Index
Introduction

This guide provides information about using the Fusion Wireless Companion software on a Zebra mobile computer.

**NOTE** Screens and windows pictured in this guide are samples and can differ from actual screens.

This guide describes the functionally using Windows Mobile operating system.

Chapter Descriptions

Topics covered in this guide are as follows:

- **Chapter 1, Getting Started** provides an overview of the Fusion Wireless Companion software.
- **Chapter 2, Find WLAN Application** provides information about the Find WLAN application.
- **Chapter 3, Manage Profiles Application** provides information about managing profiles.
- **Chapter 4, Profile Editor Wizard** explains how to configure a profile.
- **Chapter 5, Manage Certificates Application** explains how to manage certificates.
- **Chapter 6, Manage PACs Application** explains how to manage PACs.
- **Chapter 7, Options** explains how to configure the Fusion options.
- **Chapter 8, Wireless Status Application** describes how to get status about the wireless connection.
- **Chapter 9, Wireless Diagnostics Application** describes tools to help diagnose problems with the wireless connection.
- **Chapter 10, Log On/Off Application** explains how to log on and off the wireless network.
- **Chapter 11, Configuration Persistence** explains how to persist Fusion data and settings across a clean/cold boot.
- **Chapter 12, Configuration Examples** provides examples for setting up profiles with various authentication and encryption types.
• Chapter 14, Usage Notes describes the features of Fusion that can be turned on and off but do not have a standard Fusion user interface.

---

**Notational Conventions**

The following conventions are used in this document:

• *Italic* text is used to highlight the following:
  • Chapters and sections in this and related documents
  • Dialog box, window and screen names
  • Icons on a screen.

• **Bold** text is used to highlight the following:
  • Key names on a keypad
  • Button names on a screen or window.
  • Drop-down list and list box names
  • Check box and radio button names

• bullets (•) indicate:
  • Action items
  • Lists of alternatives
  • Lists of required steps that are not necessarily sequential

• Sequential lists (e.g., those that describe step-by-step procedures) appear as numbered lists.

---

**NOTE** This symbol indicates something of special interest or importance to the reader. Failure to read the note will not result in physical harm to the reader, equipment or data.

**CAUTION** This symbol indicates that if this information is ignored, the possibility of data or material damage may occur.

**WARNING!** This symbol indicates that if this information is ignored the possibility that serious personal injury may occur.

CHAPTER 1  GETTING STARTED

Introduction

Each Zebra mobile computer has a wireless local area network (WLAN) interface. This WLAN interface is managed by the Fusion Wireless Companion application. The software allows the user to configure and control the wireless radio in order to securely connect to the WLAN infrastructure. This guide enables the user to configure the mobile computer so that it can connect properly to a WLAN. This guide describes how to use the Fusion software.

Configuring the Infrastructure

WLANs allow mobile computers to communicate wirelessly. Before using the mobile computer on a WLAN, the facility must be set up with the required hardware to run the WLAN (sometimes known as infrastructure). The infrastructure and the mobile computer must both be properly configured to enable this communication.

Refer to the documentation provided with the infrastructure (access points (APs), access ports, switches, Radius servers, etc.) for instructions on how to set up the infrastructure.

Once you have set up the infrastructure to enforce your chosen WLAN security scheme, use the Fusion software to configure the mobile computer to match.

Fusion Overview

The Fusion software contains applications with which to create wireless profiles. Each profile specifies the security parameters to use for connecting to a particular WLAN as identified by its ESSID. The Fusion software also allows the user to control which profile out of a set of profiles is used to connect. Other Fusion applications allow the user to monitor the status of the current WLAN connection and to invoke diagnostic tools for troubleshooting.

The Fusion applications are accessed differently depending upon the operating system configuration, Windows Mobile 6.5, by default, supports a Windows Home screen as well as the classic Mobile 6.1 Today screen.
Windows Mobile Home Screen

When the Windows Mobile Home screen is configured, a Fusion plug-in displays on the Home screen to provide information about signal strength and profile name.

![Figure 1-1 Windows Mobile Home Screen with Fusion Plug-in](image)

Tap the **Fusion** tile to open the **Wireless Launcher** window.

Windows Classic Today Screen

When the Windows Mobile Classic Today screen is configured and Fusion is managing the WLAN, a Fusion signal strength icon appears in the Task tray.

![Figure 1-2 Windows Mobile Classic Today Screen with Fusion](image)

**Windows CE**

A Fusion signal strength icon appears in the Task tray.
Select the icon to open the **Wireless Launcher** menu.

---

**Fusion Signal Strength Icon**

The shape and color of the **Signal Strength** icon provides information about the received wireless signal strength for the WLAN connection. *Table 1-1* describes the different icons and their meanings.

<table>
<thead>
<tr>
<th>Fusion Icon</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Excellent signal strength" /></td>
<td>Excellent signal strength</td>
<td>WLAN network is ready to use.</td>
</tr>
<tr>
<td><img src="image" alt="Very good signal strength" /></td>
<td>Very good signal strength</td>
<td>WLAN network is ready to use.</td>
</tr>
<tr>
<td><img src="image" alt="Good signal strength" /></td>
<td>Good signal strength</td>
<td>WLAN network is ready to use.</td>
</tr>
<tr>
<td><img src="image" alt="Fair signal strength" /></td>
<td>Fair signal strength</td>
<td>WLAN network is ready to use. Notify the network administrator that the signal strength is “Fair”.</td>
</tr>
<tr>
<td><img src="image" alt="Poor signal strength" /></td>
<td>Poor signal strength</td>
<td>WLAN network is ready to use. Performance may not be optimum. Notify the network administrator that the signal strength is “Poor”.</td>
</tr>
<tr>
<td><img src="image" alt="Out-of-network range (not associated)" /></td>
<td>Out-of-network range (not associated)</td>
<td>No WLAN network connection. Notify the network administrator.</td>
</tr>
<tr>
<td><img src="image" alt="The WLAN radio is disabled." /></td>
<td>The WLAN radio is disabled.</td>
<td>The WLAN radio is disabled. To enable, choose <strong>Enable Radio</strong> from the <strong>Wireless Applications</strong> menu.</td>
</tr>
<tr>
<td><img src="image" alt="None" /></td>
<td>The Wireless Launcher application was exited.</td>
<td>The <strong>Wireless Launcher</strong> application has been closed. See the Fusion Functions paragraphs below for how to restart the <strong>Wireless Launcher</strong>.</td>
</tr>
</tbody>
</table>
Fusion Functions

Tap the **Signal Strength** icon or **Fusion** tile or tap **Start > Wireless Companion > Wireless Launcher** icon to display the **Wireless Launcher** menu.

![Figure 1-4 Wireless Launcher Menu](image)

Many of the items in the menu invoke one of the Fusion applications. These menu items and their corresponding applications are summarized in **Table 1-2**.

<table>
<thead>
<tr>
<th>Application</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Find WLANs</td>
<td>Invokes the <strong>Find WLANs</strong> application which displays a list of the WLANs available in your area.</td>
</tr>
<tr>
<td>Manage Profiles</td>
<td>Invokes the <strong>Manage Profiles</strong> application (which includes the <strong>Profile Editor Wizard</strong>) to manage and edit your list of WLAN profiles.</td>
</tr>
<tr>
<td>Manage Certs</td>
<td>Invokes the <strong>Certificate Manager</strong> application which allows you to manage certificates used for authentication.</td>
</tr>
<tr>
<td>Manage PACs</td>
<td>Invokes the <strong>PAC Manager</strong> application which helps you manage the list of Protected Access Credentials used with EAP-FAST authentication.</td>
</tr>
<tr>
<td>Options</td>
<td>Invokes the <strong>Options</strong> application which allows you to configure the Fusion option settings.</td>
</tr>
<tr>
<td>Wireless Status</td>
<td>Invokes the <strong>Wireless Status</strong> application which allows you to view the status of the current wireless connection.</td>
</tr>
<tr>
<td>Wireless Diagnostics</td>
<td>Invokes the <strong>Wireless Diagnostics</strong> application which provides tools with which to diagnose problems with the wireless connection.</td>
</tr>
<tr>
<td>Log On/Off</td>
<td>Invokes the <strong>Network Login</strong> dialog which allows you to log on to a particular profile or to log off from the currently active profile.</td>
</tr>
<tr>
<td>Fusion Help</td>
<td>Invokes Fusion Help application which provides on-device Fusion Help (Windows Mobile only).</td>
</tr>
</tbody>
</table>

Each of the applications have a chapter devoted to it in this guide.

Additional **Wireless Launcher** menu entries include:
• Enable/Disable Radio
• Hide Menu
• Exit.

Enable/Disable Radio

To turn the WLAN radio off, tap the Signal Strength icon and select Disable Radio. Tap the Fusion tile or tap Start > Wireless Companion > Wireless Launcher icon and select Disable Radio.

![Figure 1-5 Disable Radio](image)

To turn the WLAN radio on, tap the Fusion tile or tap Start > Wireless Companion > Wireless Launcher icon and select Enable Radio.

![Figure 1-6 Enable Radio](image)

Also note that the radio may be enabled or disabled using the Wireless Manager screen on Windows Mobile devices.

Hide Menu

To hide the menu tap Hide in the menu.
Exit

Tap Exit to close the menu and exit the Wireless Launcher application. A dialog appears to confirm exiting the Wireless Launcher application. Tap Yes to exit. This closes the Wireless Launcher application and removes the Signal Strength icon from the screen.

To restart the Wireless Launcher application and redisplay the Signal Strength icon:

1. Tap Start > Programs > Wireless Companion icon > Wireless Launch icon.
2. Tap ok twice to close the windows.
3. The Signal Strength icon appears on the screen.

Fusion Help

On Windows Mobile devices, to access the on-device Fusion Help tap Start > Wireless Companion > Fusion Help.

Minimum Setup

Below is a list of the minimum effort to achieve a wireless connection. Note that there are many discrete nuances that may affect the performance of your wireless connection that might be missed if you do not consider them carefully.

You will need to create a profile. It is recommended that you read the profile editor chapter.

1. Find out from your IT administrator what the connection settings should be (Extended Service Set Identifier (ESSID), Enterprise or Personal, authentication type, tunnel type, certificate requirements, Protected Access Credentials (PAC) requirements). Note that not all of the items listed may be relevant.
2. Create the profile using the information provided by the IT administrator.
3. Enter the Manage Profile screen, select the profile (press and hold), and select the Connect option in the context menu that appears.
CHAPTER 2 FIND WLAN APPLICATION

Introduction

Use the Find WLANs application to discover available networks in the vicinity of your and mobile computer. To open the Find WLANs application, tap the Signal Strength icon > Find WLANs. The Find WLANs window displays.

![Find WLANs Window](image)

Figure 2-1 Find WLANs Window

The Find WLANs list displays:

- WLAN Networks - Available wireless networks, (both infrastructure and Ad-hoc) with icons that indicate signal strength and encryption. The signal strength and encryption icons are described in Table 2-1 and Table 2-2.
- Network Type - Type of network. 802.11(a), 802.11(b), 802.11(g) or 802.11(n).
- Channel - Channel on which the AP/Ad-hoc peer is transmitting.
- Signal Strength - The signal strength of the signal from the AP/Ad-hoc peer.
Table 2-1  Signal Strength Icon

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Icon" /></td>
<td>Excellent signal</td>
</tr>
<tr>
<td><img src="image2" alt="Icon" /></td>
<td>Very good signal</td>
</tr>
<tr>
<td><img src="image3" alt="Icon" /></td>
<td>Good signal</td>
</tr>
<tr>
<td><img src="image4" alt="Icon" /></td>
<td>Fair signal</td>
</tr>
<tr>
<td><img src="image5" alt="Icon" /></td>
<td>Poor signal</td>
</tr>
<tr>
<td><img src="image6" alt="Icon" /></td>
<td>Out of range or no signal</td>
</tr>
</tbody>
</table>

Table 2-2  Encryption Icon

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image7" alt="Icon" /></td>
<td>No encryption. WLAN is an infrastructure network.</td>
</tr>
<tr>
<td><img src="image8" alt="Icon" /></td>
<td>WLAN is an Ad-hoc network.</td>
</tr>
<tr>
<td><img src="image9" alt="Icon" /></td>
<td>WLAN uses encryption. WLAN is an infrastructure network.</td>
</tr>
</tbody>
</table>

Tap-and-hold on a WLAN network to open a pop-up menu which provides three options: Connect to, Create profile and Refresh.

![Image](image10)

Figure 2-2  Find WLANs Menu

**NOTE**

The number of WLANs (ESSIDs) that can be detected by the wireless radio at one time is limited. If you have a large number of WLANs active in your area, the Find WLANs window may not display them all.

The scan triggered by Find WLAN is at a lower priority compared to a roam scan. If the device is attempting to roam then a Find WLAN done at the exact same time may result in showing only the currently connected AP. Redoing the Find WLAN command shows the proper full results.

If you do not see your ESSID, try a Refresh. If your ESSID is still not displayed and you wish to create or connect to a profile for it, you will need to use the Manage Profiles application.

Select Connect to to view the list of existing profiles matching the select ESSID. The mobile computer connects to the given profile upon selection.
Select **Create profile** to create a new WLAN profile for that network. This starts the **Profile Editor Wizard** which allows you to configure the security parameters that your mobile computer will use for the selected network. After editing the profile, the mobile computer automatically connects to this new profile.

**NOTE**  
A warning displays when connecting to an unsecure (or open) network via the **Find WLANs** application. For open WLANs, the profile’s settings will take on automatically generated default values. If you wish to manually configure the settings, uncheck the **Use Default configuration** checkbox.

![Wireless LAN Profile Entry](image)

**Figure 2-3  Warning Notice**

Select **Refresh** to refresh the WLAN list.
Introduction

A profile is a set of operating parameters that define how the mobile computer will connect to a specific WLAN. Create different profiles for use in different network environments. The Manage Profiles application displays the list of user-created wireless profiles. You may have a maximum of 32 profiles at any one time. To open the Manage Profiles application, tap the Signal Strength icon > Manage Profiles.

![Manage Profiles Window](image)

Figure 3-1  Manage Profiles Window

Icons next to each profile identify the profile's current state.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="No Icon" /></td>
<td>Profile is not selected, but enabled.</td>
</tr>
<tr>
<td><img src="image" alt="Profile is disabled" /></td>
<td>Profile is disabled.</td>
</tr>
<tr>
<td><img src="image" alt="Profile is cancelled" /></td>
<td>Profile is cancelled. A cancelled profile is disabled until you connect to it, either by selecting Connect from the pop-up menu, or by using the Log On/Off application.</td>
</tr>
</tbody>
</table>
You can perform various operations on the profiles in the list. To operate on an existing profile, tap and hold it in the list and select an option from the menu to connect, edit, disable (enable), or delete the profile. (Note that the Disable menu item changes to Enable if the profile is already disabled.)

![Manage Profiles Context Menu](image)

**Figure 3-2 Manage Profiles Context Menu**

### Connect to a Profile

Tap and hold a profile and select **Connect** from the pop-up menu to set this as the active profile.

![Manage Profiles - Connect](image)

**Figure 3-3 Manage Profiles - Connect**
Once selected, the mobile computer uses the settings configured in the profile (i.e., authentication, encryption, ESSID, IP Config, power consumption, etc.) to connect to a WLAN.

**Editing a Profile**

Tap and hold a profile and select Edit from the pop-up menu. This will invoke the Profile Wizard where the profile settings are configured.

**Creating a New Profile**

To create a new profile tap and hold anywhere in the Manage Profiles window and select Add from the pop-up menu.

![Manage Profiles - Add](image)

Selecting Add invokes the Profile Wizard wherein the settings for the new profile are configured, such as profile name, ESSID, security, network address information, and the power consumption level.

**Deleting a Profile**

To delete a profile from the list, tap and hold the profile and select Delete from the pop-up menu. A confirmation dialog box appears.

**Ordering Profiles**

The profiles are listed in priority order for use by the automatic Profile Roaming feature (see Profile Roaming below). Change the order by moving profiles up or down. Tap and hold a profile from the list and select Move Up or Move Down from the pop-up menu.

**Export a Profile**

To export a profile to a gpdexport file, tap and hold a profile from the list and select Export from the pop-up menu. The Save As dialog box displays with the Application folder and a default name of WCS_PROFILE{profile GUID}.gpdexport (Globally Unique Identifier).
If required, change the name in the Name field and tap Save. A confirmation dialog box appears after the export completes.

**Profile Roaming**

![Save As Dialog Box](image)

**NOTE** Turn Profile Roaming off in single profile scenarios.

Profile Roaming attempts to automatically select and connect to a profile from the profile list displayed in the Manage Profiles window. The Profile Roaming algorithm uses the order of the profiles in the profile list to determine the order in which profiles are tried.

**NOTE** Profile Roaming must be enabled in the Options application. See Chapter 7, Options.

The Profile Roaming algorithm makes two passes through the profile list. The first pass attempts to connect only to profiles that specify ESSIDs that can be detected by the wireless radio. If no connection is made, a second pass through the list is performed attempting to connect to those profiles that were not tried in the first pass. The Profile Roaming algorithm will only attempt to connect to a profile for which it is not necessary to prompt the user for credentials (i.e., username and password). This includes:

- A profile that does not require credentials.
- A device profile. A device profile is one in which the username and password have been pre-entered directly into the profile. (A profile with the username specified but with the password field left empty is still considered a device profile since an empty password is considered a valid password.)
- A user profile with cached credentials. A user profile is one in which the username and password have not been pre-entered into the profile. A profile has cached credentials if the user has entered credentials for the profile via the Network Login dialog. When a profile has cached credentials, the user is said to have logged on to the profile. See Chapter 10, Log On/Off Application for more information.

The Profile Roaming algorithm will not attempt to connect to:

- A profile that specifies EAP-GTC for its Tunnel Authentication Type and Token (as opposed to Static) for its password type. See Tunneled Authentication on page 4-6 for more information.
- A user profile without cached credentials.
• A user profile that has cached credentials but that also has the At-Connect option enabled. See Credential Cache Options on page 4-14 for more information.

• A device profile that has cached credentials because the user has logged on to it (called a user-override profile), but that also has the At-Connect option enabled.

• A profile that has been disabled.

• A profile that has been cancelled.

The Profile Roaming algorithm is invoked whenever the mobile computer becomes disconnected (disassociated) from the current WLAN.
CHAPTER 4  YPROFILE EDITOR WIZARD

Introduction

Use the Profile Editor Wizard to create a new WLAN profile or edit an existing profile. If editing a profile, the fields reflect the current settings for that profile. If creating a new profile, default values appear in the fields.

Navigate through the wizard using the Next and Back buttons. An indicator in the bottom left corner tracks the number of pages traversed and total number of pages required to complete the current profile configuration. Tap X or the Cancel button to quit. On the confirmation dialog box, tap No to return to the wizard or tap Yes to quit and return to the Manage Profiles window. See Chapter 3, Manage Profiles Application for instructions on navigating to and from the Profile Editor Wizard.

Profile Name

In the Profile Name dialog box in the Profile Editor Wizard, enter the profile name and the ESSID.

![Profile Name Dialog Box](image.png)

*Figure 4-1     Profile Name Dialog Box*
Tap **Next**. If **Ad-hoc** mode was selected the **Ad-hoc Channel** dialog box displays. If **Infrastructure** mode was selected the **Security Mode** dialog box displays. See *Encryption on page 4-16* for instruction on setting up authentication.

### Operating Mode

Use the **Operating Mode** dialog box to select the operating mode (Infrastructure or Ad-hoc) and the country location.

**NOTE**  
Two profiles with the same user friendly name are acceptable but not recommended.

Tap **Next**. The **Operating Mode** dialog box displays.

### Ad-hoc

Use the **Ad-hoc Channel** dialog box to configure the required information to create an Ad-hoc profile. This dialog box does not appear if you selected **Infrastructure** mode.

1. Select a channel number from the **Channel** drop-down list.
2. Tap Next. The Encryption dialog box displays. See Encryption on page 4-16 for encryption options.

### Security Mode

**NOTE** Security Mode dialog box only appears when Infrastructure mode is selected in the Operating Mode dialog box.

Use the Security Mode dialog box to configure the Security and Authentication methods. If Ad-hoc mode is selected, this dialog box is not available and authentication is set to None by default.
Select the security mode from the **Security Mode** drop-down list. The selection chosen affects the availability of other choices for Authentication Type and Encryption methods.

- **Legacy (Pre - WPA)** - This mode allows the user to configure protocols not available in the other Security Mode selections: Open authentication / encryption; Open authentication with WEP-40 or WEP-104; and 802.1X authentications that use WEP-104 Encryption.
- **WPA - Personal** - This mode allows the user to configure a WPA-TKIP-PSK protocol.
- **WPA2 - Personal** - This mode allows the user to configure WPA2-PSK protocols with TKIP or Advanced Encryption Standard (AES) encryption method.
- **WPA - Enterprise** - This mode allows the user to configure profiles with 802.1X Authentication that uses WPA with TKIP encryption method.
- **WPA2 - Enterprise** - This mode allows the user to configure profiles with 802.1X Authentication that uses WPA2 with TKIP or AES encryption method.

</table>
Authentication Type

Select an available authentication type from the drop-down list. The options listed in the drop-down list are based on the selected Security Mode as shown in Table 4-4.

The authentication types, other than None, all use IEEE 802.1x authentication to ensure that only valid users and sometimes servers can connect to the network. Each authentication type uses a different scheme using various combinations of tunnels, username/passwords, user certificates, server certificates, and Protected Access Credentials (PACs).

Table 4-5 Authentication Options

<table>
<thead>
<tr>
<th>Authentication</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>Use this setting when user authentication is not required. A global key mechanism, WEP or PSK, is still applied when this option is selected.</td>
</tr>
<tr>
<td>EAP-TLS</td>
<td>Select this option to enable EAP-TLS authentication. A user certificate is required; validating the server certificate is optional.</td>
</tr>
<tr>
<td>EAP-FAST</td>
<td>Select this option to enable EAP-FAST authentication. This type uses a Protected Access Credential (PAC) to establish a tunnel and then uses the selected tunnel type to verify credentials. PACs are handled behind the scenes, transparently to the user. Automatic PAC provisioning can, depending on the tunnel type and the RADIUS server settings, require a user certificate and the validation of a server certificate.</td>
</tr>
<tr>
<td>PEAP</td>
<td>Select this option to enable PEAP authentication. This type establishes a tunnel and then based on the tunnel type, uses a user certificate and/or a username/password. Validating the server certificate is optional.</td>
</tr>
<tr>
<td>LEAP</td>
<td>Select this option to enable LEAP authentication. This type does not establish a tunnel. It requires a username and password.</td>
</tr>
<tr>
<td>TTLS</td>
<td>Select this option to enable TTLS authentication. This type establishes a tunnel in which the username/password are verified. A user certificate may optionally be used. Validating the server certificate is also optional.</td>
</tr>
</tbody>
</table>

Tap Next. Selecting PEAP, TTLS or EAP-FAST displays the Tunneled Authentication Type dialog box. Selecting None displays the Encryption dialog box. Selecting EAP-TLS displays the Installed User Certs dialog box. Selecting LEAP displays the User Name dialog box.

Fast Roaming

The fast roaming settings are as follows:

Allow CCKM - Checking this allows the use of Cisco Centralized Key Management (CCKM) for fast roaming between Cisco access points. This setting is available when the security mode has been set to WPA-Enterprise or WPA2-Enterprise.

Allow HFSR - Checking this allows the use of Hyper-Fast Secure Roaming (HFSR) for fast roaming between Zebra access points. This setting is available when the security mode has been set to WPA-Enterprise, WPA2-Enterprise, WPA-Personal, or WPA2-Personal.
Tunneled Authentication

Use the Tunneled Authentication Type dialog box to select the tunneled authentication options. The content of the dialog will differ depending on the Authentication Type chosen.

To select a tunneled authentication type:

1. Select a tunneled authentication type from the drop-down list. See Table 4-6 for the Tunnel authentication options for each authentication type.

2. Select the Provide User Certificate check box if a certificate is required. If the TLS tunnel type that requires a user certificate is selected, the check box is already selected.

3. Tap Next. The Installed User Certificates dialog box appears.

</tbody>
</table>
### User Certificate Selection

If a User Certificate is required to support the chosen security scheme then the **Installed User Certificates** dialog box displays. Select a certificate from the drop-down list of currently installed certificates before proceeding. The selected certificate's name appears in the drop-down list. If the required certificate is not in the list, install it.

![Installed User Certificates Dialog Box](Image)

**Figure 4-7** Installed User Certificates Dialog Box

### User Certificate Installation

*NOTE* User Certificates can also be installed using the **Manage Certificates** Application. See Chapter 5, *Manage Certificates Application* for more information.

</tbody>
</table>
There are two methods available to install a user certificate for authentication. The first is to obtain the user certificate from the Certificate Authority (CA). This requires connectivity with that CA. The second method is to install the user certificate from a .pfx file that has been manually placed on the device.

To install a user certificate from the CA:

1. Tap Install Certificate. The Import Certificate dialog box appears.

![Figure 4-8 Import Certificate Dialog Box]

2. Select Import User Cert from Server and tap OK. The Install from Server dialog box appears.

![Figure 4-9 Install from Server Dialog Box]

3. Enter the User:, Password: and Server: information in their respective text boxes.

4. Tap Retrieve. A Progress dialog indicates the status of the certificate retrieval or tap Exit to exit.

After the installation completes, the Installed User Certs dialog box displays and the certificate is available in the drop-down for selection.

NOTE To successfully install a user certificate from a server, the mobile computer must already be connected to a network from which that server is accessible.

To install a user certificate from a .pfx file:

1. Tap Install Certificate. The Import Certificate dialog box appears.

![Figure 4-10 Import Certificate Dialog Box]
2. Choose **Import from File** and tap **OK**.

   The Open dialog box appears.

   ![Open Dialog Box](image)

   Figure 4-11 *Open Dialog Box*

3. In the **Type** drop-down list, select **Certificates (.cer, .pfx)**.

   ![Personal Certificate Window](image)

   Figure 4-12 *Personal Certificate Window*

4. Browse to the desired .pfx file and tap **OK**.

   The **Personal Certificate** dialog box appears.

5. If the .pfx file is password protected, enter the appropriate password; else leave the password fields empty. Deselect the **Hide Password** check box to see the password characters as they are entered.

6. Tap **OK**. The certificate(s) are imported.

**Server Certificate Selection**

If the user selects the **Validate Server Certificate** check box, a server certificate is required. Select a certificate from the drop-down list of currently installed certificates in the **Installed Server Certificates** dialog box. An hour glass may appear as the wizard populates the existing certificate list. If the required certificate is not listed, install it.
Server Certificate Installation

A server certificate can only be installed from either a .cer file or a .pfx file that has been loaded onto the device. The certificate file can be loaded either manually or via a web-browser-based interface to the Certificate Authority (CA).

To successfully install a server certificate from a CA using a web-browser, the mobile computer must already be connected to a network from which that CA is accessible. The procedure you should follow to download the server certificate from the CA is beyond the scope of this guide.
3. Browse to the file and tap OK.

4. A confirmation dialog verifies the installation. If the information in this dialog is correct, tap the Yes button, If the information in this dialog is not correct tap the No button. The wizard returns to the Installed Server Certs dialog box. Select the newly-installed certificate from the drop down list.

Figure 4-16  Confirmation Dialog Box

User Name

The user name and password can optionally be entered when the profile is created (called a device profile) or they can be left empty (called a user profile). If the username and password are not entered in the profile, then when attempting to connect, the user will be prompted to supply them. The entered information (credentials) will be saved (cached) for future reconnections.

Whether a profile is a device or a user profile affects how the profile is treated during a Profile Roaming operation (see Profile Roaming on page 3-4). Profiles are excluded from profile roaming consideration if they require user entry of credential information.

If the profile uses an authentication tunnel type of EAP-GTC and Token is selected (see Encryption on page 4-16), then you can control certain behavior by whether you choose to enter a value in the Enter User Name field. If you enter a value in the Enter User Name field, then whenever the Fusion software prompts you to enter credentials, the username field in the interactive credential dialog will be initialized with the value that you entered when you created the profile. If you enter a different value in the username field of the interactive credential dialog, it is cached and used to initialize the username field the next time the interactive credential dialog is shown for that profile. If you do not enter a value in the Enter User Name field when you create an EAP-GTC token profile, then the username field in the interactive credential dialog is initialized to blank. After you enter a username in the interactive credential dialog, it is cached as usual, but it is not be used to initialize the username field the next time the interactive credential dialog is shown for that profile; the username field will still be initialized to blank. In summary, the user can control whether the username field in the interactive credential dialog box is initialized, either with the last-interactively-entered username for that profile or with the username entered into the profile, by whether any value is entered in the Enter User Name field during profile entry.

Figure 4-17  Username Dialog Box

Password

Use the Password dialog box to enter a password. If EAP-TLS is the selected authentication type, the password dialog box does not display. Note that if a username was entered and no password is entered, Fusion assumes that no password is a valid password.
1. Enter a password in the **Enter Password** field.

   If an authentication tunnel type of EAP-GTC is used, a **Password** dialog box with additional radio buttons displays.

   Two radio buttons are added to allow the user to choose a token or static password.

   Choose the **Token** radio button when using the profile in conjunction with a token generator (hardware or software). The system administrator should supply the user with a token generator for use with EAP-GTC token profiles. A token generator generates a numeric value that is entered into the password field at connect time, usually along with a PIN. Tokens have a very limited lifetime and usually expire within 60 seconds. The token generator is time-synchronized with a token server. When authenticating, the RADIUS server asks the token server to verify the token entered. The token server knows what value the token generator generates given the time of day and the username. Since tokens expire, EAP-GTC token profiles are treated differently. A prompt appears at the appropriate time to enter a token, even if a token has previously been entered. Tokens are never cached in the credential cache (though the username that is entered when the token is entered is cached).

   If the **Static** radio button is selected, the **Enter Password** field is enabled and a password can be entered if desired. A profile that uses an EAP-GTC tunnel type with a static password is handled in the same manner as other profiles that have credentials that don't expire.

1. Select the **Advanced ID** check box, if advanced identification is desired.

2. Tap **Next**. The **Prompt for Login at** dialog box displays. See **Credential Cache Options on page 4-14**.

---

## Advanced Identity

Use the **Advanced ID** dialog box to enter the 802.1x identity to supply to the authenticator. This value can be 63 characters long and is case sensitive. For TTLS, EAP-FAST, and PEAP authentication types, it is recommended entering the identity **anonymous** (rather than a true identity). You can optionally enter a fully qualified domain (e.g., mydomain.local) and it will automatically be combined with the 802.1x identity (i.e., anonymous@mydomain.local) before being sent to the RADIUS server.

Entering an 802.11x Identity is required before proceeding.
Credential Cache Options

When connecting to a password-based user profile for the first time, Fusion will prompt the user to enter credentials. After the credentials have been entered, they are cached. These cached credentials will normally be used, without prompting the user, whenever Fusion reconnects to that profile. The credential caching options allow the administrator to specify additional circumstances under which Fusion will prompt the user to re-enter the credentials even though it already has cached credentials for the given profile. Requiring the user to re-enter credentials can help ensure that only an authorized user is using the device.

The credential caching options are at connection, on each resume, or at a specified time.

>Note Credential caching options only apply to user profiles and to user-override profiles (a device profile that a user has logged on to using the Log On/Off command). Credential caching options do not apply to device profiles. You are allowed to set the options for a device profile so that they will have an effect if you convert the profile to a user-override profile by logging on to it using the Log On/Off command.

If the mobile computer does not have the credentials, a username and password must be entered. If the mobile computer has the credentials (previous entered via a login dialog box), it uses these credentials unless the caching options require the mobile computer to prompt for new credentials. If credentials were entered via the profile, the mobile computer does not prompt for new credentials (except for profiles where the credentials expire, such as EAP-GTC token profiles). Table 4-7 lists the caching options.
The following authentication types have credential caching:

- EAP-TLS
- PEAP
- LEAP
- TTLS
- EAP-FAST.

Some exceptions to the credential caching rules apply for profiles where the credentials expire, such as EAP-GTC token profiles. Since the token expires after a short period, the user may be prompted for credentials even when credentials have already been entered and cached for that profile.

Selecting the **At Time** check box displays the **Time Cache Options** dialog box.

### Table 4-7 Cache Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>At Connect</td>
<td>Select this option to have the mobile computer prompt for credentials each time it tries to connect. Deselect this to use the cached credentials to authenticate. If the credentials are not cached, the user is prompted to enter credentials. This option only applies when the user has previously entered credentials. If the infrastructure has implemented a fast reconnect technology such as Fast Session Resume, or PMKID caching then selecting this option will prevent that technology from working properly by prompting the user for credentials when attempting to reconnect.</td>
</tr>
<tr>
<td>On Resume</td>
<td>Select this option to cause an authenticated user to be reauthenticated when a suspend/resume occurs. The mobile computer uses the cached credentials to authenticate. Once authenticated, the user is prompted for credentials. If the user does not enter matching credentials within three attempts, the user is disconnected from the network. This option only applies when the user has previously entered credentials. If the infrastructure has implemented a fast reconnect technology such as Fast Session Resume, or PMKID caching then selecting this option will prevent that technology from working properly by prompting the user for credentials when attempting to reconnect.</td>
</tr>
<tr>
<td>At Time</td>
<td>Select this option to perform a local verification on an authenticated user at a specified time. The time can be an absolute time or a relative time from the authentication, and should be in at least five minute intervals. Once the time has passed, the user is prompted for credentials. If the user does not enter the same credentials that were entered prior to the At-Time event within three attempts, the user is disconnected from the network. This option only applies when the user has previously entered credentials.</td>
</tr>
</tbody>
</table>

**NOTE** Entering credentials applies the credentials to a particular profile. Logging out clears all cached credentials. Editing a profile clears any cached credentials for that profile.
1. Tap the **Interval** radio button to check credentials at a set time interval.
2. Enter the value in minutes in the **Min** text box.
3. Tap the **At (hh:mm)** radio button to check credentials at a set time.
4. Tap **Next**. The **At Time** dialog box appears.

5. Enter the time using the 24 hour clock format in the **(hh:mm)** text box.
6. Tap > to move the time to the right. Repeat for additional time periods.
7. Tap **Next**. The **Encryption** dialog box displays.

---

**Encryption**

> **NOTE** The only available encryption methods in Ad-hoc mode are Open, WEP-40 and WEP-104.

Use the **Encryption** dialog box to select an encryption method. This page contains the fields to configure the encryption method and corresponding keys, if any. The drop-down list only includes encryption methods available for the selected security mode and authentication type.
Based on the encryption method and the authentication type, the user may have to manually enter pre-shared encryption keys (or a pass phrase). When the user selects any authentication type other than None, 802.1x authentication is used and the keys are automatically generated.

**Table 4-8  Encryption Options**

<table>
<thead>
<tr>
<th>Encryption</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open</td>
<td>Select <strong>Open</strong> (the default) when no data packet encryption is needed over the network. Selecting this option provides no security for data transmitted over the network.</td>
</tr>
<tr>
<td>WEP-40 (40/24)</td>
<td>Select <strong>WEP-40 (40/24)</strong> to use 64-bit key length WEP encryption. This encryption method is only available for the Legacy security mode with Authentication Type set to <strong>None</strong>. Note: This is alternately referred to as WEP-64.</td>
</tr>
<tr>
<td>WEP-104 (104/24)</td>
<td>Select <strong>WEP-104 (104/24)</strong> to use a 128-bit key length WEP encryption. If WEP-104 (104/24) is selected, other controls appear that allow you to enter keys. This encryption method is available for the Legacy security mode. Note: This is alternately referred to as WEP-128.</td>
</tr>
<tr>
<td>TKIP</td>
<td>Select <strong>TKIP</strong> for the adapter to use the Temporal Key Integrity Protocol (TKIP) encryption method. This encryption method is available for all security modes other than Legacy. When TKIP is selected, Mixed Mode support is automatically enabled. The <strong>Allow Mixed Mode</strong> checkbox is enabled and grayed out. This is true for all security modes that allow TKIP as an encryption method. This means that the mobile computer will operate in an environment in which TKIP is used for encrypting the unicast traffic, and either TKIP or WEP-104 is used for encrypting multicast/broadcast traffic. This allows the mobile computer to operate with an AP that is set up to support both WPA and legacy mobile computers simultaneously.</td>
</tr>
<tr>
<td>AES</td>
<td>Select <strong>AES</strong> for the adapter to use the Advanced Encryption Standard (AES) encryption method. This encryption method is available for the WPA2 - Enterprise and WPA2 - Personal security modes. When AES is selected, Mixed Mode support is automatically enabled. The <strong>Allow Mixed Mode</strong> checkbox is enabled and grayed out. This means that the mobile computer will use only AES encryption for unicast traffic, but allows it to use either AES, TKIP, or WEP-104 encryption for broadcast traffic. This allows the mobile computer to operate with an AP that is set up to support legacy and/or WPA and WPA2 mobile computers simultaneously.</td>
</tr>
</tbody>
</table>

For all Encryption types other than **Open**, if authentication is set to **None**, then the wizard displays additional controls for entering pre-shared keys (see **Figure 4-24 on page 4-16**). This includes **Personal** security modes, which default to authentication **None** and exclude **Enterprise** security modes, which require an authentication type to be specified.

- Select the **Pass-phrase** or **Hexadecimal Keys** radio button to indicate whether a pass-phrase or hexadecimal keys will be entered on the next page.
- Select the **For added security - Mask characters entered** check box to hide characters entered. Deselect this to show characters entered.
Hexadecimal Keys

To enter the hexadecimal key information select the **Hexadecimal Keys** radio button. An option is provided to hide the characters that are entered for added security. To hide the characters select the **For added security - Mask characters entered** check box.

To enter a hexadecimal key with characters hidden:

1. Select the **For added security - Mask characters entered** check box.
2. Tap **Next**.
3. For WEP only, in the **Edit Key** drop-down list, select the key to enter.
4. In the **Key** field, enter the key.
   a. For WEP-40 enter 10 hexadecimal characters.
   b. For WEP-104 enter 26 hexadecimal characters.
   c. For TKIP enter 64 hexadecimal characters.
   d. For AES enter 64 hexadecimal characters.
   e. For SMS4 enter 32 hexadecimal characters.
5. In the **Confirm** field, re-enter the key. When the keys match, a message appears indicating that the keys match.
6. Repeat for each WEP key.

7. For WEP only, in the Transmit Key drop-down list, select the key to transmit.

8. Tap Next. The IPv4 Address Entry dialog box displays.

To enter a hexadecimal key without characters hidden:

1. Tap Next.

![Figure 4-26 WEP-40 and WEP-104 WEP Keys Dialog Boxes](image)

2. For WEP only, in each Key field, enter the key.
   a. For WEP-40 enter 10 hexadecimal characters.
   b. For WEP-104 enter 26 hexadecimal characters.
   c. For TKIP enter 64 hexadecimal characters.
   d. For AES enter 64 hexadecimal characters.
   e. For SMS4 enter between 8 and 63 characters.

3. For WEP only, in the Transmit Key drop-down list, select the key to transmit.

4. Tap Next. The IPv4 Address Entry dialog box displays.

**Pass-phrase Dialog**

When selecting None as an authentication and WEP as an encryption, choose to enter a pass-phrase by checking the Pass-phrase radio button. The user is prompted to enter the pass-phrase. For WEP, the Pass-phrase radio button is only available if the authentication is None.

When selecting None as an authentication and TKIP as an encryption, the user must enter a pass-phrase. The user cannot enter a pass-phrase if the encryption is TKIP and the authentication is anything other than None.

When selecting None as an authentication and AES as an encryption, the user must enter a pass-phrase. The user cannot enter a pass-phrase if the encryption is AES and the authentication is anything other than None.

To enter a pass-phrase with characters hidden:

1. Select the For added security - Mask characters entered check box.

2. Tap Next.
3. In the **Key** field, enter the key.
   a. For WEP-40 enter between 4 and 32 characters.
   b. For WEP-104 enter between 4 and 32 characters.
   c. For TKIP enter between 8 and 63 characters.
   d. For AES enter between 8 and 63 characters.

4. In the **Confirm** field, re-enter the key. When the keys match, a message appears indicating that the keys match.

5. Tap **Next**. The **IPv4 Address Entry** dialog box displays.

To enter a pass-phrase key without characters hidden:

1. Tap **Next**.

IPv4 Address Entry

Use the **IPv4 Address Entry** dialog box to configure network address parameters: IP address, subnet mask, gateway, DNS, and WINS.
Select all three check boxes to automatically obtain addresses from a remote server. Tap **Next**. The **Transmit Power** dialog box displays.

Uncheck the **Obtain Device IP Address Automatically** to manually assign IP, subnet mask and default gateway addresses the mobile computer profile uses. Tap **Next**. The **Static IP Address** dialog box appears.
Table 4-11 Static IP Address Entry Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv4 Address</td>
<td>The Internet is a collection of networks with users that communicate with each other. Each communication carries the address of the source and destination networks and the particular machine within the network associated with the user or host computer at each end. This address is called the IP address (Internet Protocol address). Each node on the IP network must be assigned a unique IP address that is made up of a network identifier and a host identifier. Enter the IP address as a dotted-decimal notation with the decimal value of each octet separated by a period, for example, 192.168.7.27.</td>
</tr>
<tr>
<td>Subnet Mask</td>
<td>Most TCP/IP networks use subnets to manage routed IP addresses. All IP addresses have a network part and a host part. The network part specifies a physical network. The host part specifies a host on that physical network. The subnet mask allows a network administrator to use some of the bits that are normally used to specify the host to instead specify physical sub-networks within an organization. This helps organize and simplify routing between physical networks.</td>
</tr>
<tr>
<td>Gateway</td>
<td>The default gateway forwards IP packets to and from a remote destination.</td>
</tr>
<tr>
<td>Set Static DNS Address (Optional)</td>
<td>Check to manually assign DNS server addresses.</td>
</tr>
<tr>
<td>Set Static WINS Address (Optional)</td>
<td>Check to manually assign WINS server addresses.</td>
</tr>
</tbody>
</table>

Select the Set Static DNS Address or Set static WINS address check box, then tap Next to display the DNS/WINS Address Entry dialog box. Enter the DNS and/or WINS addresses here. Tap Next without selecting the Set Static DNS Address or Set static WINS Address check box to display the Transmit Power dialog box.

Select the Set Static DNS Address or Set static WINS address check box, then tap Next to display the DNS/WINS Address Entry dialog box. Enter the DNS and/or WINS addresses here. Tap Next without selecting the Set Static DNS Address or Set static WINS Address check box to display the Transmit Power dialog box.

Figure 4-31 DNS/WINS Address Entry Dialog Box

The IP information entered in the profile is only used if the Enable IPv4 Mgmt check box in the Options > System Options dialog box was selected (System Options on page 7-5). If not selected, the IP information in the profile is ignored and the IP information entered in the Microsoft interface applies.
Table 4-12  DNS/WINS Address Entry Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS</td>
<td>The Domain Name System (DNS) is a distributed Internet directory service. DNS translates domain names and IP addresses, and controls Internet email delivery. Most Internet services require DNS to operate properly. If DNS is not configured, Web sites cannot be located and/or email delivery fails. The Alternate DNS server address will be used if the Preferred DNS server is unavailable.</td>
</tr>
<tr>
<td>WINS</td>
<td>WINS is a Microsoft® Net BIOS name server. WINS eliminates the broadcasts needed to resolve computer names to IP addresses by providing a cache or database of translations. The Alternate WINS server address will be used if the Preferred WINS server is unavailable.</td>
</tr>
</tbody>
</table>

Tap Next. The Transmit Power dialog box displays.

Transmit Power

The Transmit Power drop-down list contains different options for Ad-hoc.

Table 4-13  Power Transmit Options (Ad-hoc Mode)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full</td>
<td>Select Full power for the highest transmission power level. Select Full power when operating in highly reflective environments and areas where other devices could be operating nearby, or when attempting to communicate with devices at the outer edge of a coverage area.</td>
</tr>
<tr>
<td>30 mW</td>
<td>Select 30 mW to set the maximum transmit power level to 30 mW. The radio transmits at the minimum power required.</td>
</tr>
<tr>
<td>15 mW</td>
<td>Select 15 mW to set the maximum transmit power level to 15 mW. The radio transmits at the minimum power required.</td>
</tr>
<tr>
<td>5 mW</td>
<td>Select 5 mW to set the maximum transmit power level to 5 mW. The radio transmits at the minimum power required.</td>
</tr>
<tr>
<td>1 mW</td>
<td>Select 1 mW to set the maximum transmit power level to 1 mW. The radio transmits at the minimum power required.</td>
</tr>
</tbody>
</table>

Tap Next to display the Battery Usage dialog box.
Battery Usage

Use the **Battery Usage** dialog box to select power consumption of the wireless LAN. There are three settings available: CAM, Fast Power Save, and MAX Power Save. Battery usage cannot be configured in Ad-hoc profiles and options are disabled (grayed-out).

![Battery Usage Dialog Box](image)

**Table 4-14  Battery Usage Options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAM</td>
<td>Continuous Aware Mode (CAM) provides the best network performance, but yields the shortest battery life.</td>
</tr>
<tr>
<td>Fast Power Save</td>
<td><strong>Fast Power Save</strong> (the default) yields much better battery life than CAM, but with some degradation in network performance.</td>
</tr>
<tr>
<td>MAX Power Save</td>
<td><strong>Max Power Save</strong> yields the longest battery life, but with potentially more degradation in network performance. However, in networks with minimal latency, <strong>MAX Power Save</strong> can yield the same network performance as <strong>Fast Power Save</strong>.</td>
</tr>
</tbody>
</table>

When the AP that the mobile computer associates to is configured to use WMM Power Save mode, the mobile computer will ignore the Battery Usage Mode setting – assuming it’s not set to CAM – and will use the WMM protocol instead. While the use of WMM Power Save mode can maximize battery life, it can also decrease network performance.

**NOTE**  WMM Power Save mode will override Fast Power Save and MAX Power Save mode and cannot be disabled.
Performance Settings

Use the **Performance Settings** dialog box to tune a profile to maximize data throughput or optimal voice quality. There are two settings available: Optimize for Data and Optimize for Voice.

![Performance Settings Dialog Box](image)

**Figure 4-34  Performance Settings Dialog Box**

**Table 4-15  Performance Settings Options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optimize for Data</td>
<td>Roam and power save parameters are tuned to maximize data throughput (legacy power savings).</td>
</tr>
<tr>
<td>Optimize for Voice</td>
<td>Roam and power save parameters are tuned to maximize voice quality (Unscheduled Automatic Power Save Delivery (UAPSD) Wi-Fi Multimedia (WMM) power savings).</td>
</tr>
</tbody>
</table>
CHAPTER 5  MANAGE CERTIFICATES
APPLICATION

Introduction

Users can view and manage security certificates in the various certificate stores. Tap the Signal Strength icon > Manage Certs. The Certificate Manager window displays.

![Certificate Manager Window](image)

Figure 5-1  Certificate Manager Window

Various certificate types display at one time. Select the Certificate Type drop-down box to filter the certificate list to display All, only Root/Server, or only User/Client certificates.
The Certificate Manager window contains command buttons at the bottom of the window. A button might be disabled (gray) if the operation cannot be performed based on any selected object.

These buttons can be hidden to allow more space for displaying the list of certificates. To hide the buttons tap-and-hold and/or double-tap the stylus in the list area depending on the mobile computer. It can also be brought up by pressing the Enter key on the keyboard. The pop-up menu appears.

Select **Hide Buttons** to hide the command buttons.

To display the buttons select **View Buttons** from the pop-up menu.

The pop-up menu also allows the user to select the **Properties**, **Import**, and **Delete** commands.

---

**Certificate Properties**

To display the detailed properties of a certificate, select a certificate in the list and tap the **Properties** button. The window display the properties of the certificate. Select a property in the upper list and the detailed information displays in the **Expanded Value** section.
Figure 5-4  Certificate Properties Window

Tap **ok**, **Escape**, or **X** button to exit (depending on the mobile computer).

---

**Import a Certificate**

Import certificates from either files or from a server machine:

- **.CER file** - DER encrypted Root/Server certificates.
- **.PFX file** - Personal Information eXchange formatted file containing one or more Root/Server and/or User/Client Certificates. These files are usually protected by a password, so a password will be prompted for. If there is no password, enter nothing and select the **OK** button.
- **Server** - User/Client certificates can be requested directly from a Certificate Authority (CA) on the network. A User name, Password (optional), and the Server (an IP address) must be provided to obtain a certificate for the User from the CA.

**NOTE**  In order to validate a server certificate for an Intermediate CA during authentication, it is only necessary to import the certificate from the associated Root CA and then specify the Root CA in the profile.

**NOTE**  It is possible to import and successfully use a user certificate issued by an Intermediate CA; however, this may require additional infrastructure setup. For example, it may be necessary to supply the RADIUS server with certificates for both the Intermediate CA and for the Root CA. Infrastructure setup is beyond the scope of this guide.

Tap the **Import** button or select from the context menu. The **Import Certificate** dialog box displays.

Figure 5-5  Import Certificate Dialog Box

Select the **Import from File (.cer, .pfx)** radio button to import a certificate file. The **Open** window displays.

Select the file to import.
Select the Import User Cert from Server radio button to import a certificate from a server. The Install From Server window displays.

Enter the user, password, and server information in the respective text boxes.

Tap the Retrieve button to import the certificate.
Delete a Certificate

To delete a certificates:

Select the certificate to delete.

![Certificate Dialog Box - Delete Certificate](image)

**Figure 5-8** Certificate Dialog Box - Delete Certificate

Tap the **Delete** button or select **Delete** from the pop-up menu.
CHAPTER 6  MANAGE PACS APPLICATION

Introduction

Users can view and manage Protected Access Credentials (PACs) used by Cisco's EAP-FAST authentication protocol. Tap the Signal Strength icon > Manage PACs. The PAC Manager window displays.

Figure 6-1  PAC Manager Window

PACs are uniquely identified by referencing a PAC Authority Identifier (A-ID) (the server that issued the PAC) and by the individual user identifier (I-ID). The PACs display sorted by A-ID (default) or by I-ID in a tree display.

The PAC Manager window contains buttons at the bottom of the window. A button might be disabled (gray) if the operation cannot be performed based on any selected object.

These buttons can be hidden to allow more space for displaying the list of certificates. To hide the buttons tap-and-hold and/or double-tap the stylus in the list area depending on the mobile computer.

Select Hide Buttons to hide the buttons.

To display the buttons select View Buttons from the pop-up menu.

The pop-up menu also allows the user to select the Properties, Import and Delete commands.

You can always sort by A-ID, sort by I-ID, view buttons and hide buttons in the pop-up menu.
PAC Properties

Display the detailed properties of a PAC by selecting an item in a sub-tree, and selecting the Properties button or pop-up menu. The following Window appears with the list of properties in the upper portion of the window. By selecting an entry in the upper list, the expanded details of the entry property display in the lower list of the window.

To return to the main page, tap the Ok button, Escape, or X button depending on the mobile computer.

Delete PAC

To delete a single PAC, tap a leaf item (right most tree item) to select the PAC, then select the Delete button or pop-up menu. A confirmation dialog box appears.

To delete a group of PACs having the same A-ID or same I-ID, sort the PACs by desired ID type, then tap on the parent item (left most tree item) to select the group. Select the Delete button or pop-up menu and a confirmation dialog box appears.
Import PAC

Usually PACs are automatically provisioned to the mobile computer over the air the first time EAP-FAST authentication occurs. For increased security, an administrator may choose to manually provision the mobile computer with a PAC instead. In this case, the administrator must generate an appropriate PAC file manually using commands on the PAC Authority. Once the PAC file is generated, it must be manually transferred to the mobile computer’s file system before it can be imported by the Manage PACs application.

To import a PAC, tap the **Import** button. A dialog displays asking you to select the PAC file to be imported.

![Import PAC Dialog Box](image)

Navigate to the file to be imported and choose it. The **Import PAC** dialog displays.

If the PAC file is password protected, enter the password in the **Password** field. If you uncheck the **Hide Password** checkbox, the password will be displayed in clear text as you type it. To hide the password as you type it, leave the **Hide Password** checkbox checked. If you wish to overwrite any existing PAC in the Fusion PAC Store without being prompted for verification, check the **Overwrite PAC if Exists** checkbox. Tap the **Ok** button to import the PAC. Tap the **Cancel** button to abort the import operation.

If you have tapped **Ok** and the PAC already exists in the PAC Store, a verification dialog box may appear. Tap **Yes** to continue the import operation or tap **No** to abort the operation. If you have tapped **Yes**, an informational dialog box appears listing the attributes (A-ID and I-ID) of the imported PAC.

![Import PAC File Dialog Box](image)
Tap ok to close the dialog box. You will be returned to the main PAC Manager window with the tree list of PACs. The newly-imported PAC should appear in the list.
CHAPTER 7  OPTIONS

Introduction

Use the wireless Option dialog box to select one of the following operation options from the drop-down list.

- Op Mode Filtering
- Regulatory
- Band Selection
- 802.11 Options
- FIPS Options
- System Options
- Auto PAC Settings
- IPv6
- Change Password
- Import/Export
- Data Management.

Change the option settings as you desire and then tap SAVE to save your changes. Until you tap the SAVE button, no changes are saved. To close the dialog, tap ok. If you tap ok and you have made changes without saving them, a dialog will display asking if you want to quit without saving.
Op (Operating) Mode Filtering

These options only affect the display of networks in the Find WLANs application.

The Op Mode Filtering options cause the Find WLANs application to filter the available networks found.

![OP Mode Filtering Dialog Box](image1)

The AP Networks and Ad-Hoc Networks check boxes are selected by default.

**Table 7-1  OP Mode Filtering Options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AP Networks</td>
<td>Select the AP Networks check box to display available AP networks and their signal strength within the Available WLAN Networks (see Chapter 2, Find WLAN Application). These are the APs in the vicinity available to the mobile computer for association. If this option was previously disabled, refresh the Available WLAN Networks window to display the AP networks available to the mobile computer. Default: Enabled.</td>
</tr>
<tr>
<td>AD-Hoc Networks</td>
<td>Select the Ad-Hoc Networks check box to display available peer (adapter) networks and their signal strength within the Available WLAN Networks. These are peer networks in the vicinity that are available to the mobile computer for association. If this option was previously disabled, refresh the Available WLAN Networks window to display the Ad Hoc networks available to the mobile computer. Default: Enabled</td>
</tr>
</tbody>
</table>

Regulatory

Use the Regulatory settings to configure the 802.11d mode for the mobile computer. Due to regulatory requirements (within a country) a mobile computer is only allowed to use certain channels.

![Regulatory Dialog Box](image2)
Table 7-2  Regulatory Options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Settings</td>
<td>Select a country from the drop-down list. If the <strong>Enable 802.11d</strong> check box is not selected, a profile's country selection must match this setting in order to connect to that profile.</td>
</tr>
<tr>
<td>Enable 802.11d</td>
<td>If the <strong>Enable 802.11d</strong> check box is selected, the WLAN adapter follows the 802.11d standard. It passively scans until valid country information is received from an AP. It limits transmit power settings based on maximums received from the AP. If the <strong>Enable 802.11d</strong> check box is not selected, the WLAN adapter uses the channel and power limit settings programmed in the device. Profiles which use Ad-hoc mode are not 802.11d compliant. <strong>NOTE:</strong> This option should only be changed by a system administrator.</td>
</tr>
</tbody>
</table>

Table 7-3  Band Selection Options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.4GHz Band</td>
<td>The <strong>Find WLANs</strong> application list includes all networks found in the 2.4 GHz band (802.11b and 802.11g).</td>
</tr>
<tr>
<td>5GHz Band</td>
<td>The <strong>Find WLANs</strong> application list includes all networks found in the 5 GHz band (802.11a).</td>
</tr>
</tbody>
</table>

**NOTE** When both bands are enabled, and the total number of channels selected does not exceed 14, interband roaming is enabled. Otherwise, the device performs roam scans only on the connected band.

Final list of channels that the device scans is decided by an intersection of Band Selection, Channel Mask and Regulatory settings. Band Selection is a top level filter, i.e., no channels from a disabled band are used for any purpose. Channel Mask and Regulatory constraints further prune the channel list. If the resulting channel list is a null set, then no scanning or connection may occur.

**NOTE** Not all devices support both 2.4 GHz and 5 GHz bands.
Use the **Channel List** button to view enabled channels for each band. Note that channel configuration for each band is remembered even if a band is deselected (these channels are effectively inactive as the band itself is deselected).

To edit default channel settings or to edit previously saved channel list, tap the button next to the band to edit. A list of channels displays.

![Channel Selection Dialog Box](image)

**Figure 7-4  Channel Selection Dialog Box**

Each channel with a check box is included in the enabled channel list.

![802.11 Options Dialog Box](image)

**Figure 7-5  802.11 Options Dialog Box**

- **NOTE** The default out-of-box channel list does not have the DFS (radar) channels selected. Also, the default channel list has more than 14 channels selected, therefore interband roaming is disabled. To enable interband roaming reduce the number of channels in the list to 14 or fewer.

---

### 802.11 Options

- **NOTE** 802.11 Option is available only when **Fusion Manages WLAN** is enabled.

Use the **802.11 Option** to enable or disable Pre-Authentication for WLAN. When Pre-Authentication feature is enabled on the mobile computer as well as the on the infrastructure, the mobile computer uses its current AP connection to “authenticate ahead” with other APs as detected by channel scan. This forward authentication reduces roam time as the mobile computer roams to these pre-authenticated APs.

802.11 Pre-Authentication complements PMKID and Opportunistic key Caching (OKC) mechanisms supported by Fusion.
Table 7-4  802.11 Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Pre-Authentication</td>
<td>Select the Enable Pre-Authentication check box to enable Pre-Authentication for WLAN. Pre-authentication option is disabled by default.</td>
</tr>
</tbody>
</table>

---

**FIPS**

Use **FIPS** (Federal Information Processing Standard) option to enable or disable FIPS 140-2 Level 1 compliant operation. With this box checked, Fusion will operate in a mode compliant with the FIPS standard. Additionally, Fusion will warn you if you try to connect using a non-FIPS-compliant profile. If this setting is changed, the new setting will take effect only after a reboot.

![FIPS Options Dialog Box](image)

**Figure 7-6  FIPS Options Dialog Box**

---

Table 7-5  FIPS Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable FIPS Mode</td>
<td>Select the FIPS check box to enable FIPS 140-2 Level 1 compliant operation. FIPS option is disabled by default.</td>
</tr>
</tbody>
</table>

---

**System Options**

Use **System Options** to set miscellaneous system setting.

![System Options Dialog Box](image)

**Figure 7-7  System Options Dialog Box**
Auto PAC Settings

**NOTE** Auto PAC Settings option is available only when Fusion Manages WLAN is enabled.

Use the Auto PAC Settings to configure whether to allow automatic PAC provisioning and automatic PAC refreshing when using the EAP-FAST authentication protocol.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllowProvisioning</td>
<td>Select Yes from the drop down list to allow the mobile computer to be automatically provisioned with a PAC when using the EAP-FAST authentication protocol. Select No to disallow automatic PAC provisioning. Default: No</td>
</tr>
<tr>
<td>AllowRefreshing</td>
<td>Select Yes from the drop down list to allow an existing PAC on the mobile computer to be automatically refreshed when using the EAP-FAST authentication protocol. Select No to disallow automatic PAC refreshing. Default: No</td>
</tr>
</tbody>
</table>

If the master key on the PAC Authority has expired then the PAC on the mobile computer that was generated with this expired key will have to be manually deleted and a new PAC provisioned even when AllowRefreshing is set to Yes.
IPv6

Use the IPv6 options to enable or disable IPv6 for WLAN.

![IPv6 Options Dialog Box](image)

**Figure 7-9 IPv6 Options Dialog Box**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable IPv6</td>
<td>Select the Enable IPv6 check box to enable IPv6 for WLAN. Default: Disabled</td>
</tr>
</tbody>
</table>

**Table 7-8 IPv6 Options**

**Change Password**

Use Change Password to require that a user enter a password before being allowed to access certain Fusion functions. The functions that are password protected include:

- Find WLANs
- Manage Profiles
- Manage Certs
- Manage PACs
- Options.

Having a password prohibits an un-trusted user from, for example, creating or editing a profile or changing the Options. This allows pre-configuring profiles and prevents users from changing the network settings. The user can use this feature to protect settings from a guest user. By default, the password is not set.

![Change Password Window](image)

**Figure 7-10 Change Password Window**

Enter the current password in the Current text box. If there is no current password, the Current text box is not displayed. Enter the new password in the New and Confirm text boxes. Tap Save.
To change an existing password, enter the current password in the **Current** text box and enter the new password in the **New** and **Confirm** text boxes. Tap **Save**.

To delete the password, enter the current password in the **Current**: text box and leave the **New**: and **Confirm**: text boxes empty. Tap **Save**.

**NOTE** Passwords are case sensitive and can not exceed 63 characters.

---

### Import/Export

**NOTE** Exporting data is now used for configuration deployment only, and persistence across cold boot (for Windows CE devices) and clean boot (for Windows Mobile devices) is handled internally by Fusion. See *Chapter 11, Configuration Persistence* for more information.

Use the **Import/Export** options to export Fusion configuration database to a file and to import previously exported data back to the Fusion configuration database.

![Import/Export Dialog Box](image)

**Figure 7-11 Options - Import/Export Dialog Box**

**Table 7-9 Import/Export Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import</td>
<td>Allows import of configuration data exported previously to a file.</td>
</tr>
<tr>
<td>Export</td>
<td>Allows export of Options, Profiles, PACs and Certificates from Fusion configuration database to a file. Allows securing the file with an optional password.</td>
</tr>
</tbody>
</table>

---

### Data Management

Use the **Data Management** option reset Fusion configuration to factory default state.

![Data Management Dialog Box](image)

**Figure 7-12 Options - Data Management Dialog Box**
**Table 7-10  Data Management Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reset Options</td>
<td>Restores default values for all Fusion option settings.</td>
</tr>
<tr>
<td>Reset Fusion Data Store</td>
<td>Restores default values for all configuration data, including profiles, certificates, and PACs. Fusion options are also set to default values.</td>
</tr>
</tbody>
</table>

Perform a warm boot on the device for the these changes to take effect.
CHAPTER 8  WIRELESS STATUS
APPLICATION

Introduction

To open the Wireless Status window, tap the Signal Strength icon > Wireless Status. The Wireless Status window displays information about the wireless connection.

Figure 8-1  Wireless Status Window

The Wireless Status window contains the following options. Tap the option to display the option window.

- Signal Strength - provides information about the connection status of the current wireless profile.
- Current Profile - displays basic information about the current profile and connection settings.
- IPv4 Status - displays the current IP address, subnet, and other IP related information assigned to the mobile computer.
- IPv6 Status – displays IPv6 status and IPv6 related information assigned to the WLAN interface of the mobile computer.
- Wireless Log - displays a log of important recent activity, such as authentication, association, and DHCP renewal completion, in time order.
- Logos & Certification – Displays logos and certificates
- Versions - displays software, firmware, and hardware version numbers.
• Quit - exits the **Wireless Status** window.

Each option window contains a back button 🔄 to return to the main **Wireless Status** window.

**Signal Strength Window**

The **Signal Strength** window provides information about the connection status of the current wireless profile including signal quality, missed beacons, and other statistics described below. The BSSID address (shown as **AP MAC Address**) displays the AP currently associated with the connection. In Ad-hoc mode, the AP MAC Address shows the BSSID of the Ad-hoc network. Information in this window updates every 2 seconds.

To open the **Signal Status** window, tap **Signal Strength** in the **Wireless Status** window.

![Figure 8-2 Signal Strength Window](image)

After viewing the **Signal Strength** window, tap the back button to return to the **Wireless Status** window.

<table>
<thead>
<tr>
<th><strong>Table 8-1 Signal Strength Status</strong></th>

<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Profile Name</td>
</tr>
<tr>
<td>Status</td>
</tr>
</tbody>
</table>
Current Profile Window

The **Current Profile** window displays basic information about the current profile and connection settings. This window updates every two seconds.

To open the **Current Profile** window, tap **Current Profile** in the **Wireless Status** window.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signal Quality</td>
<td>Displays a text format of the Signal icon.</td>
</tr>
<tr>
<td>Tx Retries</td>
<td>Displays a percentage of the number of data packets the mobile computer retransmits. The fewer transmit retries, the more efficient the wireless network is.</td>
</tr>
<tr>
<td>Signal Level</td>
<td>The AP signal level in decibels per milliwatt (dBm).</td>
</tr>
<tr>
<td>Association Count</td>
<td>Displays the number of times the mobile computer has roamed from one AP to another.</td>
</tr>
<tr>
<td>AP MAC Address</td>
<td>Displays the MAC address of the AP to which the mobile computer is connected.</td>
</tr>
<tr>
<td>Transmit Rate</td>
<td>Displays the current rate of the data transmission.</td>
</tr>
</tbody>
</table>

**Figure 8-3  Current Profile Window**

### Table 8-2  Current Profile Window

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profile Name</td>
<td>Displays the name of the profile that the mobile computer is currently using to communicate with the AP.</td>
</tr>
<tr>
<td>ESSID</td>
<td>Displays the current profile’s ESSID.</td>
</tr>
<tr>
<td>Mode</td>
<td>Displays the current profile’s mode, either Infrastructure or Ad-hoc. See Table 4-2 on page 4-2.</td>
</tr>
<tr>
<td>Security Mode</td>
<td>Displays the current profile’s security mode. See Table 4-4 on page 4-4.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Displays the current profile’s authentication type. See Table 4-5 on page 4-5.</td>
</tr>
<tr>
<td>Encryption</td>
<td>Displays the current profile’s encryption type. See Table 4-8 on page 4-17.</td>
</tr>
</tbody>
</table>
IPv4 Status Window

The IPv4 Status window displays the current IP address, subnet, and other IP related information assigned to the mobile computer. It also allows renewing the IP address if the profile is using DHCP to obtain the IP information. Tap Renew to initiate the IP address renewal process. Tap Export to export IPv4 status information to a text file. The IPv4 Status window updates automatically when the IP address changes.

To open the IPv4 Status window, tap IPv4 Status in the Wireless Status window.

Table 8-2  Current Profile Window (Continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Displays the channel currently being used to communicate with the AP.</td>
</tr>
<tr>
<td>Country/Region</td>
<td>Displays the country/region setting currently being used.</td>
</tr>
<tr>
<td>Transmit Power</td>
<td>Displays the Tx power being put out by the radio in mW.</td>
</tr>
<tr>
<td>2.4GHz Channels</td>
<td>Displays the list of channels considered for scanning on 2.4GHz band. This list takes into account effect of Channel Mask option and Smart Scan feature.</td>
</tr>
<tr>
<td>5GHz Channels</td>
<td>Displays the list of channels considered for scanning on 5GHz band. This list takes into account effect of Channel Mask option and Smart Scan feature.</td>
</tr>
<tr>
<td>Fast Roaming</td>
<td>Displays the Fast Roam option being used, if any. Potential fast roam options are Cisco CCX feature CCKM or Zebra feature HFSR.</td>
</tr>
</tbody>
</table>
IPv6 Status Window

The IPv6 Status window displays IPv6 status, current IPv6 addresses and other IPv6 related information assigned to the WLAN interface. It also allows resetting the IPv6 address. The IPv6 Status window updates automatically when the IPv6 address changes.

Tap Reset to initiate IPv6 reset. Reset forces the TCP/IPv6 stack to re-bind to the WLAN interface. During re-bind, IPv6 stack discards its current IPv6 configuration and starts a fresh address auto configuration.

Tap Export to export IPv6 status information to a text file.

To open the IPv6 Status window, tap IPv6 Status in the Wireless Status window.
Table 8-4  IPv6 Status Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Indicates whether IPv6 is enabled or disabled for the WLAN interface. You can enable or disable IPv6 from Options &gt; Enable IPv6, see IPv6 on page 7-7.</td>
</tr>
<tr>
<td>IPv6 Addresses</td>
<td>Displays the mobile computer’s IPv6 addresses assigned to WLAN interface. Displays all IPv6 addresses except Temporary IPv6 address. For each IPv6 address, it shows the scope (link local/site local/global/unknown) and remaining valid lifetime of the address.</td>
</tr>
<tr>
<td>Temporary IPv6 Address</td>
<td>Displays the mobile computer’s Temporary IPv6 address assigned to WLAN interface. It displays the scope and remaining valid lifetime of the address. Temporary IPv6 addresses are based on random interface identifiers and are generated for public address prefixes that use stateless address auto configuration.</td>
</tr>
<tr>
<td>Gateway</td>
<td>Displays the IPv6 address of the gateway. A gateway forwards IP packets to and from a remote destination.</td>
</tr>
<tr>
<td>DNS</td>
<td>Displays the IPv6 address of the DNS server.</td>
</tr>
<tr>
<td>MAC</td>
<td>The IEEE 48-bit address is assigned to the network adapter at the factory to uniquely identify the adapter at the physical layer.</td>
</tr>
<tr>
<td>Host Name</td>
<td>Displays the name of the mobile computer.</td>
</tr>
</tbody>
</table>

Double tap on a device IPv6 Addresses or Temporary IPv6 address to get more detailed information.

✓ NOTE  Depending upon the operating system, not all IPv6 address information may be displayed.
The Wireless Log window displays a log of recent activity, such as authentication, association, and DHCP renewal completion, in time order. Save the log to a file or clear the log. The auto-scroll feature automatically scrolls down when new items are added to the log.

To open the Wireless Log window, tap Wireless Log in the Wireless Status window. The Wireless Log window displays.

### Table 8-5  IPv6 Address Details Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6 Address</td>
<td>Displays the IPv6 address for which details are displayed.</td>
</tr>
<tr>
<td>Prefix origin</td>
<td>Displays the prefix origin for the IPv6 address. Possible values are Router Advertisement, Well-known, Manual, DHCPv6 or Unknown source.</td>
</tr>
<tr>
<td>Suffix origin</td>
<td>Displays the suffix origin for the IPv6 address. Possible values are Link layer address, Random, Well-known, Manual, DHCPv6 or Unknown source.</td>
</tr>
<tr>
<td>DAD state</td>
<td>Displays the Duplicate Address Detection state for the IPv6 address. Possible values are Preferred, Tentative, Deprecated, Duplicate or Invalid.</td>
</tr>
<tr>
<td>Preferred Lifetime (Remaining)</td>
<td>Displays the amount of time this address will remain in the Preferred state.</td>
</tr>
</tbody>
</table>

### Wireless Log Window

The Wireless Log window displays a log of recent activity, such as authentication, association, and DHCP renewal completion, in time order. Save the log to a file or clear the log. The auto-scroll feature automatically scrolls down when new items are added to the log.

To open the Wireless Log window, tap Wireless Log in the Wireless Status window. The Wireless Log window displays.

### Saving a Log

To save a Wireless Log:
1. Tap the **Save** button. The **Save As** dialog box displays.

2. Navigate to the desired folder.

3. In the **Name** field, enter a file name and then tap **OK**. The Wireless Log is saved as a text file in the selected folder.

**Clearing the Log**

To clear the log, tap **Clear**.

**Logos & Certifications Window**

The **Logos & Certifications** window displays a list of logos and compliance standards supported by this device, such as Wi-Fi Interoperability and Cisco Compatible Extensions. Select an item in the list to view the corresponding certificate. For a list of supported standards, see *Table 8-6 on page 8-8*.  

![Logos & Certifications Window](image)

**Figure 8-8 Logos & Certifications Window**

- When viewing the certificate, controls to adjust the zoom and scroll are available.
- For certain certificates a link is available to view the certificate in a browser, if an internet connection is available.
- Supported standards are as follows:

**Table 8-6 Logos & Certifications**

<table>
<thead>
<tr>
<th>Certification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wi-Fi Association</td>
<td>This certificate indicates the device has passed Wi-Fi Alliance interoperability tests.</td>
</tr>
<tr>
<td>Windows Mobile Logo</td>
<td>This certificate indicates the device has passed the Windows Mobile Logo test.</td>
</tr>
</tbody>
</table>
Versions Window

The **Versions** window displays software, firmware, and hardware version numbers.

To open the **Versions** window, tap **Versions** in the **Wireless Status** window.

![Versions Window](image)

**Figure 8-9  Versions Window**

- The window displays Fusion software version numbers as well as application and middleware version information.
- Tap **Export** to export version information to a text file.
- Tap **Export FusionPublicApi.h** to export the current version of the FusionPublicAPI.h header file to the specified location.

<table>

</tbody>
</table>
CHAPTER 9 WIRELESS DIAGNOSTICS APPLICATION

Introduction

The **Wireless Diagnostics** application window provides links to perform ICMP Ping, Trace Routing, and Known APs functions. To open the **Wireless Diagnostics** window, tap the **Signal Strength** icon > **Wireless Diagnostics**.

![Wireless Diagnostics Window]

**Figure 9-1  Wireless Diagnostics Window**

The **Wireless Diagnostics** window contains the following options. Tap the option to display the option window.

- **ICMP Ping** - tests the wireless network connection.
- **Trace Route** - tests a connection at the network layer between the mobile computer and any place on the network.
- **Known APs** - displays the APs in range using the same ESSID as the mobile computer.
- **Quit** - Exits the **Wireless Diagnostics** window.

Option windows contain a back button  to return to the **Wireless Diagnostics** window.
ICMP Ping Window

The **ICMP Ping** window allows testing of a connection at the network layer (part of the IP protocol) between the mobile computer and any other device on the network. Ping tests only stop when the **Stop Test** button is selected, the **Wireless Diagnostics** application is closed, or if the mobile computer switches between infrastructure and ad-hoc modes.

To open the **ICMP Ping** window, tap **ICMP Ping** in the **Wireless Diagnostics** window.

![ICMP Ping Window](image)

**Figure 9-2**  **ICMP Ping Window**

To perform an ICMP Ping:

1. In the **IP** field, enter an IP address or select an IP address from the drop-down list.
2. From the **Size** drop-down list, select a size value.
3. Tap **Start Test**. The ICMP Ping test starts. Information of the ping test displays in the appropriate fields.

The following statistics appear on the page:

- **IPv4 Address or IPv6 Address** – Target IP address.
- **Signal** - The current signal strength, measured in dBm, is provided both as a numerical value and as a histogram.
- **Total Tx** - The total number of pings sent is displayed numerically.
- **Total Rx** - The total number of valid ping responses received is displayed numerically.
- **Lost** - The total number of pings that were lost is displayed numerically.
- **RT Times** - Four round trip times: Last, Average, Minimum, and Maximum are displayed in milliseconds.
- **% Rates** - For each of the 14 data rates, the number of times that rate was used to transmit the ping is displayed as a percentage.

Use the **DNS Lookup Options** button to select the name resolution priority. Select the option and tap **OK** button. If a name is entered in the IP field, DNS Lookup Options setting will decide whether to use IPv4 or IPv6 address for the test. By default, this is set to IPv4 then IPv6, which indicates that it will try to resolve the name to an IPv4 address; if this fails and if IPv6 is enabled, it will try to resolve the name to an IPv6 address.
Graphs

A real time graph of any of the above statistics can be displayed by double tapping on that statistic.

Trace Route Window

Trace Route traces a packet from a computer to a host, showing how many hops the packet requires to reach the host and how long each hop takes. The Trace Route utility identifies where the longest delays occur.

The Trace Route window allows testing a connection at the network layer (part of the IP protocol) between the mobile computer and any other device on the network.

To open the Trace Route window, tap Trace Route in the Wireless Diagnostics window.

In the IP drop-down list, enter an IP address or choose one from the drop-down list, or enter a DNS Name and tap Start Test. When starting a test, the trace route attempts to find all routers between the mobile computer and the destination. The Round Trip Time (RTT) between the mobile computer and each router appears, along with the total test time. The total test time may be longer than all RTTs added together because it does not only include time on the network.

Use the DNS Lookup Options button to select the name resolution priority. Select the option and tap OK button. If a name is entered in the IP field, DNS Lookup Options setting will decide whether to use IPv4 or IPv6.
address for the test. By default, this is set to IPv4 then IPv6, which indicates that it will try to resolve the name to an IPv4 address; if this fails and if IPv6 is enabled, it will try to resolve the name to an IPv6 address.

![DNS Lookup Options Window](image)

**Figure 9-6** DNS Lookup Options Window

### Known APs Window

The **Known APs** window displays the APs in range using the same ESSID as the mobile computer. This window is only available in **Infrastructure** mode. To open the **Known APs** window, tap **Known APs** in the **Wireless Diagnostics** window.

![Known APs Window](image)

**Figure 9-7** Known APs Window

See **Table 9-1** for the definitions of the icons next to the AP.

#### Table 9-1 Current Profile Window

<td>The mobile computer is not associated to this AP.</td>
</tr>
</tbody>
</table>
CHAPTER 10 LOG ON/OFF APPLICATION

Introduction

There are two ways a user can connect to a profile when the profile requires credentials: either by using the Manage Profiles window, or by using the Network Login application. In the first case, Fusion automatically launches the Network Login window to allow the user to enter credentials when they are needed. In the second case, the user explicitly launches the Network Login window and supplies the credentials ahead of time and then tells the system to use them to connect. In either case, once the user has given the credentials, the user is said to have logged on (or in) to the profile. When the user has logged on to a profile, the system saves those credentials and the profile is said to have cached credentials.

When the user launches the Network Login application, the mobile computer may be in one of two states; the user may be logged onto one or more profiles, by having already entered credentials through the login window, or the user is not logged on to any profile. Each of these states has a separate set of use cases and a different look to the dialog box.
Logging On

If not already logged on to any profile, the user can launch the Network Login window in order to select a profile to log on to.

If already logged into one or more profiles, the user can launch the Network Login window to perform any of these functions:

- Connect to a different profile.
- Connect to and re-enable a cancelled profile. To do this:
  - Launch the Network Login window.
  - Select the cancelled profile from the Wireless Profile drop-down list.
  - Login to the profile.

\[NOTE\] A cancelled profile can also be re-enabled by using the Manage Profile window to connect to the cancelled profile.

- Log off from all profiles simultaneously to prevent another user from accessing the current users network privileges.
- Switch mobile computer users. This is equivalent to performing a log off followed by a log on.

The appearance of the Network Login dialog box varies if it is:

- Launched by Fusion, because the service is connecting to a new profile that needs credentials.
- Launched by Fusion, because the service is trying to verify the credentials due to credential caching rules.
- Launched by a user, when a user is logged in.
- Launched by a user, when no user is logged in

Table 10-1  Network Login Options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wireless Profile</td>
<td>When launching the login application, the Wireless Profile field lists all the wireless profiles that require credentials. This includes profiles that use EAP TLS, PEAP, LEAP, EAP-TTLS or EAP-FAST.</td>
</tr>
<tr>
<td>Profile Status icon</td>
<td>The profile status icon (next to the profile name) shows one of the following states:</td>
</tr>
<tr>
<td></td>
<td>The profile is the current profile (always the case for Fusion Launched).</td>
</tr>
<tr>
<td></td>
<td>The selected profile is enabled but is not the current profile.</td>
</tr>
<tr>
<td></td>
<td>The selected profile is cancelled.</td>
</tr>
<tr>
<td>Username</td>
<td>Used to obtain secure access on the selected Wireless profile. The Username and Domain Name fields combined are limited to 63 characters. If the field label is red, then entry is mandatory; if black, then the entry is optional.</td>
</tr>
</tbody>
</table>
Tap **OK** to send the credentials to Fusion. If one or more of the required fields is left blank, a dialog box displays requesting the user to fill in all required fields.

### Logging Off

The user can log off from all profiles simultaneously by launching the Network Login window and tapping the Log Off button. The Log Off button only displays when a user has cached credentials for one or more profiles. When the Log Off button is selected, the user is prompted with three options: **Log Off**, **Switch Users**, and **Cancel**. Switching users logs off the current user and re-initialize the Network Login window to be displayed for when there is no user logged on. Logging off logs off the current user from all profiles and closes the login dialog box. Tapping **Cancel** closes the Log Off dialog box and returns to the Login dialog box.

When the user is logged off, the mobile computer only roams to profiles that do not require credentials or to profiles that were created with the credentials entered into the profile.

Tap the **Cancel** button to close the Network Login window without logging into the network. If the Network Login window was launched by Fusion and not by the user, tapping **Cancel** first causes a message box to display a warning that the cancel will disable the current profile. If the user still chooses to cancel the login at this point, the profile is cancelled.

Once a profile is cancelled, the profile is suppressed until a user actively re-connects to it.

**NOTE**  Entering credentials applies the credentials to a particular profile. Logging out clears all cached credentials. Editing a profile clears any cached credentials for that profile.
CHAPTER 11 CONFIGURATION PERSISTENCE

Introduction

User configured Fusion settings are saved in a Fusion folder. This allows the user defined settings to persist across a warm boot and a clean/cold boot. The following settings are stored:

- Profiles
- Options
- PACs
- Certificates.

This chapter discusses how to:

- export and import configuration data
- return the Fusion settings to their factory default values.

Cold Boot Persistence

Fusion provides a clean/cold boot persistence mechanism that is transparent to the users. Fusion stores its configuration data in a GPD sub-folder under \Application. On a cold/clean boot, this data is automatically loaded.

**CAUTION** Data in \Application\GPD folder is Fusion private and must not be modified by the user.

Import/Exporting Interface

Import / Export user interface is available under the Import / Export drop down of the Fusion Options application.
Exporting Fusion Configuration

To export configuration data:

1. In the Options menu, select Import/Export.
2. Select Export. The Export File Wizard appears.
3. In the Select data to export section, select the data to export.
4. Check the Add user password to exported file check box to assign a password to the file.
5. Enter a password in the text box.
6. Select Overwrite conflicting records check box to direct a subsequent import step to overwrite any customizations present on the device. The overwrite flag is stored in the exported file and used during import. It directs the import module to resolve any conflicts in favor of the file being imported.
7. Select Delete file on successful import check box to automatically delete the file after import. The delete file flag is stored in the exported file and used during import.
8. Select Export to file to export the data to a file. The Save As window appears.
9. In the Name text box a file name is automatically populated. Change the filename if desired.

10. Use the Folder drop-down list to select a specific folder to save the file into.

11. Use the Location drop-down list to select the area of memory to save the file into.

12. Select Save.

13. Select ok.

Importing Fusion Configuration

To import configuration data:

1. In the Options menu, select Import/Export.

2. Select Import. The Open window appears.

3. Use the Folders drop-down list to locate the file to import.

4. Select a file in the list. If the file is protected, the Enter Password window appears.
5. Enter the password and then tap **OK**.

6. In the **Import File Wizard** window, select the data to import.

7. Select **Overwrite conflicting records** check box to force the import process to overwrite any user made customizations that are present on the device. It directs the import module to resolve any conflicts in favor of the file being imported.

8. Select **Delete file on successful import** check box to automatically delete the file after import. If Delete file on successful import box is checked during the export step, this checkbox is then "locked" to the checked state in the import interface.

9. Select **Import**.

10. Select **ok**.

---

**Auto Import of Configuration**

Exported Fusion configuration files with the .gpdexport extension can be placed in the \Application folder. These files are automatically imported and applied on a cold boot (for Windows CE devices) or clean boot (for Windows Mobile devices). This method can be used for recovering a device to a known good configuration, migrating configuration from one device to another or for distributing a standard configuration to multiple devices.
To return the Fusion settings to their factory default values, use **Fusion Options > Data Management**.

![Options - Data Management Dialog Box](image)

**NOTE** Check the **overwrite conflicting records** checkbox during export, to force .gpdexport file to overwrite pre configured options on auto import.

For backward compatibility, Fusion configuration stored in legacy registry files are also automatically imported on a cold or clean boot.

The importing of the GPDexport file is a one time only process. Once the file is imported it will automatically be renamed from GPDexport to GPDexport_imported and will not be imported a second time. Previously imported and saved configuration data will be loaded from the Fusion private data files in \Application\GPD, which persist across cold/clean boot. Renaming of files upon automatic import can be prevented by setting the following registry key:

```
[HKEY_LOCAL_MACHINE\Services\GPDServices\DataStoreInterfaces\FusionGPD]
"RetainAutoImportFiles"=dword:00000001
```

It is possible to trigger automatic GPD file import after a warmboot by setting the following registry key:

```
[HKEY_LOCAL_MACHINE\Services\GPDServices\DataStoreInterfaces\FusionGPD]
"WCSWarmBoot"=dword:00000000
```

It is possible to clear the existing GPD configuration prior to import by setting the following registry key (not recommended without RetainAutoImportFiles registry key):

```
[HKEY_LOCAL_MACHINE\Services\GPDServices\DataStoreInterfaces\FusionGPD]
"ClearFusionDataStore"=dword:00000001
```

---

**Returning to Factory Default Settings**

To return the Fusion settings to their factory default values, use **Fusion Options > Data Management**.

Tap **Reset Options** button to reset the Fusion options to factory default values.

Tap **Reset Fusion Data Store** to reset all configuration data including options, profiles, PACs and certificates to the factory default values.
CHAPTER 12 CONFIGURATION EXAMPLES

Introduction

This chapter provides example procedures for configuring specific authentication and encryption types.

EAP–FAST/MS Chap v2 Authentication

To configure EAP-FAST and MS Chap v2 authentication:

2. Select Options. The Options window appears.

3. In the drop-down list, select Auto PAC Settings. The Auto PAC Settings window appears.
4. In the **Allow Provisioning** drop-down list, select **Yes**.

5. In the **Allow Refreshing** drop-down list, select **Yes**.

6. Tap **Save**.

7. Tap **ok**.

8. Tap **Start > Wireless Companion > Wireless Launch**.

9. Select **Manage Profiles**. The **Manage Profiles** window appears.

10. Tap and hold in the window and select **Add** from the pop-up menu. The **Profile Editor** window appears.

11. In the **Profile Name** text box enter a name for the profile.

12. In the **ESSID** text box enter the ESSID.

13. Tap **Next**. The **Operating Mode** dialog box displays.

14. In the **Operating Mode** drop-down list, select **Infrastructure**.

15. Tap **Next**. The **Security Mode** dialog box displays.

16. In the **Security Mode** drop-down list, select **WPA2-Enterprise**.
17. In the **Authentication** drop-down list, select **EAP-FAST**.

18. Tap **Next**. The **Tunneled Authentication Type** dialog box displays.

19. In the **Tunneled Authentication Type** drop-down list, select **MS CHAP v2**.

20. Select the **Provide User Certificate** check box if a certificate is required.

21. Tap **Next**. The **Installed User Certificates** dialog box appears.

22. Select a certificate from the drop-down list of currently installed certificates before proceeding. The selected certificate’s name appears in the drop-down list.

   If the required certificate is not in the list, tap **Install Certificate**. See *User Certificate Installation on page 4-8* for information on installing User Certificates.

23. Tap **Next**. The **Install Server Certificate** dialog box appears.
24. Select a certificate from the drop-down list of currently installed certificates. The selected certificate’s name appears in the drop-down list.

If the required certificate is not in the list, tap **Install Certificate**. See *Server Certificate Installation on page 4-11* for information on installing Server Certificates.

25. Tap **Next**. The **User Name** dialog box appears.

26. Tap **Next**. The **Password** dialog box appears.

27. In the **Enter Password** text box, enter a password. Note that if a username was entered and no password is entered, Fusion assumes that no password is a valid password.

28. Select the **Advanced ID** check box, if advanced identification is desired.

29. Tap **Next**.

   If the **Advanced ID** is not selected, the **Prompt for Login** dialog box appears. Go to step 31.

   The **Advanced ID** dialog box appears.
30. Use the **Advanced ID** dialog box to enter the 802.1X identity to supply to the authenticator. This value can be 63 characters long and is case sensitive. In TTLS and PEAP, it is recommended entering the identity **anonymous** (rather than a true identity) plus any desired realm (e.g., anonymous@myrealm). A user ID is required before proceeding.

![Advanced Identity Dialog Box](image)

**Figure 12-11**  **Advanced Identity Dialog Box**

31. Tap **Next**. The **Prompt for Login** dialog box displays. See *Credential Cache Options on page 4-14* for detailed information on configuring Login settings.

![Prompt for Login at Dialog Box](image)

**Figure 12-12**  **Prompt for Login at Dialog Box**

32. Tap **Next**. The **Encryption** dialog box displays.

33. In the **Encryption Type** drop-down list, select **AES**.

![Encryption Dialog Box](image)

**Figure 12-13**  **Encryption Dialog Box**

34. Tap **Next**. The **IP Address Type** dialog box displays.

![IP Address Entry Dialog Box](image)

**Figure 12-14**  **IP Address Entry Dialog Box**
35. Ensure that all three check boxes are selected.
36. Tap Next. The Battery Usage dialog box appears.
37. In the Battery Usage Mode dialog box select a power consumption option.

![Battery Usage Dialog Box](Image)

**Figure 12-15** Battery Usage Dialog Box

38. Tap Save.
CHAPTER 13  FIPS COMPLIANT OPERATION

Introduction

This chapter describes how to set up and use Fusion in a FIPS-compliant manner.

General Guidelines

Fusion does not force the user to operate the WLAN in a FIPS-compliant manner. It is the responsibility of the user to configure and use the device in a FIPS-compliant way when FIPS-compliant operation is desired. This includes appropriately configuring:

1. The Fusion Options
2. Fusion Profiles
3. The WLAN infrastructure (e.g., APs).

Setting Up the Fusion Options

Ensure that the following Fusion Options have been selected:

1. Fusion Manages WLAN. Operation in FIPS mode is not supported when Windows Manages WLAN is set. See Chapter 7, Options for details.
2. Enable FIPS Mode. See Chapter 7, Options for details.

You may need to reboot your device for the new settings to take effect. You can verify that your device is operating in FIPS mode by checking the Wireless Log in the Wireless Status application. In FIPS mode, you should see the message “Operating in FIPS 140-2 level 1 mode” written as part of the boot-up sequence.
Setting Up FIPS-Compliant Profiles

To operate in a FIPS-compliant manner, it is the user's responsibility to set up and use appropriate profiles. (Note that it is possible to create and use non-FIPS-compliant profiles even in FIPS mode.) To create FIPS-compliant profiles, follow these guidelines:

1. Specify only WPA2-Enterprise or WPA2-Personal for Security Mode.
2. Specify only EAP-TLS, PEAP, or EAP-TTLS for Authentication Type (any Tunnel Authentication Type is OK).
3. Uncheck both the Allow MOVEOP and Allow CCKM checkboxes.
4. Specify only certificates that have been installed on your device that were generated on a host that used a key length ≥ 1024 in generating/signing the certificates. Acceptable algorithms include only DSA, RSA, and Diffie Hellman (DH).
5. Specify only AES for Encryption Type.

See Chapter 4, Profile Editor Wizard for details on setting up profiles.

If FIPS mode is enabled and you attempt to connect using a profile that is not FIPS compliant, a message will be written to the Wireless Log indicating that the profile is not FIPS compliant. The message will indicate which setting in the profile is in violation.

Setting Up the Infrastructure

Since TKIP encryption is non-FIPS-compliant, “mixed mode” infrastructure settings that support both AES and TKIP are not allowed. Specifically, you must set up your infrastructure to use only AES for the pair-wise cipher suite, and only AES for the group cipher suite.

Use of PEAP Authentication

Use of PEAP authentication in FIPS mode is only supported for non-Microsoft RADIUS servers. Attempting PEAP authentication with Microsoft's IAS server will result in failure. This occurs because the IAS server requires the use of TLS cipher-suites that are non-FIPS-compliant. Fusion detects this non-FIPS-compliant requirement and intentionally fails the authentication.

When operating your device in FIPS mode, PEAP authentication with a Microsoft IAS RADIUS server will fail.

To use PEAP authentication when FIPS mode is enabled, you must set up your infrastructure to use a non-Microsoft RADIUS server, such as the Cisco ACS server.
Dynamic Frequency Selection (DFS) channels are not supported with hidden SSIDs (secure beacons).
A

**API.** An interface by means of which one software component communicates with or controls another. Usually used to refer to services provided by one software component to another, usually via software interrupts or function calls.

C

**Clean Boot.** See Cold Boot.

**Cold Boot.** A cold boot restarts the mobile computer and erases all user stored records and entries. The operating system is reloaded; files not stored in "protected" folders are erased; the registry is erased and reloaded from "REG" files saved in protected folders.

**Cradle.** A cradle is used for charging the terminal battery and for communicating with a host compute. It also provides a storage place for the terminal when not in use.

H

**Hard Reset.** See Cold Boot.

**Host Computer.** A computer that serves other terminals in a network, providing such services as computation, database access, supervisory programs and network control.

I

**IEEE Address.** See MAC Address.
I/O Ports. Interface The connection between two devices, defined by common physical characteristics, signal
c characteristics, and signal meanings. Types of interfaces include RS-232 and PCMCIA.

Input/Output Ports. I/O ports are primarily dedicated to passing information into or out of the terminal’s memory. Series
9000 mobile computers include Serial and USB ports.

IP. Internet Protocol. The IP part of the TCP/IP communications protocol. IP implements the network layer (layer 3) of
the protocol, which contains a network address and is used to route a message to a different network or subnetwork.
IP accepts “packets” from the layer 4 transport protocol (TCP or UDP), adds its own header to it and delivers a
“datagram” to the layer 2 data link protocol. It may also break the packet into fragments to support the maximum
transmission unit (MTU) of the network.

IP Address. (Internet Protocol address) The address of a computer attached to an IP network. Every client and server
station must have a unique IP address. A 32-bit address used by a computer on an IP network. Client workstations
have either a permanent address or one that is dynamically assigned to them each session. IP addresses are written
as four sets of numbers separated by periods; for example, 204.171.64.2.

---

K

Key. A key is the specific code used by the algorithm to encrypt or decrypt the data. Also see, Encryption and
Decrypting.

---

M

MC. Mobile Computer.

Mobile Computer. In this text, mobile computer refers to a Zebra hand-held computer. It can be set up to run as a
stand-alone device, or it can be set up to communicate with a network, using wireless radio technology.

---

O

Open System Authentication. Open System authentication is a null authentication algorithm.

---

P

PAN. Personal area network. Using Bluetooth wireless technology, PANs enable devices to communicate wirelessly.
Generally, a wireless PAN consists of a dynamic group of less than 255 devices that communicate within about a
33-foot range. Only devices within this limited area typically participate in the network.

Parameter. A variable that can have different values assigned to it.

PING. (Packet Internet Groper) An Internet utility used to determine whether a particular IP address is online. It is used
to test and debug a network by sending out a packet and waiting for a response.
Q

**QWERTY.** A standard keyboard commonly used on North American and some European PC keyboards. “QWERTY” refers to the arrangement of keys on the left side of the third row of keys.

R

**RAM.** Random Access Memory. Data in RAM can be accessed in random order, and quickly written and read.

**RF.** Radio Frequency.

**Router.** A device that connects networks and supports the required protocols for packet filtering. Routers are typically used to extend the range of cabling and to organize the topology of a network into subnets. See **Subnet.**

S

**Shared Key.** Shared Key authentication is an algorithm where both the AP and the MU share an authentication key.

**Soft Reset.** See **Warm Boot.**

**Subnet.** A subset of nodes on a network that are serviced by the same router. See **Router.**

**Subnet Mask.** A 32-bit number used to separate the network and host sections of an IP address. A custom subnet mask subdivides an IP network into smaller subsections. The mask is a binary pattern that is matched up with the IP address to turn part of the host ID address field into a field for subnets. Default is often 255.255.255.0.

T

**TCP/IP.** (Transmission Control Protocol/Internet Protocol) A communications protocol used to internetwork dissimilar systems. This standard is the protocol of the Internet and has become the global standard for communications. TCP provides transport functions, which ensures that the total amount of bytes sent is received correctly at the other end. UDP is an alternate transport that does not guarantee delivery. It is widely used for real-time voice and video transmissions where erroneous packets are not retransmitted. IP provides the routing mechanism. TCP/IP is a routable protocol, which means that all messages contain not only the address of the destination station, but the address of a destination network. This allows TCP/IP messages to be sent to multiple networks within an organization or around the world, hence its use in the worldwide Internet. Every client and server in a TCP/IP network requires an IP address, which is either permanently assigned or dynamically assigned at startup.

**Terminal.** See **Mobile Computer.**

**TFTP.** (Trivial File Transfer Protocol) A version of the TCP/IP FTP (File Transfer Protocol) protocol that has no directory or password capability. It is the protocol used for upgrading firmware, downloading software and remote booting of diskless devices.
**U**

**UDP.** User Datagram Protocol. A protocol within the IP protocol suite that is used in place of TCP when a reliable delivery is not required. For example, UDP is used for real-time audio and video traffic where lost packets are simply ignored, because there is no time to retransmit. If UDP is used and a reliable delivery is required, packet sequence checking and error notification must be written into the applications.

**W**

**Warm Boot.** A warm boot restarts the mobile computer and closes all running programs. All data that is not saved to flash memory is lost.

**WZC. Wireless Zero Config.** Microsoft application used to configure wireless 802.11 radio.
