of data transmitted per second. The unit’s baud rate setting should match the data rate setting of the host device. If not, data may not reach the host device, or may reach it in distorted form.
Parity

A parity check bit is the most significant bit of each ASCII coded character. If you select ODD parity, the parity bit will have a value of 0 or 1, based on data, to ensure that an odd number of 1 bits are contained in the coded character.

If you select EVEN parity, the parity bit will have a value, 0 or 1, to ensure that and even number of 1 bits are contained in the coded character.

If you select MARK parity, the parity bit will always be 1.
If you select SPACE parity, the parity bit will always be 0.

Select the parity type according to the host device requirements.
Data Format
This parameter sets the transmit data format. The options are:

- 7 Data Bits (With Parity) (default)
- 8 Data Bits (With Parity)
- 8 Data Bits (Without Parity)

Stop Bit Select
The stop bit(s) at the end of each transmitted character marks the end of transmission of one character and prepares the receiving device for the next character in the serial data stream. The number of stop bits (one or two) selected depends on the number the receiving terminal is programmed to accommodate. Set the number of stop bits to match host device requirements.

Check Parity
This option determines whether the parity of received characters is checked. The type of parity used is selectable through the PARITY parameter.
**Hardware Handshaking**

Hardware handshaking allows you to check the readiness of the receiving device before data is transmitted. If the receiving device is periodically occupied with other tasks, hardware handshaking is needed to prevent loss of transmitted data.

Select whether the scanned data is to be transmitted as soon as it is available or whether transmission should follow the RTS/CTS procedure.

![None](image1)

![RTS/CTS](image2)

**Software Handshaking**

This parameter offers control of the data transmission process in addition to, or instead of, that offered by hardware handshaking. These options may be combined; for example, ACK/NAK with ENQ.

- No software handshaking
  ![None](image3)

- ACK/NAK only
  The ACK/NAK option checks the success or failure of transmission. The scanner expects one of the following host responses after a data transmission:

  `<ACK>` acknowledges a valid and successful transmission.
  `<NAK>` indicates a problem with the transmission.

  Whenever a NAK is received, the unit retransmits the same data and awaits an ACK/NAK response. After three unsuccessful attempts to transmit the same data, the scanner aborts any further communication attempts of that message.

![ACK/NAK](image4)
ENQ ONLY

The ENQ option needs the host to request data before it is transmitted to the host. This ensures that data transmission occurs only when the host is ready to receive.

When you select the wait for ENQ option, the scanner waits for an ENQ from the host before it transmits data; otherwise, the unit transmits data without waiting for an ENQ character from the host. With ENQ enabled, the scanner must receive an ENQ from the host within a 2-second period after the last activity, or a transmission error occurs.

ACK/NAK with ENQ

This option combines both handshaking options.
Hardware and Software Handshaking Sequence

HARDWARE HANDSHAKING

- SYMBOL IS DECODED

- RTS AND CTS HANDSHAKING LINES USED?
  - YES
  - UNIT Asserts REQUEST-TO-SEND LINE. HOST responds by asserting CLEAR-TO-SEND LINE
  - NO
  - AFTER 2 SECONDS, THE UNIT BEEPS 4 TIMES TO INDICATE A TRANSMISSION ERROR

SOFTWARE HANDSHAKING

- ENQ SWITCH ON?
  - YES
  - WAIT FOR ENQ CHARACTER TO BE RECEIVED FROM HOST
  - NO
  - AFTER 2 SECONDS, THE UNIT BEEPS 4 TIMES TO INDICATE A TRANSMISSION ERROR

- DATA IS TRANSMITTED

- ACK/NAK SWITCH ON?
  - YES
  - WAIT FOR ACK OR NAK RESPONSE FROM HOST
  - NO
  - AFTER 2 SECONDS, THE UNIT BEEPS 4 TIMES TO INDICATE A TRANSMISSION ERROR

- ACK RESPONSE?
  - NO
  - TRY 3 TIMES
  - YES
  - 4 LONG BEEPS

- FINISHED
Communications Delays and Time-Outs (Intercharacter Delay)

Selecting the intercharacter delay gives the host system time to service its receiver and perform other tasks between characters. Select from no delay to a 99 msec. delay between transmission of each character.

**Note:** Table A-1 applies to the LS 1004-I000. Tables A-1 and A-2 apply to the LS 1004-I100 only.
ASCII - American Standard Code for Information Interchange. A 7 bit code representing 128 letters, numerals, punctuation marks, and control characters. It is a standard data transmission code in the U.S.

BIT - Binary digit. One bit is the basic unit of binary information. Generally, eight consecutive bits compose one byte of data. The pattern of 0 and 1 values within the byte determines its meaning.

BOOKLAND EAN - A specially-formatted European Article Numbering symbol with 13 characters (EAN-13), the first 3 of which are “978”.

BYTE - On an addressable boundary, eight adjacent binary digits (0 and 1) combined in a pattern to represent a specific character or numeric value. Bits are numbered from the right, 0 through 7, with bit 0 the low-order bit. One byte in memory can be used to store one ASCII character.

CDRH - Center for Devices and Radiological Health. A federal agency responsible for regulating laser product safety. This agency specifies various laser operation classes based on power output during operation.

CHECK DIGIT - A digit used to verify a correct symbol decode. The scanner inserts the decoded data into an arithmetic formula and checks that the resulting number matches the encoded check digit. Check digits are required for UPC but are optional for other symbologies. Using check digits decreases the chance of substitution errors when a symbol is decoded.

CODABAR - A discrete self-checking code with a character set consisting of digits 0 to 9 and six additional characters: (- $ : / , +).
CODE 128 - A high density symbology which allows the controller to encode all 128 ASCII characters without adding extra symbol elements.

CODE 3 OF 9 (CODE 39) - A versatile and widely used alphanumeric bar code symbology with a set of 43 character types, including all uppercase letters, numerals from 0 to 9, and 7 special characters (- . / + % $ and space). The code name is derived from the fact that 3 of 9 elements representing a character are wide, while the remaining 6 are narrow.

CODE 93 - An industrial symbology compatible with Code 39 but offering a full character ASCII set and a higher coding density than Code 39.

CONTINUOUS SYMBOLOGY - A bar code or symbol in which all spaces within the symbol are parts of characters. There are no intercharacter gaps in a continuous code. The absence of gaps allows for greater information density.

DECODE - To recognize a bar code symbology (e.g., UPC/EAN) and then analyze the content of the specific bar code scanned.

DECODE ALGORITHM - A decoding scheme that converts pulse widths into data representation of the letters or numbers encoded within a bar code symbol.

DISCRETE SYMBOLOGY - A bar code or symbol in which the spaces between characters (intercharacter gaps) are not part of the code.

DISCRETE 2 OF 5 - A binary bar code symbology representing each character by a group of five bars, two of which are wide. The location of wide bars in the group determines which character is encoded; spaces are insignificant. Only numeric characters (0 to 9) and START/STOP characters may be encoded.

EAN - European Article Number. This European/International version of the UPC provides its own coding format and symbology standards. Element dimensions are specified metrically. EAN is used primarily in retail.

HOST COMPUTER - A computer that serves other terminals in a network, providing such services as computation, database access, supervisory programs, and network control.
IEC - International Electrotechnical Commission. This international agency regulates laser safety by specifying various laser operation classes based on power output during operation.

IEC CLASS I (IEC 825 Class I) - This is the lowest power IEC laser classification. Conformity is ensured through a software restriction of 25 seconds of laser operation within any 100 second window and an automatic laser shutdown if the scanner’s oscillating mirror fails.

INTERCHARACTER GAP - The space between two adjacent bar code characters in a discrete bar code.

INTERLEAVED BAR CODE - A bar code in which characters are paired together, using bars to represent the first character and the intervening spaces to represent the second.

INTERLEAVED 2 OF 5 - A binary bar code symbology representing character pairs in groups of five bars and five interleaved spaces. Interleaving provides for greater information density. The location of wide elements (bar/spaces) within each group determines which characters are encoded. This continuous code type uses no intercharacter spaces. Only numeric (0 to 9) and START/STOP characters may be encoded.

LASER - An acronym for Light Amplification by Stimulated Emission of Radiation. The laser is an intense light source. Light from a laser is all the same frequency, unlike the output of an incandescent bulb. Laser light is typically coherent and has a high energy density.

LASER DIODE - A semiconductor type of laser connected to a power source to generate a laser beam. This laser type is a compact source of coherent light.

PARAMETER - A variable that can have different values assigned to it.

PROGRAMMING MODE - The state in which a scanner is configured for parameter values. See SCANNING MODE.

QUIET ZONE - A clear space, containing no dark marks, which precedes the start character of a bar code symbol and follows the stop character.
**REDUNDANCY** - A decoding method which requires a bar code be recognized redundantly on a number of sweeps of the scan beam before a decode is declared. While slowing the time-to-decode, redundancy can help lower the possibility of a mis-decode of poorly printed symbols.

**SCANNER** - An electronic device used to scan bar code symbols and produce a digitized pattern that corresponds to the bars and spaces of the symbol. Its three main components are:

1.  Light source (laser or photoelectric cell) - illuminates a bar code.
2.  Photodetector - registers the difference in reflected light (more light reflected from spaces).
3.  Signal conditioning circuit - transforms optical detector output into a digitized bar pattern.

**SCANNING MODE** - The scanner is energized, programmed, and ready to read a bar code.

**SCANNING SEQUENCE** - A method of programming or configuring parameters for a bar code reading system by scanning bar code menus.

**SELF-CHECKING CODE** - A symbology that uses a checking algorithm to detect encoding errors within the characters of a bar code symbol.

**START/STOP CHARACTER** - A pattern of bars and spaces that provides the scanner with start and stop reading instructions and scanning direction. The start and stop characters are normally to the left and right margins of a horizontal code.

**SYMBOL** - A scannable unit that encodes data within the conventions of a certain symbology, usually including start/stop characters, quiet zones, data characters, and check characters.

**SYMBOLOGY** - The structural rules and conventions for representing data within a particular bar code type (e.g. UPC/EAN, Code 39).
UPC - Universal Product Code. A relatively complex numeric symbology. Each character consists of two bars and two spaces, each of which can be any of four widths. The standard symbology for retail food packages in the United States.
