WiNG 5.7
CLI Reference Guide
# TABLE OF CONTENTS

## ABOUT THIS GUIDE

### Chapter 1, INTRODUCTION

1.1 CLI Overview ............................................................... 1-2
1.2 Getting Context Sensitive Help ................................................ 1-7
1.3 Using the No Command ...................................................... 1-9
   1.3.1 Basic Conventions .................................................... 1-9
1.4 Using CLI Editing Features and Shortcuts ................................. 1-9
   1.4.1 Moving the Cursor on the Command Line ......................... 1-9
   1.4.2 Completing a Partial Command Name .............................. 1-10
   1.4.3 Command Output Pagination ....................................... 1-11
1.5 Using CLI to Create Profiles and Enable Remote Administration ... 1-11
   1.5.1 Creating Profiles ..................................................... 1-11
   1.5.2 Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface .......................... 1-12
   1.5.3 Enabling Remote Administration .................................. 1-12

### Chapter 2, USER EXEC MODE COMMANDS

2.1 User Exec Commands ...................................................... 2-3
   2.1.1 captive-portal-page-upload ......................................... 2-5
   2.1.2 change-passwd ....................................................... 2-8
   2.1.3 clear ........................................................................ 2-9
   2.1.4 clock ........................................................................ 2-19
   2.1.5 cluster ....................................................................... 2-20
   2.1.6 connect ..................................................................... 2-21
   2.1.7 create-cluster ......................................................... 2-22
   2.1.8 crypto ....................................................................... 2-24
   2.1.9 crypto-cmp-cert-update ............................................ 2-33
   2.1.10 device-upgrade ....................................................... 2-34
   2.1.11 disable ................................................................. 2-44
   2.1.12 enable ................................................................. 2-45
Chapter 3, PRIVILEGED EXEC MODE COMMANDS

3.1 Privileged Exec Mode Commands ................................................................. 3-3
  3.1.1 archive ........................................................................................................... 3-6
  3.1.2 boot .............................................................................................................. 3-8
  3.1.3 captive-portal-page-upload .......................................................... 3-9
  3.1.4 cd ............................................................................................................... 3-12
  3.1.5 change-passwd ...................................................................................... 3-13
  3.1.6 clear ......................................................................................................... 3-14
  3.1.7 clock ......................................................................................................... 3-26
  3.1.8 cluster ...................................................................................................... 3-27
  3.1.9 configure .................................................................................................. 3-28
  3.1.10 connect .................................................................................................... 3-29
  3.1.11 copy ....................................................................................................... 3-30
  3.1.12 cpe ......................................................................................................... 3-31
  3.1.13 create-cluster ....................................................................................... 3-33
  3.1.14 crypto .................................................................................................... 3-35
  3.1.15 crypto-cmp-cert-update ............................................................... 3-44
  3.1.16 delete ..................................................................................................... 3-45
  3.1.17 device-upgrade ................................................................................... 3-46
  3.1.18 diff ......................................................................................................... 3-53
  3.1.19 dir ......................................................................................................... 3-54
  3.1.20 disable ................................................................................................. 3-56
  3.1.21 edit ........................................................................................................ 3-57
  3.1.22 enable ................................................................................................... 3-58
  3.1.23 erase ..................................................................................................... 3-59
  3.1.24 telnet ..................................................................................................... 2-64
  3.1.25 terminal ............................................................................................... 2-65
  3.1.26 time-it .................................................................................................... 2-66
  3.1.27 traceroute ............................................................................................. 2-67
  3.1.28 traceroute6 .......................................................................................... 2-68
  3.1.29 watch .................................................................................................... 2-69
  3.1.30 exit ........................................................................................................ 2-70
  3.1.31 smart-cache ......................................................................................... 2-71
  3.1.32 virtual-machine ................................................................................... 2-72
  2.1.13 join-cluster ............................................................................................ 2-46
  2.1.14 l2tpv3 ................................................................................................... 2-48
  2.1.15 logging .................................................................................................. 2-50
  2.1.16 mint ....................................................................................................... 2-52
  2.1.17 no ......................................................................................................... 2-54
  2.1.18 on ........................................................................................................... 2-56
  2.1.19 opendns ............................................................................................... 2-57
  2.1.20 page ...................................................................................................... 2-59
  2.1.21 ping ...................................................................................................... 2-60
  2.1.22 ping6 ................................................................................................... 2-62
  2.1.23 ssh ........................................................................................................ 2-63
  2.1.24 telnet ..................................................................................................... 2-64
  2.1.25 terminal ............................................................................................... 2-65
  2.1.26 time-it .................................................................................................... 2-66
  2.1.27 traceroute ............................................................................................. 2-67
  2.1.28 traceroute6 .......................................................................................... 2-68
  2.1.29 watch .................................................................................................... 2-69
  2.1.30 exit ........................................................................................................ 2-70
  2.1.31 smart-cache ......................................................................................... 2-71
  2.1.32 virtual-machine ................................................................................... 2-72

Chapter 4, GLOBAL CONFIGURATION COMMANDS

4.1 Global Configuration Commands
   4.1.1 aaa-policy
   4.1.2 aaa-tacacs-policy
   4.1.3 alias
   4.1.4 ap621
   4.1.5 ap622
   4.1.6 ap650
   4.1.7 ap6511
   4.1.8 ap6521
   4.1.9 ap6522
Chapter 5, COMMON COMMANDS

5.1 Common Commands ........................................5-2
   5.1.1 clrscr .......................................................5-3
   5.1.2 commit ....................................................5-4
   5.1.3 exit .........................................................5-5
   5.1.4 help .........................................................5-6
   5.1.5 no ..........................................................5-9
   5.1.6 revert ......................................................5-12
   5.1.7 service .....................................................5-13
   5.1.8 show .......................................................5-48
   5.1.9 write .......................................................5-50

Chapter 6, SHOW COMMANDS

6.1 show commands ..............................................6-2
   6.1.1 show .......................................................6-5
   6.1.2 adoption .................................................6-11
   6.1.3 boot .......................................................6-15

  7.3.8 use ...................................................................................................................................... 7-453

Chapter 8, AAA-POLICY

8.1 aaa-policy ........................................................................................................................................8-3
  8.1.1 accounting ............................................................................................................................8-4
  8.1.2 attribute .............................................................................................................................8-8
  8.1.3 authentication ......................................................................................................................8-11
  8.1.4 health-check .........................................................................................................................8-16
  8.1.5 mac-address-format ............................................................................................................8-17
  8.1.6 no ......................................................................................................................................8-19
  8.1.7 proxy-attribute ....................................................................................................................8-21
  8.1.8 server-pooling-mode ..........................................................................................................8-22
  8.1.9 use ......................................................................................................................................8-23
### Chapter 13, FIREWALL-POLICY

13.1 firewall-policy ................................................................. 13-3
   13.1.1 acl-logging .......................................................... 13-4
   13.1.2 alg ........................................................................ 13-5
   13.1.3 clamp ....................................................................... 13-6
   13.1.4 dhcp-offer-convert .................................................. 13-7
   13.1.5 dns-snoop ............................................................... 13-8
   13.1.6 firewall .................................................................... 13-9
   13.1.7 flow ......................................................................... 13-10
   13.1.8 ip ............................................................................ 13-12
   13.1.9 ip-mac .................................................................... 13-20
   13.1.10 ipv6 ....................................................................... 13-23
   13.1.11 ipv6-mac ............................................................... 13-26
   13.1.12 logging ................................................................. 13-28
   13.1.13 no ......................................................................... 13-30
   13.1.14 proxy-arp ............................................................. 13-32
   13.1.15 proxy-nd ............................................................... 13-33
   13.1.16 stateful-packet-inspection-12 .................................. 13-34
   13.1.17 storm-control ....................................................... 13-35
   13.1.18 virtual-defragmentation ......................................... 13-37

### Chapter 14, MINT-POLICY

14.1 mint-policy ......................................................................... 14-2
   14.1.1 level ......................................................................... 14-3
   14.1.2 mtu .......................................................................... 14-4
   14.1.3 router ....................................................................... 14-5
   14.1.4 udp .......................................................................... 14-6
   14.1.5 no ........................................................................... 14-7

### Chapter 15, MANAGEMENT-POLICY

15.1 management-policy ........................................................... 15-3
   15.1.1 aaa-login ............................................................... 15-4
   15.1.2 banner ...................................................................... 15-6
   15.1.3 ftp .......................................................................... 15-7
Chapter 16, RADIUS-POLICY
16.1 radius-group ................................................................. 16-2
16.1.1 guest ........................................................................ 16-4
16.1.2 policy ........................................................................ 16-5
16.1.3 rate-limit ................................................................. 16-9
16.1.4 no ........................................................................... 16-10
16.2 radius-server-policy ..................................................... 16-12
16.2.1 authentication ......................................................... 16-14
16.2.2 chase-referral ......................................................... 16-16
16.2.3 crl-check ................................................................. 16-17
16.2.4 ldap-agent ............................................................ 16-18
16.2.5 ldap-group-verification .......................................... 16-20
16.2.6 ldap-server ........................................................... 16-21
16.2.7 local ........................................................................ 16-24
16.2.8 nas .......................................................................... 16-25
16.2.9 no .......................................................................... 16-26
16.2.10 proxy ................................................................. 16-28
16.2.11 session-resumption .............................................. 16-30
16.2.12 use ........................................................................ 16-31
16.3 radius-user-pool-policy ............................................... 16-32
16.3.1 duration .................................................................. 16-33
16.3.2 user ........................................................................ 16-34
16.3.3 no .......................................................................... 16-37

Chapter 17, RADIO-QOS-POLICY
17.1 radio-qos-policy .......................................................... 17-3
17.1.1 accelerated-multicast ............................................. 17-4
17.1.2 admission-control ................................................... 17-6
17.1.3 no .......................................................................... 17-9
17.1.4 smart-aggregation ................................................... 17-11
17.1.5 service ................................................................. 17-13
Chapter 18, ROLE-POLICY

18.1 role-policy .................................................................................................................................................. 18-2
18.1.1 default-role .......................................................................................................................................... 18-3
18.1.2 ldap-deadperiod ................................................................................................................................. 18-5
18.1.3 ldap-query ........................................................................................................................................... 18-6
18.1.4 ldap-server .......................................................................................................................................... 18-7
18.1.5 ldap-timeout ...................................................................................................................................... 18-9
18.1.6 no ....................................................................................................................................................... 18-10
18.1.7 user-role ........................................................................................................................................... 18-11

Chapter 19, SMART-RF-POLICY

19.1 smart-rf-policy ...................................................................................................................................... 19-3
19.1.1 area .................................................................................................................................................... 19-4
19.1.2 assignable-power ............................................................................................................................... 19-5
19.1.3 channel-list ...................................................................................................................................... 19-6
19.1.4 channel-width .................................................................................................................................. 19-7
19.1.5 coverage-hole-recovery ..................................................................................................................... 19-9
19.1.6 dfs ..................................................................................................................................................... 19-11
19.1.7 enable ............................................................................................................................................... 19-12
19.1.8 group-by ......................................................................................................................................... 19-13
19.1.9 interference-recovery ........................................................................................................................ 19-14
19.1.10 neighbor-recovery .......................................................................................................................... 19-16
19.1.11 no .................................................................................................................................................... 19-18
19.1.12 sensitivity ....................................................................................................................................... 19-20
19.1.13 smart-ocs-monitoring ..................................................................................................................... 19-21

Chapter 20, WIPS-POLICY

20.1 wips-policy ............................................................................................................................................ 20-3
20.1.1 ap-detection ...................................................................................................................................... 20-4
20.1.2 enable ............................................................................................................................................... 20-6
20.1.3 event ................................................................................................................................................ 20-7
20.1.4 history-throttle-duration .................................................................................................................... 20-11
20.1.5 interference-event ............................................................................................................................. 20-12
20.1.6 no ....................................................................................................................................................... 20-13
20.1.7 signature ....................................................................................................................................... 20-15
20.1.8 use .................................................................................................................................................... 20-32

Chapter 21, WLAN-QOS-POLICY

21.1 wlan-qos-policy ................................................................................................................................... 21-2
21.1.1 accelerated-multicast ......................................................................................................................... 21-3
21.1.2 classification .................................................................................................................................... 21-5
21.1.3 multicast-mask ................................................................................................................................. 21-7
Chapter 22, L2TPv3-POLICY

22.1 l2tpv3-policy-commands ................................................................. 22-3
  22.1.1 cookie-size ............................................................................. 22-5
  22.1.2 failover-delay ........................................................................ 22-6
  22.1.3 force-l2-path-recovery ............................................................ 22-7
  22.1.4 hello-interval .......................................................................... 22-8
  22.1.5 no .......................................................................................... 22-9
  22.1.6 reconnect-attempts ................................................................. 22-10
  22.1.7 reconnect-interval ................................................................. 22-11
  22.1.8 retry-attempts ........................................................................ 22-12
  22.1.9 retry-interval .......................................................................... 22-13
  22.1.10 rx-window-size ................................................................. 22-14
  22.1.11 tx-window-size ................................................................. 22-15

22.2 l2tpv3-tunnel-commands ............................................................ 22-16
  22.2.1 establishment-criteria ............................................................ 22-17
  22.2.2 hostname ............................................................................. 22-18
  22.2.3 local-ip-address .................................................................... 22-19
  22.2.4 mtu ..................................................................................... 22-20
  22.2.5 no ..................................................................................... 22-21
  22.2.6 peer .................................................................................. 22-22
  22.2.7 router-id ............................................................................. 22-25
  22.2.8 session ............................................................................... 22-26
  22.2.9 use .................................................................................. 22-28

22.3 l2tpv3-manual-session-commands ............................................ 22-29
  22.3.1 local-cookie ....................................................................... 22-30
  22.3.2 local-ip-address ................................................................... 22-31
  22.3.3 local-session-id .................................................................... 22-32
  22.3.4 mtu .................................................................................. 22-33
  22.3.5 no .................................................................................. 22-34
  22.3.6 peer ................................................................................ 22-36
  22.3.7 remote-cookie ................................................................. 22-37
  22.3.8 remote-session-id ............................................................ 22-38
  22.3.9 traffic-source ..................................................................... 22-39

Chapter 23, ROUTER-MODE COMMANDS

23.1 router-mode ........................................................................... 23-3
  23.1.1 area ................................................................................. 23-4
  23.1.2 auto-cost ........................................................................ 23-13
### Chapter 24, ROUTING-POLICY

24.1 routing-policy-commands .................................................. 24-2  
24.1.1 apply-to-local-packets ..................................................... 24-3  
24.1.2 logging ........................................................................... 24-4  
24.1.3 route-map ....................................................................... 24-5  
24.1.4 route-map-mode .............................................................. 24-8  
24.1.5 use .................................................................................. 24-16  
24.1.6 no ................................................................................. 24-17

### Chapter 25, AAA-TACACS-POLICY

25.1 aaa-tacacs-policy ............................................................... 25-2  
25.1.1 accounting ..................................................................... 25-3  
25.1.2 authentication ................................................................. 25-6  
25.1.3 authorization ................................................................. 25-9  
25.1.4 no ............................................................................... 25-12

### Chapter 26, MESHPOINT

26.1 meshpoint-config-instance .................................................. 26-2  
26.1.1 allowed-vlans ................................................................. 26-4  
26.1.2 beacon-format ............................................................... 26-5  
26.1.3 control-vlan ................................................................. 26-6  
26.1.4 data-rates ................................................................. 26-7  
26.1.5 description ................................................................. 26-11  
26.1.6 meshid ....................................................................... 26-12  
26.1.7 neighbor ................................................................. 26-13  
26.1.8 no ........................................................................ 26-14  
26.1.9 root ................................................................. 26-16  
26.1.10 security-mode .......................................................... 26-18  
26.1.11 service ................................................................. 26-20  
26.1.12 shutdown ................................................................. 26-21  
26.1.13 use ................................................................. 26-22  
26.1.14 wpa2 ................................................................. 26-23  
26.2 meshpoint-qos-policy-config-instance .................................. 26-26  
26.2.1 accelerated-multicast .................................................. 26-27
### Chapter 27, PASSPOINT POLICY

27.1 passpoint-policy ........................................................................................................................................... 27-3
27.1.1 3gpp ............................................................... 27-4
27.1.2 access-network-type ......................................................... 27-5
27.1.3 connection-capability .................................................... 27-6
27.1.4 domain-name ......................................................... 27-8
27.1.5 hessid ................................................................. 27-9
27.1.6 internet ................................................................. 27-10
27.1.7 ip-address-type ....................................................... 27-11
27.1.8 nai-realm .............................................................. 27-13
27.1.9 net-auth-type .......................................................... 27-19
27.1.10 no ............................................................................ 27-20
27.1.11 operator ............................................................... 27-21
27.1.12 osu ................................................................. 27-22
27.1.13 roam-consortium ..................................................... 27-32
27.1.14 venue ............................................................... 27-33
27.1.15 wan-metrics .......................................................... 27-37

### Chapter 28, BORDER GATEWAY PROTOCOL

28.1 bgp-ip-prefix-list-config commands .......................................................... 28-3
28.1.1 deny ................................................................. 28-4
28.1.2 permit ............................................................... 28-5
28.1.3 no ................................................................. 28-6
28.2 bgp-ip-access-list-config commands .......................................................... 28-7
28.2.1 deny ................................................................. 28-8
28.2.2 permit ............................................................... 28-9
28.2.3 no ................................................................. 28-10
28.3 bgp-as-path-list-config commands .......................................................... 28-11
28.3.1 deny ................................................................. 28-12
28.3.2 permit ............................................................... 28-13
28.3.3 no ................................................................. 28-14
28.4 bgp-community-list-config commands .......................................................... 28-15
28.4.1 deny ................................................................. 28-17
28.4.2 permit ............................................................... 28-19
28.4.3 no ................................................................. 28-21
28.5 bgp-extcommunity-list-config commands .......................................................... 28-22
28.5.1 deny ................................................................. 28-23
28.5.2 permit ............................................................... 28-25
28.5.3 no ................................................................. 28-27

**Appendix C, CUSTOMER SUPPORT**
ABOUT THIS GUIDE

This manual supports the following wireless controllers, service platforms, and access points:

- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

---

**NOTE:** ES6510 is an *Ethernet Switch* managed by a wireless controller or service platform, such as RFS4000, RFS6000, RFS7000, NX9000, NX9500, NX9510. ES6510 does not have radios and does not provide WLAN support.

---

**NOTE:** In this guide,

- AP7131, AP7161, and AP7181 are collectively represented as AP71XX.
- AP8122, AP8132, and AP8163 are collectively represented as AP81XX. AP8163 is an outdoor access point.
- AP8222 and AP8232 are collectively represented as AP82XX.
- NX4500 and NX4524 are collectively represented as NX45XX.
- NX6500 and NX6524 are collectively represented as NX65XX.
- NX7500, NX7510, NX7520, and NX7530 are collectively represented as NX75XX series.
- NX9000, NX9500, and NX9510 are collectively represented as NX9000 series.

---

A simplified version of the WiNG operating system *user interface* (UI) is available on the following access point and service platform models with the E-SKU:

- AP6511, AP6521, AP6522, AP6562, AP7502, AP7522, and AP7532
- NX7510
This new UI, referred to as the *WiNG Express* (WE) UI, simplifies configuration and monitoring of small access point deployments by limiting monitoring, analytics, and configuration capabilities. The WE UI is designed for single-site access point deployments not exceeding more than 24 access points of the same model.

---

**CAUTION:** If using the *WiNG Express* (WE) UI, to configure a WE access point, use the WE UI exclusively. Do not use the *command line interface* (CLI) along with it. Similarly, when using the CLI to configure the WE access point, do not use the WE UI along with it.

---

This section is organized into the following topics:

- *Document Conventions*
- *Notational Conventions*
- *End-User Software License Agreement*
Document Conventions

The following conventions are used in this document to draw your attention to important information:

- **NOTE**: Indicates tips or special requirements.
- **CAUTION**: Indicates conditions that can cause equipment damage or data loss.
- **WARNING!**: Indicates a condition or procedure that could result in personal injury or equipment damage.
- **Switch Note**: Indicates caveats unique to a RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, or NX9510 model controller.
## Notational Conventions

The following notational conventions are used in this document:

- Italics are used to highlight specific items in the general text, and to identify chapters and sections in this and related documents
- Bullets (•) indicate:
  - lists of alternatives
  - lists of required steps that are not necessarily sequential
  - action items
- Sequential lists (those describing step-by-step procedures) appear as numbered lists

### Understanding Command Syntax

<table>
<thead>
<tr>
<th>Variable Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| <variable>    | Variables are described with a short description enclosed within a '<' and a '>' pair. For example, the command,  
|               | `rfs7000-37FABE>show interface ge 1` is documented as:  
|               | `show interface ge <1-4>` where:  
|               | • show – is the command – displays information  
|               | • interface – is the keyword – represents the interface type  
|               | • <1-4> – is the variable – represents the ge interface index value |

|                | The pipe symbol. This is used to separate the variables/keywords in a list. For example, the command,  
|                | `rfs7000-37FABE> show .....` is documented as:  
|                | `show [adoption|bonjour|boot]`  
|                | `.....` where:  
|                | • show – is the command – displays information  
|                | • [adoption|bonjour|.....] – indicates the different keywords that can be combined with the show command. However, only one of the above option can be used at a time.  
|                | `show adoption ...`  
|                | `show bonjour ...`  
|                | `show boot ...` |
### Of the different keywords and variables listed inside a ‘[’ & ‘]’ pair, only one can be used.

Each choice in the list is separated with a ‘|’ (pipe) symbol.

For example, the command,

```
rfs7000-37FABE#clear ...
```

is documented as:

```
clear [arp-cache|cdp|counters|crypto|
event-history|firewall|gre|ip|ipv6|
l2tpv3-stats|license|lldp|logging|
mac-address-table|mint|role|rtls|
spanning-tree|vrrp]
```

where:

- clear – is the command
- [arp-cache|cdp|counters|crypto|event-history|firewall|gre|ip|ipv6| l2tpv3-stats|license|lldp|logging|mac-address-table|mint|role|rtls| spanning-tree|vrrp] – indicates that nineteen keywords are available for this command. However, only one can be used at a time.

### Any command/keyword/variable or a combination of them inside a ‘{’ & ‘}’ pair is optional.

All optional commands follow the same conventions as listed above. However, they are displayed italicized.

For example, the command,

```
rfs7000-37FABE> show adoption ....
```

is documented as:

```
show adoption info {on <DEVICE-NAME>}
```

here:

- show adoption info – is the command. This command can also be used as:

```
show adoption info
```

The command can also be extended as:

```
show adoption info {on <DEVICE-NAME>}
```

here:

- {on <DEVICE-NAME>} – is the keyword, which is optional.

### The first word is always a command.

Keywords are words that must be entered as is. Commands and keywords are mandatory.

For example, the command,

```
rfs7000-37FABE>show wireless
```

is documented as:

```
show wireless
```

where:

- show – is the command
- wireless – is the keyword
Any command/keyword/variable or a combination of them inside a ‘(‘ & ‘)’ pair are recursive. All recursive commands can be listed in any order and can be used once along with the rest of the commands.

For example, the command,
```
crypto pki export request generate-rsa-key
test autogen-subject-name ...
```
is documented as:
```
rfs7000-37FABE#crypto pki export request generate-rsa-key test autogen-subject-name ...
(<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>)
```
here:
- `crypto pki export request generate-rsa-key <RSA-KEYPAIR-NAME>`
  auto-gen-subject-name — is the command
- `<RSA-KEYPAIR-NAME>` — is the RSA keypair name (in this example, the keypair name is 'test'), and is a variable
- `(<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>)` — is the set of recursive parameters (separated by commas) that can be used in any order.
End-User Software License Agreement

This End-User Software License Agreement ("End-User License Agreement") is between Symbol Technologies Inc. (herein "Symbol Technologies") and End-User Customer to whom Symbol Technologies' proprietary software or Symbol Technologies Products containing embedded, pre-loaded, or installed software ("Products") is made available. This End-User License Agreement contains the terms and conditions of the license Symbol Technologies is providing to End-User Customer, and End-User Customer’s use of the Software and Documentation. By using, downloading or installing this software, you or the entity that you represent ("End-User Customer") are consenting to be bound by and are becoming a party to this End-User License Agreement.

1. DEFINITIONS

1.1. "Documentation" means product and software documentation that specifies technical and performance features and capabilities, and the user, operation and training manuals for the Software (including all physical or electronic media upon which such information is provided).

"Open Source Software" means software with either freely obtainable source code license for modification, or permission for free distribution.

"Open Source Software License" means the terms or conditions under which the Open Source Software is licensed.

"Software" (i) means proprietary software in object code format, and adaptations, translations, decompilations, disassemblies, emulations, or derivative works of such software; (ii) means any modifications, enhancements, new versions and new releases of the software provided by Symbol Technologies; and (iii) may contain items of software owned by a third party supplier. The term "Software" does not include any third party software provided under separate license or third party software not licensable under the terms of this Agreement. To the extent, if any, that there is a separate license agreement packaged with, or provided electronically with, a particular Product that becomes effective on an act of acceptance by the end user, then that agreement supersedes this End-User License Agreement as to the end use of that particular Product.

2. GRANT OF LICENSE

2.1. If the Software licensed under this End-User License Agreement contains or is derived from Open Source Software, the terms and conditions governing the use of such Open Source Software are in the Open Source Software Licenses of the copyright owner and not this End-User License Agreement. If there is a conflict between the terms and conditions of this End-User License Agreement and the terms and conditions of the Open Source Software Licenses governing End-User Customer’s use of the Open Source Software, the terms and conditions of the license grant of the applicable Open Source Software Licenses will take precedence over the license grants in this End-User License Agreement. If requested by End-User Customer, Symbol Technologies will use commercially reasonable efforts to: (i) determine whether any Open source Software is provided under this End-User License Agreement; (ii) identify the Open Source Software and provide End-User Customer a copy of the applicable Open Source Software License (or specify where that license may be found); and, (iii) provide End-User Customer a copy of the Open Source Software source code, without charge, if it is publicly available (although distribution fees may be applicable).

3. LIMITATIONS ON USE

3.1. End-User Customer may use the Software only for End-User Customer’s internal business purposes and only in accordance with the Documentation. Any other use of the Software is strictly prohibited and will be deemed a breach of this End-User License Agreement. Without limiting the general nature of these restrictions, End-User Customer will not make the Software available for use by third parties on a “time sharing,” “application service provider,” or “service bureau” basis or for any other similar commercial rental or sharing arrangement.

3.2. End-User Customer will not, and will not allow or enable any third party to: (i) reverse engineer, disassemble, peel components, decompile, reprogram or otherwise reduce the Software or any portion to a human perceptible form or otherwise attempt to recreate the source code; (ii) modify, adapt, create derivative works of, or merge the Software with other software; (iii) copy, reproduce, distribute, lend, or lease the Software or Documentation to any third party, grant any sublicense or other rights in the Software or Documentation to any third party, or take any action that would
cause the Software or Documentation to be placed in the public domain; (iv) remove, or in any way alter or obscure, any copyright notice or other notice of Symbol Technologies’ proprietary rights; (v) provide, copy, transmit, disclose, divulge or make the Software or Documentation available to, or permit the use of the Software by any third party or on any machine except as expressly authorized by this Agreement; or (vi) use, or permit the use of, the Software in a manner that would result in the production of a copy of the Software solely by activating a machine containing the Software. End-User Customer may make one copy of Software to be used solely for archival, back-up, or disaster recovery purposes; provided that End-User Customer may not operate that copy of the Software at the same time as the original Software is being operated. End-User Customer may make as many copies of the Documentation as it may reasonably require for the internal use of the Software.

3.3. Unless otherwise authorized by Symbol Technologies in writing, End-User Customer will not, and will not enable or allow any third party to: (i) install a licensed copy of the Software on more than one unit of a Product; or (ii) copy onto or transfer Software installed in one unit of a Product onto another device.

3.4. If End-User Customer is purchasing Products that require a site license, End-User Customer must purchase a copy of the applicable Software for each site at which End-User Customer uses such Software. End-User Customer may make one additional copy for each computer owned or controlled by End-User Customer at each such site. End-User Customer may temporarily use the Software on portable or laptop computers at other sites. End-User Customer must provide a written list of all sites where End-User Customer uses or intends to use the Software.

4. TRANSFERS

4.1. End-User Customer will not transfer the Software or Documentation to any third party without Symbol Technologies’ prior written consent. Symbol Technologies’ consent may be withheld at its discretion and may be conditioned upon transferee paying all applicable license fees and agreeing to be bound by this End-User License Agreement.

5. OWNERSHIP AND TITLE

5.1. Symbol Technologies, its licensors, and its suppliers retain all of their proprietary rights in any form in and to the Software and Documentation, including, but not limited to, all rights in patents, patent applications, inventions, copyrights, trademarks, trade secrets, trade names, and other proprietary rights in or relating to the Software and Documentation. No rights are granted to End-User Customer under this Agreement by implication, estoppel or otherwise, except for those rights which are expressly granted to End-User Customer in this End-User License Agreement. All intellectual property developed, originated, or prepared by Symbol Technologies in connection with providing the Software, Products, Documentation or related services remains vested exclusively in Symbol Technologies, and End-User Customer will not have any shared development or other intellectual property rights.

6. CONFIDENTIALITY

6.1. End-User Customer acknowledges that the Software contains valuable proprietary information and trade secrets and that unauthorized dissemination, distribution, modification, reverse engineering, disassembly or other improper use of the Software will result in irreparable harm to Symbol Technologies for which monetary damages would be inadequate. Accordingly, End-User Customer will limit access to the Software to those of its employees and agents who need to use the Software for End-User Customer’s internal business.

7. MAINTENANCE AND SUPPORT

7.1. No maintenance or support is provided under this End-User License Agreement. Maintenance or support, if available, will be provided under a separate Software maintenance and support agreement.

8. LIMITED WARRANTY AND LIMITATION OF LIABILITY

8.1. Unless otherwise specified in the applicable warranty statement, the Documentation or in any other media at the time of shipment of the Software by Symbol Technologies, and for the warranty period specified therein, for the first 120 days after initial shipment of the Software to the End-User Customer, Symbol Technologies warrants that the Software, when installed and/or used properly, will be free from reproducible defects that materially vary from its published specifications. Symbol Technologies does not warrant that End-User Customer’s use of the Software or the
Products will be uninterrupted or error-free or that the Software or the Products will meet End-User Customer’s particular requirements.

8.2. SYMBOL TECHNOLOGIES’ TOTAL LIABILITY, AND END-USER CUSTOMER’S SOLE REMEDY, FOR ANY BREACH OF THIS WARRANTY WILL BE LIMITED TO, AT SYMBOL TECHNOLOGIES’ OPTION, REPAIR OR REPLACEMENT OF THE SOFTWARE OR PAYMENT OF END-USER CUSTOMER’S ACTUAL DAMAGES UP TO THE AMOUNT PAID TO SYMBOL TECHNOLOGIES FOR THE SOFTWARE OR THE INDIVIDUAL PRODUCT IN WHICH THE SOFTWARE IS EMBEDDED OR FOR WHICH IT WAS PROVIDED. THIS WARRANTY EXTENDS ONLY TO THE FIRST END-USER CUSTOMER; SUBSEQUENT TRANSFEREES MUST ACCEPT THE SOFTWARE “AS IS” AND WITH NO WARRANTIES OF ANY KIND. SYMBOL TECHNOLOGIES DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

8.3. IN NO EVENT WILL SYMBOL TECHNOLOGIES BE LIABLE FOR SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES, INCLUDING, BUT NOT LIMITED TO, LOSS OF USE, TIME OR DATA, INCONVENIENCE, COMMERCIAL LOSS, LOST PROFITS, OR SAVINGS, TO THE FULL EXTENT SUCH MAY BE DISCLAIMED BY LAW, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. THE LIMITATIONS IN THIS PARAGRAPH WILL APPLY NOTWITHSTANDING ANY FAILURE OF ESSENTIAL PURPOSE OF ANY LIMITED REMEDY.

9. TERM AND TERMINATION

9.1. Any use of the Software, including but not limited to use on the Products, will constitute End-User Customer’s agreement to this End-User License Agreement. End-User Customer’s right to use the Software will continue for the life of the Products with which or for which the Software and Documentation have been provided by Symbol Technologies, unless End-User Customer breaches this End-User License Agreement, in which case this End-User License Agreement and End-User Customer’s right to use the Software and Documentation may be terminated immediately by Symbol Technologies. In addition, if Symbol Technologies reasonably believes that End-User Customer intends to breach this End-User License Agreement Symbol Technologies may, by notice to End-User Customer, terminate End-User Customer’s right to use the Software.

9.2. Upon termination, Symbol Technologies will be entitled to immediate injunctive relief without proving damages and, unless End-User Customer is a sovereign government entity, Symbol Technologies will have the right to repossess all copies of the Software in End-User Customer’s possession. Within thirty (30) days after termination of End-User Customer’s right to use the Software, End-User Customer must certify in writing to Symbol Technologies that all copies of such Software have been returned to Symbol Technologies or destroyed.

10. UNITED STATES GOVERNMENT LICENSING PROVISIONS

10.1. This Section applies if End-User Customer is the United States Government or a United States Government agency. End-User Customer’s use, duplication or disclosure of the Software and Documentation under Symbol Technologies’ copyrights or trade secret rights is subject to the restrictions set forth in subparagraphs (c)(1) and (2) of the Commercial Computer Software-Restricted Rights clause at FAR 52.227-19 (JUNE 1987), if applicable, unless they are being provided to the Department of Defense. If the Software and Documentation are being provided to the Department of Defense, End-User Customer’s use, duplication, or disclosure of the Software and Documentation is subject to the restrictions set forth in subparagraph (c)(1)(ii) of the Rights in Technical Data and Computer Software clause at DFARS 252.227-7013 (OCT 1988), if applicable. The Software and Documentation may or may not include a Restricted Rights notice, or other notice referring to this End-User License Agreement. The provisions of this End-User License Agreement will continue to apply, but only to the extent that they are consistent with the rights provided to the End-User Customer under the provisions of the FAR and DFARS mentioned above, as applicable to the particular procuring agency and procurement transaction.

11. GENERAL

11.1. Copyright Notices. The existence of a copyright notice on the Software will not be construed as an admission or presumption that public disclosure of the Software or any trade secrets associated with the Software has occurred.

11.2. Compliance with Laws. End-User Customer acknowledges that the Software is subject to the laws and regulations of the United States and End-User Customer will comply with all applicable laws and regulations, including export
laws and regulations of the United States. End-User Customer will not, without the prior authorization of Symbol Technologies and the appropriate governmental authority of the United States, in any form export or re-export, sell or resell, ship or reship, or divert, through direct or indirect means, any item or technical data or direct or indirect products sold or otherwise furnished to any person within any territory for which the United States Government or any of its agencies at the time of the action, requires an export license or other governmental approval. Violation of this provision is a material breach of this Agreement.

11.3. Third Party Beneficiaries. This End-User License Agreement is entered into solely for the benefit of Symbol Technologies and End-User Customer. No third party has the right to make any claim or assert any right under this Agreement, and no third party is deemed a beneficiary of this End-User License Agreement. Notwithstanding the foregoing, any licensor or supplier of third party software included in the Software will be a direct and intended third party beneficiary of this End-User License Agreement.

11.4. Waiver. No waiver of a right or remedy of a Party will constitute a waiver of another right or remedy of that Party.

11.5. Assignments. Symbol Technologies may assign any of its rights or sub-contract any of its obligations under this End-User License Agreement or encumber or sell any of its rights in any Software, without prior notice to or consent of End-User Customer.

11.6. Causes of Action. End-User Customer must bring any action under this End-User License Agreement within one year after the cause of action arises except that warranty claims must be brought within the applicable warranty period.

11.7. Entire Agreement and Amendment. This End-User License Agreement contains the parties’ entire agreement regarding End-User Customer’s use of the Software and may be amended only in a writing signed by both parties, except that Symbol Technologies may modify this End-User License Agreement as necessary to comply with applicable laws and regulations.

11.8. Governing Law. This End-User License Agreement is governed by the laws of the the State of Delaware in the United States to the extent that they apply and otherwise by the internal substantive laws of the country to which the Software is shipped if End-User Customer is a sovereign governmental entity. The terms of the U.N. Convention on Contracts for the International Sale of Goods do not apply. In the event that the Uniform Computer Information Transaction Act, any version of this Act, or a substantially similar law (collectively “UCITA”) becomes applicable to a Party’s performance under this Agreement, UCITA does not govern any aspect of this End-User License Agreement or any license granted under this End-User License Agreement, or any of the parties’ rights or obligations under this End-User License Agreement. The governing law will be that in effect prior to the applicability of UCITA.

11.9. Dispute Resolution. Unless End-User Customer is a sovereign governmental entity, any dispute arising from or in connection with this End-User License Agreement shall be submitted to the sole and exclusive forum of the state and federal courts sitting in New Castle County, Delaware (the "Delaware Courts"), and each Party irrevocably submits to the jurisdiction of the Delaware Courts for the litigation of such disputes. Each Party hereby irrevocably waives, and agrees not to assert in any suit, action or proceeding brought in the Delaware Courts, any claim or defense that the Party is not subject to the jurisdiction of the Delaware Courts, that the Delaware Courts are an inconvenient forum, or that the Delaware Courts are an improper venue.
CHAPTER 1
INTRODUCTION

This chapter describes the commands available within a device’s Command Line Interface (CLI) structure. CLI is available for wireless controllers, access points (APs), and service platforms.

Access the CLI by using:

- A terminal emulation program running on a computer connected to the serial port on the device (access point, wireless controller, and service platform).
- A Telnet session through Secure Shell (SSH) over a network.

**Configuration for connecting to a Controller using a terminal emulator**

If connecting through the serial port, use the following settings to configure your terminal emulator:

<table>
<thead>
<tr>
<th>Bits Per Second</th>
<th>19200</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Bits</td>
<td>8</td>
</tr>
<tr>
<td>Parity</td>
<td>None</td>
</tr>
<tr>
<td>Stop Bit</td>
<td>1</td>
</tr>
<tr>
<td>Flow Control</td>
<td>None</td>
</tr>
</tbody>
</table>

When a CLI session is established, complete the following (user input is in **bold**):

login as: <**username**>
administrator’s login password: <**password**>

**User Credentials**

Use the following credentials when logging into a device for the first time:

<table>
<thead>
<tr>
<th>User Name</th>
<th>admin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>admin123</td>
</tr>
</tbody>
</table>

When logging into the CLI for the first time, you are prompted to change the password.
Examples in this reference guide

Examples used in this reference guide are generic to each supported wireless controller, service platform, and AP model. Commands that are not common, are identified using the notation “Supported in the following platforms:” For an example, see below:

Supported in the following platforms:
- Wireless Controller – RFS6000

The above example indicates the command is only available for a RFS6000 model wireless controller.

This chapter is organized into the following sections:
- CLI Overview
- Getting Context Sensitive Help
- Using the No Command
- Using CLI Editing Features and Shortcuts
- Using CLI to Create Profiles and Enable Remote Administration

1.1 CLI Overview

**INTRODUCTION**

The CLI is used for configuring, monitoring, and maintaining the network. The user interface allows you to execute commands on supported wireless controllers, service platforms, and APs, using either a serial console or a remote access method.

This chapter describes basic CLI features. Topics covered include an introduction to command modes, navigation and editing features, help features and command history.

The CLI is segregated into different command modes. Each mode has its own set of commands for configuration, maintenance, and monitoring. The commands available at any given time depend on the mode you are in, and to a lesser extent, the particular model used. Enter a question mark (?) at the system prompt to view a list of commands available for each command mode/instance.

Use specific commands to navigate from one command mode to another. The standard order is: USER EXEC mode, PRIV EXEC mode and GLOBAL CONFIG mode.

![Hierarchy of User Modes](image)
Command Modes

A session generally begins in the USER EXEC mode (one of the two access levels of the EXEC mode). For security, only a limited subset of EXEC commands are available in the USER EXEC mode. This level is reserved for tasks that do not change the device’s (wireless controller, service platform, or AP) configuration.

rfs7000-37FABE>
The system prompt signifies the device name and the last three bytes of the device MAC address.

To access commands, enter the PRIV EXEC mode (the second access level for the EXEC mode). Once in the PRIV EXEC mode, enter any EXEC command. The PRIV EXEC mode is a superset of the USER EXEC mode.

rfs7000-37FABE>enable
rfs7000-37FABE#

Most of the USER EXEC mode commands are one-time commands and are not saved across device reboots. Save the command by executing ‘commit’ command. For example, the show command displays the current configuration and the clear command clears the interface.

Access the GLOBAL CONFIG mode from the PRIV EXEC mode. In the GLOBAL CONFIG mode, enter commands that set general system characteristics. Configuration modes, allow you to change the running configuration. If you save the configuration later, these commands are stored across device reboots.

Access a variety of protocol specific (or feature-specific) modes from the global configuration mode. The CLI hierarchy requires you to access specific configuration modes only through the global configuration mode.

rfs7000-37FABE# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config)#

You can also access sub-modes from the global configuration mode. Configuration sub-modes define specific features within the context of a configuration mode.

rfs7000-37FABE(config)#aaa-policy test
rfs7000-37FABE(config-aaa-policy-test)#

The following table summarizes available CLI commands:

1.2 Getting Context Sensitive Help

Enter a question mark (?) at the system prompt to display a list of commands available for each mode. Obtain a list of arguments and keywords for any command using the CLI context-sensitive help.

Use the following commands to obtain help specific to a command mode, command name, keyword or argument:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(prompt)# help</td>
<td>Displays a brief description of the help system</td>
</tr>
<tr>
<td>(prompt)# abbreviated-command-entry?</td>
<td>Lists commands in the current mode that begin with a particular character string</td>
</tr>
<tr>
<td>(prompt)# abbreviated-command-entry&lt;Tab&gt;</td>
<td>Completes a partial command name</td>
</tr>
<tr>
<td>(prompt)# ?</td>
<td>Lists all commands available in the command mode</td>
</tr>
<tr>
<td>(prompt)# command ?</td>
<td>Lists the available syntax options (arguments and keywords) for the command</td>
</tr>
<tr>
<td>(prompt)# command keyword ?</td>
<td>Lists the next available syntax option for the command</td>
</tr>
</tbody>
</table>

**NOTE:** The system prompt varies depending on the configuration mode.

**NOTE:** Enter Ctrl + V to use ? as a regular character and not as a character used for displaying context sensitive help. This is required when the user has to enter a URL that ends with a ?

**NOTE:** The escape character used throughout the CLI is “\”. To enter a "\" use "\\" instead.

When using context-sensitive help, the space (or lack of a space) before the question mark (?) is significant. To obtain a list of commands that begin with a particular sequence, enter the characters followed by a question mark (?). Do not include a space. This form of help is called word help, because it completes a word.

```
rfs7000-37FABE#service?
service Service Commands
rfs7000-37FABE#service
```
Enter a question mark (?) (in place of a keyword or argument) to list keywords or arguments. Include a space before the “?”.
This form of help is called command syntax help. It shows the keywords or arguments available based on the command/keyword and argument already entered.

```
rfs7000-37FABE#service ?

  request-full-config-from-adopter  Request full configuration from the
                                      adopter
  set                               Set validation mode
  show                              Show running system information
  signal                            Send a signal to a process
  smart-rf                          Smart-RF Management Commands
  snmp                              Snmp
  ssms                              Command related to ssm
  start-shell                       Provide shell access
  syslog                            Test the syslog server configuration
  trace                             Trace a process for system calls and
                                      signals
  troubleshoot                      Troubleshooting
  wireless                          Command related to wireless
```

It is possible to abbreviate commands and keywords to allow a unique abbreviation. For example, “configure terminal” can be abbreviated as `config t`. Since the abbreviated command is unique, the controller accepts the abbreviation and executes the command.

Enter the help command (available in any command mode) to provide the following description:

```
rfs7000-37FABE>help
```

When using the CLI, help is provided at the command line when typing '=?'.

If no help is available, the help content will be empty. Backup until entering a '=?' shows the help content.

There are two styles of help provided:
1. Full help. Available when entering a command argument (e.g. 'show ?'). This will describe each possible argument.
2. Partial help. Available when an abbreviated argument is entered. This will display which arguments match the input (e.g. 'show ve?').

```
rfs7000-37FABE>
```
1.3 Using the No Command

Almost every command has a **no** form. Use no to disable a feature or function or return it to its default. Use the command without the **no** keyword to re-enable a disabled feature.

1.3.1 Basic Conventions

Keep the following conventions in mind while working within the CLI structure:
- Use `?` at the end of a command to display available sub-modes. Type the first few characters of the sub-mode and press the tab key to add the sub-mode. Continue using `?` until you reach the last sub-mode.
- Pre-defined CLI commands and keywords are case-insensitive: `cfg = Cfg = CFG`. However (for clarity), CLI commands and keywords are displayed (in this guide) using mixed case. For example, `apPolicy, trapHosts, channelInfo`.
- Enter commands in uppercase, lowercase, or mixed case. Only passwords are case sensitive.

1.4 Using CLI Editing Features and Shortcuts

A variety of shortcuts and edit features are available. The following sections describe these features:
- **Moving the Cursor on the Command Line**
- **Completing a Partial Command Name**
- **Command Output Pagination**

1.4.1 Moving the Cursor on the Command Line

The following table shows the key combinations or sequences to move the command line cursor. Ctrl defines the control key, which must be pressed simultaneously with its associated letter key. Esc means the escape key (which must be pressed first), followed by its associated letter key. Keys are not case sensitive. Specific letters are used to provide an easy way of remembering their functions.

<table>
<thead>
<tr>
<th>Keystrokes</th>
<th>Function Summary</th>
<th>Function Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left Arrow or Ctrl-B</td>
<td>Back character</td>
<td>Moves the cursor one character to the left</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When entering a command that extends beyond a single line, press the Left Arrow or Ctrl-B keys repeatedly to move back to the system prompt.</td>
</tr>
<tr>
<td>Right Arrow or Ctrl-F</td>
<td>Forward character</td>
<td>Moves the cursor one character to the right</td>
</tr>
<tr>
<td>Esc- B</td>
<td>Back word</td>
<td>Moves the cursor back one word</td>
</tr>
<tr>
<td>Esc- F</td>
<td>Forward word</td>
<td>Moves the cursor forward one word</td>
</tr>
<tr>
<td>Ctrl-A</td>
<td>Beginning of line</td>
<td>Moves the cursor to the beginning of the command line</td>
</tr>
<tr>
<td>Ctrl-E</td>
<td>End of line</td>
<td>Moves the cursor to the end of the command line</td>
</tr>
<tr>
<td>Ctrl-D</td>
<td></td>
<td>Deletes the current character</td>
</tr>
</tbody>
</table>
1.4.2 Completing a Partial Command Name

Using CLI Editing Features and Shortcuts

If you cannot remember a command name (or if you want to reduce the amount of typing you have to perform), enter the first few letters of a command, then press the Tab key. The command line parser completes the command if the string entered is unique to the command mode. If your keyboard does not have a Tab key, press Ctrl-L.

The CLI recognizes a command once you have entered enough characters to make the command unique. If you enter “conf” within the privileged EXEC mode, the CLI associates the entry with the configure command, since only the configure command begins with `conf`.

In the following example, the CLI recognizes a unique string in the privileged EXEC mode when the Tab key is pressed:

```
rfs7000-37FABE# conf<Tab>
```

When using the command completion feature, the CLI displays the full command name. The command is not executed until the Return or Enter key is pressed. Modify the command if the full command was not what you intended in the abbreviation. If entering a set of characters (indicating more than one command), the system lists all commands beginning with that set of characters.

Enter a question mark (?) to obtain a list of commands beginning with that set of characters. Do not leave a space between the last letter and the question mark (?).

For example, entering U lists all commands available in the current command mode:

```
rfs7000-37FABE#co?
commit Commit all changes made in this session
configure Enter configuration mode
connect Open a console connection to a remote device
copy Copy from one file to another
```

```
rfs7000-37FABE#
```
1.4.3 Command Output Pagination

Using CLI Editing Features and Shortcuts

Output often extends beyond the visible screen length. For cases where output continues beyond the screen, the output is paused and a

```
--More--
```

prompt displays at the bottom of the screen. To resume the output, press the Enter key to scroll down one line or press the Spacebar to display the next full screen of output.

1.5 Using CLI to Create Profiles and Enable Remote Administration

The following sections describe the following essential procedures:

- Creating Profiles
- Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface
- Enabling Remote Administration

1.5.1 Creating Profiles

Using CLI to Create Profiles and Enable Remote Administration

Profiles are sort of a ‘template’ representation of configuration. The system has:

- a default profile for each of the following devices:
  - RFS4000, RFS6000, RFS7000
- a default profile for each of the following service platforms:
  - NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510
- a default profile for each of the following access points:
  - AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX

To modify the default profile to assign an IP address to the management port:

```
set rfs7000-37FABE(config)#profile rfs7000 default-rfs7000
rfs7000-37FABE(config-profile-default-rfs7000)#interface me1
rfs7000-37FABE(config-profile-default-rfs7000-if-me1)#ip address 172.16.10.2/24
rfs7000-37FABE(config-profile-default-rfs7000-if-me1)#commit
rfs7000-37FABE(config-profile-default-rfs7000)#exit
```

The following command displays a default AP71XX profile:

```
rfs7000-37FABE(config)#profile ap71xx default-ap71xx
rfs7000-37FABE(config-profile-default-ap71xx)#
rfs7000-37FABE(config-profile-default-ap71xx)#show context
profile ap71xx default-ap71xx
autoinstall configuration
autoinstall firmware
device-upgrade persist-images
crypto ikev1 policy ikev1-default
```
isakmp-proposal default encryption aes-256 group 2 hash sha
crypto ikev2 policy ikev2-default
    isakmp-proposal default encryption aes-256 group 2 hash sha
crypto ipsec transform-set default esp-aes-256 esp-sha-hmac
crypto ikev1 remote-vpn
crypto ikev2 remote-vpn
crypto auto-ipsec-secure
crypto remote-vpn-client
interface radio1
interface radio2
interface radio3
interface gel
    ip dhcp trust
cqos trust dscp
cqos trust 802.1p
interface ge2
    ip dhcp trust
cqos trust dscp
--More--

1.5.2 Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface

Using CLI to Create Profiles and Enable Remote Administration

Logon to the controller in config mode and follow the procedure below:

rfs7000-37FABE(config-profile-default-rfs7000)# interface vlan 150
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan150)# ip address 192.168.150.20/24
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan150)# exit
rfs7000-37FABE(config-profile-default-rfs7000)# interface ge 3
rfs7000-37FABE(config-profile-default-rfs7000-if-ge3)# switchport access vlan 150
rfs7000-37FABE(config-profile-default-rfs7000-if-ge3)# commit write
    [OK]
    rfs7000-37FABE(config-profile-default-rfs7000-if-ge3)# show interface vlan 150
    Interface vlan150 is UP
    Hardware-type: vlan, Mode: Layer 3, Address: 00-15-70-37-FA-BE
    Index: 8, Metric: 1, MTU: 1500
    IP-Address: 192.168.150.20/24
    input packets 43, bytes 12828, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
    output packets 0, bytes 0, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
    collisions 0

1.5.2.1 Viewing Configured APs

To view previously configured APs, enter the following command:

rfs7000-6DCD4B#show wireless ap configured

<table>
<thead>
<tr>
<th>IDX</th>
<th>NAME</th>
<th>MAC</th>
<th>PROFILE</th>
<th>RF-DOMAIN</th>
<th>ADOPTED-BY</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ap8132-711728</td>
<td>B4-C7-99-71-17-28</td>
<td>default-ap81xx</td>
<td>default</td>
<td>00-15-70-81-74-2D</td>
</tr>
</tbody>
</table>

rfs7000-6DCD4B#

1.5.3 Enabling Remote Administration

Using CLI to Create Profiles and Enable Remote Administration

A terminal server may function in remote administration mode if either the terminal services role is not installed on the machine or the client used to invoke the session has enabled the admin controller.

- A terminal emulation program running on a computer connected to the serial port on the controller. The serial port is located on the front of the controller.
- A Telnet session through a Secure Shell (SSH) over a network. The Telnet session may or may not use SSH depending on how the controller is configured. It is recommended you use SSH for remote administration tasks.
This section is organized into the following sub sections:

- **Configuring Telnet for Management Access**
- **Configuring SSH**

### 1.5.3.1 Configuring Telnet for Management Access

#### Enabling Remote Administration

Login through the serial console. Perform the following:

1. A session generally begins in the USER EXEC mode (one of the two access levels of the EXEC mode).
2. Access the GLOBAL CONFIG mode from the PRIV EXEC mode.

   ```
   rfs7000-37FABE> en
   rfs7000-37FABE# configure terminal
   Enter configuration commands, one per line. End with CNTL/Z.
   ```
3. Go to 'default-management-policy' mode.

   ```
   rfs7000-37FABE(config)# management-policy ?
   rfs7000-37FABE(config)# management-policy default
   rfs7000-37FABE(config-management-policy-default)#
   ```
4. Enter Telnet and the port number at the command prompt. The port number is optional. The default port is 23. Commit the changes after every command. Telnet is enabled.

   ```
   rfs7000-37FABE(config-management-policy-default)# telnet
   rfs7000-37FABE(config-management-policy-default)# commit write
   ```
5. Connect to the controller through Telnet using its configured IP address. Use the following credentials when logging on to the device for the first time:

<table>
<thead>
<tr>
<th>User Name</th>
<th>admin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>admin123</td>
</tr>
</tbody>
</table>

When logging into the controller for the first time, you are prompted to change the password.

To change user credentials:

1. Enter the username, password, role and access details.

   ```
   rfs7000-37FABE(config-management-policy-default)#user testuser password test@123 role helpdesk access all
   rfs7000-37FABE(config-management-policy-default)#commit
   ```

   ```
   rfs7000-37FABE(config-management-policy-default)#show context
   management-policy default
   telnet
   http server
   https server
   ssh
   user admin password 1 ba7da2b2f2f7945af1d3ae1b8b762b541bd5bac1f80a54cd4488f38ed44b91ecd role superuser access all
   user operator password 1 0be97e9e30d29dfe4733e7c5f74a7be54570c2450e855cealae96b0558a40401 role monitor access all
   user testuser password 1 bca381b5b93cdd0b209e1da8a9d387fa09bfae14cc987438a4d144cb516ffcb role helpdesk access all
   ```

```
```
2. Logon to the Telnet console and provide the user details configured in the previous step to access the controller.

```
rfs7000 release 5.7.0.0-007D
rfs7000-37FABE login: testuser
Password:
```
```
Welcome to CLI
Starting CLI...
rfs7000-37FABE>
```

1.5.3.2 Configuring SSH

**Enabling Remote Administration**

By default, SSH is enabled from the factory settings on the controller. The controller requires an IP address and login credentials.

To enable SSH access in the default profile, login through the serial console. Perform the following:

1. Access the GLOBAL CONFIG mode from the PRIV EXEC mode.
```
rfs7000-37FABE>en
rfs7000-37FABE#configure
```
```
Enter configuration commands, one per line. End with CNTL/Z.
```

2. Go to ‘config-management-policy-default’ mode.
```
rfs7000-37FABE(config)#management-policy default
rfs7000-37FABE(config-management-policy-default)#
```

3. Enter SSH at the command prompt.
```
rfs7000-37FABE(config-management-policy-default)#ssh
```

4. Log into the controller through SSH using appropriate credentials.

5. Use the following credentials when logging on to the device for the first time:

<table>
<thead>
<tr>
<th>User Name</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin</td>
<td>admin123</td>
</tr>
</tbody>
</table>

When logging into the controller for the first time, you are prompted to change the password.

To change the user credentials:

```
rfs7000 release 5.7.0.0-007D
rfs7000-37FABE login: testuser
Password:
Welcome to CLI
Starting CLI...
rfs7000-37FABE>
```
CHAPTER 2
USER EXEC MODE COMMANDS

Logging in to the wireless controller places you within the USER EXEC command mode. Typically, a login requires a user name and password. You have three login attempts before the connection attempt is refused. USER EXEC commands (available at the user level) are a subset of the commands available at the privileged level. In general, USER EXEC commands allow you to connect to remote devices, perform basic tests, and list system information.

To list available USER EXEC commands, use ? at the command prompt. The USER EXEC prompt consists of the device host name followed by an angle bracket (>).

<DEVICE>>?
Command commands:
captive-portal-page-upload  Captive portal advanced page upload
change-passwd               Change password
clear                       Clear
clock                       Configure software system clock
cluster                     Cluster commands
commit                      Commit all changes made in this session
connect                     Open a console connection to a remote device
create-cluster              Create a cluster
crypto                      Encryption related commands
crypto-cmp-cert-update      Update the cmp certs
debug                       Debugging functions
device-upgrade              Device firmware upgrade
disable                     Turn off privileged mode command
enable                      Turn on privileged mode command
help                        Description of the interactive help system
join-cluster                 Join the cluster
l2tpv3                      L2tpv3 protocol
logging                     Modify message logging facilities
mint                        MiNT protocol
no                          Negate a command or set its defaults
on                          On RF-Domain
opendns                     Opendns username/password configuration
page                        Toggle paging
ping                        Send ICMP echo messages
ping6                       Send ICMPv6 echo messages
revert                      Revert changes
service                     Service Commands
show                        Show running system information
smart-cache                 Content Cache Operation
ssh                         Open an ssh connection
telnet                      Open a telnet connection
terminal                   Set terminal line parameters
time-it                     Check how long a particular command took between request and completion of response
traceroute                  Trace route to destination
traceroute6                 Trace route to destination(IPv6)

## 2.1 User Exec Commands

The following table summarizes the User Exec Mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal-page-upload</td>
<td>Uploads captive portal advanced pages</td>
<td>page 2-5</td>
</tr>
<tr>
<td>change-passwd</td>
<td>Changes the password of a logged user</td>
<td>page 2-8</td>
</tr>
<tr>
<td>clear</td>
<td>Resets the last saved command</td>
<td>page 2-9</td>
</tr>
<tr>
<td>clock</td>
<td>Configures the system clock</td>
<td>page 2-19</td>
</tr>
<tr>
<td>cluster</td>
<td>Accesses the cluster context</td>
<td>page 2-20</td>
</tr>
<tr>
<td>connect</td>
<td>Establishes a console connection to a remote device</td>
<td>page 2-21</td>
</tr>
<tr>
<td>create-cluster</td>
<td>Creates a new cluster on a specified device</td>
<td>page 2-22</td>
</tr>
<tr>
<td>crypto</td>
<td>Enables encryption</td>
<td>page 2-24</td>
</tr>
<tr>
<td>crypto-cmp-cert-update</td>
<td>Triggers a CMP certificate update on a specified device or devices</td>
<td>page 2-33</td>
</tr>
<tr>
<td>device-upgrade</td>
<td>Configures device firmware upgrade settings</td>
<td>page 2-34</td>
</tr>
<tr>
<td>disable</td>
<td>Turns off (disables) the privileged mode command set</td>
<td>page 2-44</td>
</tr>
<tr>
<td>enable</td>
<td>Turns on (enables) the privileged mode command set</td>
<td>page 2-45</td>
</tr>
<tr>
<td>join-cluster</td>
<td>Adds a device (access point, wireless controller, or service platform) to an existing cluster of devices</td>

<tr>
<td>virtual-machine</td>
<td>Installs, configures, and monitors the status of virtual machines (VMs). This command is specific to the NX45XX, NX65XX, NX9XXX series service platforms.</td>
<td>page 2-72</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
2.1.1 captive-portal-page-upload

**User Exec Commands**

Uploads captive portal advanced pages to connected access points. Use this command to provide connected access points with specific captive portal configurations so that they can successfully provision login, welcome, and condition pages to requesting clients attempting to access the wireless network using the captive portal.

> **NOTE:** Ensure that the captive portal pages uploaded are *.tar files.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

captive-portal-page-upload [<CAPTIVE-PORTAL-NAME>|cancel-upload|load-file]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all|rf-domain] {upload-time <TIME>}
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME]|all] {from-controller} {(upload-time <TIME>)}
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>

**Parameters**

- **<CAPTIVE-PORTAL-NAME>**
  - Uploads advanced pages of the captive portal identified by the <CAPTIVE-PORTAL-NAME> parameter
  - **<MAC/HOSTNAME>** — Specify the captive portal’s name (should be existing and configured).
- **<MAC/HOSTNAME>**
  - Uploads to a specified AP
  - **<MAC/HOSTNAME>** — Specify AP's MAC address or hostname.
- **all**
  - Uploads to all APs
- **upload-time <TIME>**
  - Optional. Configures an AP upload time
  - **<TIME>** — Specify upload time in the MM/DD/YYYY-MM:MM or HH:MM format.
- **rf-domain**
  - Uploads advanced pages of the captive portal identified by the <CAPTIVE-PORTAL-NAME> parameter
  - **<DOMAIN-NAME>** — Specify captive portal's name (should be existing and configured).
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rf-domain [&lt;DOMAIN-NAME&gt;</td>

## 2.1.2 change-passwd

### User Exec Commands

Changes the password of a logged user. When this command is executed without any parameters, the password can be changed interactively.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

```
change-passwd {<OLD-PASSWORD>} <NEW-PASSWORD>
```

### Parameters

- `change-passwd {<OLD-PASSWORD>} <NEW-PASSWORD>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Note: The password can also be changed interactively. To do so, press [Enter] after the command.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;OLD-PASSWORD&gt;</code></td>
<td>Optional. Specify the password to be changed.</td>
<td></td>
</tr>
<tr>
<td><code>&lt;NEW-PASSWORD&gt;</code></td>
<td>Specify the new password.</td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

A password must be from 1 - 64 characters.

### Examples

```
rfs7000-37FABE>change-passwd
Enter old password: 
Enter new password: 
Password for user 'admin' changed successfully
Please write this password change to memory(write memory) to be persistent.
rfs7000-37FABE#write memory
OK
rfs7000-37FABE>
```
2.1.3 clear

User Exec Commands

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared, using this command, depends on the mode where the clear command is executed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

NOTE: When using the clear command, refer to the interface details provided in Chapter 7, interface.

Syntax

clear [arp-cache|cdp|counters|crypto|event-history|gre|ip|ipv6|lldp|mac-address-table|mint|role|rtls|smart-cache|spanning-tree|vrrp]
clear arp-cache {on <DEVICE-NAME>}
clear [cdp|lldp] neighbors {on <DEVICE-NAME>}
clear counters [ap|radio|wireless-client]
clear counters [ap {<MAC>}|radio {<MAC/DEVICE-NAME>} <1-X>|wireless-client {<MAC>}] {(on <DEVICE-OR-DOMAIN-NAME>)}
clear crypto [ike|ipsec] sa
clear crypto ike sa [<IP>|all] {on <DEVICE-NAME>}
clear crypto ipsec sa {on <DEVICE-NAME>}
clear event-history
clear gre stats {on <DEVICE-NAME>}
clear ip [bgp|dhcp|ospf]
clear ip bgp [<IP>|all] external {in|on|out|soft}
clear ip bgp [<IP>|all] external {in prefix-filter} {on <DEVICE-NAME>}
clear ip bgp [<IP>|all] external {out} {(on <DEVICE-NAME>)}
clear ip bgp [<IP>|all] external {soft {in|out}} {on <DEVICE-NAME>}
clear ip bgp process {on <DEVICE-NAME>}
clear ip dhcp bindings [<IP>|all] {on <DEVICE-NAME>}
clear ip ospf process {on <DEVICE-NAME>}
clear ipv6 neighbor-cache {on <DEVICE-NAME>}
clear mac-address-table {address|interface|vlan} {on <DEVICE-NAME>}
clear mac-address-table {address <MAC>|vlan <1-4094>} {on <DEVICE-NAME>}
clear mac-address-table {interface [vif <1-X>]|up <1-X>|vmif <1-X>} {on <DEVICE-NAME>}
clear mint mlcp history {on <DEVICE-NAME>}
clear role ldap-stats {on <DEVICE-NAME>}
clear rtls [aeroscout|ekahau]
clear rtls [aeroscout|ekahau] {<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>}}

clear spanning-tree detected-protocols {interface|on}
clear spanning-tree detected-protocols {on <DEVICE-NAME>}
clear spanning-tree detected-protocols {interface [{INTERFACE-NAME}|ge <1-X>|me1|
port-channel <1-X>|pppoel|up1|vlan <1-4094>|wwan1|vmif <1-X}> {on <DEVICE-NAME>}
clear vrrp [error-stats|stats] {on <DEVICE-NAME>}

The following clear command is specific to the NX45XX, NX65XX, and NX9XXX series service platforms:
clear smart-cache storage [all|url-regex <WORD>] {on <DEVICE-NAME>}

**Parameters**

- **clear arp-cache {on <DEVICE-NAME>}**

<table>
<thead>
<tr>
<th>arp-cache</th>
<th>Clears Address Resolution Protocol (ARP) cache entries on a device. This protocol matches layer 3 IP addresses to layer 2 MAC addresses.</th>
</tr>
</thead>
</table>
| on <DEVICE-NAME> | Optional. Clears ARP cache entries on a specified device  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **clear [cdp|lldp] neighbors {on <DEVICE-NAME>}**

<table>
<thead>
<tr>
<th>cdp</th>
<th>Clears Cisco Discovery Protocol (CDP) table entries</th>
</tr>
</thead>
<tbody>
<tr>
<td>llpd</td>
<td>Clears Link Layer Discovery Protocol (LLDP) table entries</td>
</tr>
<tr>
<td>neighbors</td>
<td>Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step</td>
</tr>
</tbody>
</table>
| on <DEVICE-NAME> | Optional. Clears CDP or LLDP neighbor table entries on a specified device  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **clear counters [ap {<MAC>}|radio {<MAC/DEVICE-NAME>} {<1-X>}|wireless-client {<MAC>}] {on <DEVICE-OR-DOMAIN-NAME>}**

<table>
<thead>
<tr>
<th>counters</th>
<th>Clears counters based on the parameters passed. The options are: AP, radio, and wireless clients.</th>
</tr>
</thead>
</table>
| ap <MAC> | Clears counters for all APs or a specified AP  
  - <MAC> – Optional. Specify the AP’s MAC address.  
  **Note:** If no MAC address is specified, all AP counters are cleared. |
| radio <MAC/DEVICE-NAME> <1-X> | Clears radio interface counters on a specified device or on all devices  
  - <MAC/DEVICE-NAME> – Optional. Specify the device’s hostname or MAC address.  
  Optionally, append the radio interface number (to the radio ID) using one of the following formats: AA-BB-CC-DD-EE-FF-RX or HOSTNAME-RX (where RX is the interface number).  
  - <1-X> – Optional. Identifies the radio interface by its index. Specify the radio interface index, if not specified as part of the radio ID. The number of radio interfaces available varies with the access point type.  
  **Note:** If no device name or MAC address is specified, all radio interface counters are cleared. |
| wireless-client <MAC> | Clears counters for all wireless clients or a specified wireless client  
  - <MAC> – Optional. Specify the wireless client’s MAC address.  
  **Note:** If no MAC address is specified, all wireless client counters are cleared. |
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`clear crypto ike sa &lt;IP&gt;</td>
<td>all</td>
</tr>
<tr>
<td><code>clear crypto ipsec sa {on &lt;DEVICE-NAME&gt;}</code></td>
<td>clears encryption module database for IPSec SAs</td>
</tr>
<tr>
<td><code>clear gre stats {on &lt;DEVICE-NAME&gt;}</code></td>
<td>clears GRE tunnel statistics</td>
</tr>
<tr>
<td><code>clear event-history</code></td>
<td>clears event history cache entries</td>
</tr>
<tr>
<td>`clear ip bgp [IP]</td>
<td>all</td>
</tr>
</tbody>
</table>

**Note:** This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 platforms.

**Note:** Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy etc.) take effect only after on-going BGP sessions are cleared. Use the ‘soft’ option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.

**on <DEVICE-OR-DOMAIN-NAME>**

The following option is common to all of the above keywords:
- `on <DEVICE-OR-DOMAIN-NAME>` – Optional. Clears AP, radio, or wireless client counters on a specified AP, wireless controller, service platform, or RF Domain.

**ike sa [IP]|all] {on <DEVICE-NAME>}**

Clears Internet Key Exchange (IKE) security associations (SAs)
- `<IP>` – Clears IKE SA entries for the peer identified by the `<IP>` keyword
- `all` – Clears IKE SA entries for all peers

**on <DEVICE-NAME>**

Optional. Clears IKE SA entries, for a specified peer or all peers, on a specified device
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

**ipsec sa {on <DEVICE-NAME>}**

Clears Internet Protocol Security (IPSec) database SAs
- `on <DEVICE-NAME>` – Optional. Clears IPSec SA entries on a specified device
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

**gre stats {on <DEVICE-NAME>}**

Clears GRE tunnel statistics
- `on <DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

**event-history**

Clears event history cache entries

**ip bgp [IP]|all|external] {in prefix-filter} {on <DEVICE-NAME>}**

Clears on-going BGP sessions based on the option selected
- `<IP>` – Clears BGP session with the peer identified by the `<IP>` keyword. Specify the BGP peer’s IP address.
- `all` – Clears all BGP peer sessions
- `external` – Clears external BGP (eBGP) peer sessions

**in prefix-filter**

Optional. Clears inbound route updates
- `prefix-filter` – Optional. Clears the existing Outbound Route Filtering (ORF) prefix-list
<table>
<thead>
<tr>

</tr>
</tbody>
</table>
**clear vrrp**

Clears a device’s Virtual Router Redundancy Protocol (VRRP) statistics

VRRP allows a pool of routers to be advertised as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address.

The following keywords are common to the ‘error-stats’ and ‘stats’ parameters:

- **on** `<DEVICE-NAME>` – Optional. Clears VRRP statistics on a specified device
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

### Interface

- **interface**
  - `<INTERFACE-NAME>`
  - `ge <1-X>|me1`
  - `port-channel <1-X>`
  - `ppoe1|up1|vlan <1-4094>|
  - `wwan1|vmif <1-X>`

Optional. Clears spanning tree entries on different interfaces

- `<INTERFACE-NAME>` – Clears detected spanning tree entries on a specified interface. Specify the interface name.
- `ge <1-X>` – Clears detected spanning tree entries for the selected GigabitEthernet interface. Select the GigabitEthernet interface index from 1 - X.
- `me1` – Clears FastEthernet interface spanning tree entries
- `port-channel <1-X>` – Clears detected spanning tree entries for the selected port channel interface. Select the port channel index from 1 - X.
- `ppoe1` – Clears detected spanning tree entries for Point-to-Point Protocol over Ethernet (PPPoE) interface
- `up1` – Clears detected spanning tree entries for the WAN Ethernet interface
- `vlan <1-4094>` – Clears detected spanning tree entries for the selected VLAN interface. Select a Switch Virtual Interface (SVI) VLAN ID from 1 - 4094.
- `wwan1` – Clears detected spanning tree entries for wireless WAN interface.
- `vmif <1-X>` – Clears detected spanning tree entries for VM interfaces

**Note:** The number of Ethernet interfaces supported varies for different device types. For example the NX45XX and NX65XX support 24 GE interfaces. Whereas, RFS4000 supports 5 GE interfaces.

- `me1` – Clears FastEthernet interface spanning tree entries
- `port-channel <1-X>` – Clears detected spanning tree entries for the selected port channel interface. Select the port channel index from 1 - X.

**Note:** The number of port-channel interfaces supported varies for different device types. For example the NX45XX and NX65XX support 13 port-channels. Whereas, RFS4000 supports 3 port-channels.

- `ppoe1` – Clears detected spanning tree entries for Point-to-Point Protocol over Ethernet (PPPoE) interface
- `up1` – Clears detected spanning tree entries for the WAN Ethernet interface
- `vlan <1-4094>` – Clears detected spanning tree entries for the selected VLAN interface. Select a Switch Virtual Interface (SVI) VLAN ID from 1 - 4094.
- `wwan1` – Clears detected spanning tree entries for wireless WAN interface.
- `vmif <1-X>` – Clears detected spanning tree entries for VM interfaces

**Note:** The VMIF interfaces are supported only on the NX45XX, NX65XX, NX9500, and NX9510 series service platforms. The number of supported VMIFs varies for different device types.

**Note:** The number of Ethernet interfaces supported varies for different device types. For example the NX45XX and NX65XX support 24 GE interfaces. Whereas, RFS4000 supports 5 GE interfaces.

### on `<DEVICE-NAME>`

Optional. Clears spanning tree entries on a specified device

- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

**clear vrrp [error-stats|stats] {on `<DEVICE-NAME>`}**
### USER EXEC MODE COMMANDS

**clear smart-cache storage [all|url-regex <WORD>] {on <DEVICE-NAME>}**

<table>
<thead>
<tr>
<th>clears the smart-cache storage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see <code>smart-cache-policy</code>.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>clears stored content based on the parameters passed</th>
</tr>
</thead>
<tbody>
<tr>
<td>- <code>all</code> – Clears all cached content</td>
</tr>
<tr>
<td>- <code>regex &lt;WORD&gt;</code> – Clears only those URLs matching the specified expression</td>
</tr>
<tr>
<td>- <code>&lt;WORD&gt;</code> – Provide the URL in the following format: e.g. `.xxx/(flv</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Optional. Clears stored content on a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td>- <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}
```

Parameters

- `<HH:MM:SS>` Sets the current time (in military format hours, minutes, and seconds)
- `<1-31>` Sets the numerical day of the month
- `<MONTH>` Sets the month of the year (Jan to Dec)
- `<1993-2035>` Sets a valid four digit year from 1993 - 2035
- `on <DEVICE-NAME>` Optional. Sets the clock on a specified device

Examples

```
rfs7000-6DCD4B>clock set 14:30:10 27 May 2014
rfs7000-6DCD4B>show clock
2014-05-27 14:30:15 IST
rfs7000-6DCD4B>
```
2.1.5 cluster

User Exec Commands

Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member.

Commands executed under this context are executed on all members of the cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

cluster start-election

Parameters

- cluster start-election

| start-election | Starts a new cluster master election |

Examples

rfs7000-37FABE>cluster start-election
rfs7000-37FABE>

Related Commands

- create-cluster
  Creates a new cluster on the specified device

- join-cluster
  Adds a wireless controller or service platform, as a member, to an existing cluster of controllers
### 2.1.6 connect

**User Exec Commands**

Begins a console connection to a remote device using the remote device’s MiNT ID or name

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]`

**Parameters**

- `connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mint-id &lt;MINT-ID&gt;</td>
<td>Connects to the remote system using its MiNT ID</td>
</tr>
<tr>
<td></td>
<td>• &lt;MINT-ID&gt; – Specify the remote device’s MiNT ID.</td>
</tr>
<tr>
<td>&lt;REMOTE-DEVICE-NAME&gt;</td>
<td>Connects to the remote system using its name</td>
</tr>
<tr>
<td></td>
<td>• &lt;REMOTE-DEVICE-NAME&gt; – Specify the remote device’s name.</td>

AP8132 release 5.7.0.0-008D
ap8132-711728 login:
2.1.7 create-cluster

User Exec Commands

Creates a new device cluster with the specified name and assigns it an IP address and routing level.

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member’s failure.

A cluster’s load balance is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

**Parameters**

- `create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}`

<table>
<thead>
<tr>
<th>create-cluster</th>
<th>Creates a cluster</th>
</tr>
</thead>
<tbody>
<tr>
<td>name &lt;CLUSTER-NAME&gt;</td>
<td>Configures the cluster name</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;CLUSTER-NAME&gt;</code> — Specify a cluster name. Define a name for the cluster name unique to its configuration or profile support requirements. The name cannot exceed 64 characters.</td>
</tr>
<tr>
<td>ip &lt;IP&gt;</td>
<td>Specifies the device’s IP address used for cluster creation</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;IP&gt;</code> — Specify the device’s IP address in the A.B.C.D format.</td>
</tr>
<tr>
<td>level [1</td>

2.1.8 crypto

User Exec Commands

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate Certificate Signing Request (CSR).

This command also enables trustpoint configuration. Trustpoints contain the CA's identity and configuration parameters.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

crypto [key|pki]

crypto key [export|generate|import|zeroize]

crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|on|passphrase}

crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL>
   {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}

crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|on|passphrase}

crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL>
   {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}

crypto pki [authenticate|export|generate|import|zeroize]

crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background}
   {(on <DEVICE-NAME>)}

crypto pki export [request|trustpoint]

crypto pki export request [generate-rsa-key|short|use-rsa-key] <RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]

crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> auto-gen-subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>, ip-address <IP>)

crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]| use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>, fqdn <FQDN>,ip-address <IP> , on <DEVICE-NAME>)

crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL>
   {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key| use-rsa-key] <RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]

crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key| use-rsa-key] <RSA-KEYPAIR-NAME> auto-gen-subject-name {email <SEND-TO-EMAIL>,
   fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>}

crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
   <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
   <ORGANIZATION> <ORGANIZATION-UNIT> {email <SEND-TO-EMAIL>,fqdn <FQDN>,
   ip-address <IP>,on <DEVICE-NAME>}

crypto pki import [certificate|crl|trustpoint]
### crypto pki import

- **crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL>**  
  - {background} {(on <DEVICE-NAME>)}

- **crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL>**  
  - {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

- **crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}**

#### Parameters

- **crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL>**  
  - {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

- **crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096]**  
  - {on <DEVICE-NAME>}

- **crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL>**  
  - {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

#### Description

**key**

Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.

**export rsa**

Exports an existing RSA Keypair to a specified destination

- **<RSA-KEYPAIR-NAME>** – Specify the RSA Keypair name.

- **<EXPORT-TO-URL>** Specify the RSA Keypair destination address. Both IPv4 and IPv6 address formats are supported.

- **background** Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on.

- **passphrase <KEY-PASSPHRASE> background** Optional. Encrypts RSA Keypair before exporting

- **<KEY-PASSPHRASE>** – Specify a passphrase to encrypt the RSA Keypair.

- **background** – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.

**on <DEVICE-NAME>**

The following parameter is recursive and common to all of the above parameters:

- **on <DEVICE-NAME>** – Optional. Performs export operation on a specified device

- **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

**generate rsa**

Generates a new RSA Keypair

- **<RSA-KEYPAIR-NAME>** – Specify the RSA Keypair name.

- **[2048|4096]** – Sets the size of the RSA key in bits. The options are 2048 bits and 4096 bits. The default size is 2048 bits.

After specifying the key size, optionally specify the device (access point or controller) to generate the key on.

**on <DEVICE-NAME>**

Optional. Generates the new RSA Keypair on a specified device

- **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

**import rsa**

Imports a RSA Keypair from a specified source

- **<RSA-KEYPAIR-NAME>** – Specify the RSA Keypair name.

</tbody>
</table>
**crypto pki export request** [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>

**autogen-subject-name** ([generate-rsa-key|use-rsa-key] [short [generate-rsa-key|use-rsa-key]]

**pki** Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

**export request** Exports CSR to the CA for digital identity certificate. The CSR contains applicant’s details and RSA Keypair’s public key.

**[generate-rsa-key|use-rsa-key]** <RSA-KEYPAIR-NAME> Generates a new RSA Keypair or uses an existing RSA Keypair

  - **generate-rsa-key** – Generates a new RSA Keypair for digital authentication
  - **use-rsa-key** – Uses an existing RSA Keypair for digital authentication
  - **<RSA-KEYPAIR-NAME>** – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.

**autogen-subject-name** Auto generates subject name from configuration parameters. The subject name identifies the certificate.

**<EXPORT-TO-URL>** Specify the CA’s location. Both IPv4 and IPv6 IP address formats are supported. **Note:** The CSR is exported to the specified location.

**email <SEND-TO-EMAIL>** Exports CSR to a specified e-mail address

  - **<SEND-TO-EMAIL>** – Specify the CA’s e-mail address.

**fqdn <FQDN>** Exports CSR to a specified Fully Qualified Domain Name (FQDN)

  - **<FQDN>** – Specify the CA’s FQDN.

**ip-address <IP>** Exports CSR to a specified device or system

  - **<IP>** – Specify the CA’s IP address.

**crypto pki export request** [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> ([generate-rsa-key|use-rsa-key] [short [generate-rsa-key|use-rsa-key]] [use-rsa-key] <RSA-KEYPAIR-NAME>)

**pki** Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

**export request** Exports CSR to the CA for a digital identity certificate. The CSR contains applicant’s details and RSA Keypair’s public key.

**[generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-key]** <RSA-KEYPAIR-NAME> Generates a new RSA Keypair or uses an existing RSA Keypair

  - **generate-rsa-key** – Generates a new RSA Keypair for digital authentication
  - **short [generate-rsa-key|use-rsa-key]** – Generates and exports a shorter version of the CSR
  - **use-rsa-key** – Uses an existing RSA Keypair for digital authentication. If generating a new RSA Keypair, specify a name for it.
  - **use-rsa-key** – Uses an existing RSA Keypair for digital authentication. If using an existing RSA Keypair, specify its name.

<td>Specify the trustpoint source address. Both IPv4 and IPv6 IP address formats are supported.</td>
</tr>
</tbody>
</table>
### Usage Guidelines

The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

- **IPv4 URLs:**
  - tftp://<hostname|IP>[:port]/path/file
  - ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
  - sftp://<user>@<hostname|IP>[:port]/path/file
  - http://<hostname|IP>[:port]/path/file
  - cf:/path/file
  - usb<n>:/path/file

- **IPv6 URLs:**
  - tftp://<hostname|IPv6>[:port]/path/file
  - ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file
  - sftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file
  - http://<hostname|IPv6>[:port]/path/file

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `crypto pki zeroize trustpoint <TRUSTPOINT-NAME>` | Deletes a trustpoint and its associated CA certificate, server certificate, and private key.  
  - `<TRUSTPOINT-NAME>` – Specify the trustpoint name (should be authenticated). |
| `del-key` (on <DEVICE-NAME>) | Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on.  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| `on <DEVICE-NAME>` | The following parameter is recursive and optional:  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| `background` | Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on. |
| `passphrase <KEY-PASSPHRASE>` (background) | Optional. Decrypts trustpoint with a passphrase after importing  
  - `<KEY-PASSPHRASE>` – Specify the passphrase. After specifying the passphrase, optionally specify the device to perform import on.  
  - `background` – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on. |
| `pki` | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| `zeroize trustpoint <TRUSTPOINT-NAME>` | Deletes a trustpoint and its associated CA certificate, server certificate, and private key  
  - `<TRUSTPOINT-NAME>` – Specify the trustpoint name (should be authenticated). |
| `on <DEVICE-NAME>` | The following parameter is recursive and optional:  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
**Examples**

```

2.1.9 crypto-cmp-cert-update

User Exec Commands

Triggers a Certificate Management Protocol (CMP) certificate update on a specified device or devices.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

Parameters
- crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>crypto-cmp-cert-update &lt;TRUSTPOINT-NAME&gt; {on &lt;DEVICE-NAME&gt;}</th>
</tr>
</thead>
<tbody>
<tr>
<td>Triggers a CMP certificate update on a specified device or devices</td>
</tr>
<tr>
<td>• &lt;TRUSTPOINT-NAME&gt; — Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the crypto-cmp-policy context mode to configure the trustpoint.</td>
</tr>
<tr>
<td>• on &lt;DEVICE-NAME&gt; — Optional. Initiates a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list.</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58>crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
rfs4000-229D58>
2.1.10 device-upgrade

User Exec Commands

Enables firmware upgrade on an adopted device or a set of adopted devices (access points, wireless controllers, and service platforms)

In an hierarchically managed (HM) network, this command enables centralized device upgradation across the network. The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single Network Operations Center (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

**NOTE:** Hierarchical management allows the NOC controller to upgrade controllers and access points that are directly or indirectly adopted to it. However, ensure that the NOC controller is loaded with the correct firmware version.

All adopted devices (access points and second-level controllers) are referred to as the ‘adoptee’. The adopting devices are the ‘adopters’. A controller cannot be configured as an adoptee and an adopter simultaneously. In other words, a controller can either be an adopter (adopts another controller) or an adoptee (is adopted by another controller).

Network administrators can use the device-upgrade command to schedule firmware upgrades across adopted devices within the network. Devices are upgraded based on their device names, MAC addresses, or RF Domain. The firmware image used for the upgrade can either be user-defined or built-in.

The user-defined image is pulled from the defined location and applied to the device(s). Use the `device-upgrade > load-image` command to provide the image file name and location. User-defined images always get precedence over built-in images.

NOC and site controllers possess built-in firmware images for the various device types. If the administrator has not specified an image file name and location, the image on the controller is used to upgrade the device. The following example describes the various scenarios possible in the absence of a user-defined image.

A site controller has been scheduled to upgrade all adopted AP6562s. Before executing the upgrade, the site controller compares the image it possesses with the image on the NOC controller. In case of an image version mismatch, the site controller does the following:

1. If the site controller is a cluster member, it pulls the image:
   - From a cluster peer, provided the AP6562 image version on the peer and the NOC controller matches.
   - From the NOC controller, if the AP6562 image version on the peer and the NOC controller are mismatched.
   - From the NOC controller, if none of the cluster members possess an AP6562 image.

2. If the site controller is not a cluster member, it pulls the image from the NOC controller.

When upgrading devices in a RF Domain, the process is controlled and driven by the NOC controller. For example, in case of a scheduled upgrading of all AP6562s within an RF Domain, the NOC controller:

1. Adopts all controllers, in the RF Domain, to the NOC cluster and gets the status of each controller.
2. Upgrades all controllers, in the cluster, without rebooting them.

   Once the upgrade is complete, the following two scenarios are possible:

   **Scenario 1:** If the upgrade/reboot options ARE NOT specified by the network administrator, the NOC controller:
   a. Pushes the AP6562 image on to the RF Domain manager.
   b. Reboots the active controller within the RF Domain.
   c. Reboots standby controllers after the active controller has successfully rebooted.
If the controllers are auto upgrade enabled, all AP6562s are upgraded after the controllers have rebooted and the APs have been re-adopted.

Scenario 2: If the upgrade/reboot options ARE specified by the network administrator, the NOC controller:

a. Reboots the active controller followed by the standby controllers.
b. Pushes the AP6562 image file on to the RF Domain manager.
c. Initiates upgrades on all AP6562 within the RF Domain.

Ensure the RF Domain controllers are auto upgrade enabled.

NOTE: If the persist-images option is selected, the RF Domain manager retains the old firmware image, or else deletes it. For more information on enabling device upgrade on profiles and devices (including the ‘persist-images’ option), see device-upgrade.

NOTE: A NOC controller’s capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller – RFS7000, NX9000, NX95XX (NX9500 and NX9510)
- Site controller – RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX9000, or NX95XX

Within a HM network, the devices deployed as site controllers depends on the NOC controller device type. For more information on the adoption capabilities of various NOC controller devices, see Usage Guidelines (NOC controller adoption matrix).

NOTE: Standalone devices have to be manually upgraded.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
device-upgrade [<MAC/HOSTNAME>|all|ap621|ap622|ap650|es6510|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx9000|vx9000|cancel-upgrade|load-image|rf-domain]

</tr>
</tbody>
</table>

Total number of APs displayed: 2

rfs6000-6DB5D4 >
Both APs and the controller are running the same image. Therefore, the device-upgrade command fails. This is shown in the following example:

```
rfs6000-6DB5D4>device-upgrade rf-domain TechPubs ap6522
In progress ....
```

<table>
<thead>
<tr>
<th>CONTROLLER</th>
<th>STATUS</th>
<th>MESSAGE</th>
</tr>
</thead>
<tbody>

```

The following examples show the upgradation of devices in a HM network.

The HM setup is as follows:

```
rfs7000-6DCD4B (NOC) > l3-adoption > rfs6000-81701D (SITE-CONTROLLER) > l2-adoption > ap8132-711728 (access point)
```

Step 1: Load AP81XX firmware on the NOC (rfs7000-6DCD4B):

```
rfs7000-6DCD4B#device-upgrade load-image ap81XX ftp://anonymous:anonymous@192.168.13.10/LatestBuilds/W57/AP81XX-012D.img
```

```
--- CONTROLLER          STATUS                              MESSAGE ---
--- rfs7000-6DCD4B        Success                          Successfully initiated load image ---
```

```
rfs7000-6DCD4B#
```

```
rfs7000-6DCD4B#show device-upgrade load-image-status
Download of ap81xx firmware file is complete
rfs7000-6DCD4B#
```
Step 2: Execute the upgrade command on the NOC. This pushes the AP81XX image through the Site Controller on to the adopted AP81XX (ap8132-711728).

rfs7000-6DCD4B#device-upgrade ap8132-711728

<table>
<thead>

rfs7000-6DCD4B#
2.1.11 disable

**User Exec Commands**

This command can be executed in the Priv Exec Mode only. This command turns off (disables) the privileged mode command set and returns to the User Executable Mode. The prompt changes from `rfs7000-37FABE#` to `rfs7000-37FABE>`. 

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
disable

**Parameters**
None

**Examples**

```
rfs7000-37FABE#disable
rfs7000-37FABE>
```
2.1.12 enable

User Exec Commands

Turns on (enables) the privileged mode command set. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

enable

Parameters

None

Examples

rfs7000-37FABE>enable
rfs7000-37FABE#
2.1.13 **join-cluster**

**User Exec Commands**

Adds a device (access point, wireless controller, or service platform), as a member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
join-cluster <IP> user <USERNAME> password <WORD> {level|mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>join-cluster &lt;IP&gt; user &lt;USERNAME&gt; password &lt;WORD&gt; {level [1</td>
<td>2]</td>
</tr>
<tr>
<td>&lt;IP&gt;</td>
<td>Specify the cluster member’s IP address.</td>
</tr>
<tr>
<td>user &lt;USERNAME&gt;</td>
<td>Specify a user account with super user privileges on the new cluster member</td>
</tr>
<tr>
<td>password &lt;WORD&gt;</td>
<td>Specify password for the account specified in the user parameter</td>
</tr>
<tr>
<td>level [1</td>
<td>2]</td>
</tr>
<tr>
<td>mode [active</td>
<td>standby]</td>
</tr>
<tr>
<td>1 –</td>
<td>Configures level 1 routing</td>
</tr>
<tr>
<td>2 –</td>
<td>Configures level 2 routing</td>
</tr>
<tr>
<td>active –</td>
<td>Configures this cluster as active</td>
</tr>
<tr>
<td>standby –</td>
<td>Configures this cluster to be on standby mode</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To add a device to an existing cluster:

- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding the device to a cluster, execute the “write memory” command to ensure the configuration persists across reboots.

**Examples**

```
rfs7000-37FABE>join-cluster 192.168.13.15 user admin password superuser level 1 mode standby
... connecting to 192.168.13.15
... applying cluster configuration
... committing the changes
... saving the changes
[OK]
rfs7000-37FABE>
```

```
rfs7000-37FABE>show context
! Configuration of RFS7000 version 5.7.0.0-007D
!
! version 2.3
!
```
interface vlan1
  ip address 192.168.13.15/24
  no ipv6 enable
  no ipv6 request-dhcpv6-options
cluster name TechPubs
cluster mode standby
cluster member ip 192.168.13.15
logging on
logging console warnings
logging buffered warnings
!
!
end
rfs7000-37FABE>

Related Commands

### 2.1.14 l2tpv3

#### User Exec Commands

Establishes or brings down an *Layer 2 Tunnel Protocol Version 3* (L2TPV3) tunnel

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
l2tpv3 tunnel [〈TUNNEL-NAME〉|all]
l2tpv3 tunnel 〈TUNNEL-NAME〉 [down|session|up] {on 〈DEVICE-NAME〉}
l2tpv3 tunnel 〈TUNNEL-NAME〉 session 〈SESSION-NAME〉 [down|up] {on 〈DEVICE-NAME〉}
l2tpv3 tunnel all [down|up] {on 〈DEVICE-NAME〉}
```

#### Parameters

- **l2tpv3 tunnel 〈TUNNEL-NAME〉 [down|up] {on 〈DEVICE-NAME〉}**
  - **〈TUNNEL-NAME〉**
    - Specifies the tunnel name to establish or bring down
    - *down* – Brings down the specified tunnel
    - *up* – Establishes the specified tunnel
  - **on 〈DEVICE-NAME〉**
    - Optional. Establishes or brings down a tunnel on a specified device
    - *〈DEVICE-NAME〉* – Specify the name of the AP, wireless controller, or service platform.

- **l2tpv3 tunnel 〈TUNNEL-NAME〉 session 〈SESSION-NAME〉 [down|up] {on 〈DEVICE-NAME〉}**
  - **〈TUNNEL-NAME〉**
    - Establishes or brings down a specified session inside an L2TPV3 tunnel
    - *〈SESSION-NAME〉* – Specify the session name.
    - *down* – Brings down the specified session
    - *up* – Establishes the specified session
  - **on 〈DEVICE-NAME〉**
    - Optional. Establishes or brings down a tunnel session on a specified device
    - *〈DEVICE-NAME〉* – Specify the name of the AP, wireless controller, or service platform.

- **l2tpv3 tunnel all [down|up] {on 〈DEVICE-NAME〉}**
  - **all**
    - Establishes or brings down all L2TPV3 tunnels
    - *down* – Brings down all tunnels
    - *up* – Establishes all tunnels
  - **on 〈DEVICE-NAME〉**
    - Optional. Establishes or brings down all tunnels on a specified device
    - *〈DEVICE-NAME〉* – Specify the name of the AP, wireless controller, or service platform.
Examples

rfs7000-37FABE>l2tpv3 tunnel Tunnel1 session Tunnel1Session1 up on rfs7000-37FABE

**NOTE:** For more information on the L2TPv3 tunnel configuration mode and commands, see *Chapter 22, L2TPV3-POLICY.*
2.1.15 logging

User Exec Commands

Modifies message logging settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}
```

Parameters

- `logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>monitor</td>
<td>Sets the terminal lines logging levels. The logging severity levels can be set from 0 - 7. The system configures default settings, if no logging severity level is specified.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;0-7&gt;</code> – Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows:</td>
</tr>
<tr>
<td></td>
<td>- alerts – Optional. Immediate action needed (severity=1)</td>
</tr>
<tr>
<td></td>
<td>- critical – Optional. Critical conditions (severity=2)</td>
</tr>
<tr>
<td></td>
<td>- debugging – Optional. Debugging messages (severity=7)</td>
</tr>
<tr>
<td></td>
<td>- emergencies – Optional. System is unusable (severity=0)</td>
</tr>
<tr>
<td></td>
<td>- errors – Optional. Error conditions (severity=3)</td>
</tr>
<tr>
<td></td>
<td>- informational – Optional. Informational messages (severity=6)</td>
</tr>
<tr>
<td></td>
<td>- notifications – Optional. Normal but significant conditions (severity=5)</td>
</tr>
<tr>
<td></td>
<td>- warnings – Optional. Warning conditions (severity=4)</td>
</tr>
</tbody>
</table>

**Note:** Before configuring the message logging level, ensure logging module is enabled. To enable message logging, in the device’s configuration mode, execute the `logging > on` command. Message logging can also be enabled on a profile. All devices using the profile will have message logging enabled.

Examples

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58) > logging on
rfs4000-229D58 > logging monitor debugging
rfs4000-229D58 > show logging
```

Logging module: enabled
- Aggregation time: disabled
- Console logging: level debugging
- **Monitor logging:** level debugging
- Buffered logging: level warnings
- Syslog logging: level warnings
- Facility: local7

Log Buffer (804 bytes):

```
May 30 11:23:13 2014: rfs4000-229D58 : %NSM-4-IFUP: Interface ge4 is up
```

2.1.16 mint

User Exec Commands

Uses MiNT protocol to perform a ping and traceroute to a remote device

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
mint [ping|traceroute]

mint ping <MINT-ID> {count <1-10000>|size <1-64000>|timeout <1-10>}  
mint traceroute <MINT-ID> {destination-port <1-65535>|max-hops <1-255>|source-port <1-65535}|timeout <1-255>}

Parameters
- mint ping <MINT-ID> {count <1-10000>|size <1-64000>|timeout <1-10>}
- ping <MINT-ID> Sends a MiNT echo message to a specified destination
  - <MINT-ID> – Specify the destination device's MiNT ID.
- count <1-10000> Optional. Sets the pings to the MiNT destination
  - <1-10000> – Specify a value from 1 - 10000. The default is 3.
- size <1-64000> Optional. Sets the MiNT payload size in bytes
  - <1-64000> – Specify a value from 1 - 64000 bytes. The default is 64 bytes.
- timeout <1-10> Optional. Sets a response time in seconds
  - <1-10> – Specify a value from 1 sec - 10 sec. The default is 1 second.
- mint traceroute <MINT-ID> {destination-port <1-65535>|max-hops <1-255>|source-port <1-65535}|timeout <1-255>}
- traceroute <MINT-ID> Prints the route packets trace to a device
  - <MINT-ID> – Specify the destination device's MiNT ID.
- destination-port <1-65535> Optional. Sets the Equal-cost Multi-path (ECMP) routing destination port
  - <1-65535> – Specify a value from 1 - 65535. The default port is 45.
- max-hops <1-255> Optional. Sets the maximum number of hops a traceroute packet traverses in the forward direction
  - <1-255> – Specify a value from 1 - 255. The default is 30.
- source-port <1-65535> Optional. Sets the ECMP source port
  - <1-65535> – Specify a value from 1 - 65535. The default port is 45.
- timeout <1-255> Optional. Sets the minimum response time period in seconds
  - <1-255> – Specify a value from 1 sec - 255 sec. The default is 30 seconds.
Examples

rfs7000-37FABE>mint ping 68.22.9D.58 count 5 size 120
MINT ping 68.22.9D.58 with 120 bytes of data.
Response from 68.22.9D.58: id=1 time=0.341 ms
Response from 68.22.9D.58: id=2 time=0.313 ms
Response from 68.22.9D.58: id=3 time=0.314 ms
Response from 68.22.9D.58: id=4 time=0.333 ms
Response from 68.22.9D.58: id=5 time=0.291 ms

--- 68.22.9D.58 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.291/0.318/0.341 ms
rfs7000-37FABE>
2.1.17 no

User Exec Commands

Use the no command to revert a command or to set parameters to their default. This command turns off an enabled feature or reverts settings to default.

NOTE: The commands have their own set of parameters that can be reset.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [adoption|captive-portal|crypto|debug|logging|mac-user-db|page|service|terminal|virtual-machine|wireless]

no adoption {on <DEVICE-OR-DOMAIN-NAME>}

no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>] {on <DEVICE-OR-DOMAIN-NAME>}

no crypto pki [server|trustpoint]

no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>}}

no logging monitor

no mac-user-db user [<USER-NAME>|all]

no page

no service [block-adopter-config-update|locator|snmp|ssm|wireless]

no service snmp sysoid wing5

no service block-adopter-config-update

no service ssm trace pattern {<WORD>} {on <DEVICE-NAME>}

no service wireless [trace pattern {<WORD>} {on <DEVICE-NAME>]} unsanctioned ap

no service locator {on <DEVICE-NAME>}

no terminal [length|width]

no virtual-machine assign-usb-ports {on <DEVICE-NAME>}

no wireless client [all|<MAC>]

no wireless client all {filter|on}

no wireless client all {filter [wlan <WLAN-NAME>]}

no wireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]}

no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}

Parameters

- no <PARAMETERS>

no <PARAMETERS> | Resets or reverts settings based on the parameters passed
Usage Guidelines
The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples
rfs7000-37FABE>no adoption
rfs7000-37FABE>no page
rfs7000-37FABE>no service cli-tables-expand line
2.1.18 on

User Exec Commands

Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

on rf-domain [<RF-DOMAIN-NAME>|all]

Parameters

- on rf-domain [<RF-DOMAIN-NAME>|all]

  on rf-domain <RF-DOMAIN-NAME> Enters the RF Domain context based on the parameter specified
  - <RF-DOMAIN-NAME> — Specify the RF Domain name. Enters the specified RF Domain context.
  - all — Specifies all RF Domains.

Examples

nx9500-6C8809(rf-domain-all)>?

on RF-Domain Mode commands:

<table>

<tr>
<td>show</td>
<td>Show running system information</td>
</tr>
</tbody>
</table>

nx9500-6C8809(rf-domain-all)>
2.1.19 **opendns**

- **User Exec Commands**

Retrieves the OpenDNS device-id from the OpenDNS site

This command integrates access points and controllers with OpenDNS. It obtains the device-id (16 character hex-string) from OpenDNS. This device-id is configured under all WLANs that are to be OpenDNS enabled. When configured and enabled on a WLAN, DNS queries from all wireless clients on the WLAN are redirected to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers. These OpenDNS resolvers act as proxy DNS servers, and also provide additional features, such as Web filtering, performance improvements etc.

**NOTE:** OpenDNS is a free, alternative DNS service that is faster and more reliable than other DNS services available. OpenDNS enables swift navigation of the Web without the outages that are frequent in other ISP provided DNS services. It also blocks inappropriate Web sites, phishing sites, and prevents virus and malware attacks.

**NOTE:** The ‘username’ and ‘password’ values passed in this command should be pre-registered with the OpenDNS site. The ‘label’ can be any value. Only with a combination of a valid ‘username’, ‘password’, and any ‘label’ the OpenDNS server returns a device-id.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

**Parameters**

- **opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>opendns</td>
<td>Retrieves the OpenDNS device-id from the OpenDNS site</td>
<td></td>
</tr>
<tr>
<td>username &lt;USERNAME&gt;</td>
<td>Configures the OpenDNS user name (should be valid username registered with OpenDNS)</td>
<td><code>&lt;USERNAME&gt;</code> – Provide the OpenDNS user name.</td>
</tr>
<tr>
<td>password &lt;OPENDNS-PSWD&gt;</td>
<td>Configures the password associated with the user configured in the previous step</td>
<td><code>&lt;OPENDNS-PSWD&gt;</code> – Provide the OpenDNS password for the user.</td>
</tr>
<tr>
<td>label &lt;LABEL&gt;</td>
<td>Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal.</td>
<td><code>&lt;LABEL&gt;</code> – Specify your OpenDNS server label.</td>
</tr>
</tbody>
</table>

**Note:** For every unique set of username, password, and label only one device-id is returned. Apply this device-id in WLANs that are to be OpenDNS enabled. For information on configuring the device-id in the WLAN context, see `opendns`. 
Usage Guidelines
Use your OpenDNS credentials to logon to the opendns.org site and use the labels, edit settings, and customize content filtering options to configure Web filtering settings.

Examples
ap7131-E6D512#opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7131-E6D512#
2.1.20 page

User Exec Commands

Toggles a device’s paging function. Enabling this command displays the CLI command output page by page, instead of running the entire output at once.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

page

Parameters

None

Examples

rfs7000-37FABE>page
rfs7000-37FABE>

rfs7000-6DCD4B>
2.1.22 ping6

User Exec Commands

Sends ICMPv6 echo messages to a user-specified IPv6 address

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ping6 <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}

Parameters

- ping <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}

<table>
<thead>
<tr>
<th>&lt;IPv6/HOSTNAME&gt;</th>
<th>Specify the destination IPv6 address or hostname.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Specify the interface name for link local/broadcast address</td>
</tr>
<tr>
<td>count &lt;1-10000&gt;</td>
<td>Optional. Sets the pings to the specified IPv6 destination</td>
</tr>
<tr>
<td>size &lt;1-64000&gt;</td>
<td>Optional. Sets the IPv6 ping payload size in bytes</td>
</tr>
</tbody>
</table>

Usage Guidelines

To configure a device's IPv6 address, in the VLAN interface configuration mode, use the `ipv6 > address <IPv6-ADDRESS>` command. After configuring the IPv6 address, use the `ipv6 > enable` command to enable IPv6. For more information see, `ipv6`.

Examples

rfs4000-1B3596(config-device-00-23-68-1B-35-96-if-ge4)#show ipv6 interface brief

```

admin@192.168.13.15's password:
rfs7000-37FABE>
```
2.1.24 **telnet**

- **User Exec Commands**

Opens a Telnet session between two network devices.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

**Parameters**

- **telnet** <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Configures the destination remote system’s IP (IPv4 or IPv6) address or hostname. The Telnet session is established between the connecting system and the remote system.</td>
</tr>
<tr>
<td></td>
<td>- &lt;IP/HOSTNAME&gt; – Specify the remote system’s IPv4 or IPv6 address or hostname.</td>
</tr>
<tr>
<td>&lt;TCP-PORT&gt;</td>
<td>Optional. Specify the Transmission Control Protocol (TCP) port number.</td>
</tr>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Optional. Specify the interface name for the link local address.</td>
</tr>
</tbody>
</table>

**Examples**

rfs4000-229D58#telnet 192.168.13.23

Entering character mode
Escape character is ‘^]’.

2.1.25 **terminal**

- **User Exec Commands**

Sets the length and width of the CLI display window on a terminal

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
terminal [length|width] <0-512>
```

**Parameters**

- `terminal [length|width] <0-512>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>length</code></td>
<td>Sets the number of lines displayed on the terminal window</td>
</tr>
<tr>
<td><code>&lt;0-512&gt;</code></td>
<td>- Specify a value from 0 - 512.</td>
</tr>
<tr>
<td><code>width</code></td>
<td>Sets the width (the number of characters displayed in one line) of the terminal window</td>
</tr>
<tr>
<td><code>&lt;0-512&gt;</code></td>
<td>- Specify a value from 0 - 512.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE>terminal length 150
rfs7000-37FABE>terminal width 215
rfs7000-37FABE>show terminal
Terminal Type: xterm
Length: 150     Width: 215
```

**Related Commands**

- `no` Resets the width and length of the terminal window
2.1.26 **time-it**

- **User Exec Commands**
  
  Verifies the time taken by a particular command between request and response

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
time-it <COMMAND>
```

**Parameters**

- `time-it <COMMAND>`

**Examples**

```
rfs7000-37FABE>time-it enable
That took 0.00 seconds..
rfs7000-37FABE#
```
2.1.27 traceroute

User Exec Commands

Traces the route to a defined destination

Use ‘--help’ or ‘-h’ to display a complete list of parameters for the traceroute command

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

traceroute <LINE>

Parameters

- traceroute <LINE>

| traceroute <LINE> | Traces the route to a destination IP address or hostname
|------------------|--------------------------------------------------|
| <LINE>           | Specify the destination IPv6 address or hostname.

Examples

rfs7000-37FABE>traceroute --help
BusyBox v1.14.1 () multi-call binary

Usage: traceroute [-Flndrv] [-f 1st_ttl] [-m max_ttl] [-p port#] [-q nqueries]
[-s src_addr] [-t tos] [-w wait] [-g gateway] [-i iface]
[-z pausemsecs] HOST [data size]
Trace the route to HOST
Options:
-F      Set the don't fragment bit
-I      Use ICMP ECHO instead of UDP datagrams
-l      Display the ttl value of the returned packet
-d      Set SO_DEBUG options to socket
-n      Print hop addresses numerically rather than symbolically
-r      Bypass the normal routing tables and send directly to a host
-v      Verbose
-m max_ttl  Max time-to-live (max number of hops)
-p port#    Base UDP port number used in probes (default is 33434)
-q nqueries Number of probes per 'ttl' (default 3)
-s src_addr IP address to use as the source address
-t tos      Type-of-service in probe packets (default 0)
-w wait     Time in seconds to wait for a response (default 3 sec)
-g          Loose source route gateway (8 max)

rfs7000-37FABE>

rfs7000-6DCD4B>traceroute 192.168.13.16
traceroute to 192.168.13.16 (192.168.13.16), 30 hops max, 38 byte packets
1 192.168.13.16 (192.168.13.16)  5.071 ms  0.294 ms  0.283 ms
rfs7000-6DCD4B>
2.1.28 traceroute6

User Exec Commands

Traces the route to a specified IPv6 destination

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

traceroute6 <LINE>

Parameters

- traceroute6 <LINE>

<table>
<thead>
<tr>
<th>traceroute6 &lt;LINE&gt;</th>
<th>Traces the route to a destination IPv6 address or hostname</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;LINE&gt;</td>
<td>Specify the destination IPv6 address or hostname.</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58>traceroute6 2001:10:10:10:10:10:10:1
rfs4000-229D58>
2.1.29 watch

User Exec Commands

Repeats the specified CLI command at periodic intervals

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

watch <1-3600> <LINE>

Parameters

- watch <1-3600> <LINE>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>watch</td>
<td>Repeats a CLI command at a specified interval (in seconds)</td>
</tr>
<tr>
<td>&lt;1-3600&gt;</td>
<td>Select an interval from 1 - 3600 sec. Pressing CTRL-Z halts execution of the command.</td>
</tr>
<tr>
<td>&lt;LINE&gt;</td>
<td>Specify the CLI command.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-6DCD4B>watch 40 ping 192.168.13.16
PING 192.168.13.16 (192.168.13.16) 100(128) bytes of data.
108 bytes from 192.168.13.16: icmp_seq=1 ttl=64 time=0.565 ms

108 bytes from 192.168.13.16: icmp_seq=3 ttl=64 time=0.344 ms
108 bytes from 192.168.13.16: icmp_seq=4 ttl=64 time=0.433 ms
108 bytes from 192.168.13.16: icmp_seq=5 ttl=64 time=0.352 ms

--- 192.168.13.16 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3997ms
rtt min/avg/max/mdev = 0.344/0.417/0.565/0.082 ms

rfs7000-6DCD4B>
2.1.30 exit

- **User Exec Commands**

  Ends the current CLI session and closes the session window

  For more information, see `exit`.

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
exit
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE>exit
```
2.1.31 **smart-cache**

> **User Exec Commands**

Pre-fetches cached content from the specified list of URLs

Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see `smart-cache-policy`.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
smart-cache pre-fetch-immediate <URL-LIST-NAME>
```

**Parameters**

- `smart-cache pre-fetch-immediate <URL-LIST-NAME>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>smart-cache</td>
<td>Pre-fetches content from the specified list of URLs</td>
</tr>
<tr>
<td>pre-fetch-immediate</td>
<td>Provide the URL list names (should be existing and configured). For more information on configuring URL lists, see <code>url-list</code>.</td>
</tr>
<tr>
<td>&lt;URL-LIST-NAME&gt;</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

nx4500-5CFA2B#smart-cache pre-fetch-immediate ?

```
URL-LIST  URL List to be Pre Fetched
```

nx4500-5CFA2B#
2.1.32 virtual-machine

**User Exec Commands**

Installs, configures, and monitors the status of third-party virtual machines (VMs)

In addition to the WiNG VMs, the NX45XX, NX65XX, NX9500, and NX9510 series service platforms support the installation and administration of third-party VMs. However, the third-party VMs supported by these devices varies.

The third-party VMs supported on NX45XX and NX65XX are:

- TEAM-URC
- TEAM-RLS
- TEAM-VoWLAN

The VM supported on NX9500 and NX9510 is:

- ADSP

Use the virtual-machine command to install the third-party VMs, and configure parameters, such as install media type and location, number of Virtual Central Processing Units (VCPUS), VM memory, VM disk, number of Virtual Network Interfaces (VIFs), and Virtual Networking Computing (VNC) port.

Installing third-party VMs saves on hardware cost and provides a unified VM management interface.

This section is organized into the following sub-sections:

- Syntax **NX45XX, NX65XX**
- Syntax **NX9500 and NX9510**

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

**Syntax NX45XX, NX65XX**

```
virtual-machine [assign-usb-ports|console|export|install|restart|set|start|stop|uninstall]

virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}

virtual-machine console [{VM-NAME}|team-urc|team-rls|team-vowlan]

virtual-machine export <VM-NAME> [{FILE}|<URL>] {on <DEVICE-NAME>}

virtual-machine install [{VM-NAME}|team-urc|team-rls|team-vowlan]

virtual-machine install <VM-NAME> type [disk|iso disk-size <SIZE>|vm-archive]

install-media [{FILE}|<URL>|<USB>] {autostart/memory/on/vcpus/vif-count/vnc}

virtual-machine install [team-urc|team-rls]team-vowlan] {on <DEVICE-NAME>}

virtual-machine restart [{VM-NAME}|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine restart hard [{VM-NAME}|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine set [autostart/memory/vcpus/vif-count/vif-mac/vif-to-vmif/vnc]

vif-count <0-2> vif-mac <VIF-INDEX> <MAC-INDEX> vif-to-vmif <VIF-INDEX> <VMIF-INDEX>

vnc [disable|enable] [{VM-NAME}|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine start [{VM-NAME}|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine stop [{VM-NAME}|hard|team-urc|team-rls|team-vowlan]

virtual-machine stop [{VM-NAME}|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```
virtual-machine stop hard [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine uninstall [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

Parameters NX45XX, NX65XX
- virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}
  - assign-usb-ports
  - team-vowlan
  - Assigns USB ports to TEAM-VoWLAN on a specified device
  - on <DEVICE-NAME> – Optional. Specify the device name.
  - Note: Use the no > virtual-machine > assign-usb-ports to reassign the port to WiNG.
  - Note: TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.

- virtual-machine console [<VM-NAME>|team-urc|team-rls|team-vowlan]
  - virtual-machine console
  - Connects to the VM's console, based on the parameters passed. Select one of the following console options:
    - <VM-NAME> – Connects to the console of the VM identified by the <VM-NAME> keyword. Specify the VM name.
    - team-urc – Connects to the VM TEAM Unified Retail Communication's (URC) (IP-PBX) console
    - team-rls – Connects to the VM TEAM Radio Link Service (RLS) server's console
    - team-vowlan – Connects to the VM TEAM-VoWLAN's (Voice over WLAN) console

- virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}
  - virtual-machine export
  - Exports an existing VM image and settings. Use this command to export the VM to another NX45XX or NX65XX device in the same domain.
    - <VM-NAME> – Specify the VM name.
    - <FILE> – Specify the location and name of the source file (VM image). The VM image is retrieved and exported from the specified location.
    - <URL> – Specify the destination location. This is the location to which the VM image is copied. Use one of the following formats to provide the destination path:
      - tftp://<hostname|IP>[:port]/path/file
      - ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
      - sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
      - http://<hostname|IP>[:port]/path/file
    - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
    - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.
  - Note: The VM should be in a stop state during the export process.
  - Note: If the destination is a device, the image is copied to a predefined location (VM archive).
virtual-machine install <VM-NAME> type [disk|iso disk-size <SIZE>|vm-archive] install-media [<FILE>|<URL>|<USB>] {autostart/memory/on/vcpus/vif-count/vnc}

<table>
<thead>
<tr>
<th>virtual-machine install</th>
<th>Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;VM-NAME&gt;</td>
<td>Specify the VM name.</td>
</tr>
<tr>
<td>type</td>
<td>Specify the install-media (image) type. The options are:</td>
</tr>
<tr>
<td>disk</td>
<td>Specifies the install media type as pre-installed OS disk image (located in the flash memory)</td>
</tr>
<tr>
<td>iso disk-size &lt;SIZE&gt;</td>
<td>Specifies the install media type as ISO file. This is a single file, which contains the OS bootable install media.</td>
</tr>
<tr>
<td>disk-size &lt;SIZE&gt;</td>
<td>If the install media type is ISO, specify the disk size in GB.</td>
</tr>
<tr>
<td>vm-archive</td>
<td>Specifies the install media type as VM archive. The VM archive file is a tar.gz file consisting of a pre-installed OS disk image and an associated configuration file. The configuration is a standard libvirt VM template consisting of VM specific information.</td>
</tr>
</tbody>
</table>

**Note:** After specifying the install media type, specify the location of the image. The image can be located in any of the following supported locations: FLASH, USB, or a remote location, such as http, ftp, sftp, tftp.

install-media [<FILE>|<URL>|<USB>]

| install-media [<FILE>|<URL>|<USB>] | Specifies the install media location |
|-------------------------------------|-------------------------------------|
| <FILE>                             | Specifies the install-media file is located on flash, for example flash:/cache |
| <URL>                              | Specifies the install-media file is located on a remote URL. Provide the URL using one of the following formats: tftp://<hostname/IP>[:port]/path/file |
|                                    | ftp://<user>:<passwd>@<hostname/IP>[:port]/path/file |
|                                    | sftp://<user>:<passwd>@<hostname/IP>[:port]/path/file |
|                                    | http://<hostname/IP>[:port]/path/file |
| <USB>                              | Specifies the install-media file is located on a USB. Provide the USB path and file name using the following format: usb<n>:/path/file |

After specifying the image location, you may provide the following information:

- autostart – Optional. Specifies whether to autostart the VM on system reboot
- ignore – Enables autostart on each system boot/reboot
- start – Disables autostart (default setting)
- memory – Optional. Defines the VM memory size
  - <512-8192> – Specify the VM memory from 512 - 8192 MB. The default is 2048 MB.
- on – Optional. Executes the command on a specified device
  - <DEVICE-NAME> – Specify the service platform name.
- vcpus – Optional. Specifies the number of VCPUS for this VM
  - <1-4> – Specify the number of VCPUS from 1 - 4. The default setting is 4.

Contd...
- **vif-count** – Optional. Configures or resets the VIF number for this VM
  - `<0-2>` – Specify the VIF number from 0 - 2. The default setting is 1. If assigning a virtual network interface for the VM, optionally specify the following parameters:
    - **vif-mac** – Sets the MAC index for the virtual interfaces 1 & 2.
    - **vif-to-vmif** – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8. VMIFs are layer 2 interfaces on the WiNG bridge. Each custom VM can have up to a maximum of 2 virtual Ethernet interfaces. By default, these interfaces are internally connected to the Dataplane bridge through VMIF1, which is an untagged port with access VLAN 1.
    - **vnc** – Enables or disables VNC on the virtual interfaces 1 & 2
      - **vnc** – Optional. Disables/enables VNC port. When enabled, provides remote access to VGA through the noVNC client.
      - **disable** – Disables VNC
      - **enable** – Enables VNC (default setting)

- **virtual-machine install** [team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

**virtual-machine install**
Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process. Select one of the following options:
- **team-urc** – Installs the VM TEAM-URC image
- **team-rls** – Installs the VM TEAM-RLS image
- **team-vowlan** – Installs the VM TEAM-VoWLAN image

The following keywords are common to all of the above parameters:
- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
  - **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

- **virtual-machine restart** [{<VM-NAME>|hard|team-urc|team-rls|team-vowlan} {on <DEVICE-NAME>}]
• virtual-machine set [autostart [ignore|start]] [memory <512-8192>] [vcpus <1-4>]
  vif-count <0-2> | vif-mac <VIF-INDEX> <MAC-INDEX> | vif-to-vmif <VIF-INDEX> <VMIF-INDEX> |
  vnc [disable|enable] | <VM-NAME> | team-urc | team-rls | team-vowlan | {on <DEVICE-NAME>}

virtual-machine set

- autostart – Specifies whether to autostart the VM on system reboot
- ignore – Enables autostart on each system reboot
- start – Disables autostart
- memory – Defines the VM memory size
  - <512-8192> – Specify the VM memory from 512 - 8192 MB. The default is 1024 MB.
- vcpus – Specifies the number of VCPUS for this VM
  - <1-4> – Specify the number of VCPUS from 1 - 4.
- vif-count – Configures or resets the VM's VIFs
  - <0-2> – Specify the VIF number from 0 - 2.
- vif-mac – Configures the MAC address of the selected virtual network interface
  - <1-2> – Select the VIF
  - <1-8> – Specify the MAC index for the selected VIF
  - <MAC> – Specify the customized MAC address for the selected VIF in the
    AA-BB-CC-DD-EE-FF format.

Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By
default, each VIF is automatically assigned a MAC from the range allocated for that device.
However, you can use the ‘set’ keyword to specify the MAC from within the allocated range.
Each of these VIFs are mapped to a layer 2 port in the dataplane (referred to as VMIF). These
VMIFs are standard l2 ports on the DP bridge, supporting all VLAN and ACL commands. The
WiNG software supports up to a maximum of 8 VMIFs. By default, a VM’s interface is always
mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the
vif-to-vmif command to map a VIF to a VMIF on the DP bridge.
- vif-to-vmif – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the
  VMIF interface index from 1 - 8.

WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces
define which IP address is associated with each VLAN ID the service platform is connected to
and enables remote service platform administration. Each custom VM can have up to a
maximum of two VM interfaces. Each VM interface can be mapped to one of the eight VMIF
ports for NX4500 and NX6500 service platforms and twelve ports for NX9500 on the dataplane
bridge. This mapping determines the destination for service platform routing.

By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1,
by default, is an untagged port providing access to VLAN 1 to support the capability to connect
the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface
onto different VLANs as well as configure specific firewall and QoS rules.
- vnc – Disables/enables VNC port option for an existing VM. When enabled, provides remote
  access to VGA through the noVNC client.
  - disable – Disables VNC port
  - enable – Enables VNC port

Contd...
After configuring the VM settings, identify the VM to apply the settings.

- `<VM-NAME>` – Applies these settings to the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Applies these settings to the VM TEAM-URC
- `team-rls` – Applies these settings to the VM TEAM-RLS
- `team-vowlan` – Applies these settings to the VM TEAM-VoWLAN

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Keywords</th>
</tr>
</thead>
<tbody>
<tr>
<td>virtual-machine start</td>
<td>Starts the VM, based on the parameters passed. Select one of the following options:</td>
<td><code>&lt;VM-NAME&gt;</code></td>
</tr>
<tr>
<td>virtual-machine stop</td>
<td>Stops the VM, based on the parameters passed. Select one of the following options:</td>
<td><code>&lt;VM-NAME&gt;</code></td>
</tr>
<tr>
<td>virtual-machine uninstall</td>
<td>Uninstalls the specified VM</td>
<td><code>&lt;VM-NAME&gt;</code></td>
</tr>
</tbody>
</table>

Note: The option 'hard' forces the selected VM to shutdown.
The following keywords are common to all of the above parameters:

- `on <DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
- `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Note:** This command releases the VM's resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.

### Syntax NX9500 and NX9510

```plaintext
virtual-machine
  virtual-machine console adsp
  virtual-machine install [adsp] {on <DEVICE-NAME>}
  virtual-machine restart [adsp] {on <DEVICE-NAME>}
  virtual-machine set disk-size <100-500> adsp {on <DEVICE-NAME>}
  virtual-machine set memory <512-8192> adsp {on <DEVICE-NAME>}
  virtual-machine set wing-memory <12288-32739>
  virtual-machine [start|stop] adsp {on <DEVICE-NAME>}
  virtual-machine uninstall adsp {on <DEVICE-NAME>}
```

**Note:** On an NX95XX, you can use the install, start, stop, restart, and set commands to manage a third-party VM running on a NX45XX and NX65XX. You can also configure a third-party VM's settings through a NX95XX series service platform.

### Parameters NX9500 and NX9510

- **virtual-machine console adsp**

  Connects to the Air-Defense Services Platform (ADSP) VM's management console

  When ADSP is running on the NX9500 and NX9510 model service platforms, WiNG communicates with ADSP using a single sign-on (SSO) authentication mechanism. Once the user is logged in, WiNG gains access to ADSP without being prompted to login again at ADSP. However, the WiNG and ADSP databases are not synchronized. ADSP has its own user database, stored locally within its VM, which is accessed whenever a user logs directly into ADSP.

  WiNG and ADSP must be consistent in the manner events are reported up through a network hierarchy to ensure optimal interoperability and event reporting. To provide such consistency, WiNG has added support for an ADSP-like hierarchal tree. The tree resides within WiNG, and ADSP reads it from WiNG and displays the network hierarchy in its own ADSP interface. The hierarchal tree can also be used to launch ADSP modules (like Spectrum Analyzer) directly from WiNG. For more information on configuring WiNG tree-node structure, see `tree-node`.

- **virtual-machine install adsp {on <DEVICE-NAME>}

  Installs the ADSP VM

  - `<DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

  Before installing the ADSP VM, execute the upgrade command, giving the path and file name of the ADSP firmware image. This extracts the image on to the device (NX9500 or NX9510) on which the command has been executed. On successful completion of this process, execute the reload command to reboot the device. Once the device has been successfully rebooted, execute the `virtual-machine > install > adsp` command.

Contd..
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| virtual-machine restart `adsp` `{on <DEVICE-NAME>}` | Restarts the ADSP VM.  
   - Optional. Executes the command on a specified device or devices
   - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas. |
| virtual-machine set disk-size `<100-500>` `adsp` `{on <DEVICE-NAME>}` | Sets the ADSP VM's disk size (in GB). Specify a value from 100 - 500 GB.  
   - Optional. Executes the command on a specified device or devices
   - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.  
   **Note:** Stop the ADSP VM before executing this command. |
| virtual-machine set memory `<512-8192>` `adsp` `{on <DEVICE-NAME>}` | Modifies the ADSP VM's memory. Specify a value from 512 - 8192 MB.  
   - Optional. Executes the command on a specified device or devices
   - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas. |
| virtual-machine set wing-memory `<12288-32739>` | Specifies the WiNG memory size in MB  
   **Note:** This command is applicable only to the NX9500 and NX9510 service platforms. Use the `show > virtual-machine-configuration` command to view the configured memory allocation. Use the `show > virtual-machine-statistics` to view the current allocated memory allocation.  
   - `<12288-32739>` – Specify a value from 12288 - 32739 MB. The default is 18432 MB.  
   **Note:** The new memory setting takes effect only after the next boot.
virtual-machine [start|stop] adsp {on <DEVICE-NAME>}

- virtual-machine [start|stop]
  - start – Starts the ADSP VM. Use this command to boot a shut down VM (in a stop state).
  - stop – Stops a running ADSP VM. Use this command to shut down a running VM.
  - on <DEVICE-NAME> – Optional. Executes the start/stop command on a specified device or devices
  - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

- virtual-machine uninstall adsp {on <DEVICE-NAME>}

- virtual-machine uninstall
  - Uninstalls the ADSP VM
  - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Examples**
The following examples show the VM installation process:

**Installation media: USB**

```shell
<DEVICE>#virtual-machine install <VM-NAME> type iso disk-size 8 install-media usb1://vms/win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable
```

**Installation media: pre-installed disk image**

```shell
<DEVICE>#virtual-machine install <VM-NAME> type disk install-media flash:/vms/win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on <DEVICE-NAME>
```

In the preceding example, the command is executed on the device identified by the `<DEVICE-NAME>` keyword. In such a scenario, the disk-size is ignored if specified. The VM has the install media as first boot device.

**Installation media: VM archive**

```shell
<DEVICE>#virtual-machine install type vm-archive install-media flash:/vms/<VM-NAME> vcpus 3
```

In the preceding example, the default configuration attached with the VM archive overrides any parameters specified.

**Exporting an installed VM:**

```shell
<DEVICE>#virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>
```

In the preceding example, the command copies the VM archive on to the URL (VM should be in stop state).

**NOTE:** Use the `show > virtual-machine > [configuration|debugging|export|statistics]` command to view installed VM details.
Most PRIV EXEC commands set operating parameters. Privileged-level access should be password protected to prevent unauthorized use. The PRIV EXEC command set includes commands contained within the USER EXEC mode. The PRIV EXEC mode also provides access to configuration modes, and includes advanced testing commands.

The PRIV EXEC mode prompt consists of the hostname of the device followed by a pound sign (#).

To access the PRIV EXEC mode, enter the following at the prompt:

```
<DEVICE>>enable
<DEVICE>#
```

The PRIV EXEC mode is often referred to as the enable mode, because the enable command is used to enter the mode.

There is no provision to configure a password to get direct access to PRIV EXEC (enable) mode.

```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>archive</td>
<td>Manages file archive operations</td>
<td>page 3-6</td>
</tr>
<tr>
<td>boot</td>
<td>Specifies the image used after reboot</td>
<td>page 3-8</td>
</tr>
<tr>
<td>captive-portal-page-upload</td>
<td>Uploads captive portal advanced pages</td>
<td>page 3-9</td>
</tr>
<tr>
<td>cd</td>
<td>Changes the current directory</td>
<td>page 3-12</td>
</tr>
<tr>
<td>change-passwd</td>
<td>Changes the password of a logged user</td>
<td>page 3-13</td>
</tr>
<tr>
<td>clear</td>
<td>Clears parameters, cache entries, table entries, and other similar entries</td>
<td>page 3-14</td>
</tr>
<tr>
<td>clock</td>
<td>Configures the system clock</td>
<td>page 3-26</td>
</tr>
<tr>
<td>cluster</td>
<td>Initiates a cluster context</td>
<td>page 3-27</td>
</tr>
<tr>
<td>configure</td>
<td>Enters the configuration mode</td>
<td>page 3-28</td>
</tr>
<tr>
<td>connect</td>
<td>Begins a console connection to a remote device</td>
<td>page 3-29</td>
</tr>
<tr>
<td>copy</td>
<td>Copies a file from any location to the wireless controller, service platform, or access point</td>
<td>page 3-30</td>
</tr>
<tr>
<td>cpe</td>
<td>Enables a WiNG controller to perform certain operations on an adopted T5 Customer Premises Equipment (CPE) device. This command is specific to the RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX9XXX devices.</td>
<td>page 3-31</td>
</tr>
<tr>
<td>create-cluster</td>
<td>Creates a new cluster on a specified device</td>
<td>page 3-33</td>
</tr>
<tr>
<td>crypto</td>
<td>Enables encryption</td>

<td>Displays the differences between two files</td>
<td>page 3-53</td>
</tr>
<tr>
<td>dir</td>
<td>Displays the list of files on a file system</td>
<td>page 3-54</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the privileged mode command set</td>
<td>page 3-56</td>
</tr>
<tr>
<td>edit</td>
<td>Edits a text file</td>
<td>page 3-57</td>
</tr>
<tr>
<td>enable</td>
<td>Turns on (enables) the privileged mode commands set</td>
<td>page 3-58</td>
</tr>
<tr>
<td>erase</td>
<td>Erases a file system</td>
<td>page 3-59</td>
</tr>
<tr>
<td>format</td>
<td>Formats the system’s compact flash file system</td>
<td>page 3-60</td>
</tr>
</tbody>
</table>
### Table 3.1 Privileged Exec Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>halt</td>
<td>Halts a device (access point, wireless controller, or service platform)</td>
<td>page 3-61</td>
</tr>
<tr>
<td>join-cluster</td>
<td>Adds a device (access point, wireless controller, or service platform), as cluster member, to an existing cluster of devices</td>
<td>page 3-62</td>
</tr>
<tr>
<td>l2tpv3</td>
<td>Establishes or brings down Layer 2 Tunneling Protocol Version 3 (L2TPV3) tunnels</td>
<td>page 3-64</td>
</tr>
<tr>
<td>logging</td>
<td>Modifies message logging parameters</td>
<td>page 3-66</td>

<tr>
<td>mint</td>
<td>Configures MiNT protocols</td>
<td>page 3-68</td>
</tr>
<tr>
<td>mkdir</td>
<td>Creates a new directory in the file system</td>
<td>page 3-70</td>
</tr>
<tr>
<td>more</td>
<td>Displays the contents of a file</td>
<td>page 3-71</td>
</tr>
<tr>
<td>no</td>
<td>Reverts a command or sets values to their default</td>
<td>page 3-72</td>
</tr>
<tr>
<td>on</td>
<td>Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, show</td>
<td>page 3-74</td>
</tr>
<tr>
<td>opendns</td>
<td>Connects to the OpenDNS site using OpenDNS registered credentials (username, password) to obtain the device-id. This command is a part of the process integrating access points and controllers with the OpenDNS service.</td>
<td>page 3-75</td>
</tr>
<tr>
<td>page</td>
<td>Toggles a device's (access point, wireless controller, or service platform) paging function</td>
<td>page 3-77</td>
</tr>
<tr>
<td>ping</td>
<td>Sends ICMP echo messages to a user-specified location</td>
<td>page 3-78</td>
</tr>
<tr>
<td>ping6</td>
<td>Sends ICMPv6 echo messages to a user-specified location</td>
<td>page 3-80</td>
</tr>
<tr>
<td>pwd</td>
<td>Displays the current directory</td>
<td>page 3-81</td>
</tr>
<tr>
<td>re-elect</td>
<td>Re-elects the tunnel controller (wireless controller, service platform, or access point)</td>
<td>page 3-82</td>
</tr>
<tr>
<td>reload</td>
<td>Halts a device (wireless controller, service platform, or access point) and performs a warm reboot</td>
<td>page 3-83</td>
</tr>
<tr>
<td>rename</td>
<td>Renames a file in the existing file system</td>
<td>page 3-85</td>
</tr>
<tr>
<td>rmdir</td>
<td>Deletes an existing file from the file system</td>
<td>page 3-86</td>
</tr>
<tr>
<td>self</td>
<td>Displays the configuration context of the device</td>
<td>page 3-87</td>
</tr>
<tr>
<td>ssh</td>
<td>Connects to another device using a secure shell</td>
<td>page 3-88</td>
</tr>
<tr>
<td>t5</td>
<td>Executes the following operations on a T5 device: copy, rename, delete, and write. This command is specific to the RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX9XXX devices.</td>
<td>page 3-89</td>
</tr>
<tr>
<td>telnet</td>
<td>Opens a Telnet session</td>
<td>page 3-91</td>
</tr>
<tr>
<td>terminal</td>
<td>Sets the length and width of the terminal window</td>
<td>page 3-92</td>
</tr>
<tr>
<td>time-it</td>
<td>Verifies the time taken by a particular command between request and response</td>
<td>page 3-93</td>
</tr>
<tr>
<td>traceroute</td>
<td>Traces the route to a defined destination</td>
<td>page 3-94</td>
</tr>

<tr>
<td>upgrade</td>
<td>Upgrades the software image</td>
<td>page 3-96</td>
</tr>
<tr>
<td>upgrade-abort</td>
<td>Aborts an ongoing software image upgrade</td>
<td>page 3-98</td>
</tr>
<tr>
<td>watch</td>
<td>Repeats a specified CLI command at a periodic interval</td>
<td>page 3-99</td>
</tr>
<tr>
<td>smart-cache</td>
<td>Pre-fetches content cache from the specified list of URLs. This command is specific to the NX45XX and NX65XX series service platforms.</td>
<td>page 3-101</td>
</tr>
<tr>
<td>virtual-machine</td>
<td>Installs, configures, and monitors the status of virtual machines (VMs). This command is specific to the NX45XX, NX65XX, NX9500, and NX9510 series service platforms.</td>
<td>page 3-102</td>
</tr>
<tr>
<td>raid</td>
<td>Enables RAID management. This command is specific to the NX9500 series service platforms.</td>
<td>page 3-112</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
### 3.1.1 archive

**Privileged Exec Mode Commands**

Manages file archive operations.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
archive tar /table [<FILE>|<URL>]
archive tar /create [<FILE>|<URL>] <FILE>
archive tar /xtract [<FILE>|<URL>] <DIR>
```

**Parameters**

- **archive tar /table [<FILE>|<URL>]**
  
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tar</td>
<td>Manipulates (creates, lists, or extracts) a tar file</td>
</tr>
<tr>
<td>/table</td>
<td>Lists the files in a tar file</td>
</tr>
<tr>
<td>&lt;FILE&gt;</td>
<td>Defines a tar filename</td>
</tr>
<tr>
<td>&lt;URL&gt;</td>
<td>Sets the tar file URL</td>
</tr>
</tbody>
</table>

- **archive tar /create [<FILE>|<URL>] <FILE>**
  
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tar</td>
<td>Manipulates (creates, lists, or extracts) a tar file</td>
</tr>
<tr>
<td>/create</td>
<td>Creates a tar file</td>
</tr>
<tr>
<td>&lt;FILE&gt;</td>
<td>Defines tar filename</td>
</tr>
<tr>
<td>&lt;URL&gt;</td>
<td>Sets the tar file URL</td>
</tr>
</tbody>
</table>

- **archive tar /xtract [<FILE>|<URL>] <DIR>**
  
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tar</td>
<td>Manipulates (creates, lists, or extracts) a tar file</td>
</tr>
<tr>
<td>/xtract</td>
<td>Extracts content from a tar file</td>
</tr>
<tr>
<td>&lt;FILE&gt;</td>
<td>Defines tar filename</td>
</tr>
<tr>
<td>&lt;URL&gt;</td>
<td>Sets the tar file URL</td>
</tr>
<tr>
<td>&lt;DIR&gt;</td>
<td>Specify a directory name. When used with /create, dir is the source directory for the tar file. When used with /xtract, dir is the destination file where contents of the tar file are extracted.</td>
</tr>
</tbody>
</table>
Examples

### 3.1.2 boot

**Privileged Exec Mode Commands**

Specifies the image used after reboot

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
boot system [primary|secondary] {on <DEVICE-NAME>}
```

**Parameters**

- `boot system [primary|secondary] {on <DEVICE-NAME>}`

| system [primary|secondary] | Specifies the image used after a device reboot |
|---------------------------|-----------------------------------------------|
|                           | • primary – Uses the primary image after reboot |
|                           | • secondary – Uses the secondary image after reboot |

<table>
<thead>
<tr>
<th>on &lt;DEVICE-NAME&gt;</th>
<th>Optional. Specifies the primary or secondary image location on a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809#show boot
```

<table>
<thead>
<tr>
<th>IMAGE</th>
<th>BUILD DATE</th>
<th>INSTALL DATE</th>

Current Boot: Primary
Next Boot: Secondary
Software Fallback: Enabled
VM support: Present

nx9500-6C8809#
3.1.3 captive-portal-page-upload

Privileged Exec Mode Commands

Uploads captive portal advanced pages to connected access points. Use this command to provide connected access points with specific captive portal configurations so they can successfully provision login, welcome, and condition pages to requesting clients attempting to access the wireless network using the captive portal.

**NOTE:** Ensure that the captive portal pages to be uploaded are *.tar files.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
captive-portal-page-upload [<CAPTIVE-PORTAL-NAME>|cancel-upload|load-file]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all|rf-domain]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all] {upload-time <TIME>}
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME]|all] {from-controller} {(upload-time <TIME>)}
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>
```

**Parameters**

- **captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all] {upload-time <TIME>}**

  Uploads advanced pages specified by the `<CAPTIVE-PORTAL-NAME>` parameter
  - `<CAPTIVE-PORTAL-NAME>` – Specify captive portal name (should be existing and configured).
  - `<MAC/HOSTNAME>` – Uploads to a specified AP
    - `<MAC/HOSTNAME>` – Specify the AP’s MAC address or hostname.
  - `all` – Uploads to all APs
  - `upload-time <TIME>` – Optional. Schedules an upload time
    - `<TIME>` – Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal-page-upload &lt;CAPTIVE-PORTAL-NAME&gt; rf-domain [&lt;DOMAIN-NAME&gt;</td>
<td>all] {from-controller} {(upload-time &lt;TIME&gt;)}</td>
</tr>
<tr>
<td>captive-portal-page-upload cancel-upload [&lt;MAC/HOSTNAME&gt;</td>
<td>all</td>
</tr>
</tbody>
</table>

**rf-domain [<DOMAIN-NAME]|all]**
- Uploads to all APs within a specified RF Domain or all RF Domains.
  - **<DOMAIN-NAME>** – Uploads to APs within a specified RF Domain. Specify the RF Domain name.
  - **all** – Uploads to APs across all RF Domains.

**from-controller**
- Optional. Uploads to APs from the adopted device.

**upload-time <TIME>**
- Optional. Schedules an AP upload.
  - **<TIME>** – Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format.

**cancel-upload [<MAC/HOSTNAME]|all|on rf-domain [<DOMAIN-NAME>|all]]**
- Select one of the following options:
  - **<MAC/HOSTNAME>** – Cancels a scheduled upload to a specified AP. Specify the AP MAC address or hostname.
  - **all** – Cancels all scheduled AP uploads.
  - **on rf-domain** – Cancels all scheduled uploads within a specified RF Domain or all RF Domains.
  - **<DOMAIN-NAME>** – Cancels scheduled uploads within a specified RF Domain. Specify RF Domain name.
  - **all** – Cancels scheduled uploads across all RF Domains.

**load-file <CAPTIVE-PORTAL-NAME> <URL>**
- Specify captive portal name (should be existing and configured) and location.
  - **<URL>** – Specifies location of the captive-portal’s advanced pages. Use one of the following formats:
    - IPv4 URLs:
      - tftp://<hostname|IP>[:port]/path/file
      - ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
      - sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
      - http://<hostname|IP>[:port]/path/file
      - cf:/path/file
      - usb<n>:/path/file

Contd...
**Examples**

```
ap6562-B1A214# captive-portal-page-upload load-file captive_portal_test tftp://89.89.89.17/pages_new_only.tar

ap6562-B1A214# show captive-portal-page-upload load-image-status
Download of captive_portal_test advanced page file is complete

ap6562-B1A214# captive-portal-page-upload captive_portal_test all
```

```
3.1.4 cd

Privileged Exec Mode Commands

Changes the current directory

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
cd {<DIR>}
```

Parameters

- `cd {<DIR>}`

| <DIR> | Optional. Changes the current directory to the directory identified by the `<DIR>` keyword. If a directory name is not provided, the system displays the current directory. |

Examples

```
rfs7000-37FABE#cd flash:/log/
rfs7000-37FABE#pwd
flash:/log/
rfs7000-37FABE#```
3.1.5 change-passwd

Privileged Exec Mode Commands

Changes the password of a logged user. When this command is executed without any parameters, the password can be changed interactively.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

change-passwd \{<OLD-PASSWORD>\} <NEW-PASSWORD>

Parameters

- **change-passwd \{<OLD-PASSWORD>\} <NEW-PASSWORD>**

  | <OLD-PASSWORD> | Optional. Specify the password to be changed. |
  | <NEW-PASSWORD> | Specify the new password. |

  **Note:** The password can also be changed interactively. To do so, press [Enter] after the command.

Usage Guidelines

A password must be from 1 - 64 characters.

Examples

rfs7000-37FABE#change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory(write memory) to be persistent.
rfs7000-37FABE#write memory
OK
rfs7000-37FABE#
3.1.6 clear

Privileged Exec Mode Commands

Clears parameters, cache entries, table entries, and other entries. The clear command is available for specific commands only. The information cleared using this command varies depending on the mode where the clear command is executed.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```plaintext
clear [arp-cache|cdp|counters|crypto|event-history|firewall|gre|ip|ipv6|l2tpv3-stats|license|lldp|logging|mac-address-table|mint|role|rtls|smart-cache|spanning-tree|vrrp]
clear arp-cache {on <DEVICE-NAME>}
clear [cdp|lldp] neighbors {on <DEVICE-NAME>}
clear counters [all|ap|bridge|interface|radio|router|thread|wireless-client] {on <DEVICE-NAME>}
clear counters [all|bridge|router|thread]
clear counters [ap|wireless-client] <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
clear counters interface [<INTERFACE-NAME> all|ge <1-X>|mel|port-channel <1-X>|pppoel|vlan <1-4094>|wwan|vmif <1-X>|xge <1-4>]
clear counters radio {<MAC/HOSTNAME>|<1-X>}
clear crypto {ike|ipsec}
clear crypto ike sa {on <DEVICE-NAME>}
clear crypto ipsec sa {on <DEVICE-NAME>}
clear event-history
clear firewall [dhcp snoop-table|dos stats|flows [ipv4|ipv6]|neighbors snoop-table] {on <DEVICE-NAME>}
clear gre stats {on <DEVICE-NAME>}
clear ip [bgp|dhcp|ospf]
clear ip bgp [<IP|all|external|process]
clear ip bgp [<IP|all|external] {in|on|out|soft}
clear ip bgp [<IP|all|external] {in |prefix-filter} {on <DEVICE-NAME>}
clear ip bgp [<IP|all|external] {out} {on <DEVICE-NAME>}
clear ip bgp [<IP|all|external] {soft {in|out}} {on <DEVICE-NAME>}
clear ip bgp process {on <DEVICE-NAME>}
clear ip dhcp bindings [<IP|all] {on <DEVICE-NAME>}
clear ip ospf process {on <DEVICE-NAME>}
clear ipv6 neighbor-cache {on <DEVICE-NAME>}
```

NOTE: When using the clear command, refer to the interface details provided in Chapter 7, PROFILES, section interface.
clear l2tpv3-stats tunnel <L2TPV3-TUNNEL-NAME> {session <SESSION-NAME>}  
  {on <DEVICE-NAME>} 

clear license [borrowed|lent] 
clear license borrowed {on <DEVICE-NAME>} 
clear license lent to <DEVICE-NAME> {on <DEVICE-NAME>} 

clear logging {on <DEVICE-NAME>} 

clear mac-address-table {address|interface|vlan} {on <DEVICE-NAME>} 

clear mac-address-table interface [<IF-NAME>|ge <1-X>|port-channel <1-X>|  
  t1e1 <1-4> <1-1>|up <1-X>|vmif <1-X>|xge <1-4>} {on <DEVICE-NAME>} 

clear mint mlcp history {on <DEVICE-NAME>} 

clear role ldap-stats {on <DEVICE-NAME>} 

clear rtls [aeroscout|ekahau] 
clear rtls [aeroscout|ekahau] {<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>} |  
  on <DEVICE-OR-DOMAIN-NAME>} 

clear spanning-tree detected-protocols {interface|on <DEVICE-NAME>} 

clear spanning-tree detected-protocols {interface [<INTERFACE-NAME>|ge <1-x]|me1|  
  port-channel <1-x>|pppoe1|vlan <1-4094>|wwan1|vmif <1-X>|xge <1-4>} {on <DEVICE-NAME>} 

clear vrrp {error-stats|stats} {on <DEVICE-NAME>} 

The following clear command is specific to the NX45XX, NX65XX, and NX9XXX series service platforms:

clear smart-cache storage {all|url-regex <WORD>} {on <DEVICE-NAME>} 

clear logging analytics {on <DEVICE-NAME>}  

**Parameters**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear arp-cache {on &lt;DEVICE-NAME&gt;}</td>
<td>Clears Address Resolution Protocol (ARP) cache entries on a device. This protocol matches layer 3 IP addresses to layer 2 MAC addresses.</td>
</tr>
<tr>
<td></td>
<td>Optional. Clears ARP cache entries on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

| clear [cdp|lldp] neighbors {on <DEVICE-NAME>} | Clears Cisco Discovery Protocol (CDP) table entries |
|-----------------------------------------------|---------------------------------------------------|
| clear [cdp|lldp] neighbors {on <DEVICE-NAME>} | Clears Link Layer Discovery Protocol (LLDP) neighbor table entries |
| clear neighbors {on <DEVICE-NAME>}           | Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step |
| clear neighbors {on <DEVICE-NAME>}           | Optional. Clears CDP or LLDP neighbor table entries on a specified device |
| clear neighbors {on <DEVICE-NAME>}           | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
- **clear counters [all|bridge|router|thread]**

  **counters [all|bridge|router|thread]**  
  Clears counters on a system  
  - all – Clears all counters irrespective of the interface type  
  - bridge – Clears bridge counters  
  - router – Clears router counters  
  - thread – Clears per-thread counters

- **clear counters [ap|wireless-client] \{<MAC>\} (on <DEVICE-OR-DOMAIN-NAME>)**

  **counters [ap|wireless-client]**  
  Clears counters on a system  
  - ap – Clears access point wireless counters  
  - wireless-client – Clears wireless client counters

  **<MAC>**  
  The following keyword is common to the ‘ap’ and ‘wireless-client’ parameters:  
  - <MAC> – Optional. Clears counters of the AP/wireless client identified by the <MAC> keyword. Specify the MAC address of the AP or wireless client.  
  **Note:** The system clears all AP or wireless client counters, if no MAC address is specified.

  **on <DEVICE-OR-DOMAIN-NAME>**  
  The following keyword is recursive and is applicable to the <MAC> parameter:  
  - on <DEVICE-OR-DOMAIN-NAME> – Optional. Clears AP/wireless-client counters on a specified device or RF Domain  
  **Note:** If no MAC address is specified, the system clears all AP or wireless client counters on the specified AP, wireless controller, service platform, or RF Domain.

- **clear counters interface [<INTERFACE-NAME>|all|ge <1-X>|me1|port-channel <1-X>|pppoe1|vlan <1-4094>|wwan1|vmif <1-X>|xge <1-4>]**

  **counters interface [<INTERFACE-NAME>|all|ge <1-X>|me1|port-channel <1-X>|pppoe1|vlan <1-4094>|wwan1|vmif <1-X>|xge <1-4>]**  
  Clears interface counters for a specified interface  
  - <INTERFACE-NAME> – Clears a specified interface counters. Specify the interface name.  
  - all – Clears all interface counters  
  - ge <1-X> – Clears GigabitEthernet interface counters. Specify the GigabitEthernet interface index from 1 - X.  
  **Note:** The number of Ethernet interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 24 GE interfaces. Where as, RFS4000 supports 5 GE interfaces  
  - me1 – Clears FastEthernet interface counters  
  - port-channel <1-X> – Clears port-channel interface counters. Specify the port channel interface index from 1 - X.  
  **Note:** The number of port-channel interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 13 port-channels. Where as, RFS4000 supports 3 port-channels.  
  - pppoe1 – Clears Point-to-Point Protocol over Ethernet (PPPoE) interface counters  
  - vlan <1-4094> – Clears interface counters. Specify the Switch Virtual Interface (SVI) VLAN ID from 1 - 4094.  
  - wwan1 – Clears wireless WAN interface counters  
  - vmif <1-X> – Clears VM interface counters. Specify the VM interface index from 1 - X.  
  Contd..
clear counters radio {<MAC/HOSTNAME> <1-X>} {on <DEVICE-OR-DOMAIN-NAME>}

counters radio

Clears wireless radio counters

<MAC/HOSTNAME> <1-X>

Clears counters of a radio identified by the <MAC/HOSTNAME> keyword.
- <MAC/HOSTNAME> – Optional. Specify the hostname or MAC address. Optionally, append the interface number to form radio ID in the form of AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX
- <1-X> – Optional. Specify the radio index (if not specified as part of the radio ID). The maximum number of radio antennas supported varies with the access point type.

Note: If no MAC address or radio index is specified, the system clears all radio counters.

on <DEVICE-OR-DOMAIN-NAME>

The following keyword is recursive and is applicable to the <MAC> parameter:
- on <DEVICE-OR-DOMAIN-NAME> – Optional. Clears AP/wireless-client counters on a specified device or RF Domain

Note: If no MAC address is specified, the system clears all AP or wireless client counters on the specified AP, wireless controller, service platform, or RF Domain.

clear crypto ike sa [<IP>|all] {on <DEVICE-NAME>}

crypto

Clears Internet Key Exchange (IKE) security associations (SAs)
- <IP> – Clears IKE SAs for a certain peer
- all – Clears IKE SAs for all peers

on <DEVICE-NAME>

Optional. Clears IKE SA entries, for a specified peer or all peers, on a specified device
- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

clear crypto ipsec sa {on <DEVICE-NAME>}

crypto

Clears Internet Protocol Security (IPSec) database SAs
- on <DEVICE-NAME> – Optional. Clears IPSec SA entries on a specified device
- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

clear event-history

event-history

Clears event history cache entries

clear firewall [dhcp snoop-table|dos stats|flows [ipv4|ipv6]|neighbors snoop-table] {on <DEVICE-NAME>}

firewall

Clears firewall event entries

dhcp snoop-table

Clears DHCP snoop table entries
### dos stats
Clears denial of service statistics

| flows [ipv4|ipv6] | Clears established IPv4 or IPv6 firewall sessions |
|------------------|-------------------------------------------------|
| neighbors snoop-table | Clears IPv6 neighbors snooping table entries |
| on <DEVICE-NAME> | The following keywords are common to the DHCP, DOS, and flows parameters: |
|                   | • on <DEVICE-NAME> – Optional. Clears DHCP snooping table entries, denial of service statistics, or the established firewall sessions on a specified device |
|                   | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **clear gre stats** `{on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>gre stats</th>
<th>Clears GRE tunnel statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. GRE tunnel statistics on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- **clear ip bgp [<IP>|all|external] {in prefix-filter} {on <DEVICE-NAME>}

| ip bgp [<IP>|all|external] | Clears BGP routing table information based on the option selected |
|-----------------------------|---------------------------------------------------------------|
|                             | • <IP> – Clears the BGP peer identified by the <IP> keyword. Specify the BGP peer’s IP address. |
|                             | • all – Clears Route Updates Received From All Bgp Peers |
|                             | • external – Clears route updates received from external BGP peers |
| Note:                      | This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 series service platforms. |
| Note:                      | In case of a change in routing policy it is necessary to clear BGP routing table entries in order for the new policy to take effect. |
| in prefix-filter | Optional. Clears soft-reconfiguration inbound route updates |
|                   | • prefix-filter – Optional. Clears the existing Outbound Route Filtering (ORF) prefix-list. |
| on <DEVICE-NAME> | Optional. Clears soft-reconfiguration inbound route updates on a specified device |
|                   | • <DEVICE-NAME> – Specify the name of the AP or service platform. |

- **clear ip bgp [<IP>|all|external] {out} {on <DEVICE-NAME>}

| ip bgp [<IP>|all|external] | Clears BGP routing table information based on the option selected |
|-----------------------------|---------------------------------------------------------------|
|                             | • <IP> – Clears the BGP peer identified by the <IP> keyword. Specify the BGP peer’s IP address. |
|                             | • all – Clears route updates received from all BGP peers |
|                             | • external – Clears route updates received from external BGP peers |
| Note:                      | This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 series service platforms. |
| Note:                      | In case of a change in routing policy it is necessary to clear BGP routing table entries in order for the new policy to take effect. |
| out | Optional. Clears soft-reconfiguration outbound route updates. Optionally specify the device on which to execute this command. |
### clear ip bgp

 clears BGP routing table information based on the option selected

- `<IP>` – Clears the BGP peer identified by the `<IP>` keyword. Specify the BGP peer's IP address.
- `all` – Clears route updates received from all BGP peers
- `external` – Clears route updates received from external BGP peers

**Note:** This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 series service platforms.

**Note:** In case of a change in routing policy it is necessary to clear BGP routing table entries in order for the new policy to take effect.

### soft {in|out}

Optional. Enables soft-reconfiguration of route updates for the specified IP address. This option allows routing tables to be reconfigured without clearing BGP sessions

- `in` – Optional. Enables soft reconfiguration of inbound route updates
- `out` – Optional. Enables soft reconfiguration of outbound route updates

**Note:** Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy etc.) take effect only after on-going BGP sessions are cleared. The `clear ip bgp` command clears BGP sessions. To reduce loss of route updates during the process, use the 'soft' option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.

### ip bgp [ip | all | external] {soft {in|out}} {on <DEVICE-NAME>}

Clears all BGP processes running

**Note:** This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 platforms.

Optional. Clears all BGP processes on a specified device

- `<DEVICE-NAME>` – Specify the name of the AP or service platform.

### clear ip dhcp bindings [ip | all] {on <DEVICE-NAME>}

Clears a Dynamic Host Configuration Protocol (DHCP) server's IP address bindings entries

- `<IP>` – Clears specific address binding entries. Specify the IP address to clear binding entries.
- `all` – Clears all address binding entries

Optional. Clears a specified address binding or all address bindings on a specified device

- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.
- `clear ip ospf process {on <DEVICE-NAME>}`
  
<table>
<thead>
<tr>
<th>ip ospf process</th>
<th>Clears already enabled open shortest path first (OSPF) process and restarts the process</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears OSPF process on a specified device OSPF is a link-state interior gateway protocol (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet layer which makes routing decisions based solely on the destination IP address found in IP packets.</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- `clear ipv6 neighbor-cache {on <DEVICE-NAME>}`
  
<table>
<thead>
<tr>
<th>clear ipv6 neighbor-cache</th>
<th>Clears IPv6 neighbor cache entries</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears IPv6 neighbor cache entries on a specified device</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- `clear l2tpv3-stats tunnel <L2TPV3-TUNNEL-NAME> {session <SESSION-NAME>} {on <DEVICE-NAME>} {}`
  
<table>
<thead>
<tr>
<th>l2tpv3-stats tunnel &lt;L2TPV3-TUNNEL-NAME&gt;</th>
<th>Clears L2TPv3 tunnel session statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>session &lt;SESSION-NAME&gt;</td>
<td>Optional. Clears a specified L2TPv3 tunnel session, identified by the &lt;SESSION-NAME&gt; keyword</td>
</tr>
<tr>
<td>&lt;SESSION-NAME&gt;</td>
<td>Specify the session name.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>The following parameter is recursive and optional:</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
<tr>
<td>Note:</td>
<td>If no optional parameters are specified, the system clears all L2TPv3 tunnel session statistics.</td>
</tr>
</tbody>
</table>

- `clear license borrowed {on <DEVICE-NAME>}`
  
<table>
<thead>
<tr>
<th>license borrowed {on &lt;DEVICE-NAME&gt;}</th>
<th>Releases or revokes all licenses borrowed by a site controller</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Specifies the borrowing controller’s name.</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the borrowing controller’s name.</td>
</tr>
<tr>
<td>Note:</td>
<td>If no device name is specified, the system clears all borrowed licenses on the logged device.</td>
</tr>
</tbody>
</table>

- `clear license lent to <DEVICE-NAME> {on <DEVICE-NAME>}`
  
<table>
<thead>
<tr>
<th>license lent to &lt;DEVICE-NAME&gt; {on &lt;DEVICE-NAME&gt;}</th>
<th>NOC controller releases or revokes all licenses loaned to a site controller</th>
</tr>

<td>Specifies the borrowing controller’s name</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the controller’s name.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Specifies the controller’s name</td>
</tr>
<tr>
<td>Note:</td>
<td>If no device name is specified, the system clears all loaned licenses on the logged device.</td>
</tr>
</tbody>
</table>
**clear mac-address-table**

*clear mac-address-table address <MAC>|vlan <1-4094>|on <DEVICE-NAME>*

- `address <MAC>`: Clears an address from the MAC address table. Specify the MAC address in one of the following formats: AA-BB-CC-DD-EE-FF or AA:BB:CC:DD:EE:FF or AABB.CCDD.EEFF.
- `vlan <1-4094>`: Clears all MAC addresses for a specified VLAN. Specify the VLAN ID from 1 to 4094.
- `on <DEVICE-NAME>`: Clears a single entry or all MAC entries for the specified VLAN in the MAC address forwarding table on a specified device. Specify the name of the AP, wireless controller, or service platform.

**clear mac-address-table interface**

*clear mac-address-table interface [ <IF-NAME>|ge <1-X>|port-channel <1-X> |t1e1 <1-4> |up <1-X>|vmif <1-X>|xge <1-4>]|on <DEVICE-NAME>*

- `interface`: Clears all MAC addresses for the selected interface. Use the options available to specify the interface.
- `<IF-NAME>`: Clears MAC address forwarding table for the specified layer 2 interface (Ethernet port). Specify the layer 2 interface name.
- `ge <1-X>`: Clears MAC address forwarding table for the specified GigabitEthernet interface. Specify the GigabitEthernet interface index from 1 to X.
- `port-channel <1-X>`: Clears MAC address forwarding table for the specified port-channel interface. Specify the port-channel interface index from 1 to X.
- `t1e1 <1-4> <1-1>`: Clears MAC address forwarding table for the specified T1E1L interface. Specify the slot to clear the MAC address forwarding table. A maximum of 4 slots are available. Specify the T1E1 port ID from 1 to 1.
- `up <1-X>`: Clears MAC address forwarding table for the WAN Ethernet interface. The number of WAN Ethernet interfaces supported varies for different devices. The RFS4000 and RFS6000 devices support 1 WAN Ethernet interface. The NX45XX supports 2 WAN Ethernet interfaces.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear mint mlcp history</code> {on <code>&lt;DEVICE-NAME&gt;</code>}</td>
<td>Clears MiNT Link Creation Protocol (MLCP) client history on a specified device.</td>

</table>
### clear spanning-tree detected-protocols

Clears spanning tree protocols on an interface and restarts protocol migration.

**Syntax:**
```
interface [<INTERFACE-NAME>|ge <1-X>|me1|port-channel <1-X>|pppoe1|vlan <1-4094>|wwan1|vmif <1-X>|xge <1-4>]
```

**Options:**
- `<INTERFACE-NAME>`: Clears detected spanning tree entries on a specified interface.
- `ge <1-X>`: Clears detected spanning tree entries for the selected GigabitEthernet interface.
- `me1`: Clears FastEthernet interface spanning tree entries.
- `port-channel <1-X>`: Clears detected spanning tree entries for the selected port channel interface.
- `pppoe1`: Clears detected spanning tree entries for PPPoE interface.
- `vlan <1-4094>`: Clears detected spanning tree entries for the selected VLAN interface.
- `wwan1`: Clears detected spanning tree entries for wireless WAN interface.
- `vmif <1-X>`: Clears detected spanning tree entries for VM interfaces.
- `xge <1-4>`: Clears detected spanning tree entries for TenGigabitEthernet interfaces.

**Note:**
- The number of Ethernet interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 24 GE interfaces. Whereas, RFS4000 supports 5 GE interfaces.
- The number of port-channel interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 13 port-channels. Whereas, RFS4000 supports 3 port-channels.
- VMIF interfaces are supported only on the NX45XX, NX65XX, NX9500, and NX9510 series service platforms. The number of supported VMIFs varies for different device types.
- This interface is supported only on the NX9000 series service platforms.

### clear vrrp error-stats

Clears VRRP global error statistics.

**Syntax:**
```
error-stats
```

**Options:**
- `<DEVICE-NAME>`: Optional. Clears VRRP global error statistics on a selected device.

### clear vrrp stats

Clears VRRP statistics for a device.

**Syntax:**
```
stats
```

**Options:**
- `<DEVICE-NAME>`: Specify the name of the AP, wireless controller, or service platform.
### stats

<table>
<thead>
<tr>
<th>{on &lt;DEVICE-NAME&gt;}</th>
<th>Clears VRRP related statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Clears VRRP related statistics on a selected device</td>
<td></td>
</tr>
<tr>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>

### clear smart-cache storage [all|regex <WORD>] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>smart-cache</th>
<th>Clears the smart-cache storage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see smart-cache-policy.</td>
<td></td>
</tr>
</tbody>
</table>

| storage [all|regex <WORD>] | Clears stored content based on the parameters passed |
|-----------------------------|---------------------------------------------------|
| • all – Clears all cached content |
| • regex <WORD> – Clears only those URLs matching the specified expression |
| • <WORD> – Provide the URL in the following format: e.g. \.xxx\\+\.(flv|mp4) |

<table>
<thead>
<tr>
<th>on &lt;DEVICE-NAME&gt;</th>
<th>Optional. Clears stored content on a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>

3.1.7 clock

Privileged Exec Mode Commands

Sets a device’s system clock

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}

Parameters
- clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clock set</td>
<td>Sets a device’s system clock</td>
</tr>
<tr>
<td><a href="">HH:MM:SS</a></td>
<td>Sets the current time (in military format hours, minutes and seconds)</td>
</tr>
<tr>
<td>&lt;1-31&gt;</td>
<td>Sets the numerical day of the month</td>
</tr>
<tr>
<td>&lt;MONTH&gt;</td>
<td>Sets the month of the year from Jan - Dec</td>
</tr>
<tr>
<td>&lt;1993-2035&gt;</td>
<td>Sets a valid four digit year from 1993 - 2035</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Sets the clock on a specified device</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Examples

3.1.8 **cluster**

- Privileged Exec Mode Commands

Initiates the cluster context. The cluster context provides centralized management to configure all cluster members from any one member.

Commands executed under this context are executed on all members of the cluster.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`cluster start-election`

**Parameters**

- `cluster start-election`

<table>
<thead>
<tr>
<th>start-election</th>
<th>Starts a new cluster master election</th>
</tr>
</thead>
</table>

**Examples**

```
 rfs7000-37FABE#cluster start-election
 rfs7000-37FABE#
```

**Related Commands**

<table>
<thead>
<tr>
<th>create-cluster</th>
<th>Creates a new cluster on a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td>join-cluster</td>
<td>Adds a controller, as cluster member, to an existing cluster of devices</td>
</tr>
</tbody>
</table>
3.1.9 configure

*Privileged Exec Mode Commands*

Enters the configuration mode. Use this command to enter the current device's configuration mode, or enable configuration from the terminal.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
configure {self|terminal}
```

**Parameters**

- `configure {self|terminal}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>self</code></td>
<td>Optional. Enables the current device’s configuration mode</td>
</tr>
<tr>
<td><code>terminal</code></td>
<td>Optional. Enables configuration from the terminal</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE#configure self
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#
```

```
rfs7000-37FABE#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config)#
```
3.1.10 connect

Privileged Exec Mode Commands

Begins a console connection to a remote device using the remote device’s MiNT ID or name.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]

Parameters

- connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]

<table>
<thead>
<tr>
<th>mint-id &lt;MINT-ID&gt;</th>
<th>Connects to a remote system using the MiNT ID</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;MINT-ID&gt; – Specify the remote device’s MiNT ID.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&lt;REMOTE-DEVICE-NAME&gt;</th>
<th>Connects to a remote system using its name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;REMOTE-DEVICE-NAME&gt; – Specify the remote device’s name.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-6DCD4B#show mint lsp-db
6 LSPs in LSP-db of 19.6D.CD.4B:

### 3.1.11 copy

**Privileged Exec Mode Commands**

Copies a file (config, log, txt...etc) from any location to the access point, wireless controller, or service platform and vice-versa.

**NOTE:** Copying a new config file to an existing running-config file merges it with the existing running-config file on the wireless controller. Both the existing running-config and the new config file are applied as the current running-config.

Copying a new config file to a start-up config file replaces the existing start-up config file with the parameters of the new file. It is better to erase the existing start-up config file and then copy the new config file to the startup config.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

copy [<SOURCE-FILE>|<SOURCE-URL>] [<DESTINATION-FILE>|<DESTINATION-URL>]

**Parameters**

- `<SOURCE-FILE>` Specify the source file to copy.
- `<SOURCE-URL>` Specify the source file’s location (URL).
- `<DESTINATION-FILE>` Specify the destination file to copy to.
- `<DESTINATION-URL>` Specify the destination file’s location (URL).

**Examples**

Transferring file snmpd.log to remote TFTP server.

```bash
rfs7000-37FABE#copy flash:/log/snmpd.log
```

```bash
tftp://157.235.208.105:/snmpd.log
```

Accessing running-config file from remote TFTP server into switch running-config.

```bash
rfs7000-37FABE#copy tftp://157.235.208.105:/running-config running-config
```
### 3.1.12 cpe

**Privileged Exec Mode Commands**

Enables a WiNG controller to perform certain operations on *Customer Premises Equipment* (CPEs) through an adopted T5 controller.

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a *Digital Subscriber Line* (DSL) as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
cpe [boot|led|reload|upgrade]
cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}
cpe [led|reload|upgrade] cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
```

#### Parameters

- **cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}**
  - **cpe [<1-24>|all]** Identifies the CPE(s) on which this change is implemented
    - **<1-24>** — Configures the CEP’s ID from 1 - 24
    - **all** — Configures all CPEs
  - **[primary|secondary]** Select the next boot image
    - primary — Uses the primary image when reloading
    - secondary — Uses the secondary image when reloading
  - **{on <T5-DEVICE-NAME>}** Optional. Performs this operation on a specified T5 device. Specify the T5 device’s hostname.

- **cpe [led|reload|upgrade] cpe [<1-24>|all] {on <T5-DEVICE-NAME>}**
  - **cpe [led|reload|upgrade]** Performs the following operations on CPEs
    - led — Enables/disables flashing of LEDs
    - reload — Reloads the device
    - upgrade — Upgrades the device
  - **{on <T5-DEVICE-NAME>}** Optional. Performs this operation on a specified T5 device. Specify the T5 device’s hostname.

---

*Note: After specifying the operation to perform, identify the device(s)*
Examples
rfs7000-37FABE#cpe led cpe all on t5-ED5C2C
Updated T5 CPE led state
rfs7000-37FABE#
### 3.1.13 create-cluster

> Privileged Exec Mode Commands

Creates a new device cluster, with the specified name, and assigns it an IP address and routing level.

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member’s failure.

A cluster’s load balance is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

\[ create-cluster \text{name <CLUSTER-NAME> ip <IP> \{level [1|2]\}} \]

**Parameters**

- `create-cluster name <CLUSTER-NAME> ip <IP> \{level [1|2]\}`

<table>
<thead>
<tr>

3.14 crypto

**Privileged Exec Mode Commands**

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate Certificate Signing Request (CSR).

This command also enables trustpoint configuration. Trustpoints contain the CA's identity and configuration parameters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

crypto [key|pki]
crypto key [export|generate|import|zeroize]
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|on|passphrase}
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|on|passphrase}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}
crypto pki [authenticate|export|generate|import|zeroize]
crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background}
{(on <DEVICE-NAME>)}
crypto pki export [request|trustpoint]
crypto pki export request [generate-rsa-key|short|use-rsa-key] <RSA-KEYPAIR-NAME>
[autogen-subject-name|subject-name]
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>
autogen-subject-name (<EXPORT-TO-URL>, email <SEND-TO-EMAIL>, fqdn <FQDN>, ip-address <IP>)
crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key] |
use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
<ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,
fqdn <FQDN>,ip-address <IP>)
crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

use-rsa-key] <RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|
use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name {(email <SEND-TO-EMAIL>,
fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)}
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
<ORGANIZATION> <ORGANIZATION-UNIT> {(email <SEND-TO-EMAIL>,fqdn <FQDN>,
ip-address <IP>,on <DEVICE-NAME>)}
crypto pki import [certificate|crl|trustpoint]
crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} {on <DEVICE-NAME>}
crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}
crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {on <DEVICE-NAME>}

Parameters

- crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>key</th>
<th>Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.</th>
</tr>
</thead>
<tbody>
<tr>
<td>export rsa &lt;RSA-KEYPAIR-NAME&gt;</td>
<td>Exports an existing RSA Keypair to a specified destination</td>
</tr>
<tr>
<td>&lt;EXPORT-TO-URL&gt;</td>
<td>Specify the RSA Keypair destination address. Both IPv4 and IPv6 address formats are supported. After specifying the destination address (where the RSA keypair is exported), configure one of the following parameters: background or passphrase.</td>
</tr>
<tr>
<td>background</td>
<td>Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on.</td>
</tr>
<tr>
<td>passphrase &lt;KEY-PASSPHRASE&gt; background</td>
<td>Optional. Encrypts RSA Keypair before exporting</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>The following parameter is recursive and common to all of the above parameters:</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>key</th>
<th>Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.</th>
</tr>
</thead>
<tbody>
<tr>
<td>generate rsa &lt;RSA-KEYPAIR-NAME&gt; [2048</td>
<td>4096]</td>
</tr>
<tr>
<td>&lt;RSA-KEYPAIR-NAME&gt;</td>
<td>Specify the RSA Keypair name.</td>
</tr>
<tr>
<td>[2048</td>
<td>4096]</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Generates the new RSA Keypair on a specified device</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>key</th>
<th>Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.</th>
</tr>
</thead>
<tbody>
<tr>
<td>import rsa &lt;RSA-KEYPAIR-NAME&gt;</td>
<td>Imports a RSA Keypair from a specified source</td>
</tr>
<tr>
<td>&lt;RSA-KEYPAIR-NAME&gt;</td>
<td>Specify the RSA Keypair name.</td>
</tr>
</tbody>
</table>
### crypto key zeroize rsa

<table>
<thead>
<tr>
<th>&lt;IMPORT-FROM-URL&gt;</th>
<th>Specify the RSA Keypair source address. Both IPv4 and IPv6 IP address formats are supported. After specifying the source address (where the RSA Keypair is imported from), configure one of the following parameters: background or passphrase.</th>
</tr>
</thead>
<tbody>
<tr>
<td>background</td>
<td>Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.</td>
</tr>
</tbody>
</table>
| passphrase | Optional. Decrypts the RSA Keypair after importing
  - <KEY-PASSPHRASE> – Specify the passphrase to decrypt the RSA keypair.
  - background – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on. |
| on <DEVICE-NAME> | The following parameter is recursive and common to the ‘background’ and ‘passphrase’ keywords:
  - on <DEVICE-NAME> – Optional. Performs import operation on a specific device
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

#### key

| zeroize rsa <RSA-KEYPAIR-NAME> | Deletes a specified RSA keypair
  - <RSA-KEYPAIR-NAME> – Specify the RSA keypair name. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>force</td>
<td>Optional. Forces deletion of all certificates associated with the specified RSA Keypair. Optionally specify a device on which to force certificate deletion.</td>
</tr>
</tbody>
</table>
| on <DEVICE-NAME> | The following parameter is recursive and optional:
  - on <DEVICE-NAME> – Optional. Deletes all certificates associated with the RSA Keypair on a specified device
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

---

### crypto pki authenticate

<table>
<thead>
<tr>
<th>pki authenticate &lt;TRUSTPOINT-NAME&gt; &lt;URL&gt; {background} {on &lt;DEVICE-NAME&gt;}</th>
<th>Enables Private Key Infrastructure (PKI) management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated Certificate Authority (CA) certificates.</th>
</tr>
</thead>
</table>
| authenticate <TRUSTPOINT-NAME> | Authenticates a trustpoint and imports the corresponding CA certificate
  - <TRUSTPOINT-NAME> – Specify the trustpoint name. |
| <URL> | Specify CA's location. Both IPv4 and IPv6 IP address formats are supported. The CA certificate is imported from the specified location. |
| background | Optional. Performs authentication in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional:
  - on <DEVICE-NAME> – Optional. Performs authentication on a specified device
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto pki export request</code></td>
<td>Exports CSR to the CA for a digital identity certificate. The CSR contains applicant’s details and RSA Keypair’s public key.</td>

</tr>
</tbody>
</table>
crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE>)}

subject-name <COMMON-NAME> Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate
  • <COMMON-NAME> – Specify the common name used with the CA certificate. The name should enable you to identify the certificate easily (2 to 64 characters in length).

<COUNTRY> Sets the deployment country code (2 character ISO code)

<STATE> Sets the state name (2 to 64 characters in length)

<CITY> Sets the city name (2 to 64 characters in length)

<ORGANIZATION> Sets the organization name (2 to 64 characters in length)

<ORGANIZATION-UNIT> Sets the organization unit (2 to 64 characters in length)

<EXPORT-TO-URL> Specify the CA's location. Both IPv4 and IPv6 IP address formats are supported.
  Note: The CSR is exported to the specified location.

email <SEND-TO-EMAIL> Exports CSR to a specified e-mail address
  • <SEND-TO-EMAIL> – Specify the CA's e-mail address.

fqdn <FQDN> Exports CSR to a specified FQDN
  • <FQDN> – Specify the CA's FQDN.

ip-address <IP> Exports CSR to a specified device or system
  • <IP> – Specify the CA's IP address.

• crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE>)}

pki Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

export trustpoint <TRUSTPOINT-NAME> Exports a trustpoint along with CA certificate, Certificate Revocation List (CRL), server certificate, and private key
  • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).

<EXPORT-TO-URL> Specify the destination address. Both IPv4 and IPv6 IP address formats are supported.
The trustpoint is exported to the address specified here.

background Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on.

passphrase <KEY-PASSPHRASE> background Optional. Encrypts the key with a passphrase before exporting
  • <KEY-PASSPHRASE> – Specify the passphrase to encrypt the trustpoint.
  • background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.

on <DEVICE-NAME> The following parameter is recursive and common to the ‘background’ and ‘passphrase’ keywords:
  • on <DEVICE-NAME> – Optional. Performs export operation on a specified device
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
| crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name \{(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)\} |
|---|
| **pki** |
| Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates. |
| **generate** |
| Generates a certificate and a trustpoint |
| **self-signed <TRUSTPOINT-NAME>** |
| Generates a self-signed certificate and a trustpoint |
| • <TRUSTPOINT-NAME> – Specify a name for the certificate and its trustpoint. |
| **[generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>** |
| Generates a new RSA Keypair, or uses an existing RSA Keypair |
| • generate-rsa-key – Generates a new RSA Keypair for digital authentication |
| • use-rsa-key – Uses an existing RSA Keypair for digital authentication |
| • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| **autogen-subject-name** |
| Auto generates the subject name from the configuration parameters. The subject name helps to identify the certificate. |
| **email <SEND-TO-EMAIL>** |
| Optional. Exports the self-signed certificate to a specified e-mail address |
| • <SEND-TO-EMAIL> – Specify the e-mail address. |
| **fqdn <FQDN>** |
| Optional. Exports the self-signed certificate to a specified FQDN |
| • <FQDN> – Specify the FQDN. |
| **ip-address <IP>** |
| Optional. Exports the self-signed certificate to a specified device or system |
| • <IP> – Specify the device’s IP address. |
| **on <DEVICE-NAME>** |
| Optional. Exports the self-signed certificate on a specified device |
| • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

<p>| crypto pki generate self-signed &lt;TRUSTPOINT-NAME&gt; [generate-rsa-key|use-rsa-key] &lt;RSA-KEYPAIR-NAME&gt; subject-name &lt;COMMON-NAME&gt; &lt;COUNTRY&gt; &lt;STATE&gt; &lt;CITY&gt; &lt;ORGANIZATION&gt; &lt;ORGANIZATION-UNIT&gt; {(email &lt;SEND-TO-EMAIL&gt;,fqdn &lt;FQDN&gt;,ip-address &lt;IP&gt;,on &lt;DEVICE-NAME&gt;)} |
|---|
| <strong>pki</strong> |
| Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates. |
| <strong>generate self-signed &lt;TRUSTPOINT-NAME&gt;</strong> |
| Generates a self-signed certificate and a trustpoint |
| • &lt;TRUSTPOINT-NAME&gt; – Specify a name for the certificate and its trustpoint. |
| <strong>[generate-rsa-key|use-rsa-key] &lt;RSA-KEYPAIR-NAME&gt;</strong> |
| Generates a new RSA Keypair, or uses an existing RSA Keypair |
| • generate-rsa-key – Generates a new RSA Keypair for digital authentication |
| • use-rsa-key – Uses an existing RSA Keypair for digital authentication |
| • &lt;RSA-KEYPAIR-NAME&gt; – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| <strong>subject-name &lt;COMMON-NAME&gt;</strong> |
| Configures a subject name, defined by the &lt;COMMON-NAME&gt; keyword, to identify the certificate |
| • &lt;COMMON-NAME&gt; – Specify the common name used with this certificate. The name should enable you to identify the certificate easily and should not exceed 2 to 64 characters in length. |</p>

| crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)} |
| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

| zeroize trustpoint <TRUSTPOINT-NAME> | Deletes a trustpoint and its associated CA certificate, server certificate, and private key
| • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).

| del-key | Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on.

| on <DEVICE-NAME> | The following parameter is recursive and optional:
| Optional. Deletes the trustpoint on a specified device
| • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

**Usage Guidelines**

The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

- **IPv4 URLs:**
  - tftp://<hostname>[IP]::port/path/file
  - ftp://<user>:<passwd>@<hostname>[IP]::port/path/file
  - sftp://<user>@[hostname]@[IP]::port>/path/file
  - http://<hostname>[IP]::port]/path/file
  - cf:/path/file
  - usb<n>:/path/file

- **IPv6 URLs:**
  - tftp://<hostname>[IPv6]::port]/path/file
  - ftp://<user>:<passwd>@<hostname>[IPv6]::port]/path/file
  - sftp://<user>:<passwd>@[hostname]@[IPv6]::port]/path/file
  - http://<hostname>[IPv6]::port]/path/file
Examples

rfs7000-37FABE#crypto key generate rsa key 1025
RSA Keypair successfully generated
rfs7000-37FABE#

rfs7000-37FABE#crypto key import rsa test123 url passphrase word background
RSA key import operation is started in background
rfs7000-37FABE#

rfs7000-37FABE#crypto pki generate self-signed word generate-rsa-key word autogen-
subject-name fqdn word
Successfully generated self-signed certificate
rfs7000-37FABE#

rfs7000-37FABE#crypto pki zeroize trustpoint word del-key
Successfully removed the trustpoint and associated certificates

3.1.15 `crypto-cmp-cert-update`

Privileged Exec Mode Commands

Triggers a Certificate Management Protocol (CMP) certificate update on a specified device or devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530NX9000, NX9500, NX9510

Syntax

crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

Parameters

- crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>crypto-cmp-cert-update &lt;TRUSTPOINT-NAME&gt; {on &lt;DEVICE-NAME&gt;}</th>
<th>Triggers a CMP certificate update on a specified device or devices</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;TRUSTPOINT-NAME&gt;</code> — Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the crypto-cmp-policy context to configure the trustpoint.</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; — Optional. Triggers a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list.</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58#crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
rfs4000-229D58#
3.1.16 delete

Privileged Exec Mode Commands

Deletes a specified file from the device’s file system

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

delete [/force <FILE>|/recursive <FILE>|<FILE>]

Parameters

- delete [/force <FILE>|/recursive <FILE>|<FILE>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/force &lt;FILE&gt;</td>
<td>Forces deletion without a prompt</td>
</tr>
<tr>
<td>/recursive &lt;FILE&gt;</td>
<td>Performs a recursive delete</td>
</tr>
<tr>
<td>&lt;FILE&gt;</td>
<td>Specifies the file name</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE#
3.1.17 **device-upgrade**

*Privileged Exec Mode Commands*

Enables firmware upgrade on an adopted device or a set of adopted devices (access points, wireless controllers, and service platforms)

This command simplifies device upgradation within a *hierarchically managed* (HM) network. For more information on HM networks, see `device-upgrade`.

**NOTE:** A NOC controller’s capacity is equal to, or higher than that of a site controller.

The following devices can be deployed at NOC and sites:

- **NOC controller** – RFS7000, NX9000, NX95XX (NX9500 and NX9510)
- **Site controller** – RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX75XX, NX9000, or NX95XX

Within a HM network, the devices deployed as site controllers depends on the NOC controller device type. For more information on the adoption capabilities of various NOC controller devices, see Usage Guidelines *(NOC controller adoption matrix)*.

---

**Supported in the following platforms:**

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext

---

**NOTE:**

A NOC controller’s capacity is equal to, or higher than that of a site controller.

The following devices can be deployed at NOC and sites:

- **NOC controller** – RFS7000, NX9000, NX95XX (NX9500 and NX9510)
- **Site controller** – RFS4000, RFS6000, RFS7000

Within a HM network, the devices deployed as site controllers depends on the NOC controller device type. For more information on the adoption capabilities of various NOC controller devices, see Usage Guidelines *(NOC controller adoption matrix)*.
**Parameters**

- `device-upgrade <MAC/HOSTNAME> {no-reboot|reboot-time <TIME>|upgrade-time <TIME> {no-reboot|reboot-time <TIME>}}`  
  - `<MAC/HOSTNAME>` Upgrades firmware on the device identified by the `<MAC/HOSTNAME>` keyword  
  - `<MAC/HOSTNAME>` – Specify the device’s MAC address or hostname.

- `device-upgrade all {force|no-reboot|reboot-time <TIME>|upgrade-time <TIME> {no-reboot|reboot-time <TIME>}}`  
  - `all` Upgrades firmware on all devices
  - `force` Optional. Select this option to force upgrade on the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.
  - `no-reboot` Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
  - `reboot-time <TIME>` Optional. Schedules an automatic reboot after a successful upgrade  
  - `<TIME>` – Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.
  - `upgrade-time <TIME> {no-reboot|reboot-time <TIME>}` Optional. Schedules an automatic device firmware upgrade on all devices on a specified day and time  
  - `<TIME>` – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. The following actions can be performed after a scheduled upgrade:  
  - `no-reboot` – Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
  - `reboot-time <TIME>` – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

- `staggered-reboot` This keyword is recursive and common to all of the above.
  - Optional. Enables staggered device reboot (one at a time), without network impact

  - sftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file  
  - http://<hostname|IPv6>[:port]/path/file |
### `device-upgrade rf-domain` Command

Upgrades firmware on devices in a specified RF Domain or all RF Domains. Devices within a RF Domain are upgraded through the RF Domain manager.

- `<RF-DOMAIN-NAME>` – Upgrades devices in the RF Domain identified by the `<RF-DOMAIN-NAME>` keyword.
- `<RF-DOMAIN-NAME>` – Specify the RF Domain name.
- `all` – Upgrades devices across all RF Domains
- `containing <WORD>` – Filters RF Domains by their names. RF Domains with names containing the sub-string identified by the `<WORD>` keyword are filtered. Devices on the filtered RF Domains are upgraded.
- `filter location <WORD>` – Filters devices by their location. All devices with location matching the `<WORD>` keyword are upgraded.

#### `<DEVICE-TYPE>`

After specifying the RF Domain, select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX75XX, NX9000, VX9000.

After specifying the RF Domain and the device type, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller.

#### `<MAC/HOSTNAME>`

Optional. Use this option to identify specific devices for upgradation. Specify the device's MAC address or hostname. The device should be within the specified RF Domain and of the specified device type. After identifying the devices to upgrade, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller.

**Note:** If no MAC address or hostname is specified, all devices of the type selected are upgraded.

#### `force`

Optional. Select this option to force upgrade for the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.

#### `from-controller`

Optional. Upgrades a device through the adopted device. If initiating an upgrade through the adopting controller, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.

#### `no-reboot`

Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)

#### `reboot-time <TIME>`

Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

#### `staggered-reboot`

This keyword is common to all of the above.

Optional. Enables staggered reboot (one at a time), without network impact.

rfs4000-229D58#
3.1.20 disable

*Privileged Exec Mode Commands*

Turns off (disables) the privileged mode command set. This command returns to the User Executable mode.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
disable

**Parameters**
None

**Examples**
rfs7000-37FABE#disable
rfs7000-37FABE>
3.1.21 edit

Privileged Exec Mode Commands

Edits a text file on the device’s file system

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
edit <FILE>

Parameters
- edit <FILE>

| <FILE> | Specify the name of the file to modify. |

Examples
rfs4000-229D58#edit startup-config
GNU nano 1.2.4                File: startup-config

3.1.22 enable

Privileged Exec Mode Commands

Turns on (enables) the privileged mode command set. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
enable
```

Parameters

None

Examples

```
rfs7000-37FABE#enable
rfs7000-37FABE#
```
### 3.1.23 erase

**Privileged Exec Mode Commands**

Erases a device’s (wireless controller, access point, and service platform) file system. Erases the content of the specified storage device. Also erases the startup configuration to restore the device to its default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cf:</td>
<td>Erases everything in the device’s cf: file</td>
</tr>
<tr>
<td>flash:</td>
<td>Erases everything in the device’s flash: file</td>
</tr>
<tr>
<td>nvram:</td>
<td>Erases everything in the device’s nvram: file</td>
</tr>
<tr>
<td>startup-config</td>
<td>Erases the device’s startup configuration file. The startup configuration file is used to configure the device when it reboots.</td>
</tr>
<tr>
<td>usb1:</td>

<td>Erases everything in the device’s usb3: file</td>
</tr>
<tr>
<td>usb4:</td>
<td>Erases everything in the device’s usb4: file</td>
</tr>
</tbody>
</table>

**Examples**

```
nx4500-5CFA2B# erase ?
flash:   Erase everything in flash:
nvram:  Erase everything in nvram:
startup-config  Reset configuration to factory default
usb1:  Erase everything in usb1:
usb2:  Erase everything in usb2:
usb3:  Erase everything in usb3:
usb4:  Erase everything in usb4:
nx4500-5CFA2B#

rfs7000-37FABE# erase startup-config
Erase startup-config? (y/n): n
rfs7000-37FABE#
```
3.1.24 **format**

- **Privileged Exec Mode Commands**

Formats a device's compact flash file system

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

format cf:

**Parameters**

- format cf:

  - **cf:** Formats the compact flash file system

**Examples**

rfs7000-37FABE#format cf:

Warning: This will destroy the contents of compact flash. Do you want to continue [y/n]? n

rfs7000-37FABE
3.1.25 halt

Privileged Exec Mode Commands

Stops (halts) a device (access point, wireless controller, or service platform). Once halted, the system must be restarted manually.

This command stops the device immediately. No indications or notifications are provided while the device shuts down.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

halt {force} {(on <DEVICE-NAME>)}

Parameters

- halt {force} {(on <DEVICE-NAME>)}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>halt</td>
<td>Halts a device</td>
</tr>
<tr>
<td>force</td>
<td>Optional. Forces a device to halt ignoring in-progress operations, such as firmware upgrades, downloads, unsaved configuration changes etc.</td>
</tr>
</tbody>
</table>
| on <DEVICE-NAME> | The following keywords are recursive and applicable to the 'force' parameter:  
  - on <DEVICE-NAME> — Optional. Specifies the name of the device to be halted  
  - <DEVICE-NAME> — Enter the name of the AP, wireless controller, or service platform. |

Note: If the device name is not specified, the logged device is halted.

Examples

rfs7000-37FABE#halt on rfs7000-37FABE
rfs7000-37FABE#
### 3.1.26 join-cluster

**Privileged Exec Mode Commands**

Adds a device (access point, wireless controller, or service platform), as cluster member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```bash
join-cluster <IP> user <USERNAME> password <WORD> {level|mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}
```

**Parameters**

- **join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}**
  - **<IP>** Specify the cluster member’s IP address.
  - **user <USERNAME>** Specify a user account with super user privileges on the new cluster member.
  - **password <WORD>** Specify password for the account specified in the user parameter.
  - **level [1|2]** Optional. Configures the routing level
    - 1 – Configures level 1 routing
    - 2 – Configures level 2 routing
  - **mode [active|standby]** Optional. Configures the cluster mode
    - active – Configures cluster mode as active
    - standby – Configures cluster mode as standby

**Usage Guidelines**

To add a device to an existing cluster:
- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding the device to a cluster, execute the “write memory” command to ensure the configuration persists across reboots.

**Examples**

```bash
rfs6000-6DB5D4#join-cluster 192.168.13.16 user admin password superuser level 1 mode standby
... connecting to 192.168.13.16
... applying cluster configuration
... committing the changes
... saving the changes
[OK]
rfs6000-6DB5D4#

rfs6000-6DB5D4#show context
!
! Configuration of RFS6000 version 5.7.0.0-009D
!
! version 2.3
!```
interface ge1
  switchport mode access
  switchport access vlan 1
interface vlan1
  ip address 192.168.13.16/24
  ip dhcp client request options all
  no ipv6 enable
  no ipv6 request-dhcpv6-options

cluster name TechPubs
cluster mode standby
cluster member ip 192.168.13.16 level 1
logging on
  logging console warnings
  logging buffered warnings
end

3.1.27 l2tpv3

Privileged Exec Mode Commands

Establishes or brings down an L2TPv3 tunnel

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

l2tpv3 tunnel [<TUNNEL-NAME>|all]

l2tpv3 tunnel <TUNNEL-NAME> [down|session|up]

l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}

l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}

l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}

Parameters

- l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}

| l2tpv3 tunnel <TUNNEL-NAME> [down|up] | Establishes or brings down an L2TPv3 tunnel
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;TUNNEL-NAME&gt; — Specify the tunnel name.</td>
</tr>
<tr>
<td></td>
<td>• down — Brings down the specified tunnel</td>
</tr>
<tr>
<td></td>
<td>• up — Establishes the specified tunnel</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Establishes or brings down a tunnel on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; — Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}

| l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] | Establishes or brings down a session in the specified tunnel |
|-------------------------------------------------------------|-------------------------------------------------------------|
|                                                             | • <SESSION-NAME> — Specify the session name.               |
|                                                             | • down — Brings down the specified tunnel session           |
|                                                             | • up — Establishes the specified tunnel session             |
| on <DEVICE-NAME>                                           | Optional. Establishes or brings down a tunnel session on a specified device |
|                                                             | • <DEVICE-NAME> — Specify the name of the AP, wireless controller, or service platform. |

- l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}

| l2tpv3 tunnel all [down|up] | Establishes or brings down all L2TPv3 tunnels |
|-----------------------------|-----------------------------------------------|
|                            | • down — Brings down all tunnels               |
|                            | • up — Establishes all tunnels                 |
| on <DEVICE-NAME>           | Optional. Establishes or brings down all tunnels on a specified device |
|                            | • <DEVICE-NAME> — Specify the name of the AP, wireless controller, or service platform. |
Examples
rfs7000-37FABE#l2tpv3 tunnel Tunnell session TunnellSession1 up on rfs7000-37FABE

NOTE: For more information on the L2TPv3 tunnel configuration mode and commands, see Chapter 22, L2TPV3-POLICY.
3.1.28 logging

Modifies message logging settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}

Parameters

- logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>monitor</td>
<td>Sets terminal lines logging levels. The logging severity levels can be set from 0 - 7. The system configures default settings, if no logging severity level is specified.</td>
</tr>
<tr>
<td></td>
<td>- &lt;0-7&gt; – Optional. Enter the logging severity level from 0 - 7. The various levels and their implications are:</td>
</tr>
<tr>
<td></td>
<td>- alerts – Optional. Immediate action needed (severity=1)</td>
</tr>
<tr>
<td></td>
<td>- critical – Optional. Critical conditions (severity=2)</td>
</tr>
<tr>
<td></td>
<td>- debugging – Optional. Debugging messages (severity=7)</td>
</tr>
<tr>
<td></td>
<td>- emergencies – Optional. System is unusable (severity=0)</td>
</tr>
<tr>
<td></td>
<td>- errors – Optional. Error conditions (severity=3)</td>
</tr>
<tr>
<td></td>
<td>- informational – Optional. Informational messages (severity=6)</td>
</tr>
<tr>
<td></td>
<td>- notifications – Optional. Normal but significant conditions (severity=5)</td>
</tr>
<tr>
<td></td>
<td>- warnings – Optional. Warning conditions (severity=4)</td>
</tr>
</tbody>
</table>

Note: Ensure that the logging module is enabled, before configuring the message logging level. To enable message logging, in the device’s configuration mode, execute the `logging on` command. Message logging can also be enabled on a profile.

Examples

```
rfs4000-229D58(config-device-00-23-68-22-9D-58)#logging on
rfs4000-229D58#logging monitor debugging
rfs4000-229D58#show logging
```

Logging module: enabled

```
Aggregation time: disabled
Console logging: level debugging
Monitor logging: level debugging
Buffered logging: level warnings
Syslog logging: level warnings
Facility: local7
```

Log Buffer (804 bytes):

```
May 30 11:23:13 2014: rfs4000-229D58 : %NSM-4-IFUP: Interface ge4 is up
```
May 30 11:23:11 2014: rfs4000-229D58 : %NSM-4-IFUP: Interface ge4 is up

3.1.29 mint

Privileged Exec Mode Commands

Uses MiNT protocol to perform a ping and traceroute to a remote device

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

mint [ping|traceroute]

mint ping <MINT-ID> {count <1-10000>|size <1-64000>|timeout <1-10>}

mint traceroute <MINT-ID> {destination-port <1-65535>|max-hops <1-255>|source-port <1-65535>|timeout <1-255>}

Parameters

- mint ping <MINT-ID> {count <1-10000>|size <1-64000>|timeout <1-10>}

  ping <MINT-ID> Sends a MiNT echo message to a specified destination
  - <MINT-ID> – Specify the destination device’s MiNT ID.

  count <1-10000> Optional. Sets the pings to the MiNT destination
  - <1-10000> – Specify a value from 1 - 60. The default is 3.

  size <1-64000> Optional. Sets the MiNT payload size in bytes
  - <1-64000> – Specify a value from 1 - 640000 bytes. The default is 64 bytes.

  timeout <1-10> Optional. Sets a response time in seconds
  - <1-10> – Specify a value from 1 - 10 seconds. The default is 1 second.

- mint traceroute <MINT-ID> {destination-port <1-65535>|max-hops <1-255>|source-port <1-65535>|timeout <1-255>}

  traceroute <MINT-ID> Prints the route packets trace to a device
  - <MINT-ID> – Specify the destination device’s MiNT ID.

  destination-port <1-65535> Optional. Sets the Equal-cost Multi-path (ECMP) routing destination port
  - <1-65535> – Specify a value from 1 - 65535. The default port is 45.

  max-hops <1-255> Optional. Sets the maximum number of hops a traceroute packet traverses in the forward direction
  - <1-255> – Specify a value from 1 - 255. The default is 30.

  source-port <1-65535> Optional. Sets the ECMP source port
  - <1-65535> – Specify a value from 1 - 65535. The default port is 45.

  timeout <1-255> Optional. Sets the minimum response time period
  - <1-255> – Specify a value from 1 - 255 seconds. The default is 30 seconds.
Examples

rfs4000-229D58#mint ping 68.88.0D.A7
MiNT ping 68.88.0D.A7 with 64 bytes of data.
Response from 68.88.0D.A7: id=1 time=0.364 ms
Response from 68.88.0D.A7: id=2 time=0.333 ms
Response from 68.88.0D.A7: id=3 time=0.368 ms

--- 68.88.0D.A7 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 0.333/0.355/0.368 ms
rfs4000-229D58#
3.1.30 mkdir

Privileged Exec Mode Commands

Creates a new directory in the file system

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
mkdir <DIR>

Parameters

- mkdir <DIR>

Examples
rfs4000-229D58# dir
Directory of flash:/.

```

3.1.31 more

Privileged Exec Mode Commands

Displays files on the device’s file system. This command navigates and displays specific files in the device’s file system. Provide the complete path to the file `more <file>`.

The more command also displays the startup configuration file.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
```
more <FILE>
```

Parameters
- more <FILE>

Examples
```
rfs4000-229D58# more flash:/archived_logs/startup.1.log
23-38-04-06-08-14
Jun 09 05:08:05 2014: %PM-6-PROCSTART: Starting process "/usr/sbin/logd"

--More--
rfs4000-229D58#
```
3.1.32 no

Privileged Exec Mode Commands

Use the no command to revert a command or a set of parameters to their default. This command is useful to turn off an enabled feature or to revert to default settings.

The no commands have their own set of parameters that can be reset. These parameters depend on the context in which the command is being used.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```plaintext
no [adoption|captive-portal|cpe|crypto|debug|logging|mac-user-db|page|raid|service|
    terminal|upgrade|virtual-machine|wireless]

no adoption {on <DEVICE-OR-DOMAIN-NAME>}

no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>]
    {on <DEVICE-OR-DOMAIN-NAME>}

no crypto pki [server|trustpoint]
no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>}|
    on <DEVICE-NAME>}

no logging monitor

no page

no service [block-adopter-config-update|locator|snmp|ssm|wireless]
no service block-adopter-config-update
no service locator {on <DEVICE-NAME>}
no service snmp sysoid wing5
no service ssm trace pattern `<WORD>` {on <DEVICE-NAME>}
no service wireless [trace pattern `<WORD>` {on <DEVICE-NAME>}]|
    unsanctioned ap air-terminate <BSSID> {on <DOMAIN-NAME>}
no terminal [length|width]

no upgrade <PATCH-NAME> {on <DEVICE-NAME>}

no wireless client [all|<MAC>]
no wireless client all {filter|on}
no wireless client all {filter [wlan <WLAN-NAME>]}
no wireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]}
no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
```

The following command is available only on the RFS4000, RFS7000, NX45XX, NX65XX, and NX9000 series service platforms:

```plaintext
no cpe led cpe [1-24]|all {on <T5-DEVICE-NAME>}
```

The following command is available only on the NX45XX, NX65XX, and NX9000 series service platforms:

```plaintext
no virtual-machine assign-usb-ports {on <DEVICE-NAME>}
```

The following commands are available only on the NX9000 series service platforms:

```plaintext
no mac-user-db user [USER-NAME]|all
no raid locate
no service analytics wifi
```
Parameters
- no <PARAMETERS>

| no <PARAMETERS> | Resets or reverts settings based on the parameters passed |

Usage Guidelines
The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples
rfs7000-37FABE# no adoption
rfs7000-37FABE#

rfs7000-37FABE# no page
rfs7000-37FABE#

rfs7000-37FABE# no service cli-tables-expand line
rfs7000-37FABE#

nx9500-6C8809# no service analytics wifi
Wifi data polling will be enabled. Please run status command to check Wifi data polling status.
nx9500-6C8809#
### 3.1.33 on

**Privileged Exec Mode Commands**

Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`on rf-domain [<RF-DOMAIN-NAME>|all]`

**Parameters**

- `on rf-domain [<RF-DOMAIN-NAME>|all]`

| on rf-domain [<RF-DOMAIN-NAME>| all] | Enters the RF Domain context based on the parameter specified |
|---------------------------------------|-------------------------------------------------------------|
|                                       | • `<RF-DOMAIN-NAME>` — Specify the RF Domain name. Enters the specified RF Domain context. |
|                                       | • `all` — Specifies all RF Domains. |

**Examples**

```
nx9500-6C8809#on rf-domain TechPubs
nx9500-6C8809(TechPubs)#
nx9500-6C8809(TechPubs)#?
ton RF-Domain Mode commands:

### 3.1.34 opendns

Privileged Exec Mode Commands

Retrieves the OpenDNS device-id from the OpenDNS site

This command integrates access points and controllers with OpenDNS. It obtains the device-id (16 character hex-string) from OpenDNS. This device-id is configured under all WLANs that are to be OpenDNS enabled. When configured and enabled on a WLAN, DNS queries from all wireless clients on the WLAN are redirected to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers. These OpenDNS resolvers act as proxy DNS servers, and also provide additional features, such as Web filtering, performance improvements etc.

**NOTE:** OpenDNS is a free, alternative DNS service that is faster and more reliable than other DNS services available. OpenDNS enables swift navigation of the Web without the outages that are frequent in other ISP provided DNS services. It also blocks inappropriate Web sites, phishing sites, and prevents virus and malware attacks.

**NOTE:** The 'username' and 'password' values passed in this command should be pre-registered with the OpenDNS site. The 'label' can be any value. Only with a combination of a valid 'username', 'password', and any 'label' the OpenDNS server returns a device-id.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

**Parameters**

- **opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>**

  - **opendns** Obtains the OpenDNS device-id from the OpenDNS site
  - **username <USERNAME>** Configures the OpenDNS user name (should be valid username registered with OpenDNS)
    - `<USERNAME>` – Provide the OpenDNS user name.
  - **password <OPENDNS-PSWD>** Configures the password associated with the user configured in the previous step
    - `<OPENDNS-PSWD>` – Provide the OpenDNS password for the user.
  - **label <LABEL>** Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal.
    - `<LABEL>` – Specify your network label.
    - **Note:** For every unique set of username, password, and label only one device-id is returned. Apply this device-id in WLANs that are to be OpenDNS enabled. For information on configuring the device-id in the WLAN context, see `opendns`.

**Usage Guidelines**

Use your OpenDNS credentials to logon to the opendns.org site and use the `labels`, `edit settings`, and `customize content filtering` options to configure Web filtering settings.
Examples

ap7131-E6D512#opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7131-E6D512#
## 3.1.35 page

Privileged Exec Mode Commands

Toggles controller paging. Enabling this command displays the CLI command output page by page, instead of running the entire output at once.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

3.1.36 ping

Privileged Exec Mode Commands

Sends Internet Controller Message Protocol (ICMP) echo messages to a user-specified location

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|source [<IP]|pppoe|vlan <1-4094>|wwan}
```

Parameters

- `<IP/HOSTNAME>` Specify the destination IP address or hostname to ping. When entered without any parameters, this command prompts for an IP address or a hostname.
- `count <1-10000>` Optional. Sets the pings to the specified destination
  - `<1-10000>` – Specify a value from 1 - 10000. The default is 5.
- `dont-fragment {count|size}` Optional. Sets the dont-fragment bit in the ping packet. Packets with the dont-fragment bit specified, are not fragmented. When a packet, with the dont-fragment bit specified, exceeds the specified Maximum Transmission Unit (MTU) value, an error message is sent from the device trying to fragment it.
  - `count <1-10000>` – Sets the pings to the specified destination from 1 - 10000. The default is 5.
  - `size <1-64000>` – Sets the size of ping payload size from 1 - 64000 bytes. The default is 100 bytes.
- `size <1-64000>` Optional. Sets the ping packet’s size in bytes
  - `<1-64000>` – Specify the ping payload size from 1 - 64000 bytes. The default is 100 bytes.
- `source [<IP]|pppoe|vlan <1-4094>|wwan]` Optional. Sets the source address or interface name. This is the source of the ICMP packet to the specified destination.
  - `<IP>` – Specifies the source IP address
  - `pppoe` – Selects the PPP over Ethernet interface
  - `vlan <1-4094>` – Selects the VLAN interface from 1 - 4094
  - `wwan` – Selects the wireless WAN interface

Examples

```
rfs7000-37FABE#ping 172.16.10.4 count 6
PING 172.16.10.4 (172.16.10.4) 100 (128) bytes of data.

rfs7000-6DCD4B#
3.1.37 ping6

privileged exec mode commands

Sends ICMPv6 echo messages to a user-specified IPv6 address

Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

`ping6 <IPv6/HOSTNAME> {<INTF-NAME>|count <1-10000>|size <1-64000>}`

Parameters

- ping <IPv6/HOSTNAME> {<INTF-NAME>|count <1-10000>|size <1-64000>}

<table>
<thead>
<tr>
<th>&lt;IPv6/HOSTNAME&gt;</th>
<th>Specify the destination IPv6 address or hostname.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Optional. Specify the interface name for link local/broadcast address</td>
</tr>
<tr>
<td>count &lt;1-10000&gt;</td>
<td>Optional. Sets the pings to the specified IPv6 destination</td>
</tr>
<tr>
<td>size &lt;1-64000&gt;</td>
<td>Optional. Sets the IPv6 ping payload size in bytes</td>
</tr>
</tbody>
</table>

Usage Guidelines

To configure a device’s IPv6 address, in the VLAN interface configuration mode, use the `ipv6 > address <IPv6-ADDRESS>` command. After configuring the IPv6 address, use the `ipv6 > enable` command to enable IPv6. For more information see, page 7-198.

Examples

```
 rfs4000-1B3596#ping6 2001:10:10:10:10:10:10:2 count 6 size 200
 208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=1 ttl=64 time=0.509 ms
 208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=2 ttl=64 time=0.323 ms
 208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=3 ttl=64 time=0.318 ms
 208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=4 ttl=64 time=0.317 ms
 208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=5 ttl=64 time=0.314 ms
 208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=6 ttl=64 time=0.318 ms

6 packets transmitted, 6 received, 0% packet loss, time 4999ms
rtt min/avg/max/mdev = 0.314/0.349/0.509/0.075 ms
```

rfs4000-1B3596#
3.1.38 `pwd`

*Privileged Exec Mode Commands*

Displays the full path of the present working directory, similar to the UNIX `pwd` command

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`pwd`

**Parameters**

None

**Examples**

```
rfs4000-229D58#pwd
flash:/
rfs4000-229D58#
```

```
rfs4000-229D58#dir

rfs4000-229D58#
```
3.1.39 re-elect

Privileged Exec Mode Commands

Re-elects the tunnel controller (wireless controller or service platform)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
re-elect tunnel-controller {<WORD> on <DEVICE-NAME>} | on <DEVICE-NAME>
```

Parameters

- re-elect tunnel-controller {<WORD> on <DEVICE-NAME>} | on <DEVICE-NAME>

<table>
<thead>
<tr>
<th>re-elect tunnel-controller</th>
<th>Re-elects the tunnel controller</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt; on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Re-elects the tunnel controller on all devices whose preferred tunnel controller name matches &lt;WORD&gt;</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>- Optional. Re-elects the tunnel controller on a specified device</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>- Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE# re-elect tunnel-controller
OK
rfs7000-37FABE#
```
### 3.1.40 reload

**Privileged Exec Mode Commands**

Halts the device and performs a warm reboot

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
reload {cancel|force|in|on|staggered}
reload {on <DEVICE-OR-DOMAIN-NAME>}
reload {cancel|force {staggered}|staggered} {on <DEVICE-OR-DOMAIN-NAME>}
reload {in <1-999>} {list|on}
reload {in <1-999>} {list {<LINE>|all}|on <DEVICE-OR-DOMAIN-NAME>}
reload {in <1-999>} {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

- `on <DEVICE-OR-DOMAIN-NAME>`
  Optional. Performs reload on a specified device or RF Domain. Halts the system and performs a warm reboot
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

- `cancel {cancel|force {staggered}|staggered} {on <DEVICE-OR-DOMAIN-NAME>}`
  Optional. Cancels pending reloads

- `force staggered`
  Optional. Forces reboot, while ignoring conditions like upgrade in progress, unsaved changes etc.
  - staggered – Optional. Forces staggered reboot of devices (one at a time) without network impact. Use this option when rebooting multiple devices within an RF Domain or adopted by the same controller.

- `staggered`
  Optional. Enables staggered reboot of devices (one at a time) without network impact. Use this option when rebooting multiple devices within an RF Domain or adopted by the same controller.

- `on <DEVICE-OR-DOMAIN-NAME>`
  The following keyword if common to all of the above parameters:
  - `on <DEVICE-OR-DOMAIN-NAME>` – Optional. Cancels reload or forces reload on a specified device or all devices within a specified RF Domain
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

- `in <1-999>`
  Optional. Performs a reload after a specified time period
  - `<1-999>` – Specify the time from 1 - 999 minutes.
### Examples

```plaintext
rfs7000-37FABE# reload force on rfs7000-37FABE
rfs7000-37FABE#
```

The following example shows devices available in RF Domain ‘default’:

```plaintext
rfs7000-6DCD4B# reload force staggered on default/
default/ap8132-711728   default/rfs6000-81701D  default/rfs7000-6DCD4B
rfs7000-6DCD4B#`
```

| list {<LINE>|all} | Optional. Reloads all adopted devices or specified devices  |
|-------------------|---------------------------------------------------------------|
|                   | • <LINE> – Optional. Reloads listed devices. List all devices (to be reloaded) separated by a space.  |
|                   | • all – Optional. Reloads all devices adopted by this controller  |

<table>
<thead>
<tr>
<th>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</th>
<th>Optional. Reloads a specified device or all devices within a specified RF Domain</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>
3.1.41 rename

Privileged Exec Mode Commands

Renames a file in the devices' file system

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
rename <OLD-FILE-NAME> <NEW-FILE-NAME>

Parameters
- rename <OLD-FILE-NAME> <NEW-FILE-NAME>

<table>
<thead>
<tr>
<th>&lt;OLD-FILE-NAME&gt;</th>
<th>Specify the file to rename.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;NEW-FILE-NAME&gt;</td>
<td>Specify the new file name.</td>
</tr>
</tbody>
</table>

Examples
rfs4000-229D58#dir
Directory of flash:/.

```
drwx     Wed Jan 30 02:45:10 2014   log
drwx     Sat Jan 1 00:00:09 2000   configs
drwx     Sat Jan 1 00:00:08 2000   cache
drwx     Wed Jan 16 22:26:53 2014   crashinfo
drwx     Fri Feb 15 14:50:49 2014   testdir
drwx     Sat Jan 1 00:00:08 2000   upgrade
drwx     Sat Jan 1 00:00:09 2000   hotspot
drwx     Sat Jan 1 00:00:09 2000   floorplans
drwx     Sat Jan 1 00:00:09 2000   startuplog
-rw-  176128   Fri Feb 15 14:32:51 2014   out.tar
```

rfs4000-229D58#
rfs4000-229D58#rename flash:/testdir/ Final
rfs4000-229D58#
rfs4000-229D58#dir
Directory of flash:/.

```
drwx     Wed Jan 30 02:45:10 2014   log
drwx     Sat Jan 1 00:00:09 2000   configs
drwx     Sat Jan 1 00:00:08 2000   cache
```

rfs4000-229D58#
3.1.42 rmdir

Privileged Exec Mode Commands

Deletes an existing directory from the file system (only empty directories can be removed)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
rmdir <DIR>

Parameters

- rmdir <DIR>

<table>
<thead>
<tr>
<th>rmdir &lt;DIR&gt;</th>
<th>Specifies the directory name</th>
</tr>
</thead>
</table>

Note: The directory, specified by the <DIR> parameter, is removed from the file system.

Examples

```bash
rfs4000-229D58# dir
Directory of flash:/.
  drwx     Wed Jan 30 02:45:10 2014   log
  drwx     Sat Jan  1 00:00:09 2000   configs
  drwx     Fri Feb 15 14:50:49 2014   Final
  drwx     Sat Jan  1 00:00:08 2000   cache
  drwx     Wed Jan 16 22:26:53 2014   crashinfo
  drwx     Sat Jan  1 00:00:08 2000   upgrade
  drwx     Sat Jan  1 00:00:09 2000   hotspot
  drwx     Sat Jan  1 00:00:09 2000   floorplans
  drwx     Sat Jan  1 00:00:09 2000   startuplog
-rw-   176128    Fri Feb 15 14:32:51 2014   out.tar
rfs4000-229D58#
```

```bash
rfs4000-229D58# rmdir Final
rfs4000-229D58#
```

```bash
rfs4000-229D58# dir
Directory of flash:/.
  drwx     Wed Jan 30 02:45:10 2014   log
  drwx     Sat Jan  1 00:00:09 2000   configs
  drwx     Sat Jan  1 00:00:08 2000   cache
  drwx     Wed Jan 16 22:26:53 2014   crashinfo
  drwx     Sat Jan  1 00:00:08 2000   upgrade
  drwx     Sat Jan  1 00:00:09 2000   hotspot
  drwx     Sat Jan  1 00:00:09 2000   floorplans
  drwx     Sat Jan  1 00:00:09 2000   startuplog
-rw-   176128    Fri Feb 15 14:32:51 2014   out.tar
rfs4000-229D58#```
3.1.43 self

- Privileged Exec Mode Commands

Enters the logged device's configuration context

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

self

Parameters

None

Examples

rfs7000-37FABE#self
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#
3.1.44 ssh

Privileged Exec Mode Commands

Opens a Secure Shell (SSH) connection between two network devices.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ssh <IP/HOSTNAME> <USERNAME> {<INF-NAME/LINK-LOCAL-ADD>}

Parameters

- ssh <IP/HOSTNAME> <USERNAME> {<INF-NAME/LINK-LOCAL-ADD>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Specify the remote system’s IP address or hostname.</td>
</tr>
<tr>
<td>&lt;USERNAME&gt;</td>
<td>Specify the name of the user requesting the SSH connection.</td>
</tr>
<tr>
<td>&lt;INF-NAME/LINK-LOCAL-ADD&gt;</td>
<td>Optional. Specify the interface’s name or link local address.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To exit the other device’s context, use the command that is relevant to that device.

Examples

nx9500-6C8809#ssh 192.168.13.16 admin
admin@192.168.13.16's password:
rfs6000-6DB5D4>
3.1.45 t5

Privileged Exec Mode Commands

Executes following operations on a T5 device through the WiNG controller:

- copy, rename, and delete files on the T5 device’s file system
- write running configuration to the T5 device’s memory

The T5 switch is a means of providing cost-effective, high-speed, wall-to-wall coverage across a building. The T5 switch leverages the in-building telephone lines to extend Ethernet and Wireless LAN networks without additional expenditure on re-wiring. This setup is ideally suited for hotels, providing high-speed Wi-Fi coverage to guest rooms.

The entire setup consists of the DSL T5 switch, TW-510 Ethernet wallplates, and TW-511 wireless wallplate access points. Replace the phone jack plate in a room with the TW-511 delivers 802.11 a/b/g/n and extend wireless connectivity in that room and the neighboring rooms. These TW-511 wallplates (also referred to as the CPEs) are connected to the T5 switch over the DSL interface using a phone block.

The T5 switch is adopted and managed through a WiNG controller. The connection between the T5 and WiNG switches is over a WebSocket.

NOTE: For more information on other T5 CPE related commands, see cpe.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
t5 [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME>|delete <FILE-NAME>|rename <SOURCE-FILE-NAME> <DEST-FILE-NAME>|write memory] {on <T5-DEVICE-NAME>}
```

Parameters

- **copy**<br>  `<SOURCE-FILE-NAME>` `<DEST-FILE-NAME>`<br>  Copies file to an external server<br>  - `<SOURCE-FILE-NAME>` – Specify the source file name.<br>  - `<DEST-FILE-NAME>` – Specify the destination file name.<br>  **Note:** The content from the source file is copied to the destination file.<br>  The source or destination files can be local or remote FTP or TFTP files. The source file also can be a pre-defined keyword. At least one of the files should be a local file. Use this command to copy the startup and/or running configurations to an external server.

- **delete** `<FILE-NAME>`<br>  Deletes files on the T5 device’s file system<br>  - `<FILE-NAME>` – Specify the file name. The specified file is deleted.

- **rename**<br>  `<SOURCE-FILE-NAME>` `<DEST-FILE-NAME>`<br>  Renames a file on the T5 device’s file system<br>  - `<SOURCE-FILE-NAME>` – Specify the source file name<br>  - `<DEST-FILE-NAME>` – Specify the new file name. The source file is renamed to the input provided here.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>write memory</td>
<td>Writes running configuration to an adopted T5 device’s memory</td>
</tr>
<tr>
<td></td>
<td>• memory – Writes running configuration to the T5 device’s <em>non-volatile</em> (NV) memory.</td>
</tr>
<tr>
<td>on &lt;T5-DEVICE-NAME&gt;</td>
<td>Optional. Executes these operation on a specified wireless controller or service platform</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE#t5 write memory on t5-ED5C2C
Success
rfs7000-37FABE#
```
### 3.1.46 `telnet`

*Privileged Exec Mode Commands*

Opens a Telnet session between two network devices

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

telnet `<IP/HOSTNAME>` `{<TCP-PORT>}` `{<INTF-NAME>}`

**Parameters**

- `telnet `<IP/HOSTNAME>` `{<TCP-PORT>}` `{<INTF-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IP/HOSTNAME&gt;</code></td>
<td>Configures the remote system’s IP (IPv4 or IPv6) address or hostname. The Telnet session will be established between the connecting system and the remote system.</td>
</tr>
<tr>
<td><code>&lt;TCP-PORT&gt;</code></td>
<td>Optional. Specify the Transmission Control Protocol (TCP) port.</td>
</tr>
<tr>
<td><code>&lt;INTF-NAME&gt;</code></td>
<td>Optional. Specify the interface name for the link local address.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To exit the other device’s context, use the command relevant to that device.

**Examples**

```
nx9500-6C8809#telnet 192.168.13.23
Entering character mode
Escape character is '^]'.
```

Password:
ap7131-11B6C4>
3.1.47 terminal

Privileged Exec Mode Commands

Sets the number of characters per line, and the number of lines displayed within the terminal window

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
terminal [length|width] <0-512>

Parameters
- terminal [length|width] <0-512>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| length <0-512> | Sets the number of lines displayed on a terminal window
| width <0-512> | Sets the width or number of characters displayed on the terminal window

Examples
rfs7000-37FABE#terminal length 150
rfs7000-37FABE#terminal width 215
rfs7000-37FABE#show terminal
Terminal Type: xterm
Length: 150     Width: 215
rfs7000-37FABE#

Related Commands
no

Resets the width of the terminal window or the number of lines displayed on a terminal window
3.1.48 time-it

Privileged Exec Mode Commands

Verifies the time taken by a particular command between request and response

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

time-it <COMMAND>

Parameters

- time-it <COMMAND>

<table>
<thead>
<tr>
<th>time-it &lt;COMMAND&gt;</th>
<th>Verifies the time taken by a particular command to execute and provide a result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;COMMAND&gt; – Specify the command name.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE#time-it config terminal
Enter configuration commands, one per line. End with CNTL/Z.
That took 0.00 seconds.
rfs7000-37FABE(config)#
3.1.49 traceroute

Traces the route to a defined destination

Use ‘--help’ or ‘-h’ to display a complete list of parameters for the traceroute command

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
traceroute <LINE>

Parameters
- traceroute <LINE>

<table>
<thead>
<tr>
<th>&lt;LINE&gt;</th>
<th>Traces the route to a destination IP address or hostname</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;LINE&gt;</td>
<td>Specify the destination IPv4 address or hostname.</td>
</tr>
</tbody>
</table>

Examples
nx9500-6C8809#traceroute 192.168.13.16
traceroute to 192.168.13.16 (192.168.13.16), 30 hops max, 46 byte packets
  1 192.168.13.16 (192.168.13.16) 0.479 ms 0.207 ms 0.199 ms
nx9500-6C8809#
3.1.50 **traceroute6**

*Privileged Exec Mode Commands*

Traces the route to a specified IPv6 destination

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX6510, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
traceroute6 <LINE>

**Parameters**

- traceroute6 <LINE>

<table>
<thead>
<tr>
<th>traceroute6 &lt;LINE&gt;</th>
<th>Traces the route to a destination IPv6 address or hostname</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;LINE&gt;</td>
<td>Specify the destination IPv6 address or hostname.</td>
</tr>
</tbody>
</table>

**Examples**

```
2001:10:10:10:10:10:10:1, 30 hops max, 16 byte packets
  1  2001:10:10:10:10:10:10:2 (2001:10:10:10:10:10:10:2) 0.622 ms 0.497 ms 0.531 ms
rfs4000-1B3596#
```
3.1.51 upgrade

Privileged Exec Mode Commands

Upgrades a device's software image

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

upgrade [<FILE>|<URL>] {background|on <DEVICE-NAME>}

Parameters

- upgrade [<FILE>|<URL>] {background|on <DEVICE-NAME>}

### 3.1.52 upgrade-abort

**Privileged Exec Mode Commands**

Aborts an ongoing software image upgrade

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
upgrade-abort {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

- `upgrade-abort {on <DEVICE-OR-DOMAIN-NAME>}`

  | upgrade-abort | Aborts an ongoing software image upgrade |
  | on <DEVICE-OR-DOMAIN-NAME> | Optional. Aborts an ongoing software image upgrade on a specified device or domain |

  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

**Examples**

```
rfs4000-229D58#upgrade ftp://anonymous:anonymous@192.168.13.10/LatestBuilds/W57/RFS4000.img
Running from partition /dev/mtdblock6
Validating image file header
Making file system
Extracting files (this may take some time).................

rfs7000-37FABE#upgrade-abort on rfs4000-229D58

rfs4000-229D58#upgrade ftp://anonymous:anonymous@192.168.13.10/LatestBuilds/W57/RFS4000.img
Running from partition /dev/mtdblock6
Validating image file header
Making file system
Extracting files (this may take some time).................
Update error: Aborted
rfs4000-229D58#
```
### 3.1.53 watch

**Privileged Exec Mode Commands**

Repeats a specified CLI command at periodic intervals

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
watch <1-3600> <LINE>
```

**Parameters**

- `watch <1-3600> <LINE>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>watch</code></td>
<td>Repeats a CLI command at a specified interval</td>
</tr>
<tr>
<td><code>&lt;1-3600&gt;</code></td>
<td>Select an interval from 1 - 3600 seconds. Pressing CTRL-Z halts execution of the command</td>
</tr>
<tr>
<td><code>&lt;LINE&gt;</code></td>
<td>Specify the CLI command name.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE#watch 1 show clock
rfs7000-37FABE#
```
3.1.54 exit

Privileged Exec Mode Commands

Ends the current CLI session and closes the session window.

For more information, see exit.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9000, NX9500, NX9510

Syntax

exit

Parameters

None

Examples

rfs7000-37FABE#exit
3.1.55 smart-cache

Pre-fetches cached content from the specified list of URLs

Smart caching is a licensed service available on the NX45XX and, NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see `smart-cache-policy`.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax
```
smart-cache pre-fetch-immediate <URL-LIST-NAME>
```

Parameters
- `smart-cache pre-fetch-immediate <URL-LIST-NAME>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>smart-cache</td>
<td>Pre-fetches content from the specified list of URLs</td>
</tr>
<tr>
<td>pre-fetch-immediate</td>
<td>Provide the URL list names (should be existing and configured). For more information on configuring URL lists, see <code>url-list</code>.</td>
</tr>
<tr>
<td>&lt;URL-LIST-NAME&gt;</td>
<td></td>
</tr>
</tbody>
</table>

Examples
```
nx4500-5CFA2B#smart-cache pre-fetch-immediate ?
  URL-LIST  URL List to be Pre Fetched

nx4500-5CFA2B#
```
3.1.56 virtual-machine

Privileged Exec Mode Commands

Installs, configures, and monitors the status of third-party virtual machines (VMs).

In addition to the WiNG VMs, the NX45XX, NX65XX, NX9500, and NX9510 series service platforms support the installation and administration of third-party VMs. However, the third-party VMs supported by these devices varies.

The third-party VMs supported on NX45XX and NX65XX are:

- TEAM-URC
- TEAM-RLS
- TEAM-VoWLAN

The VM supported on NX9500 and NX9510 is:

- ADSP

Use the virtual-machine command to install the third-party VMs, and configure parameters, such as install media type and location, number of Virtual Central Processing Units (VCPUs), VM memory, VM disk, number of Virtual Network Interfaces (VIFs), and Virtual Networking Computing (VNC) port.

Installing third-party VMs saves on hardware cost and provides a unified VM management interface.

This section is organized into the following sub-sections:

- Syntax NX45XX, NX65XX
- Syntax NX9500 and NX9510

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9500, NX9510

Syntax NX45XX, NX65XX

```bash
virtual-machine [assign-usb-ports|console|export|install|restart|set|start|stop|uninstall]

virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}

virtual-machine console [{<VM-NAME>|team-urc|team-rls|team-vowlan}]

virtual-machine export <VM-NAME> [{<FILE>|<URL}> {on <DEVICE-NAME>}

virtual-machine install [{<VM-NAME>|team-urc|team-rls|team-vowlan}
install-media [{<FILE>|<URL>|<USB}> {autostart|memory|on|vcpus|vif-count|vnc}
virtual-machine install [{team-urc|team-rls|team-vowlan} {on <DEVICE-NAME>}

virtual-machine restart [{<VM-NAME>|team-urc|team-rls|team-vowlan} {on <DEVICE-NAME>}
virtual-machine restart hard [{<VM-NAME>|team-urc|team-rls|team-vowlan}
{on <DEVICE-NAME>}

virtual-machine set [autostart|memory|vcpus|vif-count|vif-mac|vif-to-vmif|vnc}

virtual-machine set [autostart [ignore|start]|memory {<512-8192>}|vcpus {<1-4}|
vif-count {<0-2}>|vif-mac {<VIF-INDEX>}{<MAC-INDEX>}{vif-to-vmif {<VIF-INDEX>}{<VMIF-INDEX>}
vnc [disable|enable]| {<VM-NAME>|team-urc|team-rls|team-vowlan} {on <DEVICE-NAME>}

virtual-machine start [{<VM-NAME>|team-urc|team-rls|team-vowlan} {on <DEVICE-NAME>}

virtual-machine stop [{<VM-NAME>|hard|team-urc|team-rls|team-vowlan}
{on <DEVICE-NAME>}
```
virtual-machine stop hard [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine uninstall [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

Parameters NX45XX, NX65XX

- virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}

Assigns USB ports to TEAM-VoWLAN on a specified device

- on <DEVICE-NAME> – Optional. Specify the device name.

Note: Use the no > virtual-machine > assign-usb-ports to reassign the port to WiNG.

Note: TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.

- virtual-machine console [<VM-NAME>|team-urc|team-rls|team-vowlan]

Connects to the VM's console, based on the parameters passed. Select one of the following console options:

- <VM-NAME> – Connects to the console of the VM identified by the <VM-NAME> keyword. Specify the VM name.
- team-urc – Connects to the VM TEAM-URC's (IP-PBX) console
- team-rls – Connects to the VM TEAM Radio Link Server's (RLS) console
- team-vowlan – Connects to the VM TEAM-VoWLAN's (Voice over WLAN) console

- virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}

Exports an existing VM image and settings. Use this command to export the VM to another NX45XX or NX65XX device in the same domain.

- <VM-NAME> – Specify the VM name.
- <FILE> – Specify the location and name of the source file (VM image). The VM image is retrieved and exported from the specified location.
- <URL> – Specify the destination location. This is the location to which the VM image is copied. Use one of the following formats to provide the destination path:
  tpft://<hostname|IP>[:<port>]<path>/file
  ftp://<user>:<passwd>@<hostname|IP>[:<port>]<path>/file
  sftp://<user>:<passwd>@<hostname|IP>[:<port>]<path>/file
  http://<hostname|IP>[:<port>]<path>/file

- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Note: The VM should be in a stop state during the export process.

Note: If the destination is a device, the image is copied to a predefined location (VM archive)
virtual-machine install <VM-NAME> type [disk|iso disk-size <SIZE>|vm-archive] install-media [<FILE>|<URL>|<USB>] {autostart/memory/on/vcpus/vif-count|vnc}

virtual-machine install

Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process.

- <VM-NAME> – Specify the VM name.
- type – Specify the install-media (image) type. The options are:
  - disk – Specifies the install media type as pre-installed OS disk image (located in the flash memory)
  - iso disk-size <SIZE> – Specifies the install media type as ISO file. This is a single file, which contains the OS bootable install media.
  - disk-size <SIZE> – If the install media type is ISO, specify the disk size in GB.
  - vm-archive – Specifies the install media type as VM archive. The VM archive file is a tar.gz file consisting of a pre-installed OS disk image and an associated configuration file. The configuration is a standard libvirt VM template consisting of VM specific information.

Note: After specifying the install media type, specify the location of the image. The image can be located in any of the following supported locations: FLASH, USB, or a remote location, such as http, ftp, sftp, tftp.

install-media [<FILE>|<URL>|<USB>]

Specifies the install media location

- <FILE> – Specifies the install-media file is located on flash, for example flash:/cache
- <URL> – Specifies the install-media file is located on a remote URL. Provide the URL using one of the following formats:
  - tftp://<hostname|IP>[:port]/path/file
  - ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
  - sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
  - http://<hostname|IP>[:port]/path/file
- <USB> – Specifies the install-media file is located on a USB. Provide the USB path and file name using the following format:
  - usb<n>:/path/file

After specifying the image location, you may provide the following information:

- autostart – Optional. Specifies whether to autostart the VM on system reboot
- ignore – Enables autostart on each system boot/reboot
- start – Disables autostart (default setting)
- memory – Optional. Defines the VM memory size
  - <512-8192> – Specify the VM memory from 512 - 8192 MB. The default is 2048 MB.
- on – Optional. Executes the command on a specified device
  - <DEVICE-NAME> – Specify the service platform name.
  - vcpus – Optional. Specifies the number of VCPUS for this VM
    - <1-4> – Specify the number of VCPUS from 1- 4. The default setting is 4.

Contd...
### virtual-machine install

**virtual-machine install** installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process. Select one of the following options:

- **team-urc** – Installs the VM TEAM-URC image
- **team-rls** – Installs the VM TEAM-RLS image
- **team-vowlan** – Installs the VM TEAM-VoWLAN image

The following keywords are common to all of the above parameters:

- **on** `<DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
- `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

### virtual-machine restart

**virtual-machine restart** restarts the VM.

- **<VM-NAME>** – Restarts the VM identified by the `<VM-NAME>` keyword
- **team-urc** – Restarts the VM TEAM-URC
- **team-rls** – Restarts the VM TEAM-RLS
- **team-vowlan** – Restarts the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- **on** `<DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
- `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Note:** The option ‘hard’ forces the specified VM to restart.
virtual-machine set | Configures the VM settings

- autostart – Specifies whether to autostart the VM on system reboot
- ignore – Enables autostart on each system reboot
- start – Disables autostart
- memory – Defines the VM memory size
  - <512-8192> – Specify the VM memory from 512 - 8192 MB. The default is 1024 MB.
- vcpus – Specifies the number of VCPUS for this VM
  - <1-4> – Specify the number of VCPUS from 1-4.
- vif-count – Configures or resets the VM's VIFs
  - <0-2> – Specify the VIF number from 0-2.
- vif-mac – Configures the MAC address of the selected virtual network interface
  - <1-2> – Select the VIF
  - <1-8> – Specify the MAC index for the selected VIF
  - <MAC> – Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format.

Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the ‘set’ keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the Dataplane (referred to as VMIF). These VMIFs are standard l2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM’s interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the `vif-to-vmif` command to map a VIF to a VMIF on the DP bridge.

- vif-to-vmif – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8.

WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two VM interfaces. Each VM interface can be mapped to one of eight VMIF ports for NX4500 and NX6500 service platforms and twelve ports for NX9500 on the dataplane bridge. This mapping determines the destination for service platform routing.

By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1, by default, is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.

- vnc – Enables/disables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client.
  - disable – Disables VNC port
  - enable – Enables VNC port

Contd...
After configuring the VM settings, identify the VM to apply the settings.

- `<VM-NAME>` – Applies these settings to the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Applies these settings to the VM TEAM-URC
- `team-rls` – Applies these settings to the VM TEAM-RLS
- `team-vowlan` – Applies these settings to the VM TEAM-VoWLAN

virtual-machine start [ `<VM-NAME>|team-urc|team-rls|team-vowlan` ] { on `<DEVICE-NAME>` }

virtual-machine start

Starts the VM, based on the parameters passed. Select one of the following options:

- `<VM-NAME>` – Starts the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Starts the VM TEAM-URC
- `team-rls` – Starts the VM TEAM-RLS
- `team-vowlan` – Starts the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- `on `<DEVICE-NAME>`` – Optional. Executes the command on a specified device or devices
- `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Note: The option 'hard' forces the selected VM to shutdown.

virtual-machine stop [ `<VM-NAME>|hard|team-urc|team-rls|team-vowlan` ] { on `<DEVICE-NAME>` }

virtual-machine stop

Stops the VM, based on the parameters passed. Select one of the following options:

- `<VM-NAME>` – Stops the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Stops the VM TEAM-URC
- `team-rls` – Stops the VM TEAM-RLS
- `team-vowlan` – Stops the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- `on `<DEVICE-NAME>`` – Optional. Executes the command on a specified device or devices
- `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Note: The option 'hard' forces the selected VM to shutdown.

virtual-machine uninstall [ `<VM-NAME>|team-urc|team-rls|team-vowlan` ] { on `<DEVICE-NAME>` }

virtual-machine uninstall

Uninstalls the specified VM

- `<VM-NAME>` – Uninstalls the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Uninstalls the VM TEAM-URC
- `team-rls` – Uninstalls the VM TEAM-RLS
- `team-vowlan` – Uninstalls the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- `on `<DEVICE-NAME>`` – Optional. Executes the command on a specified device or devices
- `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Note: This command releases the VM’s resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.
Syntax NX9500 and NX9510

virtual-machine
virtual-machine console adsp
virtual-machine install adsp {on <DEVICE-NAME>}
virtual-machine restart adsp {on <DEVICE-NAME>}
virtual-machine set disk-size <100-500> adsp {on <DEVICE-NAME>}
virtual-machine set memory <512-8192> adsp {on <DEVICE-NAME>}
virtual-machine set wing-memory <12288-32739>
virtual-machine [start|stop] adsp {on <DEVICE-NAME>}
virtual-machine uninstall adsp {on <DEVICE-NAME>}

NOTE: On an NX95XX, you can use the install, start, stop, restart, and set commands to manage a third-party VM running on a NX45XX and NX65XX. You can also configure a third-party VM's settings through a NX95XX series service platform.

Parameters NX9500 and NX9510

- virtual-machine console adsp

<table>
<thead>
<tr>
<th>virtual-machine console</th>
<th>Connects to the Air-Defense Services Platform (ADSP) VM's console</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>When ADSP is running on the NX9500 and NX9510 model service platforms, WiNG communicates with ADSP using a single sign-on (SSO) authentication mechanism. Once the user is logged in, WiNG gains access to ADSP without being prompted to login again at ADSP. However, the WiNG and ADSP databases are not synchronized. ADSP has its own user database, stored locally within its VM, which is accessed whenever a user logs directly into ADSP.</td>
</tr>
<tr>
<td></td>
<td>WiNG and ADSP must be consistent in the manner events are reported up through a network hierarchy to ensure optimal interoperability and event reporting. To provide such consistency, WiNG has added support for an ADSP-like hierarchal tree. The tree resides within WiNG, and ADSP reads it from WiNG and displays the network hierarchy in its own ADSP interface. The hierarchal tree can also be used to launch ADSP modules (like Spectrum Analyzer) directly from WiNG. For more information on configuring WiNG tree-node structure, see tree-node.</td>
</tr>
</tbody>
</table>
virtual-machine install adsp {on <DEVICE-NAME>}
Installs the ADSP VM
- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Note: Before installing the ADSP VM, execute the upgrade command, giving the path and file name of the ADSP firmware image. This extracts the image on to the device (NX9500 or NX9510) on which the command has been executed. On successful completion of this process, execute the reload command to reboot the device. Once the device has been successfully rebooted, execute the virtual-machine > install > adsp command.

For example:
nx9500-6C874D#upgrade tftp://20.1.1.60/adsp-9.1.Mar 20
15:12:41 2014: %DAEMON-6-INFO: lighttpd[2405]: 127.0.0.1
127.0.0.1:443 - "POST /mapi.fcgi HTTP/1.1" 200 192 "-" "-"
-03-5.7.0.0-029B.img
Mar 20 15:12:51 2014: nx9500-6C874D : %DIAG-6-
NEW_LED_STATE: LED state message FIRMWARE_UPGRADE_STARTED
from module led_msg
Running from partition /dev/sda8
Validating image file header
Extracting files (this may take some time)......Mar 20
15:12:53 2014: %DAEMON-6-INFO: lighttpd[2405]: 127.0.0.1
127.0.0.1:443 - "POST /mapi.fcgi HTTP/1.1" 200 923 "-" "-"
............

virtual-machine restart adsp {on <DEVICE-NAME>}
Restarts the ADSP VM
- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

virtual-machine set disk-size <100-500> adsp {on <DEVICE-NAME>}
Sets the ADSP VM’s disk size (in GB). Specify a value from 100 - 500 GB.
- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Note: Stop the ADSP VM before executing this command.

virtual-machine set memory <512-8192> adsp {on <DEVICE-NAME>}
Modifies the ADSP VM’s memory. Specify a value from 512 - 8192 MB.
- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.
• virtual-machine set wing-memory <12288-32739>

virtual-machine set wing-memory <12288-32739> Specifies the WiNG memory size in MB

Note: This command is applicable only to the NX9500 and NX9510 service platforms. Use the show > virtual-machine-configuration command to view the configured memory allocation. Use the show > virtual-machine-statistics to view the current allocated memory allocation.

• <12288-32739> – Specify a value from 12288 - 32739 MB. The default is 18432 MB.

Note: The new memory setting takes effect only after the next boot.

• virtual-machine [start|stop] adsp {on <DEVICE-NAME>}

virtual-machine [start|stop] adsp {on <DEVICE-NAME>} Starts/stops the ADSP VM

• start – Starts the ADSP VM. Use this command to boot a shut down VM (in a stop state).
• stop – Stops a running ADSP VM. Use this command to shut down a running VM.
• on <DEVICE-NAME> – Optional. Executes the start/stop command on a specified device or devices
  • <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

• virtual-machine uninstall adsp {on <DEVICE-NAME>}

virtual-machine uninstall adsp {on <DEVICE-NAME>} Uninstalls the ADSP VM

• on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
  • <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Examples
The following examples show the VM installation process:

Installation media: USB

<DEVICE>#virtual-machine install <VM-NAME> type iso disk-size 8 install-media usb1://vms/ win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable

Installation media: pre-installed disk image

<DEVICE>#virtual-machine install <VM-NAME> type disk install-media flash:/vms/ win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on <DEVICE-NAME>

In the preceding example, the command is executed on the device identified by the <DEVICE-NAME> keyword. In such a scenario, the disk-size is ignored if specified. The VM has the install media as first boot device.

Installation media: VM archive

<DEVICE>#virtual-machine install type vm-archive install-media flash:/vms/<VM-NAME> vcpus 3

In the preceding example, the default configuration attached with the VM archive overrides any parameters specified.

Exporting an installed VM:

<DEVICE>#virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>

In the preceding example, the command copies the VM archive on to the URL (VM should be in stop state).
nx4500-5CFA2B>virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.
nx4500-5CFA2B>

NOTE: Use the show > virtual-machine > [configuration|debugging|export|statistics] command to view installed VM details.
Privileged Exec Mode Commands

Enables Redundant Array of Independent Disks (RAID) management

RAID is a group of one or more independent, physical drives, referred to as an array or drive group. These physically independent drives are linked together and appear as a single storage unit or multiple virtual drives. Replacing a single, large drive system with an array, improves performance (input and output processes are faster) and increases fault tolerance within the data storage system.

In an array, the drives can be organized in different ways, resulting in different RAID types. Each RAID type is identified by a number, which determines the RAID level. The common RAID levels are 0, 00, 1, 5, 6, 50 and 60. The WiNG MegaRAID implementation supports RAID-1, which provides data mirroring, but does not support data parity. RAID-1 consists of a two-drive array, where the data is simultaneously written on both drives, ensuring total data redundancy. In case of a drive failure the information on the other drive is used to rebuild the failed drive.

An array is said to be degraded when one of its drives has failed. A degraded array continues to function and can be rebooted using the one remaining functional drive. When a drive fails, the chassis sounds an alarm (if enabled), and the CLI prompt changes to “RAID degraded”. The failed drive is automatically replaced with a hot spare (provided a spare is installed). The spare is used to re-build the array.

Use this command to:

- Verify the current array status
- Start and monitor array consistency checks
- Retrieve date and time of the last consistency check
- Shut down drives before physically removing them
- Install new drives
- Assign drives as hot spares
- Identify a degraded drive
- Deactivate an alarm (triggered when a drive is removed from the array)

Supported in the following platforms:
- Service Platforms — NX9500

**NOTE:** The NX9500 service platform includes a single Intel MegaRAID controller, configured to provide a single virtual drive. This virtual drive is of the RAID-1 type, and has a maximum of two physical drives. In addition to these two drives, there are three hot spares, which are used in case of a primary drive failure.

**Syntax**

```
raid [check|install|locate|remove|silence|spare]
raid [check|silence]
raid [install|locate|remove|spare] drive <0-4>
```
### Parameters

- **raid [check|silence]**

  **check**  
  Starts a consistency check on the RAID array. Use the `show > raid` command to view consistency check status.  
  A consistency check verifies the data stored in the array. When regularly executed, it helps protect against data corruption, and ensures data redundancy. Consistency checks also warn of potential disk failures.

  **silence**  
  Deactivates an alarm  
  **Note:** When enabled, an audible alarm is triggered when a drive in the array fails. The `silence` command deactivates the alarm (sound).  
  **Note:** To enable RAID alarm, in the device configuration mode, use the `raid > alarm > enable` command. A NX9500 profile can also have the RAID alarm feature activated. For more information on the enabling RAID alarm, see `raid`.

- **raid [install|locate|remove|spare] drive <0-4>**

  **install <0-4>**  
  Includes a new drive, inserted in one of the available slots, in the array. Specify the drive number.  
  **Note:** Drives 0 and 1 are the array drives. Drives 2, 3, and 4 are the hot spare drives. You can include the new drive in a degraded array, or enable it as a hot spare.  
  **Note:** If the array is in a degraded state, the re-build process is triggered and the new drive is used to repair the degraded array.

  **locate <0-4>**  
  Enables LEDs to blink on a specified drive. Specify the drive number.  
  **Note:** Blinking LEDs enable you correctly locate a drive.

  **remove <0-4>**  
  Removes (shuts downs) a disk from the array, before it is physically removed from its slot. Specify the drive number containing the disk.  
  **Note:** Use this command to also remove a hot spare.

  **spare <0-4>**  
  Converts an unused drive into a hot spare. Specify the drive number.

### Examples

```
nx9500-6C874D#raid install drive 0
Error: Input Error: Drive 0 is already member of array, can't be added
nx9500-6C874D#
```
CHAPTER 4
GLOBAL CONFIGURATION COMMANDS

This chapter summarizes the global-configuration commands in the CLI command structure.

The term global indicates characteristics or features effecting the system as a whole. Use the Global Configuration Mode to configure the system globally, or enter specific configuration modes to configure specific elements (such as interfaces or protocols). Use the configure terminal command (under PRIV EXEC) to enter the global configuration mode.

The following example describes the process of entering the global configuration mode from the privileged EXEC mode:

<DEVICE># configure terminal
<DEVICE>(config)#

NOTE: The system prompt changes to indicate you are now in the global configuration mode. The prompt consists of the device host name followed by (config) and a pound sign (#).

Commands entered in the global configuration mode update the running configuration file as soon as they are entered. However, these changes are not saved in the startup configuration file until a commit write memory command is issued.

<DEVICE>(config)#?
Global configuration commands:
  aaa-policy Configure a authentication/accounting/authorization policy
  aaa-tacacs-policy Configure an authentication/accounting/authorization TACACS policy
  alias Alias
  ap621 AP621 access point
  ap622 AP622 access point
  ap650 AP650 access point
  ap6511 AP6511 access point
  ap6521 AP6521 access point
  ap6522 AP6522 access point
  ap6532 AP6532 access point
  ap6562 AP6562 access point
  ap71xx AP71XX access point
  ap7502 AP7502 access point
  ap7522 AP7522 access point
  ap7532 AP7532 access point
  ap81xx AP81XX access point
  ap82xx AP82XX access point
  association-acl-policy Configure an association acl policy
  auto-provisioning-policy Configure an auto-provisioning policy
bgp                                BGP Configuration
bonjour-gw-discovery-policy        Bonjour Gateway discovery policy
bonjour-gw-forwarding-policy       Bonjour Gateway forwarding policy
bonjour-gw-query-forwarding-policy Bonjour Gateway Query forwarding policy
captive-portal                    Configure a captive portal
clear                              Clear
client-identity                    Client identity (DHCP Device Fingerprinting)
client-identity-group              Client identity group (DHCP Fingerprint Database)
close                              Clone configuration object
crypto-cmp-policy                  CMP policy
customize                           Customize the output of summary cli commands
device                             Configuration on multiple devices
device-categorization              Configure a device categorization object
dhcp-server-policy                 DHCP server policy
dhcpv6-server-policy               DHCPv6 server related configuration
dns-whitelist                      Configure a whitelist
event-system-policy                Configure a event system policy
firewall-policy                    Configure firewall policy
global-association-list            Configure a global association list
help                               Description of the interactive help system
host                               Enter the configuration context of a device by specifying its hostname
igmp-snoop-policy                  Create igmp snoop policy
inline-password-encryption         Store encryption key in the startup configuration file
ip                                 Internet Protocol (IP)
ipv6                               Internet Protocol version 6 (IPv6)
ipv6-router-advertisement-policy  IPv6 Router Advertisement related configuration
l2tpv3                             L2tpv3 tunnel protocol
mac                                MAC configuration
management-policy                  Configure a management policy
meshpoint                          Create a new MESHPOINT or enter MESHPOINT configuration context for one or more MESHPOINTS
meshpoint-qos-policy               Configure a meshpoint quality-of-service policy
mint-policy                        Configure the global mint policy
nac-list                           Configure a network access control list
no                                 Create context of the device currently logged into
nx45xx                             NX45XX integrated services platform
nx65xx                             NX65XX integrated services platform
nx75xx                             NX75XX wireless controller
nx9000                             NX9000 wireless controller
passpoint-policy                   Configure a passpoint policy
password-encryption                Encrypt passwords in configuration
profile                            Profile related commands - if no parameters are given, all profiles are selected
radio-qos-policy                   Configure a radio quality-of-service policy
radius-group                       Configure radius user group parameters
radius-server-policy               Create device onboard radius policy
radius-user-pool-policy            Configure Radius User Pool
rename                             Create configuration object
rf-domain                          Create a RF Domain or enter rf-domain context for one or more rf-domains
rfs4000                            RFS4000 wireless controller
rfs6000                            RFS6000 wireless controller
rfs7000                            RFS7000 wireless controller
roaming-assist-policy              Configure a roaming-assist policy
role-policy                        Role based firewall policy
route-map                          Dynamic routing route map Configuration
routing-policy                     Policy Based Routing Configuration
self                               Config context of the device currently logged into
smart-cache-policy                  Configure a content caching
smart-rf-policy                     Configure a Smart-RF policy
t5                                    T5 wireless controller
url-filter                           Configure a url filter
url-list                             Configure a URL list
vx9000                               VX9000 wireless controller
web-filter-policy                    Configure a web filter policy
wips-policy                          Configure a wips policy
wlan                                 Create a new WLAN or enter WLAN configuration context for one or more WLANs
wlan-qos-policy                      Configure a wlan quality-of-service policy
write                                Write running configuration to memory or terminal

clrscr                               Clears the display screen
commit                               Commit all changes made in this session
do                                   Run commands from Exec mode
end                                   End current mode and change to EXEC mode
exit                                  End current mode and down to previous mode
revert                               Revert changes
service                              Service Commands
show                                 Show running system information

4.1 Global Configuration Commands

The following table summarizes Global Configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa-policy</td>
<td>Configures a AAA policy</td>
<td>page 4-8</td>
</tr>
<tr>
<td>aaa-tacacs-policy</td>
<td>Configures AAA-TACACS policy</td>
<td>page 4-9</td>
</tr>
<tr>
<td>alias</td>
<td>Configures network, VLAN, and service aliases</td>
<td>page 4-10</td>
</tr>
<tr>
<td>ap621</td>
<td>Adds an AP621 to the network</td>
<td>page 4-17</td>
</tr>
<tr>
<td>ap622</td>
<td>Adds an AP622 to the network</td>
<td>page 4-18</td>
</tr>
<tr>
<td>ap650</td>
<td>Adds an AP650 to the network</td>
<td>page 4-19</td>
</tr>
<tr>
<td>ap6511</td>
<td>Adds an AP6511 to the network</td>
<td>page 4-20</td>
</tr>
<tr>
<td>ap6521</td>
<td>Adds an AP6521 to the network</td>
<td>page 4-21</td>
</tr>
<tr>
<td>ap6522</td>
<td>Adds an AP6522 to the network</td>
<td>page 4-22</td>
</tr>
<tr>
<td>ap6532</td>
<td>Adds an AP6532 to the network</td>
<td>page 4-23</td>
</tr>
<tr>
<td>ap6562</td>
<td>Adds an AP6562 to the network</td>
<td>page 4-24</td>
</tr>
<tr>
<td>ap71xx</td>
<td>Adds an AP71XX to the network</td>
<td>page 4-25</td>
</tr>
<tr>
<td>ap7502</td>
<td>Adds an AP7502 to the network</td>
<td>page 4-26</td>
</tr>
<tr>
<td>ap7522</td>
<td>Adds an AP7522 to the network</td>
<td>page 4-27</td>
</tr>
<tr>
<td>ap7532</td>
<td>Adds an AP7532 to the network</td>
<td>page 4-28</td>
</tr>
<tr>
<td>ap81xx</td>
<td>Adds an AP81XX to the network</td>
<td>page 4-29</td>
</tr>
<tr>
<td>ap82xx</td>
<td>Adds an AP82XX to the network</td>
<td>page 4-30</td>
</tr>
<tr>
<td>association-acl-policy</td>
<td>Configures an association ACL policy</td>
<td>page 4-31</td>
</tr>
<tr>
<td>auto-provisioning-policy</td>
<td>Configures an auto provisioning policy, which defines the process by which an access point discovers controllers and associates with it.</td>
<td>page 4-32</td>
</tr>
<tr>
<td>bgp</td>
<td>Configures Border Gateway Protocol (BGP) settings</td>
<td>page 4-33</td>
</tr>
<tr>
<td>bonjour-gw-discovery-policy</td>
<td>Configures a Bonjour GW Discovery policy (RFS7000 and AP7131)</td>
<td>page 4-35</td>
</tr>
<tr>
<td>bonjour-gw-forwarding-policy</td>
<td>Configures a Bonjour GW Forwarding policy (RFS7000 and AP7131)</td>
<td>page 4-37</td>
</tr>
<tr>
<td>bonjour-gw-query-forwarding-policy</td>
<td>Configures a Bonjour GW Query Forwarding policy, which enables Bonjour query forwarding across multiple VLANs (RFS7000 and AP7131)</td>
<td>page 4-38</td>
</tr>
<tr>
<td>captive portal</td>
<td>Configures a captive portal</td>
<td>page 4-39</td>

<tr>
<td>-------------------------</td>
<td>------------------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>clear</td>
<td>Clears the event history</td>
<td>page 4-72</td>
</tr>
<tr>
<td>client-identity</td>
<td>Enables client identification through DHCP device fingerprinting</td>
<td>page 4-73</td>
</tr>
<tr>
<td>client-identity-group</td>
<td>Creates a new client identity group and enters its configuration mode</td>
<td>page 4-81</td>
</tr>
<tr>
<td>clone</td>
<td>Clones a specified configuration object</td>
<td>page 4-88</td>
</tr>
<tr>
<td>crypto-cmp-policy</td>
<td>Creates a crypto Certificate Management Protocol (CMP) policy and enters its configuration mode</td>
<td>page 4-89</td>
</tr>
<tr>
<td>customize</td>
<td>Customizes the CLI command summary output</td>
<td>page 4-90</td>
</tr>
<tr>
<td>device</td>
<td>Specifies configuration on multiple devices</td>
<td>page 4-101</td>
</tr>
<tr>
<td>device-categorization</td>
<td>Configures a device categorization object</td>
<td>page 4-103</td>
</tr>
<tr>
<td>dhcp-server-policy</td>
<td>Configures a DHCP server policy</td>
<td>page 4-109</td>
</tr>
<tr>
<td>dhcpv6-server-policy</td>
<td>Configures DHCPv6 server policy parameters, such as class, address range, and options</td>
<td>page 4-110</td>
</tr>
<tr>
<td>dns-whitelist</td>
<td>Configures a DNS whitelist</td>
<td>page 4-112</td>
</tr>
<tr>
<td>event-system-policy</td>
<td>Configures an event system policy</td>
<td>page 4-118</td>
</tr>
<tr>
<td>firewall-policy</td>
<td>Configures a firewall policy</td>
<td>page 4-134</td>
</tr>
<tr>
<td>global-association-list</td>
<td>Configures a global list of client MAC addresses</td>
<td>page 4-136</td>
</tr>
<tr>
<td>host</td>
<td>Sets the system’s network name</td>
<td>page 4-138</td>
</tr>
<tr>
<td>inline-password-encryption</td>
<td>Stores the encryption key in the startup configuration file</td>
<td>page 4-139</td>
</tr>
<tr>
<td>ip</td>
<td>Creates a IP access control list (ACL) and/or a SNMP IP ACL, and enters its configuration mode</td>
<td>page 4-140</td>
</tr>
<tr>
<td>ipv6</td>
<td>Creates a IPv6 ACL and enters its configuration mode</td>
<td>page 4-142</td>
</tr>
<tr>
<td>ipv6-router-advertisement-policy</td>
<td>Creates an IPv6 router advertisement (RA) policy and enters its configuration mode</td>
<td>page 4-143</td>
</tr>
<tr>
<td>l2tpv3</td>
<td>Configures Layer 2 Tunneling Protocol Version 3 (L2TPV3) tunnel policy</td>
<td>page 4-161</td>
</tr>
<tr>
<td>mac</td>
<td>Configures MAC access lists (goes to the MAC Access Control List (ACL) mode)</td>
<td>page 4-163</td>
</tr>
<tr>
<td>management-policy</td>
<td>Configures a management policy</td>
<td>page 4-164</td>
</tr>
<tr>
<td>meshpoint</td>
<td>Configures meshpoint related configuration commands</td>
<td>page 4-166</td>
</tr>
<tr>
<td>meshpoint-qos-policy</td>
<td>Configures a set of parameters that defines the quality of service (QoS)</td>
<td>page 4-167</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>mint-policy</td>
<td>Configures a MiNT security policy</td>
<td>page 4-168</td>
</tr>
<tr>
<td>nac-list</td>
<td>Configures a network ACL</td>
<td>page 4-169</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or sets its default</td>
<td>page 4-175</td>
</tr>
<tr>
<td>passpoint-policy</td>
<td>Creates a new passpoint policy and enters its configuration mode</td>
<td>page 4-178</td>
</tr>
<tr>
<td>password-encryption</td>
<td>Enables password encryption</td>
<td>page 4-180</td>
</tr>
<tr>
<td>profile</td>
<td>Configures profile related commands</td>
<td>page 4-181</td>
</tr>
<tr>
<td>radio-qos-policy</td>
<td>Configures a radio qos policy</td>
<td>page 4-185</td>
</tr>
<tr>
<td>radius-group</td>
<td>Configures a RADIUS group</td>
<td>page 4-186</td>
</tr>
<tr>
<td>radius-server-policy</td>
<td>Configures a RADIUS server policy</td>
<td>page 4-187</td>
</tr>
<tr>
<td>radius-user-pool-policy</td>
<td>Configures a RADIUS user pool policy</td>
<td>page 4-188</td>
</tr>
<tr>
<td>rename</td>
<td>Renames and existing top-level object (TLO)</td>
<td>page 4-189</td>
</tr>
<tr>
<td>rf-domain</td>
<td>Creates an RF Domain</td>
<td>page 4-193</td>
</tr>
<tr>
<td>rfs4000</td>
<td>Adds an RFS4000 to the network</td>
<td>page 4-222</td>
</tr>
<tr>
<td>rfs6000</td>
<td>Adds an RFS6000 to the network</td>
<td>page 4-223</td>
</tr>
<tr>
<td>rfs7000</td>
<td>Adds an RFS7000 to the network</td>
<td>page 4-224</td>
</tr>
<tr>
<td>nx45xx</td>
<td>Adds an NX45XX to the network</td>
<td>page 4-225</td>
</tr>
<tr>
<td>nx65xx</td>
<td>Adds an NX65XX to the network</td>
<td>page 4-226</td>
</tr>
<tr>
<td>nx75xx</td>
<td>Adds an NX75XX to the network</td>
<td>page 4-227</td>
</tr>
<tr>
<td>nx9000</td>
<td>Adds a NX9000, NX9500, or NX9510 to the network</td>
<td>page 4-228</td>
</tr>
<tr>
<td>roaming-assist-policy</td>
<td>Configures a roaming assist policy that enables access points to assist wireless clients in making roaming decisions, such as which access point to connect etc.</td>
<td>page 4-229</td>
</tr>
<tr>
<td>role-policy</td>
<td>Configures a role policy</td>
<td>page 4-230</td>
</tr>
<tr>
<td>route-map</td>
<td>Creates a dynamic BGP route map and enters its configuration mode</td>
<td>page 4-231</td>
</tr>
<tr>
<td>routing-policy</td>
<td>Configures a routing policy</td>
<td>page 4-232</td>
</tr>
<tr>
<td>self</td>
<td>Displays a logged device’s configuration context</td>
<td>page 4-233</td>
</tr>
<tr>
<td>smart-rf-policy</td>
<td>Configures a Smart RF policy</td>
<td>page 4-234</td>
</tr>
<tr>
<td>t5</td>
<td>Configures a t5 wireless controller. This command is applicable only on the RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, and NX9510 platforms.</td>
<td>page 4-235</td>
</tr>
</tbody>
</table>
### Table 4.1 Global Config Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

4.1.1 aaa-policy

Global Configuration Commands

Configures an Authentication, Accounting, and Authorization (AAA) policy. This policy configures multiple servers for authentication and authorization. Up to six servers can be configured for providing AAA services.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

aaa-policy <AAA-POLICY-NAME>

Parameters

- aaa-policy <AAA-POLICY-NAME>

Examples

rfs7000-37FABE(config)#aaa-policy test
rfs7000-37FABE(config-aaa-policy-test)#?

AAA Policy Mode commands:

accounting Configure accounting parameters
attribute Configure RADIUS attributes in access and accounting requests
authentication Configure authentication parameters
health-check Configure server health-check parameters
mac-address-format Configure the format in which the MAC address must be filled in the Radius-Request frames
no Negate a command or set its defaults
proxy-attribute Configure radius attribute behavior when proxying through controller or rf-domain-manager
server-pooling-mode Configure the method of selecting a server from the pool of configured AAA servers
use Set setting to use
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-aaa-policy-test)#

Related Commands

no Removes an existing AAA policy

NOTE: For more information on the AAA policy commands, see Chapter 8, AAA-POLICY.
4.1.2 aaa-tacacs-policy

Configures AAA Terminal Access Controller Access-Control System (TACACS) policy. This policy configures multiple servers for authentication and authorization. A TACACS Authentication server should be configured when the server preference is authenticated server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>

Parameters
- aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>

Examples
rfs7000-37FABE(config)#aaa-tacacs-policy testpolicy
rfs7000-37FABE(config-aaa-tacacs-policy-testpolicy)#?
AAA TACACS Policy Mode commands:
accounting Configure accounting parameters
authorization Configure authorization parameters
no Negate a command or set its defaults
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
del End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-aaa-tacacs-policy-testpolicy)#

Related Commands

no Removes an existing AAA TACACS policy

NOTE: For more information on the AAA-TACACS policy commands, see Chapter 25, AAA-TACACS-POLICY.
4.1.3 alias

**Global Configuration Commands**

Configures network, VLAN, host, string, and network-service aliases.

Aliases are objects having a unique name and content that is determined by the alias type (network, VLAN, and network-service).

A typical large enterprise network, consists of multiple sites (RF Domains) having similar configuration parameters with few elements that vary, such as networks or network ranges, hosts having different IP addresses, and VLAN IDs or URLs. These elements can be defined as aliases (object oriented wireless firewalls) and used across sites by applying overrides to the object definition. Using aliases results in a configuration that is easier to understand and maintain.

Multiple instances of an alias (same type and same name) can be defined at any of the following levels: global, RF Domain, profile, or device. An alias defined globally functions as a top-level-object (TLO). Global aliases are not mandatory, and can be defined at the domain-level, or profile, or device-level only. An alias defined on a device is applicable to that device only. An alias defined on a profile applies to every device using the profile. Similarly, aliases defined at the RF Domain level apply to all devices within that domain.

Aliases defined at any given level can be overridden at any of the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

Aliases can be classified as:

- **address-range alias** – Maps a name to a range of IP addresses. An address-range alias can be utilized at different deployments. For example, if an ACL defines a pool of network addresses as 192.168.10.10 through 192.168.10.100 for an entire network, and a remote location's network range is 172.16.13.20 through 172.16.13.110, the remote location's ACL can be overridden using an alias. At the remote location, the ACL works with the 172.16.13.20-110 address range. A new ACL need not be created specifically for the remote deployment location.

- **host alias** – Maps a name to a specific host (identified by its IP address). For example, 192.168.10.23. A host alias can be utilized at different deployments. For example, if a central network DNS server is set a static IP address, and a remote location's local DNS server is defined, this host can be overridden at the remote location. At the remote location, the network is functional with a local DNS server, but uses the name set at the central network. A new host need not be created at the remote location. This simplifies creating and managing hosts and allows an administrator to better manage specific local requirements.

- **network alias** – Maps a name to a network. A network alias can be utilized at different deployments. For example, if a central network ACL defines a network as 192.168.10.0/24, and a remote location's network range is 172.16.10.0/24, the ACL can be overridden at the remote location to suit their local (but remote) requirement. At the remote location, the ACL functions with the 172.16.10.0/24 network. A new ACL need not be created specifically for the remote deployment. This simplifies ACL definition and allows an administrator to better manage specific local requirements.

- **network-group alias** – Maps a name to a single or a range of addresses of devices, hosts, and network configurations. Network configurations are complete networks in the form 192.168.10.0/24 or IP address range in the form 192.168.10.0-192.168.10.20. A network-group alias can contain a maximum of eight (8) host entries, eight (8) network entries, and eight (8) IP address-range entries. A maximum of 32 network-group alias entries can be created. A network-group alias can be used in IP firewall rules to substitute hosts, subnets, and IP address ranges.

- **network-service alias** – Maps a name to service protocols and ports to match. Both source and destination ports are configurable. For each protocol, up to 2 source port ranges and up to 2 destination port ranges can be configured. A maximum of 4 protocol entries can be configured per network-service alias. When used with an ACL, the network-service alias defines the service-specific components of the ACL rule. Overrides can be applied to the service alias, at the device level, without modifying the ACL. Application of overrides to the service alias allows an ACL to be used across sites.
Use a network-service alias to associate more than one IP address to a network interface, providing multiple connections to a network from a single IP node.

**NOTE:** When used with ACLs, network, network-group, and network-service aliases act as enhanced firewalls.

- **vlan alias** — maps a name to a VLAN ID. A VLAN alias can be used at different deployments. For example, if a named VLAN is defined as 10 for the central network, and the VLAN is set at 26 at a remote location, the VLAN can be overridden at the deployment location with an alias. At the remote deployment location, the network is functional with a VLAN ID of 26 but utilizes the name defined at the centrally managed network. A new VLAN need not be created specifically for the remote deployment.

- **string alias** — Maps a name to a specific string (for example, RF Domain name). A host alias can be utilized at different deployments. For example, if the main domain at a remote location is called `loc1.domain.com` and at another deployment location it is called `loc2.domain.com`, the alias can be overridden at the remote location to suit the local (but remote) requirement. At one remote location, the alias functions with the `loc1.domain.com` domain and at the other with the `loc2.domain.com` domain.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
alias [address-range|host|network|network-group|network-service|string|vlan]
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
alias host <HOST-ALIAS-NAME> <HOST-IP>
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP>]
    | host <HOST-IP> {<HOST-IP>}
    | network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto {<0-254>|<WORD>|eigrp|gre|
    igmp|igp|ospf|vrrp} {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|
    ntp|pop3|proto|sip|smtp|sourceport|ssh|telnet|tftp|www)}
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto {<0-254>|<WORD>|eigrp|gre|
    igmp|igp|ospf|vrrp} {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|
    ntp|pop3|proto|sip|smtp|sourceport [<1-65535]|<WORD>|ssh|telnet|tftp|www)}
alias string <STRING-ALIAS-NAME> <LINE>
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

**Parameters**

- **address-range address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>**

  ```plaintext
  address-range <ADDRESS-RANGE-ALIAS-NAME>
  Creates a address range alias, defining a range of IP addresses
  ```

  ```plaintext
  <ADDRESS-RANGE-ALIAS-NAME> — Specify the address range alias name.
  ```

  **Note:** Alias name should begin with `\$`. 
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias host &lt;HOST-ALIAS-NAME&gt; &lt;HOST-IP&gt;</td>
<td>Creates a host alias, defining a single network host</td>
</tr>
<tr>
<td>host &lt;HOST-ALIAS-NAME&gt;</td>
<td>Associates the network host's IP address with this host alias.</td>
</tr>
<tr>
<td>&lt;HOST-IP&gt;</td>
<td>Associates the network host's IP address with this host alias.</td>
</tr>
<tr>
<td>alias network &lt;NETWORK-ALIAS-NAME&gt; &lt;NETWORK-ADDRESS/MASK&gt;</td>
<td>Creates a network alias, defining a single network address</td>
</tr>
<tr>
<td>network &lt;NETWORK-ALIAS-NAME&gt;</td>
<td>Associates a single network with this network alias.</td>
</tr>
<tr>
<td>&lt;NETWORK-ADDRESS/MASK&gt;</td>
<td>Associates a range of IP addresses with this network-group alias</td>
</tr>
<tr>
<td>address-range &lt;STARTING-IP&gt;</td>
<td>Associates a range of IP addresses with this network-group alias</td>
</tr>
<tr>
<td>to &lt;ENDING-IP&gt;</td>
<td>Associates a range of IP addresses with this network-group alias</td>
</tr>
<tr>
<td>host &lt;HOST-IP&gt;</td>
<td>Associates a single or multiple hosts with this network-group alias</td>
</tr>
</tbody>
</table>

**Note:**
- Alias name should begin with `$`
- Network-group aliases are used in ACLs, to define the network-specific components. ACLs using aliases can be used across sites by re-defining the network-group alias elements at the device or profile level.

After specifying the name, specify the following: a range of IP addresses, host addresses, or a range of network addresses.

| Source port | • `<WORD>` — Optional. Identifies the destination port by the service name provided. For example, the secure shell (SSH) service uses TCP port 22. |
| bgp — Optional. Configures the default Border Gateway Protocol (BGP) services port (179) |
| dns — Optional. Configures the default Domain Name System (DNS) services port (53) |
| ftp — Optional. Configures the default File Transfer Protocol (FTP) control services port (21) |
| ftp-data — Optional. Configures the default FTP data services port (20) |
| gopher — Optional. Configures the default gopher services port (70) |

Contd..
## Examples

- `rfs4000-229D58 (config)# alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13`
- `rfs4000-229D58 (config)# alias network $TestNetworkAlias 192.168.13.0/24`
- `rfs4000-229D58 (config)# alias host $TestHostAlias 192.168.13.10`
- `rfs4000-229D58 (config)# alias vlan $TestVLANAlias 1`
rfs4000-229D58(config)#alias network-group $TestNetGrpAlias address-range 192.168.13.7 to 192.168.13.16 192.168.13.20 to 192.168.13.25
rfs4000-229D58(config)#commit

rfs4000-229D58(config)#alias network-group $TestNetGrpAlias network 192.168.13.0/24 192.168.16.0/24
rfs4000-229D58(config)#commit

rfs4000-229D58(config)#alias network-service $NetworkServAlias proto 17
rfs4000-229D58(config)#commit

rfs4000-229D58(config)#show context

Example 1:
rfs4000-229D58(config)# alias network-group $test host 192.168.1.10 192.168.1.11
rfs4000-229D58(config)# alias network-group $test network 192.168.2.0/24 192.168.3.0/24
rfs4000-229D58(config)# alias network-group $test address-range 192.168.4.10 to 192.168.4.20

In the preceding example, the network-group alias ‘$test’ includes hosts 192.168.1.10 and 192.168.1.11, networks 192.168.2.0/24 and 192.168.3.0/24 and address-range 192.168.4.10 to 192.168.4.20.

Example 2:
rfs4000-229D58(config)#alias network-service $kerberos proto tcp 749 750 80 proto tcp sourceport 20 proto udp 68 sourceport 67
rfs4000-229D58(config)#commit

In the preceding example, the network-service alias ‘$kerberos’ is configured to allow following traffic:

- TCP traffic to destination ports 749, 750, and 80
- TCP traffic from source port 20
- UDP traffic to destination port 68 and from source port 67
rfs4000-229D58(config)#show context

Related Commands

| no | Removes an existing network, VLAN, service, or string alias |
### 4.1.4 ap621

**Global Configuration Commands**

Adds an AP621 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`ap621 <MAC>`

**Parameters**

- `ap621 <MAC>`

  **<MAC>** Specify the AP621's MAC address.

**Examples**

```
rfs7000-37FABE(config)#ap621 5C-0E-8B-E3-C3-56
rfs7000-37FABE(config-device-5C-0E-8B-E3-C3-56)#show context

ap621 5C-0E-8B-E3-C3-56
  use profile default-ap621
  use rf-domain default
  hostname ap621-E3C356
rfs7000-37FABE(config-device-5C-0E-8B-E3-C3-56)#
```

```
rfs7000-37FABE(config)#show wireless ap configured

<table>
<thead>
<tr>
<th>IDX</th>
<th>NAME</th>
<th>MAC</th>
<th>PROFILE</th>
<th>RF-DOMAIN</th>
<th>ADOPTED-BY</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

<td>un-adopted</td>
</tr>
</tbody>
</table>
```

**Related Commands**

- `no` Removes an AP621 from the network
4.1.5 ap622

Global Configuration Commands

Adds an AP622 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ap622 <MAC>

Parameters

- ap622 <MAC>

Examples

rfs7000-37FABE(config)#ap622 B4-C7-99-43-C3-DC
rfs7000-37FABE(config-device-B4-C7-99-43-C3-DC)#show context
    ap622 B4-C7-99-43-C3-DC
    use profile default-ap622
    use rf-domain default
    hostname ap622-43C3DC
rfs7000-37FABE(config-device-B4-C7-99-43-C3-DC)#

rfs7000-37FABE(config)#show wireless ap configured

Related Commands

no

Removes an AP622 from the network
4.1.6 ap650

Global Configuration Commands

Adds an AP650 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ap650 <MAC>

Parameters

- **<MAC>**<MAC> Specify the AP650's MAC address.

Examples

rfs7000-37FABE(config)#ap650 5C-0E-8B-34-81-BC

4.1.18 association-acl-policy

**Global Configuration Commands**

Configures an association ACL policy. This policy defines a list of devices allowed or denied access to the network.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>
```

**Parameters**

- **association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>**

| <ASSOCIATION-ACL-POLICY-NAME> | Specify the association ACL policy name. If the policy does not exist, it is created. |

**Examples**

```plaintext
rfs7000-37FABE(config)#association-acl-policy test
rfs7000-37FABE(config-assoc-acl-test)#?
```

Association ACL Mode commands:
- **deny** Specify MAC addresses to be denied
- **no** Negate a command or set its defaults
- **permit** Specify MAC addresses to be permitted
- **clrscr** Clears the display screen
- **commit** Commit all changes made in this session
- **do** Run commands from Exec mode
- **end** End current mode and change to EXEC mode
- **exit** End current mode and down to previous mode
- **help** Description of the interactive help system
- **revert** Revert changes
- **service** Service Commands
- **show** Show running system information
- **write** Write running configuration to memory or terminal

```plaintext
rfs7000-37FABE(config-assoc-acl-test)#
```

**Related Commands**

| **no** | Resets values or disables commands |

**NOTE:** For more information on the association-acl-policy, see Chapter 10, ASSOCIATION-ACL-POLICY.
4.1.19 auto-provisioning-policy

Global Configuration Commands

Configures an auto provisioning policy. This policy configures the automatic provisioning of device adoption. The policy configures how an AP is adopted based on its type.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>

Parameters

- auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>

Examples

rfs7000-37FABE(config)#auto-provisioning-policy test
rfs7000-37FABE(config-auto-provisioning-policy-test)#?

Auto-Provisioning Policy Mode commands:

- adopt: Add rule for device adoption
- default-adoption: Adopt devices even when no matching rules are found.
- deny: Add rule to deny device adoption
- evaluate-always: Set the flag to evaluate the policy everytime, regardless of previous adoption status
- no: Negate a command or set its defaults
- redirect: Add rule to redirect device adoption
- upgrade: Add rule for device upgrade
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

rfs7000-37FABE(config-auto-provisioning-policy-test)#

Related Commands

no: Removes an existing Auto Provisioning policy

NOTE: For more information on the association-acl-policy, see Chapter 9, AUTO-PROVISIONING-POLICY.
4.1.20 bgp

Configure Border Gateway Protocol (BGP) settings

BGP is an inter-ISP routing protocol which establishes routing between Internet Service Providers (ISPs). ISPs use BGP to exchange routing and reachability information between Autonomous Systems (AS) on the Internet. BGP makes routing decisions based on paths, network policies and/or rules configured by network administrators. The primary role of a BGP system is to exchange network reachability information with other BGP peers. This information includes information on AS that the reachability information traverses. This information is sufficient to create a graph of AS connectivity from which routing decisions can be created and rules enforced.

An AS is a set of routers under the same administration that use Interior Gateway Protocol (IGP) and common metrics to define how to route packets within the AS. AS uses inter-AS routing to route packets to other ASs. For an external AS, an AS appears to have a single coherent interior routing plan and presents a consistent picture of the destinations reachable through it.

Routing information exchanged through BGP supports only destination based forwarding (it assumes a router forwards packets based on the destination address carried in the IP header of the packet).

BGP uses TCP as its transport protocol. This eliminates the need to implement explicit update fragmentation, retransmission, acknowledgment, and sequencing. BGP listens on TCP port 179. The error notification mechanism used in BGP assumes that TCP supports a graceful close (all outstanding data is delivered before the connection is closed).

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>

Parameters
- bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as-path-list &lt;LIST-NAME&gt;</td>

nx4500-5CFA2B(config)#bgp as-path-list AS-TEST-PATH
nx4500-5CFA2B(config-bgp-as-path-list-AS-TEST-PATH)#?

BGP AS Path List Mode commands:
  deny Specify packets to reject
  no    Negate a command or set its defaults
  permit Specify packets to forward
  clrscr Clears the display screen
  commit Commit all changes made in this session
  do     Run commands from Exec mode
  end    End current mode and change to EXEC mode
  exit   End current mode and down to previous mode
  help   Description of the interactive help system
  revert Revert changes
  service Service Commands
  show   Show running system information
  write  Write running configuration to memory or terminal

Related Commands

| no      | Modifies BGP settings, based on the parameters passed |

NOTE: For more information on configuring BGP Top-Level Objects (TLOs), see Chapter 28, BORDER GATEWAY PROTOCOL.
4.1.21 bonjour-gw-discovery-policy

Bonjour is Apple’s zero-configuration networking (Zeroconf) implementation. Zeroconf is a group of technologies that include service discovery, address assignment and hostname resolution. Bonjour locates the devices (printers, computers etc.) and services these computers provide over a local network.

Bonjour provides a method to discover services on a local area network (LAN). Bonjour allows users to set up a network without any configuration. Services such as printers, scanners and file-sharing servers can be found using Bonjour. Bonjour only works within a single broadcast domain. However, with a special DNS configuration, it can be extended to find services across broadcast domains.

This command configures a Bonjour GW Discovery policy. The policy defines a list of services clients can discover across subnets. A maximum of 8 (eight) policies can be created on access point, wireless controller, or service platform.

When configured and applied, this feature enables discovery of Bonjour services on local and/or tunneled VLANs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
bonjour-gw-discovery-policy <POLICY-NAME>

Parameters
- bonjour-gw-discovery-policy <POLICY-NAME>

| <POLICY-NAME> | Specify the Bonjour GW Discovery policy name. If the policy does not exist, it is created. In the Bonjour GW Discovery policy configuration mode, use the allow-service keyword to configure the services that the Bonjour gateway is allowed to discover. A maximum of 16 (sixteen) service rules can be created. Optionally, you can restrict this facility for users on specific VLANs. To do so, specify the VLAN IDs.  
**Note:** Execute the bonjour-gw-forwarding-policy command to enable forwarding of Bonjour service responses across VLANs.  
**Note:** To associate a Bonjour GW Discovery policy with a WLAN, in the WLAN configure mode, execute the following command: use > bonjour-gw-discovery-policy > <POLICY-NAME>. For more information see, use.  
**Note:** To associate a Bonjour GW Discovery policy with a WLAN, in the interface VLAN configure mode, execute the following command: use > bonjour-gw-discovery-policy > <POLICY-NAME>. For more information see, use.  
**Note:** To associate a Bonjour GW Discovery policy with a user role, in the role-policy - user-role config mode, execute the following command: use > bonjour-gw-discovery-policy > <POLICY-NAME> For more information see, use. |
Examples
rfs7000-37FABE(config)#bonjour-gw-discovery-policy TestPolicy
rfs7000-37FABE(config-bonjour-gw-discovery-policy-TestPolicy)#?
commands:
  allow-service  Allow Bonjour Service on local or tunneled vlan, Optionally
                  VLAN IDs can be given so service will be discovered for those
                  vlan only
  no             Negate a command or set its defaults
clrscr          Clears the display screen
commit          Commit all changes made in this session
do              Run commands from Exec mode
end             End current mode and change to EXEC mode
exit            End current mode and down to previous mode
help            Description of the interactive help system
revert          Revert changes
service         Service Commands
show            Show running system information
write           Write running configuration to memory or terminal

rfs7000-37FABE(config-bonjour-gw-discovery-policy-TestPolicy)#
Related Commands

| no             | Removes an existing Bonjour GW Discovery policy |
4.1.22 bonjour-gw-forwarding-policy

**Global Configuration Commands**

Configures a Bonjour GW Forwarding policy. When configured and applied on the controller, the policy defines the service VLANs (the VLANs on which Bonjour services are running) and client VLANs where clients are present. All Bonjour responses from service VLANs are forwarded to client VLANs. A maximum of 2 (two) policies can be created on a wireless controller or service platform. And only 1 (one) policy can be created on an access point.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
bonjour-gw-forwarding-policy <POLICY-NAME>
```

**Parameters**
- `bonjour-gw-forwarding-policy <POLICY-NAME>`

<table>
<thead>
<tr>
<th>&lt;POLICY-NAME&gt;</th>
<th>Specify the Bonjour GW Forwarding policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>To receive Bonjour service responses from specific VLANs, specify the VLAN IDs. In the Bonjour GW Forwarding policy configuration mode, provide a list of VLAN IDs from which Bonjour responses can be received (format: 10-20, 25, 30-35). And then specify the list of client VLANs that can access Bonjour services.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Execute the <code>bonjour-gw-discovery-policy</code> command to define the Bonjour services allowed on local and tunneled VLANs.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>To associate a Bonjour GW Forwarding policy with a device or profile, in the profile/device configuration mode, execute the <code>use &gt; bonjour-gw-forwarding-policy &gt; &lt;POLICY-NAME&gt;</code> command. For more information see, <code>use</code>.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config)#bonjour-gw-forwarding-policy TestPolicy
rfs7000-37FABE(config-bonjour-gw-forwarding-policy-TestPolicy)##
```

**Commands:**
- `forward-bonjour-response` Forwards Bonjour service response across VLANs
- `no` Negate a command or set its defaults
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

**Related Commands**

```plaintext
no
```

Removes an existing Bonjour GW Forwarding policy
4.1.23 bonjour-gw-query-forwarding-policy

Configures a Bonjour GW Query Forwarding policy and enters its configuration mode. When created and applied, this policy enables forwarding of Bonjour queries across VLANs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
bonjour-gw-query-forwarding-policy <POLICY-NAME>

Parameters
- bonjour-gw-query-forwarding-policy <POLICY-NAME>

Examples
rfs7000-37FABE(config)#bonjour-gw-query-forwarding-policy TestPolicy
rfs7000-37FABE(config-bonjour-gw-query-forwarding-policy-test)#?
(config-bonjour-gw-query-forwarding-policy) commands:
  forward-bonjour-query  Forwards bonjour query across vlans
  no                     Negate a command or set its defaults
  clrscr                 Clears the display screen
  commit                 Commit all changes made in this session
  do                     Run commands from Exec mode
  end                    Exit current mode and change to EXEC mode
  exit                   Exit current mode and down to previous mode
  help                   Description of the interactive help system
  revert                 Revert changes
  service                Service Commands
  show                   Show running system information
  write                  Write running configuration to memory or terminal

4.1.24 captive portal

A captive portal provides secure guest access and authentication services within the network. The following table lists the commands available to enter the captive portal configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal</td>
<td>Creates a new captive portal and enters its configuration mode</td>
<td>page 4-40</td>
</tr>
<tr>
<td>captive-portal-mode commands</td>
<td>Summarizes captive portal configuration commands</td>
<td>page 4-42</td>
</tr>
</tbody>
</table>
4.1 captive-portal

4.1.24.1 captive-portal

Configures a captive portal

A captive portal provides secure access using a standard Web browser. Captive portals provide authenticated access by capturing and re-directing a wireless user's Web browser session to a captive portal login page where the user must enter valid credentials to access to the wireless network. Once logged into the captive portal, additional Acknowledgment, Agreement, Welcome, No Service, and Fail pages provide the administrator options to customize the screen flow and user appearance.

Captive portals are recommended for providing guests or visitors authenticated access to network resources when 802.1X EAP is not a viable option. Captive portal authentication does not provide end-user data encryption, but it can be used with static WEP, WPA-PSK or WPA2-PSK encryption.

Authentication for captive portal access requests is performed using a username and password pair, authenticated by an integrated RADIUS server. Authentication for private network access is conducted either locally on the requesting wireless client, or centrally at a datacenter.

Captive portals use a Web provisioning tool to create guest user accounts directly on the controller, service platform, or access point. The connection medium defined for the Web connection is either HTTP or HTTPS. Both HTTP and HTTPS use a request and response procedure to disseminate information to and from requesting wireless clients.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

captive-portal <CAPTIVE-PORTAL-NAME>

Parameters

- captive-portal <CAPTIVE-PORTAL-NAME>

Examples

rfs7000-37FABE(config)#captive-portal test
rfs7000-37FABE(config-captive-portal-test)#?

Captive Portal Mode commands:

OAuth: OAuth 2.0 authentication configuration
access-time: Allowed access time for the client. Used when there is no session time in radius response
access-type: Access type of this captive portal
accounting: Configure how accounting records are created for this captive portal policy
bypass: Bypass captive portal
connection-mode: Connection mode for this captive portal
custom-auth: Custom user information
data-limit: Enforce data limit for clients
inactivity-timeout: Inactivity timeout in seconds. If a frame is not received from client for this amount of time, then current session will be removed
ipv6: Internet Protocol version 6 (IPv6)
logout-fqdn: Configure the FQDN address to logout the session from client
no: Negate a command or set its defaults
post-authentication-vlan: Configure post authentication vlan for captive portal users
radius-vlan-assignment    Enable radius vlan assignment for captive portal users
redirection               Configure connection redirection parameters
server                    Configure captive portal server parameters
simultaneous-users        Particular username can only be used by a certain number of MAC addresses at a time
terms-agreement           User needs to agree for terms and conditions
use                       Set setting to use
webpage                    Configure captive portal webpage parameters
webpage-auto-upload       Enable automatic upload of advanced webpages
webpage-location          The location of the webpages to be used for authentication. These pages can either be hosted on the system or on an external web server.

clrscr                    Clears the display screen
commit                    Commit all changes made in this session
do                        Run commands from Exec mode
end                        End current mode and change to EXEC mode
exit                      End current mode and down to previous mode
help                      Description of the interactive help system
revert                    Revert changes
service                   Service Commands
show                      Show running system information
write                     Write running configuration to memory or terminal

4.1.24.2.1 OAuth

- captive-portal-mode commands

Configures the client ID used by OAuth 2.0 to authenticate a client and provide access to protected resources on the captive portal.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
OAuth client-id [facebook|google] <WORD>

Parameters
- OAuth client-id [facebook|google] <WORD>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OAuth client-id</td>
<td>Configures OAuth 2.0 settings required to provide OAuth access to clients</td>
</tr>
<tr>
<td>[facebook</td>
<td>google]</td>
</tr>
<tr>
<td>&lt;WORD&gt;</td>
<td>- facebook – Configures the client's Facebook ID</td>
</tr>
<tr>
<td></td>
<td>- google – Configures the client's Google ID</td>
</tr>
<tr>
<td></td>
<td>- &lt;WORD&gt; – Provide the client's Facebook/Google ID (should be registered with the OAuth provider)</td>
</tr>
</tbody>
</table>

Examples
rfs7000-6DCD4B(config-captive-portal-test2)#OAuth client-id Google TechPubs.printer.google.com
rfs7000-6DCD4B(config-captive-portal-test2)#show context captive-portal test2
OAuth client-id Google TechPubs.printer.google.com
rfs7000-6DCD4B(config-captive-portal-test2)#

Related Commands

- **no** Removes all OAuth client identities configured for this captive portal
4.1.24.2.2 access-time

- captive-portal-mode commands

Defines the permitted access time for a client. It is used when no session time is defined in the RADIUS response.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
access-time <10-10080>

Parameters
- access-time <10-10080>

| <10-10080>   | Defines the access time allowed for a wireless client from 10 - 10080 minutes. The default is 1440 minutes. |

Examples
rfs7000-37FABE(config-captive-portal-test)#access-time 35
rfs7000-37FABE(config-captive-portal-test)# show context captive-portal test
   access-time 35
rfs7000-37FABE(config-captive-portal-test)#

Related Commands
- no
  Reverts to the default permitted access time (1440 minutes)
4.1.24.2.3 access-type

Defines the captive portal's access type. The authentication scheme configured here is applied to wireless clients using this captive portal.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
access-type [OAuth|custom-auth-radius|email|logging|no-auth|radius]

Parameters
- access-type [OAuth|custom-auth-radius|email|logging|no-auth|radius]

<table>
<thead>
<tr>
<th>OAuth</th>
<th>Uses OAuth 2.0 authorization framework to authenticate a client requesting captive portal access</th>
</tr>
</thead>
<tbody>
<tr>
<td>custom-auth-radius</td>
<td>Specifies the custom user information used for authentication (RADIUS lookup of given information, such as name, e-mail address, telephone etc.). When configured, accessing clients are required to provide a 1-32 character lookup data string used to authenticate their credentials. <strong>Note:</strong> When selecting this option, use the custom-auth command to configure the required user information.</td>
</tr>
<tr>
<td>email</td>
<td>Uses user’s e-mail address for authentication</td>
</tr>
<tr>
<td>logging</td>
<td>Provides users access without authentication. The system logs access details of users allowed access.</td>
</tr>
<tr>
<td>no-auth</td>
<td>Defines no authentication required for a guest (guest is redirected to welcome message). Provides users access to the captive portal without authentication.</td>
</tr>
<tr>
<td>radius</td>
<td>Enables RADIUS authentication for wireless clients. Provides captive portal access to successfully authenticated users only. This is the default setting.</td>
</tr>
</tbody>
</table>

Examples

Related Commands
no
  Removes the captive portal access type or reverts to default (radius)
4.1.24.2.4 accounting

- captive-portal-mode commands

Enables support for accounting messages for this captive portal.

When enabled, accounting for clients entering and exiting the captive portal is initiated. Accounting is the method of collecting and sending security server information for billing, auditing, and reporting user data. This data includes information, such as start and stop times, executed commands (such as PPP), number of packets and number of bytes transmitted etc. Accounting enables tracking of captive portal services consumed by clients.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

accounting [radius|syslog]
accounting radius
accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}

Parameters

- accounting radius

  radius
  Enables support for RADIUS accounting messages. When enabled, this option uses an external RADIUS resource for AAA accounting. This option is disabled by default.

- accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}

  syslog
  Enables support for syslog accounting messages. When enabled, data relating to wireless client usage of remote access services is logged on the specified external syslog resource. This information assists in differentiating between local and remote users. Remote user information can be archived to an external location for periodic network and user administration. This option is disabled by default.

  - host <IP/HOSTNAME> – Specifies the destination where accounting messages are sent. Specify the destination’s IP address or hostname.

  port <1-65535> Optional. Specifies the syslog server’s listener port

  - <1-65535> – Specify the UDP port from 1-65535. The default is 514.

  proxy-mode [none|through-controller|through-rf-domain-manager] Optional. Specifies the mode of proxying the syslog server

  - none – Accounting messages are sent directly to the syslog server
  - through-controller – Accounting messages are sent through the controller configuring the device
  - through-rf-domain-manager – Accounting messages are sent through the local RF Domain manager
Examples

rfs7000-37FABE(config-captive-portal-test)#accounting syslog host 172.16.10.13 port 1

rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-type logging
  access-time 35
  accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#

Related Commands

| **no** | Enables accounting records for this captive portal |
4.1.24.2.5 bypass

captive-portal-mode commands

Enables bypassing of captive portal detection requests from wireless clients.

Certain devices, such as Apple IOS devices send Captive Network Assistant (CNA) requests to detect existence of captive portals. When enabled, the bypass option does not allow CNA requests to be redirected to the captive portal pages.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
bypass captive-portal-detection
```

Parameters

- bypass captive-portal-detection

<table>
<thead>
<tr>
<th>bypass captive-portal-detection</th>
<th>Bypasses captive portal detection requests</th>
</tr>
</thead>
</table>

Examples

```
rfs4000-229D58 (config-captive-portal-test)#bypass captive-portal-detection
rfs4000-229D58 (config-captive-portal-test)# show context captive-portal test
  bypass captive-portal-detection
rfs4000-229D58 (config-captive-portal-test)#
```

Related Commands

- `no` Disables bypassing of captive portal detection requests
4.1.24.2.6 connection-mode

<table>
<thead>
<tr>
<th>captive-portal-mode commands</th>
</tr>
</thead>
</table>

Configures a captive portal’s mode of connection to the Web server. HTTP uses plain unsecured connection for user requests. HTTPS uses an encrypted connection to support user requests.

Both HTTP and HTTPS use the same Uniform Resource Identifier (URI), so controller and client resources can be identified. However, the use of HTTPS is recommended, as it affords controller and client transmissions some measure of data protection HTTP cannot provide.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
connection-mode [http|https]

Parameters

- connection-mode [http|https]

<table>
<thead>
<tr>
<th>http</th>
<th>Sets HTTP as the default connection mode. This is the default setting.</th>
</tr>
</thead>
<tbody>
<tr>
<td>https</td>
<td>Sets HTTPS as the default connection mode</td>
</tr>
</tbody>
</table>

Note: HTTPS is a more secure version of HTTP, and uses encryption while sending and receiving requests.

Examples

rfs7000-37FABE(config-captive-portal-test)#connection-mode https

rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
    access-type logging
    access-time 35

4.1.24.2.7 custom-auth

* captive-portal-mode commands

Configures custom user information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

custom-auth info <LINE>

**Parameters**

- custom-auth info <LINE>

<table>
<thead>
<tr>
<th>info &lt;LINE&gt;</th>
<th>Configures information used for RADIUS lookup when custom-auth RADIUS access type is configured</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;LINE&gt;</td>
<td>Guest data needs to be provided. Specify the name, e-mail address, and telephone number of the user.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-captive-portal-test)#custom-auth info bob bob@examplecompany.com

rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test access-type logging access-time 35 custom-auth info bob bob@examplecompany.com connection-mode https accounting syslog host 172.16.10.13 port 1 rfs7000-37FABE(config-captive-portal-test)#

**Related Commands**

| no | Removes custom user information configured with this captive portal |
4.1.24.2.8 data-limit

Enforces data transfer limits on captive portal clients. This feature enables the tracking and logging of user usage. Users exceeding the allowed bandwidth are restricted from the captive portal.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

data-limit <1-102400> {action [log-and-disconnect|log-only]}

Parameters

- data-limit <1-102400> {action [log-and-disconnect|log-only]}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data-limit &lt;1-102400&gt;</td>
<td>Sets a captive portal client’s data transfer limit in megabytes. This limit is applicable for both upstream and downstream data transfer.</td>
</tr>
<tr>
<td>action [log-and-disconnect</td>
<td>log-only]</td>
</tr>
<tr>
<td>log-and-disconnect</td>
<td>Logs a record and disconnects the client</td>
</tr>
<tr>
<td>log-only</td>
<td>Only a log is generated and the client remains connected to the captive portal. This is the default setting.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-captive-portal-test)#data-limit 200 action log-and-disconnect
```

```
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
  data-limit 200 action log-and-disconnect
```

Related Commands

4.1.24.2.9 inactivity-timeout

**captive-portal-mode commands**

Defines an inactivity timeout in seconds. If a frame is not received from a client for the specified interval the current session is terminated.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

inactivity-timeout <60-86400>

**Parameters**

- inactivity-timeout <60-86400>

<table>
<thead>
<tr>
<th>&lt;60-86400&gt;</th>
<th>Defines the timeout interval after which a captive portal session is automatically terminated</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;60-86400&gt;</td>
<td>Specify a value from 60 - 86400 seconds. The default is 10 minutes or 600 seconds.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-captive-portal-test)#inactivity-timeout 750

rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
access-type logging
access-time 35
custom-auth info bob bob@examplecompany.com
connection-mode https

**Related Commands**

| no | Removes the client inactivity interval configured with this captive portal |
4.1.24.2.10 ipv6

captive-portal-mode commands

Configures the internal captive portal server’s (running on the centralized mode) IPv6 address

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
ipv6 server host <IPv6>

Parameters
- ipv6 server host <IPv6>

ipv6 server host <IPv6> | Configures the IPv6 address of the internal captive portal server
- <IPv6> – Specify the captive portal server’s global IPv6 address.

Examples
rfs7000-6DCD4B(config-captive-portal-test2)#show context captive-portal test2
  access-type OAuth
  OAuth client-id Google TechPubs.printer.google.com
rfs7000-6DCD4B(config-captive-portal-test2)#

Related Commands

no | Removes the captive portal server’s IPv6 address
4.1.24.2.11 logout-fqdn

- captive-portal-mode commands

Configures the Fully Qualified Domain Name (FQDN) address to log out of the session from the client

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
logout-fqdn <WORD>

Parameters
- logout-fqdn <WORD>

<table>
<thead>
<tr>
<th>logout-fqdn &lt;WORD&gt;</th>
<th>Configures the FQDN address used to log out</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>- Provide the FQDN address (for example, logout.guestaccess.com).</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-captive-portal-test)#logout-fqdn logout.testuser.com
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test logout-fqdn logout.testuser.com rfs7000-37FABE(config-captive-portal-test)#

Related Commands

no OAuth <CLIENT-ID>

no accounting [radius|syslog]

no bypass captive-portal-detection

no custom-auth info

no ipv6 server host

no redirection ports

no server host

no server mode {centralized-controller [hosting-vlan-interface]}

no use [aaa-policy|dns-whitelist]

no webpage external [acknowledgment|agreement|fail|login {post}|no-service|welcome]

no webpage internal [org-name|org-signature]

no webpage internal [acknowledgment|agreement|fail|login|no-service|welcome]

[description|footer|header|main-logo|small-logo|title]

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes or resets this captive portal’s settings, based on the parameters passed. |

Examples

The following example shows the captive portal ‘test’ settings before the ‘no’ commands are executed:

rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
access-type logging
access-time 35
custom-auth info bob bob@examplecompany.com
connection-mode https
inactivity-timeout 750
accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#
The following example shows the captive portal 'test' settings after the 'no' commands are executed:

```
rfs7000-37FABE(config-captive-portal-test)#no accounting syslog
rfs7000-37FABE(config-captive-portal-test)#no access-type
```

The following example shows captive-portal 'test2' settings before the 'no' command is executed:

```
rfs7000-6DCD4B(config-captive-portal-test2)#show context
captive-portal test2
  access-type OAuth
rfs7000-6DCD4B(config-captive-portal-test2)#
```

The following example shows captive-portal 'test2' settings after the 'no' command is executed:

```
rfs7000-6DCD4B(config-captive-portal-test2)#no ipv6 server host
```

```
rfs7000-6DCD4B(config-captive-portal-test2)#show context
captive-portal test2
  access-type OAuth
rfs7000-6DCD4B(config-captive-portal-test2)#
```
4.1.24.2.13 post-authentication-vlan

**captive-portal-mode commands**

Configures the VLAN that is assigned to this captive portal’s users upon successful authentication.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]
```

**Parameters**

- **post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]**

  | post-authentication-vlan [<1-4096>|<VLAN-ALIAS>] | Configures the post authentication VLAN. The VLAN specified here is assigned to this captive portal’s users after they have authenticated and logged on to the network. Provide the VLAN ID, or use an existing VLAN alias to identify the post authentication VLAN. |
  |-----------------------------------------------|------------------------------------------------------------------------------------------------|
  | <1-4096> – Specify the VLAN’s number from 1 - 4096. |                                                                                                  |
  | <VLAN-ALIAS> – Specify the VLAN alias (should be existing and configured). |

**Note:** VLAN alias names begin with a ‘$’.

**Examples**

```
rfs4000-229D58(config-captive-portal-test)#post-authentication-vlan 1
rfs4000-229D58(config-captive-portal-test)#show context captive-portal test
post-authentication-vlan 1
rfs4000-229D58(config-captive-portal-test)#
```

### 4.1.24.2.14 radius-vlan-assignment

<table>
<thead>
<tr>
<th>captive-portal-mode commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables assignment of a RADIUS VLAN for this captive portal</td>
</tr>
</tbody>
</table>

When enabled, if the RADIUS server as part of the authentication process returns a client’s VLAN-ID in a RADIUS access-accept packet, then all client traffic is forwarded on the post authentication VLAN. If disabled, the RADIUS server’s VLAN assignment is ignored and the VLAN configuration defined within the WLAN configuration is used instead. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

radius-vlan-assignment

#### Parameters

None

#### Examples

```bash
rfs4000-229D58(config-captive-portal-test)#radius-vlan-assignment
```

```bash
rfs4000-229D58(config-captive-portal-test)#show context captive-portal test
post-authentication-vlan 1
radius-vlan-assignment
rfs4000-229D58(config-captive-portal-test)#
```

4.1.24.2.15 redirection

**captive-portal-mode commands**

Configures a list of destination ports (separated by commas, or using a dash for a range) that are taken into consideration when redirecting client connections.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
redirection ports <LIST-OF-PORTS>
```

**Parameters**
- **ports <LIST-OF-PORTS>**
  
  Configures destination ports considered for redirecting client connection.

  **Note:** A maximum of 16 ports can be specified. Standard ports 80 and 443 are always considered for client connections regardless of what's entered by the administrator.

**Examples**

```
rfs4000-229D58(config-captive-portal-test)#redirection ports 1,2,3

rfs4000-229D58(config-captive-portal-test)#show context captive-portal test
redirection ports 1-3
rfs4000-229D58(config-captive-portal-test)#
```

**Related Commands**

```
no
```

Disables redirection of client connection.
4.1.24.2.16 server

**captive-portal-mode commands**

Configures captive portal server parameters, such as the hostname, IP address, and mode of operation. This is the server validating guest user permissions.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
server [host|mode]
server host <IP/HOSTNAME>
server mode [centralized|centralized-controller \{hosting-vlan-interface <0-4096>\}|self]
```

**Parameters**

- **host <IP/HOSTNAME>**  
  Configures the internal captive portal authentication server (wireless controller, access point, service platform)  
  - `<IP/HOSTNAME>` — Specify the IPv4 address or hostname of the captive portal server.  
    **Note:** For centralized wireless controller mode, this should be a virtual hostname and not an IP address.  
    **Note:** This option is available only when hosting the captive portal on an external (fixed) server resource.

- **server mode [centralized|centralized-controller \{hosting-vlan-interface <0-4096>\}|self]**  
  Selects the captive portal server as the same device supporting the WLAN (the captive portal and the WLAN are configured on the same device). Select this option to maintain the captive portal configuration (Web pages) internally. This is the default setting.
Examples
rfs7000-37FABE(config-captive-portal-test)#server host 172.16.10.9

### 4.1.24.2.17 simultaneous-users

**captive-portal-mode commands**

Specifies the number of users (client MAC addresses) that can simultaneously logon to the captive portal. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
simultaneous-users <1-8192>
```

**Parameters**
- `simultaneous-users <1-8192>`

| <1-8192> | Specifies the number of MAC addresses that can simultaneously access the captive portal. Select a number from 1 - 8192. |

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#simultaneous-users 5
```
```
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
access-time 35
custom-auth info bob bob@examplecompany.com
connection-mode https
inactivity-timeout 750
server host 172.16.10.9
simultaneous-users 5
rfs7000-37FABE(config-captive-portal-test)#
```

**Related Commands**

```
no | Resets or disables captive portal commands
```
4.24.18 terms-agreement

**captive-portal-mode commands**

Enforces the user to agree to terms and conditions (included in the login page) for captive portal access. This feature is disabled by default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ESP510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

terms-agreement

**Parameters**

None

**Examples**

```bash
rfs7000-37FABE(config-captive-portal-test)#terms-agreement
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
    access-time 35
    custom-auth info bob bob@examplecompany.com
    connection-mode https
    inactivity-timeout 750
    server host 172.16.10.9
    simultaneous-users 5
    terms-agreement
rfs7000-37FABE(config-captive-portal-test)#
```

4.1.24.2.19 use

* captive-portal-mode commands

Configures a AAA policy and DNS whitelist with this captive portal policy. AAA policies are used to configure authentication and accounting servers for this captive portal. DNS whitelists restrict users to a set of configurable domains on the Internet.

For more information on AAA policies, see Chapter 8, AAA-POLICY.

For more information on DNS whitelists, see Chapter 4, dns-whitelist.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]

Parameters

- use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa-policy &lt;AAA-POLICY-NAME&gt;</td>
<td>Configures a AAA policy with this captive portal. AAA policies validate user credentials and provide captive portal access to the network.</td>
</tr>
<tr>
<td>dns-whitelist &lt;DNS-WHITELIST-NAME&gt;</td>
<td>Configures a DNS whitelist to use with this captive portal. DNS whitelists restrict captive portal access.</td>
</tr>
</tbody>
</table>

**Note:** To effectively host captive portal pages on an external Web server, the IP address of the destination Web server(s) should be added to the DNS whitelist.

Examples

rfs7000-37FABE(config-captive-portal-test)#use aaa-policy test
rfs7000-37FABE(config-captive-portal-test)#use dns-whitelist test

4.1.24.2.20 webpage

Use this command to define the appearance and flow of Web pages requesting clients encounter when accessing a controller, service platform, or access point managed captive portal. Define whether the Web pages are maintained locally or externally to the managing device as well as messages displayed requesting clients.

Configures Web pages displayed when interacting with a captive portal. There are six (6) different pages.

- acknowledgment – This page displays details for the user to acknowledge
- agreement – This page displays “Terms and Conditions” that a user accepts before allowed access to the captive portal.
- fail – This page is displayed when the user is not authenticated.
- login – This page is displayed when the user connects to the captive portal. It fetches login credentials from the user.
- no-service – This page is displayed when a captive portal user is unable to access the captive portal due to unavailability of critical services.
- welcome – This page is displayed to welcome an authenticated user to the captive portal.

These Web pages, which interact with captive portal users, can be located either on the controller or an external location.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

webpage [external|internal]

webpage external [acknowledgment|agreement|fail|login {post}|no-service|welcome] <URL>

webpage internal [acknowledgment|agreement|fail|login|no-service|org-name|org-signature|welcome]

webpage internal [acknowledgment|agreement|fail|login|no-service|org-name|org-signature|welcome]
[description|footer|header|title] <CONTENT>

webpage internal [acknowledgment|agreement|fail|login|no-service|welcome]
[main-logo|small-logo] <URL>

webpage internal [org-name|org-signature] <LINE>

Parameters

- webpage external [acknowledgment|agreement|fail|login {post}|no-service|welcome] <URL>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>external</td>
<td>Indicates Web pages being served are hosted on an external (to the captive portal) server resource</td>
</tr>
<tr>
<td>acknowledgment</td>
<td>Indicates the page is displayed for user acknowledgment of details. Users are redirected to this page to acknowledge information provided.</td>
</tr>
<tr>
<td>agreement</td>
<td>Indicates the page is displayed for “Terms &amp; Conditions” The agreement page provides conditions that must be agreed to before captive portal access is permitted.</td>
</tr>
</tbody>
</table>
fail

Indicates the page is displayed for login failure.
The fail page asserts that the authentication attempt has failed, the user is not allowed to access the Internet (using this captive portal) and must provide the correct login information again to access the Internet.

login {post}

Indicates the page is displayed for getting user credentials. This page is displayed by default.

- post – Optional. Redirects users to post externally when they during authentication.
The login page prompts the user for a username and password to access the captive portal and proceed to either the agreement page (if used) or the welcome page.

no-service

Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The no-service page asserts the captive portal service is temporarily unavailable due to technical reasons. Once the services become available, the captive portal user is automatically connected back to the services available through the captive portal. The possible scenarios are:

- The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated
- The external captive portal server is not reachable
- The connectivity between the adopted AP and controller is lost
- The external DHCP server is not reachable

To provide this service, enable the following:

- External captive portal server monitoring
- AAA server monitoring. This enables detection of RADIUS server failure.
- External DHCP server monitoring

Note: For more information on enabling these critical resource monitoring, see service.

welcome

Indicates the page is displayed after a user has been successfully authenticated.
The welcome page asserts a user has logged in successfully and can access the captive portal.

<URL>

Indicates the URL to the Web page displayed. Query String: URL can include query tags.
Supported Query Tags are:

- 'WING_TAG_CLIENT_IP' - Captive portal client IPv4 address
- 'WING_TAG_CLIENT_MAC' - Captive portal client MAC address
- 'WING_TAG_WLAN_SSID' - Captive portal client WLAN ssid
- 'WING_TAG_AP_MAC' - Captive portal client AP MAC address
- 'WING_TAG_AP_NAME' - Captive portal client AP Name
- 'WING_TAG_RF_DOMAIN' - Captive portal client RF Domain
- 'WING_TAG_CP_SERVER' - Captive portal server address
- 'WING_TAG_USERNAME' - Captive portal authentication username

Example:

Use ‘&’ or ‘?’ character to separate field-value pair.

Note: Enter ‘ctrl-v’ followed by ‘?’ to configure query string.
webpage internal [acknowledgment|agreement|fail|login|no-service|welcome]
[description|footer|header|title] <CONTENT>

**internal** Indicates the Web pages are internal. This is the default setting.

**acknowledgment** Indicates the Web page is displayed for users to acknowledge the information provided.

**agreement** Indicates the page is displayed for “Terms & Conditions”.

**fail** Indicates the page is displayed for login failure.

**login** Indicates the page is displayed for user credentials.

**no-service** Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The possible scenarios are:
- The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated
- The external captive portal server is not reachable
- The connectivity between the adopted AP and controller is lost
- The external DHCP server is not reachable

To provide this service, enable the following:
- External captive portal server monitoring
- AAA server monitoring. This enables detection of RADIUS server failure.
- External DHCP server monitoring
- AP to controller connectivity monitoring

**Note:** For more information on enabling these critical resource monitoring, see service.

**welcome** Indicates the page is displayed after a user has been successfully authenticated.

**description** Indicates the content is the description portion of each of the following internal Web pages: acknowledgment, agreement, fail, login, no-service, and welcome.

**footer** Indicates the content is the footer portion of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, and welcome page. The footer portion contains the signature of the organization that hosts the captive portal.

**header** Indicates the content is the header portion of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, and welcome page. The header portion contains the heading information for each of these pages.

**title** Indicates the content is the title of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, and welcome page. The title for each of these pages is configured here.

<CONTENT> The following keyword is common to all of the above internal Web page options:
- <CONTENT> – Specify the content displayed for each of the different components of the internal Web page. Enter up to 900 characters for the description and 256 characters each for header, footer, and title.

webpage internal [acknowledgment|agreement|fail|login|no-service|welcome]
[main-logo|small-logo] <URL>

**internal** Indicates the Web pages are internal.
<table>
<thead>
<tr>

</tbody>
</table>
| no-service    | Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The possible scenarios are:  
- The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated  
- The external captive portal server is not reachable  
- The connectivity between the adopted AP and controller is lost  
- The external DHCP server is not reachable  
To provide this service, enable the following:  
- External captive portal server monitoring  
- AAA server monitoring. This enables detection of RADIUS server failure.  
- External DHCP server monitoring  
- AP to controller connectivity monitoring  
**Note:** For more information on enabling these critical resource monitoring, see `wlan`. |
| welcome       | Indicates the page is displayed after a user has been successfully authenticated |
| main-logo     | The following keyword is common to all of the above internal Web page options:  
- main-logo – Indicates the main logo displayed in the header portion of each Web page |
| small-logo    | The following keyword is common to all of the above internal Web page options:  
- small-logo – Indicates the logo image displayed in the footer portion of each Web page, and constitutes the organization’s signature |
| <URL>         | Provides the complete URL of the main-logo and small-logo files  
- <URL> – Specify the location of the main-logo and the small-logo files. The files are loaded from the specified location. |

- `webpage internal [org-name|org-signature] <LINE>`

4.1.24.2.21 webpage-auto-upload

* captive-portal-mode commands

Enables automatic upload of advanced Web pages to requesting clients on association. Enable this option if the webpage-location is selected as *advanced*. For more information see, *webpage-location*.

If this feature is enabled, access points shall request for Web pages from the controller during adoption. If the controller has a different set of Web pages, than the ones existing on the access points, the controller shall distribute the Web pages uploaded on it to the access points.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

4.1.26 client-identity

With an increase in *Bring Your Own Device* (BYOD) corporate networks, there is a parallel increase in the number of possible attack scenarios within the network. BYOD devices are inherently unsafe, as the organization’s security mechanisms do not extend to these personal devices deployed in the corporate wireless network. Organizations can protect their network by limiting how and what these BYODs can access on and through the corporate network.

Device fingerprinting assists administrators by controlling how BYOD devices access a corporate wireless domain.

Device fingerprinting uses DHCP options sent by the client in request or discover packets to derive a unique signature specific to device class. For example, Apple devices have a different signature from Android devices. The signature is used to classify the devices and assign permissions and restrictions on each device class.

The following table summarizes the commands available for creating and configuring a set of new client identity parameters:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>client-identity</code></td>
<td>Creates a new client identity and enters its configuration mode</td>

</tr>
<tr>
<td><code>client-identity-</code></td>
<td>Invokes the client identity policy configuration mode commands</td>
<td>page 4-76</td>
</tr>
<tr>
<td><code>mode commands</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>client-identity-</code></td>
<td>Creates a new client identity group and enters its configuration mode</td>
<td>page 4-81</td>
</tr>
<tr>
<td><code>group</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
4.1.26.1 client-identity

client-identity

Creates a new client identity and enters its configuration mode. Client identity is a set of unique fingerprints used to identify a class of devices. This information is used to configure permissions and access rules for the identified class of devices in the network. The client-identity feature enables device fingerprinting.

Device fingerprinting is a technique of collecting, analyzing, and identifying traffic patterns originating from remote computing devices. When enabled, device fingerprinting helps to identify a wireless client's device type. There are two methods of fingerprinting devices: Active and Passive.

Active fingerprinting is based on the fact that traffic patterns vary with varying device types. It involves the sending of requests (HTTP etc.) to devices (clients) and analyzing their response to determine the device type. For example, an invalid request is sent to a device, and its error response is analyzed to identify the device type. Since active device fingerprinting involves sending of packets, the probability of the network getting flooded is very high, especially when many devices are being fingerprinted simultaneously.

Passive fingerprinting involves monitoring of devices to check for known traffic patterns specific to devices based on the protocol, driver implementation etc. This method accurately classifies a client’s TCP/IP configuration, OS fingerprints, wireless settings etc. No packets are sent to the device. Some of the commonly used protocols for passive device fingerprinting are, TCP, DHCP, HTTP etc.

This feature implements DHCP device fingerprinting, which relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
client-identity <CLIENT-IDENTITY-NAME>
```

Parameters

- `client-identity <CLIENT-IDENTITY-NAME>`

Usage Guidelines

The following points should be considered when configuring the client identity (device fingerprinting) feature:

1. Ensure that DHCP is enforced on the WLANs. For more information on enforcing DHCP on WLANs, see `enforce-dhcp`.
2. Successful identification of different device types depends on the uniqueness of the configured fingerprints. DHCP fingerprinting identifies clients based on the patterns (fingerprints) in the DHCP discover and request messages sent by clients. If different operating systems have the same fingerprints, it will be difficult to identify the device type.
3. When associating client identities with a role policy, ensure that the profile/device, under which the role policy is being used, also has an associated client identity group (containing all the client identities used by the role policy).
Examples
rfs4000-229D58(config)#client-identity test
rfs4000-229D58(config-client-identity-test)#?

rfs4000-229D58(config-client-identity-test)#?
Client Identity Mode commands:
  dhcp                     Add a DHCP option based match criteria
  dhcp-match-message-type  Specify DHCP message type to match
  no                       Negate a command or set its defaults
  clrscr                   Clears the display screen
  commit                   Commit all changes made in this session
  do                       Run commands from Exec mode
  end                      End current mode and change to EXEC mode
  exit                     End current mode and down to previous mode
  help                     Description of the interactive help system
  revert                   Revert changes
  service                  Service Commands
  show                     Show running system information
  write                    Write running configuration to memory or terminal

rfs4000-229D58(config-client-identity-test)#

</tbody>
</table>
4.1.26.2.1 dhcp

▲ client-identity-mode commands

Configures the DHCP option match criteria (signature) for the discover and request message types received from wireless clients.

When accessing a network, DHCP discover and request messages are passed between wireless clients and the DHCP server. These messages contain DHCP options and option values that differ from device to device and are based on the DHCP implementation in the device's operating system (OS). Options and option values contained in a client's messages are parsed and compared against the configured DHCP option values to identify the device. Once a device type is identified, the wireless client database is updated with the discovered device type.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
dhcp <1-16> message-type [discover|request] [option|option-codes]
dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes]
    [contains|exact|starts-with] [ascii|hexstring] <WORD>
```

Parameters

- dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes]
  [contains|exact|starts-with] [ascii|hexstring] <WORD>

</tr>
<tr>
<td></td>
<td>• &lt;1-254&gt; – Configures a code for this DHCP option from 1 - 254 (except option 53)</td>
</tr>
</tbody>
</table>
### Usage Guidelines

The following DHCP options are useful for identifying different device types:

1. **Option 55**: Used by a DHCP client to request values for specific configuration parameters. It is a list of DHCP option codes and can be in the client's order of preference.

2. **Client configured list of DHCP options**: (all options parsed into a hex string).

3. **Option 60**: Vendor class identifier. Used to identify the vendor and functionality of a DHCP client (some devices do not set the value of this field).

Though it is possible to use any option to configure a device fingerprint, the use of a combination of one or more of the preceding options to define a device is recommended.

### Examples

```
rfs4000-229D58(config-client-identity-test)#dhcp 1 message-type request option 60 exact ascii MSFT\5.0
rfs4000-229D58(config-client-identity-test)#dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
rfs4000-229D58(config-client-identity-test)#show context client-identity test
dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT5.0
rfs4000-229D58(config-client-identity-test)#
```

### Related Commands

```
no
```

Removes a DHCP option signature (match criteria)
4.1.26.2.2 dhcp-match-message-type

> client-identity-mode commands

Configures the DHCP message type to match

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

dhcp-match-message-type [all|any|discover|request]

Parameters

- dhcp-match-message-type [all|any|discover|request]

| dhcp-match-message-type [all|any|discover|request] | Specifies the DHCP message type to consider for matching |
|---------------------------------------------------|--------------------------------------------------------|
| • all – Matches all message types: discover and request. Indicates that the fingerprint is checked with both the DHCP request and the DHCP discover message. |
| • any – Matches any message type: discover or request. Indicates that the fingerprint is checked with either the DHCP request or the DHCP discover message. |
| • discover – Matches discover messages only. Client matches the client identity only if the discover message sent by the client matches. Values configured for request messages are ignored. |
| • request – Matches request messages only. Client matches the client identity only if the request message sent by the client matches. Values configured for discover messages are ignored. |

Examples

rfs4000-229D58 (config-client-identity-test)#dhcp-match-message-type all

rfs4000-229D58 (config-client-identity-test)#show context client-identity test
dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT5.0

dhcp-match-message-type all
rfs4000-229D58 (config-client-identity-test)#

Related Commands

no | Removes the DHCP message type to match
4.1.26.2.3 no

Removes the DHCP options match criteria configurations.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [dhcp <1-16>|dhcp-match-message-type]

Parameters

- no [dhcp <1-16>|dhcp-match-message-type]

| dhcp <1-16> | Removes the DHCP option match criteria rule identified by the <1-16> keyword
| dhcp-match-message-type | Removes the DHCP message type to match

Examples

The following example shows the client identity ‘test’ settings before the ‘no’ commands are executed:

```
rfs4000-229D58(config-client-identity-test)#show context
client-identity test
   dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT5.0
   dhcp-match-message-type all
rfs4000-229D58(config-client-identity-test)#
```

The following example shows the client identity ‘test’ settings after the ‘no’ commands are executed:

```
rfs4000-229D58(config-client-identity-test)#no dhcp 2
rfs4000-229D58(config-client-identity-test)#no dhcp-match-message-type
rfs4000-229D58(config-client-identity-test)#show context
client-identity test
   dhcp 1 message-type request option 60 exact ascii MSFT5.0
rfs4000-229D58(config-client-identity-test)#
```

Related Commands

<td>Invokes the client identity group configuration mode commands</td>
<td>page 4-83</td>
</tr>
<tr>
<td><code>client-identity</code></td>
<td>Creates new client identity policy and enters its configuration mode</td>
<td>page 4-73</td>
</tr>
</tbody>
</table>
4.1.27.1 client-identity-group

Configures a new client identity group

A client identity group is a collection of client identities. Each client identity included in a client identity group is set a priority value that indicates the priority for that identity when device fingerprinting.

Device Fingerprinting relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

A client identity group can be attached to a profile or device, enabling device fingerprinting on them.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
client-identity-group <CLIENT-IDENTITY-GROUP-NAME>

Parameters
- client-identity-group <CLIENT-IDENTITY-GROUP-NAME>

Examples
rfs4000-229D58(config)#client-identity-group test
rfs4000-229D58(config-client-identity-group-test)##

rfs4000-229D58(config-client-identity-group-test)##?
Client Identity group Mode commands:

- client-identity Client identity (DHCP Device Fingerprinting)
- no Negate a command or set its defaults

- clrscrr clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs4000-229D58(config-client-identity-group-test)#
4.1.27.2 client-identity-group-mode commands

The following table summarizes client identity group configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>

<td>Removes the client identity associated with this client identity group</td>
<td>page 4-80</td>
</tr>
</tbody>
</table>
4.1.27.2.1 client-identity

Associates an existing and configured client identity (device fingerprint) with this client identity group

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
```

Parameters

- `client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>`

Examples

The following example shows two client identities created and configured:

```
rfs4000-229D58(config)#show context

### client-identity-group-mode commands

Removes the client identity associated with the client identity group

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
no client-identity <CLIENT-IDENTITY-NAME>
```

#### Parameters
- `no client-identity <CLIENT-IDENTITY-NAME>`

#### Examples
```
rfs4000-229D58(config-client-identity-group-test)#show context
client-identity-group test
  client-identity test precedence 1
rfs4000-229D58(config-client-identity-group-test)#
```
```
rfs4000-229D58(config-client-identity-group-test)#no client-identity test
rfs4000-229D58(config)#
```

#### Related Commands

- `client-identity` Associates an existing and configured client identity (device fingerprinting) with this client identity group
4.1.28 clone

Global Configuration Commands

Creates a replica of an existing object or device. The configuration of the new object or device is an exact copy of the existing object or device configuration. Use this command to copy existing configurations and then modifying only the required parameters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

clone [TLO|device]
clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>
clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>

Parameters

- clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>

  TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>

  Creates a new TLO by cloning an existing top-level object. The new object has the same configuration as the cloned object.
  - <EXISTING-OBJECT-NAME> – Specify the existing object’s (to be cloned) name
  - <NEW-OBJECT-NAME> – Provide the new object’s name.
  
  **Note:** Enter `clone` and press **Tab** to list objects available for cloning.

- clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>

  device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>

  Configures a new device based on an existing device configuration
  - <EXISTING-DEVICE-MAC/NAME> – Specify the existing device’s name or MAC address (the device to be cloned)
  - <NEW-DEVICE-MAC> – Provide the new device’s MAC address.
  
  **Note:** Enter `clone > device` and press **Tab** to list devices available for cloning.

Examples

```bash
nx9500-6C8809(config)#clone rf_domain TechPubs Cloned_TechPubs2
nx9500-6C8809(config)#show context
!
! Configuration of NX9500 version 5.7.0.0-013D
!
!
version 2.3
!

!
rf-domain Cloned_TechPubs2
  location SanJose
  --More--
nx9500-6C8809(config)#
```
4.1.29 crypto-cmp-policy

Global Configuration Commands

Creates a crypto Certificate Management Protocol (CMP) policy and enters its configuration mode

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>

Parameters
- crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>

Examples

nx9500-6C8809(config)#crypto-cmp-policy CMP
nx9500-6C8809(config-cmp-policy-CMP)#?

CMP Policy Mode commands:
- ca-server: CMP CA Server configuration commands
- cert-renewal-timeout: Trigger a cert renewal request on timeout
- cert-update: Enable cert renewal of certificate when about to expire
- no: Negate a command or set its defaults
- subjectAltName: Configure subjectAltName value
- trustpoint: Trustpoint for CMP
- use: Set setting to use
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

nx9500-6C8809(config-cmp-policy-CMP)#

Related Commands

no

Resets values or disables commands

NOTE: For more information on the crypto CMP policy, see Chapter 29, CRYPTO-CMP-POLICY.
4.1.30 customize

Customizes the output of the summary CLI commands. Use this command to define the data displayed as a result of various show commands.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

customize [cdp-lldp-info-column-width|hostname-column-width|show-adoption-status|
  show-wireless-meshpoint|show-wireless-meshpoint-accelerated-multicast|
  show-wireless-meshpoint-neighbor-stats|show-wireless-meshpoint-neighbor-stats-rf|

    client-alias <1-64>, error-rate, noise, portal-alias <1-64>, portal-bss, q-index, rx-rate
    signal, snr, tx-rate)
**GLOBAL CONFIGURATION COMMANDS**

```plaintext
customize show-wireless-mint-portal (client-alias <1-64>, client-bss, portal-alias <1-64>, portal-bss, up-time)
customize show-wireless-mint-portal-stats (client-alias <1-64>, client-bss, portal-alias <1-64>, rx-bytes, rx-errors, rx-packets, rx-throughput, tx-bytes, tx-dropped, tx-packets, tx-throughput)
customize show-wireless-mint-portal-stats-rf (average-retry-number, client-alias <1-64>, client-bss, error-rate, noise, portal-alias <1-64>, q-index, rx-rate, signal, snr, tx-rate)
customize show-wireless-radio (adopt-to, ap-name <1-64>, channel, location <1-64>, num-clients, power, radio-alias <3-67>, radio-id, radio-mac, rf-mode, state)
customize show-wireless-radio-stats (radio-alias <3-67>, radio-id, radio-mac, rx-bytes, rx-errors, rx-packets, rx-throughput, tx-bytes, tx-dropped, tx-packets, tx-throughput)
customize show-wireless-radio-stats-rf (average-retry-number, error-rate, noise, q-index, radio-alias <3-67>, radio-id, radio-mac, rx-rate, signal, snr, t-index, tx-rate)
```

**Parameters**

- **hostname-column-width <1-64>**
  - Configures default width of the hostname column in all show command outputs
  - `<1-64>` – Sets the hostname column width from 1 - 64 characters

- **cdp-lldp-info-column-width <1-64>**
  - Configures the column width in the `show > cdp/lldp > [neighbor|report]` command output
  - `<1-64>` – Sets the column width from 1 - 64 characters

- **show-adoption-status (adopted-by, ap-name <1-64>, cdp-lldp-info, config-status, last-adoption, msgs, uptime, version)**
  - Configures the information displayed in the `show > adoption > status` command output. Select the columns (information) displayed from the following options: adopted-by, ap-name, cdp-lldp-info, config-status, last-adoption, msgs, uptime, and version. These are recursive parameters and you can select multiple options at a time.
  - **Note:** The columns displayed by default are: Device-Name, Version, Config-Status, MSGS, Adopted-By, Last-Adoption, and Uptime.
  - **Note:** Where ever available, you can optionally use the `<1-64>` parameter to set the column width.

- **show-wireless-client (ap-name <1-64>, auth, client-identity <1-32>, bss, enc, hostname <1-64>, ip, last-active, location <1-64>, mac, radio-alias <3-67>, radio-id, radio-type, role <1-32>, state, username <1-64>, vendor, vlan, wlan)**
  - Customizes the `show > wireless > client` command output
  - **Note:** The columns displayed by default are: MAC, IPv4, Vendor, Radio-ID, WLAN. VLAN, and State.

- **ap-name <1-64>**
  - Includes the ap-name column, which displays the name of the AP with which this client associates
  - `<1-64>` – Sets the ap-name column width from 1 - 64 characters

- **auth**
  - Includes the auth column, which displays the authorization protocol used by the wireless client

- **client-identity <1-32>**
  - Includes the client-identity (device type) column, which displays details gathered from DHCP device fingerprinting feature (when enabled). For more information, see `client-identity`.
  - `<1-32>` – Sets the client-identity column width from 1 - 32 characters

- **bss**
  - Includes the BSS column, which displays the BSS ID the wireless client is associated with

- customize show-wireless-client-stats-rf (average-retry-number, error-rate, host-name <1-64>, mac, noise, q-index, rx-rate, signal, snr, tx-rate)

- show-wireless-client-stats-rf
  - average-retry-number: Includes the average-retry-number column, which displays the average number of retransmissions made per packet
  - error-rate: Includes the error-rate column, which displays the rate of error for the wireless client
  - hostname <1-64>: Includes the hostname column, which displays the wireless client’s hostname
    - <1-64> – Sets the hostname column width from 1 - 64 characters
  - mac: Includes the MAC column, which displays the wireless client’s MAC address
  - noise: Includes the noise column, which displays the noise (in dBm) as detected by the wireless client
  - q-index: Includes the q-index column, which displays the RF quality index
    - Note: Higher values indicate better RF quality.
  - rx-rate: Includes the rx-rate column, which displays the receive rate at the particular wireless client
  - signal: Includes the signal column, which displays the signal strength (in dBm) at the particular wireless client
  - snr: Includes the snr column, which displays the signal to noise (SNR) ratio (in dB) at the particular wireless client
  - tx-rate: Includes the tx-rate column, which displays the packet transmission rate at the particular wireless client
• customize show-wireless-meshpoint-accelerated-multicast (ap-hostname, group-addr, mesh-name, neighbor-hostname, neighbor-ifid, radio-alias, radio-id, radio-mac, subscriptions)

| show-wireless-meshpoint-accelerated-multicast | Configures the information displayed in the `show > wireless > meshpoint > accelerated multicast` command output. Select the columns (information) displayed from the following options: ap-hostname, group-addr, mesh-name, neighbor-hostname, neighbor-ifid, radio-alias, radio-id, radio-mac, subscriptions. These are recursive parameters and you can select multiple options at a time. **Note:** The columns displayed by default are: Mesh, Radio, Neighbor-IFID, Neighbor-Hostname, Group-MAC, and Subscriptions. |

• customize show-wireless-meshpoint (ap-mac,cfg-as-root,hops,hostname <1-64>,interface-ids,is-root,mesh-name <1-64>,mpid,next-hop-hostname <1-64>,next-hop-ifid,next-hop-use-time,path-metric,root-bound-time,root-hostname <1-64>,root-mpid)

| show-wireless-meshpoint | Customizes the `show > wireless > meshpoint` command output. **Note:** The columns displayed by default are: Mesh, Hostname, Hops, Is-Root, Config-As-Root, Root-Hostname, Root-Bound-Time, Path-Metric, Next-Hop-Hostname, and Next-Hop-Use-Time. |

| ap-mac | Includes the ap-mac column, which displays the AP's MAC address in the AA-BB-CC-DD-EE-FF format. Applicable only in case of non-controller meshpoints |

| cfg-as-root | Includes the cfg-as-root column, which displays the configured root state of the meshpoint |

| hops | Includes the hops column, which displays the number of hops to the root for this meshpoint |

| hostname <1-64> | Includes the hostname column, which displays the AP's hostname. Applicable only in case of non-wireless controller meshpoints

• `<1-64>` – Sets the hostname column width from 1 - 64 characters |

| interface-ids | Includes the interface-ids column, which displays the interface identifiers (interfaces used by this meshpoint) |

| is-root | Includes the is-root column, which displays the current root state of the meshpoint |

| mesh-name <1-64> | Includes the mesh-name column, which displays the meshpoint's name

• `<1-64>` – Sets the mesh-name column width from 1 - 64 characters |

| mpid | Includes the mpid column, which displays the meshpoint identifier in the AA-BB-CC-DD-EE-FF format |

| next-hop-hostname <1-64> | Includes the next-hop-hostname column, which displays the next-hop AP's name (the AP next in the path to the bound root)

• `<1-64>` – Sets the next-hop-hostname column width from 1 - 64 characters |

| next-hop-ifid | Includes the next-hop-ifid column, which displays the next-hop interface identifier in the AA-BB-CC-DD-EE-FF format |

| next-hop-use-time | Includes the next-hop-use-time column, which displays the time since this meshpoint started using this next hop |

<p>| root-bound-time | Includes the root-bound-time column, which displays the time since this meshpoint has been bound to the current root |</p>

- customize show-wireless-mint-client (client-alias <1-64>, client-bss, portal-alias <1-64>, portal-bss, up-time)

### show-wireless-mint-client

Configures the information displayed in the `show > wireless > mint > client` command output. Select the columns (information) displayed from the following options: client-alias, client-bss, portal-alias, portal-bss, and up-time. These are recursive parameters and you can select multiple options at a time.

**Note:** The columns displayed by default are: Portal, Portal-Radio-MAC, Client, Client-Radio-MAC, and Up-Time.

- customize show-wireless-mint-client-stats (client-alias <1-64>, portal-alias <1-64>, portal-bss, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)

### show-wireless-mint-client-stats

Configures the information displayed in the `show > wireless > mint > client > statistics` command output. Select the columns (information) displayed from the following options: client-alias, portal-alias, portal-bss, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput. These are recursive parameters and you can select multiple options at a time.

**Note:** The columns displayed by default are: Portal, Portal-Radio-MAC, Client, Tx bytes, Rx bytes, TX pkts, Rx pkts, TX (bps), Rx (bps), T-Index (%), and Dropped pkts.

**Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- customize show-wireless-mint-client-stats-rf (average-retry-number, client-alias <1-64>, error-rate, noise, portal-alias <1-64>, portal-bss, q-index, rx-rate, signal, snr, tx-rate)

### show-wireless-mint-client-stats-rf

Configures the information displayed in the `show > wireless > mint > client > statistics > rf` command output. Select the columns (information) displayed from the following options: average-retry-number, client-alias, error-rate, noise, portal-alias, portal-bss, q-index, rx-rate, signal, snr, and tx-rate. These are recursive parameters and you can select multiple options at a time.

**Note:** The columns displayed by default are: MAC, Signal (dbm), Noise (dbm), SNR (db), Tx-Rate (Mbps), Rx-rate (Mbps), Retry Avg, Errors (pps), and Q-Indes (%).

**Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.
- customize `show-wireless-mint-portal` *(client-alias <1-64>, client-bss, portal-alias <1-64>, portal-bss, up-time)*

**show-wireless-mint-portal**
Configures the information displayed in the `show > wireless > mint > portal` command output. Select the columns (information) displayed from the following options: client-alias, client-bss, portal-alias, portal-bss, and up-time. These are recursive parameters and you can select multiple options at a time.

**Note:** The columns displayed by default are: Client, Client-Radio-MAC, Portal, Portal-Radio-MAC, and Up-Time.

**Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- customize `show-wireless-mint-portal-stats` *(client-alias <1-64>, client-bss, portal-alias <1-64>, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)*

**show-wireless-mint-portal-stats**
Configures the information displayed in the `show > wireless > mint > portal > statistics` command output. Select the columns (information) displayed from the following options: client-alias, client-bss, portal-alias, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput. These are recursive parameters and you can select multiple options at a time.

**Note:** The columns displayed by default are: Client, Client-Radio-MAC, Portal, Tx bytes, Rx bytes, TX pkts, Rx pkts, TX (bps), Rx (bps), T-Index (%), and Dropped pkts.

**Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- customize `show-wireless-mint-portal-stats-rf` *(average-retry-number, client-alias <1-64>, client-bss, error-rate, noise, portal-alias <1-64>, q-index, rx-rate, signal, snr, tx-rate)*

**show-wireless-mint-portal-stats-rf**
Configures the information displayed in the `show > wireless > mint > portal > statistics > rf` command output. Select the columns (information) displayed from the following options: average-retry-number, client-alias, client-bss, error-rate, noise, portal-alias, q-index, rx-rate, signal, snr, tx-rate. These are recursive parameters and you can select multiple options at a time.

**Note:** The columns displayed by default are: Client, Client-Radio-MAC, Portal, Signal (dbm), Mosie (dbm), SNR (db), Tx-Rate (Mbps), Rx-rate (Mbps), Retry Avg, Errors (pps), and Q-Indes (%).

**Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- customize `show-wireless-radio` *(adopt-to, ap-name <1-64>, channel, location <1-64>, num-clients, power, radio-alias <3-67>, radio-id, radio-mac, rf-mode, state)*

**show-wireless-radio**
Customizes the show wireless radio command output

| adopt-to | Includes the adopt-to column, which displays information about the wireless controller adopting this AP |
| ap-name <1-64> | Includes the ap-name column, which displays information about the AP this radio belongs |
| channel | Includes the channel column, which displays information about the configured and current channel for this radio |

• | <1-64> – Sets the ap-name column width from 1 - 64 characters |
| Location: <1-64> | Includes the location column, which displays the location of the AP this radio belongs to. 
  - <1-64> – Sets the location column width from 1 - 64 characters |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Num-clients</td>
<td>Includes the num-clients column, which displays the number of clients associated with this radio.</td>
</tr>
<tr>
<td>Power</td>
<td>Includes the power column, which displays the radio's configured and current transmit power.</td>
</tr>
</tbody>
</table>
| Radio-alias <3-67>| Includes the radio-alias column, which displays the radio's alias (combination of AP's hostname and radio interface number in the "HOSTNAME:RX" format). 
  - <3-67> – Sets the radio-alias column width from 3 - 67 characters |
| Radio-id         | Includes the radio-id column, which displays the radio's ID (combination of AP's MAC address and radio interface number in the "AA-BB-CC-DD-EE-FF:RX" format). |
| Radio-mac        | Includes the radio-mac column, which displays the radio's base MAC address. |
| Rf-mode          | Includes the rf-mode column, which displays the radio's operating mode. The radio mode can be 2.4 GHz, 5.0 GHz, or sensor. |
| State            | Includes the state column, which displays the radio's current operational state. |

- **Customize show-wireless-radio-stats** (radio-alias <3-67>, radio-id, radio-mac, rx-bytes, rx-errors, rx-packets, rx-throughput, tx-bytes, tx-dropped, tx-packets, tx-throughput)

<table>
<thead>
<tr>
<th>Show-wireless-radio-stats</th>
<th>Customizes the show wireless radio statistics command output.</th>
</tr>
</thead>
</table>
| Radio-alias <3-67>        | Includes the radio-alias column, which displays the radio's alias (combination of AP's hostname and radio interface number in the "HOSTNAME:RX" format). 
  - <3-67> – Sets the radio-alias column width from 3 - 67 characters |
| Radio-id                  | Includes the radio-id column, which displays the radio's ID (combination of AP's MAC address and radio interface number in the "AA-BB-CC-DD-EE-FF:RX" format). |
| Radio-mac                 | Includes the radio-mac column, which displays the radio's base MAC address. |
| Rx-bytes                  | Includes the rx-bytes column, which displays the total number of bytes received by the radio. |
| Rx-errors                 | Includes the rx-error column, which displays the total number of errors received by the radio. |
| Rx-packets                | Includes the rx-packets column, which displays the total number of packets received by the radio. |
| Rx-throughput             | Includes the rx-throughput column, which displays the receive throughput at the radio. |
| Tx-bytes                  | Includes the tx-bytes column, which displays the total number of bytes transmitted by the radio. |
| Tx-dropped                | Includes the tx-dropped column, which displays the total number of packets dropped by the radio. |
| Tx-packets                | Includes the tx-packets column, which displays the total number of packets transmitted by the radio. |
| Tx-throughput             | Includes the tx-throughput column, which displays the transmission throughput at the radio. |

- **Customize show-wireless-radio-stats-rf** (average-retry-number, error-rate, noise, q-index, radio-alias <3-67>, radio-id, radio-mac, rx-rate, signal, snr, t-index, tx-rate)

| Show-wireless-radio-stats-rf | Customizes the show wireless radio stats RF command output. |
average-retry-number | Includes the average-retry-number column, which displays the average number of retransmissions per packet
---|---
error-rate | Includes the error-rate column, which displays the rate of error for the radio
noise | Includes the noise column, which displays the noise detected by the radio
q-index | Includes the q-index column, which displays the RF quality index
  **Note:** Higher values indicate better RF quality.
radio-alias <3-67> | Includes the radio-alias column, which displays the radio's alias (combination of AP's hostname and radio interface number in the “HOSTNAME:RX” format)
  - <3-67> – Sets the radio-alias column width from 3 - 67 characters
radio-id | Includes the radio-id column, which displays the radio’s ID (combination of AP’s MAC address and radio interface number in the “AA-BB-DD-EE-FF:RX” format)
radio-mac | Includes the radio-mac column, which displays the radio’s base MAC address
rx-rate | Includes the rx-rate column, which displays the receive rate at the particular radio
signal | Includes the signal column, which displays the signal strength at the particular radio
snr | Includes the snr column, which displays the signal-to-noise ratio at the particular radio
t-index | Includes the t-index column, which displays the traffic utilization index at the particular radio
tx-rate | Includes the tx-rate column, which displays the packet transmission rate at the particular radio

**Examples**

The following example shows the `show > adoption > status` command output before customizing the output:

```
rfs7000-6DCD4B(config)#show adoption status

rfs6000-81742D 5.7.0.0-022D configured  No  rfs7000-6DCD4B  3 days 22:37:27  3 days 22:40:34

Total number of devices displayed: 1
```

```
rfs7000-6DCD4B(config)#customize show-adoption-status adopted-by ap-name cdp-lldp-info config-status last-adoption

rfs7000-6DCD4B(config)#commit
```

The following example shows the `show > adoption > status` command output after customizing the output:

```
rfs7000-6DCD4B(config)#show adoption status

ADOPTED-BY  DEVICE-NAME   CONNECTED-TO         CFG-STAT     LAST-ADOPTION
rfs7000-6DCD4B  rfs6000-81742D  L3-Router:gel  configured  3 days 22:40:48

Total number of devices displayed: 1
```

```
Use the `no > customize > show-adoption-status` command to revert back to the default format.

rfs7000-6DCD4B(config)#no customize show-adoption-status
rfs7000-6DCD4B(config)#commit

rfs7000-6DCD4B(config)#show adoption status

```
+-----------------+-----------------+-----------------+--------+-----------------+-----------------+-----------------+-----------------+-----------------+-----------------+-----------------+-----------------+
| DEVICE-NAME     | VERSION         | CFG-STAT        | MSGS   | ADOPTED-BY      | LAST-ADOPTION   | UPTIME          |

### 4.1.31 device

**Global Configuration Commands**

Enables simultaneous configuration of multiple devices

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
```
device {containing|filter}
```
```
device {containing <STRING>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000|t5|vx9000]}
```
```
device {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000|t5|vx9000]}
```

**Parameters**
- **device {containing <STRING>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000|t5|vx9000]}
- **device {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000|t5|vx9000]}

<table>

</tr>
</tbody>
</table>
4.1.32.1 device-categorization

Configures a device categorization list

Proper classification and categorization of devices (access points, clients etc.) helps suppress unnecessary unauthorized access point alarms, allowing network administrators to focus on alarms on devices actually behaving in a suspicious manner. An intruder with a device erroneously authorized could potentially perform activities that harm your organization.

Authorized access points and clients are generally known to you and conform with your organization's security policies. Unauthorized devices are those detected as interoperating within the network, but are not approved. These devices should be filtered to avoid jeopardizing the data within a managed network. Use this command to apply the neighboring and sanctioned (approved) filters on peer devices operating within a wireless controller or access point's radio coverage area. Detected client MAC addresses can also be filtered based on their classification.

If a device categorization list does not exist, it is created.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9511

Syntax

device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>

Parameters

- device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>

Examples

rfs7000-37FABE(config)#device-categorization rfs7000

4.32.1.1 mark-device

device-categorization-mode commands

Adds a device to the device categorization list as sanctioned or neighboring. Devices are further classified as AP or client.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

mark-device <1-1000> [sanctioned|neighboring] [ap|client]
mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}

Parameters

- mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
  - <1-1000> — Configures the device categorization entry index number
  - sanctioned — Marks a device as sanctioned. A sanctioned device is authorized to use network resources.
  - neighboring — Marks a device as neighboring. A neighboring device is a neighbor in the same network as this device.
  - ap {mac <MAC>|ssid <SSID>} — Marks a specified AP as sanctioned or neighboring based on its MAC address or SSID
    - mac <MAC> — Optional. Specify the AP's MAC address
    - ssid <SSID> — Optional. Specify the AP's SSID. After specifying the SSID, you can optionally specify its MAC SSID.
  
  Note: All APs are marked if no specific MAC address or SSID is provided.

- mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}
  - <1-1000> — Configures the device categorization entry index number
  - sanctioned — Marks the wireless client as sanctioned. A sanctioned device is authorized to use network resources.
  - neighboring — Marks the wireless client as neighboring. A neighboring device is a neighbor in the same network as this device.
  - client {mac <MAC>} — Marks a specified wireless client as sanctioned or neighboring based on its MAC address
    - mac <MAC> — Optional. Specify the wireless client's MAC address.

Examples

rfs7000-37FABE(config-device-categorization-rfs7000)#mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#show context
device-categorization rfs7000

4.1.32.2.2 no

- **device-categorization-mode commands**

Removes a device from the device categorization list

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
no mark-device <1-1000> [neighboring|sanctioned] [ap|client]
no mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}
no mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
```

**Parameters**

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes a mark device (AP or wireless client) entry from this device categorization list</th>
</tr>
</thead>
</table>

**Examples**

The following example shows the device categorization list ‘rfs7000’ settings before the ‘no’ command is executed:

```
rfs7000-37FABE(config-device-categorization-rfs7000)#show context
device-categorization rfs7000
    mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#
```

```
rfs7000-37FABE(config-device-categorization-rfs7000)#no mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#
```

The following example shows the device categorization list ‘rfs7000’ settings after the ‘no’ command is executed:

```
rfs7000-37FABE(config-device-categorization-rfs7000)#show context
device-categorization rfs7000
rfs7000-37FABE(config-device-categorization-rfs7000)#
```

**Related Commands**

| mark-device | Adds a device to a list of sanctioned or neighboring devices |
4.1.33 **dhcp-server-policy**

- **Global Configuration Commands**

Configures DHCPv4 server policy parameters, such as class, address range, and options. A new policy is created if it does not exist.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

dhcp-server-policy <DHCP-SERVER-POLICY-NAME>

**Parameters**

- dhcp-server-policy <DHCP-SERVER-POLICY-NAME>

<table>
<thead>
<tr>
<th>&lt;DHCP-SERVER-POLICY-NAME&gt;</th>
<th>Specify the DHCPv4 server policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
</table>

**Examples**

rfs7000-37FABE(config)#dhcp-server-policy test
rfs7000-37FABE(config-dhcp-policy-test)#?

DHCP policy Mode commands:

- bootp     BOOTP specific configuration
- dhcp-class Configure DHCP class (for address allocation using DHCP user-class options)
- dhcp-pool Configure DHCP server address pool
- dhcp-server Activating dhcp server based on criteria
- no        Negate a command or set its defaults

4.1.34  dhcpv6-server-policy

Global Configuration Commands

Creates a DHCPv6 server policy and enters its configuration mode

DHCPv6 is a networking protocol for configuring IPv6 hosts with IP addresses, IP prefixes, or other configuration attributes required on an IPv6 network.

DHCPv6 servers pass IPv6 network addresses to IPv6 clients. The DHCPv6 address assignment feature manages non-duplicate addresses in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple pools. Additional options, such as the default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface or on multiple interfaces, or the server can automatically find the appropriate pool.

When configured and applied to a device, the DHCPv6 server policy enables the device to function as a stateless DHCPv6 server.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>

Parameters

- dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>

Examples

rfs7000-6DCD4B(config)#dhcpv6-server-policy test
rfs7000-6DCD4B(config-dhcpv6-server-policy-test)#?
DHCPv6 server policy Mode commands:
dhcpv6-pool      Configure DHCPV6 server address pool
no                Negate a command or set its defaults
option           Define DHCPv6 server option
restrict-vendor-options Restrict vendor specific options to be sent in server reply
server-preference Server preference value sent in the reply, by the server to client
c1rscr            Clears the display screen
commit            Commit all changes made in this session
do                Run commands from Exec mode
end               End current mode and change to EXEC mode
exit              End current mode and down to previous mode
help              Description of the interactive help system
revert            Revert changes
service           Service Commands
show              Show running system information
write             Write running configuration to memory or terminal
rfs7000-6DCD4B(config-dhcpv6-server-policy-test)#

Related Commands

no  Removes an existing DHCPv6 server policy
NOTE: For more information on DHCP policy, see Chapter 12, DHCP-SERVER-POLICY.
4.1.35 **dns-whitelist**

> Global Configuration Commands

Configures a DNS whitelist. A DNS whitelist is a list of domains allowed access to the network.

The following table lists DNS Whitelist configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>dns-whitelist</td>
<td>Creates a DNS whitelist and enters its configuration mode</td>
<td>page 4-113</td>
</tr>
<tr>
<td>dns-whitelist-mode</td>
<td>Summarizes DNS whitelist configuration mode commands</td>
<td>page 4-114</td>
</tr>
</tbody>
</table>
4.1.35.1 dns-whitelist

```
Configures a DNS whitelist. A DNS whitelist is a list of allowed DNS destination IP addresses pre-approved to access a controller, service platform, or access point managed captive portal.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510
```

**Syntax**

dns-whitelist <DNS-WHITELIST-NAME>

**Parameters**
- dns-whitelist <DNS-WHITELIST-NAME>

| <DNS-WHITELIST-NAME> | Specify the DNS whitelist name. If the whitelist does not exist, it is created. |

**Examples**

```
rfs7000-37FABE(config)#dns-whitelist test
rfs7000-37FABE(config-dns-whitelist-test)#?
DNS Whitelist Mode commands:
  no    Negate a command or set its defaults
  permit Match a host
  clrscr Clears the display screen
  commit Commit all changes made in this session
  end    End current mode and change to EXEC mode
  exit   End current mode and down to previous mode
  help   Description of the interactive help system
  revert Revert changes
  service Service Commands
  show   Show running system information
  write  Write running configuration to memory or terminal
```

```
rfs7000-37FABE(config-dns-whitelist-test)#
```

**Related Commands**

```
no
Removes an existing DNS Whitelist
```
4.1.35.2 dns-whitelist-mode commands

The following table summarizes DNS Whitelist configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>permit</td>
<td>Permits a host, existing on a DNS whitelist, access to the network or captive portal</td>
<td>page 4-115</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts to default</td>
<td>page 4-116</td>
</tr>
</tbody>
</table>

Table 4.11 DNS-Whitelist-Mode Commands
4.1.35.2.1 permit

dns-whitelist-mode commands

A whitelist is a list of host names and IP addresses permitted access to the network or captive portal. This command adds a host or destination IP address to the DNS whitelist.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
permit <IPv4/IPv6/HOSTNAME> {suffix}

Parameters
- permit <IPv4/IPv6/HOSTNAME> {suffix}

<table>
<thead>
<tr>
<th>&lt;IPv4/IPv6/HOSTNAME&gt;</th>
<th>Adds a device to the DNS whitelist</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IPv4/IPv6/HOSTNAME&gt;</td>
<td>Provide a hostname or numerical IPv4 or IPv6 address for each destination IP address or host included in the whitelist.</td>
</tr>
</tbody>
</table>

**Note:** A maximum of 256 entries can be made.

<table>
<thead>
<tr>
<th>suffix</th>
<th>Optional. Matches any hostname or domain name including the specified name as suffix</th>
</tr>
</thead>
</table>

Examples
rfs7000-37FABE(config-dns-whitelist-test)#permit example_company.com suffix
rfs7000-37FABE(config-dns-whitelist-test)#show context
dns-whitelist test
permit example_company.com suffix
rfs7000-37FABE(config-dns-whitelist-test)#

Related Commands
- no
  Removes a DNS whitelist entry
### 4.1.35.2.2 no

**dns-whitelist-mode commands**

Removes a specified host or IP address from the DNS whitelist, and prevents it from accessing network resources.

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
no permit <IPv4/IPv6/HOSTNAME>
```

**Parameters**
- `no permit <IPv4/IPv6/HOSTNAME>`

**Examples**

```plaintext
rfs7000-37FABE(config-dns-whitelist-test)#show context
dns-whitelist test
rfs7000-37FABE(config-dns-whitelist-test)#

rfs7000-37FABE(config-dns-whitelist-test)#no permit example_company.com
rfs7000-37FABE(config-dns-whitelist-test)#

rfs7000-37FABE(config-dns-whitelist-test)#show context
dns-whitelist test
rfs7000-37FABE(config-dns-whitelist-test)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>permit</code></td>
<td>Adds a device to the DNS whitelist</td>
</tr>
</tbody>
</table>
4.1.36 end

- Global Configuration Commands

Ends and exits the current mode and moves to the PRIV EXEC mode.
The prompt changes to the PRIV EXEC mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
end

Parameters
None

Examples
rfs7000-37FABE(config)#end
rfs7000-37FABE#
4.1.37 event-system-policy

*Global Configuration Commands*

Configures how events are supported. Each event can be configured individually to perform an action such as sending an e-mail or forwarding a notification.

The following table lists event system configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>event-system-policy</td>
<td>Creates an event system policy and enters its configuration mode</td>
<td>page 4-119</td>
</tr>
<tr>
<td>event-system-policy-mode commands</td>
<td>Summarizes event system policy configuration mode commands</td>
<td>page 4-120</td>
</tr>
</tbody>
</table>

*Table 4.12 Event-System-Policy Config Command*
4.1.37.1 event-system-policy

Configures a system wide events handling policy

Event system policies enable administrators to create notification mechanisms using one, some, or all of the SNMP, syslog, controller forwarding, or email notification options available to the controller or service platform. Each listed event can have customized notification settings defined and saved as part of an event policy. Thus, policies can be configured and administered in respect to specific sets of client association, authentication or encryption, and performance events. Once policies are defined, they can be mapped to device profiles strategically as the likelihood of an event applies to particular devices.

To view an existing event system policy configuration details, use the `show > event-system-policy` command.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
event-system-policy <EVENT-SYSTEM-POLICY-NAME>
```

Parameters

- `event-system-policy <EVENT-SYSTEM-POLICY-NAME>`

Examples

```
rfs7000-37FABE(config)#event-system-policy event-testpolicy
rfs7000-37FABE(config-event-system-policy-event-testpolicy)#?
```

Event System Policy Mode commands:

- `event` Configure an event
- `no` Negate a command or set its defaults
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-event-system-policy-event-testpolicy)#
```

Related Commands

- `no` Removes an event system policy
### 4.1.37.2 event-system-policy-mode commands

The following table summarizes event system policy configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>event</td>
<td>Configures an event</td>
<td>page 4-121</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts to default</td>
<td>page 4-133</td>
</tr>
</tbody>
</table>

*Table 4.13 Event-System-Policy Mode Commands*
### 4.1.37.2.1 event

#### event-system-policy-mode commands

Configures an event and sets the action performed when the event happens

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
event <EVENT-TYPE> <EVENT-NAME> (email,forward-to-switch,snmp,syslog) [default|on|off]
```

The event types are:

```
rfs7000-37FABE(config-event-system-policy-testpolicy)#event ?

aaa              AAA/Radius module
adopt-service    Adoption Service
adv-wips         Adv-wips module
ap               Access Point module
captive-portal  Captive Portal
certmgr         Certificate Manager (Not valid for NCAP/MCN)
certmgr-lite    Lite version of certificate manager (NCAP & MCN) only
cfgd            Cfgd module
cluster         Cluster module
crm             Critical Resource Monitoring
device          Device module
dhcpsvr         DHCP Configuration Daemon
diag            Diag module
dot11           802.11 management module
dot1x           802.1X Authentication
fwu             Firmware update module
isdn            Isdn module
l2tpv3          Layer 2 Tunneling Protocol Version 3
licmgr          License module
mesh            Mesh module
mgmt            Management Services
nsm             Network Services Module
pm              Process-monitor module
radconf         Radius Configuration Daemon
rasst           Roaming-Assist module
radio           Radio module
smrt            Smart-rf module
smtpnot         Smtpnot module
system          System module
test            Test module
vrrp            Virtual Router Redundancy Protocol
wips            Wireless IPS module
```

```
rfs7000-37FABE(config-event-system-policy-testpolicy)#
```

---

**NOTE:** The parameter values for `<EVENT-TYPE>` and `<EVENT-NAME>` are summarized in the table under the Parameters section.
### Parameters

- `event <EVENT-TYPE> <EVENT-NAME>` (email, forward-to-switch, snmp, syslog) [default|on|off]

<table>
<thead>
<tr>

4.1.37.2.2 no

event-system-policy-mode commands

Negates an event monitoring configuration

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no event <EVENT-TYPE> <EVENT-NAME> [email|forward-to-switch|snmp|syslog] [default|on|off]

Parameters

- no <PARAMETERS>

Examples

rfs7000-37FABE(config-event-system-policy-TestPolicy)#event ap adopted syslog default
rfs7000-37FABE(config-event-system-policy-TestPolicy)#no event ap adopted syslog

Related Commands

- event

Configures the action taken for each event
### 4.1.38 firewall-policy

**Global Configuration Commands**

Configures a firewall policy. This policy defines a set of rules for managing network traffic and prevents unauthorized access to the network behind the firewall.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
firewall-policy <FIREWALL-POLICY-NAME>
```

**Parameters**

- `firewall-policy <FIREWALL-POLICY-NAME>`

<table>
<thead>
<tr>
<th><code>&lt;FIREWALL-POLICY-NAME&gt;</code></th>
<th>Specify the firewall policy name. If a firewall policy does not exist, it is created.</th>
</tr>
</thead>
</table>

**Examples**

```
rfs7000-37FABE(config)#firewall-policy test
rfs7000-37FABE(config-fw-policy-test)#?
```

Firewall policy Mode commands:

- acl-logging Log on flow creating traffic
- alg Enable ALG
- clamp Clamp value
- dhcp-offer-convert Enable conversion of broadcast dhcp offers to unicast
- dns-snoop DNS Snooping
- firewall Wireless firewall
- flow Firewall flow
- ip Internet Protocol (IP)
- ip-mac Action based on ip-mac table
- ipv6 Internet Protocol version 6 (IPv6)
- ipv6-mac Action based on ipv6-mac table
- logging Firewall enhanced logging
- no Negate a command or set its defaults
- proxy-arp Enable generation of ARP responses on behalf of another device
- proxy-nd Enable generation of ND responses (for IPv6) on behalf of another device
- stateful-packet-inspection-l2 Enable stateful packet inspection in layer2 firewall
- storm-control Storm-control
- virtual-defragmentation Enable virtual defragmentation for IPv4 packets (recommended for proper functioning of firewall)

```
rfs7000-37FABE(config-fw-policy-test)#
```

</table>

**NOTE:** For more information on Firewall policy, see *Chapter 13, FIREWALL-POLICY.*
### 4.1.39 global-association-list

**Global Configuration Commands**

Configures a global list of client MAC addresses. Based on the deny or permit rules specified, clients are either allowed or denied access to the managed network.

The global association list serves the same purpose as an Association Access Control List (ACL). However, the Association ACL allows a limited number of entries, a few thousand only, and does not suffice the requirements of a large deployment. This gap is filled by a global association list, which is much larger (with tens of thousands of entries). Both lists co-exist in the system. When an access request comes in, the association ACL is looked up first and if the requesting MAC address is listed in one of the deny ACLs, the association is denied. But, if the requesting client is permitted access, or if in case none of the ACLs list the client’s MAC address, the global association ACL is checked. Once authenticated, the client’s credentials are cached on the access point, and subsequent requests are not referenced to the controller. An entry in an APs credential cache means a pass in the global association list.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

global-association-list <GLOBAL-ASSOC-LIST-NAME>

**Parameters**

- global-association-list <GLOBAL-ASSOC-LIST-NAME>

<table>
<thead>
<tr>
<th>&lt;GLOBAL-ASSOC-LIST-NAME&gt;</th>
<th>Specify the global association list name. If a list with the same name does not exist, it is created.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note:</strong> Map this global association list to a device (controller) or a controller profile. Once associated, the controller applies this association list to requests received from all adopted APs. For more information, see use.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The global association list can also be mapped to a WLAN. The usage of global access lists is controlled on a per-WLAN basis. For more information, see association-list.</td>
</tr>
</tbody>
</table>

**Examples**

rfs4000-229D58 (config)#global-association-list my-clients
rfs4000-229D58 (config-global-assoc-list-my-clients)#?

Global Association List Mode commands:

- default-action Configure the default action when the client MAC does not match any rule
- deny Specify MAC addresses to be denied
- no Negate a command or set its defaults
- permit Specify MAC addresses to be permitted
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

4.1.40 host

Global Configuration Commands

Enters the configuration context of a remote device using its hostname

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
host <DEVICE-NAME>

Parameters
- host <DEVICE-NAME>

| <DEVICE-NAME> | Specify the device’s hostname. All discovered devices are displayed when ‘Tab’ is pressed to auto complete this command. |

Examples
rfs4000-229D58 (config)#host rfs4000-229D58
rfs4000-229D58 (config-device-00-23-68-22-9D-58)#
4.1.41 inline-password-encryption

Global Configuration Commands

Stores the encryption key in the startup configuration file.

By default, the encryption key is not stored in the startup-config file. Use the inline-password-encryption command to move the encrypted key to the startup-config file. This command uses the master key to encrypt the password, then moves it to the startup-config file.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

inline-password-encryption

**Parameters**

None

**Usage Guidelines**

When the configuration file is imported to a different device, it first decrypts the encryption key using the default key and then decrypts the rest of the configuration using the administrator configured encryption key.

**Examples**

rfs7000-37FABE(config)#password-encryption secret 2 12345678
rfs7000-37FABE(config)#

rfs7000-37FABE(config)#commit wr mem
rfs7000-37FABE(config)#

This command uses the specified password for encryption key and stores it outside of startup-config

rfs7000-37FABE(config)#inline-password-encryption
rfs7000-37FABE(config)#

This command moves the same password to the startup-config and encrypts it with the master key.

</tbody>
</table>
4.1.42 ip

> Global Configuration Commands

Creates a IP access control list (ACL) and/or a SNMP IP ACL.

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ip [access-list|snmp-access-list]

ip access-list <IP-ACL-NAME>

ip snmp-access-list <IP-SNMP-ACL-NAME>

Parameters

- ip access-list <IP-ACL-NAME>

  access-list <IP-ACL-NAME>

  Creates an IP ACL and enters its configuration mode

  - <IP-ACL-NAME> – Specify the ACL name. If the access list does not exist, it is created.

- ip snmp-access-list <IP-SNMP-ACL-NAME>

  snmp-access-list <IP-SNMP-ACL-NAME>

  Creates a SNMP IP ACL and enters its configuration mode. An SNMP IP ACL is an access control mechanism that uses a combination of IP ACL and SNMP community string.

  SNMP performs network management functions using a data structure called a Management Information Base (MIB). SNMP is widely implemented but not very secure, since it uses only text community strings for accessing controller or service platform configuration files.

  Use SNMP ACLs (firewalls) to help reduce SNMP's vulnerabilities, as SNMP traffic can be easily exploited to produce a denial of service (DoS).

  - <IP-SNMP-ACL-NAME> – Specify the SNMP IP ACL name. If the access list does not exist, it is created. After creating the SNMP ACL, define the deny/permit rules based on the network and/or host IP addresses. Once created and configured, link this SNMP IP ACL with a SNMP community string.

  Note: To link the SNMP community string with the SNMP IP ACL, in the management-policy-config-mode, use the following command: snmp-server > community <COMMUNITY-STRING> > [ro|rw] > ip-snmp-access-list <IP-SNMP-ACL-NAME>
Examples

rfs7000-37FABE(config)#ip access-list test

rfs7000-37FABE(config-ip-acl-test)#?

ACL Configuration commands:
  deny Specify packets to reject
  disable Disable rule if not needed
  no Negate a command or set its defaults
  permit Specify packets to forward

  clrscr Clears the display screen
  commit Commit all changes made in this session
  end End current mode and change to EXEC mode
  exit End current mode and down to previous mode
  help Description of the interactive help system
  revert Revert changes

**NOTE:** For more information on access control lists, see Chapter 11, ACCESS-LIST.
4.1.43 ipv6

Global Configuration Commands

Creates a IPv6 ACL

An IPv6 ACL defines a set of rules that filter IPv6 packets flowing through a port or interface. Each rule specifies the action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
ipv6 access-list <IPv6-ACL-NAME>

Parameters

- **ipv6 access-list <IPv6-ACL-NAME>**

<table>
<thead>
<tr>
<th>access-list &lt;IPv6-ACL-NAME&gt;</th>
<th>Configures an IPv6 access list and enters its configuration mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IPv6-ACL-NAME&gt;</td>
<td>&lt;IPv6-ACL-NAME&gt; – Specify the IPv6 ACL name. If the access list does not exist, it is created.</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58(config)#ipv6 access-list IPv6ACLTest

rfs4000-229D58(config-ipv6-acl-IPv6ACLTest)#?

IPv6 Access Control Mode commands:
- **deny** Specify packets to reject
- **no** Negate a command or set its defaults
- **permit** Specify packets to forward
- **clrscr** Clears the display screen
- **commit** Commit all changes made in this session
- **do** Run commands from Exec mode
- **end** End current mode and change to EXEC mode
- **exit** End current mode and down to previous mode
- **help** Description of the interactive help system
- **revert** Revert changes
- **service** Service Commands
- **show** Show running system information
- **write** Write running configuration to memory or terminal

rfs4000-229D58(config-ipv6-acl-IPv6ACLTest)#

Related Commands

| no | Removes an IPv6 access control list |

NOTE: For more information on access control lists, see Chapter 11, ACCESS-LIST.
4.1.44 ipv6-router-advertisement-policy

The following table lists the IPv6 router advertisement (RA) policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6-router-advertisement-policy</td>
<td>Creates a new IPv6 RA policy and enters its configuration mode</td>
<td>page 4-144</td>
</tr>
<tr>
<td>ipv6-router-advertisement-policy-mode commands</td>
<td>Summarizes the IPv6 RA policy configuration mode commands</td>
<td>page 4-146</td>
</tr>
</tbody>
</table>
4.1.44.1 ipv6-router-advertisement-policy

ipv6-router-advertisement-policy

Creates an IPv6 *router advertisement* (RA) policy and enters its configuration mode.

An IPv6 router policy allows routers to advertise their presence in response to solicitation messages. After receiving a neighbor solicitation message, the destination node sends an advertisement message, which includes the link layer address of the source node. After receiving the advertisement, the destination device replies with a neighbor advertisement message on the local link. After the source receives the advertisement it can communicate with other devices.

Advertisement messages are also sent to indicate a change in link layer address for a node on the local link. With such a change, the multicast address becomes the destination address for advertisement messages.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
ipv6-router-advertisement-policy <POLICY-NAME>
```

**Parameters**

- ipv6-router-advertisement-policy <POLICY-NAME>

| ipv6-router-advertisement-policy <POLICY-NAME> | Specify an IPv6 RA policy name. If the policy does not exist, it is created. |

**Examples**

```
rfs4000-229D58(config-ipv6-radv-policy-test)#?
IPv6 Router Advertisement Policy Mode commands:
advertise Option to advertise in router advertisement
assist-neighbor-discovery Send the Source Link Layer address option in Router Advertisement to assist in neighbor discovery
check-ra-consistency Check if the parameters advertised by other routers on the link are in conflict with those configured on this router. Conflicts are logged.
dns-server DNS Server
domain-name Configure domain-name
managed-config-flag Set the managed-address-configuration flag in Router Advertisements. When set, it indicates that the addresses are available via DHCPv6
nd-reachable-time Time that a node assumes a neighbor is reachable after having received a reachability confirmation
no Negate a command or set its defaults
ns-interval Time between retransmitted Neighbor Solicitation messages
other-config-flag Set the other-configuration flag in Router Advertisements. When set, it indicates that other configuration information is available via DHCPv6.
ra Router Advertisements
router-lifetime Lifetime associated with the default router
router-preference Preference of this router over other routers
unicast-solicited-advertisement Unicast the solicited Router Advertisements
```
clearscr                           Clears the display screen
commit                           Commit all changes made in this session

4.1.44.2.1 advertise

`ipv6-router-advertisement-policy-mode commands`

Enables/disables advertisement of IPv6 *maximum transmission unit* (MTU) and hop-count value in RAs. Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
advertise [hop-limit|mtu]
```

**Parameters**

- `advertise [hop-limit|mtu]`

| advertise [hop-limit|mtu] | Enables/disables advertisement of IPv6 MTU and hop-count value in RAs. Both these features are disabled by default. |
|--------------------------|---------------------------------------------------------------------------------------------------------------|

**Examples**

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#advertise hop-limit
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#advertise mtu
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test
advertise mtu
advertise hop-limit
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```

**Related Commands**

```
no
```

| no | Disables advertisement of IPv6 MTU and hop-count value in RAs |
4.1.44.2.2 assist-neighbor-discovery

* ipv6-router-advertisement-policy-mode commands

Enables/disables advertisement of the source link layer address in RAs to facilitate neighbor discovery. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`assist-neighbor-discovery`

**Parameters**

None

**Examples**

```
 rfs7000-6DCD4B(config-ipv6-radv-policy-test)#assist-neighbor-discovery
```

**Related Commands**

<p>| | |</p>
<table>
<thead>
<tr>

</tbody>
</table>
4.1.44.2.3 check-ra-consistency

Enables/disables checking of consistency in RA values advertised by this router with those advertised by other routers, if any, on the same link. If the values advertised are inconsistent, a conflict is logged.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
check-ra-consistency

Parameters
None

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#check-ra-consistency

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test
advertise mtu
advertise hop-limit
check-ra-consistency
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

| no | Disables comparison of interface-specific parameters advertised by other routers, within the link, with those advertised with this router |
4.1.44.2.4 dns-server

ipv6-router-advertisement-policy-mode commands

Configures the DNS server’s IPv6 address and lifetime. The configured values are advertised in RAs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}

Parameters

- dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}

| dns-server <IPv6> | Configures the DNS server’s IPv6 address
|-------------------|---------------------------------------------------------------
|                   | Enables the use of a DNS server to resolve host names to IPv6 addresses. When an IPv6 host is configured with the address of a DNS server, the host sends DNS name queries to the server for resolution.
|                   | <IPv6> — Specify the DNS server’s address. This address is advertised in RAs. A maximum of four (4) entries can be made per policy.

| lifetime [4-3600] | Optional. Configures the DNS server’s (identified by the <IPv6> parameter) lifetime
|-------------------|---------------------------------------------------------------
| expired | Configures a lifetime in seconds. Specify a value form 4 - 3600 seconds. The default is 600 seconds.
| infinite | Advertises that this DNS server’s lifetime has expired and should not be used
| infinite | Advertises that this DNS server’s lifetime is infinite

Examples

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#dns-server 2002::2 lifetime 3000

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
  advertise mtu
  advertise hop-limit
  check-ra-consistency
  dns-server 2002::2 lifetime 3000
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

no | Removes the DNS server settings advertised in RAs. Once removed these values are not advertised in RAs.
4.144.2.5 domain-name

ipv6-router-advertisement-policy-mode commands

Configures the Domain name search label advertised in RAs

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
domain-name <WORD> {lifetime [<4-3600>|expired|infinite]}

Parameters
- domain-name <WORD> {lifetime [<4-3600>|expired|infinite]}

| domain-name <WORD> | Configures the Domain name search label advertised in RAs
|                    | Enter a *fully qualified domain name* (FQDN), which is an unambiguous domain name available in a router advertisement resource. To distinguish an FQDN from a regular domain name, a trailing period is added. For example, somehost.example.com.
|                    | • <WORD> — Specify the Domain name search label. A maximum of four (4) entries can be made per policy.

| lifetime [<4-3600>|expired|infinite] | Optional. Configures the Domain name search label’s lifetime
|                                      | • <4-3600> — Configures a lifetime in seconds. Specify a value form 4 - 3600 seconds. The default is 600 seconds.
|                                      | • expired — Advertises that this Domain name search label’s lifetime has expired and should not be used
|                                      | • infinite — Advertises that this Domain name search label’s lifetime is infinite

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test advertise mtu advertise hop-limit check-ra-consistency dns-server 2002::2 lifetime 3000 domain-name TechPubs lifetime infinite rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

no

Removes the Domain name settings advertised in RAs. Once removed these values are not advertised in RAs.
4.14.2.6 managed-config-flag

Sets/removes the managed address configuration flag in RAs. When set, it indicates that IPv6 addresses are available through DHCPv6. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
managed-config-flag

Parameters
None

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#managed-config-flag
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context

4.1.44.2.7 nd-reachable-time

Enables/disables advertisement of neighbor discovery reachable time in RAs. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
nd-reachable-time [<5000-3600000>|global]

Parameters
- nd-reachable-time [<5000-3600000>|global]

| nd-reachable-time [<5000-3600000>|global] | Configures the interval, in milliseconds, that a node assumes a neighbor is reachable after receiving a reachability confirmation from the neighbor. Therefore, a neighbor is reachable, after being discovered, for a period specified here. This value is advertised in RAs. Use one of the following options:
- <5000-3600000> – Configures an interface-specific value. Specify a value from 5000 - 3600000 milliseconds. The default is 5000 milliseconds.
- global – Advertises the neighbor reachable time configured for the system. This is the value configured at the device configuration mode. For more information, see ipv6.

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#nd-reachable-time 6000

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context

4.1.44.2.8 no

- ipv6-router-advertisement-policy-mode commands

Removes or reverts router advertisement policy settings. Use the no command to remove or revert the interface-specific parameters that are advertised by link router.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [advertise|assist-neighbor-discovery|check-ra-consistency|dns-server|domain-name|
managed-config-flag|nd-reachable-time|ns-interval|other-config-flag|ra|
router-lifetime|unicast-solicited-advertisement]

Parameters
- no <PARAMETERS>

4.14.2.9 ns-interval

ipv6-router-advertisement-policy-mode commands

Configures the neighbor solicitation (NS) retransmit timer value advertised in RAs. This is the interval between two successive NS messages. When specified, it enables the sending of the specified value in RAs. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ns-interval [<1000-3600000>|global]

Parameters

- ns-interval [<1000-3600000>|global]

| ns-interval [<1000-3600000>|global] | Configures the NS interval advertised in RAs. Use one of the following options:
|----------------------------------------|-----------------------------------------------------|
| [global] | Configures the NS interval advertised in RAs. Use one of the following options:
| [global] | • <1000-3600000> – Specify a value from 1000 - 3600000 milliseconds. The default is 1000 milliseconds.
| [global] | • global – Advertises the NS interval configured for the system. This is configured on the device in the device configuration mode. For more information, see ipv6.

Examples

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#ns-interval 3000

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test managed-config-flag nd-reachable-time global ns-interval 3000 advertise mtu advertise hop-limit check-ra-consistency dns-server 2002::2 lifetime 3000 domain-name TechPubs lifetime infinite rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

| no | Disables advertisement of NS interval in RAs |
4.1.44.2.10 other-config-flag

Sets/removes the other-configuration flag in RAs. When set, it indicates that other configuration details, such as DNS-related information, are available through DHCPv6. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
other-config-flag

Parameters

### 4.1.44.2.11 ra

**ipv6-router-advertisement-policy-mode commands**

Configures RA related parameters, such as the interval between two unsolicited successive RAs. It also allows suppression of RAs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
ra [interval <3-1800>|suppress]
```

**Parameters**

- `ra [interval <3-1800>|suppress]`

  - **interval <3-1800>** Configures the interval, in seconds, between two unsolicited successive RAs
    - `<3-1800>` – Specify a value from 3 - 1800 seconds. The default is 300 seconds.
    - **Note:** The router-lifetime should be at least three times the specified router interval.

  - **suppress** Enables/disables the suppression of RAs. By default, RAs are suppressed. The `no ra suppress` command enables the sending of RAs.

**Examples**

```plaintext
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#ra interval 200
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#no ra suppress
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test
no ra suppress
ra interval 200
managed-config-flag
nd-reachable-time global
advertise mtu
advertise hop-limit
check-ra-consistency
dns-server 2002::2 lifetime 3000
domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```

**Related Commands**

- `no ra interval 200`
  - Removes the RA interval, and enables the sending of RAs
4.1.44.2.12 router-lifetime

**ipv6-router-advertisement-policy-mode commands**

Configures the default router’s lifetime, in seconds, advertised in RAs

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`router-lifetime <0-9000>`

**Parameters**

- `router-lifetime <0-9000>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>router-lifetime</code> <code>&lt;0-9000&gt;</code></td>
<td>Configures the default router’s lifetime</td>
</tr>
<tr>
<td><code>&lt;0-9000&gt;</code></td>
<td>Specify a value from 0 - 9000 seconds. The default value is 1500 seconds.</td>
</tr>
</tbody>
</table>

**Note:** A value of “0” indicates that this router is not the default router.

**Examples**

```plaintext
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#router-lifetime 2000

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test

check-ra-consistency
dns-server 2002::2 lifetime 3000
domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```

**Related Commands**

```plaintext
no
```

Removes the default router’s lifetime
4.1.44.2.13 router-preference

Configures the router preference field value advertised in RAs. The options are high, medium, and low. This value is used to prioritize and select the default router when multiple routers are discovered.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
```
router-preference [high|medium|low]
```

Parameters
- `router-preference [high|medium|low]`

| router-preference [high|medium|low] | Sets this router’s preference over other routers, in the link, to be the default router. The options are high, low, and medium. The default value is medium. |

Note: The following points should be taken into consideration when configuring router preference:
- For a router to be selected as a default router, the router’s lifetime should not be equal to “0”.
- To enable default router selection, using router information contained in RAs, configure default router selection on that interface.

Examples
```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#router-preference high
fs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
  no ra suppress
  ra interval 200
  managed-config-flag
  nd-reachable-time global
  router-lifetime 2000
  advertise mtu
  advertise hop-limit
  router-preference high
  check-ra-consistency
dns-server 2002::2 lifetime 3000
domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```
4.1.44.2.14 unicast-solicited-advertisement

ipv6-router-advertisement-policy-mode commands

Enables/disables unicasting of solicited RAs. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
unicast-solicited-advertisement

Parameters
None

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#unicast-solicited-advertisement
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test
  no ra suppress
  ra interval 200
  unicast-solicited-advertisement
  managed-config-flag
  nd-reachable-time global
  router-lifetime 2000
  advertise mtu
  advertise hop-limit
  router-preference high
  check-ra-consistency
  dns-server 2002::2 lifetime 3000
  domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

| no | Disables unicasting of solicited RAs |
4.1.45 l2tpv3

**Global Configuration Commands**

Configures a *Layer 2 Tunnel Protocol Version 3* (L2TPv3) tunnel policy, used to create one or more L2TPv3 tunnels.

The L2TPv3 policy defines the control and encapsulation protocols needed for tunneling layer 2 frames between two IP nodes. This policy enables creation of L2TPv3 tunnels for transporting Ethernet frames between bridge VLANs and physical GE ports. L2TPv3 tunnels can be created between any vendor devices supporting L2TPv3 protocol.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
l2tpv3 policy <L2TPV3-POLICY-NAME>
```

**Parameters**

- `l2tpv3 policy <L2TPV3-POLICY-NAME>`

**Examples**

```
rfs7000-37FABE(config)#l2tpv3 policy L2TPV3Policy1
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#?

4.1.46 mac

**Global Configuration Commands**

Configures a MAC ACLs

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
mac access-list <MAC-ACCESS-LIST-NAME>
```

**Parameters**

- `mac access-list <MAC-ACCESS-LIST-NAME>`

**Examples**

```
rfs7000-37FABE(config)#mac access-list test
```

```
rfs7000-37FABE(config-mac-acl-test)#?
```

MAC Extended ACL Configuration commands:
- `deny` Specify packets to reject
- `disable` Disable rule if not needed
- `no` Negate a command or set its defaults
- `permit` Specify packets to forward
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-mac-acl-test)#
```

</table>

**NOTE:** For more information on MAC access control lists, see *Chapter 11, ACCESS-LIST.*
4.1.47 **management-policy**

*Global Configuration Commands*

Configures a management policy. Management policies include services that run on a device, welcome messages, banners etc.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`management-policy <MANAGEMENT-POLICY-NAME>`

**Parameters**

- `management-policy <MANAGEMENT-POLICY-NAME>`

| <MANAGEMENT-POLICY-NAME> | Specify the management policy name. If the policy does not exist, it is created. |

**Examples**

<DEVICE>(config)#management-policy test
<DEVICE>(config-management-policy-test)#?

Management Mode commands:

- `aaa-login` Set authentication for logins
- `banner` Define a login banner
- `ftp` Enable FTP server
- `http` Hyper Text Terminal Protocol (HTTP)
- `https` Secure HTTP
- `idle-session-timeout` Configure idle timeout for a configuration session (GUI or CLI)
- `ipv6` IPv6 Protocol
- `no` Negate a command or set its defaults
- `privilege-mode-password` Set the password for entering CLI privilege mode
- `restrict-access` Restrict management access to the device
- `snmp-server` SNMP
- `ssh` Enable ssh
- `t5` T5 configuration
- `telnet` Enable telnet
- `user` Add a user account

<DEVICE>(config-management-policy-test)#

**Related Commands**

- `no` Removes an existing management policy
NOTE: For more information on Management policy configuration, see Chapter 15, MANAGEMENT-POLICY.
4.1.48 meshpoint

▷ Global Configuration Commands

Creates a new meshpoint and enters its configuration mode. Use this command to select and configure existing meshpoints.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
meshpoint [ <MESHPOINT-NAME> | containing <WORD> ]
```

**Parameters**

- meshpoint [ <MESHPOINT-NAME> | containing <WORD> ]

| <MESHPOINT-NAME> | Specify the meshpoint name. If the meshpoint does not exist, it is created. |
| containing <WORD> | Selects existing meshpoints containing the sub-string <WORD> in their names |

**Examples**

```
rfs7000-37FABE(config)#meshpoint TestMeshpoint
rfs7000-37FABE(config-meshpoint-TestMeshpoint)#?
```

Mesh Point Mode commands:

- **allowed-vlans** Set the allowed VLANs
- **beacon-format** The beacon format of this meshpoint
- **control-vlan** VLAN for meshpoint control traffic
- **data-rates** Specify the 802.11 rates to be supported on this meshpoint
- **description** Configure a description of the usage of this meshpoint
- **meshid** Configure the Service Set Identifier for this meshpoint
- **neighbor** Configure neighbor specific parameters
- **no** Negate a command or set its defaults
- **root** Set this meshpoint as root
- **security-mode** The security mode of this meshpoint
- **shutdown** Shutdown this meshpoint
- **use** Set setting to use
- **wpa2** Modify ccmp wpa2 related parameters
- **clrscr** Clears the display screen
- **commit** Commit all changes made in this session
- **do** Run commands from Exec mode
- **end** End current mode and change to EXEC mode
- **exit** End current mode and down to previous mode
- **help** Description of the interactive help system
- **revert** Revert changes
- **service** Service Commands
- **show** Show running system information
- **write** Write running configuration to memory or terminal

```
rfs7000-37FABE(config-meshpoint-TestMeshpoint)#
```

**Related Commands**

```
no Removes an existing meshpoint
```

**NOTE:** For more information on Meshpoint configuration, see Chapter 26, MESHPOINT.
4.1.49 meshpoint-qos-policy

Global Configuration Commands

Configures a set of parameters that defines the meshpoint quality of service (QoS) policy

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>

Parameters

- meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>

Examples

rfs7000-37FABE(config)#meshpoint-qos-policy TestMeshpointQoS
rfs7000-37FABE(config-meshpoint-qos-TestMeshpointQoS)#?
Mesh Point QoS Mode commands:
  accelerated-multicast Configure accelerated multicast streams address and forwarding QoS classification
  no Negate a command or set its defaults
  rate-limit Configure traffic rate-limiting parameters on a per-meshpoint/per-neighbor basis
  clrscr Clears the display screen
  commit Commit all changes made in this session
  do Run commands from Exec mode
  end End current mode and change to EXEC mode
  exit End current mode and down to previous mode
  help Description of the interactive help system
  revert Revert changes
  service Service Commands
  show Show running system information
  write Write running configuration to memory or terminal

rfs7000-37FABE(config-meshpoint-qos-TestMeshpointQoS)#

Related Commands

- no

**NOTE:** For more information on Meshpoint QoS policy configuration, see Chapter 26, MESHPOINT.
4.1.50 mint-policy

> Global Configuration Commands

Configures the global MiNT policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

mint-policy global-default

Parameters

- mint-policy global-default

| global-default | Uses the global default MiNT policy |

Examples

rfs7000-37FABE(config)#mint-policy global-default
rfs7000-37FABE(config-mint-policy-global-default)#?

Mint Policy Mode commands:

- level Mint routing level
- mtu Configure the global Mint MTU
- no Negate a command or set its defaults
- router Mint router
- udp Configure mint UDP/IP encapsulation
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-mint-policy-global-default)#

Related Commands

| no | Removes an existing MiNT policy |

NOTE: For more information on MiNT policy configuration, see Chapter 14, MINT-POLICY.
4.1.51 nac-list

A Network Access Control (NAC) policy configures a list of devices that can access a network based on their MAC addresses. The following table lists NAC list configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>nac-list</td>
<td>Creates a NAC list and enters its configuration mode</td>
<td>page 4-170</td>
</tr>
<tr>
<td>nac-list-mode commands</td>
<td>Summarizes NAC list configuration mode commands</td>
<td>page 4-171</td>
</tr>
</tbody>
</table>
4.1.51.1 nac-list

Configures a NAC list that manages access to the network

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
nac-list <NAC-LIST-NAME>

Parameters

- nac-list <NAC-LIST-NAME>

Examples

rfs7000-37FABE(config)#nac-list test
rfs7000-37FABE(config-nac-list-test)#?

NAC List Mode commands:

exclude Specify MAC addresses to be excluded from the NAC enforcement list
include Specify MAC addresses to be included in the NAC enforcement list
no Negate a command or set its defaults
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-nac-list-test)#

Related Commands

- no Removes a NAC list
4.1.51.2 nac-list-mode commands

The following table summarizes NAC list configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude</td>
<td>Specifies the MAC addresses excluded from the NAC enforcement list</td>
<td>page 4-172</td>
</tr>
<tr>
<td>include</td>
<td>Specifies the MAC addresses included in the NAC enforcement list</td>
<td>page 4-173</td>
</tr>
<tr>
<td>no</td>
<td>Cancels an exclude or include NAC list rule</td>
<td>page 4-174</td>
</tr>
</tbody>
</table>
4.1.51.2.1 exclude

nac-list-mode commands

Specifies the MAC addresses excluded from the NAC enforcement list

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
exclude <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]

Parameters
- exclude <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]

| <START-MAC> | Specifies a range of MAC addresses or a single MAC address to exclude from the NAC enforcement list
|             | • <START-MAC> – Specify the first MAC address in the range.
|             | **Note:** Use this parameter to specify a single MAC address.

| <END-MAC> | Specifies the last MAC address in the range (optional if a single MAC is added to the list)
|           | • <END-MAC> – Specify the last MAC address in the range.

precedence <1-1000> | Sets the rule precedence. Exclude entries are checked in the order of their rule precedence.
|                   | • <1-1000> – Specify a value from 1 - 1000.

Examples
rfs7000-37FABE(config-nac-list-test)#exclude 00-40-96-B0-BA-2A precedence 1
rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
   exclude 00-40-96-B0-BA-2A 00-40-96-B0-BA-2A precedence 1
rfs7000-37FABE(config-nac-list-test)#
4.1.51.2.2 include

nac-list-mode commands

Specifies the MAC addresses included in the NAC enforcement list

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

include <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]

Parameters

- include <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]

| <START-MAC> | Specifies a range of MAC addresses or a single MAC address to include in the NAC enforcement list
| --- | --- |
|  | - <START-MAC> – Specify the first MAC address in the range.
| Note: Use this parameter to specify a single MAC address

| <END-MAC> | Specifies the last MAC address in the range (optional if a single MAC is added to the list)
| --- | --- |
|  | - <END-MAC> – Specify the last MAC address in the range.

precedence <1-1000> | Sets the rule precedence. Include entries are checked in the order of their rule precedence.
| --- | --- |
|  | - <1-1000> – Specify a value from 1 - 1000.

Examples

rfs7000-37FABE(config-nac-list-test)#include 00-15-70-38-06-49 precedence 2

rfs7000-37FABE(config-nac-list-test)#show context nac-list test
exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#
4.1.51.2.3 no

nac-list-mode commands

Cancels an exclude or include NAC list rule

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [exclude|include]

no [exclude|include] <START-MAC> [<END-MAC> precedence <1-1000>][precedence <1-1000>]

Parameters

- no <PARAMETERS>

no <PARAMETERS> Removes or reverts this NAC list’s settings based on the parameters passed

Examples

The following example shows the NAC list ‘test’ settings before the ‘no’ command is executed:

```
rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
  exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
  include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#
```

```
rfs7000-37FABE(config-nac-list-test)#no exclude 00-40-96-B0-BA-2A precedence 1
```

The following example shows the NAC list ‘test’ settings after the ‘no’ command is executed:

```
rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
  include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#
```

Related Commands

| exclude | Specifies MAC addresses excluded from the NAC enforcement list |
| include | Specifies MAC addresses included in the NAC enforcement list |
4.1.52 no

- **Global Configuration Commands**

  Negates a command, or reverts configured settings to their default

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

nx45xx                               Delete an NX45XX integrated services
                                     platform
nx65xx                               Delete an NX65XX integrated services
                                     platform
nx75xx                               Delete an NX75XX wireless controller
nx9000                               Delete an NX9000 wireless controller
passpoint-policy                    Delete a passpoint configuration policy
password-encryption                 Disable password encryption in
                                     configuration
profile                              Delete a profile and all its associated
g                                     configuration
radio-qos-policy                     Delete a radio QoS configuration policy
radius-group                         Local radius server group configuration
radius-server-policy                 Remove device onboard radius policy
radius-user-pool-policy              Configure Radius User Pool
rf-domain                            Delete one or more RF-domains and all
g                                     their associated configurations
rfs4000                              Delete an RFS4000 wireless controller
rfs6000                              Delete an RFS6000 wireless controller
rfs7000                              Delete an RFS7000 wireless controller
roaming-assist-policy               Delete a roaming-assist policy
role-policy                          Role based firewall policy
route-map                           Dynamic routing route map Configuration
routing-policy                      Policy Based Routing Configuration
smart-cache-policy                  Delete a content caching
smart-rf-policy                     Delete a smart-rf-policy
t5                                   Delete an T5 wireless controller
url-filter                          Delete a url filter
url-list                            Delete a URL list
vx9000                              Delete an VX9000 wireless controller
web-filter-policy                   Delete a web filter policy
wips-policy                         Delete a wips policy
wlan                                Delete a wlan object
wlan-qos-policy                     Delete a wireless lan QoS configuration
                                     policy
service                              Service Commands
<DEVICE>(config)#
4.1.53 passpoint-policy

Global Configuration Commands

Creates a new passpoint policy and enters its configuration mode.

The passpoint policy implements the Hotspot 2.0 Wi-Fi Alliance standard, enabling interoperability between clients, infrastructure, and operators. It makes a portion of the IEEE 802.11u standard mandatory and adds Hotspot 2.0 extensions that allow clients to query a network before actually attempting to join it.

The passpoint policy allows a single or set of Hotspot 2.0 configurations to be global and referenced by the devices that use it. It is mapped to a WLAN. However, only primary WLANs on a BSSID will have their passpoint policy configuration used.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

passpoint-policy <POLICY-NAME>

Parameters

- passpoint-policy <POLICY-NAME>

Examples

rfs4000-229D58(config)#passpoint-policy test
rfs4000-229D58(config-passpoint-policy-test)#?

rfs4000-229D58(config-passpoint-policy-test)#?

Passpoint Policy Mode commands:

3gpp Configure a 3gpp plmn (public land mobile network) id
access-network-type Set the access network type for the passpoint
collection-capability Configure the connection capability for the passpoint
domain-name Add a domain-name for the passpoint
hessid Set a homogeneous ESSID value for the passpoint
internet Advertise the passpoint having internet access
ip-address-type Configure the advertised ip-address-type
nai-realm Configure a NAI realm for the passpoint
net-auth-type Add a network authentication type to the passpoint
no Negate a command or set its defaults
operator Add configuration related to the operator of the passpoint
osu Online signup
roam-consortium Add a roam consortium for the passpoint
venue Set the venue parameters of the passpoint
wan-metrics Set the wan-metrics of the passpoint
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode

Related Commands

no Removes an existing passpoint policy
NOTE: For more information on passpoint policy, see Chapter 27, PASSPOINT POLICY.
4.1.54 password-encryption

- **Global Configuration Commands**

Enables password encryption

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
password-encryption secret 2 <LINE>
```

**Parameters**

- **password-encryption secret 2 <LINE>**

<table>
<thead>
<tr>
<th>secret 2 &lt;LINE&gt;</th>
<th>Encrypts passwords with a secret phrase</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- 2 – Specifies the encryption type as either SHA256 or AES256</td>
</tr>
<tr>
<td></td>
<td>- &lt;LINE&gt; – Specify the encryption passphrase.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config)#password-encryption secret 2 example_company
```

```
x6500-31FABE(config)#password-encryption secret 2 example_
x6500-31FABE(config)#
```

**Related Commands**

- **no** | Disables password encryption |
### 4.1.55 profile

**Global Configuration Commands**

Configures profile related commands. If no parameters are given, all profiles are selected.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|containing|filter|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000}
profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000} {<DEVICE-PROFILE-NAME>}
profile {containing <DEVICE-PROFILE-NAME>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000]}
profile {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000]}
```

**Parameters**

- **profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|containing|filter|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000}**

  Configures device profile commands. If no device profile is specified, the system configures all device profiles.

  - **<DEVICE-TYPE>** – Select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX75XX, and NX9000. After specifying the device type, specify the profile name.

  - **<DEVICE-PROFILE-NAME>** – Specify the profile name.

  **Note:** Select ‘anyap’ to configure a profile applicable to any access point.

- **profile {containing <DEVICE-PROFILE-NAME>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000]}**

**Parameters**

- **profile {containing <DEVICE-PROFILE-NAME>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000] <DEVICE-PROFILE-NAME>**

  Configures device profile commands.
<table>
<thead>
<tr>
<th>filter type</th>
<th>Optional. An additional filter used to configure a specific type of device profile. If no device type is specified, the system configures all device profiles.</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Filters profiles by the device type. Select a device type from the following options: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX75XX, and NX9000.</td>
</tr>
</tbody>
</table>

```
profile {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000]}
```

<table>
<thead>
<tr>
<th>filter type</th>
<th>Configures device profile commands</th>
</tr>
</thead>
</table>

```
profile
```

Examples

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE_NAME>
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#?
```

Profile Mode commands:

- adopter-auto-provisioning-policy-lookup Use centralized auto-provisioning policy when adopted by another controller
- adoption Adoption configuration
- alias Alias
- analytics Enable WiNG Onboard Analytics Data
- area Set name of area where the system is located
- arp Address Resolution Protocol (ARP)
- auto-learn-staging-config Enable learning network configuration of the devices that come for adoption
- autogen-uniqueid Autogenerate a unique id
- autoinstall Autoinstall settings
- bluetooth-detection Detect Bluetooth devices using the Bluetooth USB module
- bridge Ethernet bridge
- captive-portal Captive portal
- cdp Cisco Discovery Protocol
- cluster Cluster configuration
- configuration-persistence Enable persistence of configuration across reloads (startup config file)
- controller WLAN controller configuration
- critical-resource Critical Resource
- crypto Encryption related commands
- device-upgrade Device firmware upgrade
- dot1x 802.1X
- dscp-mapping Configure IP DSCP to 802.1p priority mapping for untagged frames
- email-notification Email notification configuration
- enforce-version Check the firmware versions of devices before interoperating
- environmental-sensor Environmental Sensors Configuration
- events System event messages
- export Export a file
- floor Set the floor within a area where the system is located
- gre GRE protocol
- http-analyze Specify HTTP-Analysis configuration
interface                                Select an interface to configure
ip                                       Internet Protocol (IP)
ipv6                                     Internet Protocol version 6 (IPv6)
l2tpv3                                   L2tpv3 protocol
l3e-lite-table                           L3e lite Table
led                                      Turn LEDs on/off on the device
led-timeout                              Configure the time for the led to
turn off after the last radio state
change
legacy-auto-downgrade                    Enable device firmware to auto
downgrade when other legacy devices
are detected
legacy-auto-update                       Auto upgrade of legacy devices
lldp                                      Link Layer Discovery Protocol
load-balancing                           Configure load balancing parameter
logging                                  Modify message logging facilities
mac-address-table                       MAC Address Table
mac-auth                                 802.1X
memory-profile                           Memory profile to be used on the
device
meshpoint-device                         Configure meshpoint device
parameters
meshpoint-monitor-interval               Configure meshpoint monitoring
interval
min-misconfiguration-recovery-time      Check controller connectivity after
configuration is received

misconfiguration-recovery-time          Check controller connectivity after
configuration is received
neighbor-inactivity-timeout             Configure neighbor inactivity
timeout
neighbor-info-interval                   Configure neighbor information
exchange interval
no                                       Negate a command or set its
defaults
noc                                      Configure the noc related setting
ntp                                      Ntp server WORD
offline-duration                         Set duration for which a device
remains unadopted before it
generates offline event
power-config                             Configure power mode
preferred-controller-group              Controller group this system will
prefer for adoption
preferred-tunnel-controller             Tunnel Controller Name this system
will prefer for tunneling extended
vlan traffic
radius                                   Configure device-level radius
authentication parameters
raid                                      RAID
remove-override                          Remove configuration item override
from the device (so profile value
takes effect)
rf-domain-manager                        RP Domain Manager
router                                   Dynamic routing
slot                                     PCI expansion Slot
spanning-tree                            Spanning tree
traffic-class-mapping                    Configure IPv6 traffic class to
802.1p priority mapping for
untagged frames
use                                      Set setting to use
vrrp                                      VRRP configuration
vrrp-state-check                         Publish interface via OSPF/BGP only
if the interface VRRP state is not
BACKUP
wep-shared-key-auth                      Enable support for 802.11 WEP
shared key authentication
clrscr                                    Clears the display screen

4.1.56 *radio-qos-policy*

**Global Configuration Commands**

Configures a radio *quality-of-service* (QoS) policy

Supported in the following platforms:
- Wireless Controllers — RFS4011

**Syntax**

```plaintext
radio-qos-policy <RADIO-QOS-POLICY-NAME>
```

**Parameters**

- `radio-qos-policy <RADIO-QOS-POLICY-NAME>`

| `<RADIO-QOS-POLICY-NAME>` | Specify the radio QoS policy name. If the policy does not exist, it is created. |

**Examples**

```plaintext
rfs7000-37FABE(config)#radio-qos-policy test
rfs7000-37FABE(config-radio-qos-test)#?
```

Radio QoS Mode commands:
- `accelerated-multicast` Configure multicast streams for acceleration
- `admission-control` Configure admission-control on this radio for one or more access categories
- `no` Negate a command or set its defaults
- `smart-aggregation` Configure smart aggregation parameters
- `wmm` Configure 802.11e/Wireless MultiMedia parameters
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```plaintext
rfs7000-37FABE(config-radio-qos-test)#
```

**Related Commands**

```plaintext
no
```

Removes an existing Radio QoS policy

---

**NOTE:** For more information on radio qos policy, see *Chapter 17, RADIO-QOS-POLICY.*
4.1.57 **radius-group**

**Global Configuration Commands**

Configures RADIUS user group parameters

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
radius-group <RADIUS-GROUP-NAME>
```

**Parameters**

- `radius-group <RADIUS-GROUP-NAME>`

| <RADIUS-GROUP-NAME> | Specify a RADIUS user group name. The name should not exceed 64 characters. If the RADIUS user group does not exist, it is created. |

**Examples**

```
rfs7000-37FABE(config)#radius-group testgroup
rfs7000-37FABE(config-radius-group-testgroup)#?
```

Radius user group configuration commands:

- `guest` Make this group a Guest group
- `no` Negate a command or set its defaults
- `policy` Radius group access policy configuration
- `rate-limit` Set rate limit for group
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-radius-group-testgroup)#
```

**Related Commands**

- `no` Removes an existing RADIUS group

**NOTE:** For more information on RADIUS user group commands, see Chapter 16, RADIUS-POLICY.
4.1.58 radius-server-policy

Global Configuration Commands

Creates an onboard device RADIUS policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

radius-server-policy <RADIUS-SERVER-POLICY-NAME>

Parameters

- radius-server-policy <RADIUS-SERVER-POLICY-NAME>

Examples

rfs7000-37FABE(config)#radius-server-policy testpolicy
rfs7000-37FABE(config-radius-server-policy-testpolicy)#?

Radius Configuration commands:

- authentication: Radius authentication
- chase-referral: Enable chasing referrals from LDAP server
- crl-check: Enable Certificate Revocation List (CRL) check
- ldap-agent: LDAP Agent configuration parameters
- ldap-group-verification: Enable LDAP Group Verification setting
- ldap-server: LDAP server parameters
- local: RADIUS local realm
- nas: RADIUS client
- no: Negate a command or set its defaults
- proxy: RADIUS proxy server
- session-resumption: Enable session resumption/fast reauthentication by using cached attributes
- use: Set setting to use
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

rfs7000-37FABE(config-radius-server-policy-testpolicy)#

Related Commands

no

Removes an existing RADIUS server policy

NOTE: For more information on RADIUS server policy commands, see Chapter 16, RADIUS-POLICY.
4.1.59 radius-user-pool-policy

Global Configuration Commands

Configures a RADIUS user pool

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

radius-user-pool-policy <RADIUS-USER-POOL-POLICY-NAME>

Parameters

- radius-user-pool-policy <RADIUS-USER-POOL-POLICY-NAME>

Examples

rfs7000-37FABE(config)#radius-user-pool-policy testpool
rfs7000-37FABE(config-radius-user-pool-testpool)#?

Radius User Pool Mode commands:

duration Set a guest user’s access duration
no Negate a command or set its defaults
user Radius user configuration
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-radius-user-pool-testpool)#

Related Commands

- no Removes an existing RADIUS user pool

NOTE: For more information on RADIUS user group commands, see Chapter 16, RADIUS-POLICY.
4.1.60 rename

Renames and existing TLO

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

rename tlo <TLO-NAME>

Parameters

- rename tlo <TLO-NAME> <NEW-TLO-NAME>

Examples

The following example shows the top level objects available for renaming:

```
rfs4000-229D58(config)#rename

4.1.61 rf-domain

Global Configuration Commands

An RF Domain groups devices that can logically belong to one network.

The following table lists the RF Domain configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>rf-domain</td>
<td>Creates a RF Domain policy and enters its configuration mode</td>
<td>page 4-193</td>
</tr>
<tr>
<td>rf-domain-mode commands</td>
<td>Invokes RF Domain configuration mode commands</td>
<td>page 4-195</td>
</tr>
</tbody>
</table>
4.1.61.1 rf-domain

rf-domain

Creates an RF Domain or enters the RF Domain configuration context for one or more RF Domains. If the RF Domain does not exist, it is created.

The configuration of controllers (wireless controllers, service platforms, and access points) comprises of RF Domains that define regulatory, location, and other relevant policies. At least one default RF Domain is assigned to each controller.

RF Domains allow administrators to assign configuration data to multiple devices deployed in a common coverage area, such as in a floor, building, or site. Each RF Domain contains policies that set the Smart RF or WIPS configuration.

RF Domains also enable administrators to override WLAN SSID name and VLAN assignments. This enables the deployment of a global WLAN across multiple sites and unique SSID name or VLAN assignments to groups of access points servicing the global WLAN. This WLAN override eliminates the need to define and manage a large number of individual WLANs and profiles.

A controller’s configuration contains:

- A default RF Domain - Each controller utilizes a default RF Domain. Access Points are assigned to this default RF Domain as they are discovered by the controller. A default RF Domain can be used for single-site and multi-site deployments.
  - Single-site deployment – The default RF Domain can be used for single site deployments, where regional, regulatory, and RF policies are common between devices.
  - Multi-site deployment – A default RF Domain can omit configuration parameters to prohibit regulatory configuration from automatically being inherited by devices as they are discovered. This is desirable in multi-site deployments with devices spanning multiple countries. Omitting specific configuration parameters eliminates the risk of an incorrect country code from being automatically assigned to a device.
- A user-defined RF Domain - Created by administrators. A user-defined RF Domain can be assigned to multiple devices manually or automatically.
  - Manually assigned – Use the CLI or UI to manually assign a user-defined RF Domain to controllers and service platforms.
  - Automatically assigned – Use a AP provisioning policy to automatically assign specific RF Domains to access points based on the access point’s model, serial number, VLAN, DHCP option, and IP address or MAC address. Automatic RF Domain assignments are useful in large deployments, as they enable plug-n-play access point deployments by automatically applying RF Domains to remote access points. For more information on auto provisioning policy, see Chapter 9, AUTO-PROVISIONING-POLICY.

Configure and deploy user-defined RF Domains for single or multiple sites where devices require unique regulatory and regional configurations, or unique Smart RF and WIPS policies. User-defined RF Domains can be used to:

- Assign unique Smart RF or WIPS policies to access points deployed on different floors or buildings within in a site.
- Assign unique regional or regulatory configurations to devices deployed in different states or countries.
- Assign unique WLAN SSIDs and/or VLAN IDs to sites assigned a common WLAN without having to define individual WLANs for each site.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510
Syntax
rf-domain {<RF-DOMAIN-NAME>|containing <DOMAIN-NAME>}

Parameters
- rf-domain {<RF-DOMAIN-NAME>|containing <DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>rf-domain</th>
<th>Creates a new RF Domain or enters its configuration context</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;RF-DOMAIN-NAME&gt;</td>
<td>Optional. Specify the RF Domain name (should not exceed 32 characters and should represent the intended purpose). Once created, the name cannot be edited.</td>
</tr>
<tr>
<td>containing &lt;DOMAIN-NAME&gt;</td>
<td>Optional. Identifies an existing RF Domain that contains a specified sub-string in the domain name</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config)#rf-domain rfs7000
rfs7000-37FABE(config-rf-domain-rfs7000)#?

RF Domain Mode commands:
- alias
- channel-list Configure channel list to be advertised to wireless clients
- contact Configure the contact
- control-vlan VLAN for control traffic on this RF Domain
- controller-managed RF Domain manager for this domain will be an adopting controller
- country-code Configure the country of operation
- layout Configure layout
- location Configure the location
- mac-name Configure MAC address to name mappings
- no Negate a command or set its defaults
- override-smartrf Configured RF Domain level overrides for smart-rf
- override-wlan Configured RF Domain level overrides for wlan
- sensor-server AirDefense sensor server configuration
- stats Configure the stats related setting
- timezone Configure the timezone
- tree-node Configure tree node under which this rf-domain appears
- use Set setting to use
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal
rfs7000-37FABE(config-rf-domain-rfs7000)#
4.1.61.2 rf-domain-mode commands

This section describes the default commands under RF Domain.

The following table summarizes RF Domain configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>Configures network, VLAN, and service aliases at the RF Domain level</td>
<td>page 4-196</td>
</tr>
<tr>
<td>channel-list</td>
<td>Configures the channel list advertised by radios</td>
<td>page 4-201</td>
</tr>
<tr>
<td>contact</td>
<td>Configures network administrator's contact information (needed in case of any problems impacting the RF Domain)</td>
<td>page 4-202</td>
</tr>
<tr>
<td>control-vlan</td>
<td>Configures VLAN for traffic control on a RF Domain</td>
<td>page 4-203</td>
</tr>
<tr>
<td>controller-managed</td>
<td>Configures the adopting controller or service platform as this RF Domain's manager</td>
<td>page 4-204</td>
</tr>
<tr>
<td>country-code</td>
<td>Configures the country of operation</td>
<td>page 4-205</td>
</tr>
<tr>
<td>layout</td>
<td>Configures layout information</td>
<td>page 4-206</td>
</tr>
<tr>
<td>location</td>
<td>Configures the physical location of a RF Domain</td>
<td>page 4-208</td>
</tr>
<tr>
<td>mac-name</td>
<td>Maps MAC addresses to names</td>
<td>page 4-209</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts configured settings to their default</td>
<td>page 4-210</td>
</tr>
<tr>
<td>override-smart-rf</td>
<td>Configures RF Domain level overrides for Smart RF</td>
<td>page 4-211</td>
</tr>
<tr>
<td>override-wlan</td>
<td>Configures RF Domain level overrides for a WLAN</td>
<td>page 4-212</td>
</tr>
<tr>
<td>sensor-server</td>
<td>Configures an AirDefense sensor server on this RF Domain</td>
<td>page 4-213</td>
</tr>
<tr>
<td>stats</td>
<td>Configures stats related settings on this RF Domain. These settings define how RF Domain statistics are updated</td>
<td>page 4-215</td>
</tr>
<tr>
<td>timezone</td>
<td>Configures a RF Domain’s geographic time zone</td>
<td>page 4-217</td>
</tr>
<tr>
<td>tree-node</td>
<td>Configures the hierarchial (tree-node) structure under which this RF Domain appears</td>
<td>page 4-218</td>
</tr>
<tr>
<td>use</td>
<td>Enables the use of a specified Smart RF and/or WIPS policy</td>
<td>page 4-220</td>
</tr>
</tbody>
</table>
4.1.61.2.1 alias

rf-domain-mode commands

Configures network, VLAN, host, string, and network-service aliases at the RF Domain level

This command also allows you to associate existing aliases, created in the global configuration mode, and apply overrides to customize for use at the domain level.

For information on aliases, see alias.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias address-range &lt;ADDRESS-RANGE-ALIAS-NAME&gt; &lt;STARTING-IP&gt; to &lt;ENDING-IP&gt;</td>
<td>Creates a new address-range alias for this RF Domain. Or associates an existing address-range alias with this RF Domain. An address-range alias maps a name to a range of IP addresses.</td>
</tr>
<tr>
<td>alias host &lt;HOST-ALIAS-NAME&gt; &lt;HOST-IP&gt;</td>
<td></td>
</tr>
<tr>
<td>alias network &lt;NETWORK-ALIAS-NAME&gt; &lt;NETWORK-ADDRESS/MASK&gt;</td>
<td></td>
</tr>
<tr>
<td>alias network-group &lt;NETWORK-GROUP-ALIAS-NAME&gt; [address-range</td>
<td>host</td>
</tr>
<tr>
<td>alias network-group &lt;NETWORK-GROUP-ALIAS-NAME&gt; [address-range &lt;STARTING-IP&gt; to &lt;ENDING-IP&gt;]</td>
<td></td>
</tr>
<tr>
<td>alias network-service &lt;NETWORK-SERVICE-ALIAS-NAME&gt; proto [&lt;0-254&gt;</td>
<td>&lt;WORD&gt;</td>
</tr>
<tr>
<td>alias string &lt;STRING-ALIAS-NAME&gt; &lt;LINE&gt;</td>
<td></td>
</tr>
<tr>
<td>alias vlan &lt;VLAN-ALIAS-NAME&gt; &lt;1-4094&gt;</td>
<td></td>
</tr>
</tbody>
</table>

Parameters

- alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

  - <ADDRESS-RANGE-ALIAS-NAME> — Specify the address range alias name.

    Note: Alias name should begin with ‘$’.

  - <STARTING-IP> to <ENDING-IP> — Associates a range of IP addresses with this address range alias

    - <STARTING-IP> — Specify the first IP address in the range.
    - to <ENDING-IP> — Specify the last IP address in the range.

    Note: If using an existing address-range alias, you can apply overrides to the alias at the RF Domain level.
• alias host `<HOST-ALIAS-NAME>` `<HOST-IP>`

<table>
<thead>
<tr>
<th>host <code>&lt;HOST-ALIAS-NAME&gt;</code></th>
<th>Creates a host alias for this RF Domain. Or associates an existing host alias with this RF Domain. A host alias maps a name to a single network host.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;HOST-ALIAS-NAME&gt;</code></td>
<td>Specify the host alias name.</td>
</tr>
<tr>
<td><code>&lt;HOST-IP&gt;</code></td>
<td>Associates the network host's IP address with this host alias</td>
</tr>
<tr>
<td>Note:</td>
<td>Alias name should begin with <code>$</code>.</td>
</tr>
</tbody>
</table>

| `<HOST-IP>`             | If using an existing host alias, you can apply overrides to the alias at the RF Domain level. |

• alias network `<NETWORK-ALIAS-NAME>` `<NETWORK-ADDRESS/MASK>`

<table>
<thead>
<tr>
<th>network <code>&lt;NETWORK-ALIAS-NAME&gt;</code></th>
<th>Creates a network alias for this RF Domain. Or associates an existing network alias with this RF Domain. A network alias maps a name to a single network address.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;NETWORK-ALIAS-NAME&gt;</code></td>
<td>Specify the network alias name.</td>
</tr>
<tr>
<td><code>&lt;NETWORK-ADDRESS/MASK&gt;</code></td>
<td>Associates a single network with this network alias</td>
</tr>
<tr>
<td>Note:</td>
<td>Alias name should begin with <code>$</code>.</td>
</tr>
</tbody>
</table>

| `<NETWORK-ADDRESS/MASK>`     | If using an existing network alias, you can apply overrides to the alias at the RF Domain level. |

• alias network-group `<NETWORK-GROUP-ALIAS-NAME>` [address-range `<STARTING-IP>` to `<ENDING-IP>` {<STARTING-IP> to `<ENDING-IP>`}]|host `<HOST-IP>` `{<HOST-IP>}`|network `<NETWORK-ADDRESS/MASK>` `{<NETWORK-ADDRESS/MASK>}`

<table>
<thead>
<tr>
<th>network <code>&lt;NETWORK-GROUP-ALIAS-NAME&gt;</code></th>
<th>Creates a network-group alias for this RF Domain. Or associates an existing network-group alias with this RF Domain.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;NETWORK-GROUP-ALIAS-NAME&gt;</code></td>
<td>Specify the network-group alias name.</td>
</tr>
<tr>
<td>Note:</td>
<td>Alias name should begin with <code>$</code>.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Note:</th>
<th>If using an existing network-group alias, you can apply overrides to the alias at the RF Domain level.</th>
</tr>
</thead>
<tbody>
<tr>
<td>address-range <code>&lt;STARTING-IP&gt;</code> to <code>&lt;ENDING-IP&gt;</code> {&lt;STARTING-IP&gt; to <code>&lt;ENDING-IP&gt;</code>}</td>
<td>Associates a range of IP addresses with this network-group alias</td>
</tr>
<tr>
<td></td>
<td>Specify the first IP address in the range.</td>
</tr>
<tr>
<td>to <code>&lt;ENDING-IP&gt;</code></td>
<td>Specify the last IP address in the range.</td>
</tr>
<tr>
<td>{&lt;STARTING-IP&gt; to <code>&lt;ENDING-IP&gt;</code>}</td>
<td>Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured.</td>
</tr>
</tbody>
</table>

| `<STARTING-IP>` to `<ENDING-IP>`     | Optional. Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured. |

| host `<HOST-IP>` `{<HOST-IP>}`       | Associates a single or multiple hosts with this network-group alias |
|                                      | Specify the hosts’ IP address. |
|                                      | Optional. Specifies more than one host. A maximum of eight (8) hosts can be configured. |

| network `<NETWORK-ADDRESS/MASK>` `{<NETWORK-ADDRESS/MASK>}` | Associates a single or multiple networks with this network-group alias |
|                                                             | Specify the network’s address and mask. |
|                                                             | Optional. Specifies more than one network. A maximum of eight (8) networks can be configured. |

**alias network-service <NETWORK-SERVICE-ALIAS-NAME>**

Creates a network-service alias for this RF Domain. Or associates an existing network-service alias with this RF Domain. A network-service alias maps a name to network services and the corresponding source and destination software ports.

- **<NETWORK-SERVICE-ALIAS-NAME>** – Specify a network-service alias name.

**Note:** Alias name should begin with '$'.

**Note:** If using an existing network-service alias, you can apply overrides to the alias at the RF Domain level.

**proto [<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp]**

Use one of the following options to associate an Internet protocol with this network-service alias:

- **<0-254>** – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the Protocol field of the IPv4 header and the Next Header field of IPv6 header. For example, the User Datagram Protocol's (UDP) designated number is 17.

- **<WORD>** – Identifies the protocol by its name. Specify the protocol name.

- **eigrp** – Selects Enhanced Interior Gateway Routing Protocol (EIGRP). The protocol number is 88.

- **gre** – Selects Generic Routing Encapsulation (GRE). The protocol number is 47.

- **igmp** – Selects Internet Group Management Protocol (IGMP). The protocol number is 2.

- **igp** – Selects Interior Gateway Protocol (IGP). The protocol number is 9.

- **ospf** – Selects Open Shortest Path First (OSPF). The protocol number is 89.

- **vrrp** – Selects Virtual Router Redundancy Protocol (VRRP). The protocol number is 112.

After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports.

- **<1-65535>** – Optional. Configures a destination port number from 1 - 65535

- **<WORD>** – Optional. Identifies the destination port by the service name provided. For example, the secure shell (SSH) service uses TCP port 22.

- **bgp** – Optional. Configures the default Border Gateway Protocol (BGP) services port (179)

- **dns** – Optional. Configures the default Domain Name System (DNS) services port (53)

- **ftp** – Optional. Configures the default File Transfer Protocol (FTP) control services port (21)

- **ftp-data** – Optional. Configures the default FTP data services port (20)

- **gopher** – Optional. Configures the default gopher services port (70)

- **https** – Optional. Configures the default HTTPS services port (443)

- **ldap** – Optional. Configures the default Lightweight Directory Access Protocol (LDAP) services port (389)

- **ntp** – Optional. Configures the default Newsgroup (NNTP) services port (119)

- **nntp** – Optional. Configures the default Network Time Protocol (NTP) services port (123)

- **POP3** – Optional. Configures the default Post Office Protocol (POP3) services port (110)

- **proto** – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step.
### GLOBAL CONFIGURATION COMMANDS

#### alias string <STRING-ALIAS-NAME> <LINE>

*string alias* Creates a string alias for this RF Domain. Or associates an existing string alias with this RF Domain. String aliases map a name to an arbitrary string value. For example, alias string `$DOMAIN test.example_company.com`. In this example, the string alias name is: `$DOMAIN` and the string value it is mapped to is: `test.example_company.com`. In this example, the string alias refers to a domain name.

- `<STRING-ALIAS-NAME>` – Specify the string alias name.
- `<LINE>` – Specify the string value.

**Note:** Alias name should begin with `$`.

**Note:** If using an existing string alias, you can apply overrides to the alias at the RF Domain level.

#### alias vlan <VLAN-ALIAS-NAME> <1-4094>

*vlan alias* Creates a VLAN alias for this RF Domain. Or associates an existing VLAN alias with this RF Domain. A VLAN alias maps a name to a VLAN ID.

- `<VLAN-ALIAS-NAME>` – Specify the VLAN alias name.

**Note:** Alias name should begin with `$`.

- `<1-4094>` Maps the VLAN alias to a VLAN ID

**Note:** If using an existing VLAN alias, you can apply overrides to the alias at the RF Domain level.

### Examples

```
rfs4000-229D58(config)#show context
!
! Configuration of RFS4000 version 5.7.0.0-013D
!
!
! version 2.3
!
alias network-group $TestNetGrpAlias network 192.168.13.0/24 192.168.16.0/24
alias network-group $TestNetGrpAlias address-range 192.168.13.7 to 192.168.13.16 192.168.13.20 to 192.168.13.25
!
alias network $TestNetworkAlias 192.168.13.0/24
!
alias host $TestHostAlias 192.168.13.10
!
alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
!
alias network-service $NetworkServAlias proto udp
```
In the following examples, the global aliases 'kerberos' and 'TestVLANAlias' are associated with the RF Domain 'test' and overrides applied:

```
rfso000-229D58(config-rf-domain-test)#alias network-service $kerberos proto tcp 749 750 80
rfso000-229D58(config-rf-domain-test)#alias vlan $TestVLANAlias 10
```

In the preceding example, the 'host' element of the network-group alias 'test' has been overridden. But the 'network' and 'address-range' elements have been retained as is.

4.1.61.2.2 channel-list

rf-domain-mode commands

Configures the channel list advertised by radios. This command also enables a dynamic update of a channel list.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

channel-list [2.4GHz|5GHz|dynamic]
channel-list dynamic
channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

Parameters

- channel-list dynamic

<table>
<thead>
<tr>
<th>dynamic</th>
<th>Enables a dynamic update of a channel list</th>
</tr>
</thead>
</table>

- channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

<table>
<thead>
<tr>
<th>2.4GHz &lt;CHANNEL-LIST&gt;</th>
<th>Configures the channel list advertised by radios operating in the 2.4 GHz mode</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;CHANNEL-LIST&gt; — Specify the list of channels separated by commas or hyphens.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>5GHz &lt;CHANNEL-LIST&gt;</th>
<th>Configures the channel list advertised by radios operating in the 5.0 GHz mode</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;CHANNEL-LIST&gt; — Specify the list of channels separated by commas or hyphens.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-rf-domain-default)#channel-list 2.4GHz 1-10

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
no country-code
channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
rfs7000-37FABE(config-rf-domain-default)#

Related Commands

no

Removes the list of channels configured on the selected RF Domain for 2.4 GHz and 5.0 GHz bands. Also disables dynamic update of a channel list.
4.1.61.2.3 contact

- **rf-domain-mode commands**

  Configures the network administrator’s contact details. The network administrator is responsible for addressing problems impacting the network.

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
contact <WORD>
```

**Parameters**

- `contact <WORD>`

**Examples**

```
rfs7000-37FABE(config-rf-domain-default)#contact Bob+14082778691
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
  no country-code
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
rfs7000-37FABE(config-rf-domain-default)#
```

**Related Commands**

- `no` Removes a network administrator’s contact details
4.1.61.2.4 control-vlan

rf-domain-mode commands

Configures the VLAN designated for traffic control in this RF Domain

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

control-vlan <1-4094>

Parameters

- control-vlan <1-4094>

Examples

rfs7000-37FABE(config-rf-domain-default)#control-vlan 1

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
  no country-code
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
  control-vlan 1
rfs7000-37FABE(config-rf-domain-default)#

Related Commands

no

Disables the VLAN designated for controlling RF Domain traffic
4.1.61.2.5 controller-managed

**rf-domain-mode commands**

Configures the adopting controller (wireless controller, access point, or service platform) as this RF Domain’s manager. In other words, the RF Domain is controller managed, and the managing controller is the device managing the RF Domain.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

controller-managed

**Parameters**

None

**Examples**

```
rfs4000-229D58(config-rf-domain-test)#controller-managed
rfs4000-229D58(config-rf-domain-test)#commit
rfs4000-229D58(config-rf-domain-test)#show context
```

**Related Commands**

| **no** | Removes the adopting controller or service platform as this RF Domain’s manager |
4.1.6.1.26 country-code

rf-domain-mode commands

Configures a RF Domain’s country of operation. Since device channels transmit in specific channels unique to the country of operation, it is essential to configure the country code correctly or risk using illegal operation.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```plaintext
country-code <WORD>
```

Parameters

- `country-code <WORD>`

Examples

```plaintext
rfs7000-37FABE(config-rf-domain-default)#country-code us
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
country-code us
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
  control-vlan 1
rfs7000-37FABE(config-rf-domain-default)#
```

Related Commands

```plaintext
no
```

Removes the country of operation configured on a RF Domain
### 4.1.61.2.7 layout

**rf-domain-mode commands**

Configures the RF Domain layout in terms of area, floor, and location on a map. It allows users to place APs across the deployment map. A maximum of 256 layouts is permitted.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
layout [area|floor|map-location]
layout area <AREA-NAME> {floor|map-location}
layout floor <FLOOR-NAME> {<1-4094>|area|maplocation}
layout map-location <URL> units [feet|meters] {area <AREA-NAME>|floor <FLOOR-NAME>}
```

**Parameters**

- **layout area <AREA-NAME>**
  - Configures the RF Domain’s area name
    - `<AREA-NAME>` – Specify the area name.
    - **Note:** After configuring the RF Domain’s area of functioning, optionally specify the floor name (and number), and/or the map location.

- **layout floor <FLOOR-NAME>**
  - Configures the RF Domain’s floor name
    - `<FLOOR-NAME>` – Specify the floor name.
    - `<1-4094>` – Optional. Specifies the floor number from 1 - 4094. The default floor number is 1.
    - **Note:** After configuring the floor name (and number) for this RF Domain, optionally specify the area name and/or the map location.

- **layout map-location <URL> units [feet|meters]**
  - Configures the location of the RF Domain on the map
    - `<URL>` – Specify the URL to configure the map location.
    - **Note:** Configures the map units in terms of feet or meters
Examples

rfs7000-37FABE(config-rf-domain-default)#layout map-location www.firstfloor.com units meters area Ecospace floor Floor5

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
  country-code us
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
  layout area Ecospace floor Floor5 map-location www.firstfloor.com units meters
  control-vlan 1

</table>
4.1.61.2.8 location

**rf-domain-mode commands**

Configures the RF Domain’s physical location. The location could be as specific as the building name or floor number. Or it could be generic and include an entire site. The location defines the physical area where a common set of device configurations are deployed and managed by a RF Domain policy.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
location <WORD>
```

**Parameters**

- **location <WORD>**

**Examples**

```
rfs7000-37FABE(config-rf-domain-default)#location SanJose

rfs7000-37FABE(config-rf-domain-default)#show context

```

Removes the RF Domain location
4.1.61.2.9 mac-name

rf-domain-mode commands

Configures a relevant name for each MAC address

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
mac-name <MAC> <NAME>
```

**Parameters**

- **mac-name <MAC> <NAME>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>

rfs7000-37FABE(config-rf-domain-default)#
```

**Related Commands**

```
o  Removes the MAC address to name mapping
```

---

**Note:** The content above is a natural representation of the provided image and text. It includes the global configuration commands, specifically focusing on the `mac-name` command, its syntax, parameters, supported platforms, and examples. The table provides a structured view of the command's parameters and their descriptions. The related commands section includes the `no` command, which removes the MAC address to name mapping.
4.1.61.2.10 no

rf-domain-mode commands

Negates a command or reverts configured settings to their default. When used in the config RF Domain mode, the no command negates or reverts RF Domain settings.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

no [alias|channel-list|contact|control-vlan|controller-managed|country-code|layout|location|mac-name|override-smartrf|override-wlan|sensor-server|stats|timezone|tree-node|use]

**Parameters**

- no <PARAMETERS>

| no <PARAMETERS> | Removes or reverts this RF Domain's settings based on the parameters passed |

**Examples**

The following example shows the default RF Domain settings before the 'no' commands are executed:

```bash
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  location SanJose
    contact Bob+14082778691
    country-code us
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
  mac-name 11-22-33-44-55-66 TestDevice
  layout area Ecospace floor Floor5 map-location www.firstfloor.com units meters
  control-vlan 1
rfs7000-37FABE(config-rf-domain-default)#
```

```bash
rfs7000-37FABE(config-rf-domain-default)#no channel-list 2.4GHz 1-10
rfs7000-37FABE(config-rf-domain-default)#no mac-name 11-22-33-44-55-66
rfs7000-37FABE(config-rf-domain-default)#no location
rfs7000-37FABE(config-rf-domain-default)#no control-vlan
```

The following example shows the default RF Domain settings after the 'no' commands are executed:

```bash
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  location SanJose
    contact Bob+14082778691
    country-code us
  layout area Ecospace floor Floor5 map-location www.firstfloor.com units meters
rfs7000-37FABE(config-rf-domain-default)#
```
4.1.61.2.11 override-smart-rf

Enables dynamic channel switching for Smart RF radios

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

override-smartrf channel-list [2.4GHz|5GHZ] <CHANNEL-LIST>

Parameters

- **override-smartrf channel-list [2.4GHz|5GHZ] <CHANNEL-LIST>**

<table>
<thead>
<tr>
<th>Parameter</th>

layout area Ecospace floor Floor5 map-location www.firstfloor.com units meters
rfs7000-37FABE(config-rf-domain-default)#

Related Commands

- **no** Resets the override Smart RF settings its default
4.1.61.2.12 override-wlan

rf-domain-mode commands

Configures RF Domain level overrides for a WLAN

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

overrides-wlan <WLAN> [ssid|vlan-pool|wpa-wpa2-psk]

overrides-wlan <WLAN> [ssid <SSID>|vlan-pool <1-4094> {limit <0-8192>}]

wpa-wpa2-psk <PASSPHRASE>

Parameters

- overrides-wlan <WLAN> [ssid <SSID>|vlan-pool <1-4094> {limit <0-8192>}|wpa-wpa2-psk <PASSPHRASE>]

<table>
<thead>
<tr>
<th>&lt;WLAN&gt;</th>
<th>Configures the WLAN name</th>
</tr>
</thead>
<tbody>
<tr>
<td>The name should not exceed 32 characters and should represent the WLAN coverage area. After creating the WLAN, configure its override parameters.</td>
<td></td>
</tr>
</tbody>
</table>

| ssid <SSID> | Configures a override SSID associated with this WLAN |
| The SSID should not exceed 32 characters. |

| vlan-pool <1-4094> | Configures the override VLANs available to this WLAN |
| The VLAN ID from 1 - 4094. |
| limit <0-8192> | Optional. Sets a limit to the number of users on this VLAN from 0 - 8192. The default is 0. |

| wpa-wpa2-psk <PASSPHRASE> | Configures the WPA-WPA2 pre-shared key or passphrase for this WLAN |
| <PASSPHRASE> | Specify a WPA-WPA2 key or passphrase. |

Examples

rfs7000-37FABE(config-rf-domain-default)#override-wlan test vlan-pool 2 limit 20

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default

4.1.61.2.13 sensor-server

rf-domain-mode commands

Configures an AirDefense sensor server on this RF Domain. Sensor servers allow network administrators to monitor and download data from multiple sensors remote locations using Ethernet TCP/IP or serial communications. This enables administrators to respond quickly to interferences and coverage problems.

The Wireless Intrusion Protection System (WIPS) protects the controller managed network, wireless clients and access point radio traffic from attacks and unauthorized access. WIPS provides tools for standards compliance and around-the-clock wireless network security in a distributed environment. WIPS allows administrators to identify and accurately locate attacks, rogue devices and network vulnerabilities in real time and permits both a wired and wireless lockdown of wireless device connections upon acknowledgement of a threat.

In addition to dedicated AirDefense sensors, an access point radio can function as a sensor and upload information to a dedicated WIPS server (external to the controller). Unique WIPS server configurations can be used by RF Domains to ensure a WIPS server configuration is available to support the unique data protection needs of individual RF Domains.

WIPS is not supported on a WLAN basis, rather sensor functionality is supported on the access point radio(s) available to each controller managed WLAN. When an access point radio is functioning as a WIPS sensor, it is able to scan in sensor mode across all legal channels within the 2.4 and 5.0 GHz bands. Sensor support requires a AirDefense WIPS Server on the network. Sensor functionality is not provided by the access point alone. The access point works in conjunction with a dedicated WIPS server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

sensor-server <1-3> ip <IP> {port [443|<1-65535>]}

Parameters

- sensor-server <1-3> ip <IP> {port [443|<1-65535>]}

| Sensor-server <1-3> | Configures an AirDefense sensor server parameters
|---------------------|---------------------------------------------------------------------------------------------------
| <1-3>               | <1-3> – Select the server ID from 1 - 3. The server with the lowest defined ID is reached first. The default is 1.

| ip <IP>            | Configures the (non DNS) IP address of the sensor server
|--------------------|---------------------------------------------------------------------------------------------------
| <IP>               | <IP> – Specify the IP address of the sensor server.

| port [443|<1-65535>] | Optional. Configures the sensor server port. The options are:
|----------------|---------------------------------------------------------------------------------------------------
| 443            | 443 – Configures port 443, the default port used by the AirDefense server
| 1-65533         | <1-65533> – Allows you to select a WIPS/AirDefense sensor server port from 1 - 65535

4.1.6.1.2.14 stats

rf-domain-mode commands

Configures stats settings that define how RF Domain statistics are updated.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
stats [open-window|update-interval]
stats open-window <1-2> {sample-interval <5-86640>} {size <3-100>}
stats update-interval [<5-300]|auto
```

Parameters

Removes a RF Domain's time zone
4.1.61.2.16 tree-node

rf-domain-mode commands

Configures the hierarchial (tree-node) structure under which this RF Domain is located.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
tree-node [campus|city|country|region] {campus|city|country|region}
```

Parameters

- `tree-node [campus|city|country|region] {campus|city|country|region}`

Usage Guidelines

The following points need to be taken into consideration when creating the tree-node structure:

- Adding a `country` first is a good idea since `region`, `city`, and `campus` can all be added as sub-nodes in the tree structure. However, the selected country is an invalid tree node until a RF Domain is mapped.
- A city and campus can be added in the tree structure as sub-nodes under a region. An RF Domain can be mapped anywhere down the hierarchy for a region and not just directly under a country. For example, a region can have city, campus, and one RF Domain mapped.
- Only a campus can be added as a sub-node under a city. The city is an invalid tree node until a RF Domain is mapped somewhere within the directory tree.
- A campus is the last node in the hierarchy before a RF Domain, and it is not valid unless it has a RF Domain mapped.
- After creating the tree structure do a `commit` and `save` for the tree configuration to take effect and persist across reboots.
Examples
rfs4000-229D58(config-rf-domain-test)#tree-node campus EcoSpace City Bangalore
  country India region South
rfs4000-229D58(config-rf-domain-test)#

Enables the use of Smart RF and WIPS with this RF Domain

Assigns an existing Wireless IPS (WIPS) policy to the RF Domain

A WIPS policy provides protection against wireless threats and acts as a key layer of security complementing wireless VPNs, encryption and authentication. A WIPS policy uses a dedicated sensor for actively detecting and locating rogue AP devices. After detection, WIPS uses mitigation techniques to block the devices by manual termination, air lockdown, or port suppression

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
use [smart-rf-policy|wips-policy]
use [smart-rf-policy <SMART-RF-POLICY-NAME>|wips-policy <WIPS-POLICY-NAME>]
```

**Parameters**

- **use [smart-rf-policy <SMART-RF-POLICY-NAME>|wips-policy <WIPS-POLICY-NAME>]**
  
  - **smart-rf-policy <SMART-RF-POLICY-NAME>**
    - Specifies a Smart RF policy
    - `<SMART-RF-POLICY-NAME>` – Specify the Smart RF policy name. For more information on configuring Smart RF policy, see [SMART-RF-POLICY].
  
  - **wips-policy <WIPS-POLICY-NAME>**
    - Specifies a WIPS policy
    - `<WIPS-POLICY-NAME>` – Specify the WIPS policy name. For more information on configuring WIPS policy, see [WIPS-POLICY].

**Examples**

### 4.1.65 nx45xx

Global Configuration Commands

Adds an integrated NX45XX series service platform to the network. If a profile for service platform is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

---

**NOTE:** In this guide, NX4500 and NX4524 are collectively represented as a NX45XX series service platform.

---

**Syntax**

nx45xx <DEVICE-NX45XX-MAC>

**Parameters**

- nx45xx <DEVICE-NX45XX-MAC>

<DEVICE-NX45XX-MAC> Specifies the MAC address of a NX45XX series service platform.

**Examples**

nx9500-6C8809(config)#nx45xx B4-C7-99-5C-FA-8E
nx9500-6C8809(config-device-B4-C7-99-5C-FA-8E)#

**Related Commands**

- `no` Removes a NX45XX series service platform from the network
4.1.66 nx65xx

**Global Configuration Commands**

Adds an integrated NX65XX series service platform to the network. If a profile for service platform is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

---

**NOTE:** In this guide, NX6500 and NX6524 are collectively represented as a NX65XX series service platform.

---

**Syntax**

```
nx65xx <DEVICE-NX65XX-MAC>
```

**Parameters**

- `<DEVICE-NX65XX-MAC>`

- Specifies the MAC address of a NX65XX series service platform.

**Examples**

```
nx9500-6C8809(config)#nx65xx 00-15-70-88-9E-C4
nx9500-6C8809(config-device-00-15-70-88-9E-C4)#
```

**Related Commands**

- `no` Removes a NX65XX series service platform from the network.
4.1.67 nx75xx

Global Configuration Commands

Adds an integrated NX75XX series service platform to the network. If a profile for service platform is not available, a new profile is created.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**NOTE:** In this guide, NX7500, NX7510, NX7520, and NX7530 are collectively represented as a NX75XX series service platform.

**Syntax**

nx75xx <DEVICE-NX75XX-MAC>

**Parameters**

- nx75xx <DEVICE-NX75XX-MAC>

  <DEVICE-NX75XX-MAC> | Specifies the MAC address of a NX75XX series service platform.

**Examples**

```plaintext
nx9500-6C8809(config)#nx75xx B4-C9-81-6C-FA-7C

```

**Related Commands**

- `no` Removes a NX9000 series service platform from the network
4.1.69 roaming-assist-policy

**Global Configuration Commands**

Configures a roaming assist policy that enables access points to assist wireless clients in making roaming decisions, such as which access point to connect etc.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

roaming-assist-policy <POLICY-NAME>

**Parameters**

- roaming-assist-policy <POLICY-NAME>

**Examples**

```
roaming-assist-policy testPolicy
```

**Example Output**

```
rfs7000-37FABE(config)#roaming-assist-policy testPolicy
rfs7000-37FABE(config-roaming-assist-policy-testPolicy)#?
```

**Roaming Assist Mode commands:**

- **action**
  - Configure action - action is either to log / deauth

- **detection-threshold**
  - Configure the detection threshold - when exceeded, client monitoring starts

- **handoff-count**
  - Configure the handoff count - number of times client can exceed handoff threshold

- **handoff-threshold**
  - Configure the handoff threshold - when exceeds an action is taken.

- **monitoring-interval**
  - Configure the monitoring interval - interval at which client monitoring occurs

- **no**
  - Negate a command or set its defaults

- **sampling-interval**
  - Configure the sampling interval - interval at which client rssi values are checked

- **clrscr**
  - Clears the display screen

- **commit**
  - Commit all changes made in this session

- **end**
  - End current mode and change to EXEC mode

- **exit**
  - End current mode and down to previous mode

- **help**
  - Description of the interactive help system

- **revert**
  - Revert changes

- **service**
  - Service Commands

- **show**
  - Show running system information

- **write**
  - Write running configuration to memory or terminal

```
rfs7000-37FABE(config-roaming-assist-policy-testPolicy)#
```

**NOTE:** For more information on roaming assist policy commands, see Chapter 30, **ROAMING ASSIST POLICY**.

4.1.70 **role-policy**

*Global Configuration Commands*

Configures a role-based firewall policy

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
role-policy <ROLE-POLICY-NAME>
```

**Parameters**

- `role-policy <ROLE-POLICY-NAME>`

| <ROLE-POLICY-NAME> | Specify the role policy name. If the policy does not exist, it is created. |

**Examples**

```
rfs7000-37FABE(config)#role-policy role1
rfs7000-37FABE(config-role-policy-role1)#?
```

Role Policy Mode commands:

- `default-role` Configuration for Wireless Clients not matching any role
- `ldap-deadperiod` Ldap dead period interval
- `ldap-server` Add a ldap server
- `ldap-timeout` Ldap query timeout interval
- `no` Negate a command or set its defaults
- `user-role` Create a role
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-role-policy-role1)#
```

**NOTE:** For more information on role policy commands, see *Chapter 18, ROLE-POLICY.*

**Related Commands**

| `no` | Removes an existing role policy |
4.1.71 route-map

Global Configuration Commands

Creates a dynamic BGP route map and enters its configuration mode

BGP route maps are used by network administrators to define rules controlling redistribution of routes between routers and routing processes. These route maps are also used to control and modify routing information.

Supported in the following platforms:
  * Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000

Syntax
route-map <ROUTE-MAP-NAME>

Parameters
  * route-map <ROUTE-MAP-NAME>

Examples
nx9500-6C8809(config)#route-map test
nx9500-6C8809(config-dr-route-map-test)#

nx9500-6C8809(config-dr-route-map-test)#?

Route Map Mode commands:
  * deny       Add a deny route map rule to deny set operations
  * no         Negate a command or set its defaults
  * permit     Add a permit route map rule to permit set operations
  * clrscr     Clears the display screen
  * commit     Commit all changes made in this session
  * do         Run commands from Exec mode
  * end        End current mode and change to EXEC mode
  * exit       End current mode and down to previous mode
  * help       Description of the interactive help system
  * revert     Revert changes
  * service    Service Commands
  * show       Show running system information
  * write      Write running configuration to memory or terminal

nx9500-6C8809(config-dr-route-map-test)#

Related Commands

no

Removes an existing dynamic BGP route map

NOTE: For more information on BGP route maps, see Chapter 28, BORDER GATEWAY PROTOCOL.
4.1.72 routing-policy

Global Configuration Commands

Configures a routing policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

role-policy <ROUTING-POLICY-NAME>

Parameters

- role-policy <ROUTING-POLICY-NAME>

| <ROUTING-POLICY-NAME> | Specify the role policy name. If the policy does not exist, it is created. |

Examples

rfs7000-37FABE(config)#routing-policy TestRoutingPolicy
rfs7000-37FABE(config-routing-policy-TestRoutingPolicy)#?

Routing Policy Mode commands:

- apply-to-local-packets: Use Policy Based Routing for packets generated by the device
- logging: Enable logging for this Route Map
- no: Negate a command or set its defaults
- route-map: Create a Route Map
- use: Set setting to use
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

rfs7000-37FABE(config-routing-policy-TestRoutingPolicy)#

NOTE: For more information on routing policy commands, see Chapter 24, ROUTING-POLICY.

Related Commands

- no: Removes an existing routing policy
4.1.73 self

- **Global Configuration Commands**

Displays the device’s configuration context

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
self
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config)#self
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#
```
4.1.74 **smart-rf-policy**

**Global Configuration Commands**

Configures a Smart RF policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
smart-rf-policy <SMART-RF-POLICY-NAME>
```

**Parameters**

- `smart-rf-policy <SMART-RF-POLICY-NAME>`

<table>
<thead>
<tr>
<th>&lt;SMART-RF-POLICY-NAME&gt;</th>
<th>Specify the Smart RF policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
</table>

**Examples**

```
rfs7000-37FABE(config)#smart-rf-policy test
rfs7000-37FABE(config-smart-rf-policy-test)#?
```

**Smart RF Mode commands:**

| area | Specify channel list/ power for an area |
| assignable-power | Specify the assignable power during power-assignment |
| channel-list | Select channel list for smart-rf |
| channel-width | Select channel width for smart-rf |
| coverage-hole-recovery | Recover from coverage hole |
| enable | Enable this smart-rf policy |
| group-by | Configure grouping parameters |
| interference-recovery | Recover issues due to excessive noise and interference |
| neighbor-recovery | Recover issues due to faulty neighbor radios |
| no | Negate a command or set its defaults |
| sensitivity | Configure smart-rf sensitivity (Modifies various other smart-rf configuration items) |
| smart-ocs-monitoring | Smart off channel scanning |
| clrscr | Clears the display screen |
| commit | Commit all changes made in this session |
| end | End current mode and change to EXEC mode |
| exit | End current mode and down to previous mode |
| help | Description of the interactive help system |
| revert | Revert changes |
| service | Service Commands |
| show | Show running system information |
| write | Write running configuration to memory or term |

```
rfs7000-37FABE(config-smart-rf-policy-test)#
```

**NOTE:** For more information on Smart RF policy commands, see Chapter 19, SMART-RF-POLICY.

**Related Commands**

| no | Removes an existing Smart RF policy |
4.1.75 t5

Global Configuration Commands

Invokes the configuration mode of a t5 wireless controller

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

t5 <T5-DEVICE-MAC>

Parameters

- t5 <T5-DEVICE-MAC>

<table>
<thead>
<tr>
<th>t5 &lt;T5-DEVICE-MAC&gt;</th>
<th>Specify the t5 device’s MAC address. The system enters the identified device’s configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The Customer Premises Equipment (CPEs) are the T5 controller managed radio devices using the IPX operating system. These CPEs use a Digital Subscriber Line (DSL) as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.</td>
</tr>
</tbody>
</table>

Note: After logging on to the T5 device, use the ‘cpe’ keyword and configure the following mandatory settings:
- vlan – Set a VLAN from 1 - 4,094 used as a virtual interface for connections between the T5 controller and its managed CPE devices.
- start ip – Set a starting IP address used in a range of addresses available to T5 controller connecting CPE devices.
- end ip – Set an end IP address used in a range of addresses available to T5 controller connecting CPE devices.

Examples

rfs7000-37FABE(config)#t5 B4:C7:99:ED:5C:2C
rfs7000-37FABE(config-device-B4:C7:99:ED:5C:2C)#?

T5 Device Mode commands:
- bridge Sets MAC address expiration time in the bridge address table
- clock Configure clock options
- cpe T5 CPE configuration
- hostname Set system's network name
- interface Select an interface to configure
- ip Internet Protocol (IP)
- no Negate a command or set its defaults
- ntp Configure NTP
- password T5 password configuration
- qos QOS settings
- radius-server Radius server settings
- t5 T5 configuration
- t5-logging Modify message logging facilities
- use Set setting to use
- clrscr Clears the display screen
commit      Commit all changes made in this session
do         Run commands from Exec mode
end        End current mode and change to EXEC mode
exit       End current mode and down to previous mode
help       Description of the interactive help system
revert     Revert changes
service    Service Commands
show       Show running system information
write      Write running configuration to memory or terminal

rfs7000-37FABE(config-device-B4:C7:99:ED:5C:2C)#

<td>Summarizes the Web Filter policy configuration mode commands</td>
<td>page 4-239</td>
</tr>
</tbody>
</table>
4.1.76.1  web-filter-policy

- web-filter-policy

Creates a Web Filtering policy and enters its configuration mode. This policy defines rules managing the local classification database and the cached data. When configured and applied, this policy also enables caching of URL classification records in a local database in a controller-based, hierarchically managed (HM) deployment. Use this option to specify the following: classification server details, size of the local database, time for which records are cached in the database, the action taken in case the classification server is unavailable etc.

The Web filter policy is applied at the profile or device level.

For more information on URL filtering, see url-filter.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

web-filter-policy <WEB-FILTER-POLICY-NAME>

Parameters

- web-filter-policy <WEB-FILTER-POLICY-NAME>

Examples

nx4500-5CFA2B(config)#web-filter-policy test
nx4500-5CFA2B(config-web-filter-policy-test)#?

Content Filter Mode commands:
- cache-max-recs Configure the maximum number of records in local cache
- cache-save-interval Configure the time a record is saved in local cache
- no Negate a command or set its defaults
- server-host Configure URL classification server if it is not the adopted controller
- server-unreachable Permission to access website when classification server is unreachable (default is pass)
- uncategorized-url Permission to website when server fails to classify the URL request (default is pass)
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

Related Commands

- no Removes an existing Web filter policy
4.1.76.2 web-filter-policy-config-mode commands

</tbody>
</table>
4.1.76.2.1 cache-max-recs

web-filter-policy-config-mode commands

Configures the maximum number of records (URL and Web page classification entries) cached in the local database

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

cache-max-recs <1-1000000>

Parameters

- cache-max-recs <1-1000000>

Examples

nx4500-5CFA2B(config-web-filter-policy-test)#cache-max-recs 9000

nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000

nx4500-5CFA2B(config-web-filter-policy-test)#

Related Commands

no

Reverts the maximum number of stored records to default. Please see the parameter table for default values for the different device types.
4.1.76.2.2 cache-save-interval

**web-filter-policy-config-mode commands**

Configures the maximum time period, in seconds, for which a record (URL and Web page classification entry) is cached in the local database. Once the specified time has expired the record is removed from the cache.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

**Syntax**
cache-save-interval <1-86400>

**Parameters**
- cache-save-interval <1-86400>

| cache-save-interval <1-86400> | Specify the maximum time period, in seconds, for which a record is cached in the local database from 1 - 86400 seconds. The default is 60 seconds. |

**Examples**
nx4500-5CFA2B(config-web-filter-policy-test)#cache-save-interval 1000

nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
cache-max-recs 9000
cache-save-interval 1000
nx4500-5CFA2B(config-web-filter-policy-test)#

**Related Commands**

no
Reverts the maximum time period for which a record (URL and Web page classification entry) is cached in the local database to default (60)
4.1.76.2.3 no

**web-filter-policy-config-mode commands**

Reverts the selected Web Filter policy settings to default, based on the parameters passed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

**Syntax**

no [cache-max-recs|cache-save-interval|server-host|server-unreachable|uncategorized-url]

**Parameters**
- no <PARAMETERS>

| no <PARAMETERS> | Reverts the selected Web Filter policy settings to default, based on the parameters passed. Specify the parameters to revert back to default value. |

**Examples**

The following example shows the Web Filter policy ‘test’ settings before the ‘no’ command is executed:

```
nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
  uncategorized-url block
  server-unreachable block
  server-host ip-address 192.168.13.13
```

```
nx4500-5CFA2B(config-web-filter-policy-test)#no cache-max-recs
nx4500-5CFA2B(config-web-filter-policy-test)#no server-unreachable
nx4500-5CFA2B(config-web-filter-policy-test)#no uncategorized-url
```

The following example shows the Web Filter policy ‘test’ settings after the ‘no’ command has been executed:

```
nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-save-interval 1000
  server-host ip-address 192.168.13.13
```

```
nx4500-5CFA2B(config-web-filter-policy-test)#no cache-max-recs
nx4500-5CFA2B(config-web-filter-policy-test)#no server-unreachable
nx4500-5CFA2B(config-web-filter-policy-test)#no uncategorized-url
```
4.1.76.2.4 server-host

web-filter-policy-config-mode commands

Configures the URL classification server in case it is not the adopted controller

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax
server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]

Parameters
- server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]

Examples
nx4500-5CFA2B(config-web-filter-policy-test)#server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
  server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#

Related Commands

no

Removes the URL classification server’s configured details, such as hostname, ip-address, or MiNT ID.
4.1.76.2.5 server-unreachable

> web-filter-policy-config-mode commands

Configures the action taken in case the classification server is unreachable. Based on the value configured the an end user’s request for a URL/Website is either blocked or passed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

```
server-unreachable [block|pass]
```

Parameters

- server-unreachable [block|pass]

```
+-------------------------+--------------------------------------------------+
| server-unreachable      | Configures the action taken in case the classification server is unreachable. The options are: |
| [block|pass]              |   • block – Denies access to the requested URL/Website |
|                        |   • pass – Allows access to the requested URL/Website. This is the default value. |
+-------------------------+--------------------------------------------------+
```

Examples

```
nx4500-5CFA2B(config-web-filter-policy-test)#server-unreachable block

nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
   cache-max-recs 9000
   cache-save-interval 1000
   server-unreachable block
   server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#
```

Related Commands

```
no
```

Reverts the action taken in case the classification server is unreachable to default (pass)
### 4.1.76.2.6 uncategorized-url

*web-filter-policy-config-mode commands*

Configures the action taken in case the classification server fails to classify a URL/Website. Based on the value configured the end user’s request for a non-classified URL/Website is either blocked or passed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

#### Syntax

```
uncategorized-url [block|pass]
```

#### Parameters

- `uncategorized-url [block|pass]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uncategorized-url [block</td>
<td>pass]</td>
</tr>
<tr>
<td></td>
<td>* block – Denies access to the requested non-classified URL/Website</td>
</tr>
<tr>
<td></td>
<td>* pass – Allows access to the requested non-classified URL/Website. This is the default value.</td>
</tr>
</tbody>
</table>

#### Examples

```
nx4500-5CFA2B(config-web-filter-policy-test)#uncategorized-url block

nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
  uncategorized-url block
  server-unreachable block
  server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#
```

### 4.1.77 wips-policy

**Global Configuration Commands**

Configures a WIPS policy

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
wips-policy <WIPS-POLICY-NAME>
```

#### Parameters

- `wips-policy <WIPS-POLICY-NAME>`

<table>
<thead>
<tr>
<th><code>&lt;WIPS-POLICY-NAME&gt;</code></th>
<th>Specify the WIPS policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
</table>

#### Examples

```
rfs7000-37FABE(config)#wips-policy test
rfs7000-37FABE(config-wips-policy-test)#?
```

WIPS Policy Mode commands:

- `ap-detection` — Rogue AP detection
- `enable` — Enable this wips policy
- `event` — Configure an event
- `history-throttle-duration` — Configure the duration for which event duplicates are not stored in history
- `interference-event` — Specify events which will contribute to smart-rf wifi interference calculations
- `no` — Negate a command or set its defaults
- `signature` — Signature to configure
- `use` — Set setting to use
- `clrscr` — clears the display screen
- `commit` — Commit all changes made in this session
- `do` — Run commands from Exec mode
- `end` — End current mode and change to EXEC mode
- `exit` — End current mode and down to previous mode
- `help` — Description of the interactive help system
- `revert` — Revert changes
- `service` — Service Commands
- `show` — Show running system information
- `write` — Write running configuration to memory or terminal

```
rfs7000-37FABE(config-wips-policy-test)#
```

---

**NOTE:** For more information on WIPS policy commands, see *Chapter 20, WIPS-POLICY.*

#### Related Commands

| `no` | Removes an existing WIPS policy |

</tbody>
</table>

Table 4.22 WLAN-Policy Config Commands
4.1.78.1 wlan

wlan

Configures a WLAN and enters its configuration mode. Use this command to modify an existing WLAN’s settings.

A WLAN is a data-communications system that flexibly extends the functionality of a wired LAN. A WLAN links two or more computers or devices using spread-spectrum or OFDM modulation based technology. WLANs do not require lining up devices for line-of-sight transmission, and are thus, desirable for wireless networking. Roaming users can be handed off from one access point to another, like a cellular phone system. WLANs can therefore be configured around the needs of specific user groups, even when they are not in physical proximity.

WLANs can provide an abundance of services, including data communications (allowing mobile devices to access applications), e-mail, file, and print services or even specialty applications (such as guest access control and asset tracking).

Each WLAN configuration contains encryption, authentication and QoS policies and conditions for user connections. Connected access point radios transmit periodic beacons for each BSS. A beacon advertises the SSID, security requirements, supported data rates of the wireless network to enable clients to locate and connect to the WLAN.

WLANs are mapped to radios on each access point. A WLAN can be advertised from a single access point radio or can span multiple access points and radios. WLAN configurations can be defined to provide service to specific areas of a site. For example, a guest access WLAN may only be mapped to a 2.4 GHz radio in a lobby or conference room providing limited coverage, while a data WLAN is mapped to all 2.4 GHz and 5.0 GHz radios at the branch site to provide complete coverage.

The maximum number of WLANs supported by different devices is as follows:

- RFS4000 and RFS6000 wireless controllers – 32 WLANs
- RFS7000 wireless controller – 256 WLANs
- NX4500 and NX6500 series service platforms – 32 WLANs
- NX9000 series service platforms – 1000 WLANs
- Access Points – 16 WLANs

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

wlan {<WLAN-NAME>|containing <WLAN-NAME>}

Parameters

- wlan {<WLAN-NAME>|containing <WLAN-NAME>}

<table>
<thead>
<tr>
<th>wlan &lt;WLAN-NAME&gt;</th>
<th>Configures a new WLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;WLAN-NAME&gt; – Optional. Specify the WLAN name. The WLAN name could be a logical representation of its coverage area (for example, engineering, marketing etc.). The name cannot exceed 32 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>containing &lt;WLAN-NAME&gt;</th>
<th>Optional. Configures an existing WLAN’s settings</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;WLAN-NAME&gt; – Specify a sub-string in the WLAN name. Use this parameter to filter a WLAN. This option allows you to select and enter the configuration mode of one or more WLANs.</td>
</tr>
</tbody>
</table>
Examples

```
rfs7000-37FABE(config)#wlan 1
rfs7000-37FABE(config-wlan-1)#
```

```
rfs7000-37FABE(config)#wlan containing wlan1
rfs7000-37FABE(config-wlan-{'containing': 'wlan1'})#
```

```
rfs7000-37FABE(config-wlan-1)#?
Wireless LAN Mode commands:
  accounting Configure how accounting records are created for this wlan
  acl Actions taken based on ACL configuration [packet drop being one of them]
  answer-broadcast-probes Include this wlan when responding to probe requests that do not specify an SSID
  assoc-response Association response threshold
  association-list Configure the association list for the wlan
  authentication-type The authentication type of this WLAN
  bridging-mode Configure how packets to/from this wlan are bridged
  broadcast-dhcp Configure broadcast DHCP packet handling
  broadcast-ssid Advertise the SSID of the WLAN in beacons
  captive-portal-enforcement Enable captive-portal enforcement on the wlan
  client-access Enable client-access (normal data operations) on this wlan
  client-client-communication Allow switching of frames from one wireless client to another on this wlan
  client-load-balancing Configure load balancing of clients on this wlan
  controller-assisted-mobility Enable controller assisted mobility to determine wireless clients' VLAN assignment
  data-rates Specify the 802.11 rates to be supported on this wlan
  description Configure a description of the usage of this wlan
  downstream-group-addressed-forwarding Enable downstream group addressed forwarding of packets
  dynamic-vlan-assignment Dynamic VLAN assignment configuration
  eap-types Configure client access based on eap-type used for authentication
  encryption-type Configure the encryption to use on this wlan
  enforce-dhcp Drop packets from Wireless Clients with static IP address
  fast-bss-transition Configure support for 802.11r Fast BSS Transition
  http-analyze Enable HTTP URL analysis on the wlan
  ip Internet Protocol (IP)
  ipv6 Internet Protocol version 6 (IPv6)
  kerberos Configure kerberos authentication parameters
  mac-authentication Configure mac-authentication related parameters
  mac-registration Enable dynamic MAC registration of user
  no Negate a command or set its defaults
  opendns OpenDNS related config for this wlan
  protected-mgmt-frames Protected Management Frames (IEEE 802.11w) related configuration (DEMO FEATURE)
  proxy-arp-mode Configure handling of ARP requests
proxy-nd-mode Configure handling of IPv6 ND requests with proxy-nd is enabled
qos-map Support the 802.11u QoS map element and frame
radio-resource-measurement Configure support for 802.11k Radio Resource Measurement
radius Configure RADIUS related parameters
relay-agent Configure dhcp relay agent info
shutdown Shutdown this wlan
ssid Configure the Service Set Identifier for this WLAN
t5-client-isolation Isolate traffic among clients
t5-security Configure encryption and authentication
time-based-access Configure client access based on time
use Set setting to use
vlan Configure the vlan where traffic from this wlan is mapped
vlan-pool-member Add a member vlan to the pool of vlans for the wlan (Note: configuration of a vlan-pool overrides the 'vlan' configuration)
wep128 Configure WEP128 parameters
wep64 Configure WEP64 parameters
wing-extensions Enable support for WiNG-Specific extensions to 802.11
wireless-client Configure wireless-client specific parameters
wpa-wpa2 Modify tkip-ccmp (wpa/wpa2) related parameters
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-wlan-1)#
### 4.1.78.2 wlan-mode commands

**wlan**

This section documents the WLAN configuration mode commands in detail. Use the (config) instance to configure WLAN related parameters. To navigate to this instance, use the following command:

```
<DEVICE>(config)#wlan <WLAN-NAME>
```

The following table summarizes WLAN configuration mode commands:

4.1.78.2.1 accounting

Defines the WLAN’s accounting configuration

Accounting is the method of collecting user data, such as start and stop times, executed commands (for example, PPP), number of packets and number of bytes received and transmitted. This data is sent to the security server for billing, auditing, and reporting purposes. Accounting enables wireless network administrators to track the services and network resources accessed and consumed by users. When enabled, this feature allows the network access server to report and log user activity to a RADIUS security server in the form of accounting records. Each accounting record is comprised of AV pairs and is stored on the access control server. The data can be analyzed for network management, client billing, and/or auditing. Accounting methods must be defined through AAA policies.

Accounting can be enabled and applied to access point, wireless controller, or service platform managed WLANs. Once enabled, it uniquely logs accounting events specific to the managed WLAN. Accounting logs contain information about the use of remote access services by users. This information is of great assistance in partitioning local versus remote users and how to best accommodate each. Remote user information can be archived to a location outside of the access point for periodic network and user permission administration.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

accounting [radius|syslog|wait-client-ip]
accounting [radius|wait-client-ip]
accounting syslog [host|mac-address-format]
accounting syslog host <IP/HOSTNAME> {port <1-65535>}
    {proxy-mode [none|through-controller|through-rf-domain-manager]}
accounting syslog mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot] case [lower|upper]

Parameters

- accounting [radius|wait-client-ip]

| accounting radius | Enables support for WLAN RADIUS accounting messages. This option is disabled by default. When enabled, the WLAN uses an external RADIUS resource for accounting. |
| accounting wait-client-ip | Enables waiting for client’s IP before commencing the accounting procedure |

- accounting syslog host <IP/HOSTNAME> {port <1-65535>}
  {proxy-mode [none|through-controller|through-rf-domain-manager]}

accounting syslog | Enables support for WLAN syslog accounting messages in standard syslog format (RFC 3164). This option is disabled by default.
### Global Configuration Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host &lt;IP/HOSTNAME&gt;</td>
<td>Configures a syslog destination hostname or IP address for accounting records.</td>
</tr>
<tr>
<td>port &lt;1-65535&gt;</td>
<td>Optional. Configures the syslog server’s UDP port (this port is used to connect to the server).</td>
</tr>
<tr>
<td>proxy-mode [none</td>
<td>through-controller</td>
</tr>
<tr>
<td>mac-address-format</td>
<td>Configures the MAC address format used in syslog messages.</td>
</tr>
<tr>
<td>middle-hyphen</td>
<td>Configures the MAC address format with middle hyphen (AABBCC-DDEEFF).</td>
</tr>
<tr>
<td>no-delim</td>
<td>Configures the MAC address format without delimiters (AABBCCDDEEFF).</td>
</tr>
<tr>
<td>pair-colon</td>
<td>Configures the MAC address format with pair-colon delimiters (AA:BB:CC:DD:EE:FF).</td>
</tr>
<tr>
<td>pair-hyphen</td>
<td>Configures the MAC address format with pair-hyphen delimiters (AA-BB-CC-DD-EE-FF). This is the default setting.</td>
</tr>
<tr>
<td>quad-dot</td>
<td>Configures the MAC address format with quad-dot delimiters (AABB.CCDD.EEFF).</td>
</tr>
<tr>
<td>case [lower</td>
<td>upper]</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-wlan-test)#accounting syslog host 172.16.10.4 port 2 proxy-mode none

rfs7000-37FABE(config-wlan-test)#
4.1.78.2.2 acl

> wlan-mode commands

Defines the actions taken based on an ACL rule configuration.

Use the `use > ip-access-list <IP-ACCESS-LIST-NAME>` to associate an ACL with the WLAN. The ACL rule is determined by the associated ACL's configuration.

A firewall is a mechanism enforcing access control, and is considered a first line of defense in protecting proprietary information within the network. The means by which this is accomplished varies, but in principle, a firewall can be thought of as mechanisms allowing and denying data traffic in respect to administrator defined rules. For an overview of firewalls, see `FIREWALL-POLICY`.

WLANs use firewalls like Access Control Lists (ACLs) to filter/mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of Access Control Entries (ACEs). Each ACE specifies an action and a set of conditions (rules) a packet must satisfy to match the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP based firewall rules are specific to source and destination IP addresses and the unique rules and precedence orders assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, administrators can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC Firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist|disassociate}
acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400>|disassociate}
```

Parameters

- `acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist|disassociate}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl exceed-rate</td>
<td>Sets the action taken based on an ACL rule configuration (for example, drop a packet)</td>
</tr>
<tr>
<td>wireless-client-denied-traffic &lt;0-1000000&gt;</td>
<td>Sets the action to deny traffic to the wireless client when the rate exceeds the specified value</td>
</tr>
<tr>
<td>blacklist &lt;0-86400&gt;</td>
<td>Optional. When enabled, sets the time interval to blacklist a wireless client</td>
</tr>
<tr>
<td>disassociate</td>
<td>Optional. When enabled, disassociates a wireless client</td>
</tr>
</tbody>
</table>
Examples

rfs7000-37FABE(config-wlan-test)#acl exceed-rate wireless-client-denied-traffic 20 disassociate

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test)#
4.1.78.2.3 answer-broadcast-probes

* wlan-mode commands

Allows the WLAN to respond to probe requests that do not specify a SSID. These probes are for broadcast ESS. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

answer-broadcast-probes

**Parameters**

None

**Examples**

rfs7000-37FABE(config-wlan-1)#answer-broadcast-probes
rfs7000-37FABE(config-wlan-1)#
4.1.78.2.4 assoc-response

**wlan-mode commands**

Configures a minimum RSSI value below which the WLAN does not send a response to the association request from a client.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

assoc-response rssi-threshold <-100--40>

**Parameters**

- assoc-response rssi-threshold <-100--40>

<table>
<thead>
<tr>
<th>assoc-response</th>
<th>Configures an association response RSSI threshold value. If the RSSI is below the configured threshold value, the WLAN does not respond to the client’s association request.</th>
</tr>
</thead>
<tbody>
<tr>
<td>rssi-threshold</td>
<td>Specify a value from -100 - -40 dBm.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-wlan-test)#assoc-response rssi-threshold -50

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test

### 4.1.78.2.5 association-list

**wlan-mode commands**

Attaches an existing global association list with this WLAN. For more information on global association lists, see `global-association-list`.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`association-list global <GLOBAL-ASSO-LIST-NAME>`

**Parameters**

- `association-list global <GLOBAL-ASSO-LIST-NAME>`

<table>
<thead>
<tr>
<th>association-list global &lt;GLOBAL-ASSO-LIST-NAME&gt;</th>
<th>Attaches an existing global association list with this WLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;GLOBAL-ASSO-LIST-NAME&gt;</td>
<td>- Specify the global association list name (should be existing and configured).</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config-wlan-test)#association-list global my-clients
```
4.1.78.2.6 authentication-type

Sets the WLAN’s authentication type

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none]

Parameters
- authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none]

<table>
<thead>
<tr>
<th>authentication-type</th>
<th>Configures a WLAN’s authentication type</th>
</tr>
</thead>
<tbody>
<tr>
<td>eap</td>
<td>Configures EAP authentication (802.1X)</td>
</tr>
<tr>
<td></td>
<td>EAP is the de-facto standard authentication method used to provide secure authenticated access to controller managed WLANs. EAP provides mutual authentication, secured credential exchange, dynamic keying and strong encryption. 802.1X EAP can be deployed with WEP, WPA or WPA2 encryption schemes to further protect user information forwarded over controller managed WLANs. The EAP process begins when an unauthenticated supplicant (client device) tries to connect with an authenticator (in this case, the authentication server). An access point passes EAP packets from the client to an authentication server on the wired side of the access point. All other packet types are blocked until the authentication server (typically, a RADIUS server) verifies the client’s identity. If using eap authentication ensure that a AAA policy is mapped to the WLAN.</td>
</tr>
<tr>
<td>eap-mac</td>
<td>Configures EAP or MAC authentication depending on client. (This setting is valid only with the None encryption type. EAP-MAC is useful when in a hotspot environment, as some clients support EAP and an administrator may want to authenticate based on just the MAC address of the device.</td>
</tr>
<tr>
<td>eap-psk</td>
<td>Configures EAP authentication or pre-shared keys depending on client. (This setting is only valid with Temporal Key Integrity Protocol (TKIP) or Counter Mode with Cipher Block Chaining Message Authentication Code Protocol (CCMP) encryption types. When using PSK with EAP, the controller sends a packet requesting a secure link using a pre-shared key. The controller and authenticating device must use the same authenticating algorithm and passcode during authentication. EAP-PSK is useful when transitioning from a PSK network to one that supports EAP. If using eap-psk authentication ensure that a AAA policy is mapped to the WLAN.</td>
</tr>
</tbody>
</table>
kerberos

Configures Kerberos authentication (encryption will change to WEP128 if it’s not already WEP128 or Keyguard)

Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection.

Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses Network Time Protocol (NTP) for synchronizing the clocks of its Key Distribution Center (KDC) server(s).

---

mac

Configures MAC authentication (RADIUS lookup of MAC address)

MAC is a device level authentication method used to augment other security schemes when legacy devices are deployed using static WEP.

MAC authentication can be used for device level authentication by permitting WLAN access based on device MAC address. MAC authentication is typically used to augment WLAN security options that do not use authentication (such as static WEP, WPA-PSK and WPA2-PSK) MAC authentication can also be used to assign VLAN memberships, Firewall policies and time and date restrictions.

MAC authentication can only identify devices, not users.

If using mac authentication ensure that a AAA policy is mapped to the WLAN.

---

none

No authentication is used or the client uses pre-shared keys

---

**Examples**

```bash
rfs7000-37FABE(config-wlan-test)#authentication-type eap

rfs7000-37FABE(config-wlan-test)#show context
wlan test
ssid test
bridging-mode tunnel
encryption-type none
authentication-type eap
accounting syslog host 172.16.10.4 port 2
acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test)#
```
4.1.78.2.7 bridging-mode

* wlan-mode commands

Configures how packets are bridged to and from a WLAN.

Use this command to define which VLANs are bridged, and how local VLANs are bridged between the wired and wireless sides of the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
bridging-mode [local|tunnel]
```

**Parameters**

- bridging-mode [local|tunnel]

<table>
<thead>
<tr>
<th>bridging-mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local</td>
<td>Bridges packets between WLAN and local ethernet ports</td>
</tr>
<tr>
<td>tunnel</td>
<td>Tunnels packets to other devices (typically a wireless controller or service platform). This is the default mode.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-wlan-test)#bridging-mode local
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type eap
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test)#
```
4.1.78.2.8 broadcast-dhcp

- wlan-mode commands

Configures broadcast DHCP packet parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

broadcast-dhcp validate-offer

Parameters
- broadcast-dhcp validate-offer

| validate-offer | Validates the broadcast DHCP packet destination (a wireless client associated to the radio) before forwarding over the air |

Examples

rfs7000-37FABE(config-wlan-test)#broadcast-dhcp validate-offer

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type eap
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
  broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#
4.1.78.2.9 broadcast-ssid

Advertises the WLAN SSID in beacons. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
broadcast-ssid

Parameters
None

Examples
rfs7000-37FABE(config-wlan-1)#broadcast-ssid
rfs7000-37FABE(config-wlan-1)#
4.1.78.2.10 captive-portal-enforcement

- wlan-mode commands

Configures the WLAN's captive portal enforcement

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
captive-portal-enforcement {fall-back}
```

Parameters

- captive-portal-enforcement {fall-back}

<table>
<thead>
<tr>
<th>captive-portal-enforcement</th>
<th>Enables captive portal enforcement on a WLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>fall-back</td>
<td>Optional. Enforces captive portal validation if WLAN authentication fails (applicable to EAP or MAC authentication only)</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-wlan-test)#captive-portal-enforcement fall-back
rfs7000-37FABE(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 captive-portal-enforcement fall-back
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 broadcast-dhcp validate-offer
 rfs7000-37FABE(config-wlan-test)#
```
4.1.78.2.11 client-access

- wlan-mode commands

Enables WLAN client access (for normal data operations)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
client-access
```

Parameters

None

Examples

```
rfs7000-37FABE(config-wlan-1)#client-access
rfs7000-37FABE(config-wlan-1)#
```
4.1.78.2.12 client-client-communication

**wlan-mode commands**

Allows frame switching from one client to another on a WLAN

This option is enabled by default. It allows clients to exchange packets with other clients. It does not necessarily prevent clients on other WLANs from sending packets to this WLAN, but as long as this setting is also disabled on that WLAN, clients are not permitted to interoperate.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

client-client-communication

**Parameters**

None

**Examples**

rfs7000-37FABE(config-wlan-1)#client-client-communication
rfs7000-37FABE(config-wlan-1)#
### 4.1.78.2.13 client-load-balancing

**wlan-mode commands**

Configures client load balancing on a WLAN. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
client-load-balancing
{allow-single-band-clients|band-discovery-intvl|
capability-ageout-time|max-probe-req|probe-req-intvl}
```

```
client-load-balancing
{allow-single-band-clients [2.4Ghz|5Ghz]|
band-discovery-intvl <0-10000>|capability-ageout-time <0-10000>}
```

```
client-load-balancing {max-probe-req|probe-req-intvl} [2.4Ghz|5Ghz] <0-10000>
```

**Parameters**

- **client-load-balancing**
  - `allow-single-band-clients [2.4GHz|5GHz]`
  - `band-discovery-intvl <0-10000>`
  - `capability-ageout-time <0-10000>`
  - `max-probe-req [2.4GHz|5GHz] <0-10000>`
  - `probe-req-intvl [2.4GHz|5GHz] <0-10000>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>band-discovery-intvl &lt;0-10000&gt;</td>
<td>Optional. Configures the interval to discover a client’s band capability before connection</td>
</tr>
<tr>
<td>capability-ageout-time &lt;0-10000&gt;</td>
<td>Optional. Configures a client’s capability ageout interval</td>
</tr>
<tr>
<td>max-probe-req [2.4GHz</td>
<td>5GHz] &lt;0-10000&gt;</td>
</tr>
<tr>
<td>probe-req-intvl [2.4GHz</td>
<td>5GHz] &lt;0-10000&gt;</td>
</tr>
</tbody>
</table>
Examples

rfs7000-37FABE(config-wlan-test)#client-load-balancing band-discovery-intvl 2

rfs7000-37FABE(config-wlan-test)#client-load-balancing probe-req-intvl 5ghz 5

broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#
4.1.78.2.14 controller-assisted-mobility

Enabled controller or service platform assisted mobility to determine a wireless client’s VLAN assignment. When enabled, a controller or service platform’s mobility database is used to assist in roaming between RF Domains. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
controller-assisted-mobility

Parameters
None

Examples
rfs4000-229D58(config-wlan-test)#controller-assisted-mobility

```
4.1.78.2.16 description

Defines the WLAN description

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
description <LINE>

Parameters
- description <LINE>

Specify a WLAN description
The WLAN's description should help differentiate it from others with similar configurations. The description should not exceed 64 characters.

Examples
rfs7000-37FABE(config-wlan-test)#description TestWLAN
rfs7000-37FABE(config-wlan-test)#show context
wlan test

rfs7000-37FABE(config-wlan-test)#
4.1.78.2.17 downstream-group-addressed-forwarding

wlan-mode commands

Enables/disables forwarding of downstream BCMC packets to a group on this WLAN. This feature is enabled by default. Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
downstream-group-addressed-forwarding

Parameters
None

Examples
rfs4000-229D58 (config-wlan-test)#downstream-group-addressed-forwarding
rfs4000-229D58 (config-wlan-test)#
4.1.78.2.18 dynamic-vlan-assignment

* wlan-mode commands *

Configures dynamic VLAN assignment on this WLAN

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
dynamic-vlan-assignment allowed-vlans <VLAN-ID>
```

**Parameters**
- dynamic-vlan-assignment allowed-vlans <VLAN-ID>

<table>
<thead>
<tr>
<th>dynamic-vlan-assignment allowed-vlans</th>
<th>Configures a list of VLAN IDs or VLAN alias allowed access to the WLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;VLAN-ID&gt;</td>
<td>Specify the list of VLAN IDs or the VLAN alias names. For example, 10-20, 25, 30-35, $guest. For information on VLAN aliases, see alias.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config-wlan-test)#dynamic-vlan-assignment allowed-vlans 10-20
rfs4000-229D58(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  dynamic-vlan-assignment allowed-vlans 10-20
rfs4000-229D58(config-wlan-test)#
```
### 4.1.78.2.19 eap-types

* wlan-mode commands

Configures client access based on the EAP type used

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls] 
{(aka|all|fast|peap|sim|tls|ttls)}

**Parameters**

- **eap-types [allow|deny]**  [aka|all|fast|peap|sim|tls|ttls]  
  {(aka|all|fast|peap|sim|tls|ttls)}

| eap-types [allow|deny] | Configures a list of allowed or denied EAP types |
|------------------------|-----------------------------------------------|
| allow –                   | Configures a list of EAP types allowed for WLAN client authentication |
| deny –                   | Configures a list of EAP types not allowed for WLAN client authentication |

| [aka|all|fast|peap|sim|tls|ttls] | The following EAP types are common to the ‘allow’ and ‘deny’ keywords: |
|------------------------------------------|---------------------------------------------------------------------|
| aka – EAP Authentication and Key Agreement (AKA) and EAP-AKA’ (AKA Prime). EAP-AKA is one of the methods in the EAP authentication framework. It uses Universal Mobile Telecommunications System (UMTS) and Universal Subscriber Identity Module (USIM) for client authentication and key distribution. |
| all – Allows or denies usage of all EAP types on the WLAN |
| peap – Configures Protected Extensible Authentication Protocol (PEAP). PEAP or Protected EAP uses encrypted and authenticated TLS tunnel to encapsulate EAP. |
| sim – Configures EAP Subscriber Identity Module (SIM). EAP-SIM uses Global System for Mobile Communications (GSMC) SIM for client authentication and key distribution. |
| tls – Configures EAP Transport Layer Security (TLS). EAP-TLS is an EAP authentication method that uses PKI to communicate with a RADIUS server or any other authentication server. |
| ttls – Configures Tunneled Transport Layer Security (TTLS). EAP-TTLS is an extension of TLS. Unlike TLS, TTLS does not require every client to generate and install a CA- signed certificate. |

**Note:** These options are recursive, and more than one EAP type can be selected. The selected options are added to the allowed or denied EAP types list.
Examples

rfs7000-37FABE(config-wlan-test)#eap-types allow fast sim tls

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  eap-types allow fast sim tls
rfs7000-37FABE(config-wlan-test)#
4.1.78.2.20 encryption-type

Sets a WLAN’s encryption type

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
encryption-type [ccmp|keyguard|none|tkip-ccmp|wep128|web128-keyguard|wep64]
```

Parameters

- encryption-type [ccmp|keyguard|none|tkip-ccmp|wep128|web128-keyguard|wep64]

<table>
<thead>
<tr>
<th>encryption-type</th>
<th>Configures the WLAN’s data encryption parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccmp</td>
<td>Configures Advanced Encryption Standard (AES) Counter Mode CBC-MAC Protocol (AES-CCM/CCMP)</td>
</tr>
<tr>
<td>keyguard</td>
<td>Configures Keyguard-MCM (Mobile Computing Mode)</td>
</tr>
<tr>
<td>tkip-ccmp</td>
<td>Configures the TKIP and AES-CCM/CCMP encryption modes</td>
</tr>
<tr>
<td>wep128</td>
<td>Configures WEP with 128 bit keys</td>
</tr>
<tr>
<td>wep128-keyguard</td>
<td>Configures WEP128 as well as Keyguard-MCM encryption modes</td>
</tr>
<tr>
<td>wep64</td>
<td>Configures WEP with 64 bit keys. A WEP64 configuration is insecure when two WLANs are mapped to the same VLAN, and one uses no encryption while the other uses WEP.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-wlan-test)#encryption-type tkip-ccmp
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  description TestWLAN

client-load-balancing band-discovery-intvl 2
captive-portal-enforcement fall-back
acl exceed-rate wireless-client-denied-traffic 20 disassociate
broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#
```
4.1.78.2.21 enforce-dhcp

- wlan-mode commands

Drops packets from clients with a static IP address

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
enforce-dhcp

Parameters
None

Examples
rfs7000-37FABE(config-wlan-test)#enforce-dhcp

rfs7000-37FABE(config-wlan-test)#show context wlan test
description TestWLAN
ssid test

acl exceed-rate wireless-client-denied-traffic 20 disassociate
enforce-dhcp
broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#
4.1.78.2.22 fast-bss-transition

- wlan-mode commands

Enables or disables support for 802.11r Fast-BSS Transition (FT) on the selected WLAN. This feature is disabled by default. 802.11r is an attempt to undo the burden that security and QoS added to the handoff process, and restore it back to an original four message exchange process. The central application for the 802.11r standard is VOIP using mobile phones within wireless Internet networks. 802.11r FT redefines the security key negotiation protocol, allowing parallel processing of negotiation and requests for wireless resources.

Enabling FT standards provides wireless clients fast, secure and seamless transfer from one base station to another, ensuring continuous connectivity.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
fast-bss-transition {over-ds}

Parameters
- fast-bss-transition {over-ds}

<table>
<thead>
<tr>
<th>fast-bss-transition</th>
<th>over-ds</th>
</tr>
</thead>
</table>
| over-ds             | Enables 802.11r FT support on this WLAN
|                     | - over-ds — Optional. Enables 802.11r client roaming over the Distribution System (DS). When enabled, all client communication with the target AP is via the current AP. This communication, carried in FT action frames, is first sent by the client to the current AP, then forwarded to the target AP through the controller.

Examples
rfs7000-37FABE(config-wlan-test)#fast-bss-transition

rfs7000-37FABE(config-wlan-test)#show context
wlan test
ssid test
vlan 1
bridging-mode tunnel
encryption-type none
authentication-type none
fast-bss-transition
rfs7000-37FABE(config-wlan-test)#
4.1.78.2.23 http-analyze

**wlan-mode commands**

Enables HTTP URL analysis on the WLAN

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5600, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
http-analyze [filter|syslog]
http-analyze filter [images|post|query-string]
http-analyze syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}
```

**Parameters**

- `filter` filters URLs, based on the parameters set, before forwarding them.
- `images` filters out URLs referring to images (does not forward URL requesting images).
- `post` filters out URLs requesting POST (does not forward POST requests). This option is disabled by default.
- `query-string` removes query strings from URLs before forwarding them (forwards requests and no data). This option is disabled by default.

```
http-analyze syslog host 192.168.13.10 port 21 proxy-mode through-controller
```

**Examples**

- `rfs4000-229D58(config-wlan-test)#http-analyze syslog host 192.168.13.10 port 21 proxy-mode through-controller`
- `rfs4000-229D58(config-wlan-test)#show context
  wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  http-analyze syslog host 192.168.13.10 port 21 proxy-mode through-controller
  rfs4000-229D58(config-wlan-test)#`
4.1.78.2.24 ip

wlan-mode commands

Configures Internet Protocol (IP) settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ip [arp|dhcp]

ip arp [header-mismatch-validation|trust]

ip dhcp trust

Parameters
- ip arp [header-mismatch-validation|trust]
- ip dhcp trust

<table>
<thead>
<tr>
<th>ip arp</th>
<th>Configures the IP settings for ARP packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>header-mismatch-validation</td>
<td>Verifies mismatch of source MAC address in the ARP and Ethernet headers</td>
</tr>
<tr>
<td>trust</td>
<td>Sets ARP responses as trusted for a WLAN/range</td>
</tr>
</tbody>
</table>

| ip dhcp trust | Configures the IP settings for DHCP packets |
| trust | Sets DHCP responses as trusted for a WLAN/range |

Examples

rfs7000-37FABE(config-wlan-test)#ip dhcp trust

rfs7000-37FABE(config-wlan-test)#show context wlan test
description TestWLAN
ssid test
bridging-mode local
encryption-type tkip-ccmp

rfs7000-37FABE(config-wlan-test)#
4.1.78.2.25 ipv6

WLAN-mode commands

Sets the DHCPv6 and ICMPv6 neighbor discovery (ND) components for this WLAN. Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
ipv6 [dhcpv6|nd]
ipv6 dhcpv6 trust
ipv6 nd [header-mismatch-validation|raguard|trust]
```

Parameters

- ipv6 dhcpv6 trust
- ipv6 nd [header-mismatch-validation|raguard|trust]

<table>
<thead>
<tr>
<th>ipv6 dhcpv6 trust</th>
<th>Enables DHCPv6 trust state for DHCPv6 responses on this WLAN. When enabled, all DHCPv6 responses received on this WLAN are trusted and forwarded. This option is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6 nd [header-mismatch-validation</td>
<td>raguard</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-wlan-test)#ipv6 dhcpv6 trust
rfs7000-37FABE(config-wlan-test)#ipv6 nd trust
rfs7000-37FABE(config-wlan-test)#show context wlan test
  ssid test

  bridging-mode tunnel
  encryption-type none
  authentication-type none
  ipv6 dhcpv6 trust
  ipv6 nd trust
rfs7000-37FABE(config-wlan-test)#
```
### 4.1.78.2.26 kerberos

**wlan-mode commands**

Configures Kerberos authentication parameters on a WLAN.

Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection.

Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses **Network Time Protocol (NTP)** for synchronizing the clocks of its **Key Distribution Center (KDC)** server(s).

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
kerberos [password|realm|server]
kerberos password [0 <LINE>|2 <LINE>|<LINE>]
kerberos realm <REALM>
kerberos server [primary|secondary|timeout]
kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}
kerberos server timeout <1-60>
```

**Parameters**

- `kerberos password [0 <LINE>|2 <LINE>|<LINE>]`
- `kerberos realm <REALM>`
- `kerberos server [primary|secondary|timeout]`
- `kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}`
- `kerberos server timeout <1-60>`

<table>
<thead>
<tr>
<th>kerberos</th>
<th>Configures a WLAN's Kerberos authentication parameters. The parameters are: password, realm, and server.</th>
</tr>
</thead>
<tbody>
<tr>
<td>password</td>
<td>Configures a Kerberos <strong>Key Distribution Center (KDC)</strong> server password. The password should not exceed 127 characters. The password options are:</td>
</tr>
<tr>
<td></td>
<td>- 0 &lt;LINE&gt; – Configures a clear text password</td>
</tr>
<tr>
<td></td>
<td>- 2 &lt;LINE&gt; – Configures an encrypted password</td>
</tr>
<tr>
<td></td>
<td>- &lt;LINE&gt; – Specify the password.</td>
</tr>
</tbody>
</table>

- `kerberos realm <REALM>`
- `kerberos server [primary|secondary|timeout]`
- `kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}`
- `kerberos server timeout <1-60>`
### GLOBAL CONFIGURATION COMMANDS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| server [primary|secondary] | Configures the primary and secondary KDC server parameters  
- primary – Configures the primary KDC server parameters  
- secondary – Configures the secondary KDC server parameters |
| host <IP/HOSTNAME> | Sets the primary or secondary KDC server address  
- <IP/HOSTNAME> – Specify the IP address or name of the KDC server. |
| port <1-65535> | Optional. Configures the UDP port used to connect to the KDC server  
- <1-65535> – Specify the port from 1 - 65535. The default is 88. |

**Examples**

```bash
rfs7000-37FABE(config-wlan-test)#kerberos server timeout 12
rfs7000-37FABE(config-wlan-test)#kerberos server primary host 172.16.10.2 port 88
rfs7000-37FABE(config-wlan-test)#show context

  http-analyze controller
rfs7000-37FABE(config-wlan-test)#
```
4.1.78.2.27 mac-authentication

- wlan-mode commands

Enables MAC authentication. When enabled, the system uses cached credentials (RADIUS server lookups are skipped) to authenticate clients.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
mac-authentication [cached-credentials|enforce-always]

Parameters
- mac-authentication [cached-credentials|enforce-always]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-authentication</td>
<td>Enables MAC authentication on this WLAN and configures related parameters</td>
</tr>
<tr>
<td>cached-credentials</td>
<td>Uses cached credentials to skip RADIUS lookups. This option is disabled by default.</td>
</tr>
<tr>
<td>enforce-always</td>
<td>Enforces MAC authentication on this WLAN. When enabled, MAC authentication is enforced, each time a client logs in, even when the authentication type specified (using the authentication-type command) is not MAC authentication. This option is disabled by default.</td>
</tr>
</tbody>
</table>

Examples
rfs4000-229D58(config-wlan-test)#mac-authentication cached-credentials
rfs4000-229D58(config-wlan-test)#
### 4.1.78.2.28 mac-registration

**wlan-mode commands**

Enables dynamic MAC registration of a user

**NOTE:** This feature is supported only if MAC authentication is enabled. To enable MAC authentication use the **authentication-type > mac** command in the config WLAN mode.

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
mac-registration [external|group-name]
mac-registration external host <IP/HOSTNAME> {proxy-mode [none|through-controller|through-rf-domain-manager]}
mac-registration group-name <RAD-GROUP-NAME> {agreement-refresh <0-100>|expiry-time <1-1500>}
```

**Parameters**

- **mac-registration external host <IP/HOSTNAME> {proxy-mode [none|through-controller|through-rf-domain-manager]}**
  - *proxy-mode*
    - **none** – Requests are sent directly to the controller from the requesting device
    - **through-controller** – Requests are proxied through the controller configuring the device
    - **through-rf-domain** – Requests are proxied through the local RF Domain manager

- **mac-registration group-name <RAD-GROUP-NAME> {agreement-refresh <0-100>|expiry-time <1-1500>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-registration</td>
<td>Enables dynamic MAC registration of a user</td>
</tr>
<tr>
<td>external</td>
<td>Forwards MAC registration user information to the external controller</td>
</tr>
<tr>
<td>host &lt;IP/HOSTNAME&gt;</td>
<td>Specifies the external controller’s IP address or hostname</td>
</tr>
<tr>
<td>proxy-mode</td>
<td>Optional. Specifies the forwarding mode</td>
</tr>
</tbody>
</table>
| {none|through-controller|through-rf-domain} | • none – Requests are sent directly to the controller from the requesting device
|                  | • through-controller – Requests are proxied through the controller configuring the device
|                  | • through-rf-domain – Requests are proxied through the local RF Domain manager |
| group-name     | Specifies the group to which the MAC registered user should be added        |
| <RAD-GROUP-NAME> | • <RAD-GROUP-NAME> – Specify the RADIUS group name.                        |
| expiry-time    | Optional. Specifies the user expiry time in days from 1 - 1500             |
| <1-1500>       | agreement-refresh | Optional. Sets the time (in days), after which an inactive user has to refresh the WLAN’s terms of agreement. For example, if the agreement refresh period is set to 10, a user logging in after 10 days of inactivity will be displayed the agreement page. and will be allowed WLAN access only after refreshing the terms of agreement. |
| <0-100>        | • <0-100> – Specify the number of days from 0 - 100.                       |
Examples

rfs7000-37FABE(config-wlan-1)#mac-registration group-name test expiry-time 100

rfs7000-37FABE(config-wlan-1)#mac-registration external host 172.16.10.8 proxy-mode through-controller
rfs7000-37FABE(config-wlan-1)#show context
wlan 1
ssid 1
bridging-mode tunnel
encryption-type none
authentication-type mac
mac-registration group-name test expiry-time 100
mac-registration external host 172.16.10.8 proxy-mode through-controller
rfs7000-37FABE(config-wlan-1)#

rfs4000-229D58(config-wlan-wlan-testing)#mac-registration group-name Group3 ?
agreement-refresh Specify when the agreement page should be displayed to
the user (in days)
expiry-time Specify the user expiry time in days
<cr>

rfs4000-229D58(config-wlan-wlan-testing)#mac-registration group-name Group3 agreement-refresh ?
<0-100> Agreement page will be displayed to the user if the user has not
visited in the past (number of days)

rfs4000-229D58(config-wlan-wlan-testing)#

rfs4000-229D58(config-wlan-wlan-testing)#mac-registration group-name Group3 agreement-refresh 19
4.1.78.2.29 no

**wlan-mode commands**

Negates WLAN mode commands and reverts values to their default

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

**Parameters**

- no <PARAMETERS>

| no <PARAMETERS> | Removes or reverts this WLAN's settings based on the parameters passed |

**Usage Guidelines**

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

```bash
rfs7000-37FABE(config-wlan-test)#no ?
accounting        Configure how accounting records are created for this wlan
acl               Actions taken based on ACL configuration [ packet drop being one of them]
answer-broadcast-probes Do not Include this wlan when responding to probe requests that do not specify an SSID
assoc-response    Association response threshold
association-list  Configure the association list for the wlan
authentication-type Reset the authentication to use on this wlan to default (none/Pre-shared keys)
broadcast-dhcp    Configure broadcast DHCP packet handling
broadcast-ssid    Do not advertise the SSID of the WLAN in beacons
captive-portal-enforcement Configure how captive-portal is enforced on the wlan
client-access     Disallow client access on this wlan (no data operations)
client-client-communication Disallow switching of frames from one wireless client to another on this wlan
client-load-balancing Disable load-balancing of clients on this wlan
controller-assisted-mobility Disable configure assisted mobility
data-rates         Reset data rate configuration to default
description       Reset the description of the wlan
downstream-group-addressed-forwarding Disable downstream group addressed forwarding of packets
dynamic-vlan-assignment Dynamic VLAN assignment configuration
eap-types         Allow all EAP types on this wlan
encryption-type   Reset the encryption to use on this wlan to default (none)```
enforce-dhcp                           Drop packets from Wireless Clients with static IP address
fast-bss-transition                   Disable support for 802.11r Fast BSS Transition
http-analyze                          Enable HTTP URL analysis on the wlan
ip                                     Internet Protocol (IP)
ipv6                                   Internet Protocol version 6 (IPv6)
kerberos                               Configure kerberos authentication parameters
mac-authentication                    Configure mac-authentication related parameters
mac-registration                      Dynamic MAC registration of user
opendns                                OpenDNS related config for this wlan
protected-mgmt-frames                  Disable support for Protected Management Frames (IEEE 802.11w)
proxy-arp-mode                         Configure handling of ARP requests with proxy-arp is enabled
proxy-nd-mode                          Configure handling of IPv6 ND requests with proxy-nd is enabled
gos-map                                Disable the 802.11u QoS map element and frame
radio-resource-measurement             Disable support for 802.11k Radio Resource Measurement
radius                                 Configure RADIUS related parameters
relay-agent                            Configure dhcp relay agent info
shutdown                               Enable the use of this wlan
ssid                                    Configure ssid
t5-client-isolation                    Do not Isolate traffic among clients
t5-security                            Configure encryption and authentication
time-based-access                      Reset time-based-access parameters to default
use                                     Set setting to use
vlan                                    Map the default vlan (vlan-id 1) to the wlan
vlan-pool-member                       Delete a mapped vlan from this wlan
wep128                                  Reset WEP128 parameters
wep64                                   Reset WEP64 parameters
wing-extensions                        Disable support for WiNG-Specific extensions to 802.11
wireless-client                        Configure wireless-client specific parameters
wpa-wpa2                                Modify tkip-ccmp (wpa/wpa2) related parameters
service                                 Service to monitor to show no-service page to user

rfs7000-37FABE(config-wlan-test)#
4.1.78.2.30 opendns

wlan-mode commands

Enables integration of access points, wireless controllers, and service platforms with OpenDNS. When configured, DNS queries from wireless clients are redirected to OpenDNS (208.67.220.220 OR 208.67.222.222). These OpenDNS resolvers act as proxy DNS servers that provide additional functionalities, such as Web filtering, reporting, and performance enhancement.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

opendns device-id <DEVICE-ID>

Parameters

- opendns device-id <DEVICE-ID>

<table>
<thead>
<tr>
<th>opendns device-id &lt;DEVICE-ID&gt;</th>
<th>Configures the device ID sent to OpenDNS</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DEVICE-ID&gt; – Specify the device ID. The device-id entered here is obtained from the OpenDns site by executing the following command in the Privi Exec Mode: opendns &gt; username &lt;WORD&gt; password &lt;WORD&gt; label &lt;WORD&gt;. For more information, see opendns.</td>
<td></td>
</tr>
<tr>
<td>Once configured on a WLAN, this value is embedded in each DNS query packet going out from an access point, wireless controller, or service platform to the OpenDNS server. The device ID is a sixteen (16) character hex string representing a 64 bit unsigned integer. Use the no &gt; opendns &gt; device-id command to remove the configured device-id.</td>
<td></td>
</tr>
<tr>
<td>Therefore, when a wireless client associates with a OpenDNS enabled WLAN, all DNS queries originating from the client are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet.</td>
<td></td>
</tr>
</tbody>
</table>

Note: To enable redirection of DSN query to OpenDNS it is necessary that the DNS server’s IP address provided in the DHCP Server policy (used by the client) should point to the OpenDNS IP address (208.67.220.220 OR 208.67.222.222). For more information, see dns-server.

For example:

```
 rfs7000-37FABE(config-dhcp-policy-dhcoppolicy-pool-dhccppool)#show context
dhcp-pool dhcppool
 network 192.168.13.0/24
 address range 192.168.13.160 192.168.13.200
 default-router 192.168.13.105
dns-server 208.67.220.220 208.67.222.222
```

Contd...
Examples

Following examples show all configurations required to integrate access points and controllers with the OpenDNS service:

Step 1. In the Privilege Executable Mode:

```
ap7131-E6D512#opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7131-E6D512#
```

Step 2: To enable OpenDNS on a WLAN, apply the device-id, obtained in the preceding step, to the WLAN:

```
ap7131-E6D512(config)#wlan opendns
ap7131-E6D512(config-wlan-opendns)#opendns device-id 0014AADF8EDC6C59
ap7131-E6D512(config-wlan-opendns)#commit
```

```
ap7131-E6D512(config-wlan-opendns)#show context
wlan opendns
ssid opendns
vlan 1
bridging-mode local
encryption-type none
authentication-type none
open dns device-id 0014AADF8EDC6C59
ap7131-E6D512(config-wlan-opendns)#
```

Step 3: To enable DNS resolution on the access point or controller, execute the following commands:

```
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#ip name-server 144.189.100.51
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#ip dns-server-forward
```

The following examples show the other mandatory configurations needed to redirect wireless client DNS queries to the OpenDNS server:

```
ap7131-E6D512(config)#self
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#
```

Step 3: To enable DNS resolution on the access point or controller, execute the following commands:

```
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#ip name-server 144.189.100.51
```

```
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#ip dns-server-forward
```

```
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#show context
ap71xx 00-15-70-E6-D5-12
use profile default-ap71xx
use rf-domain default
hostname ap7131-E6D512
country-code us
no mint mlcp vlan
ip name-server 144.189.100.51
no ip domain-lookup
ip default-gateway 144.190.204.222
no device-upgrade auto
interface radiol
wlan opendns bss 1 primary
```

Note: To prevent wireless clients from bypassing the OpenDNS resolver by adding their own DNS servers, configure and apply an IP ACL on the access point, wireless controller, or service platform containing the following firewall rules:

```
rfs7000-37FABE(config-ip-acl-dns-list)#show context
ip access-list dns-list
    permit udp any any host 208.67.222.222 eq dns rule-precedence 1 rule-description "allow dns queries only to OpenDNS"
deny udp any any eq dns rule-precedence 10 rule-description "block all other dns queries"
    permit ip any any rule-precedence 100 rule-description "allow all other ip packets"
rfs7000-37FABE(config-ip-acl-dns-list)#
```
interface radio2
   wlan opendns bss 1 primary
interface ge1
   switchport mode access
   switchport access vlan 10
interface vlan1
   ip address 192.168.1.105/24
   ip dhcp client request options all
   ip nat inside
   no ipv6 enable
   no ipv6 request-dhcpv6-options
interface vlan10
   ip address 144.190.204.218/24
   no ipv6 enable
   no ipv6 request-dhcpv6-options
   use dhcp-server-policy dhcppolicy
   ip dns-server-forward
   logging on
   logging console debugging
   logging buffered warnings
   ip nat inside source list my_list precedence 10 interface vlan10 overload
   enforce-version adoption none
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#

Step 4: To ensure that the OpenDNS-enabled WLAN's client’s DNS queries are redirected to the OpenDNS server, execute the following commands:

ap7131-E6D512(config)#dhcp-server-policy dhcppolicy
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#dhcp-pool opendns
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#show context
dhcp-server-policy dhcppolicy
   dhcp-pool dhcppool
      address range 192.168.1.160 192.168.1.200
      default-router 192.168.1.105
      dns-server 208.67.222.222
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#
ap7131-E6D512(config)#self
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#use dhcp-server-policy dhcppolicy
4.1.78.2.31 protected-mgmt-frames

- *wlan-mode commands*

Configures the WLAN’s frame protection mode and security association.

802.11w provides protection for both unicast management frames and broadcast/multicast management frames. The ‘robust management frames’ are *action*, *disassociation*, and *deauthentication* frames. The standard provides one security protocol CCMP for protection of unicast robust management frames. *Protected management frames* (PMF) protocol only applies to robust management frames after establishment of RSNA PTK. Robust management frame protection is achieved by using CCMP for unicast management frames, *broadcast/multicast integrity protocol* (BIP) for broadcast/multicast management frames and SA query protocol for protection against (re)association attacks.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|timeout <100-1000>]]`

**Parameters**

- **protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|timeout <100-1000>]]**

<table>
<thead>
<tr>
<th>protected-mgmt-frames</th>
<th>Enables and configures WLAN’s frame protection mode and security association. Use this command to specify whether management frames are continually or optionally protected.</th>
</tr>
</thead>
<tbody>
<tr>
<td>mandatory</td>
<td>Enforces <em>protected management frames</em> (PMF) on this WLAN (management frames are continually optionally protected)</td>
</tr>
<tr>
<td>optional</td>
<td>Provides PMF only for those clients that support PMF (management frames are optionally protected)</td>
</tr>
</tbody>
</table>
  | sa-query [attempts <1-10>|timeout <100-1000>] | Configures the following *security association* (SA) parameters:
  | attempts <1-10>       | Configures the number of SA query attempts from 1 - 10. The default is 5. |
  | timeout <100-1000>    | Configures the interval, in milliseconds, used to timeout association requests that exceed the defined interval. Specify a value from 100 - 1000 milliseconds. The default value is 201 milliseconds. |

**Examples**

```
rfs7000-37FABE(config-wlan-test)#protected-mgmt-frames mandatory
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  protected-mgmt-frames mandatory
rfs7000-37FABE(config-wlan-test)#
```
### 4.1.78.2.32 proxy-arp-mode

**wlan-mode commands**

Enables proxy ARP mode for handling ARP requests

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
proxy-arp-mode [dynamic|strict]
```

**Parameters**

- **proxy-arp-mode** [dynamic|strict]

<table>
<thead>
<tr>
<th>proxy-arp-mode</th>
<th>Enables proxy ARP mode for handling ARP requests. The options available are dynamic and strict.</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic</td>
<td>Forwards ARP requests to the wireless side (for which a response could not be proxied)</td>
</tr>
<tr>
<td>strict</td>
<td>Does not forward ARP requests to the wireless side</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-wlan-test)#proxy-arp-mode strict
rfs7000-37FABE(config-wlan-test)#show context
wlan test
    ssid test
    bridging-mode local
    encryption-type none
    authentication-type none
    protected-mgmt-frames mandatory
    wing-extensions wmm-load-information
    client-load-balancing probe-req-intvl 5ghz 5
    client-load-balancing band-discovery-intvl 2
    acl exceed-rate wireless-client-denied-traffic 20 disassociate
    proxy-arp-mode strict
    broadcast-dhcp validate-offer
    http-analyze controller
rfs7000-37FABE(config-wlan-test)#
```
4.1.78.2.33 proxy-nd-mode

wlan-mode commands

Configures the proxy ND mode for this WLAN member clients as either strict or dynamic.

ND proxy is used in IPv6 to provide reachability by allowing a client to act as proxy. Proxy certificate signing can be done either dynamically (requiring exchanges of identity and authorization information) or statically when the network topology is defined.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

`proxy-nd-mode [dynamic|strict]`

Parameters

- `proxy-nd-mode [dynamic|strict]`

| proxy-nd-mode [dynamic|strict] | Configures the proxy ND mode for this WLAN member clients. The options are: dynamic and strict. |
|--------------------------------|------------------------------------------------|
| dynamic                       | • dynamic – Forwards ND request to wireless for which a response could not be proxied. This is the default value. |
| strict                         | • strict – Does not forward ND requests to the wireless side |

Examples

```
rfs7000-37FABE(config-wlan-test)#proxy-nd-mode strict
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  wpa-wpa2 server-only-authentication
  proxy-nd-mode strict
  opendns device-id 44-55-66
rfs7000-37FABE(config-wlan-test)#
```
### 4.1.78.2.34 qos-map

- **wlan-mode commands**

Enables support for 802.11u QoS map element and frames

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
qos-map
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-wlan-test)#qos-map
rfs7000-37FABE(config-wlan-test)#show context
disable
  wlan test
    ssid test
    bridging-mode tunnel
    encryption-type none
    authentication-type none
    qos-map
      wpa-wpa2 server-only-authentication
      proxy-nd-mode strict
      opendns device-id 44-55-66
      rfs7000-37FABE(config-wlan-test)#
```
### 4.1.78.2.35 radio-resource-measurement

**wlan-mode commands**

Enables support for 802.11k radio resource measurement capabilities (IEEE 802.11k) on this WLAN.

802.11k improves how traffic is distributed. In a WLAN, devices normally connect to the access point with the strongest signal. Depending on the number and location of clients, this arrangement can lead to excessive demand on one access point and under utilization of others, resulting in degradation of overall network performance. With 802.11k, if the access point with the strongest signal is loaded to its capacity, a client connects to an under-utilized access point. Even if the signal is weaker, the overall throughput is greater since it’s an efficient use of the network’s resources. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
radio-resource-measurement {channel-report|neighbor-report {hybrid}}
```  

**Parameters**

- **radio-resource-measurement** `{channel-report|neighbor-report {hybrid}}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>radio-resource-measurement</td>
<td>Enables support for 802.11k radio resource measurement capabilities</td>
</tr>
<tr>
<td>channel-report</td>
<td>Optional. Includes the channel-report element in beacons and probe responses</td>
</tr>
<tr>
<td>neighbor-report {hybrid}</td>
<td>Optional. Enables responding to neighbor-report requests</td>
</tr>
<tr>
<td>hybrid</td>
<td>Optional. Uses the hybrid model of smart-rf neighbors and roaming frequency to neighbors</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs4000-229D58(config-wlan-test)#radio-resource-measurement

rfs4000-229D58(config-wlan-test)#show context
wlan test
  ssid test
  vlan 1
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  radio-resource-measurement
  controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#
```
4.1.78.2.36 radius

**wlan-mode commands**

Configures RADIUS related parameters

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
radius [dynamic-authorization|nas-identifier|nas-port-id|vlan-assignment]
radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|vlan-assignment]
```

**Parameters**

- `radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|vlan-assignment]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dynamic-authorization</code></td>
<td>Enables support for disconnect and change of authorization messages (RFC5176)</td>
</tr>
<tr>
<td><code>nas-identifier &lt;NAS-ID&gt;</code></td>
<td>Configures the WLAN NAS identifier sent to the RADIUS server. The NAS identifier should not exceed 256 characters.</td>
</tr>
<tr>
<td><code>nas-port-id &lt;NAS-PORT-ID&gt;</code></td>
<td>Configures the WLAN NAS port ID sent to the RADIUS server. The NAS port identifier should not exceed 256 characters.</td>
</tr>
<tr>
<td><code>vlan-assignment</code></td>
<td>Configures the VLAN assignment of a WLAN</td>
</tr>
</tbody>
</table>

When enabled, this option assigns clients to the RADIUS server specified VLANs, overriding the WLAN configuration. This option is disabled by default. If, as part of the authentication process, the RADIUS server returns a client’s VLAN-ID in a RADIUS access-accept packet, and this feature is enabled, all client traffic is forwarded on that VLAN. If disabled, the RADIUS server returned VLAN-ID is ignored and the VLAN specified using the `vlanvlan-pool-member` options (in the WLAN config mode) is used.

**Note:** If both the RADIUS VLAN assignment and the post authentication VLAN options are enabled, then RADIUS VLAN assignment takes priority over post authentication VLAN configuration.

**Examples**

```
rfs7000-37FABE(config-wlan-test)#radius vlan-assignment
```

```
rfs7000-37FABE(config-wlan-test)#show context
wlan test
ssid test
bridging-mode local
encryption-type none
authentication-type none
protected-mgmt-frames mandatory
radius vlan-assignment
wing-extensions wmm-load-information
client-load-balancing probe-req-intvl 5ghz 5
client-load-balancing band-discovery-intvl 2
```

```
--More--
rfs7000-37FABE(config-wlan-test)#
```
### 4.1.78.2.37 relay-agent

* wlan-mode commands

Enables support for DHCP/DHCPv6 relay agent information (option 82 and DHCPv6-LDRA) feature on this WLAN.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
```plaintext
relay-agent [dhcp-option82|dhcpv6-ldra]
```

**Parameters**
- `relay-agent [dhcp-option82|dhcpv6-ldra]`

| relay-agent | Enables support for the following DHCP and DHCPv6 options: option 82 and *Lightweight DHCPv6 Relay Agent* (LDRA) respectively. When enabled, this feature allows the DHCP/DHCPv6 relay agent to insert the relay agent information option (option 82, LDRA) in client requests forwarded to the DHCP/DHCPv6 server.
| dhcp-option82 | Enables DHCP option 82. DHCP option 82 provides client physical attachment information. This option is disabled by default.
| dhcpv6-ldra | Enables the DHCPv6 relay agent. The DHCPv6 LDRA allows DHCPv6 messages to be transmitted on existing networks that do not currently support IPv6 or DHCPv6. This option is disabled by default.

**Examples**
```
rfs4000-229D58(config-wlan-test)#relay-agent dhcp-option82
rfs4000-229D58(config-wlan-test)#show context
wlan test
  ssid test
  vlan 1
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  radio-resource-measurement
  relay-agent dhcp-option82
  controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#
```
```
rfs6000-81701D(config-wlan-test)#relay-agent dhcpv6-ldra
rfs6000-81701D(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  relay-agent dhcpv6-ldra
rfs6000-81701D(config-wlan-test)#
```
**4.1.78.2.38 shutdown**

* wlan-mode commands

Auto shuts down a WLAN

The auto shutdown mechanism helps regulate the availability of a WLAN based on an administrator defined access period. Use this feature to shut down a WLAN on specific days and hours and restrict periods when the WLAN traffic is either not desired or cannot be properly administrated. The normal practice is to shut down WLANs when there are no users on the network, such as after hours, weekends or holidays. This allows administrators more time to manage mission critical tasks since the WLAN’s availability is automated.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
shutdown {on-critical-resource|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}
```

**Parameters**
- **shutdown** {on-critical-resource|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shutdown</td>
<td>Auto shuts down the WLAN when specified events occur. Disabled by default.</td>
</tr>
<tr>
<td>on-critical-resource</td>
<td>Optional. Auto shuts down the WLAN when critical resource failure occurs. Disabled by default.</td>
</tr>
<tr>
<td>on-meshpoint-loss</td>
<td>Optional. Auto shuts down the WLAN when the root meshpoint link fails (is unreachable). Disabled by default.</td>
</tr>
<tr>
<td>on-primary-port-link-loss</td>
<td>Optional. Auto shuts down the WLAN when a device losses its primary Ethernet port (ge1/up1) link. Disabled by default.</td>
</tr>
<tr>
<td>on-unadoption</td>
<td>Optional. Auto shuts down the WLAN when an adopted device becomes unadopted. Disabled by default.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the shutdown on-meshpoint-loss feature is enabled, the WLAN status changes only if the meshpoint and the WLAN are mapped to the same VLAN. If the meshpoint is mapped to VLAN 1 and the WLAN is mapped to VLAN 2, then the WLAN status does not change on loss of the meshpoint.
Examples

rfs7000-37FABE(config-wlan-test)#shutdown on-unadoption

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none
  protected-mgmt-frames mandatory
  radius vlan-assignment
  wing-extensions wmm-load-information
  client-load-balancing probe-req-intvl 5ghz 5
  client-load-balancing band-discovery-intvl 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
  proxy-arp-mode strict
  broadcast-dhcp validate-offer
  shutdown on-unadoption
  http-analyze controller
rfs7000-37FABE(config-wlan-test)#
4.1.78.2.39 ssid

Configures a WLAN’s SSID

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```plaintext
ssid <SSID>
```

Parameters

- `ssid <SSID>`

Examples

```plaintext
rfs7000-37FABE(config-wlan-test)#ssid testWLAN1
rfs7000-37FABE(config-wlan-test)#show context
wlan test
   ssid testWLAN1
   bridging-mode local
   encryption-type none
   authentication-type none
   protected-mgmt-frames mandatory
   radius vlan-assignment
   wing-extensions wmm-load-information
   client-load-balancing probe-req-intvl 5ghz 5
   client-load-balancing band-discovery-intvl 2
   acl exceed-rate wireless-client-denied-traffic 20 disassociate
   proxy-arp-mode strict
   broadcast-dhcp validate-offer
   shutdown on-unadoption
   http-analyze controller
rfs7000-37FABE(config-wlan-test)#
```

<SSID> Specify the WLAN’s SSID. The WLAN SSID is case sensitive and alphanumeric. Its length should not exceed 32 characters.
4.1.78.2.40 t5-client-isolation

wlan-mode commands

Disallows clients connecting to the WLAN to communicate with one another. This setting applies exclusively to CPE devices managed by aT5 controller and is disabled by default.

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.

NOTE: This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

Supported in the following platforms:

- Wireless Controllers — RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
t5-client-isolation
```

Parameters

None

Examples

```
nx9500-6C8809(config-wlan-test)#t5-client-isolation

nx9500-6C8809(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none
  t5-client-isolation

nx9500-6C8809(config-wlan-test)#
```
4.1.78.2.41 t5-security

**wlan-mode commands**

Configures T5 PowerBroadband security settings

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

**NOTE:** This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

Supported in the following platforms:

- Wireless Controllers — RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

t5-security [static-wep|wpa-enterprise|wpa-personal]

t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]

t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp] version [mixed|wpa|wpa2]

**Parameters**

- t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]

  - t5-security static-wep Configures the T5 WLAN security type as static-wep
  - encryption-type [wep128|wep64] Applies one of the following encryption algorithms to the T5 support WLAN configuration: WEP64 or WEP128
  - hex <STRING> Configures the hex password (used to derive the security key)
    - <STRING> – Specify the hex password (should not exceed the 10 - 26 characters).
  - passphrase <STRING> Configures the passphrase shared by both transmitting and receiving authenticators
    - <STRING> – Specify the passphrase. It could either be an alphanumeric string of 8 to 63 ASCII characters or 64 HEX characters. The alphanumeric string allows character spaces. This string is converted to a numeric value. Configuring a passphrase saves you the need to create a 256-bit key each time keys are generated.

- t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp] version [mixed|wpa|wpa2]

  - t5-security [wpa-enterprise|wpa-personal] Configures the T5 WLAN security type as: wpa-enterprise OR wpa-personal
| encryption-type [ccmp|tkip|tkip-ccmp] | The following parameters are common to the `wpa-enterprise` and `wpa-personal` keywords: Applies one of the following encryption algorithms to the T5 support WLAN configuration: CCMP, TKIP, or TKIP-CCMP |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| version [mixed|wpa|wpa2] | The following parameters are common to the `wpa-enterprise` and `wpa-personal` keywords: - version – Applies one of the following encryption schemes to the T5 support WLAN configuration: WPA, WPA2, or mixed |

**Examples**

```plaintext
nx9500-6C8809(config-wlan-test)#t5-security wpa-enterprise encryption-type ccmp version wpa

nx9500-6C8809(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none
  t5-security wpa-enterprise encryption-type ccmp version wpa
  t5-client-isolation

nx9500-6C8809(config-wlan-test)#
```
4.1.78.2.42 time-based-access

**wlan-mode commands**

Configures time-based client access to the network resources

Administrators can use this feature to assign fixed days and time of WLAN access for wireless clients

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

time-based-access days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start <START-TIME>} [end <END-TIME>]

**Parameters**
- day <option> Specifies the day or days on which the client can access the WLAN
  - sunday – Allows access on Sundays only
  - monday – Allows access on Mondays only
  - tuesday – Allows access on Tuesdays only
  - wednesday – Allows access on Wednesdays only
  - thursday – Allows access on Thursdays only
  - friday – Allows access on Fridays only
  - saturday – Allows access on Saturdays only
  - weekends – Allows access on weekends only
  - weekdays – Allows access on weekdays only
  - all – Allows access on all days
- start <START-TIME> Optional. Specifies the access start time in hours and minutes (HH:MM)
- end <END-TIME> Specifies the access end time in hours and minutes (HH:MM)

**Usage Guidelines**

Ensure the system clock is configured correctly.

**Examples**

rfs7000-37FABE(config-wlan-test)#time-based-access days weekdays start 10:00 end 16:30

rfs7000-37FABE(config-wlan-test)#show context
wlan test
ssid testWLAN1
bridging-mode local
encryption-type none
authentication-type none
protected-mgmt-frames mandatory
radius vlan-assignment
time-based-access days weekdays start 10:00 end 16:30
--More--
rfs7000-37FABE(config-wlan-test)#
4.1.78.2.43 use

This command associates an existing captive portal with a WLAN.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

use [aaa-policy|association-acl-policy|bonjour-gw-discovery-policy|captive-portal|ip-access-list|ipv6-access-list|mac-access-list|passpoint-policy|roaming-assist-policy|url-list|wlan-qos-policy]
use ip-access-list [in|out] <IP-ACCESS-LIST-NAME>
use ipv6-access-list [in|out] <IPv6-ACCESS-LIST-NAME>
use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME>

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa-policy &lt;AAA-POLICY-NAME&gt;</td>
<td>Uses an existing AAA policy with a WLAN</td>
</tr>
<tr>
<td>association-acl &lt;ASSOCIATION-POLICY-NAME&gt;</td>
<td>Uses an existing association ACL policy with a WLAN</td>
</tr>
<tr>
<td>bonjour-gw-discovery-policy &lt;POLICY-NAME&gt;</td>
<td>Uses an existing Bonjour GW Discovery policy with a WLAN. When associated, the Bonjour GW Discovery policy is applied for the Bonjour requests coming over WLAN.</td>
</tr>
<tr>
<td>captive-portal &lt;CAPTIVE-PORTAL-NAME&gt;</td>
<td>Enables a WLAN's captive portal authentication</td>
</tr>
</tbody>
</table>

Note: For more information on Bonjour GW Discovery policy, see bonjour-gw-discovery-policy.
### passpoint-policy `<PASSPOINT-POLICY-NAME>`
Associates a passpoint policy (Hotspot2 configuration) with this WLAN
- `<PASSPOINT-POLICY-NAME>` – Specify the Hotspot 2.0 policy name.

**Note:** For more information on passpoint policy, see *PASSPOINT POLICY.*

Map a passpoint policy to a WLAN. Since the configuration gets applied to the radio by BSS, only the Hotspot 2.0 configuration of primary WLANs on a BSSID is used. Incoming Hotspot 2.0 GAQ/ANQP requests from clients are identified by their destination MAC addresses and are handled by the passpoint policy from the primary WLAN on that BSS.

Define one passpoint policy for every WLAN configured.

### roaming-assist-policy `<POLICY-NAME>`
Associates an existing roaming assist policy with this WLAN
- `<POLICY-NAME>` – Specify the Roaming Assist policy name.

**Note:** For more information on roaming assist policy, see *ROAMING ASSIST POLICY.*

### url-filter `<URL-FILTER-NAME>`
Associates an existing URL list with this WLAN
- `<URL-FILTER-NAME>` – Specify the URL filter name.

**Note:** For more information on configuring a URL list, see *url-list.*

### wlan-qos-policy `<WLAN-QOS-POLICY-NAME>`
Uses an existing WLAN QoS policy with a WLAN
- `<wlan-qos-policy-name>` – Specify the WLAN QoS policy name.

---

### ip-access-list `[in|out] `<IP-ACCESS-LIST-NAME>`
Specifies the IP access list for incoming and outgoing packets
- `in` – Applies the IP ACL to incoming packets
- `out` – Applies IP ACL to outgoing packets
  - `<IP-ACCESS-LIST-NAME>` – Specify the IP access list name.

### ipv6-access-list `[in|out] `<IPv6-ACCESS-LIST-NAME>`
Specifies the IPv6 access list for incoming and outgoing packets
- `in` – Applies the IPv6 ACL to incoming packets
- `out` – Applies IPv6 ACL to outgoing packets
  - `<IPv6-ACCESS-LIST-NAME>` – Specify the IPv6 access list name.

### mac-access-list `[in|out] `<MAC-ACCESS-LIST-NAME>`
Specifies the MAC access list for incoming and outgoing packets.
- `in` – Applies the MAC ACL to incoming packets
- `out` – Applies MAC ACL to outgoing packets
  - `<MAC-ACCESS-LIST-NAME>` – Specify the MAC access list name.
Usage Guidelines

IP and MAC ACLs act as firewalls within a WLAN. WLANs use ACLs as firewalls to filter or mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of Access Control Entries (ACEs). Each ACE specifies a set of conditions (rules) and the action taken in case of a match. The action can be permit, deny, or mark. Therefore, when a packet matches an ACE's conditions, it is either forwarded, dropped, or marked depending on the action specified in the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP ACLs contain deny and permit rules specifying source and destination IP addresses. Each rule has a precedence order assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, you can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny, or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

Examples

rfs7000-37FABE(config-wlan-test)#use aaa-policy test
rfs7000-37FABE(config-wlan-test)#use association-acl-policy test

rfs7000-37FABE(config-wlan-ipad_clients)#
4.1.78.2.44 vlan

**wlan-mode commands**

Sets the VLAN where traffic from a WLAN is mapped

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

**Parameters**

- **vlan [<1-4094>|<VLAN-ALIAS-NAME>]**

  - `<1-4094>` Sets a WLAN's VLAN ID. This command starts a new VLAN assignment for a WLAN index. All prior VLAN settings are erased.
  
  Use this command to assign just one VLAN to the WLAN. Utilizing a single VLAN per WLAN is a more typical deployment scenario than using a VLAN pool.

  - `<VLAN-ALIAS-NAME>` Assigns a VLAN alias to the WLAN. The VLAN alias should exist and be configured.

    **Note:** A VLAN alias maps a name to a VLAN ID. When applied to ports (for example GE ports) using the trunk mode, a VLAN alias denies or permits traffic, on the port, to and from the VLANs specified in the alias. For more information on aliases, see `alias`.

**Examples**

```
rfs7000-37FABE(config-wlan-test)#vlan 4
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid testWLAN1
  vlan 4
  bridging-mode local
  encryption-type none
  authentication-type none
  protected-mgmt-frames mandatory
  radius vlan-assignment
  time-based-access days weekdays start 10:00 end 16:30

  client-load-balancing probe-req-intvl 5ghz 5
  client-load-balancing band-discovery-intvl 2
  use aaa-policy test
  use association-acl-policy test
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
  proxy-arp-mode strict
  broadcast-dhcp validate-offer
  shutdown on-unadoption
  http-analyze controller
rfs7000-37FABE(config-wlan-test)#
```
### 4.1.78.2.45 vlan-pool-member

**wlan-mode commands**

Adds a member VLAN to a WLAN’s VLAN pool. Use this option to define the VLANs available to this WLAN. Additionally, define the number of wireless clients supported by each VLAN.

**NOTE:** Configuration of a VLAN pool overrides the 'vlan' configuration.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
vlan-pool-member <WORD> {limit <0-8192>}
```

**Parameters**

- **vlan-pool-member <WORD> {limit <0-8192>}**
  - *vlan-pool-member* Adds a member VLAN to a WLAN’s VLAN pool
  - *<WORD>* Define the VLANs available to this WLAN. It is either a single index, or a list of VLAN IDs (for example, 1,3,7), or a range (for example, 1-10)
  - *limit* {0-8192} — Specifies the number of users allowed

**Examples**

```
rfs7000-37FABE(config-wlan-test)#vlan-pool-member 1-10 limit 1
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid testWLAN1
  vlan-pool-member 1 limit 1
  vlan-pool-member 2 limit 1
  vlan-pool-member 3 limit 1
  vlan-pool-member 4 limit 1
  vlan-pool-member 5 limit 1
  vlan-pool-member 6 limit 1
  vlan-pool-member 7 limit 1
  vlan-pool-member 8 limit 1
  vlan-pool-member 9 limit 1
  vlan-pool-member 10 limit 1
  bridging-mode local
  encryption-type none
  authentication-type none
  protected-mgmt-frames mandatory
  radius vlan-assignment
  time-based-access days weekdays start 10:00 end 16:30
  wing-extensions wmm-load-information
  --More--
rfs7000-37FABE(config-wlan-test)#
```
### 4.1.78.2.46 wep128

* wlan-mode commands

Configures WEP128 parameters

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

```
wep128 [key|keys-from-passkey|transmit-key]
wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
wep128 keys-from-passkey <WORD>
wep128 transmit-key <1-4>
```

### Parameters

- **wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]**
  
  *Key 1-4 Configures pre-shared hex keys*
  
  - **<1-4>** – Configures a maximum of four key indexes. Select the key index from 1 - 4.
  
  *ascii*
  
  - [0 <WORD>|2 <WORD>|<WORD>] – Configures keys as ASCII characters (5 characters for WEP64, 13 for WEP128)
    
    - **0 <WORD>** – Configures a clear text key
    
    - **2 <WORD>** – Configures an encrypted key
    
    - **<WORD>** – Configures keys as 13 ASCII characters converted to hex, or 26 hexadecimal characters
  
  *hex*
  
  - [0 <WORD>|2 <WORD>|<WORD>] – Configures keys as hexadecimal characters (10 characters for WEP64, 26 for WEP128)
    
    - **0 <WORD>** – Configures a clear text key
    
    - **2 <WORD>** – Configures an encrypted key
    
    - **<WORD>** – Configures keys as 13 ASCII characters converted to hex, or 26 hexadecimal characters

- **wep128 keys-from-passkey <WORD>**

  Specifies a passphrase from which keys are derived

  - **<WORD>** – Specify a passphrase from 4 - 32 characters.

- **wep128 transmit-key <1-4>**

  Configures the key index used for transmission from an AP to a wireless client or service platform

  - **<1-4>** – Specify a key index from 1 - 4.
Examples

rfs7000-37FABE(config-wlan-test)#wep128 keys-from-passkey example@123

rfs7000-37FABE(config-wlan-test)#
4.1.78.2.47 wep64

- **wlan-mode commands**

  Configures WEP64 parameters

  Supported in the following platforms:

  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

- `wep64 [key|keys-from-passkey|transmit-key]`
- `wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]`
- `wep64 keys-from-passkey <WORD>`
- `wep64 transmit-key <1-4>`

**Parameters**

- `wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]`
  - Configures pre-shared hex keys
  - `<1-4>` — Configures a maximum of four key indexes. Select a key index from 1 - 4.
  - **ascii**
    - `[0 <WORD>|2 <WORD>|<WORD>]` — Configures keys as ASCII characters (5 characters for WEP64, 13 for WEP128)
    - `0 <WORD>` — Configures a clear text key
    - `2 <WORD>` — Configures an encrypted key
    - `<WORD>` — Configures the key (10 hex or 5 ASCII characters for WEP64, 26 hex or 13 ASCII characters for WEP128).
  - **hex**
    - `[0 <WORD>|2 <WORD>|<WORD>]` — Configures keys as hexadecimal characters (10 characters for WEP64, 26 for WEP128)
    - `0 <WORD>` — Configures a clear text key
    - `2 <WORD>` — Configures an encrypted key
    - `<WORD>` — Configures the key (10 hex or 5 ASCII characters for WEP64, 26 hex or 13 ASCII characters for WEP128).

- `wep64 keys-from-passkey <WORD>`
  - Specifies a passphrase from which keys are derived
  - `<WORD>` — Specify a passphrase from 4 - 32 characters.

- `wep64 transmit-key <1-4>`
  - Configures the key index used for transmission from an AP to a wireless client or service platform
  - `<1-4>` — Specify a key index from 1 - 4.
**Examples**

### 4.1.78.2.49 wireless-client

#### wlan-mode commands

Configures the transmit power indicated to clients

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
wireless-client [count-per-radio|cred-cache-ageout|hold-time|inactivity-timeout|
max-firewall-sessions|reauthentication|roam-notification|t5-inactivity-timeout|
rx-power|vlan-cache-ageout]
```

```
wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|
hold-time <1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|
reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|
vlan-cache-ageout <60-86400>]
```

```
wireless-client roam-notification [after-association|after-data-ready|auto]
```

#### Parameters

- `wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|
  hold-time <1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|
  reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|
  vlan-cache-ageout <60-86400>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| count-per-radio   | Configures the maximum number of clients allowed on this WLAN per radio  
  `<0-256>` – Specify a value from 0 - 256.                                                                                                          |
| cred-cache-ageout | Configures the timeout period for which client credentials are cached across associations  
  `<60-86400>` – Specify a value from 60 - 86400 seconds.                                                                                         |
| hold-time         | Configures the time period for which wireless client state information is cached post roaming  
  `<1-86400>` – Specify a value from 1 - 86400 seconds.                                                                                          |
| inactivity-timeout| Configures an inactivity timeout period in seconds. If a frame is not received from a wireless client for this period of time, the client is disassociated.  
  `<60-86400>` – Specify a value from 60 - 86400 seconds.                                                                                       |
| max-firewall-sessions | Configures the maximum firewall sessions allowed per client on a WLAN  
  `<10-10000>` – Specify the maximum number of firewall sessions allowed from 10 - 10000.                                                        |
| reauthentication  | Configures periodic reauthentication of associated clients  
  `<30-86400>` – Specify the client reauthentication interval from 30 - 86400 seconds.                                                            |
| t5-inactivity-timeout | Configures and inactivity timeout, in seconds, for T5 devices. When configured, the T5 device is disassociated if the time lapsed after the last frame received from it exceeds the value specified here.  
  `<60-86400>` – Specify a value from 60 - 86400 seconds. The default is 60 seconds.                                                          |
wireless-client roam-notification [after-association|after-data-ready|auto]

4.1.78.2.50 wpa-wpa2

- **wlan-mode commands**

Modifies TKIP-CCMP (WPA/WPA2) related parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|server-only-authentication|psk|tkip-countermeasures|use-sha256-akm]
wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|server-only-authentication|use-sha256-akm]
```

```
wpa-wpa2 handshake [attempts|init-wait|priority|timeout]
wpa-wpa2 handshake [attempts <1-5>|init-wait <5-100000>|priority [high|normal]|timeout <10-5000> {10-5000}]
wpa-wpa2 key-rotation [broadcast|unicast] <30-86400>
wpa-wpa2 psk [0 <LINE>|2 <LINE>|<LINE>]
wpa-wpa2 tkip-countermeasures holdtime <0-65535>
```

**Parameters**

- **wpa-wpa2** Modifies TKIP-CCMP (WPA/WPA2) related parameters
- **exclude-wpa2-tkip** Excludes the Wi-Fi Protected Access II (WPA2) version of TKIP. It supports the WPA version of TKIP only. This option is disabled by default.
- **opp-pmk-caching** Uses opportunistic key caching (same Pairwise Master Key (PMK) across APs for fast roaming with EAP.802.1x. This option is enabled by default.
- **pmk-caching** Uses cached pair-wise master keys (fast roaming with eap/802.1x). This option is enabled by default.
- **preauthentication** Uses pre-authentication mode (WPA2 fast roaming)
- **server-only-authentication** Uses online sign up server-only-authenticated encryption network. This option is disabled by default.
- **use-sha256-akm** Uses sha256 authentication key management suite. This option is disabled by default.

- **wpa-wpa2 handshake** Configures WPA/WPA2 handshake parameters

```
wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|server-only-authentication|use-sha256-akm]
```

```
wpa-wpa2 handshake [attempts <1-5>|init-wait <5-100000>|priority [high|normal]|timeout <10-5000> {10-5000}]
wpa-wpa2 key-rotation [broadcast|unicast] <30-86400>
wpa-wpa2 psk [0 <LINE>|2 <LINE>|<LINE>]
wpa-wpa2 tkip-countermeasures holdtime <0-65535>
```

**Parameters**

- **wpa-wpa2** Modifies TKIP-CCMP (WPA/WPA2) related parameters

<table>

rfs7000-37FABE(config-wlan-test)#
4.1.78.2.51 service

**wlan-mode commands**

Invokes service commands applicable in the WLAN configuration mode

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
service [allow-ht-only|allow-open-passpoint|cred-cache|eap-mac-mode|eap-mac-multicopy|
eap-mac-multikeys|eap-throttle|enforce-pmkid-validation|key-index|monitor|
radio-crypto|reauthentication|session-timeout|tx-deauth-on-roam-detection|
unresponsive-client|wpa-wpa2|show]
```

```
service [allow-ht-only|allow-open-passpoint|cred-cache clear-on-disconnect|
eap-mac-multicopy|eap-mac-multikeys|enforce-pmkid-validation|radio-crypto|
reauthentication seamless|session-timeout mac|tx-deauth-on-roam-detection|show cli]
```

```
service eap-mac-mode [mac-always|normal]
```

```
service key-index eap-wep-unicast <1-4>
```

```
service monitor [aaa-server|adoption|captive-portal|dhcp|dns]
```

```
service monitor [aaa-server|adoption vlan <1-4094>|captive-portal external-server]
```

```
service unresponsive-client [attempts <1-1000>|timeout <1-60>]
```

```
service wpa-wpa2 exclude-ccmp
```

**Parameters**

- **allow-ht-only** Only allows clients capable of High Throughput (802.11n) data rates to associate

- **allow-open-passpoint** Enables non-WPA2 security for passpoint WLANs.
  For more information on passpoint policy and configuration, see [PASSPOINT POLICY](#).

- **cred-cache clear-on-disconnect** Clears credential cache after a client has disconnected from the network

- **eap-mac-multicopy** Enables sending of multiple copies of broadcast and unicast messages

- **eap-mac-multikeys** Enables configuration of different key indices for MAC authentication
<table>
<thead>
<tr>
<th>Command/Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enforce-pmkid-validation</code></td>
<td>Validates the <em>Predictive real-time pairwise master key identifier</em> (PMKID) contained in a client’s association request against the one present in the wpa-wpa2 handshake. This functionality is based on the <em>Proactive Key Caching</em> (PKC) extension of the 802.11i EEEE standard. Whenever a wireless client successfully authenticates with an AP, it receives a <em>pairwise master key</em> (PMK). PKC allows clients to cache this PMK and reuse it for future re-authentications with the same AP. The PMK is unique for every client and is identified by the PMKID. The PMKID is a combination of the hash of the PMK, a string, the station and the MAC addresses of the AP.</td>
</tr>
<tr>
<td><code>radio-crypto</code></td>
<td>Uses radio hardware for encryption and decryption. This is applicable only for devices using <em>Counter Cipher Mode with Block Chaining Message Authentication Code Protocol</em> (CCMP) encryption mode.</td>
</tr>
<tr>
<td><code>reauthentication seamless</code></td>
<td>Enables seamless EAP client reauthentication without disconnecting the client after the session has timed out.</td>
</tr>
<tr>
<td><code>session-timeout mac</code></td>
<td>Enables reauthentication of MAC authenticated clients without disconnecting the client after the session has timed out.</td>
</tr>
<tr>
<td><code>tx-deauth-on-roam-detection</code></td>
<td>Transmits a deauthentication on the air while disassociating a client because its roam is detected on the wired side.</td>
</tr>
<tr>
<td><code>show cli</code></td>
<td>Displays the CLI tree of the current mode. When used in the WLAN mode, this command displays the WLAN CLI structure.</td>
</tr>
<tr>
<td>`service eap-mac-mode [mac-always</td>
<td>normal]`</td>
</tr>
<tr>
<td><code>eap-mac-mode</code></td>
<td>Enables both EAP and MAC authentication. MAC authentication is performed first, followed by EAP authentication. Clients are granted access based on the EAP authentication result. If a client does not have EAP, the MAC authentication result is used to grant access.</td>
</tr>
<tr>
<td><code>mac-always</code></td>
<td>Grants client access if the client clears either EAP or MAC authentication.</td>
</tr>
<tr>
<td><code>normal</code></td>
<td>Enables reauthentication of MAC authenticated clients without disconnecting the client after the session has timed out.</td>
</tr>
<tr>
<td><code>tx-deauth-on-roam-detection</code></td>
<td>Transmits a deauthentication on the air while disassociating a client because its roam is detected on the wired side.</td>
</tr>
<tr>
<td><code>show cli</code></td>
<td>Displays the CLI tree of the current mode. When used in the WLAN mode, this command displays the WLAN CLI structure.</td>
</tr>
<tr>
<td><code>service eap-throttle &lt;0-254&gt;</code></td>
<td>Enables EAP request throttling. Use this command to specify the maximum number of parallel EAP sessions allowed on this WLAN. Once this specified value is exceeded, all incoming EAP session requests are throttled.</td>
</tr>
<tr>
<td><code>eap-throttle &lt;0-254&gt;</code></td>
<td>Enables EAP request throttling. Use this command to specify the maximum number of parallel EAP sessions allowed on this WLAN. Once this specified value is exceeded, all incoming EAP session requests are throttled.</td>
</tr>
<tr>
<td><code>service key-index eap-wep-unicast &lt;1-4&gt;</code></td>
<td>Configures an index with each key during EAP authentication with WEP.</td>
</tr>
<tr>
<td><code>key-index eap-wep-unicast &lt;1-4&gt;</code></td>
<td>Configures an index with each key during EAP authentication with WEP.</td>
</tr>
<tr>
<td><code>wpa-wpa2 exclude-ccmp</code></td>
<td>Configures exclusion of CCMP requests when the authentication mode is set to tkip-ccmp. When enabled, it provides compatibility for client devices not compliant with tkip-ccmp.</td>
</tr>
</tbody>
</table>
### GLOBAL CONFIGURATION COMMANDS

**service monitor [aaa-server|adoption vlan <1-4094>|captive-portal external-server]**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>monitor</td>
<td>Enables critical resource monitoring. In a WLAN, service monitoring enables regular monitoring of external AAA servers, captive portal servers, access point adoption, DHCP and DNS servers. When enabled, it allows administrators to notify users of a service’s availability and make resource substitutions in case of unavailability of a service.</td>
</tr>
<tr>
<td>aaa-server</td>
<td>Enables external AAA server failure monitoring. When enabled monitors an external RADIUS server resource’s AAA activity and ensures its adoption and availability. This feature is disabled by default.</td>
</tr>
<tr>
<td>adoption vlan</td>
<td>Enables adoption failure monitoring on an adopted AP. Also configures a adoption failover VLAN. This feature is disabled by default.</td>
</tr>
<tr>
<td>_capture-port</td>
<td>Enables external captive portal server failure monitoring. When enabled, monitors externally hosted captive portal activity, and user access to the controller or service platform managed network. This feature is disabled by default.</td>
</tr>
<tr>
<td>external-server</td>
<td>Enables external captive portal server failure monitoring. When enabled, monitors externally hosted captive portal activity, and user access to the controller or service platform managed network. This feature is disabled by default.</td>
</tr>
</tbody>
</table>

**Note:** When enabled, this feature enables APs to display, to an externally located captive portal’s user, the no-service page when the captive portal’s server is not reachable.

**service monitor [dhcp|dns] crm <RESOURCE-NAME> vlan <1-4094>**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>monitor</td>
<td>Enables DHCP and/or DNS server monitoring on this WLAN.</td>
</tr>
<tr>
<td>dhcp</td>
<td>Enables monitoring of a specified DHCP server. When the connection to the DHCP server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default.</td>
</tr>
<tr>
<td>dns</td>
<td>Enables monitoring of a specified DNS server. When the connection to the DNS server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default.</td>
</tr>
</tbody>
</table>

**Note:** Use the `crm` keyword to specify the DHCP server to monitor.
### Examples

```
rfs4000-229D58(config-wlan-test)#service allow-ht-only

rfs4000-229D58(config-wlan-test)#service monitor aaa-server

rfs4000-229D58(config-wlan-test)#show context
wlan test
  ssid test
  vlan 1
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  service monitor aaa-server
  service allow-ht-only
  controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#
```
### 4.1.79 wlan-qos-policy

**Global Configuration Commands**

Configures a WLAN QoS policy.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
wlan-qos-policy <WLAN-QOS-POLICY-NAME>
```

**Parameters**

- `wlan-qos-policy <WLAN-QOS-POLICY-NAME>`

**Examples**

```
rfs7000-37FABE(config)#wlan-qos-policy test
rfs7000-37FABE(config-wlan-qos-test)#?
```

**WLAN QoS Mode commands:**

- `accelerated-multicast` Configure accelerated multicast streams address asnd forwarding QoS classification
- `classification` Select how traffic on this WLAN must be classified (relative prioritization on the radio)
- `multicast-mask` Egress multicast mask (frames that match bypass the PSPqueue. This permits intercom mode operation without delay even in the presence of PSP clients)
- `no` Negate a command or set its defaults
- `qos` Quality of service
- `rate-limit` Configure traffic rate-limiting parameters on a per-wlan/per-client basis
- `svp-prioritization` Enable spectralink voice protocol support on this wlan
- `voice-prioritization` Prioritize voice client over other client (for non-WMM clients)
- `wmm` Configure 802.11e/Wireless MultiMedia parameters
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-wlan-qos-test)#
```

**NOTE:** For more information on WLAN QoS policy commands, see Chapter 21, WLAN-QOS-POLICY.

</tbody>
</table>
smart-cache-policy

`smart-cache-policy`

Creates a new smart cache policy and enters its configuration mode

Content caching is a mechanism that allows temporary caching of frequently accessed content on intermediate network devices. When enabled, subsequent requests for the same content are serviced from the cache locally and not fetched from originating servers, resulting in reduced bandwidth usage, lower latency, and reduced data transfers from originating servers. The WiNG smart cache policy supports both forward caching and transparent caching.

Forward content caching stores content temporarily on the local network. This locally stored content can be retrieved, when required, without routing a request to an external server on the Internet.

Transparent content caching, on the other hand, acts as an intermediary for the originating servers and returns cached content to clients as if the data originated from the associated servers. Transparent caching proxies perform server load-balancing and compression to regulate load on the originating servers and reduce bandwidth usage.

The smart cache policy also supports dynamic content caching, allowing caching of content from popular video content sharing sites, such as youtube.com, cnn.com, msn.com etc.

Enabling content caching improves Web browsing (for data and video content) for consumers using Kiosks, tablets, and smart phones. A smart cache policy is enabled by associating it with a device or a profile.

Configure the policy’s forward proxy, transparent proxy and several additional settings before actual HTML pages can be defined for the smart caching configuration.

**NOTE:** Content caching is a licensed feature, supported only on the NX45XX and NX65XX series service platforms. To enable content caching on a device, use the license command (in the device-config mode) and provide the SMART-CACHE license key. For more information, see `license`.

**NOTE:** Though the NX9000 series service platforms do not support content caching, they support the configuration of smart-content caching policies that can be applied to the NX45XX and NX65XX series service platforms. The NX9000 series service platforms are capable of adopting and configuring NX45XX and NX65XX series service platforms.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`smart-cache-policy <SMART-CACHE-POLICY-NAME>`

**Parameters**

- `smart-cache-policy <SMART-CACHE-POLICY-NAME>`

| `<SMART-CACHE-POLICY-NAME>` | Creates a new smart content cache policy. Specify the policy name. If the policy does not exist, it is created. |

**Examples**

```
nx4500-5CFA2B(config)#smart-cache-policy ?
  SMART-CACHE-POLICY  Name of the content caching to be configured ( will be created if it does not exist )

nx4500-5CFA2B(config)#smart-cache-policy test
nx4500-5CFA2B(config-smart-cache-policy-test)#
```
nx4500-5CFA2B(config-smart-cache-policy-test)#?
Content Cache Policy Mode commands:
  access-log Log all client requests
  aging Configure the refresh pattern
  cache Configure cache management
  forward-proxy Configure address and port for forward caching proxy
  http-access Configure http filter
  no Negate a command or set its defaults
  parent-proxy Configure parent proxy
  pre-fetch Enable pre-fetching of a URL list
  smart-cache Content cache
  transparent-proxy Transparent caching proxy

  clrscr Clears the display screen
  commit Commit all changes made in this session
  do Run commands from Exec mode
  end End current mode and change to EXEC mode
  exit End current mode and down to previous mode
  help Description of the interactive help system
  revert Revert changes
  service Service Commands
  show Show running system information
  write Write running configuration to memory or terminal

4.1.80.2.1 access-log

smart-cache-policy-mode commands

Enables or disables client request logging. When enabled, this feature logs client access details to the /var/log/smart-cache.log. This feature is enabled by default.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
access-log {rotate <0-10> rotate-type [duration <1-100> day|size <1-100> MB]}

Parameters
- access-log {rotate <0-10> rotate-type [duration <1-100> day|size <1-100> MB]}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotate &lt;0-10&gt;</td>
<td>Optional. Enables log file rotation, and configures the number of rotation.</td>
</tr>
<tr>
<td></td>
<td>This is the number of log files retained (stored locally) out of the total</td>
</tr>
<tr>
<td></td>
<td>generated.</td>
</tr>
<tr>
<td></td>
<td>&lt;0-10&gt; – Optional. Specify the number of rotations from 0 - 10. The default</td>
</tr>
<tr>
<td></td>
<td>is 10 rotations on every 1 MB.</td>
</tr>
<tr>
<td>rotate-type [duration</td>
<td>Optional. Configures access log file rotation conditions, such as duration</td>
</tr>
<tr>
<td>&lt;1-100&gt; day</td>
<td>size &lt;1-100&gt; MB]</td>
</tr>
<tr>
<td></td>
<td>duration &lt;1-100&gt; – Rotates log files by time. Specify the time from 1 - 100</td>
</tr>
<tr>
<td></td>
<td>days. The default is 1 day.</td>
</tr>
<tr>
<td></td>
<td>size &lt;1-100&gt; – Rotates log files by file size. Specify the size from 1 - 100</td>
</tr>
<tr>
<td></td>
<td>MB.</td>
</tr>
</tbody>
</table>

Examples
nx4500-5CFA2B(config-smart-cache-policy-test)#access-log rotate 10 rotate-type duration 10 day

nx4500-5CFA2B(config-smart-cache-policy-test)#show context

  access-log rotate 10 rotate-type duration 10 day
nx4500-5CFA2B(config-smart-cache-policy-test)#

Related Commands
- no
  Disables client request logging
4.1.80.2.2 aging

*smart-cache-policy-mode commands*

Configures the aging rule (refresh pattern) for specific content types

The aging parameters configured are the maximum and minimum age, freshness factor, and the URL regular expressions. These parameters enable the content caching engine to determine if a given request can be processed and the content loaded from the cache or not.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
aging precedence <1-100> [ <WORD>|ignore-case <WORD>] min-age <0-525600>
  freshness-factor <0-100> max-age <0-525600> { (override-expire|override-lastmod|
  reload-into-ims)}
```

**Parameters**
- **aging precedence <1-100> [ <WORD>|ignore-case <WORD>]**
  - Configures content cache aging rules and assigns a precedence to each rule
  - **precedence <1-100>** — Specify a precedence for this aging rule.
- **<WORD>**
  - Specifies the regular expression to match. This option is case sensitive, and is the default setting.
- **ignore-case <WORD>**
  - Specifies the regular expression to match. This option is not case sensitive.
- **min-age <0-525600>**
  - Configures the minimum age, in minutes, of matched objects. This value specifies the lower limit on the staleness of a response. A response is not considered stale unless its time in the cache exceeds the specified minimum value.
  - **<0-525600>** — Specify a value from 0 - 525600 minutes. The default is 1 minute.
- **freshness-factor <0-100>**
  - Configures the freshness factor of matched objects as a percentage value. Freshness is an expression of how long Web content resides on the service platform’s local cache before being updated or removed.
  - **<0-100>** — Specify a value from 0 - 100%. The default is 100%.
- **max-age <0-525600>**
  - Configures the maximum age, in minutes, of matched objects. This value specifies the upper limit on the freshness of a response. A response is not considered fresh unless its time in the cache is less than the specified maximum value.
  - **<0-525600>** — Specify a value from 0 - 525600 minutes. The default is 525600.
Examples
nx4500-5CFA2B(config-smart-cache-policy-test)#aging precedence 1 ignore-case \\.jgp$ min-age 100 freshness-factor 75 max-age 200 reload-into-ims

nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
  aging precedence 1 ignore-case \\.jgp$ min-age 100 freshness-factor 75 max-age 200 reload-into-ims
  access-log rotate 10 rotate-type duration 10 day
nx4500-5CFA2B(config-smart-cache-policy-test)#

Related Commands

smart-cache-policy-mode commands

Configures cache management settings

This command specifies content cache rules that determine if a content is cached or not. Use this feature to filter content before caching. By default content is not cached.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
cache [media|precedence|size]
cache media {(all|aol|bing|break|cnn|daily-motion|metacafe|vimeo|youtube)}
cache precedence <1-100> [deny|permit] {destination-domain <DOMAIN-NAME>|
  destination-domain-regex <WORD>|destination-ip [<IP/M]|any]|source-ip <IP/M>|
  url-regex <URL>}
cache size <1-32>
```

Parameters

- cache media {(all|aol|bing|break|cnn|daily-motion|metacafe|vimeo|youtube)}

<table>
<thead>
<tr>
<th>cache media</th>
<th>Enables content caching from the following video content sharing sites. The sites currently supported are:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• aol.com</td>
</tr>
<tr>
<td></td>
<td>• bing.com</td>
</tr>
<tr>
<td></td>
<td>• break.com</td>
</tr>
<tr>
<td></td>
<td>• dailymotion.com</td>
</tr>
<tr>
<td></td>
<td>• metacafe.com</td>
</tr>
<tr>
<td></td>
<td>• vimeo.com</td>
</tr>
<tr>
<td></td>
<td>• cnn.com</td>
</tr>
<tr>
<td></td>
<td>• youtube.com</td>
</tr>
</tbody>
</table>

Note: Select All to include the entire list of supported sites. Selected sites have their video content cached locally on the service platform and made available to clients that request the video content.

- cache precedence <1-100> [deny|permit] {destination-domain <DOMAIN-NAME>|
  destination-domain-regex <WORD>|destination-ip [<IP/M]|any]|source-ip <IP/M>|
  url-regex <URL>}

<table>
<thead>
<tr>
<th>cache precedence &lt;1-100&gt;</th>
<th>Configures cache filtering rules that determine if a content received from the originating server is to be cached or not. You can create multiple cache filtering rules and assign precedence values to each. These rules are applied in order of their precedence.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-100&gt; — Specify a precedence rule from 1 - 100.</td>
</tr>
</tbody>
</table>

| [deny|permit] | Configures the deny or permit caching parameters for this rule |
|--------------|----------------------------------------------------------------|
|              | • permits — Caches content if it matches the defined permit parameters |
|              | • deny — Does not cache content if it matches the defined deny parameters |
### cache size <1-32>

Configures the maximum caching storage size. This is upper limit on the disk space used for storing cached contents.
- `<1-32>` – Specify a value from 1 - 32 GB. The default is 32 GB.

### Examples

```
nx4500-5CFA2B(config-smart-cache-policy-test)#cache size 30
```

```
nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
  cache size 30
  aging precedence 1 ignore-case \..jpg$ min-age 100 freshness-factor 75 max-age 200
  reload-into-ims
  access-log rotate 10 rotate-type duration 10 day
nx4500-5CFA2B(config-smart-cache-policy-test)#
```

4.1.80.2.4 forward-proxy

> smart-cache-policy-mode commands

Enables or disables forward proxy mode on this smart cache policy. This option is disabled by default.

Devices using this smart-cache policy act as a forward proxy on specified VLANs.

This command configures the IP address and port on which the forward proxy server listens for incoming HTTP requests.

Forward content caching stores content temporarily on the local network. This locally stored content can be retrieved, when required, without routing a request to an external server on the Internet.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

forward-proxy {ip|protocol|vlan}

forward-proxy {ip <IP> port <1-32768>}

forward-proxy {protocol [all|ftp|gopher|https]}

forward-proxy {vlan <VLAN-ID>}

Parameters

- forward-proxy {ip <IP> port <1-32768>}

  | ip <IP> | port <1-32768> | Configures the IP address and TCP port for forward proxying. If no IP address is provided, the system uses the default smart caching proxy server’s IP (127.0.1.1). This is the IP address where the forward smart caching proxy server is listening. The default port is 3128.

- forward-proxy {protocol [all|ftp|gopher|https]}

  | protocol [all|ftp|gopher|https] | Optional. Selects the additional forward proxy resource protocol for smart caching. the options are:
  | | - ftp – Selects FTP as the forward proxy resource protocol
  | | - gopher – Selects Gopher as the forward proxy resource protocol
  | | - https – Selects HTTPS as the forward proxy resource protocol
  | | - all – Selects all protocols (this is the default setting)

- forward-proxy {vlan <VLAN-ID>}

  | vlan <VLAN-ID> | Optional. Configures the VLAN(s) for which forward proxy mode (content caching) is enabled. By default content caching is disabled on all VLANs. This option is disabled by default.
  | | - <VLAN-ID> – Specify the list of VLANs

Examples

nx4500-5CFA2B(config-smart-cache-policy-test)#forward-proxy vlan 10-20

nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test

  forward-proxy vlan 10-20
  cache size 30
  aging precedence 1 ignore-case \\ .jgp$ min-age 100 freshness-factor 75 max-age 200
  reload-into-ims
  access-log rotate 10 rotate-type duration 10 day

nx4500-5CFA2B(config-smart-cache-policy-test)#

4.1.80.2.5 http-access

Configuration HTTP filters. This command configures rules to deny or permit HTTP access. A deny rule specifies the destination domains and source and destination IPs to deny content access. A permit rule specifies the destination domains and source and destination IPs to permit content access.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```plaintext
http-access precedence <1-100> [deny|permit] {destination-domain <DOMAIN-NAME>|
destination-domain-regex <WORD>|destination-ip <IP/M>|mimetype-regex <WORD>|
source-ip <IP/M>|url-regex <URL>}
```

Parameters

- **http-access precedence <1-100> [deny|permit]**
  - `<1-100>` – Specify a precedence rule from 1 - 100.

- **[deny|permit]**
  - `deny` – Denies access if the specified parameters are matched
  - `permit` – Permits access if the specified parameters are matched

- **destination-domain <DOMAIN-NAME>**
  - Optional. Specifies the destination domain to match against the hostname in the HTTP request URL
  - `<DOMAIN-NAME>` – Specify the domain name.

- **destination-domain-regex <WORD>**
  - Optional. Specifies a regular expression matching on originating server names
  - `<WORD>` – Specify the regular expression.
  - The destination domain regex is the same as the destination domain, but the destination domain regex allows your to use standard expression matching on originating server names.

- **destination-ip [<IP/M>|any]**
  - Optional. Specifies the destination server’s IP address, obtained from the HTTP request URL
  - `<IP/M>` – Specify the destination server’s IP address and mask. This is used as the match criteria.
  - `any` – Select to specify any destination IP address as the match criteria.
  - **Note:** Provide the IP address in the A.B.C.D/M format.
  - **Note:** Specify any to consider all servers.

- **mimetype-regex <WORD>**
  - Optional. Specifies the regular expression used to match the mimetype of a HTTP request
| source-ip [IP/M]any | Optional. Specifies the source IP address (client’s IP address) that is sent out as part of the HTTP request.  
| | • <IP/M> – Specify the source IP address and mask. This is used as the match criteria.  
| | • any – Select to specify any source IP address as the match criteria.  
| | **Note:** Provide the IP address in the A.B.C.D/M format.  
| | **Note:** Specify any to consider all client requests. |

| url-regex <URL> | Optional. Specifies regular expressions used to match any part of a requested URL, including the transfer protocol and originating server hostname  
| | • <URL> – Specify the regular expression. |

**Examples**

```
nx4500-5CFA2B(config-smart-cache-policy-test)#http-access precedence 4 deny destination-domain .TechPubs
```

```
nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test  
forward-proxy vlan 10-20  
cache size 30  
aging precedence 1 ignore-case \.jgp$ min-age 100 freshness-factor 75 max-age 200  
reload-into-ims
```

```
http-access precedence 4 deny destination-domain .TechPubs  
access-log rotate 10 rotate-type duration 10 day  
x4500-5CFA2B(config-smart-cache-policy-test)#
```

**Related Commands**

- smart-cache-policy-mode commands

Removes or resets smart cache policy settings

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [access-log|aging|cache|forward-proxy|http-access|parent-proxy|pre-fetch|smart-cache|transparent-proxy]

Parameters
- no <PARAMETERS>

Examples

The following example displays the content cache policy 'test' settings before the no commands are executed:

```
nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
  forward-proxy vlan 10-20
  aging precedence 1 ignore-case \:\.jgp$ min-age 100 freshness-factor 75 max-age 200
  reload-into-ims
  http-access precedence 4 deny destination-domain .TechPubs
  access-log rotate 10 rotate-type duration 10 day
```

```
nx4500-5CFA2B(config-smart-cache-policy-test)#no forward-proxy vlan 10-20
```

```
nx4500-5CFA2B(config-smart-cache-policy-test)#no aging precedence 1
```

```
nx4500-5CFA2B(config-smart-cache-policy-test)#no access-log rotate
```

The following example displays the content cache policy 'test' settings after the no commands are executed:

```
nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
  cache size 30
  http-access precedence 4 deny destination-domain .TechPubs
```

```
nx4500-5CFA2B(config-smart-cache-policy-test)#
```
4.1.80.2.7 pre-fetch

smart-cache-policy-mode commands

Pre-fetches a specified list of URLs (whose credentials can be stored in the local cache)

This command allows the content cache engine to pre-fetch URLs specified in a URL list. The pre-fetch function is performed immediately or at a scheduled time, based on configuration.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
pre-fetch <URL-LIST-NAME> schedule <TIME>
```

Parameters

- **pre-fetch <URL-LIST-NAME> schedule <TIME>**

<table>
<thead>
<tr>
<th><strong>&lt;URL-LIST-NAME&gt;</strong></th>
<th>Pre-fetches a list of URLs identified by the &lt;URL-LIST-NAME&gt; keyword. URL lists are used to select highly utilized URLs for smart caching. The selected URLs are monitored and routed according to existing cache content policies. The URL list should be existing and configured. For more information on configuring URL lists, see <code>url-list</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>schedule &lt;TIME&gt;</strong></td>
<td>Pre-fetches the specified URL list at a specified time&lt;br&gt;- <strong>&lt;TIME&gt;</strong> – Specify the time in the HH:MM format.</td>
</tr>
</tbody>
</table>

Examples

```
nx4500-5CFA2B(config-content-cache-policy-test)#pre-fetch test schedule 12:30
```

```
nx4500-5CFA2B(config-content-cache-policy-test)#show context
content-cache-policy test
forward-proxy vlan 10-20
cache media all
cache size 30
http-access precedence 100 deny destination-domain test destination-domain-regex test
access-log rotate 10 every 50 day
pre-fetch test schedule 12:30
nx4500-5CFA2B(config-content-cache-policy-test)#
```

Related Commands

```

Removes an ACL
4.1.80.2.8 parent-proxy

*smart-cache-policy-mode commands*

Enables or disables upper-layer parent proxy on this smart cache policy.

The parent proxy server requires users to authenticate to access Web sites like WinRoute. This setting is disabled by default.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
parent-proxy [enable|host <IP/HOST-NAME> port <1-32768>]
```

**Parameters**

| parent-proxy [enable|host <IP/HOST-NAME> port <1-32768>] |
|---------------------------------------------------------|
| enable | Enables parent proxy on this smart cache policy |
| host | Configures the hostname or IP address of the parent proxy server |
| port | Specifies the TCP port number for the parent proxy server. The default port is 8080. |

**Examples**

```
nx4500-5CFA2B(config-smart-cache-policy-test)#parent-proxy host 192.168.13.8 port 21
nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
parent-proxy host 192.168.13.8 port 21
http-access precedence 4 deny destination-domain .TechPubs
```

**Related Commands**

| no | Disables parent proxy on this smart cache policy |
4.180.2.9 smart-cache

*smart-cache-policy-mode commands*

Enables smart content caching

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

smart-cache enable

**Parameters**

- smart-cache enable

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>smart-cache enable</td>
<td>Enables smart content caching. When enabled, devices using this smart-cache policy act as forward proxy.</td>
</tr>
</tbody>
</table>

**Examples**

nx4500-5CFA2B(config-smart-cache-policy-test)#smart-cache enable
nx4500-5CFA2B(config-smart-cache-policy-test)#

**Related Commands**

- **no** | Disables smart content caching
4.1.80.2.10 transparent-proxy

smart-cache-policy-mode commands

Enables or disables the transparent proxy mode on a device. This is the default mode of proxying.

When enabled, all packets are automatically routed to the port on which the content cache engine listens (3128) by default. The advantage of the transparent proxy mode is that clients need not be configured with an explicit proxy.

Transparent content caching, on the other hand, acts as an intermediary for the originating servers and returns cached content to clients as if the data originated from the associated servers. Transparent caching proxies perform server load-balancing and compression to regulate load on the originating servers and reduce bandwidth usage.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
transparent-proxy {protocol|vlan}
transparent-proxy {protocol {all|https}}
transparent-proxy {vlan <VLAN-ID>}

Parameters
- transparent-proxy {protocol {all|https}}
  - protocol {all|https} Optional. Selects the protocols used for transparent proxy mode
    - https — Optional. Enables HTTPS for transparent proxy
    - all — Optional. Enables all protocols for transparent proxy

- transparent-proxy {vlan <VLAN-ID>}
  - vlan <VLAN-ID> Optional. Configures the VLAN(s) for which transparent proxy mode (content caching) is enabled. By default content caching is disabled on all VLANs.
    - <VLAN-ID> — Specify the list of VLANs.

Examples
nx4500-5CFA2B(config-smart-cache-policy-test)#transparent-proxy vlan 10-20

nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
parent-proxy host 192.168.13.8 port 21
transparent-proxy vlan 10-20
    cache size 30
    http-access precedence 4 deny destination-domain .TechPubs

Related Commands
- no Resets or removes transparent caching proxy settings
4.1.81 url-filter

The following table lists the commands that allow you to enter the URL filter configuration mode:

Table 4.26 Commands Creating a URL Filter

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>

</tr>
</tbody>
</table>
4.1.8.1.1 url-filter

`url-filter` command creates a new URL filter (Web filter) and enters its configuration mode. URL filtering is a licensed feature. When applied to a WiNG device, the license allows you to enable URL filtering on the device, create and apply a URL filter defining the banned and/or allowed URLs. When enabled, the URL filter is applied to all user-initiated URL requests to determine if the requested URL is banned or allowed. Only if allowed is the user’s request (in the form of an HTTP request packet) forwarded to the Web server.

URL filters can be applied at any of the following points: the user’s application (browser/email reader), the network’s gateway, at the Internet service provider’s (ISP) end, and also on a Web portal. For wireless clients, the WLAN infrastructure is the best place to implement these filters.

A URL filter is a set of whitelist and/or blacklist rules. The whitelist allows access only to those Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the whitelist, are banned. On the other hand, the blacklist bans all Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the blacklist, are allowed.

To simplify URL filter configuration, Websites have been classified into pre-defined category-types and categories. The system provides 12 category-types and 64 categories. To further simplify configuration, these 12 category-types have been grouped into five (5) pre-defined levels. (See Usage Guidelines section for the list of category-types, categories, and levels). The actual classification of URLs (on the basis of the pre-defined factors mentioned above) is done by the classification server. A local database also helps by caching URL records for a user-defined time period. The classification server host is specified in the Web filter policy. The Web filter policy also defines the URL database parameters. For more information, see `web-filter-policy`.

The WiNG software also allows you to create URL lists. Each URL list contains a list of user-defined URLs. Use the URL list in a URL filter (whitelist or blacklist rule) to identify the URLs to ban or allow. For example, a URL list named SocialNetworking is created listing the following three sites: Facebook, Twitter, and LinkedIn. When applied to a URL filter’s blacklist, these three sites are banned. Where as, when applied to a whitelist only these three sites are allowed. For more information on configuring a URL list, see `url-list`.

**NOTE:** URL filtering is a licensed feature. Procure and install the license in the device configuration mode. For more information, see `license`.

**Supported in the following platforms:**
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

**Syntax**
```
url-filter <URL-FILTER-NAME>
```

**Parameters**
- `url-filter <URL-FILTER-NAME>`

| <URL-FILTER-NAME> | Creates a new URL filter and enters its configuration mode. Specify the URL filter name. If the filter does not exist, it is created. |

4.1.81.2.1 blacklist

A blacklist is a list of Websites and URLs denied access by clients. Clients requesting blacklisted URLs are presented with a page displaying the 'Web page blocked' message. Parameters relating to this page are configured using the 'blockpage' option.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the URL category-types and categories to include in the blacklist.

In addition to identifying URLs by the categories and category-types they are classified into, the system also provides five levels of Web filtering (basic, high, low, medium, and medium-high). Each level identifies a specific set of URL categories to blacklist. For more information on category-types, categories, and URL filtering levels, see url-filter.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

**Syntax**

blacklist [category-type|level|url-list]

blacklist category-type [adult-content|all|business|communication|entertainment|file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}

blacklist level [basic|high|low|medium|medium-high] precedence <1-500> {description <LINE>}

blacklist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}

**Parameters**

- blacklist category-type [adult-content|all|business|communication|entertainment|file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}

blacklist category-type <SELECT-CATEGORY-TYPE>

Selects the category-type to blacklist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can be created with the URL List and added to the database.

Websites have been classified into the following 12 category types:
- adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates

Select ‘all’ to blacklist all category-types.

Some of the category-types are further classified into categories. For example, the ‘adult-content’ category-type is differentiated into the following categories:
- alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons.

The system blocks all categories (URLs falling within their limits) within the selected category-type.
GLOBAL CONFIGURATION COMMANDS

preference <1-500>  Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.

description <LINE>  Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.

• blacklist level [basic|high|low|medium|medium-high] precedence <1-500>  {description <LINE>}

blacklist level [basic|high|low|medium|medium-high]  Configures the Web filtering level as basic, high, low, medium, or medium-high. Each of these filter-levels are pre-configured to use a set of category types and this mapping cannot be modified.

precedence <1-1500>  Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.

description <LINE>  Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.

• blacklist url-list <URL-LIST-NAME> precedence <1-500>  {description <LINE>}

blacklist url-list <URL-LIST-NAME>  Associates a URL list with this URL filter. When associated with a blacklist rule, all URLs listed in the specified URL list are blacklisted.

URL lists are customized categories included in the custom filter-level setting. URL lists enable an administrator to blacklist or whitelist URLs in addition to the built-in categories. For more information on configuring a URL list, see url-list.

• <URL-LIST-NAME> – Enter URL list name (should be existing and configured)

precedence <1-500>  Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.

description <LINE>  Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.

Examples

rfs7000-6DCD4B(config-url-filter-test)#blacklist level medium-high precedence 10
rfs7000-6DCD4B(config-url-filter-test)#blacklist category-type adult-content category alcohol-tobacco precedence 1
rfs7000-6DCD4B(config-url-filter-test)#blacklist category-type security-risk category botnets precedence 3
rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
rfs7000-6DCD4B(config-url-filter-test)#

Related Commands

no  Removes a blacklist rule from this URL filter. Specify the category-type, category, and precedence to identify the blacklist rule. The identified rule is removed form the URL filter.
4.1.81.2.2 blockpage

- url-filter-config-mode commands

Configures the parameters that retrieve the page or content displayed by the client's browser when a requested URL is blocked and cannot be viewed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

blockpage [external|internal|path]

blockpage path [external|internal]

blockpage external url <URL>

blockpage internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title] <LINE/IMAGE-URL>

Parameters

- blockpage path [external|internal]

  blockpage path [external|internal] Specifies if the location of the page displayed, to the client when a requested URL is blocked, is external or internal

  - external – Indicates the page displayed is hosted on an external Web server resource. If selecting this option, use the blockpage > external > url <URL> command to provide the path to the external Web server hosting the page.

  Note: internal – Indicates the page displayed is hosted internally. This is the default setting. If selecting this option, use the blockpage > internal > <SELECT-PAGE-TYPE> > <LINE/IMAGE-URL> to define the page configuration.

- blockpage external url <URL>

  blockpage external url <URL> Configures the URL of the external Web server hosting the page (displayed to the client when a requested URL is blocked).

  - url <URL> – Specify the URL of the Web server and the blocking page name

  Valid URLs should begin with http:// or https://

  The URL can contain query strings.

  Use ' & ' or '?' character to separate field-value pair.

  Enter 'ctrl-v' followed by '?' to configure query strings.

- blockpage internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title] <LINE/IMAGE-URL>

  blockpage internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title] <LINE/IMAGE-URL> Configures the internally hosted blocking page parameters, such as the content displayed, page footer and header, organization (the organization enforcing the Web page blocking) details (name, signature, and logo), and page title

  - content – Configures the text (message) displayed on the blocking page

  Contd...
Examples

rfs7000-6DCD4B(config-url-filter-test)#blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"

rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test
  blacklist level medium-high precedence 10
  blacklist category-type security-risk category botnets precedence 3
  blacklist category-type adult-content category alcohol-tobacco precedence 1
  blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"

Related Commands

no | Removes the blocking page configurations

- footer – Configures the text displayed as the blocking page footer
- header – Configures the text displayed as the blocking page header
- org-name – Configures the organization’s name displayed on the blocking page
- org-signature – Configures the organization’s signature displayed on the blocking page
- title – Configures the title of the blocking page.
- main-logo – Configures the location of the main logo (organization’s large logo)
- small-logo – Configures the location of the small logo (organization’s small logo)

The following keyword is common to all of the above parameters:

- `<LINE/IMAGE-URL>` – Specify the location of the logo (main and small) image file. The image is retrieved and displayed from the location configured here. If you are using this option to provide content, such as organization name, footer, header etc. enter a text string not exceeding 255 characters in length.
4.1.81.2.3 description

**url-filter-config-mode commands**

Configures a description for this URL filter. Provide a description that enables you to identify the purpose of this URL filter.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

**Syntax**
description <LINE>

**Parameters**

- description <LINE>

| description <LINE> | Enter an appropriate description for this URL filter. The description should identify the URL filter’s purpose and should not exceed 80 characters in length. |

**Examples**

rfs7000-6DCD4B(config-url-filter-test)#description "Blacklists sites inappropriate for children and are security risks"

rfs7000-6DCD4B(config-url-filter-test)#show context
url-filter test
description "Blacklists sites inappropriate for children and are security risks"
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"

rfs7000-6DCD4B(config-url-filter-test)#

**Related Commands**

| no | Removes this URL filter’s description |
4.1.81.2.4 no

**url-filter-config-mode commands**

Use the no command to remove this URL filter’s configured parameters

Supported in the following platforms:

- **Access Points** — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

**Syntax**

no [blacklist|blockpage|description|whitelist]

no blacklist [category-type|level|url-list]

no blacklist [category-type <SELECT-CATEGORY-TYPE>|level <SELECT-LEVEL>|url-list <URL-LIST-NAME>] precedence <1-500>

no blockpage [external|internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title]|path]

no description

no whitelist [category-type|url-list]

no whitelist [category-type <SELECT-CATEGORY-TYPE>|url-list <URL-LIST-NAME>] precedence <1-500>

**Parameters**

- no <PARAMETERS>

  Removes this URL filter’s configured parameters based on the values passed here

**Examples**

The following example displays the URL filter ‘test’ settings before the ‘no’ is executed:

```
rfs7000-6DCD4B(config-url-filter-test)#show context
url-filter test
description "Blacklists\ sites\ inappropriate\ for\ children\ and\ are\ security\ risks"
blacklist level medium-high precedence 10
whitelist category-type communication category chat precedence 7
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#
```

```
rfs7000-6DCD4B(config-url-filter-test)#no description
```

```
rfs7000-6DCD4B(config-url-filter-test)#no blacklist category-type adult-content category alcohol-tobacco precedence 1
```

```
rfs7000-6DCD4B(config-url-filter-test)#no whitelist category-type communication category chat precedence 7
```

The following example displays the URL filter ‘test’ settings after the ‘no’ is executed:

```
rfs7000-6DCD4B(config-url-filter-test)#show context
url-filter test
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#
```
4.1.81.2.5 whitelist

**url-filter-config-mode commands**

Creates a whitelist rule. A whitelist is a list of Websites and URLs allowed access by clients.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the category-types and categories to include in the whitelist.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

**Syntax**

```plaintext
whitelist [category-type|url-list]
whitelist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
whitelist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}
```

**Parameters**

- **whitelist category-type**
  - [adult-content|all|business|communication|entertainment|
    file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
    social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}

  Selects the category-type to add to this whitelist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can created with the URL List and added to the database.

  Websites have been classified into the following 12 category types:
  - adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates
  - Select 'all' to whitelist all category-types.

  Some of the category-types are further classified into categories. For example, the 'adult-content' category-type is differentiated into the following categories:
  - alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons.

  The system allows all categories (URLs falling within their limits) within the selected category-type.

- **precedence**
  - <1-500>

  Configures the precedence value for this whitelist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.

- **description**
  - <LINE>

  Optional. Configures a description (not exceeding 80 characters) for this whitelist rule. Enter a description that allows you to identify the purpose of the rule.
whitelist url-list `<URL-LIST-NAME>` precedence `<1-500>` \{description `<LINE>`\}

<table>

Global Configuration Commands

The following table lists the commands that allow you to enter the URL list configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>url-list</td>
<td>Creates a new URL list and enters its configuration mode</td>
<td>page 4-365</td>
</tr>
<tr>
<td>url-list-config-mode commands</td>
<td>Summarizes the URL list configuration mode commands</td>
<td>page 4-366</td>
</tr>
</tbody>
</table>
4.1.82.1 url-list

`url-list` creates a URL list and enters its configuration mode. After creating the URL list, add URL entries to the list.

URL lists are used to pre-fetch content from the listed URLs. URL Lists are used to select highly utilized URLs for smart caching. The selected URLs are monitored and routed according to existing cache content policies. To enable pre-fetching of cached content, use the `smart-cache > pre-fetch-immediate > <URL-LIST-NAME>` command. For more information, see `smart-cache`.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax
`url-list <URL-LIST-NAME>`

Parameters
- `url-list <URL-LIST-NAME>`

Examples
```
nx4500-5CFA2B(config)#url-list URLlist1
nx4500-5CFA2B(config-url-list-URLlist1)#?
  description  Description of the category
  no           Negate a command or set its defaults
  url          Add a URL entry
  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal

<td>page 4-369</td>
</tr>
</tbody>
</table>
4.1.82.2.1 description

url-list-config-mode commands

Configures a description for this URL list. The description should be unique and enable you to identify the type of URLs listed in the URL list.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax
description <LINE>

Parameters
- description <LINE>

<table>
<thead>
<tr>
<th>description &lt;LINE&gt;</th>
<th>Provide a unique description for this URL list (should not exceed 500 characters in length)</th>
</tr>
</thead>
</table>

Examples
nx4500-5CFA2B(config-url-list-test)#description This URL list contains social media URLs

nx4500-5CFA2B(config-url-list-test)#show context
url-list test
description This URL list contains social media URLs

nx4500-5CFA2B(config-url-list-test)#

Related Commands

| no | Removes this URL list's description |
4.1.82.2.2 url

- url-list-config-mode commands

Adds URL entries to this URL list

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax
url <WORD> {depth <1-10>}

Parameters
- url <WORD> {depth <1-10>}

<table>
<thead>
<tr>
<th>url &lt;WORD&gt; {depth &lt;1-10&gt;}</th>
<th>Adds a URL entry</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- &lt;WORD&gt; — Specify the URL to add.</td>
</tr>
<tr>
<td></td>
<td>- depth — Optional. Sets number of levels to be cached. Since Web sites have different parameters to uniquely identify specific content, the same content may be stored on multiple origin servers. Smart caching uses subsets of these parameters to recognize that the content is the same and serves it from cache.</td>
</tr>
<tr>
<td></td>
<td>- &lt;1-10&gt; — Specify the depth from 1 - 10.</td>
</tr>
</tbody>
</table>

Examples
nx4500-5CFA2B(config-url-list-test)#url http://www.facebook.com

```
nx4500-5CFA2B(config-url-list-test)#show context
url-list test
description This URL list contains social communication URLs
```

```
nx4500-5CFA2B(config-url-list-test)#
```
4.1.83 vx9000

Global Configuration Commands

Configures a Virtual WLAN Controller (V-WLC) in a virtual machine (VM) environment. V-WLC can be deployed on a shared, third-party server hardware, thereby reducing overhead costs of procuring and maintaining dedicated appliances. The external, third-party hardware needs to have installed hypervisors, such as VmWare, Xen, VirtualBox, KVM, Amazon EC2 or Hyper-V, enabling it to communicate with V-WLC software.

The V-WLC controls and manages access points and other controllers (at NOC or as a site-controller) in the network. The traffic between the access points and the V-WLC is over the layer-3 MINT protocol.

V-WLC is a licensed feature, and the WiNG software provides the following two new licenses:

- VX – When installed, this license activates VM controller instance, and enables the V-WLC to trigger adoption process allowing access points to adopt to the V-WLC. The adoption capacity of the V-WLC is determined by the number of licenses installed on it.

- VX-DEMO – This is a 60 day trial license. This license also activates VM controller instance, and enables the V-WLC to adopt access points. But, the access point adoption capacity is limited to 16. Having installed this license on a device, the only other license that you can install on it is the VX license. All existing installed licenses will continue to work as before. Since this license has a limited validity period, ensure that the system clock on the license generating tool and the device are in sync. preferably through NTP.

To install the VX or VX-DEMO license on an existing V-WLC instance, use the license command. For more information, see the examples provided in this section.

Supported in the following platforms:

- Service Platforms — NX9000, NX9500, NX9510

Syntax

vx9000 <MAC>

Parameters

- vx9000 <MAC>

vx <MAC> Configures a V-WLC and enters its configuration mode

Note: The V-WLC configuration is the same as that of a normal controller.

Examples

nx9500-6C8809(config)#vx 11-22-33-44-55-66
nx9500-6C8809(config-device-11-22-33-44-55-66)#?

Device Mode commands:

- adopter-auto-provisioning-policy-lookup
- adoption-site
- alias
- area
- arp
- auto-learn-staging-config
- autogen-uniqueid
- autoinstall
- bridge
- captive-portal
- cdp
- channel-list
- cluster
- configuration-persistence

Use centralized auto-provisioning policy when adopted by another controller
Set system's adoption site
Alias
Set name of area where the system is located
Address Resolution Protocol (ARP)
Enable learning network configuration of the devices that come for adoption
Autogenerate a unique id
Autoinstall settings

This chapter describes the CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes.

The PRIV EXEC command set contains commands available within the USER EXEC mode. Some commands can be entered in either mode. Commands entered in either the USER EXEC or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.
5.1 Common Commands

The following table summarizes commands common to the User Exec, Priv Exec, and Global Config modes:

<table>
<thead>

</table>
### 5.1.1 clrscr

> **Common Commands**

Clears the screen and refreshes the prompt, irrespective of the mode

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

clrscr

**Parameters**

None

**Examples**

The terminal window or screen before the clrscr command is executed:

```
rfs4000-229D58#device-upgrade ?
DEVICE-NAME       Name/MAC address of device
all                Upgrade all devices
ap621             Upgrade AP621 Device
ap622             Upgrade AP622 Device
ap650             Upgrade AP650 Device
ap6511            Upgrade AP6511 Device
ap6521            Upgrade AP6521 Device
ap6522            Upgrade AP6522 Device
ap6532            Upgrade AP6532 Device
ap6562            Upgrade AP6562 Device
ap71xx            Upgrade AP71XX Device
ap7502            Upgrade AP7502 Device
ap7522            Upgrade AP7522 Device
ap7532            Upgrade AP7532 Device
ap81xx            Upgrade AP81XX Device
ap82xx            Upgrade AP82XX Device
cancel-upgrade    Cancel upgrading the device
load-image        Load the device images to controller for device-upgrades
rf-domain         Upgrade all devices belonging to an RF Domain
rfs4000           Upgrade RFS4000 Device
```

rfs4000-229D58#

The terminal window or screen after the clrscr command is executed:

```
rfs4000-229D58#
```
### 5.1.2 commit

**Common Commands**

Commits changes made in the active session. Use the commit command to save and invoke settings entered during the current transaction.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

committ {write}{memory}

**Parameters**

- commit {write}{memory}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>write</td>
<td>Optional. Commits changes made in the current session</td>
</tr>
<tr>
<td>memory</td>
<td>Optional. Writes to memory. This option ensures current changes persist across reboots.</td>
</tr>
</tbody>
</table>

**Examples**

rf7000-37FABE#commit write memory

[OK]

rf7000-37FABE#
5.1.3 exit

Common Commands

The exit command works differently in the User Exec, Priv Exec, and Global Config modes. In the Global Config mode, it ends the current mode and moves to the previous mode, which is Priv Exec mode. The prompt changes from (config)# to #. When used in the Priv Exec and User Exec modes, the exit command ends the current session, and connection to the terminal device is terminated. If the current session has changes that have not been committed, the system prompts you to either do a commit or a revert before terminating the session.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
exit

Parameters
None

Examples
rfs7000-37FABE(config)#exit
rfs7000-37FABE#
5.1.4 help

Describes the interactive help system

Use this command to access the advanced help feature. Use “?” anytime at the command prompt to access the help topic.

Two kinds of help are provided:

- Full help is available when ready to enter a command argument
- Partial help is provided when an abbreviated argument is entered and you want to know what arguments match the input (for example ‘show ve?’).

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

help {search}

help {search <WORD>} {detailed|only-show|skip-no|skip-show}

Parameters

- help {search <WORD>} {detailed|only-show|skip-no|skip-show}

<table>
<thead>
<tr>
<th>search &lt;WORD&gt;</th>
<th>Optional. Searches for CLI commands related to a specified target term</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>Specify a target term (for example, a feature or a configuration parameter). After specifying the term, select one of the following options: detailed, only-show, skip-no, or skip-show. The system displays information based on the option selected.</td>
</tr>
<tr>
<td>detailed</td>
<td>Optional. Searches and displays help strings in addition to mode and commands</td>
</tr>
<tr>
<td>only-show</td>
<td>Optional. Displays only “show” commands. Does not display configuration commands</td>
</tr>
<tr>
<td>skip-no</td>
<td>Optional. Displays only configuration commands. Does not display “no” commands</td>
</tr>
<tr>
<td>skip-show</td>
<td>Optional. Displays only configuration commands. Does not display “show” commands</td>
</tr>
</tbody>
</table>

5.1.5 no

Negates a command or sets its default. Though the no command is common to the User Exec, Priv Exec, and Global Config modes, it negates a different set of commands in each mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
no <PARAMETERS>

Parameters
- no <PARAMETERS>

| no <PARAMETERS> | The no command is common across all configuration modes and sub modes. It resets or reverts settings based on the mode in which executed. For example, when executed in the AAA policy configuration mode, it allows you to reset or revert a specific AAA policy settings. Similarly, when executed in the global configuration mode, it only resets or reverts settings configured in the global configuration mode. |

Usage Guidelines
The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples
Global Config mode: No command options
Enter configuration commands, one per line. End with CNTL/Z.

5.1.6 revert

Reverts changes made, in the current session, to their last saved configuration.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

revert

**Parameters**

None

**Examples**

rfs7000-37FABE>revert
rfs7000-37FABE>
5.1.7 service

Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode. The User Exec mode and Priv Exec mode commands provide same functionalities with a few minor changes. The Global Config service command sets the size of history files. It also enables viewing the current mode’s CLI tree.

This section consists of the following sub-sections:

- **Syntax (User Exec Mode)**
- **Syntax (Privilege Exec Mode)**
- **Syntax (Privilege Exec Mode: NX9000, NX9500, and NX9510)**
- **Syntax (Global Config Mode)**

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax (User Exec Mode)**

```
service [block-adopter-config-update|clear|cli-tables-skin|cluster|
delete-offline-aps|force-send-config|force-update-vm-stats|load-balancing|
locator|radio|radius|request-full-config-from-adopter|set|show|smart-rf|ssm|snmp|
syslog|wireless]
```

```
service [block-adopter-config-update|request-full-config-from-adopter]
```

```
service clear [adoption|captive-portal-page-upload|command-history|device-upgrade|

Parameters (User Exec Mode)

**service**

- service [block-adopter-config-update|request-full-config-from-adopter]

| **block-adopter-config-update** | Blocks the configuration updates sent from the NOC server |
| **request-full-config-from-adopter** | Configures a request for full configuration updates from the adopter device |
  |
  | In an **hierarchically managed** (HM) network devices are deployed in two levels. The first level consists of the **Network Operations Center** (NOC) controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (access points and site controllers) are referred to as the adoptee. The devices adopting the adoptee are the 'adopters'. |

- service clear adoption history {on <DEVICE-NAME>}

| clear adoption history | Clears adoption history on this device and its adopted access points |
| on <DEVICE-NAME> | Optional. Clears adoption history on a specified device |
  | <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- service clear device-upgrade history {on <DOMAIN-NAME>}

| clear device-upgrade history | Clears device upgrade history |
| on <DOMAIN-NAME> | Optional. Clears all firmware upgrade history in a specified RF Domain |
  | <DOMAIN-NAME> – Specify the RF Domain name. |

- service clear captive-portal-page-upload history {on <DOMAIN-NAME>}

| clear captive-portal-page-upload history | Clears captive portal page upload history |
| on <DOMAIN-NAME> | Optional. Clears captive portal page upload history on a specified RF Domain |
  | <DOMAIN-NAME> – Specify the RF Domain name. |
- **service clear [command-history|reboot-history|upgrade-history|virtual-machine-history] {on <DEVICE-NAME>}

| clear [command-history|reboot-history|upgrade-history] | Clears command history, reboot history, or device upgrade history |
|--------------------------------------------------------|---------------------------------------------------------------|
| clear virtual-machine-history                          | Clears virtual-machine history on the logged device or a specified device |
| **Note:** This command is applicable only on the NX45XX, NX65XX, NX9500, and NX9510 series service platforms. |
| on <DEVICE-NAME>                                       | Optional. Clears history on a specified device |
| **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform. |
| **Note:** When executing the clear virtual-machine-history command, provide the name of the service platform running the VMs. |

- **service clear noc statistics**

| clear noc statistics | Clears Network Operations Center (NOC) applicable statistics counters |

- **service clear unsanctioned aps {on <DEVICE-OR-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>clear unsanctioned aps</th>
<th>Clears the unsanctioned APs list</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>Optional. Clears the unsanctioned APs list on a specified device or RF Domain</td>
</tr>
<tr>
<td><strong>&lt;DEVICE-OR-DOMAIN-NAME&gt;</strong> – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
<td></td>
</tr>
</tbody>
</table>

- **service clear wireless [ap|client] {<MAC>} {on <DEVICE-OR-DOMAIN-NAME>}

| clear wireless [ap|client] statistics | Clears wireless statistics counters based on the parameters passed |
|---------------------------------------|---------------------------------------------------------------|
| **ap statistics** – Clears applicable AP statistics counters |
| **client statistics** – Clears applicable wireless client statistics counters |
| <MAC> {on <DEVICE-OR-DOMAIN-NAME>} | The following keywords are common to the ‘ap’ and ‘client’ parameters: |
| **<MAC>** – Optional. Clears statistics counters for a specified AP or client. Specify the AP/client MAC address. |
| **on <DEVICE-OR-DOMAIN-NAME>** – Optional. Clears AP/client statistics counters on a specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain. |

- **service clear wireless controller-mobility-database**

| clear wireless controller-mobility-database | Clears the controller assisted mobility database |

- **service clear web-filter cache {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>clear web-filter cache</th>
<th>Clears the cache used for Web filtering</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears the Web filtering cache on a specified device</td>
</tr>
<tr>
<td><strong>&lt;DEVICE-NAME&gt;</strong> – Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>
### Service Clear Wireless Radio Statistics

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear wireless radio statistics</td>
<td>Clears applicable wireless radio statistics counters</td>
</tr>
</tbody>
</table>

#### Optional Parameters

- `<MAC/hostname>`
- `<1-3>`

#### Detailed Description
- **`<MAC/hostname>`**: Optional. Specify the MAC address or hostname of the radio, or append the interface number to form the radio ID in the AA-BB-CC-DD-EE:FF:Rx or HOSTNAME:RX format.
- **`<1-3>`**: Optional. Specify the radio interface index, if not specified as part of the radio ID.

- **on `<DEVICE-OR-DOMAIN-NAME>`**: Optional. This is a recursive parameter, which clears wireless radio statistics on a specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain.

### Service Clear Wireless WLAN Statistics

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear wireless wlan statistics</td>
<td>Clears WLAN statistics counters</td>
</tr>
</tbody>
</table>

#### Optional Parameters

- `<WLAN-NAME>`

#### Detailed Description
- **`<WLAN-NAME>`**: Optional. Clears statistics counters on a specified WLAN. Specify the WLAN name.

- **on `<DEVICE-OR-DOMAIN-NAME>`**: Optional. This is a recursive parameter, which clears WLAN statistics on a specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain.

### Service Clear XPath Requests

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear xpath requests</td>
<td>Clears XPATH related information</td>
</tr>
</tbody>
</table>

#### Optional Parameters

- `<1-100000>`

#### Detailed Description
- **`<1-100000>`**: Optional. Specifies the session number (cookie from show sessions)
- **`<1-100000>`**: Specify the session number from 1 - 100000.

#### Note
- Omits clearing the current session's pending XPATH get requests.

### Service Cli-Tables-Skin

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cli-tables-skin [ansi</td>
<td>hashes</td>
</tr>
</tbody>
</table>

#### Optional Parameters

- **ansi**
- **hashes**
- **minimal**
- **none**
- **percent**
- **stars**
- **thick**
- **thin**
- **utf-8**

#### Detailed Description
- **ansi**: Uses ANSI characters for borders
- **hashes**: Uses hashes (#) for borders
- **minimal**: Uses one horizontal line between title and data rows
- **none**: Displays space separated items with no decoration
- **percent**: Uses the percent sign (%) for borders
- **stars**: Uses asterisks (*) for borders
- **thick**: Uses thick lines for borders
- **thin**: Uses thin lines for borders
- **utf-8**: Uses UTF-8 characters for borders

- **grid**: Optional. Uses a complete grid instead of just title lines

### Service Cluster Force

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service cluster force [active</td>
<td>configured-state</td>
</tr>
</tbody>
</table>

#### Optional Parameters

- **active**
- **configured-state**
- **standby**
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>force</strong></td>
<td>Forces action commands on a cluster (active, configured-state, and standby)</td>
</tr>
<tr>
<td><strong>active</strong></td>
<td>Changes the cluster run status to active</td>
</tr>
<tr>
<td><strong>configured-state</strong></td>
<td>Restores a cluster to the configured state</td>
</tr>
<tr>
<td><strong>standby</strong></td>
<td>Changes the cluster run status to standby</td>
</tr>
<tr>
<td>• <strong>service delete-offline-aps all</strong></td>
<td>Deletes all off-line access points</td>
</tr>
<tr>
<td><strong>delete-offline-aps all</strong></td>
<td>Deletes all off-line access points for a specified interval</td>
</tr>
<tr>
<td>• <strong>service delete-offline-aps offline-for days &lt;0-999&gt; {time &lt;TIME&gt;</strong>}</td>
<td>Deletes off-line access points for a specified number of days</td>
</tr>
<tr>
<td><strong>day &lt;0-999&gt;</strong></td>
<td>Deletes off-line access points for a specified number of days</td>
</tr>
<tr>
<td>• &lt;0-999&gt; – Specify the number of off-line days from 0 - 999.</td>
<td></td>
</tr>
<tr>
<td><strong>time &lt;TIME&gt;</strong></td>
<td>Optional. Deletes off-line access points for a specified time</td>
</tr>
<tr>
<td>• &lt;TIME&gt; – Specify the time in HH:MM:SS format.</td>
<td></td>
</tr>
<tr>
<td>• <strong>service force-send-config {on &lt;DEVICE-OR-DOMAIN-NAME&gt;}</strong></td>
<td>Resends configuration to device(s)</td>
</tr>
<tr>
<td><strong>force-send-config</strong></td>
<td>Resends configuration to device(s)</td>
</tr>
<tr>
<td><strong>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</strong></td>
<td>Optional. Resends configuration to a specified device or all devices in a specified RF Domain</td>
</tr>
<tr>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
<td></td>
</tr>
<tr>
<td>• <strong>service force-update-vm-stats {on &lt;DEVICE-NAME&gt;}</strong></td>
<td>Forcefully pushes VM statistics on to the NOC</td>
</tr>
<tr>
<td><strong>force-update-vm-stats</strong></td>
<td>Forcefully pushes VM statistics on to the NOC</td>
</tr>
<tr>
<td><strong>on &lt;DEVICE-NAME&gt;</strong></td>
<td>Optional. Executes the command on a specified device</td>
</tr>
<tr>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the device.</td>
<td></td>
</tr>
<tr>
<td>• **service load-balancing clear-client-capability [&lt;MAC&gt;</td>
<td>all] {on &lt;DEVICE-NAME&gt;}**</td>
</tr>
<tr>
<td><strong>load-balancing</strong></td>
<td>Enables wireless load balancing by clearing client capability records</td>
</tr>
<tr>
<td>**clear-client-capability [&lt;MAC&gt;</td>
<td>all]**</td>
</tr>
<tr>
<td>• &lt;MAC&gt; – Clears capability records of a specified client. Specify the client’s MAC address in the AA-BB-CC-DD-EE-FF format.</td>
<td></td>
</tr>
<tr>
<td>• all – Clears the capability records of all clients</td>
<td></td>
</tr>
<tr>
<td><strong>on &lt;DEVICE-NAME&gt;</strong></td>
<td>Optional. Clears client capability records on a specified device</td>
</tr>
<tr>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
<tr>
<td>• <strong>service locator {&lt;1-60&gt;} {on &lt;DEVICE-NAME&gt;}}</strong></td>
<td>Enables LEDs</td>
</tr>
<tr>
<td><strong>locator</strong></td>
<td>Enables LEDs</td>
</tr>
<tr>
<td><strong>&lt;1-60&gt;</strong></td>
<td>Sets LED flashing time from 1 - 60 seconds.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| **radio <1-3> dfs simulate-radar [extension|primary]** | Enables Dynamic Frequency Selection (DFS) and simulates the presence of a radar on a channel. Select the channel type from the following options: 
  - **extension** – Simulates a radar on the radio’s current extension channel 
  - **primary** – Simulates a radar on the radio’s current primary channel |
| **radius test [<IP>|<HOSTNAME>] <WORD> <USERNAME> <PASSWORD> {wlan <WLAN-NAME> ssid <SSID>} {(on <DEVICE-NAME>)}** | Tests RADIUS server’s account. This command sends an access-request packet to the RADIUS server. Use this command to confirm time and data/bandwidth parameters for valid wireless clients. 
  - **test** – Tests the RADIUS server’s account with user provided parameters |
| **on <DEVICE-NAME>** | The following keyword is recursive and common to the <1-60> parameter: 
  - **on <DEVICE-NAME>** – Optional. Enables LEDs on a specified device 
  - **<DEVICE-NAME>** – Specify name of the AP, wireless controller, or service platform. |
| **<DEVICE-NAME>** | Optional. This is a recursive parameter also applicable to the WLAN parameter. Performs tests on a specified device 
  - **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform. |
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>set</td>
<td>Sets the validation mode for running configuration validation</td>
</tr>
<tr>

### WiNG 5.7 CLI Reference Guide

**ppoe1**
Optional. Displays DHCP lease information for a PPP over Ethernet interface

**vlan <1-4094>**
Optional. Displays DHCP lease information for a VLAN interface
- `<1-4094>` – Specify a VLAN index from 1 - 4094.

**wwan1**
Optional. Displays DHCP lease information for a Wireless WAN interface

The following keywords are common to all of the above:
- `on <DEVICE-NAME>` – Optional. Displays DHCP lease information for a specified device. If no device is specified, the system displays information for the logged device.
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- **service show diag [led-status|stats] {on <DEVICE-NAME>}

**show**
Displays running system statistics based on the parameters passed

**diag**
Displays diagnostic statistics, such as LED status, fan speed, and sensor temperature

**led-status**
Displays LED state variables and the current state

**stats**
Displays fan speed and sensor temperature statistics

- **service show fast-switching {on <DEVICE-NAME>}

**show**
Displays running system statistics based on the parameters passed

**fast-switching**
Displays fast switching state (enabled or disabled)

- **service show [fib|fib6] {table-id <0-255>}

**show**
Displays running system statistics based on the parameters passed

**fib**
Displays entries in the Forwarding Information Base (FIB)

**fib6**
Displays FIB IPv6 static routing entries
The WiNG software allows the IPv6 FIB to maintain only IPv6 static and interface routes. FIB is collection of routing entries. A route entry consists of IPv6 network (which can also be a host) address, the prefix length for the network (for IPv6 routes this is between 0 - 128), and the next hop’s (gateway) IPv6 address. Since a destination can be reached through multiple next hops, you can configure multiple routes to the same destination with multiple next hops.

- **table-id <0-255>**
  - `<0-255>` – Specify the table ID from 0 - 255.

- **service show hardware-switch mac-address-table

**show**
Displays running system statistics based on the parameters passed
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mint</td>
<td>Displays MiNT protocol details</td>
</tr>
</tbody>
</table>
| adopted-devices on <DEVICE-NAME> | Displays adopted devices status in dpd2  
  - on <DEVICE-NAME> – Optional. Displays MiNT protocol details for a specified device. If no device is specified, the system displays information for the logged device.  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| ports   | Displays MiNT ports used by various services and features |
| pm      | Displays the Process Monitor (PM) controlled process details |
| history on <DEVICE-NAME> | Optional. Displays process change history (the time at which the change was implemented, and the events that triggered the change)  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| rf-domain-manager [diag|info] <MAC/HOSTNAME> on <DEVICE-OR-DOMAIN-NAME> | Displays RF Domain manager information  
  - diag | Displays RF Domain manager related diagnostics statistics  
  - info | The following keyword is common to the ‘diag’ and ‘info’ parameters: Displays RF Domain manager related information  
  - <MAC/HOSTNAME> | Optional. Specify the MAC address or hostname of the RF Domain manager.  
  - <DEVICE-OR-DOMAIN-NAME> | Optional. Displays diagnostics statistics on a specified device or domain  
  - <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain. |
| sites   | Displays NOC sites related information |
### service show virtual-machine-history {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show virtual-machine-history</code></td>
<td>Displays virtual machine history based on the parameters passed</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>on <code>&lt;DEVICE-NAME&gt;</code> – Optional. Displays virtual machine history on a specified device. If no device is specified, the system displays information for the logged device.</td>
</tr>
<tr>
<td><code>&lt;DEVICE-NAME&gt;</code></td>
<td>&lt;DEVICE-NAME&gt; – Specify the name of the service platform.</td>
</tr>
</tbody>
</table>

**Note:** This command is applicable only to the NX45XX, NX65XX, and NX9500, and NX9510 series service platforms. It is also available on the Privilege Executable Mode of these devices.

### service show wireless [aaa-stats|credential-cache|dns-cache|radar-status|vlan-usage] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show wireless</code></td>
<td>Displays running system statistics based on the parameters passed</td>
</tr>
<tr>
<td><code>aaa-stats</code></td>
<td>Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage etc.)</td>
</tr>
<tr>
<td><code>credential-cache</code></td>
<td>Displays clients cached credentials statistics (VLAN, keys etc.)</td>
</tr>
<tr>
<td><code>dns-cache</code></td>
<td>Displays cache of resolved names of servers related to wireless networking</td>
</tr>
<tr>
<td><code>radar-status</code></td>
<td>Displays radar discovery status. This option displays following information:</td>
</tr>
<tr>
<td></td>
<td>• If a radar has been discovered by the AP</td>
</tr>
<tr>
<td></td>
<td>• The time of discovery</td>
</tr>
<tr>
<td><code>vlan-usage</code></td>
<td>Displays VLAN statistics across WLANs</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>The following keywords are common to all of the above:</td>
</tr>
<tr>
<td><code>&lt;DEVICE-NAME&gt;</code></td>
<td>• on <code>&lt;DEVICE-NAME&gt;</code> – Optional. Displays running system statistics on a specified device. If no device is specified, the system displays information for the logged device.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Note:** This command is not supported on the NX45XX, NX65XX, and NX9000 series service platforms.

### service show wireless [config-internal|log-internal|neighbors]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show wireless</code></td>
<td>Displays running system statistics based on the parameters passed</td>
</tr>
<tr>
<td><code>config-internal</code></td>
<td>Displays internal configuration parameters</td>
</tr>
<tr>
<td><code>log-internal</code></td>
<td>Displays recent internal wireless debug logs (info and above severity)</td>
</tr>
<tr>
<td><code>neighbors</code></td>
<td>Displays neighboring device statistics for roaming and flow migration</td>
</tr>
</tbody>
</table>

**Note:** This command is not supported on the NX45XX, NX65XX, and NX9000 series service platforms.
### proc
The following keyword is common to client and meshpoint neighbor parameters:
- **proc** – Displays dataplane proc entries based on the parameter selected

**Note:** These proc entries provide statistics on each wireless client on the WLAN.

**Note:** For the meshpoint parameter, it displays proc entries about neighbors.

### info
This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified wireless client or neighbor

**info**
This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified wireless client or neighbor

### stats
This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified wireless client or neighbor

<table>
<thead>
<tr>
<th>&lt;MAC&gt;</th>
<th>Displays information for a specified wireless client or neighbor</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified wireless client or neighbor.</td>
</tr>
</tbody>
</table>

**• service show wireless radio-internal [radio1|radio2] <LINE>**

**show**
Displays running system statistics based on the parameters passed

**wireless**
Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage etc.)

**radio-internal [radio1|radio2]**
Displays radio internal debug logs. Select the radio from the following options:
- **radio1** – Selects radio 1
- **radio2** – Selects radio 2.

| <LINE> | Specify the radio internal debug command to enable. |

**• service show wireless reference [channels|frame|handshake|mcs-rates|reason-codes|status-codes]**

**show**
Displays running system statistics based on the parameters passed

**wireless**
Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage etc.)

**reference**
Displays look up reference information related to standards, protocols etc.

**channels**
Displays 802.11 channels information

**frame**
Displays 802.11 frame structure

**handshake**
Displays a flow diagram of 802.11 handshakes

**mcs-rates**
Displays MCS rate information

**reason-codes**
Displays 802.11 reason codes (for deauthentication, disassociation etc.)

**status-codes**
Displays 802.11 status codes (for association response etc.)

**• service show wireless stats-client diag {<MAC/HOSTNAME>} {on <DEVICE-OR-DOMAIN-NAME>]**

**show**
Displays running system statistics based on the parameters passed

**wireless**
Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage etc.)

**stats-client**
Displays managed AP statistics

| <MAC/HOSTNAME> | Optional. Specify the MAC address or hostname of the AP. |

---

**proc**

**show**

**wireless**

**stats-client**

| <MAC/HOSTNAME> | Optional. Specify the MAC address or hostname of the AP. |
| **on <DEVICE-OR-DOMAIN-NAME>** | Optional. Displays statistics on a specified AP, or all APs on a specified domain.  
- `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain. |

**service smart-rf clear-config `<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>`**

| **smart-rf** | Enables Smart RF management |
| **clear-config** | Clears WLAN Smart RF configuration on a specified device or on all devices |
| `<MAC>` | Optional. Clears WLAN Smart RF configuration on a device identified by its MAC address. Specify the device’s MAC address in the AA-BB-CC-DD-EE-FF format. |
| `<DEVICE-NAME>` | Optional. Clears WLAN Smart RF configuration on a device identified by its hostname. Specify the device’s hostname. |
| `on <DOMAIN-NAME>` | Optional. Clears WLAN Smart RF configuration on all devices in a specified RF Domain  
- `<DOMAIN-NAME>` – Specify the RF Domain name. |

**service smart-rf [clear-history|clear-interfering-aps|save-config] `on <DOMAIN-NAME>`**

| **smart-rf** | Enables Smart RF management |
| **clear-history** | Clears WLAN Smart RF history on all devices |
| **clear-interfering-aps** | Clears Smart-RF interfering APs |
| **save-config** | Saves the Smart RF configuration on all devices, and also saves the history on the RF Domain Manager |
| `on <DOMAIN-NAME>` | Optional. Clears WLAN Smart RF configuration on all devices in a specified RF Domain  
- `<DOMAIN-NAME>` – Specify the RF Domain name. |

**service snmp sysoid wing5**

| **snmp sysoid wing5** | Configures a new sysObjectID (sysoid), in the MIB, for devices running WiNG 5.X devices  
When configured, the SNMP manager returns sysoid for WiNG 5.X OS. Hardwares running the WiNG 4.X and WiNG 5.X images have different sysoids. For example, the sysoid for a RFS4000 using the WiNG 4.X image differs from another RFS4000 running the WiNG 5.X image.  
This command is applicable only to RFS4000, RFS6000, and RFS7000 platforms, since they have the same sysoid supported in WiNG 4.X and WiNG 5.X.  
The WiNG 4.X sysoids are:  
- RFS4000 – 1.3.6.1.4.1.388.18  
- RFS6000 – 1.3.6.1.4.1.388.16  
- RFS7000 – 1.3.6.1.4.1.388.15  
The WiNG 5.X sysoids are:  
- RFS4000 – 1.3.6.1.4.1.388.50.1.1.35  
- RFS6000 – 1.3.6.1.4.1.388.50.1.1.36  
- RFS7000 – 1.3.6.1.4.1.388.50.1.1.37 |
- **service ssm dump-core-snapshot**

  ssm dump-core-snapshot | Triggers a debug core dump of the SSM module

- **service syslog test** `{level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings]} {on <DEVICE-NAME>}`

  syslog test | Sends a test message to the syslog server to confirm server availability

  level | Optional. Sets the logging level. In case syslog server is unreachable, an event is logged based on the logging level defined. This is an optional parameter, and the system configures default settings, if no logging severity level is specified.

  - <0-7> – Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows:
    - alerts – Optional. Immediate action needed (severity=1)
    - critical – Optional. Critical conditions (severity=2)
    - debugging – Optional. Debugging messages (severity=7)
    - emergencies – Optional. System is unusable (severity=0)
    - errors – Optional. Error conditions (severity=3)
    - informational – Optional. Informational messages (severity=6)
    - notifications – Optional. Normal but significant conditions (severity=5)
    - warnings – Optional. Warning conditions (severity=4). This is the default setting.

  on <DEVICE-NAME> | Optional. Executes the command on a specified device

  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- **service ssm trace pattern <WORD>** `{on <DEVICE-NAME>}`

  ssm trace | Displays the SSM module trace based on parameters passed

  pattern <WORD> | Configures the pattern to match

  - <WORD> – Specify the pattern to match.

  on <DEVICE-NAME> | Optional. Displays the SSM module trace on a specified device

  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- **service wireless client beacon-request <MAC> mode [active|passive|table] ssid [SSID|any] channel-report [CHANNEL-LIST|none] {on <DEVICE-NAME>}`

  wireless client beacon-requests | Sends beacon measurement requests to a wireless client

  <MAC> | Specify the wireless client’s MAC address.

  mode [active|passive|table] | Specifies the beacon measurement mode. The following modes are available:

  - active – Requests beacon measurements in the active mode
  - Passive – Requests beacon measurements in the passive mode
  - Table – Requests beacon measurements in the table mode

  ssid [SSID|any] | Specifies if the measurements have to be made for a specified SSID or for any SSID

  - <SSID> – Requests beacon measurement for a specified SSID
  - any – Requests beacon measurement for any SSID
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>channel-report</code></td>
<td>Configures channel report in the request. The request can include a list of channels or can apply to all channels.</td>
</tr>
<tr>
<td><code>-&lt;CHANNEL-LIST&gt;</code></td>
<td>Request includes a list of channels. The client has to send beacon measurements only for those channels included in the request.</td>
</tr>
<tr>
<td><code>none</code></td>
<td>Request applies to all channels.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>Optional. Sends requests on a specified device.</td>
</tr>
<tr>
<td><code>quiet-element</code></td>
<td>Enables/disables the quite-element information in beacons sent to wireless clients.</td>
</tr>
<tr>
<td><code>start</code></td>
<td>Enables the quite-element information in beacons sent to wireless clients. This is the interval for which all wireless clients are to remain quiet.</td>
</tr>
<tr>
<td><code>stop</code></td>
<td>Disables the quite-element information in beacons sent to wireless clients. Once disabled, this information is no longer included in beacons.</td>
</tr>
<tr>
<td>`service wireless client quiet-element [start</td>
<td>stop]`</td>
</tr>
<tr>
<td><code>trigger-bss-transition</code></td>
<td>Sends a 80211v-Wireless Network Management BSS transition request to a client.</td>
</tr>
<tr>
<td><code>mac &lt;MAC&gt;</code></td>
<td>Specifies the wireless client's MAC address.</td>
</tr>
<tr>
<td><code>timeout &lt;0-65535&gt;</code></td>
<td>Specifies the time remaining, for this client, before BSS transition is initiated. In other words on completion of the specified time period, BSS transition is triggered.</td>
</tr>
<tr>
<td><code>&lt;0-65535&gt;</code></td>
<td>Specify a time from 0 - 65535 seconds.</td>
</tr>
<tr>
<td><code>url &lt;URL&gt;</code></td>
<td>Optional. Specifies session termination URL.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</code></td>
<td>Optional. Sends request on a specified device.</td>
</tr>
<tr>
<td><code>trigger-wnm</code></td>
<td>Sends a WNM notification (action frame) to a wireless client.</td>
</tr>
<tr>
<td><code>mac &lt;MAC&gt;</code></td>
<td>Specifies the wireless client's MAC address.</td>
</tr>
<tr>
<td>`type [deauth-imminent</td>
<td>subscription-remediation]`</td>
</tr>
<tr>
<td><code>uri &lt;WORD&gt;</code></td>
<td>Optional. Specifies the unique resource identifier (URI).</td>
</tr>
<tr>
<td><code>&lt;CHANNEL-LIST&gt;</code></td>
<td>Request includes a list of channels. The client has to send beacon measurements only for those channels included in the request.</td>
</tr>
<tr>
<td><code>none</code></td>
<td>Request applies to all channels.</td>
</tr>
<tr>
<td><code>service wireless client trigger-bss-transition mac &lt;MAC&gt; {timeout &lt;0-65535}} {url &lt;URL}&gt; {on &lt;DEVICE-OR-DOMAIN-NAME&gt;}</code></td>
<td></td>
</tr>
<tr>
<td>`service wireless client trigger-wnm mac &lt;MAC&gt; type [deauth-imminent</td>
<td>subscription-remediation] {uri &lt;WORD&gt;}`</td>
</tr>
</tbody>
</table>
- **service wireless dump-core-snapshot**

  Triggers a debug core dump of the wireless module

- **service wireless meshpoint zl <MESHPOINT-NAME> [on <DEVICE-NAME>] {<ARGS>} timeout <1-65535>**

  Triggers a zonal level debug of a specified meshpoint’s modules

  - **<MESHPOINT-NAME>** Specify the meshpoint name
  - **on <DEVICE-NAME>** Triggers zonal level debug of a specified meshpoint’s modules on a specified device
    - **<DEVICE-NAME>** – Specify the name of the device (AP, wireless controller, or service platform)
  - **<ARGS>** Optional. Specifies the zonal arguments. These zonal arguments represent the meshpoint modules identified by the zonal and subzonal arguments passed here. Also specify the debug level from 0 - 7. Please see the Examples section, at the end of this topic, for more information.
  - **timeout <1-65535>** Optional. Specifies a timeout value from 1 - 65535 seconds. When specified, meshpoint logs are debugged for the time specified here.

- **service wireless qos delete-tspec <MAC> tid <0-7>**

  Sends a delete TSPEC request to a wireless client

  - **<MAC>** Specify the MAC address of the wireless client.
  - **tid <0-7>** Deletes the Traffic Identifier (TID)
    - **<0-7>** – Select the TID from 0 - 7.

- **service wireless trace pattern <WORD> {on <DEVICE-NAME>}**

  Displays the wireless module trace based on parameters passed

  - **pattern <WORD>** Configures the pattern to match
    - **<WORD>** – Specify the pattern to match.
  - **on <DEVICE-NAME>** Optional. Displays the wireless module trace on a specified device
    - **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

- **service wireless unsanctioned ap air-terminate <MAC> {on <DOMAIN-NAME>}**

  Enables unsanctioned access points termination

  - **<MAC>** Configures the unsanctioned access points’ BSSID (MAC address)
  - **on <DOMAIN-NAME>** Optional. Specifies the RD Domain of the access point
    - **<DOMAIN-NAME>** – Specify the name of the RF Domain.
• service wireless wips clear-client-blacklist [all|mac <MAC>]

<table>

</tr>
</tbody>
</table>

Syntax (Privilege Exec Mode)

NOTE: The “service” command of the Priv Exec Mode is the same as the service command in the User Exec Mode. There are a few modifications that have been documented in this section. For the syntax and parameters of the other commands refer to the (User Exec Mode) syntax and (User Exec Mode) parameters sections of this chapter.

service

service [block-adopter-config-updates|clear|cli-tables-skin|cluster|copy|

<table>
<thead>
<tr>
<th>delete sessions</th>
<th>Deletes session cookies</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;SESSION-COOKIES&gt;</td>
<td>&lt;SESSION-COOKIES&gt; – Provide a list of cookies to delete.</td>
</tr>
</tbody>
</table>
### Service mint

```
```

**mint** Enables MiNT protocol management (clears LSP database, enables debug logging, enables running silence etc.)

| clear [lsp-dp|mlcp] | Clears LSP database and MiNT Link Control Protocol (MLCP) links |
|---------------------|------------------------------------------------------------------|
| lsp-dp – Clears MiNT Label Switched Path (LSP) database          |
| mlcp – Clears MLCP links                                       |

| debug-log [flash-and-syslog|flash-only] | Enables debug message logging |
|------------------------------------------|-------------------------------|
| flash-and-syslog – Logs debug messages to the flash and syslog files |
| flash-only – Logs debug messages to the flash file only |

| expire [lsp|spf] | Forces expiration of LSP and recalculation of Shortest Path First (SPF) |
|-----------------|------------------------------------------------------------------------|
| lsp – Forces expiration of LSP |
| spf – Forces recalculation of SPF |

| flood [csnp|lsp] | Floods control packets |
|-----------------|------------------------|
| csnp – Floods our Complete Sequence Number Packets (CSNP) |
| lsp – Floods our LSP |

### Service pm stop

```
  service pm stop {on <DEVICE-NAME>}
```

**pm** Stops the Process Monitor (PM)

**stop** Stop the PM from monitoring all daemons

**on <DEVICE-NAME>** Optional. Stops the PM on a specified device

- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

### Service pktcap on

```
  service pktcap on {bridge|deny|drop|ext-vlan|rim|router|vpn|wireless}\
  [(acl-name <ACL>, count <1-1000000>, direction [any|inbound|outbound], filter, hex, rate <1-100>, snap <1-2048>, tcpdump, verbose, write [file|url|tzsp <IP/TZSP-HOSTNAME>])]
```

**pktcap on** Captures data packets crossing at a specified location

- `<DEVICE-NAME>` – Defines the packet capture location

<table>
<thead>
<tr>
<th>bridge</th>
<th>Captures packets transiting through the Ethernet bridge</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Captures packets denied by an Access Control List (ACL)</td>
</tr>
<tr>
<td>drop</td>
<td>Captures packets at the drop locations</td>
</tr>
<tr>
<td>ext-vlan</td>
<td>Captures packets forwarded to or from an extended VLAN</td>
</tr>
<tr>
<td>rim</td>
<td>Captures packets at the Radio Interface Module (RIM)</td>
</tr>
<tr>
<td>router</td>
<td>Captures packets transiting through an IP router</td>
</tr>
<tr>
<td>vpn</td>
<td>Captures packets forwarded to or from a VPN link</td>
</tr>
<tr>
<td>wireless</td>
<td>Captures packets forwarded to or from a wireless device</td>
</tr>
<tr>
<td>acl-name &lt;ACL&gt;</td>
<td>Optional. Specify the ACL that matches the acl-name for the 'deny' location</td>
</tr>
<tr>
<td>count &lt;1-1000000&gt;</td>
<td>Optional. Limits the captured packet count. Specify a value from 1 - 1000000.</td>
</tr>
<tr>
<td>direction</td>
<td>Optional. Changes the packet direction with respect to a device. The direction can be set as any, inbound, or outbound.</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>filter</td>
<td>Optional. Filters packets based on the option selected (must be used as a last option)</td>
</tr>
<tr>
<td>[any</td>
<td>inbound</td>
</tr>
<tr>
<td>[&lt;LINE&gt;</td>
<td>arp</td>
</tr>
<tr>
<td></td>
<td>• arp – Matches ARP packets</td>
</tr>
<tr>
<td></td>
<td>• capwap – Matches CAPWAP packets</td>
</tr>
<tr>
<td></td>
<td>• cdp – Matches CDP packets</td>
</tr>
<tr>
<td></td>
<td>• dot11 – Matches 802.11 packets</td>
</tr>
<tr>
<td></td>
<td>• dropreason – Matches packet drop reason</td>
</tr>
<tr>
<td></td>
<td>• dst – Matches IP destination</td>
</tr>
<tr>
<td></td>
<td>• ether – Matches Ethernet packets</td>
</tr>
<tr>
<td></td>
<td>• failed – Matches failed 802.11 transmitted frames</td>
</tr>
<tr>
<td></td>
<td>• host – Matches host destination</td>
</tr>
<tr>
<td></td>
<td>• icmp – Matches ICMP packets</td>
</tr>
<tr>
<td></td>
<td>• icmp6 – Matches ICMPv6 frames</td>
</tr>
<tr>
<td></td>
<td>• igmp – Matches IGMP packets</td>
</tr>
<tr>
<td></td>
<td>• ip – Matches IPV4 packets</td>
</tr>
<tr>
<td></td>
<td>• ipv6 – Matches IPV6 packets</td>
</tr>
<tr>
<td></td>
<td>• l2 – Matches L2 header</td>
</tr>
<tr>
<td></td>
<td>• l3 – Matches L3 header</td>
</tr>
<tr>
<td></td>

```

**pdcp on**  
Captures data packets at a specified interface  
• on – Specify the capture location.

**interface**  
Captures packets at a specified interface. The options are:  
• <INTERFACE> – Specify the interface name.  
• ge <1-4> – Selects a GigabitEthernet interface index from 1 - 4  
• me1 – Selects the FastEthernet interface  
• port-channel <1-2> – Selects a port-channel interface index from 1- 2  
• vlan <1-4094> – Selects a VLAN ID from 1 - 4094

**acl-name <ACL>**  
Optional. Specify the ACL that matches the ACL name for the 'deny' location

**count <1-1000000>**  
Optional. Sets a specified number of packets to capture  
• <1-1000000> – Specify a value from 1 - 1000000.

**direction**  
Optional. Changes the packet direction with respect to a device. The direction can be set as any, inbound, or outbound.

**filter <LINE>**  
Optional. Filters packets based on the option selected (must be used as a last option)  
• <LINE> – Define a packet capture filter or select any one of the available options.

**hex**  
Optional. Provides binary output of the captured packets

**rate <1-100>**  
Optional. Specifies the packet capture rate  
• <1-100> – Specify a value from 1 - 100 seconds.

**snap <1-2048>**  
Optional. Captures the data length  
• <1-2048> – Specify a value from 1 - 2048 characters.

**tcpdump**  
Optional. Decodes the TCP dump
### service show

  - Sends an abort signal to a process, and forces it to dump to core
  - **<PROCESS-NAME>** – Specify the process name.

- **kill**
  - Sends a kill signal to a process, and forces it to terminate without a core
  - **<PROCESS-NAME>** – Specify the process name.
Syntax (Privilege Exec Mode: NX9000, NX9500, and NX9510)

```
service
```

The following service commands are specific to the NX9000, NX9500, and NX9510 series service platforms:

```
service analytics [clear-data|get-last-detailed-status|migrate|nfsserver|primary|
   restart|secondary|start-detailed-status|status]
```

```
service analytics [clear-data|get-last-detailed-status|migrate|restart|
    start-detailed-status|status]
```

```
service analytics nfsserver [<IP>|<HOST-NAME>]
```

```
service analytics primary [<IP>|<HOST-NAME>]
```

```
service analytics secondary [<IP>|<HOST-NAME>]
```

```
service copy [<URL]|analytics-support|mac-user-db|tech-support]
```

```
service copy <URL>
```

```
service copy analytics-support [<FILE>|<URL>]
```

```
service copy mac-user-db <URL>
```

Parameters (Privilege Exec Mode: NX9000, NX9500, and NX9510)

```
service
```

- service analytics [clear-data|get-last-detailed-status|migrate|restart|start|start-
  detailed-status|status]

<table>

<tr>
<td>service copy mac-user-db</td>
<td>Exports MAC user database file (in the <em>comma-separated values</em> (CSV) format) to a specified location.</td>
</tr>
<tr>
<td>&lt;URL&gt;</td>
<td>Use one of the following options to specify the file to copy and the location. Both IPv4 and IPv6 formats are supported.</td>
</tr>
</tbody>
</table>
Usage Guidelines
The NX9500 and NX9510 model service platforms (NOC) provide granular and robust analytic reporting for a RFS4000, RFS6000, RFS7000, NX45XX, or NX65XX device managed network. The data analyzed is collected at intervals specified by the administrator.

To enable data analytics, procure and apply a separate hot spare analytics license at the NOC. The license restricts the number of access point streams processed at the NOC or forwarded to partner systems for further processing. The analytics feature can be turned on at select APs by enabling them in configuration. This way the customer can enable analytics on a select set of APs and not the entire system as long as the number of APs on which it is enabled is less than or equal to the total number of AP analytics licenses available at the NOC controller.

In an NOC managed network, the analytics engine parses and processes Smart RF events as they are received. The analytics engine parses the new channel and power information from the Smart RF event, as opposed to retrieving the event from the devices themselves.

Syntax (Global Config Mode)

```
service
```

```
service [set|show cli]
```

```
set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100]|virtual-machine-history <10-200] {on <DEVICE-NAME>}
```

```
show cli
```

Parameters (Global Config Mode)

- `service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100]|virtual-machine-history <10-200] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>set</th>
<th>Sets the size of history files</th>
</tr>
</thead>
<tbody>
<tr>
<td>command-history &lt;10-300&gt;</td>
<td>Sets the size of the command history file</td>
</tr>
<tr>
<td>upgrade-history &lt;10-100&gt;</td>
<td>Sets the size of the upgrade history file</td>
</tr>
<tr>
<td>reboot-history &lt;10-100&gt;</td>
<td>Sets the size of the reboot history file</td>
</tr>
<tr>
<td>virtual-machine-history &lt;10-200&gt;</td>
<td>Sets the size of the virtual-machine history file</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Sets the size of history files on a specified device</td>
</tr>
</tbody>
</table>

- `cli` - Displays the CLI tree of the current mode

Note: This command is applicable only to the NX45XX, NX65XX, NX9500, and NX9510 series service platforms. Use the `no > service > set > virtual-machine-history > {on <DEVICE-NAME>}` to revert the history file size to 100.

ROOT1-ap81xx-71174C#
```

In the preceding example,
- The meshpoint name is mesh_root
- The device on which the command is executed is ROOT1-ap81xx-71174C
- The vertical ZONE column represents meshpoint modules. For example, 3-ND presents the Neighbor Discovery module.
- The SUBZONE 0 to 7 represents the available processes for each of the zonal modules.
- Debugging is disabled for all modules for the mesh-root meshpoint. A value of 0 (Zero) represents debugging disabled.
To enable meshpoint module debugging, specify the module number and the process number separated by a period (.). And then specify the debugging level from 0 - 7.

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 3.2 7
```

In the preceding command,

- The meshpoint module number provided is 3 (ND)
- The process number provided is 2 (RX - Received signals from neighbors)
- The debugging level provided is 7 (highest level - warning)

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C
<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

In the preceding example, level 7 debugging has been enabled only for the ND module's received signals. Note that debugging for all other modules and processes are still disabled.

To disable debugging for all modules, specify 0 (zero) in the command. For example:

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 0
```

To enable debugging for all modules, specify the debugging level number. For example:

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 5
```

ROOT1-ap81xx-71174C#
5.1.8 show

Displays specified system component settings. There are a number of ways to invoke the show command:

- When invoked without any arguments, it displays information about the current context. If the current context contains instances, the show command (usually) displays a list of these instances.
- When invoked with the display parameter, it displays information about that component.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
show <PARAMETERS>
```

Parameters

- show <PARAMETERS>

| show <PARAMETERS> | The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy's current settings. The example below shows the configuration details that can be viewed in the Priv Executable mode. |

Examples

```
rfs7000-37FABE#show ?
adoption  Display information related to adoption to wireless controller
bonjour   Bonjour Gateway related commands
boot      Display boot configuration.
captive-portal  Captive portal commands
classify-url Query the category of an URL
clock     Display system clock
cdp       Cisco Discovery Protocol
classifier-url Query the category of an URL
classifier
cluster   Cluster Protocol
cmap-factory-certs Display the CMP certificate status
commands  Display command lists
context   Information about current context
critical-resources Critical Resources
crypto    Encryption related commands
debug    Debugging functions
debugging Debugging functions
device-upgrade Device Upgrade
dot1x     802.1X
dot1x

**NOTE:** For more information on the show command, see Chapter 6, *SHOW COMMANDS.*
5.1.9 write

Common Commands

Writes the system running configuration to memory or terminal

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

write [memory|terminal]

Parameters

- write [memory|terminal]

<table>
<thead>
<tr>
<th>memory</th>
<th>Writes to the non-volatile (NV) memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>terminal</td>
<td>Writes to the terminal</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE>write memory
[OK]
rfs7000-37FABE>
Show commands display configuration settings or statistical information. Use this command to view the current running configuration as well as the start-up configuration. The show command also displays the current context’s configuration.

This chapter describes the ‘show’ CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes. Commands entered in either USER EXEC mode or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.

This chapter also describes the ‘show’ commands in the ‘GLOBAL CONFIG’ mode. The commands can be entered in all three modes, except commands like file, IP access list statistics, MAC access list statistics, and upgrade statistics, which cannot be entered in the USER EXEC mode.
## 6.1 show commands

The following table summarizes show commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>show</td>
<td>Displays settings for the specified system component</td>
<td>page 6-5</td>
</tr>
<tr>
<td>adoption</td>
<td>Displays information related to adoption</td>
<td>page 6-11</td>
</tr>
<tr>
<td>boot</td>
<td>Displays a device boot configuration</td>
<td>page 6-15</td>
</tr>
<tr>
<td>bonjour</td>
<td>Displays the configured Bonjour services available on local and remote sites</td>
<td>page 6-16</td>
</tr>
<tr>
<td>captive-portal</td>
<td>Displays WLAN hotspot functions</td>
<td>page 6-17</td>
</tr>
<tr>
<td>captive-portal-page-upload</td>
<td>Displays captive portal page related information</td>
<td>page 6-19</td>
</tr>
<tr>
<td>cdp</td>
<td>Displays a <em>Cisco Discovery Protocol</em> (CDP) neighbor table</td>
<td>page 6-20</td>
</tr>
<tr>
<td>classify-url</td>
<td>Queries a specified global data center or a pre-configured classification server for the category of a specified URL.</td>
<td>page 6-22</td>
</tr>
<tr>
<td>clock</td>
<td>Displays the software system clock</td>
<td>page 6-23</td>
</tr>
<tr>
<td>cluster</td>
<td>Displays cluster commands</td>
<td>page 6-24</td>
</tr>
<tr>
<td>cmp-factory-certs</td>
<td>Displays factory installed CMP certificates</td>
<td>page 6-25</td>
</tr>
<tr>
<td>commands</td>
<td>Displays command list</td>
<td>page 6-26</td>
</tr>
<tr>
<td>context</td>
<td>Displays information about the current context</td>
<td>page 6-27</td>
</tr>
<tr>
<td>critical-resources</td>
<td>Displays critical resource information</td>
<td>page 6-28</td>
</tr>
<tr>
<td>crypto</td>
<td>Displays encryption mode information</td>
<td>page 6-29</td>
</tr>
<tr>
<td>device-upgrade</td>
<td>Displays device firmware upgradation information for devices adopted by a wireless controller or access point</td>
<td>page 6-32</td>
</tr>
<tr>
<td>dot1x</td>
<td>Displays dot1x information on interfaces</td>
<td>page 6-35</td>
</tr>
<tr>
<td>environmental-sensor</td>
<td>Displays environmental sensor's historical data (applicable only to APB132)</td>
<td>page 6-37</td>
</tr>
<tr>
<td>event-history</td>
<td>Displays event history</td>
<td>page 6-41</td>
</tr>
<tr>
<td>event-system-policy</td>
<td>Displays event system policy configuration information</td>
<td>page 6-42</td>
</tr>
<tr>
<td>file</td>
<td>Displays file system information</td>
<td>page 6-43</td>
</tr>
<tr>
<td>firewall</td>
<td>Displays wireless firewall information</td>
<td>page 6-44</td>
</tr>
<tr>
<td>global</td>
<td>Displays global information for network devices based on the parameters passed</td>
<td>page 6-48</td>
</tr>
<tr>
<td>gre</td>
<td>Displays GRE tunnel related information</td>
<td>page 6-50</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>interface</td>
<td>Displays interface status</td>
<td>page 6-51</td>
</tr>
<tr>
<td>ip</td>
<td>Displays IP related information</td>
<td>page 6-55</td>
</tr>
<tr>
<td>ip-access-list</td>
<td>Displays IP access list statistics</td>
<td>page 6-63</td>
</tr>
<tr>
<td>ipv6</td>
<td>Displays IPv6 related information</td>
<td>page 6-65</td>
</tr>
<tr>
<td>ipv6-access-list</td>
<td>Displays IPv6 access list statistics</td>
<td>page 6-69</td>
</tr>
<tr>
<td>l2tpv3</td>
<td>Displays Layer 2 Tunnel Protocol Version 3 (L2TPV3) information</td>
<td>page 6-70</td>
</tr>
<tr>
<td>ldap-agent</td>
<td>Displays an LDAP agent’s join status (join status to a LDAP server domain)</td>
<td>page 6-73</td>
</tr>
<tr>
<td>licenses</td>
<td>Displays installed licenses and usage information</td>
<td>page 6-74</td>
</tr>
<tr>
<td>lldp</td>
<td>Displays Link Layer Discovery Protocol (LLDP) information</td>
<td>page 6-77</td>
</tr>
<tr>
<td>logging</td>
<td>Displays logging information</td>
<td>page 6-78</td>
</tr>
<tr>
<td>mac-access-list</td>
<td>Displays MAC access list statistics</td>
<td>page 6-79</td>
</tr>
<tr>
<td>mac-address-table</td>
<td>Displays MAC address table entries</td>
<td>page 6-80</td>
</tr>
<tr>
<td>mac-auth</td>
<td>Displays details of wired ports that have MAC address-based authentication enabled</td>
<td>page 6-81</td>
</tr>
<tr>
<td>mint</td>
<td>Displays MiNT protocol configuration commands</td>
<td>page 6-83</td>
</tr>
<tr>
<td>ntp</td>
<td>Displays Network Time Protocol (NTP) information</td>
<td>page 6-86</td>
</tr>
<tr>
<td>password-encryption</td>
<td>Displays password encryption status</td>
<td>page 6-87</td>
</tr>
<tr>
<td>pppoe-client</td>
<td>Displays Point to Point Protocol over Ethernet (PPPoE) client information</td>
<td>page 6-88</td>
</tr>
<tr>
<td>privilege</td>
<td>Displays current privilege level information</td>
<td>page 6-89</td>
</tr>
<tr>
<td>radius</td>
<td>Displays the amount of access time consumed and the access time remaining for all guest users configured on a RADIUS server</td>
<td>page 6-90</td>
</tr>
<tr>
<td>reload</td>
<td>Displays scheduled reload information</td>
<td>page 6-92</td>
</tr>
<tr>
<td>rf-domain-manager</td>
<td>Displays RF Domain manager selection details</td>
<td>page 6-93</td>
</tr>
<tr>
<td>role</td>
<td>Displays role-based firewall information</td>
<td>page 6-94</td>
</tr>
<tr>
<td>route-maps</td>
<td>Display route map statistics</td>
<td>page 6-95</td>
</tr>
<tr>
<td>rtls</td>
<td>Displays Real Time Location Service (RTLS) statistics of access points</td>
<td>page 6-96</td>
</tr>
<tr>
<td>running-config</td>
<td>Displays configuration file contents</td>
<td>page 6-97</td>
</tr>
<tr>
<td>session-changes</td>
<td>Displays configuration changes made in this session</td>
<td>page 6-103</td>
</tr>
<tr>
<td>session-config</td>
<td>Displays a list of currently active open sessions on the device</td>
<td>page 6-104</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>sessions</td>
<td>Displays CLI sessions</td>
<td>page 6-105</td>
</tr>
<tr>
<td>site-config-diff</td>
<td>Displays the difference between site configuration available on NOC and the actual site configuration</td>
<td>page 6-106</td>
</tr>
<tr>
<td>smart-rf</td>
<td>Displays Smart RF management commands</td>
<td>page 6-107</td>
</tr>
<tr>
<td>spanning-tree</td>
<td>Displays spanning tree information</td>
<td>page 6-110</td>
</tr>
<tr>
<td>startup-config</td>
<td>Displays complete startup configuration script on the console</td>
<td>page 6-113</td>
</tr>
<tr>
<td>t5</td>
<td>Displays adopted T5 controller details. This command is applicable only on the RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, and NX9510.</td>
<td>page 6-114</td>
</tr>
<tr>
<td>terminal</td>
<td>Displays terminal configuration parameters</td>
<td>page 6-117</td>
</tr>
<tr>
<td>timezone</td>
<td>Displays timezone information for the system and managed devices</td>
<td>page 6-118</td>
</tr>
<tr>
<td>upgrade-status</td>
<td>Displays image upgrade status</td>
<td>page 6-119</td>
</tr>
<tr>
<td>version</td>
<td>Displays a device's software and hardware version</td>
<td>page 6-121</td>
</tr>
<tr>
<td>vrrp</td>
<td>Displays Virtual Router Redundancy Protocol (VRRP) protocol details</td>
<td>page 6-122</td>
</tr>
<tr>
<td>web-filter</td>
<td>Displays pre-configured, in-built Web filter options available. These options are: category (URL category), category-types, filter-level etc. This command also displays Web filter statistics and status.</td>
<td>page 6-124</td>
</tr>
<tr>
<td>what</td>
<td>Displays details of a specified search phrase</td>
<td>page 6-126</td>
</tr>
<tr>
<td>wireless</td>
<td>Displays wireless configuration parameters</td>
<td>page 6-127</td>
</tr>
<tr>
<td>wwan</td>
<td>Displays the wireless WAN status</td>
<td>page 6-144</td>
</tr>
<tr>
<td>slot</td>
<td>Displays Peripheral Component Interconnect (PCI) express slot statistics</td>
<td>page 6-145</td>
</tr>
<tr>
<td>smart-cache</td>
<td>Displays details on the cached entry for a specific URL or all URLs</td>
<td>page 6-146</td>
</tr>
<tr>
<td>virtual-machine</td>
<td>Displays the virtual-machine (VM) configuration, logs, and statistics (applicable only to the NX45XX and NX65XX service platforms)</td>
<td>page 6-148</td>
</tr>
<tr>
<td>mirroring</td>
<td>Displays the port mirroring sessions (applicable only to the NX4524 and NX6524 service platforms)</td>
<td>page 6-151</td>
</tr>
<tr>
<td>raid</td>
<td>Displays Redundant Array of Independent Disks (RAID) related information, such as array status, consistency check status, and RAID log.</td>
<td>page 6-152</td>
</tr>
</tbody>
</table>
**6.1.1 show**

> **show commands**

The `show` command displays following information:

- A device’s current configuration
- A device’s start-up configuration
- A device’s current context configuration, such as profiles and policies

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show <PARAMETERS>
```

**Parameters**

- `show <PARAMETERS>`

| `show <PARAMETERS>` | The `show` command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy’s current settings. The examples below show the configuration parameters that can be viewed in the User Executable, Priv Executable, and Global Configurable modes. |

**Examples**

The following examples list the `show` commands in the User Exec, Priv Exec, and Global Config modes:

**GLOBAL CONFIG Mode**

```
<DEVICE> (config)# show ?
 adoption                        Display information related to adoption to wireless controller
 bonjour                         Bonjour Gateway related commands
 boot                            Display boot configuration.
 captive-portal                  Captive portal commands
 captive-portal-page-upload      Captive portal advanced page upload
 cdp                             Cisco Discovery Protocol
 classify-url                    Query the category of an URL
 clock                           Display system clock
 cluster                         Cluster Protocol
 cmp-factory-certs               Display the CMP certificate status
 commands                        Show command lists
 context                         Information about current context
 critical-resources              Critical Resources
 crypto                          Encryption related commands
 debug                           Debugging functions
 debugging                       Debugging functions
 device-upgrade                  Device Upgrade
 dotlx                           802.1X
 environmental-sensor            Display Environmental Sensor Module status
 event-history                   Display event history
 event-system-policy             Display event system policy
 file                            Display filesystem information
 firewall                        Wireless Firewall
 global                          Global-level information
 gre                             Displays gre related information
 interface                       Interface Configuration/Statistics commands
```

ip                          Internet Protocol (IP)
ip-access-list              IP ACL
ipv6                        Internet Protocol version 6 (IPv6)
ipv6-access-list            IPv6 ACL
l2tpv3                      L2TPv3 information
ldap-agent                  LDAP Agent Configuration
licenses                    Show installed licenses and usage
ldpd                        Link Layer Discovery Protocol
logging                     Show logging information
mac-access-list             MAC ACL
mac-address-table           Display MAC address table
mac-auth                    MAC authentication
mint                        MiNT protocol
mirroring                   Show mirroring sessions
ntp                         Network time protocol
password-encryption         Password encryption
pppoe-client                PPP Over Ethernet client
privilege                   Show current privilege level
radius                      RADIUS statistics commands
raid                        Show RAID status
reload                      Scheduled reload information
remote-debug                Show details of remote debug sessions
rf-domain-manager           Show RF Domain Manager selection details
role                        Role based firewall
route-maps                  Display Route Map Statistics
rtls                        RTLS Statistics
running-config             Current operating configuration
session-changes             Configuration changes made in this session
session-config              This session configuration
sessions                    Display CLI sessions
site-config-diff            Difference between site configuration on the NOC and actual site configuration
slot                        Expansion slots stats
smart-cache                 Content caching
smart-rf                    Smart-RF Management Commands
spanning-tree               Display spanning tree information
startup-config              Startup configuration
t5                          T5 details
terminal                   Display terminal configuration parameters
timezone                    The timezone
upgrade-status              Display last image upgrade status
version                     Display software & hardware version
virtual-machine             Virtual Machine
vrer                           VRRP protocol
web-filter                  Web filter
what                        Perform global search
wireless                    Wireless commands
wwan                        Display wireless WAN Status

nx9500-6C874D(config)#
6.1.2 adoption

Displays adoption related information, and is common to the User Exec, Priv Exec, and Global Config modes.

In an *hierarchically managed* (HM) network devices are deployed in two levels. The first level consists of the *Network Operations Center* (NOC) controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (access points and second-level controllers) are referred to as the adoptee. The devices adopting the adoptee are the ‘adopters’.

Use this command to confirm if a device is an adoptee or an adopter. This command also allows you to determine the devices adopted by an adopter device.

**NOTE:** A NOC controller’s capacity is equal to or higher than a site controller’s capacity. The following devices can be deployed at NOC and sites:

- **NOC controller** – RFS6000, RFS7000, NX65XX, NX9000, NX9500, or NX9510.
- **Site controller** – NX45XX, NX65XX, RFS7000, RFS6000, or RFS4000.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show adoption [config-errors|controllers|history|info|log|offline|pending|status|timeline]
show adoption offline
show adoption config-errors <DEVICE-NAME>
show adoption log [adoptee|adopter {<MAC>}]{on <DEVICE-NAME>}
show adoption [controllers|history|info|pending|status|timeline] {on <DEVICE-NAME>}
```

**Parameters**

- **show adoption offline**
- **show adoption config-errors <DEVICE-NAME>**
- **show adoption log [adoptee|adopter {<MAC>}]{on <DEVICE-NAME>}
- **show adoption [controllers|history|info|pending|status|timeline] {on <DEVICE-NAME>}

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>adoption</td>
<td>Displays adoption related information. It also displays configuration errors.</td>
</tr>
<tr>
<td>config-errors &lt;DEVICE-NAME&gt;</td>
<td>Displays configuration errors for a specified adopted device</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- **show adoption log [adoptee|adopter {<MAC>}]{on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>adoption</td>
<td>Displays adoption related information. It also displays configuration errors.</td>
</tr>
</tbody>
</table>
```
log [adoptee|adopter {MAC}]
{on <DEVICE-NAME>}

Displays adoption logs, for the specified device. If no device name is specified, the system displays logs for the logged device.

- adoptee – Displays adoption logs for adoptee devices (APs, wireless controllers, and service platforms). To view logs for a specified adoptee, specify the device’s name. If no device name is specified, the system displays logs for the logged device. If the logged device is not an adoptee, the system states that the device is a controller.
  
  For example, 2013-01-19 22:00:13:MLCP_TAG_CLUSTER_MASTER not present and this device is a controller. Ignoring
- on <DEVICE-NAME> – Optional. Displays adoptee status and details for the device identified by the <DEVICE-NAME> keyword

- adopter – Displays adoption logs for adopter devices (APs, wireless controllers, and service platforms). To view logs for a specified adopter, specify the device’s name. If no device name is specified, the system displays logs for the logged device.
  
  - <MAC> – Optional. Filters adopters by the adoptee device’s MAC address.
    
    Specify the adoptee device’s MAC address. The system displays logs for the device that has adopted the device identified by the <MAC> keyword.
  - on <DEVICE-NAME> – Optional. Displays adopter status and details for the device identified by the <DEVICE-NAME> keyword. Specify the adopter device’s name.

Note: A wireless controller or service platform cannot be configured as an adoptee and an adopter simultaneously. In other words, an adopted wireless controller or service platform cannot be configured to adopt another device and vice versa.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>adoption</td>
<td>Displays adoption related information. It also displays configuration errors.</td>
</tr>
<tr>
<td>controllers</td>
<td>Displays information about adopted controllers. This is applicable in a Hierarchically managed network, where site controllers are adopted by the NOC controllers.</td>
</tr>
<tr>
<td>history</td>
<td>Displays adoption history of the logged device and its adopted access points</td>
</tr>
<tr>

nx9500-6C8809(config)#
6.1.3 boot

- show commands

Displays a device’s boot configuration. Use this command to view the primary and secondary image details, such as Build Date, Install Date, and Version. This command also displays the current boot and next boot information.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show boot {on <DEVICE-NAME>}

Parameters

- show boot {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>boot</th>
<th>Displays primary and secondary image boot configuration details (build date, install date, version, and the image used to boot the current session)</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays a specified device's boot configuration</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>

Note: Use the on <DEVICE-NAME> option to view a remote device’s boot configuration.

Examples

rfs4000-229D58(config)#show boot

```
---------------------------------------------------------------------
<table>
<thead>
<tr>
<th>IMAGE</th>
<th>BUILD DATE</th>
<th>INSTALL DATE</th>
<th>VERSION</th>
</tr>
</thead>

Next Boot : Secondary
Software Fallback : Enabled

rfs4000-229D58(config)#
6.1.4 **bonjour**

> **show commands**

Displays the configured Bonjour services available on local and remote sites.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show bonjour services {on <DEVICE-NAME>}
```

**Parameters**

- **show bonjour services {on <DEVICE-NAME>}
  - **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

**Examples**

```
rfs7000-37FABE# show bonjour services on ap7131-11E6C4

---------------------------------------------------------------------------------------

rfs7000-37FABE#
```
### 6.1.5 captive-portal

Displays WLAN captive portal information. Use this command to view a configured captive portal’s client information.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
```

**Parameters**

- **captive-portal sessions**
  - Displays active captive portal client session details
  - `include-ipv6` Optional. Includes IPv6 address (if known) of captive portal clients
  - Note: By default the system only displays IPv4 addresses. The include-ipv6 parameter includes IPv6 address (if known) of each client.
  - `on <DEVICE-OR-DOMAIN-NAME>` Optional. Displays active captive portal session details on a specified device or RF Domain.
    - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.
  - `statistics` Optional. Displays statistical information regarding client sessions
  - `filter` This parameter is recursive and can be used with any of the above parameters to define additional filters.
    - Optional. Defines additional filters. Use one of the following options: captive-portal, ip, ipv6, state, vlan, or wlan.
  - `captive-portal [<CAPTIVE-PORTAL>|not <CAPTIVE-PORTAL>]` Optional. Displays captive portal client and client session information, based on the captive portal name passed
    - `<CAPTIVE-PORTAL>` – Specify the captive portal name. Displays client details for the specified captive portal.
    - `not <CAPTIVE-PORTAL>` – Inverts the match selection. Displays client details for all captive portals other than the specified captive portal.
    - `<IPv4>` – Specify the client’s IPv4 address. Displays information of the client identified by the `<IPv4>` parameter
    - `not <IPv4>` – Inverts the match selection. Displays client details for all clients other than the one identified by the `<IPv4>` parameter.
### Examples

**rfs4000-229D58#show captive-portal sessions**

<table>
<thead>
<tr>
<th>CLIENT</th>
<th>IPv4</th>
<th>CAPTIVE-PORTAL</th>
<th>WLAN/PORT</th>
<th>VLAN</th>
<th>STATE</th>
<th>SESSION</th>
<th>TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>00-26-55-F4-5F-79</td>
<td>192.168.3.99</td>
<td>cappo</td>
<td>rfs4000-229D58:ge2</td>
<td>400</td>
<td>Success</td>
<td>23:58:35</td>
<td></td>
</tr>
</tbody>
</table>

Total number of captive portal sessions displayed: 1

**rfs4000-229D58#**
### 6.1.6 captive-portal-page-upload

Displays captive portal page information, such as upload history, upload status, and page file download status.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

- `show captive-portal-page-upload {history|load-image-status|status}`
- `show captive-portal-page-upload load-image-status`
- `show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}`
- `show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>|<RF-DOMAIN-MANAGER>]}`

**Parameters**
- `show captive-portal-page-upload load-image-status` Displays captive portal advanced page file download status on the logged device.
- `show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}` Displays captive portal page upload history.
  - on `<RF-DOMAIN-NAME>` – Optional. Displays captive portal page upload history within a specified RF Domain. Specify the RF Domain name.
- `show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>|<RF-DOMAIN-MANAGER>]}` Displays captive portal page upload status.
  - on `<RF-DOMAIN-NAME>` – Optional. Displays captive portal page upload status within a specified RF Domain. Specify the RF Domain name.
  - on `<RF-DOMAIN-MANAGER>` – Optional. Displays captive portal page upload status for a specified RF Domain Manager. Specify the RF Domain Manager name.

**Examples**

```
rfs7000-37FABE>show captive-portal-page-upload status
Number of APs currently being uploaded : 0
Number of APs waiting in queue to be uploaded : 0
--------------------------------------------------------------------------------
AP STATE UPLOAD TIME PROGRESS RETRIES LAST UPLOAD ERROR UPLOADED BY
--------------------------------------------------------------------------------
--------------------------------------------------------------------------------
rfs7000-37FABE>
```
```
rfs7000-37FABE>show captive-portal-page-upload history
---------------------------------------------------------------------------------------
AP      RESULT                 TIME  RETRIES        UPLOADED-BY LAST-UPLOAD-ERROR
---------------------------------------------------------------------------------------
No upload history is present
---------------------------------------------------------------------------------------
rfs7000-37FABE>
```
```
rfs7000-37FABE>show captive-portal-page-upload load-image-status
No captive portal advanced page file download is in progress
rfs7000-37FABE>
```
6.1.7 cdp

Displays the Cisco Discovery Protocol (CDP) neighbor table

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show cdp [neighbors|report] {detail {on <DEVICE-NAME>}|on <DEVICE-NAME>}

Parameters

- show cdp [neighbors|report] {detail {on <DEVICE-NAME>}|on <DEVICE-NAME>}

| cdp [neighbors|report] | Displays CDP neighbors table or aggregated CDP neighbors table |
|------------------------|---------------------------------------------------------------|
| detail {on <DEVICE-NAME>} | Optional. Displays detailed CDP neighbors table or aggregated CDP neighbors table |
| on <DEVICE-NAME> | Optional. Displays table details on a specified device |
| <DEVICE-NAME> | Specify the name of the AP, wireless controller, or service platform. |

Examples

The following example shows detailed CDP neighbors table:

```
nx4500-5CFA2B#show cdp neighbors detail
-------------------------
Device ID: rfs4000-880DA7
Entry address(es):
  IP Address: 192.168.13.8
  IP Address: 192.168.0.1
  IP Address: 1.2.3.4
Platform: RFS-4011-11110-US, Capabilities: Router Switch
Interface: up1, Port ID (outgoing port): ge1
Hold Time: 154 sec

advertisement version: 2
Native VLAN: 1
Duplex: full
Version : 5.7.0.0-019D
-------------------------
Device ID: ap5142-587258
Entry address(es):
  IP Address: 192.168.13.24
Platform: AP-5142-66040-WR, Capabilities: Router
Interface: up1, Port ID (outgoing port): ge1
Hold Time: 178 sec

--More--
nx4500-5CFA2B#
```
The following example shows a non-detailed CDP neighbors table:

```
nx4500-5CFA2B#show cdp neighbors
  +-----------------+-----------------+-------------+------------+-----------------+-------+
  | Device ID       | Platform        | Local Interface | Port ID    | Duplex          |
  +-----------------+-----------------+-------------+------------+-----------------+-------+

  | CiscoLab        | cisco WS-C2960S-24PS-L | ge2        | GigabitEthernet1/0/3 | full |
  | nx4500-5CFA8E   | NX-4500-0000-00-WR | ge2        | up1        | full            |
  | L3-Router       | RFS-4010-00010-WR | ge1          | ge2        | full            |
  | nx4500-5CFA2B   | NX-4500-0000-00-WR | ge2          | up1        | full            |
  +-----------------+-----------------+-------------+------------+-----------------+-------+
nx4500-5CFA2B# show cdp neighbors
```
6.1.8 classify-url

Displays a specified URL's category. Use this command to query the category of a specific URL. The query is sent to a configured classification server. This option is available only if a valid URL filter license is available.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]

Parameters
- show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]

<table>
<thead>
<tr>
<th>classify-url</th>
<th>Queries the category of a specified URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;URL-TO-QUERY&gt;</td>
<td>Specify the URL to query. The query is sent to the configured classification server.</td>
</tr>
<tr>
<td>datacenter &lt;URL-TO-QUERY&gt;</td>
<td>The query is sent to a global classification datacenter</td>
</tr>
</tbody>
</table>
- <URL-TO-QUERY> – Specify the URL to query.

Examples
nx4500-5CFA2B# show classify-url www.google.com
  Categories: search-engines-portals,
  Custom Categories:
  nx4500-5CFA2B#

nx4500-5CFA2B# show classify-url www.ndtv.com
  Categories: news,
  Custom Categories: list1,
  nx4500-5CFA2B#
6.1.9 clock

Displays a selected system's clock

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

`show clock {on <DEVICE-NAME>}`

Parameters

- `show clock {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>clock</th>
<th>Displays a system's clock</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays system clock on a specified device</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config)#show clock
2014-01-27 08:55:15 UTC
rfs7000-37FABE(config)#
```
6.1.10 cluster

show commands

Displays cluster information (cluster configuration parameters, members, status etc.)

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show cluster  [configuration|members|status]
show cluster  [configuration|members  {detail}|status]

Parameters

- show cluster  [configuration|members  {detail}|status]

<table>
<thead>
<tr>
<th>cluster</th>
<th>Displays cluster information</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Displays cluster configuration parameters</td>
</tr>
<tr>
<td>members  {detail}</td>
<td>Displays cluster members configured on the logged device</td>
</tr>
<tr>
<td>status</td>
<td>Displays cluster status</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config)#show cluster configuration

Name : TechPubsLan
Configured Mode : Active
Master Priority : 128
Force configured state : Disabled
Force configured state delay : 5 minutes
Handle STP : Disabled
Radius Counter DB Sync Time : 5 minutes

rfs7000-37FABE(config)#

rfs7000-37FABE(config)#show cluster members detail

<table>
<thead>
<tr>
<th>ID</th>
<th>MAC</th>
<th>MODE</th>
<th>AP COUNT</th>
<th>AAP COUNT</th>
<th>AP LICENSE</th>
<th>AAP LICENSE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>19.6D.CD.4B</td>
<td>B4-C7-99-6D-CD-4B</td>
<td>Active</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>5.7.0.0-033B</td>
</tr>
</tbody>
</table>

rfs7000-37FABE(config)#

rfs7000-37FABE(config)#show cluster status

Cluster Runtime Information
Protocol version : 1
Cluster operational state : active
AP license : 0
AAP license : 0
AP count : 0
AAP count : 0
Max AP adoption capacity : 1024
Number of connected member(s) : 0

rfs7000-37FABE(config)#
6.1.11  **cmp-factory-certs**

*show commands*

Displays factory installed CMP certificates

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

show cmp-factory-certs {all}

**Parameters**

- show cmp-factory-certs {all}

| show cmp-factory-certs {all} | Displays factory installed CMP certificates on the logged device. Optionally use the ‘all’ keyword to view certificate details. |

**Examples**

nx9500-6C8809>show cmp-factory-certs
No CMP factory certificate exist
nx9500-6C8809>
### 6.1.12 commands

- **show commands**

Displays commands available for the current mode

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
show commands
```

**Parameters**

None

**Examples**

```plaintext
rfs4000-229D58(config)#show commands
help
help search WORD (|detailed|only-show|skip-show|skip-no)
show commands
show adoption log adoptee(|(on DEVICE-NAME))

--More--
```

```plaintext
nx4500-5CFA2B(config)#
```
### 6.1.13 context

- **show commands**

  Displays the current context details

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show context {include-factory|session-config {include-factory}}
```

**Parameters**

- **show context {include-factory|session-config {include-factory}}**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>include-factory</code></td>
<td>Optional. Includes factory defaults</td>
</tr>
</tbody>
</table>
| `session-config`        | Optional. Displays running system information in the current context
| `{include-factory}`     | `include-factory` – Optional. Includes factory defaults |

**Examples**

```
rfs4000-229D58(config)#show context

! Configuration of RFS4000 version 5.7.0.0-019D

! version 2.3
!
client-identity Android-2-2

--More--
rfs4000-229D58(config)#
```
6.1.14 critical-resources

Displays critical resource information. Critical resources are resources vital to the network.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show critical-resources 

Parameters

- **show critical-resources** 
- **on <DEVICE-NAME>**

<table>
<thead>
<tr>
<th>critical-resources</th>
<th>Displays critical resources information</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays critical resource information on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58(config)#show critical-resources

<table>
<thead>
<tr>
<th>CRITICAL RESOURCE IP</th>
<th>VLAN</th>
<th>PING-MODE</th>
<th>STATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>172.168.1.103</td>
<td>1</td>
<td>arp-icmp</td>
<td>up</td>
</tr>
</tbody>
</table>

rfs4000-229D58(config)#
### 6.1.15 crypto

> **show commands**

Displays encryption mode information

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show crypto [cmp|ike|ipsec|key|pki]
```

```
show crypto cmp request status
```

```
show crypto ike sa {detail|on|peer} {on <DEVICE-NAME>}
```

```
show crypto ike sa {version [1|2]} {peer <IP>} {(on <DEVICE-NAME>)}
```

```
show crypto ipsec sa {detail|on|peer} {on <DEVICE-NAME>}
```

```
show crypto ipsec sa {peer <IP>} {detail} {(on <DEVICE-NAME>)}
```

```
show crypto key rsa {on|public-key-detail} {on <DEVICE-NAME>}
```

```
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all|on} {on <DEVICE-NAME>}
```

**Parameters**

- **crypto cmp request status**
  Displays current status of in-progress certificate management protocol (CMP) requests

  **Note:** For more information, see Chapter 29, CRYPTO-CMP-POLICY.

- **crypto ike sa**
  Displays *Internet Key Exchange* (IKE) *security association* (SA) statistics

  - **detail**
    Displays detailed IKE SA statistics

  - **peer <IP>**
    Optional. Displays IKE SA statistics for a specified peer
    - `<IP>` – Specify the peer’s IP address in the A.B.C.D format

  - **on <DEVICE-NAME>**
    Optional. Displays IKE SA statistics on a specified device
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- **crypto ike sa**
  Displays IKE SA details

  - **version [1|2]**
    Optional. Displays IKE SA version statistics
    - 1 – Displays IKEv1 statistics
    - 2 – Displays IKEv2 statistics
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show crypto ipsec sa</code></td>
<td>Displays IPSec SA statistics. The IPSec encryption authenticates and encrypts each IP packet in a communication session.</td>
</tr>
<tr>
<td><code>{detail}</code></td>
<td>Optional. Displays detailed IPSec SA statistics.</td>
</tr>
<tr>
<td><code>{on &lt;DEVICE-NAME&gt;}</code></td>
<td>The following keyword is recursive and common to the <code>peer ip</code> parameter:</td>
</tr>
<tr>
<td></td>
<td>- on &lt;DEVICE-NAME&gt; – Optional. Displays IPSec SAs on a specified device</td>
</tr>
<tr>
<td></td>
<td>- &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
<tr>
<td><code>crypto ipsec sa {peer &lt;IP&gt;} detail</code></td>

### 6.1.16 device-upgrade

> **show commands**

Displays device firmware upgradation information for devices adopted by a wireless controller or access point

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
show device-upgrade [history|load-image-status|status|versions]

show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status|versions {on <DEVICE-OR-DOMAIN-NAME>}

show device-upgrade status {on [<DOMAIN-NAME>|rf-domain-manager] | summary {on <DOMAIN-NAME>}}
```

**Parameters**

- **show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status|versions {on <DEVICE-OR-DOMAIN-NAME>}]**
  - `device-upgrade` Displays device upgrade information based on the parameters passed
  - `history` Displays device upgrade history
    - `on <DOMAIN-NAME>` — Optional. Displays upgrade history for all devices within a specified RF Domain. Specify the RF Domain name.
  - `load-image-status` Displays firmware image loading status. The output displays the `<DEVICE>` image loading status in percentage.
    - For example:
      ```plaintext
      #show device-upgrade load-image-status
      Download of ap81xx firmware file is 47 percent complete
      ```
  - `versions {on <DEVICE-OR-DOMAIN-NAME>}` Displays firmware image versions
    - `on <DEVICE-OR-DOMAIN-NAME>` — Optional. Displays firmware image versions loaded on specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain.

- **show device-upgrade status {on [<DOMAIN-NAME>|rf-domain-manager] | summary {on <DOMAIN-NAME>}}**
  - `status` Displays in progress device upgrade status
  - `on [<DOMAIN-NAME>|rf-domain-manager]` Optional. Displays in progress upgrade status of all devices within a specified RF Domain, or all devices upgraded by the RF Domain manager. Use this option to view upgrade status of multiple devices.
  - `summary {on <DOMAIN-NAME>}` Displays a summary of in progress upgrade processes. Optionally specify the RF Domain name to view status of upgrades in progress within a specified domain.
Examples

rfs7000-37FABE#
6.1.17 dot1x

- show commands

Displays dot1x information on interfaces

Dot1x (or 802.1x) is an IEEE standard for network authentication. Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

Supported in the following platforms:

- Access Points — AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524

NOTE: Dot.1x supplicant configuration is supported on the following platforms:

- Access Points – AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX4524

NOTE: Dot.1x authenticator configuration is supported on the following platforms:

- Access Points – ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX4524, NX6500, NX6524

Syntax

show dot1x {all|interface|on}
show dot1x {all {on <DEVICE-NAME>}|on <DEVICE-NAME>}
show dot1x {interface [<INTERFACE-NAME]|ge <1-4]|port-channel <1-2>}{on <DEVICE-NAME>}

Parameters

- show dot1x {all {on <DEVICE-NAME>}}|on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>dot1x all {on &lt;DEVICE-NAME&gt;}</th>
<th>Optional. Displays dot1x information for all interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>on &lt;DEVICE-NAME&gt; – Optional. Displays dot1x information for all interfaces on a specified device</td>
</tr>
<tr>
<td></td>
<td>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>dot1x {on &lt;DEVICE-NAME&gt;}</th>
<th>Optional. Displays dot1x information for interfaces on a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;DEVICE-NAME&gt; – Specify the name of AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- show dot1x {interface [<INTERFACE-NAME]|ge <1-4]|port-channel <1-2>}{on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>dot1x interface</th>
<th>Optional. Displays dot1x information for a specified interface or interface type</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;INTERFACE-NAME&gt;</td>
<td>Displays dot1x information for the layer 2 (Ethernet port) interface specified by the &lt;INTERFACE-NAME&gt; parameter</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ge &lt;1-4&gt;</th>
<th>Displays dot1x for a specified GigabitEthernet interface</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;1-4&gt; – Select the interface index from 1 - 4.</td>
</tr>
</tbody>
</table>
port-channel <1-2> Displays dot1x for a specified port channel interface
• <1-2> – Select the interface index from 1 - 2.

on <DEVICE-NAME> The following keywords are common to all of the above parameters:
• on <DEVICE-NAME> – Optional. Displays dot1x interface information on a specified device
• <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

Examples
rfs7000-37FABE(config)#show dot1x all

Port Status = AUTHORIZED
Host Mode = SINGLE
Auth Vlan = None
Guest Vlan = None

rfs7000-37FABE(config)#
show commands

Displays environmental sensor’s recorded data. The environmental sensor has to be enabled and configured in order to collect data related to humidity, light, motion, and temperature.

For more information on enabling and configuring environmental sensor settings, see `environmental-sensor`.

**NOTE:** The environmental sensor is supported only on an AP8132. When executed on any controller (other than an AP8132), the show > environmental-sensor > <parameters> command displays environmental-sensor details for adopted AP8132s (if any).

**Supported in the following platforms:**
- Access Points — AP8132

**Syntax**

`show environmental-sensor [history|humidity|light|motion|summary|temperature|version]`

`show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}`

`show environmental-sensor [humidity|light|motion|summary|temperature|version]`

**Parameters**

- `show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}`

<table>
<thead>
<tr>
<th>environmental-sensor history</th>
<th>Displays environmental sensor history once in every hour, 20 minutes, or 24 hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-hour</td>
<td>Optional. Displays environmental sensor history once in every 1 (one) hour</td>
</tr>
<tr>
<td>20-minute</td>
<td>Optional. Displays environmental sensor history once in every 20 minutes</td>
</tr>
<tr>
<td>24-hour</td>
<td>Optional. Displays environmental sensor history once in every 24 hours</td>
</tr>
</tbody>
</table>

- `show environmental-sensor [humidity|light|motion|summary|temperature|version]`

<table>
<thead>
<tr>
<th>environmental-sensor</th>
<th>Displays environmental sensor’s recorded data, based on the parameters passed. The system displays the specified recorded data.</th>
</tr>
</thead>
<tbody>
<tr>
<td>humidity</td>
<td>Displays the minimum, average, and maximum humidity recorded</td>
</tr>
<tr>
<td>light</td>
<td>Displays the minimum, average, and maximum light recorded</td>
</tr>
<tr>
<td>motion</td>
<td>Displays the minimum, average, and maximum motion recorded:</td>
</tr>
<tr>
<td>temperature</td>
<td>Displays the minimum, average, and maximum temperature recorded</td>
</tr>
<tr>
<td>version</td>
<td>Displays the hardware and firmware versions</td>
</tr>
<tr>
<td>summary</td>
<td>Displays a summary of the data recorded at following intervals:</td>
</tr>
</tbody>
</table>

**Syntax**

`show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}`

**Parameters**

- `show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}`
Examples

<DEVICE-NAME>#
```
**6.1.19 event-history**

- **show commands**

Displays event history report

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show event-history {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

- show event-history {on <DEVICE-OR-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event-history</td>
<td>Displays event history report</td>
</tr>
<tr>
<td>on &lt;DEVICE-OR-</td>
<td>Optional. Displays event history report on a device or RF Domain</td>
</tr>
<tr>
<td>DOMAIN-NAME&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;DEVICE-OR-DOMAIN-</td>
<td>Specify the name of the AP, wireless controller, service platform, or RF</td>
</tr>
<tr>
<td>NAME&gt;</td>
<td>Domain.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-6DCD4B(config)#show event-history

6.1.20 **event-system-policy**

*show commands*

Displays detailed event system policy configuration

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>
```

**Parameters**

- **show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event-system-policy</td>
<td>Displays event system policy configuration</td>
</tr>
<tr>
<td>config</td>
<td>Displays configuration for a specified policy</td>
</tr>
<tr>
<td>detail</td>
<td>Displays detailed configuration for a specified policy</td>
</tr>
<tr>
<td>&lt;EVENT-SYSTEM-POLICY-NAME&gt;</td>
<td>Specify the event system policy name.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config)#show event-system-policy config testpolicy
```

### 6.1.22 firewall

#### show commands

Displays wireless firewall information, such as Dynamic Host Configuration Protocol (DHCP) snoop table entries, denial of service statistics, active session summaries etc.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
show firewall [dhcp|dos|flows|neighbors]
show firewall [dhcp snoop-table|dos stats] {on <DEVICE-NAME>}
show firewall flows {filter|management|on|stats|wireless-client}
show firewall flows {filter} {(dir|dst port |ether|flow-type|icmp|icmpv6|igmp|ip|ipv6|max-idle|min-bytes|min-idle|min-pkts|not|port|src|tcp|udp)}
show firewall flows {management {on <DEVICE-NAME>}}|stats {on <DEVICE-NAME>}}|wireless-client <MAC>{on <DEVICE-NAME>}
show firewall neighbors snoop-table {on <DEVICE-NAME>}
```

#### Parameters

- **dhcp snoop-table**
  - Displays DHCP snooping acts as a firewall between non-trusted hosts and the DHCP server. Snoop table entries contain MAC address, IP address, lease time, binding type, and interface information of non-trusted interfaces.

- **dos stats**
  - Displays Denial of Service (DoS) statistics
  - **Note:** This option is not available in the User Exec mode.

- **on <DEVICE-NAME>**
  - The following keyword is common to the ‘DHCP snoop table’ and ‘DoS stats’ parameters:
    - **on <DEVICE-NAME>** — Optional. Displays snoop table entries, or DoS stats on a specified device
    - **<DEVICE-NAME>** — Specify the name of the AP, wireless controller, or service platform.

```
• show firewall flows {filter} {(dir|dst|ether|flow-type|icmp|icmpv6|igmp|ip|ipv6|max-idle|min-bytes|min-idle|min-pkts|not|port|src|tcp|udp)}
```

- **firewall flows**
  - Notifies a session has been established

- **filter**
  - Optional. Defines additional firewall flow filter parameters
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **dir** [wired-wired|wired-wireless|wireless-wired|wireless-wireless] | Optional. Matches the packet flow direction
  - **wired-wired** – Wired to wired flows
  - **wired-wireless** – Wired to wireless flows
  - **wireless-wired** – Wireless to wired flows
  - **wireless-wireless** – Wireless to wireless flows |
| **dst port** | Optional. Matches the destination port with the specified port
  - **port <1-65535>** – Specifies the destination port number from 1 - 65535 |
| **ether** [dst <MAC>|host <MAC>|src <MAC>|vlan <1-4094>] | Optional. Displays Ethernet filter options
  - **dst <MAC>** – Matches only the destination MAC address
  - **host <MAC>** – Matches flows containing the specified MAC address
  - **src <MAC>** – Matches only the source MAC address
  - **vlan <1-4094>** – Matches the VLAN number of the traffic with the specified value. Specify a value from 1-4094. |
| **flow-type** [bridged|natted|routed|wired|wireless] | Optional. Matches the traffic flow type
  - **bridged** – Bridged flows
  - **natted** – Natted flows
  - **routed** – Routed flows
  - **wired** – Flows belonging to wired hosts
  - **wireless** – Flows containing a mobile unit |
| **icmp** {code|type} | Optional. Matches flows with the specified Internet Control Message Protocol (ICMP) version 4 code and type
  - **code** – Matches flows with the specified ICMPv4 code
  - **type** – Matches flows with the specified ICMPv4 type |
| **icmpv6** {code|type} | Optional. Matches flows with the specified ICMP version 6 code and type
  - **code** – Matches flows with the specified ICMPv6 code
  - **type** – Matches flows with the specified ICMPv6 type |
| **igmp** | Optional. Matches Internet Group Management Protocol (IGMP) flows |
| **ip** [dst <IP>|host <IP>|proto <0-254>|src <IP>] | Optional. Filters firewall flows based on the IPv4 parameters passed
  - **dst <IP>** – Matches destination IP address
  - **host <IP>** – Matches flows containing IPv4 address
  - **proto <0-254>** – Matches the IPv4 protocol number with the specified number
  - **src <IP>** – Matches source IP address |
| **ipv6** [dst <IPv6>|host <IPv6>|proto <0-254>|src <IPv6>] | Optional. Filters firewall flows based on the IPv6 parameters passed
  - **dst <IPv6>** – Matches destination IPv6 address
  - **host <IPv6>** – Matches flows containing IPv6 address
  - **proto <0-254>** – Matches the IPv6 protocol number with the specified number
  - **src <IPv6>** – Matches source IPv6 address |
| **max-idle** | Optional. Filters firewall flows idle for at least the specified duration. Specify a max-idle value from 1 - 4294967295 bytes. |

**Note:** The commands and options are interpreted as commands to filter network flows based on specific criteria. Each command is designed to match network traffic based on various parameters such as flow direction, port numbers, MAC addresses, VLANs, traffic flow types, and protocol parameters like ICMP and IP versions.
show firewall flows {management {on <DEVICE-NAME>}, stats {on <DEVICE-NAME>}, wireless-client <MAC> | on <DEVICE-NAME>}

- min-bytes <1-4294967295>: Optional. Filters firewall flows with at least the specified number of bytes. Specify a min-bytes value from 1 - 4294967295 bytes.

- min-idle <1-4294967295>: Optional. Filters firewall flows idle for at least the specified duration. Specify a min-idle value from 1 - 4294967295 bytes.

- min-pkts <1-4294967295>: Optional. Filters firewall flows with at least the given number of packets. Specify a min-bytes value from 1 - 4294967295 bytes.

- not: Optional. Negates the filter expression selected.

- port <1-65535>: Optional. Matches either the source or destination port. Specify a port from 1 - 65535.

- src <1-65535>: Optional. Matches only the source port with the specified port. Specify a port from 1 - 65535.

- tcp: Optional. Matches TCP flows.

- udp: Optional. Matches UDP flows.

Examples
rfs7000-6DCD4B(config)#show firewall dhcp snoop-table

6.1.23 global

show commands
Displays global information for network devices based on the parameters passed

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
show global [device-list|domain]

show global device-list {filter {offline|online|rf-domain}}
show global device-list {filter {offline|online}}
show global device-list {filter rf-domain [<DOMAIN-NAME>|not <DOMAIN-NAME>]}  

Parameters
- show global device-list {filter {offline|online}}

<table>
<thead>
<tr>
<th>global device-list</th>
<th>Displays global information for all network devices. Use the following keywords to specify additional filters: offline, online, and rf-domain.</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter {offline</td>
<td>online}</td>
</tr>
<tr>
<td>offline – Optional. Displays global information for offline devices only</td>
<td></td>
</tr>
<tr>
<td>online – Optional. Displays global information for online devices only</td>
<td></td>
</tr>
</tbody>
</table>

- show global device-list {filter rf-domain [<DOMAIN-NAME>|not <DOMAIN-NAME>]}  

<table>
<thead>
<tr>
<th>global device-list</th>
<th>Displays global information for all network devices. Use the following keywords to specify additional filters: offline, online, and rf-domain.</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter rf-domain [&lt;DOMAIN-NAME&gt;</td>
<td>not &lt;DOMAIN-NAME&gt;]</td>
</tr>
<tr>
<td>rf-domain – Optional. Displays global information for all devices in a specified RF Domain</td>
<td></td>
</tr>
<tr>
<td>&lt;DOMAIN-NAME&gt; – Optional. Displays information of all devices within the domain identified by the &lt;DOMAIN-NAME&gt; keyword</td>
<td></td>
</tr>
<tr>
<td>not &lt;DOMAIN-NAME&gt; – Optional. Displays information of all devices in domains not matching the &lt;DOMAIN-NAME&gt; keyword</td>
<td></td>
</tr>
</tbody>
</table>

- show global domain managers

| global domain managers | Displays global information for all RF Domains and managers in the network |
### Examples

```bash
rfs7000-6DCD4B(config)#show global device-list filter rf-domain default

6.1.24 gre

Displays GRE tunnel info

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
show gre info

Parameters
- show gre info

Examples
nx4500-5CFA2B>show gre info
Gre Tunnel info:
    {'No tunnel found': 0}
nx4500-5CFA2B>
## 6.1.25 `interface`

- **show commands**

  Displays configured system interfaces and their status

  **Supported in the following platforms:**
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

  **Syntax**

  ```plaintext
  show interface {<INTERFACE-NAME>|brief|counters|ge <1-4>|me1|port-channel <1-2>|pppoe1|switchport|vlan <1-4094>|wwan1} {on <DEVICE-NAME>}
  ```

  **Parameters**

  - **interfaces** Optional. Displays system interface status based on the parameters passed
  - `<INTERFACE-NAME>` Optional. Displays status of the interface specified by the `<INTERFACE-NAME>` parameter. Specify the interface name.
  - **brief** Optional. Displays a brief summary of the interface status and configuration
  - **counters** Optional. Displays interface Tx or Rx counters
  - **ge <1-4>** Optional. Displays Gigabit Ethernet interface status and configuration
  - `<1-4>` – Select the Gigabit Ethernet interface index from 1 - 4.
  - **Note:** For the NX45XX and NX65XX service platforms the index range is <1 - 24>.
  - **me1** Optional. Displays Fast Ethernet interface status and configuration
  - **port-channel <1-2>** Optional. Displays port channel interface status and configuration
  - `<1-2>` – Specify the port channel index from 1 - 2.
  - **pppoe1** Optional. Displays PPP over Ethernet interface status and configuration
  - **switch-port** Optional. Displays layer 2 interface status
  - **vlan <1-4094>** Optional. Displays VLAN interface status and configuration
  - `<1-4094>` – Specify the Switch Virtual Interface (SVI) VLAN ID from 1 - 4094.
  - **wwan1** Optional. Displays Wireless WAN interface status, configuration, and counters
  - **on <DEVICE-NAME>** The following keywords are common to all of the above interfaces:
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.
Examples

Following interfaces are available on a RFS7000 controller:

```
rfs7000-37FABE(config)#show interface ?
WORD          Interface name
brief         Brief summary of interface status and configuration
counters      Interface tx/rx counters
ge            GigabitEthernet interface
me1           FastEthernet interface
on            On AP/Controller
port-channel  Port-Channel interface
ppoe1         PPP Over Ethernet interface
switchport    Status of Layer2 interfaces
vlan          Switch VLAN interface
wwan1         Wireless WAN interface
|             Output modifiers
>             Output redirection
>>            Output redirection appending
<r>
rfs7000-37FABE(config)#
```

Following interfaces are available on a NX45XX and NX65XX series service platform:

```
x4500-5CFA2B(config)#show interface ?
WORD        Interface name
brief       Brief summary of interface status and configuration
counters    Interface tx/rx counters
ge          GigabitEthernet interface
on          On AP/Controller
pppoel      PPP Over Ethernet interface
serial      Serial interface
switchport  Status of Layer2 interfaces
t1e1        T1/E1 interface
up          WAN Ethernet interface
vlan        Switch VLAN interface
vmif        Virtual Machine interface
wwan1       Wireless WAN interface
|           Output modifiers
>           Output redirection
>>          Output redirection appending
<r>
x4500-5CFA2B(config)#
```

```

### 6.1.26 ip

**show commands**

Displays IP related information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```bash
show ip [arp|bgp|ddns|default-gateways|dhcp|dhcp-vendor-options|domain-name|
  extcommunity-list|igmp|interface|name-server|nat|ospf|route|routing]
show ip arp {<VLAN-NAME>} {(on <DEVICE-NAME>)}
show ip bgp {<IP>|<IP/M>|community|community-list|filter-list|neighbors|on|paths|
  prefix-list|regexp|route-map|state|summary}
show ip ddns bindings {on <DEVICE-NAME>}
show ip dhcp [binding|networks|status]
show ip dhcp binding {manual} {(on <DEVICE-NAME>)}
show ip dhcp [networks|status] {on <DEVICE-NAME>}
show ip [default-gateways|dhcp-vendor-options|domain-name|name-server|routing]
  {on <DEVICE-NAME>}
show ip extcommunity-list [{1-500}|<NAME>]
show ip igmp snooping [mrouter|querier|vlan]
show ip igmp snooping [mrouter|querier] vlan <1-4095> {on <DEVICE-NAME>}
show ip igmp snooping vlan <1-4095> {<IP>} {(on <DEVICE-NAME>)}
show ip interface {<INTERFACE-NAME>|brief|on}
show ip interface {<INTERFACE-NAME>|brief} {(on <DEVICE-NAME>)}
show ip nat translations verbose {on <DEVICE-NAME>}
show ip route {<INTERFACE-NAME>|ge|me1|on|port-channel|pppoel|vlan|wwan1}
show ip route {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|vlan <1-4094>|pppoel|wwan1} {(on <DEVICE-NAME>)}
show ip ospf {border-router|interface|neighbor|on|route|state}
show ip ospf {border-router|neighbor|route|on|state} {on <DEVICE-NAME>}
show ip ospf {interface} {vlan|on}
show ip ospf {interface} {vlan <1-4094>} {(on <DEVICE-NAME>)}
```

**Parameters**

- **show ip arp {<VLAN-NAME>} {(on <DEVICE-NAME>)}**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip arp</code></td>
<td>Displays <em>Address Resolution Protocol</em> (ARP) mappings</td>
</tr>
<tr>
<td><code>&lt;VLAN-NAME&gt;</code></td>
<td>Optional. Displays ARP mapping on a specified VLAN. Specify the VLAN name.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>

<tr>
<td></td>
<td>- on <code>&lt;DEVICE-NAME&gt;</code> – Optional. Displays ARP configuration details on a specified device</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- `show ip bgp {<IP>|<IP/M>|community|community-list|filter-list|neighbors|on|paths|prefix-list|regexp|route-map|state|summary}`

- `ip bgp` Displays BGP routing table statistics based on the match criteria specified here. Routes matching the specified criteria are filtered. Use available options to filter the information displayed.  
  **Note:** This command is applicable to the RFS4000, RFS6000, NX45XX, NX65XX, NX9XXX model devices.

- `<IP>` Optional. Filters routes matching the specified IP address

- `<IP/M>` Optional. Filters routes matching the specified network

- `community` Optional. Filters routes based on the community attribute specified. The options are:
  - `AA:NN` – Filters routes based on the community number (AA: is the autonomous system number (ASN), NN: is the community number within the specified ASN)
  - `local-as` – Filters routes carrying the local-as attribute (these routes are not sent outside the local AS)
  - `no-advertise` – Filters routes carrying the no-advertise attribute (these routes are not advertised to any peers)
  - `no-export` – Filters routes carrying no-export attribute (these routes are not exported to next AS)

- `community-list` Optional. Displays routes that are members of communities included in the specified BGP community-list
  - `<1-500>` – Specify the community-list number.
  - `<WORD>` – Specify the community-list name.

- `filter-list` Optional. Filters routes having AS-path matching the specified AS-path access list. Specify the AS-path ACL name.

- `neighbors` Optional. Displays BGP neighbor details. Specify the IP address, to view a specific neighbor details. Use one of the following options to filter information:
  - `advertised-routes` – Displays route information for routes advertised to the selected neighbor device
  - `received-routes` – Displays route information for routes received from the selected neighbor device
  - `routes` – Displays the route information for routes learned from the selected neighbor device
  **Note:** If no neighbor IP address is specified, the system displays all neighbor-related routes on the logged device.

- `on <DEVICE-NAME>` Optional. Displays BGP routing table statistics on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- `paths` Optional. Displays BGP path details

- `prefix-list <PREFIX-LIST-NAME>` Optional. Displays routes confirming to the specified prefix-list
  - `<PREFIX-LIST-NAME>` – Specify the prefix list name.

</table>
| **show ip route** `{<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|vlan <1-4094>|pppoe1|wwan1} {(on <DEVICE-NAME>)}` | Displays route table details. The route tables use flags to distinguish between routes. The different flags are:  
  * C – Connected  
  * G – Gateway  
  * O – OSPF route  
  * S – Static route  
  **Note:** Flags ‘S’ and ‘O’ identify static learned routes and dynamic learned routes respectively.  
  **<INTERFACE-NAME>** Displays route table details for a specified interface. Specify the interface name  
  **ge <1-4>** Displays GigabitEthernet interface route table details  
  * <1-4> – Specify the GigabitEthernet interface index from 1 - 4.  
  **me1** Displays FastEthernet interface route table details  
  **port-channel <1-2>** Displays port channel interface route table details. Specify the port channel index from 1 - 2.  
  **vlan <1-4095>** Displays VLAN interface route table details. Select the VLAN interface ID from 1 - 4094.  
  **pppoe1** Displays Point-to-point Protocol over Ethernet (PPPoE) interface route table details  
  **wwan1** Displays Wireless WAN route table details  
  **on <DEVICE-NAME>** The following keywords are recursive and common to all of the above parameters:  
  * on <DEVICE-NAME> – Displays route table details, based on the parameters passed, on a specified device  
  * <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| **show ip ospf** `{border-router|interface|neighbor|route|on|state} {on <DEVICE-NAME>}` | Displays overall OSPF information  
  **border-router** Optional. Displays details of all the border routers connected  
  **interface** `{on|vlan <1-4094>} {on <DEVICE-NAME>}` Optional. Displays details of all the interfaces with OSPF enabled  
  * on <DEVICE-NAME> – Optional. Displays specified device details  
  * vlan <1-4094> – Displays VLAN interface details  
  * <DEVICE-NAME> – Specify the name of the AP or wireless controller.  
  **neighbor** Optional. Displays an OSPF neighbors list  
  **route** Optional. Displays OSPF routes information  
  **on <DEVICE-NAME>** Optional. Displays overall OSPF information on a specified device  
  * <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.  
  **state** Optional. Displays an OSPF process state |

6.1.27 ip-access-list

Displays IP access list statistics

**NOTE:** This command is not available in the USER EXEC Mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail|on}
show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>} (on <DEVICE-NAME>)
```

**Parameters**

- `show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail|on}
  show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>} (on <DEVICE-NAME>)`

<table>
<thead>
<tr>
<th>ip-access-list stats</th>
<th>Displays IP access list statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IP-ACCESS-LIST-NAME&gt;</code></td>
<td>Optional. Displays statistics for a specified IP access list. Specify the IP access list name.</td>
</tr>
<tr>
<td><code>detail &lt;IP-ACCESS-LIST-NAME&gt;</code></td>
<td>Optional. Displays detailed statistics for a specified IP access list. Specify the IP access list name.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>The following keyword is recursive and common to the ‘IP-ACCESS-LIST-NAME’ and ‘detail’ parameters:</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>- Optional. Displays all or a specified IP access list statistics on a specified device.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>- Optional. Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config)#show ip-access-list stats
IP Access-list: # Restrict Management ACL #
  permit tcp any any eq ftp rule-precedence 1         Hitcount: 0
  permit tcp any any eq www rule-precedence 2         Hitcount: 4
  permit tcp any any eq ssh rule-precedence 3         Hitcount: 448
  permit tcp any any eq https rule-precedence 4       Hitcount: 0
  permit udp any any eq snmp rule-precedence 5        Hitcount: 0
  permit tcp any any eq telnet rule-precedence 6       Hitcount: 4
rfs7000-37FABE(config)#
```
The following example displays the 'auto-tunnel-acl' IP ACL configuration:

```
rfs4000-229D58(config)#ip access-list auto-tunnel-acl
rfs4000-229D58(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2
permit ip host 200.200.200.99 any rule-precedence 3
rfs4000-229D58(config-ip-acl-auto-tunnel-acl)#
```

The following example displays the statistics for the 'auto-tunnel-acl' ACL:

```
rfs4000-229D58#show ip-access-list stats
IP Access-list: auto-tunnel-acl
    permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2        Hitcount: 0
    permit ip host 200.200.200.99 any rule-precedence 3        Hitcount: 0
rfs4000-229D58#
```

```
x6524-5483B0#show ip-access-list stats scaleacl | i 125
    permit ip host 125.1.1.1 any rule-precedence 125        Hitcount: 893        Hardware
Hitcount: 3120
    permit ip host 125.2.1.1 any rule-precedence 346        Hitcount: 0        Hardware
Hitcount: 0
x6524-5483B0#
```
### 6.1.28 ipv6

- **show commands**
  
  Displays IPv6 related information

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
show ipv6 [default-gateways|delegated-prefix|dhcp|hop-limit|interface|mld|name-server|neighbors|route]
show ipv6 [default-gateways|delegated-prefix|hop-limit|name-server]
    {on <DEVICE-NAME>}
show ipv6 dhcp [client received-options|relay status|status]
    {on <DEVICE-NAME>}
show ipv6 interface [{<IF-NAME>|brief} {on <DEVICE-NAME>}]
show ipv6 mld snooping [mrouter vlan <1-4095>|querier vlan <1-4095>|vlan <1-4095>]
    {on <DEVICE-NAME>}
show ipv6 neighbors <VLAN-NAME> {on <DEVICE-NAME>}
show ipv6 route {<IF-NAME>|ge <1-X>|me1|port-channel <1-2>|pppoe1|serial <1-4>|t1e1 <1-4> <1-1>|up|vlan <1-4095>|vmif <1-X>|wwan1|xge}
    {on <DEVICE-NAME>}
```

**Parameters**

- **ipv6**
  
  Displays IPv6 related information

- **default-gateways**
  
  Displays all learnt default gateways

- **delegated-prefix**
  
  Displays prefix delegation information

- **hop-limit**
  
  Displays the configured IPv6 hop count value

- **name-server**
  
  Displays DNS name servers

- **on <DEVICE-NAME>**
  
  This parameter is common to all of the above keywords.

  - **on <DEVICE-NAME>** — Optional. Displays the specified information on a device (access point, wireless controller, or service platform)

- **show ipv6 dhcp [client received-options|relay status|status] {on <DEVICE-NAME>}

  - **ipv6**
    
    Displays IPv6 related information

  - **dhcp**
    
    Displays DHCPv6 related information

  - **client received-options**
    
    Displays DHCP options received from clients

  - **relay status**
    
    Displays the DHCPv6 relay agent’s running status
<table>

rfs4000-229D58#
6.1.29 ipv6-access-list

Displays IPv6 access list statistics

NOTE: This command is not available in the USER EXEC Mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {on <DEVICE-NAME>}

Parameters
- show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>ipv6-access-list stats</th>
<th>Displays IPv6 access list statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IPv6-ACCESS-LIST-NAME&gt;</td>
<td>Optional. Displays statistics for a specified IPv6 access list. Specify the IPv6 access list name. <strong>Note:</strong> If IPv6 ACL name is not provided, the system displays statistics for all ACLs configured and applied.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays all or a specified IPv6 access list statistics on a specified device</td>
</tr>
</tbody>
</table>

Examples

6.1.30 l2tpv3

Display commands

Displays a Layer 2 Tunnel Protocol Version 3 (L2TPV3) session information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**NOTE:** This command is not available in the USER EXEC mode.

**Syntax**

- `l2tpv3 {on|tunnel|tunnel-summary}
- `l2tpv3 {on <DEVICE-NAME>}
- `l2tpv3 {tunnel <L2TPV3-TUNNEL-NAME>} {session <L2TPV3-SESSION-NAME>}
  
  `{on <DEVICE-NAME>}
  
- `l2tpv3 {tunnel-summary} {down|on|up}
- `l2tpv3 {tunnel-summary} {on <DEVICE-NAME>}
- `l2tpv3 {tunnel-summary} {down|up} {on <DEVICE-NAME>}

**Parameters**

- `l2tpv3 {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2tpv3</td>
<td>Displays a L2TPv3 tunnel and session details or summary</td>

### 6.1.31 ldap-agent

Show commands

Displays an LDAP agent’s join status (join status to a LDAP server domain)

- **show commands**

**NOTE:** This command is not available in the USER EXEC Mode.

---

**Supported in the following platforms:**

- Access Points — AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
show ldap-agent join-status {on <DEVICE-NAME>}
```

**Parameters**

- `show ldap-agent join-status {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>ldap-agent</th>
<th>Displays LDAP agent related configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>join-status</td>
<td>Displays if the LDAP agent has successfully joined a LDAP server’s domain</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays if the LDAP agent has successfully joined a specified LDAP server’s domain.</td>
</tr>
</tbody>
</table>

- `<DEVICE-NAME>` — Specify the name of the device running the LDAP server (access point, wireless controller, or service platform).

**Examples**

```
rfs6000-81701D#show ldap-agent join-status
Primary LDAP Server’s agent join-status : Joined domain TEST.
Secondary LDAP Server’s agent join-status : Not Configured
rfs6000-81701D#
```
6.1.32 licenses

Displays installed licenses and usage information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

`show licenses {borrowed|lent}`

Parameters

- `show licenses {borrowed|lent}`

| licenses {borrowed|lent} | Displays installed licenses and usage information |
|-------------------------|-----------------------------------------------|
|                         | • borrowed – Optional. Displays information on licenses borrowed |
|                         | • lent – Optional. Displays information on licenses lent |

Usage Guidelines

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single Network Operations Center (NOC) controller. The NOC and the site controllers constitute the first and second tiers of the hierarchy respectively. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy. The site controllers may or may not be grouped to form clusters.

At the time of adoption, access points and adaptive access points are provided license by the adopting controller. These license packs can be installed on both the NOC and site controllers. When a AP/AAP is adopted by a controller, the controller pushes a license on to the device. At this point the various possible scenarios are:

- **AP/AAP license packs installed on the NOC controller only.**
  
  The NOC controller provides the site controllers with the AP licenses, ensuring that per platform limits are not exceeded.

- **AP/AAP license packs installed on the NOC and site controllers.**
  
  The site controller uses its installed licenses and, in case of a shortage, the site controller borrows additional licenses from the NOC. If the NoC controller is unable to allocate sufficient licenses, the site controller unadopts some of the AP/AAPs.

- **AP/AAP license packs installed on one controller within a cluster.**
  
  The site controller shares its installed and borrowed licenses with other cluster controllers.

Examples

```
rfs4000-229D58#show licenses
Serial Number : 9184521800027

Device Licenses:
AP-LICENSE
  String     : DEFAULT-6AP-LICENSE
  Value      : 6
  Borrowed   : 0
  Total      : 6
  Used       : 0
AAP-LICENSE
  String     : 
  Value      : 0
  Borrowed   : 0
```
The following example shows the show > licenses command output on a NOC controller:

```
nx4500-5CFA2B#show licenses
Serial Number : 6283529900127

Device Licenses:
  AP-LICENSE
    String : 41a5a30ee9bb0bd78e943dba0a36ac34d3cdc66c956ef1f449d89f1c28be032ac9747a8f0c9f98f
    Value : 1
  AAP-LICENSE
    String : 41a5a30ee9bb0bd7f8d421c001f7c9c8d3c66c956ef1f41960aa2a030abb41ac9747a8f0c9f98f
    Value : 1

Total Licenses:
  AP-LICENSE
    Value : 263
    Used : 0
  AAP-LICENSE
    Value : 329
    Used : 3

Cluster Licenses:
  AP-LICENSE
    Value : 257
    Used : 0
  AAP-LICENSE
    Value : 257
    Used : 2

Active Members:

<table>
<thead>
<tr>
<th>MEMBER</th>
<th>SERIAL</th>
<th>LIC TYPE</th>
<th>VALUE</th>
<th>LENT</th>
<th>TOTAL</th>
<th>NO.APS</th>
<th>NO.AAPS</th>
</tr>
</thead>
<tbody>
<tr>
<td>00-15-70-5C-FA-3B</td>
<td>6283529900127</td>
<td>AP</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>2</td>
</tr>
<tr>
<td>00-15-70-5C-FA-3B</td>
<td>6283529900127</td>

<td>0</td>
<td>1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Non-Active Members:

<table>
<thead>
<tr>
<th>MEMBER</th>
<th>SERIAL</th>
<th>LIC TYPE</th>
<th>VALUE</th>
<th>LENT</th>
<th>TOTAL</th>
<th>VALIDITY (HRS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>00-15-70-81-70-1D</td>
<td>7295520400017</td>
<td>AP</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>93 days, 5 hours</td>
</tr>
<tr>
<td>00-15-70-81-70-1D</td>
<td>7295520400017</td>
<td>AAP</td>
<td>51</td>
<td>0</td>
<td>51</td>
<td>93 days, 5 hours</td>
</tr>
</tbody>
</table>

nx4500-5CFA2B#
In the following example, the 'VALIDITY(HRS)' column specifies the validity period, in days and hours, of a lent license. On a NOC controller, a 'VALIDITY(HRS)' value of 'current' implies that the site controller is currently adopted. Whereas, a numerical 'VALIDITY(HRS)' value indicates the days and hours the lent license is valid for a site controller that is not reachable.

```

rfs7000-6DCD4B>
### 6.1.33 lldp

*show commands*

Displays *Link Layer Discovery Protocol* (LLDP) information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show lldp [neighbors|report]
show lldp neighbors {on <DEVICE-NAME>}
show lldp report {detail|on}
show lldp report {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

**Parameters**

- `lldp neighbors {on <DEVICE-NAME>}`
  - *lldp* Displays an LLDP neighbors table or aggregated LLDP neighbors table
  - *neighbors* Displays an LLDP neighbors table
  - *on <DEVICE-NAME>* Optional. Displays an LLDP neighbors table on a specified device
    - `<DEVICE-NAME>` — Specify the name of the AP, wireless controller, or service platform.

- `show lldp report {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}`
  - *lldp* Displays an LLDP neighbors table or aggregated LLDP neighbors table
  - *report* Displays an aggregated LLDP neighbors table
    - *detail* — Optional. Displays detailed aggregated LLDP neighbors table
    - *Note:* If the ‘on’ keyword is used without the ‘detail’ keyword, the system displays LLDP neighbors table summary on the specified device or RF Domain.
  - *on <DEVICE-OR-DOMAIN-NAME>* The following keyword is recursive and common to the ‘report detail’ parameter:
    - *on <DEVICE-OR-DOMAIN-NAME>* — Displays an aggregated LLDP neighbors table on a specified device or RF Domain
    - `<DEVICE-OR-DOMAIN-NAME>` — Specify the name of the AP, wireless controller, service platform, or RF Domain.

**Examples**

```
rfs7000-37FABE(config)#show lldp neighbors
rfs7000-37FABE(config)#
```
6.1.34 logging

Displays the network’s activity log

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
show logging {on <DEVICE-NAME>}
```

Parameters

- `show logging {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>logging {on &lt;DEVICE-NAME&gt;}</th>
<th>Displays logging information on a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DEVICE-NAME&gt; – Optional. Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809#show logging

Logging module: enabled
  Aggregation time: disabled
  Console logging: level debugging
  Monitor logging: disabled
  Buffered logging: level warnings

nx9500-6C8809#
```
6.1.35 *mac-access-list*

- *show commands*

Displays MAC access list statistics

**NOTE:** This command is not present in USER EXEC mode.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
```
show mac-access-list stats {<MAC-ACCESS-LIST-NAME>|on}
show mac-access-list stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>)}
```

**Parameters**

- *show mac-access-list-stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>)}*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

permit D0-67-E5-3F-00-00 FF-FF FF-FF F0-00 host 00-1E-EC-F2-0A-76 rule-precedence 311
Hitcount: 0        Hardware Hitcount: 0
nx6524-5483B0#  ```
6.1.36 **mac-address-table**

> **show commands**

Displays MAC address table entries

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show mac-address-table {on <DEVICE-NAME>}
```

**Parameters**

- `show mac-address-table {on <DEVICE-NAME>}`

<table>
<thead>
<tr>

**Total number of MACs displayed: 20**

```
rfs7000-6DCD4B(config)#
```
### 6.1.37 mac-auth

> show commands

Displays details of wired ports that have MAC address authentication enabled.

For more information on enabling MAC address authentication on a wired port, see `mac-auth`.

Supported in the following platforms:
- Access Points — AP6511
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

```
show mac-auth [all|interface|on]
```

```
show mac-auth [all|interface [ [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|t1e1 <1-4>|up <1-2>|vmif <1-X>|xge <1-4>] ] { (on <DEVICE-NAME>) }
```

**Parameters**

- `show mac-auth [all|interface [ [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|t1e1 <1-4>|up <1-2>|vmif <1-X>|xge <1-4>] ] { (on <DEVICE-NAME>) }`

<table>
<thead>
<tr>
<th>mac-auth</th>
<th>Displays MAC authentication related information for all interfaces or all interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays MAC authentication related information for all interfaces</td>
</tr>
<tr>
<td>interface [ [&lt;INTERFACE-NAME&gt;</td>
<td>ge &lt;1-5&gt;</td>
</tr>
<tr>
<td>- <code>&lt;INTERFACE-NAME&gt;</code> – Selects the interface identified by the <code>&lt;INTERFACE-NAME&gt;</code> keyword</td>
<td></td>
</tr>
<tr>
<td>- <code>ge &lt;1-5&gt;</code> – Selects the GigabitEthernet interface identified by the index number</td>
<td></td>
</tr>
<tr>
<td>- <code>port-channel &lt;1-3&gt;</code> – Selects the port channel interface identified by the index number</td>
<td></td>
</tr>
<tr>
<td>- <code>t1e1 &lt;1-4&gt;</code> – Selects the layer 2 interface (Ethernet port)</td>
<td></td>
</tr>
<tr>
<td>- <code>up &lt;1-2&gt;</code> – Selects the WAN Ethernet interface identified by the index number</td>
<td></td>
</tr>
<tr>
<td>- <code>vmif &lt;1-X&gt;</code> – Selects the <code>virtual machine interface</code> (VMIF) identified by the index number</td>
<td></td>
</tr>
<tr>
<td>- <code>xge &lt;1-4&gt;</code> – Selects the TenGigabitEthernet interface identified by the index number</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>on &lt;DEVICE-NAME&gt;</th>
<th>The following keywords are common to the ‘all’ and ‘interface’ parameters:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- <code>on &lt;DEVICE-NAME&gt;</code> – Optional. Displays MAC authentication related information on a specified device</td>
<td></td>
</tr>
<tr>
<td>- <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**: When the ‘on’ keyword is used exclusively, without the ‘all’ and ‘interface’ options, the system displays MAC authentication related information for interfaces configured on the specified device.

**Examples**

```
rfs4000-229D58(config)#show mac-auth all
AAA-Policy is none

Mac Auth info for interface GE1
-----------------------------------
Mac Auth Enabled
Mac Auth Not Authorized

Mac Auth info for interface GE2
-----------------------------------

-----------------------------------
  Mac Auth Disabled
  Mac Auth Not Authorized

Mac Auth info for interface GE4
-----------------------------------
  Mac Auth Disabled
  Mac Auth Authorized

Mac Auth info for interface GE5
-----------------------------------
  Mac Auth Disabled
  Mac Auth Not Authorized

Mac Auth info for interface UP1
-----------------------------------
  Mac Auth Disabled
  Mac Auth Not Authorized
rfs4000-229D58(config)#
6.1.38 mint

Displays MiNT protocol configuration commands

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show mint [config|dis|id|info|known-adopters|links|lsp|lsp-db|mlcp|neighbors|route|stats|tunnel-controller|tunneled-vlans]

show mint [config|id|info|known-adopters|route|stats|tunnel-controller|tunneled-vlans] {on <DEVICE-NAME>}

show mint [dis|links|neighbors|tunnel-controller] {details} {on <DEVICE-NAME>}

show mint lsp

show mint lsp-db {details <MINT-ADDRESS>} {on <DEVICE-NAME>}

show mint mlcp {history} {on <DEVICE-NAME>}

Parameters

- mint Displays MiNT protocol information based on the parameters passed
- config Displays MiNT configuration
- id Displays local MiNT ID
- info Displays MiNT status
- known-adopters Displays known, possible, or reachable adopters
- route Displays MiNT route table details
- stats Displays MiNT related statistics
- tunneled-vlans Displays MiNT tunneled VLAN details
- on <DEVICE-NAME> The following keywords are common to all of the above parameters:
  - on <DEVICE-NAME> – Optional. Displays MiNT protocol details on a specified device
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- show mint [dis|links|neighbors|tunnel-controller] {details} {on <DEVICE-NAME>}

- mint Displays MiNT protocol information based on the parameters passed
- dis Displays MiNT network Designated Intermediate Systems (DISes) and Ethernet Virtualization Interconnects (EVISe)
- links Displays MiNT networking link details
### neighbors
Displays adjacent MiNT peer details

### tunnel-controller
Displays details of MiNT VLAN network tunnel wireless controllers for extended VLAN load balancing

### details
{on <DEVICE-NAME>}</details <MINT-ADDRESS>}>{on <DEVICE-NAME>}> The following keywords are common to the ‘dis’, ‘links’, ‘neighbors’, and ‘tunnel-controller’ parameters:
- `details` – Optional. Displays detailed MiNT information
- `on <DEVICE-NAME>` – Optional. This is a recursive parameter, which displays MiNT information on a specified device

### Examples
```
rfs7000-37FABE(config)#show mint stats

ap7532-15E6E4#
6.1.39 ntp

▶ show commands

Displays Network Time Protocol (NTP) information. NTP enables clock synchronization within a network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show ntp [associations|status]
show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]  

Parameters
- show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]

| ntp associations {detail|on} | Displays existing NTP associations |
|-----------------------------|-----------------------------------|
|                            | detail – Optional. Displays detailed NTP associations |
|                            | on <DEVICE-NAME> – Optional. Displays NTP associations on a specified device |
|                            | <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

Note: If the ‘on’ keyword is used without the ‘detail’ keyword, the system displays a summary of existing NTP associations on the specified device or RF Domain.

<table>
<thead>
<tr>
<th>ntp status {on &lt;DEVICE-NAME&gt;}</th>
<th>Displays NTP association status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>on &lt;DEVICE-NAME&gt;– Optional. Displays NTP association status on a specified device</td>
</tr>
<tr>
<td></td>
<td>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE>show ntp associations
address ref clock st when poll reach delay offset disp
* master (synced), # master (unsynced), + selected, - candidate, ~ configured
rfs7000-37FABE>

rfs7000-37FABE>show ntp status
Clock is synchronized, stratum 0, actual frequency is 0.0000 Hz, precision is 2**0
reference time is 00000000.00000000 (Feb 07 06:28:16 UTC 2036)
clock offset is 0.000 msec, root delay is 0.000 msec
root dispersion is 0.000 msec
rfs7000-37FABE>
### 6.1.40 password-encryption

▶ show commands

Displays password encryption status (enabled/disabled)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show password-encryption status
```

**Parameters**

- `show password-encryption status`

**Examples**

```
rfs7000-37FABE(config)#show password-encryption status
Password encryption is enabled
rfs7000-37FABE(config)#
```
6.1.41 **pppoe-client**

> **show commands**

Displays *Point-to-Point Protocol over Ethernet* (PPPoE) client information

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show pppoe-client [configuration|status] {on <DEVICE-NAME>}
```

**Parameters**

- **show pppoe-client [configuration|status] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>pppoe-client</th>
<th>Displays PPPoE client information (configuration and status)</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Displays detailed PPPoE client configuration</td>
</tr>
<tr>
<td>status</td>
<td>Displays detailed PPPoE client status</td>
</tr>
</tbody>
</table>

**on <DEVICE-NAME>**

The following keywords are common to ‘configuration’ and ‘status’ parameters:

- **on <DEVICE-NAME>** – Optional. Displays detailed PPPoE client status or configuration on a specified device
- **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

**Examples**

```
rfs7000-37FABE(config)#show pppoe-client configuration
PPPoE Client Configuration:
+-------------------------------------------
| Mode : Disabled                           |
| Service Name :                             |
| Auth Type : pap                            |
| Username :                                 |
| Password :                                 |
| Idle Time : 600                            |
| Keepalive : Disabled                       |
| Local n/w : vlan1                          |
| Static IP : 0.0.0.0                        |
| MTU : 1492                                 |
+-------------------------------------------
```

```
rfs7000-37FABE(config)#
```
6.1.42 privilege

Displays a device's existing privilege level

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show privilege

Parameters

None

Examples

rfs7000-37FABE(config)#show privilege
Current user privilege: superuser
rfs7000-37FABE(config)#
6.1.43 radius

Displays the amount of access time consumed and the amount of access time remaining for all guest users configured on a RADIUS server.

Every captive portal guest user can access the captive portal for a specified duration. This results in the following three scenarios:

- Scenario 1: Access duration not specified (in this case the default of 1440 minutes is applied)
- Scenario 2: Access duration is specified and is greater than 0
- Scenario 3: Access duration is specified and equals to 0 (in this case the guest user has unlimited access)

In all the three scenarios the access time consumed is the duration for which the guest user has logged. But the access time remaining varies. It is calculated as follows:

- Scenarios 1 & 2 - It is the lesser of the following two values: difference between the configured access duration and the time consumed AND the time until user account expiration.
- Scenario 3 - It is the time until user account expiration

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
show radius guest-users {<GUEST-USER-NAME>}
```

Parameters

- `show radius guest-users {<GUEST-USER-NAME>}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>radius guest-users {&lt;GUEST-USER-NAME&gt;}</code></td>
<td>Displays RADIUS server's guest user's access details: total time for which the user has logged in, and the amount of access time remaining.</td>
</tr>
</tbody>
</table>

- `<GUEST-USER-NAME>` — Optional. Provide the name of the guest user (whose access details are to be viewed). If no name is provided, the system displays details of all guest users who have successfully logged in at least once.

Use this command in the captive-portal context to view time and data statistics for guest user(s) having bandwidth-based or time-based vouchers configured. In such a scenario, the system displays the following information: data configured, data remaining, configured and current bandwidths (for both downlink and uplink), time configured, and time remaining. If bandwidth-based voucher is not applicable to a guest user, the data configured and data remaining values are displayed as ‘unlimited’. The bandwidth columns are blank. If time-based voucher is not applicable to a guest user, the only value displayed is the time remaining (which is the time till the expiration of the guest user's account).

**Note:** For more information on configuring bandwidth-based and time-based vouchers, see `user`.
**Examples**

```
rfs4000-229D58#show radius guest-users
TIME (min:sec)               USED    REMAINING   GUEST USER
  0:00                9:00   time9
  0:00                5:00   time5
  0:00               15:00   time15
  0:00            305416:35   notime
  2:31              7:29   time10
rfs4000-229D58#
```

The following example shows a RADIUS user pool with guest users having bandwidth-based, time-based, bandwidth and time based, and no bandwidth or time based vouchers:

```
rfs4000-229D58(config-captive-portal-wdws)#show context
radius-user-pool-policy wdws
  user time_and_data password 0 both group wdws guest expiry-time 12:00 expiry-date 12/31/2014 access-duration 8000 data-limit 500 committed-downlink 3000 committed-uplink 2000 reduced-downlink 1000 reduce4
  user neither password 0 nine group wdws guest expiry-time 12:00 expiry-date 12/31/2014
  user data_only password 0 data group wdws guest expiry-time 12:00 expiry-date 12/31/2014 data-limit 125 committed-downlink 1000 committed-uplink 800 reduced-downlink 500 reduced-uplink 400
  user time_only password 0 time group wdws guest expiry-time 12:00 expiry-date 12/31/2014 access-duration 5000
rfs4000-229D58(config-captive-portal-wdws)#
```

The following example shows the captive portal access details for the above mentioned RADIUS user pool users:

```
rfs4000-229D58(config-captive-portal-wdws)#show radius guest-users

rfs4000-229D58(config-captive-portal-wdws)#
```
6.1.44 reload

Displays scheduled reload information for a specific device

NOTE: This command is not present in the USER EXEC mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
show reload {on <DEVICE-OR-DOMAIN-NAME>}

Parameters
- show reload {on <DEVICE-OR-DOMAIN-NAME>}
  - on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays configuration on a specified device
  - <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

Examples
rfs7000-37FABE(config)#show reload
No reload is scheduled.
rfs7000-37FABE(config)#
### 6.1.45 rf-domain-manager

> show commands

Displays RF Domain manager selection details

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX9000, NX9500, NX9510

**Syntax**

```
show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

- `show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}`

<table>
<thead>
<tr>
<th>rf-domain-manager</th>
<th>Displays RF Domain manager selection details</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>Optional. Displays RF Domain manager selection details on a specified device or domain</td>
</tr>
</tbody>
</table>

- `<DEVICE-OR-DOMAIN-NAME>` – specify the name of the AP, wireless controller, service platform, or RF Domain.

**Examples**

```
rfs7000-37FABE(config)#show rf-domain-manager
RF Domain RFDOMAIN_TechPubsLabLan
RF Domain Manager:
  ID: 70.37.FA.BE
  Priority: 180
  Has IP MiNT link
  Has wired MiNT links
Device under query:
  Priority: 180
  Has IP MiNT links
  Has wired MiNT links
rfs7000-37FABE(config)#
```
6.1.46 role

- **show commands**

Displays role based firewall information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
show role [ldap-stats|wireless-clients]
show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}
```

**Parameters**

- `show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>role ldap-stats</th>
<th>Displays LDAP server status and statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays LDAP server status on a specified device</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>role wireless-clients</th>
<th>Displays clients associated with roles</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays clients associated with roles on a specified device</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config)#show role wireless-clients
No ROLE statistics found.
rfs7000-37FABE(config)#
```
**6.1.47 route-maps**

*show commands*

Displays route map statistics for defined device routes

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP7502, AP7522, AP7532, AP71XX, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
show route-maps {on <DEVICE-NAME>}
```

**Parameters**

- `show route-maps {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-maps</td>
<td>Displays configured route map statistics for all defined routes</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays route map statistics on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; — Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Note:** For more information on route maps, see route-map on page 24-5.

**Examples**

```
rfs7000-37FABE(config)#show route-maps
rfs7000-37FABE(config)#
```
### 6.1.48 rtls

*show commands*

Displays *Real Time Location Service* (RTLS) statistics for access points contributing locationing information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show rtls [aeroscout|ekahau] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

**Parameters**

- `aeroscout` Displays access point Aeroscout statistics
- `ekahau` Displays access point Ekahau statistics
- `<MAC/HOSTNAME>` Optional. Displays Aeroscout or Ekahau statistics for a specified access point. Specify the MAC address or hostname of the access point.
- `on <DEVICE-OR-DOMAIN-NAME>` The following keyword is recursive and common to ‘Aeroscout’ and ‘Ekahau’ parameters:
  - `on <DEVICE-OR-DOMAIN-NAME>` – Optional. Displays Aeroscout or Ekahau statistics on a specified device or domain.
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

**Examples**

```plaintext
rfs4000-229D58(config)#show rtls aeroscout

Aeroscout Engine IP: 0.0.0.0 Port: 0
Send Count : 0
Recv Count : 0
Tag Reports : 0
Nacks : 0
Acks : 0
Lbs : 0
AP Status : 0
AP Notif : 0
Send Err : 0
Errmsg Count : 0

Total number of APs displayed: 1
```

```plaintext
rfs4000-229D58(config)#
```
6.1.49 running-config

Displays configuration files (where all configured MAC and IP access lists are applied to an interface)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show running-config {aaa-policy|association-acl-policy|auto-provisioning-policy|captive-portal-policy|dhcp-server-policy|firewall-policy|include-factory|interface|ip-access-list|mac-access-list|management-policy|meshpoint|profile|radio-qos-policy|rf-domain|smart-rf-policy|wlan|wlan-qos-policy} <POLICY-NAME> {include-factory}

Parameters
- Running-configuration Optional. Displays current running configuration
- aaa-policy Optional. Displays AAA policy configuration
- association-acl-policy Optional. Displays association ACL policy configuration
- auto-provisioning-policy Optional. Displays auto provisioning policy configuration
- captive-portal-policy Optional. Displays captive portal policy configuration
- dhcp-server-policy Optional. Displays the DHCP server policy configuration
- firewall-policy Optional. Displays firewall policy configuration
<table>
<thead>
<tr>

</tr>
</tbody>
</table>
### SHOW COMMANDS

- **wwan1**
  Optional. Displays Wireless WAN interface configuration

- **include-factory**
  The following keyword is common to all interfaces:
  - Optional. Includes factory defaults

- **show running-config** `{ip-access-list <IP-ACCESS-LIST-NAME>|mac-access-list <MAC-ACCESS-LIST-NAME>} {include-factory}`
  - Optional. Displays IP access list configuration
    - `<IP-ACCESS-LIST-NAME>` – Specify the IP access list name
  - Optional. Displays MAC access list configuration
    - `<MAC-ACCESS-LIST-NAME>` – Specify the MAC access list name

- **include-factory**
  The following keyword is common to the ‘ip-access-list’ and ‘mac-access-list’ parameters:
  - Optional. Includes factory defaults

- **show running-config** `{meshpoint <MESHPOINT-NAME>} {include-factory}`
  - Optional. Displays meshpoint configuration
    - `<MESHPOINT-NAME>` – Specify the meshpoint name

- **include-factory**
  Optional. Includes factory defaults along with running configuration details

- **show running-config** `{profile [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx9000] <PROFILE-NAME>} {include-factory}`
  - Optional. Displays current configuration for a specified profile
    - `<PROFILE-NAME>` – Displays configuration for a specified profile. Specify the AP621 profile name.
    - `<PROFILE-NAME>` – Displays configuration for a specified AP622 profile. Specify the AP622 profile name.
    - `<PROFILE-NAME>` – Displays configuration for a specified AP650 profile. Specify the AP650 profile name.
    - `<PROFILE-NAME>` – Displays configuration for a specified AP6511 profile. Specify the AP6511 profile name.
<table>
<thead>

x6500-31FABE(config)#
6.1.50 session-changes

Displays configuration changes made in the current session

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
show session-changes

Parameters
None

Examples
rfs7000-37FABE(config)#show session-changes
No changes in this session
rfs7000-37FABE(config)#
6.1.51 session-config

Lists active open sessions on a device

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
show session-config {include-factory}
```

Parameters

- `show session-config {include-factory}`

<table>
<thead>
<tr>
<th>Parameter</th>

### 6.1.52 sessions

> show commands

Displays CLI sessions initiated on a device

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, RFS7000, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show sessions {on <DEVICE-NAME>}
```

**Parameters**

- `show sessions {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>sessions</th>
<th>Displays CLI sessions initiated on a device</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays CLI sessions on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config)# show sessions
INDEX COOKIE NAME START TIME FROM ROLE
1 49 admin 2013-02-15 15:45:10 192.168.100.225 superuser
2 2 snmp 2013-01-16 22:37:59 127.0.0.1 superuser
3 3 snmp2 2013-01-16 22:37:59 127.0.0.1 superuser

rfs4000-229D58(config)#
```
6.1.53 site-config-diff

Displays the difference in site configuration available on the NOC and a site.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single Network Operations Center (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

NOC controllers possess default site configuration details. Overrides applied at the site level result in a mismatch of configuration at the site and the default site configuration available on the NOC controller. Use this command to view this difference.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
show site-config-diff <SITE-NAME>
```

Parameters

- `show site-config-diff <SITE-NAME>`

Examples

```
nx9500-6C874D#show site-config-diff 5C-0E-8B-18-06-F4
---- Config diff for switch 5C-0E-8B-18-06-F4 ----
rfs6000 5C-0E-8B-18-06-F4
interface pppoel
  no shutdown
nx9500-6C874D#
```
6.1.54 smart-rf

Shows commands

Displays Smart RF management commands

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

- show smart-rf [ap|calibration-config|calibration-status|channel-distribution|history|history-timeline|interfering-ap|interfering-neighbors|radio]
- show smart-rf ap {<MAC>|<DEVICE-NAME>|activity|energy|neighbors} {on <DOMAIN-NAME>}
- show smart-rf radio {<MAC>|activity|all-11an|all-11bgn|channel|energy|neighbors} {on <DOMAIN-NAME>}
- show smart-rf interfering-ap {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME>}
- show smart-rf interfering-neighbors {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME>} {threshold <50-100>}

Parameters
- show smart-rf ap {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap</td>
<td>Displays access point related commands</td>
</tr>
<tr>
<td>&lt;MAC&gt;</td>
<td>Optional. Uses MAC addresses to identify access points. Displays all access</td>
</tr>
<tr>
<td></td>
<td>points, if no MAC address is specified.</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Optional. Uses an administrator defined name to identify an access point</td>
</tr>
<tr>
<td>on &lt;DOMAIN-NAME&gt;</td>
<td>Optional. Displays access point details on a specified RF Domain. Specify</td>
</tr>
<tr>
<td></td>
<td>the domain name.</td>
</tr>
<tr>
<td>activity</td>
<td>Displays AP activity for a specified AP or all APs</td>
</tr>
<tr>
<td>energy</td>
<td>Displays AP energy for a specified AP or all APs</td>
</tr>
<tr>
<td>neighbors</td>
<td>Displays AP neighbors</td>
</tr>
<tr>
<td>{&lt;MAC&gt;</td>
<td>&lt;DEVICE-NAME&gt;}</td>
</tr>
<tr>
<td></td>
<td>- &lt;MAC&gt; — Displays a specified AP related information. Uses MAC address to</td>
</tr>
<tr>
<td></td>
<td>identify the AP</td>
</tr>
<tr>
<td></td>
<td>- &lt;DEVICE-NAME&gt; — Displays a specified AP related information. Uses device</td>
</tr>
<tr>
<td></td>
<td>name to identify the AP</td>
</tr>
</tbody>
</table>
on `<DOMAIN-NAME>`

Optional. Displays access point details on a specified RF Domain. Specify the domain name.

- show smart-rf [calibration-config|calibration-status|channel-distribution|history|history-timeline] {on `<DOMAIN-NAME>`}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calibration-config</td>
<td>Displays interactive calibration configurations</td>
</tr>
<tr>
<td>calibration-status</td>
<td>Displays Smart RF calibration status</td>
</tr>
<tr>
<td>channel-distribution</td>
<td>Displays Smart RF channel distribution</td>
</tr>
<tr>
<td>history</td>
<td>Displays Smart RF calibration history</td>
</tr>
<tr>
<td>history-timeline</td>
<td>Displays extended Smart RF calibration history on an hourly or daily timeline</td>
</tr>
</tbody>
</table>

on `<DOMAIN-NAME>`

This parameter is common to all of above smart RF options:
- on `<DOMAIN-NAME>` – Optional. Displays Smart RF configuration, based on the parameters passed, on a specified RF Domain
- on `<DOMAIN-NAME>` – Specify the RF Domain name.

- show smart-rf radio `{<MAC>|all-11an|all-11bgn|energy <MAC>}` {on `<DOMAIN-NAME>`}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>radio</td>
<td>Displays radio related commands</td>
</tr>
<tr>
<td><code>&lt;MAC&gt;</code></td>
<td>Optional. Displays details of a specified radio. Specify the radio’s MAC address in the AA-BB-CC-DD-EE-FF format.</td>
</tr>
<tr>
<td>all-11an</td>
<td>Optional. Displays all 11a radios currently in the configuration</td>
</tr>
<tr>
<td>all-11bgn</td>
<td>Optional. Displays all 11bg radios currently in the configuration</td>
</tr>
<tr>
<td>energy <code>&lt;MAC&gt;</code></td>
<td>Optional. Displays radio energy Specify the MAC address of the radio</td>
</tr>
<tr>
<td><code>&lt;MAC&gt;</code></td>
<td><code>&lt;MAC&gt;</code> – Optional. Specify the radio’s MAC address in the AA-BB-CC-DD-EE-FF format.</td>
</tr>
</tbody>
</table>

on `<DOMAIN-NAME>`

The following keyword is common to above parameters:
- on `<DOMAIN-NAME>` – Optional. Displays radio details on a specified RF Domain
- `<DOMAIN-NAME>` – Specify the RF Domain name.

- show smart-rf radio `{activity|neighbors} `{<MAC>|all-11an|all-11bgn}` {on `<DOMAIN-NAME>`}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>radio</td>
<td>Displays radio related commands</td>
</tr>
<tr>
<td>activity</td>
<td>Optional. Displays changes related to radio power, number of radio channels, or coverage holes. Use additional filters to view specific details.</td>
</tr>
<tr>
<td><code>&lt;MAC&gt;</code></td>
<td>Optional. Displays radio activity for a specified radio</td>
</tr>
<tr>
<td>all-11an</td>
<td>Optional. Displays radio activity of all 11a radios in the configuration</td>
</tr>
<tr>
<td>all-11bgn</td>
<td>Optional. Displays radio activity of all 11bg radios in the configuration</td>
</tr>
<tr>
<td>on <code>&lt;DOMAIN-NAME&gt;</code></td>
<td>Optional. Displays radio activity of all radios within a specified RF Domain</td>
</tr>
<tr>
<td><code>&lt;DOMAIN-NAME&gt;</code></td>
<td><code>&lt;DOMAIN-NAME&gt;</code> – Specify the RF Domain name.</td>
</tr>
</tbody>
</table>
• show smart-rf interfering-ap {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>}

interfering-ap | Displays interfering access points (requiring potential isolation) information
--- | ---
<MAC> | Optional. Displays information of a specified interfering access point
  • <MAC> – Specify the access point’s MAC address.
  Note: Considers all APs if this parameter is omitted
<br>
<DEVICE-NAME> | Optional. Displays interfering access point information on a specified device
  • <DEVICE-NAME> – Specify the device name.
  Note: Considers all APs if this parameter is omitted
<br>
on <DOMAIN-NAME> | Optional. Displays all interfering access point information within a specified RF Domain
  • <DOMAIN-NAME> – Specify the RF Domain name.

• show smart-rf interfering-neighbors {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>|threshold <50-100>}

interfering-ap | Displays interfering neighboring access point information
--- | ---
<MAC> | Optional. Displays interfering neighboring access point information
  • <MAC> – Specify the access point’s MAC address.
  Note: Considers all APs if this parameter is omitted
<br>
<DEVICE-NAME> | Optional. Displays all interfering neighboring access point information on a specified device
  • <DEVICE-NAME> – Specify the device name.
  Note: Considers all APs if this parameter is omitted
<br>
threshold <50-100> | Specifies the maximum attenuation threshold of interfering neighbors. Specify a value from 50 - 100.
<br>
on <DOMAIN-NAME> | Optional. Displays radio activity of all radios within a specified RF Domain
  • <DOMAIN-NAME> – Specify the RF Domain name.

Examples

rfs7000-37FABE(config)#show smart-rf calibration-status
No calibration currently in progress

---
Total number of history entries displayed: 0
rfs7000-37FABE(config)#
6.1.55 spanning-tree

- show commands

Displays spanning tree utilization information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show spanning-tree mst {configuration|detail|instance|on <DEVICE-NAME>}
show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}
show spanning-tree mst {detail} {interface|on}
show spanning-tree mst {detail} interface {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {(on <DEVICE-NAME>)}
show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>} {(on <DEVICE-NAME>)}

Parameters

- show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}

<table>
<thead>
<tr>
<th>spanning-tree</th>
<th>Displays spanning tree utilization information</th>
</tr>
</thead>
<tbody>
<tr>
<td>mst</td>
<td>Displays <em>Multiple Spanning Tree</em> (MST) related information</td>
</tr>
<tr>
<td>configuration</td>
<td>Optional. Displays MST configuration</td>
</tr>
<tr>
<td>{on &lt;DEVICE-NAME&gt;}</td>
<td></td>
</tr>
<tr>
<td>• on &lt;DEVICE-NAME&gt; — Optional. Displays MST configuration on a specified device</td>
<td></td>
</tr>
<tr>
<td>• &lt;DEVICE-NAME&gt; — Specify the name of the AP or wireless controller.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> If the ‘on’ keyword is used without any of the other options, the system displays a summary of spanning tree utilization information on the specified device.</td>
<td></td>
</tr>
</tbody>
</table>

- show spanning-tree mst {detail} interface {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {(on <DEVICE-NAME>)}

<table>
<thead>
<tr>
<th>spanning-tree</th>
<th>Displays spanning tree information</th>
</tr>
</thead>
<tbody>
<tr>
<td>mst</td>
<td>Displays MST configuration</td>
</tr>
<tr>
<td>detail</td>
<td>Optional. Displays detailed MST configuration, based on the parameters passed</td>
</tr>
<tr>
<td>interface</td>
<td>Displays detailed MST configuration for a specified interface</td>
</tr>
<tr>
<td>[&lt;INTERFACE&gt;]</td>
<td></td>
</tr>
<tr>
<td>age &lt;1-4&gt;</td>
<td>me1</td>
</tr>
<tr>
<td>• &lt;INTERFACE&gt; — Displays detailed MST configuration for a specified interface. Specify the interface name.</td>
<td></td>
</tr>
<tr>
<td>• age &lt;1-4&gt; — Displays GigabitEthernet interface MST configuration</td>
<td></td>
</tr>
<tr>
<td>• &lt;1-4&gt; — Select the GigabitEthernet interface index from 1 - 4.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> The GE interface range for NX45XX and NX65XX service platforms is &lt;1 - 24&gt;</td>
<td></td>
</tr>
<tr>
<td>• me1 — Displays FastEthernet interface MST configuration</td>
<td></td>
</tr>
</tbody>
</table>

Contd..
show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>} {on <DEVICE-NAME>}

### 6.1.57 t5

> **show commands**

Displays adopted T5 controller details

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7510, NX7520, NX9000, NX9500, NX9510

---

**NOTE:** This command is applicable only on WiNG controllers with adopted and managed T5 controllers.

---

**Syntax**

```
show t5 [boot|clock|cpe|error|interface|system|temperature|uptime|version|wireless] {on <DEVICE-NAME>}
```

**Parameters**

- `show t5 [boot|clock|cpe|error|interface|system|temperature|uptime|version|wireless] {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show t5</code></td>
<td>Displays adopted T5 controller details</td>
</tr>
<tr>
<td><code>boot</code></td>
<td>Displays the T5 device's boot details</td>
</tr>
<tr>
<td><code>clock</code></td>
<td>Displays the T5 device's clock</td>
</tr>
<tr>
<td><code>cpe</code></td>
<td>Displays the following details for CPEs linked with the specified T5 controller:</td>
</tr>
<tr>
<td></td>
<td>- address — Displays CPE address information</td>
</tr>
<tr>
<td></td>
<td>- boot — Displays CPE boot information</td>
</tr>
<tr>
<td></td>
<td>- led — Displays CPE LED information (enabled/disabled)</td>
</tr>
<tr>
<td></td>
<td>- system — Displays CPE system information</td>
</tr>
<tr>
<td></td>
<td>- uptime — Displays CPE’s uptime information</td>
</tr>
<tr>
<td></td>
<td>- version — Displays CPEs current software information</td>
</tr>
<tr>
<td><code>error</code></td>
<td>Displays error history</td>
</tr>
<tr>
<td><code>interface</code></td>
<td>Displays T5 interface details</td>
</tr>
<tr>
<td><code>system</code></td>
<td>Displays T5 system information</td>
</tr>
<tr>
<td><code>temperature</code></td>
<td>Displays T5 temperature</td>
</tr>
<tr>
<td><code>uptime</code></td>
<td>Displays T5 uptime information</td>
</tr>
<tr>
<td><code>version</code></td>
<td>Displays the image version running on the T5</td>
</tr>
<tr>
<td><code>wireless</code></td>
<td>Displays the T5 WiFi related information</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>Specify the T5 device’s hostname. An error message is displayed if no T5 device name is specified,</td>
</tr>
</tbody>
</table>
Examples
The following examples are for show commands executed on the ‘t5-ED5EE8’ controller adopted by the ‘rfs7000-37FABE’ wireless controller:

rfs7000-37FABE#
6.1.58 terminal

- **show commands**

Displays terminal configuration parameters

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`show terminal`

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config)#show terminal
Terminal Type: xterm
Length: 24   Width: 200
rfs7000-37FABE(config)#
```
6.1.59 timezone

- show commands

Displays a device’s timezone

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show timezone

Parameters

None

Examples

rfs7000-37FABE(config)#show timezone
Timezone is America/Los_Angeles
rfs7000-37FABE(config)#
### 6.1.60 upgrade-status

- **show commands**

Displays the last image upgrade status

- **NOTE:** This command is not available in the USER EXEC Mode.

#### Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
show upgrade-status {detail|on}
show upgrade-status {detail} {(on <DEVICE-NAME>)}
```

#### Parameters

- `show upgrade-status {detail} {(on <DEVICE-NAME>)}`

<table>
<thead>
<tr>
<th>upgrade-status</th>
<th>Displays last image upgrade status and log</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail</td>
<td>Optional. Displays last image upgrade status in detail</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>The following keyword is recursive and common to the “detail” parameter:</td>
</tr>
</tbody>
</table>

- `on <DEVICE-NAME>` — Optional. Displays last image upgrade status on a specified device
- `<DEVICE-NAME>` — Specify the name of the AP, wireless controller, or service platform.

- **Note:** If the ‘on’ keyword is used without the ‘detail’ keyword, the system displays a summary of upgrade status and log on the specified device.

#### Examples

```
rfs4000-229D58# show upgrade-status
Last Image Upgrade Status : In_Progress(3 percent completed)
Last Image Upgrade Time   : 2014-11-27 05:13:05
rfs4000-229D58#
rfs4000-229D58# show upgrade-status
Last Image Upgrade Status : Successful
rfs4000-229D58#
rfs4000-229D58(config)# show upgrade-status detail
Last Image Upgrade Status : Successful
Last Image Upgrade Time   : 2014-11-24 05:16:52
Running from partition /dev/sda8
Free Memory 378044 kB
FWU invoked via Linux shell
Validating image file header
Removing other partition
Making file system
Extracting files (this may take some time).
Control C disabled
Version of firmware update file is 5.7.0.0-041B
```
Creating LILO files
Running LILO
Successful

rfs4000-229D58(config)#
6.1.61 **version**

> show commands

Displays a device’s software and hardware version

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show version {on <DEVICE-NAME>}
```

**Parameters**

- `show version {on <DEVICE-NAME>}`

| **version**<br> `{on <DEVICE-NAME>}` | Displays software and hardware versions on all devices or a specified device  
|--------------------------------------|------------------------------------------------------------------|
| on <DEVICE-NAME> – Optional. Displays software and hardware versions on a specified device  
| <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

**Examples**

```
rfs4000-229D58(config)#show version
RFS4000 version 5.7.0.0-025D
Copyright (c) 2004-2014 Symbol Technologies, Inc. All rights reserved.
Booted from primary

rfs4000-229D58 uptime is 14 days, 03 hours 55 minutes
CPU is Cavium Networks Octeon CN50XX V0.1
Base ethernet MAC address is 00-23-68-22-9D-58
System serial number is 9184521800027
Model number is RFS-4010-00010-WR
PoE firmware version is 211 build 1
FPGA version is 2.28
Radio HAL version is 92 (DFS:73)

rfs4000-229D58(config)#
```
## 6.1.62 vrrp

- `show commands`

Displays Virtual Router Redundancy Protocol (VRRP) protocol details

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

```
show vrrp [brief|details|error-stats|stats]
show vrrp [brief|details|stats] {<1-255>} {on <DEVICE-NAME>}
show vrrp error-stats {on <DEVICE-NAME>}
```

### Parameters

- **brief**
  - Displays virtual router information in brief
- **details**
  - Displays virtual router information in detail
- **stats**
  - Displays virtual router statistics
- **<1-255>**
  - The following keyword is common to all of the above parameters:
    - `<1-255>` – Optional. Displays information for a specified Virtual Router. Specify the router’s ID from 1 - 255.
- **on <DEVICE-NAME>**
  - The following keyword is recursive and common to the ‘<1-255>’ parameter:
    - **on <DEVICE-NAME>** – Optional. Displays specified router information on a specified device
    - **on <DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

### Examples

```
rfs7000-37FABE(config)#show vrrp error-stats
Last protocol error reason: none
IP TTL errors: 0
Version mismatch: 0
Packet Length error: 0
Checksum error: 0
Invalid virtual router id: 0
Authentication mismatch: 0
Invalid packet type: 0
```

```
rfs7000-37FABE(config)#
```
rfs7000-37FABE(config)#show vrrp details
VRRP Group 1:
  version 2
  interface none
  configured priority 1
  advertisement interval 1 sec
  preempt enable, preempt-delay 0
  virtual mac address 00-00-5E-00-01-01
  sync group disable
rfs7000-37FABE(config)#
### 6.1.63 web-filter

#### show commands

Displays pre-configured, in-built Web filter options available. These options are: category (URL category), category-types, filter-level etc. This command also displays Web filter statistics and status.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

#### Syntax

```
show web-filter [category|category-type|config|filter-level [basic|high|low|medium|medium-high]|statistics {on <DEVICE-NAME>]|status
```

#### Parameters

- **show web-filter [category|category-type|config|filter-level [basic|high|low|medium|medium-high]|statistics {on <DEVICE-NAME>]|status**

  - **web-filter** Displays an existing and configured Web filter details
  - **category** Displays Web filter categories. A category is a pre-defined URL list available in the WiNG software.
  - **category-type** Displays the Web filter category types. This is a pre-configured list of categories and sub-categories in to which commonly accessed URLs have been classified.
  - **config** Displays all existing Web filters and their configuration details.
  - **filter-level [basic|high|low|medium|medium-high]** Displays category types for the selected filter-level. Each filter level is pre-configured to use a set of category types. You cannot change the categories in the category types used for these pre-configured filter-level setting. Nor can you add, modify, or remove the category types mapped to a filter-level setting. The options are:
    - basic – Displays all category types configured for the basic filter-level
    - high – Displays all category types configured for the high filter-level
    - low – Displays all category types configured for the low filter-level
    - medium – Displays all category types configured for the medium filter-level
    - medium-high – Displays all category types configured for the medium-high filter-level
  - **statistics {on <DEVICE-NAME>}}** Displays Web filter statistics on a specified device
    - on <DEVICE-NAME> – Optional. Specifies the device name
    - <DEVICE-NAME> – Specify the name of the AP, controller, or service platform.

  **Note:** Web filtering is a licensed feature, and only when enforced can the system display Web filtering statistics.

  - **status {on <DEVICE-NAME>}}** Displays Web filter status on a specified device
    - on <DEVICE-NAME> – Optional. Specifies the device name
    - <DEVICE-NAME> – Specify the name of the AP, controller, or service platform.

  **Note:** Web filtering is a licensed feature, and only when enforced can the system display Web filtering status.
Examples

```
nx9500-6C8809(config)#show web-filter category
  advertisement-popups
    Sites that provide advertising graphics or other ad content
    files such as banners and pop-ups.
  alcohol-tobacco
    Sites that promote or sell alcohol- or tobacco-related
    products or services.
  anonymizers
    Sites and proxies that act as an intermediary for surfing to
    other websites in an anonymous fashion, whether to
    circumvent web filtering or for other reasons.
  arts
    Sites with artistic content or relating to artistic
    institutions such as theaters, museums, galleries, dance
    companies, photography, and digital graphic resources.
  botnets
    Sites that use bots (zombies) including command-and-control
    sites.
--More--
nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#show web-filter config
URL filters configured for this device are:
  WebFilter_ShoppingSites
    Blacklisted categories:
      shopping,
    Whitelisted categories:
      <AllowedShopping>,
 nx9500-6C8809(config)#
```
6.1.64 what

> show commands

Displays details of a specified search phrase (performs global search)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`show what [contain|is] <WORD> {on <DEVICE-OR-DOMAIN-NAME>}`

**Parameters**

- `contain <WORD>` Searches on all the items that contain a specified word
  - `<WORD>` – Specify a word to search (for example, MAC address, hostname etc.).
- `is <WORD>` Searches on an exact match
  - `<WORD>` – Specify a word to search (for example, MAC address, hostname etc.).
- `on <DEVICE-OR-DOMAIN-NAME>` Optional. Performs global search on a specified device or RF Domain
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

**Examples**

```
rfs4000-229D58#show what contain default
---------------------------------------------------------------------------------------
NO.  CATEGORY             MATCHED                        OTHER KEY INFO (1)             OTHER
     KEY INFO (2)             NAME/VALUE                     NAME/VALUE (2)             NAME/VALUE
---------------------------------------------------------------------------------------
      1  device-cfg           default-trustpoint             rfs4000                        00-
            23-68-22-9D-58              default
      2  firewall_policy      default                        default                        True
            name
      3  management_policy    default                        default                        True
            timeout
---------------------------------------------------------------------------------------
```

```
---More---
rfs4000-229D58#
```
## 6.1.65 wireless

> show commands

Displays wireless configuration parameters

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

```
show wireless [ap|client|meshpoint|mobility-database|radio|regulatory|rf-domain|
sensor-server|unsanctioned|wips|wlan]
```

```
show wireless ap {configured|detail|load-balancing|on <DEVICE-NAME>}
show wireless ap {configured}
show wireless ap {detail} {<MAC/HOST-NAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
show wireless ap {load-balancing} {client-capability|events|neighbors}
{(on <DEVICE-NAME>)}
```

```
show wireless client {association-history|detail|filter|include-ipv6|on <DEVICE-OR-DOMAIN-NAME>|statistics|tspec}
```

```
show wireless client {association-history <MAC>} {on <DEVICE-OR-DOMAIN-NAME>}
show wireless client {detail <MAC>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

```
show wireless client {filter [ip|on|state|wlan]}
show wireless client {filter [ip [<IP>|not <IP>]]} {on <DEVICE-OR-DOMAIN-NAME>}
show wireless client {filter} {on <DEVICE-OR-DOMAIN-NAME>}
```

```
show wireless client {filter} {wlan [<WLAN-NAME]|not <WLAN-NAME>]
{on <DEVICE-OR-DOMAIN-NAME>}
```

```
show wireless client {include-ipv6} {detail|on|filter}
show wireless client {include-ipv6} {detail <MAC>} {((on <DEVICE-OR-DOMAIN-NAME>)}
show wireless client {include-ipv6} {filter [ip|ipv6|state|wlan]}
```

```
show wireless client {statistics} {detail|on|rf|window-data}
show wireless client {statistics} {detail <MAC>|rf|window-data <MAC>}
{((on <DEVICE-OR-DOMAIN-NAME>)}
```

```
show wireless client {tspec <MAC>} {((on <DEVICE-OR-DOMAIN-NAME>)}
```

```
show wireless meshpoint {config|detail|multicast|neighbor|on|path|proxy|root|security|statistics|tree|usage-mappings}
show wireless meshpoint {config} {filter [device <DEVICE-NAME>|rf-domain <DOMAIN-NAME>]
show wireless meshpoint {detail} {<MESHPOINT-NAME>}
show wireless meshpoint {on <DEVICE-OR-DOMAIN-NAME>}
show wireless meshpoint {multicast|path|proxy|root|security|statistics} [{<MESHPOINT-NAME>|detail}] {on <DEVICE-OR-DOMAIN-NAME>}
show wireless meshpoint neighbor [{<MESHPOINT-NAME>|detail}statistics {rf}]
{on <DEVICE-OR-DOMAIN-NAME>}
```

```
show wireless meshpoint {tree} {on <DEVICE-OR-DOMAIN-NAME>}
show wireless meshpoint {usage-mappings}
```

```
show wireless mobility-database {on <DEVICE-NAME>}
```

```
show wireless radio {detail|on <DEVICE-OR-DOMAIN-NAME>|statistics|tspec|wlan-map}
show wireless radio {detail} {<DEVICE-NAME>|filter|on <DEVICE-OR-DOMAIN-NAME>}

show wireless radio {statistics} {detail|window-data} {<DEVICE-NAME>} {<1-3>}
filter <RADIO-MAC> {(on <DEVICE-OR-DOMAIN-NAME>)}
show wireless radio {tspec} {<DEVICE-NAME>|filter|on <DEVICE-OR-DOMAIN-NAME>|option}
show wireless radio {wlan-map} {on <DEVICE-OR-DOMAIN-NAME>}

show wireless regulatory [channel-info <WORD>|country-code <WORD>|device-type]
show wireless regulatory device-type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap7131|ap7161|ap7181|ap82xx|rfs4000] <WORD>

show wireless rf-domain statistics {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}
show wireless sensor-server {on <DEVICE-OR-DOMAIN-NAME>}
show wireless unsanctioned aps {detail|statistics} {(on <DEVICE-OR-DOMAIN-NAME>)}
show wireless wips [client-blacklist|event-history] {on <DEVICE-OR-DOMAIN-NAME>}
show wireless wlan {config|detail <WLAN>|on <DEVICE-OR-DOMAIN-NAME>|policy-mappings|statistics|usage-mappings} {on <DEVICE-OR-DOMAIN-NAME>}
show wireless wlan {detail <WLAN>|on <DEVICE-OR-DOMAIN-NAME>|policy-mappings|usage-mappings}
show wireless wlan {config filter {device <DEVICE-NAME>|rf-domain <DOMAIN-NAME>}}
show wireless wlan statistics {<WLAN>|detail|traffic} {on <DEVICE-OR-DOMAIN-NAME>}

**Parameters**

- **show wireless ap {configured}**

| wireless | Displays wireless configuration parameters |
| ap | Displays managed access point information |
| configured | Optional. Displays configured AP information, such as name, MAC address, profile, RF Domain and adoption status |

- **show wireless ap {detail} {<MAC/HOST-NAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}**

| wireless | Displays wireless configuration parameters |
| ap | Displays managed access point information |
| detail | Optional. Displays detailed information for all APs or a specified AP |
| <MAC/HOST-NAME> | • <MAC/HOST-NAME> – Optional. Displays information for a specified AP. Specify the AP’s MAC address. |
| on <DEVICE-OR-DOMAIN-NAME> | The following keyword is recursive and common to the ‘detail <MAC/HOST-NAME>’ parameter: |
| | • on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays information on a specified device or RF Domain |
| | • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain. |

- **show wireless ap {load-balancing} {client-capability|events|neighbors} {on <DEVICE-NAME>}**

<p>| wireless | Displays wireless configuration parameters |
| ap | Displays managed access point information |</p>

### SHOW COMMANDS

**show wireless client {tspec} {<MAC>} {on <DEVICE-OR-DOMAIN-NAME>}**

- **wireless**
  - Displays wireless configuration parameters
- **client**
  - Displays client information based on the parameters passed
- **tspec <MAC>**
  - Optional. Displays detailed traffic specification (TSPEC) information for all clients or a specified client
    - **<MAC>** – Optional. Displays detailed TSPEC information for a specified client. Specify the MAC address of the client.

**on <DEVICE-OR-DOMAIN-NAME>**

The following keyword is recursive and common to the ‘tspec <MAC>’ parameter:

- **on <DEVICE-OR-DOMAIN-NAME>** – Optional. Displays detailed TSPEC information for wireless clients on a specified device or RF Domain
- **<DEVICE-OR-DOMAIN-NAME>** – Specify the name of the AP, wireless controller, service platform, or RF Domain.

**show wireless client {include-ipv6} {detail <MAC>} {on <DEVICE-OR-DOMAIN-NAME>}**

- **wireless**
  - Displays wireless configuration parameters
- **client**
  - Displays client information based on the parameters passed
- **include-ipv6**
  - Includes IPv6 address (if known) of wireless clients
- **detail <MAC>**
  - Optional. Displays detailed wireless client(s) information
    - **<MAC>** – Optional. Displays detailed information for a specified wireless client. Specify the MAC address of the client.

**on <DEVICE-OR-DOMAIN-NAME>**

The following keyword is recursive and common to the ‘detail <MAC>’ parameter:

- **on <DEVICE-OR-DOMAIN-NAME>** – Optional. Displays detailed information on a specified device or RF Domain
- **<DEVICE-OR-DOMAIN-NAME>** – Specify the name of the AP, wireless controller, service platform, or RF Domain.

**show wireless client {include-ipv6} {filter {ip|ipv6|state|wlan}}**

- **wireless**
  - Displays wireless configuration parameters
- **client**
  - Displays wireless client information based on the parameters passed
- **include-ipv6 {filter}**
  - Optional. Includes IPv6 address (if known) of wireless clients
    - **filter** – Optional. Defines additional filters. Use one of the following options to filter clients: ip, ipv6, state, and wlan
  - **Note:** By default the system only displays the IPv4 address of clients. The include-ipv6 parameter includes the known IPv6 address of each client.
### show wireless meshpoint

</tbody>
</table>
| `show wireless meshpoint {neighbor} [<MESHPOINT-NAME>| detail| statistics {rf}]` | Displays meshpoint neighbor information, based on the parameters passed. Select one of the following parameter to view neighbor related information:  
  - `<MESHPOINT-NAME>` – Displays detailed multicast information for a specified meshpoint. Specify the meshpoint name.  
  - `detail` – Displays detailed multicast information for all meshpoints  
  - `statistics` – Displays neighbors related statistics  
  - `rf` – Optional. Displays RF related statistics for neighbors  

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `show wireless meshpoint {tree} {on <DEVICE-OR-DOMAIN-NAME>}` | Displays meshpoint network tree. The following keyword is common to all of the above parameters:  
  - `on <DEVICE-OR-DOMAIN-NAME>` – Optional. Displays meshpoint network tree on a specified device or RF Domain. |

**Note:** The `show > wireless > meshpoint > tree` command can be executed only from a wireless controller.
### show wireless mobility-database {on <DEVICE-NAME>}

- **usage-mappings**: Optional. Lists all devices and profiles using the meshpoint
- **on <DEVICE-OR-DOMAIN-NAME>**: Optional. Displays meshpoint applied to a specified device or RF Domain
  - `<DEVICE-OR-DOMAIN-NAME>` – Optional. Specify the name of AP, wireless controller, service platform, or RF Domain

### show wireless radio {detail} {filter/on} {on <DEVICE-OR-DOMAIN-NAME>}

- **wireless**: Displays wireless configuration parameters
- **mobility-database**: Displays controller-assisted mobility database
- **on <DEVICE-OR-DOMAIN-NAME>**: The following keyword is recursive and common to the ‘filter <RADIO-MAC>’ parameter:
  - **on <DEVICE-OR-DOMAIN-NAME>**: Optional. Displays detailed radio operation status for all or a specified radio on a specified device or RF Domain.

- **<DEVICE-NAME>**: Optional. Displays detailed information for a specified radio. Specify the MAC address or hostname, or append the interface number to form the radio ID in the AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX format.
- **<1-3>**: Optional. Specify the radio interface index from 1 - 3 (if not specified as part of the radio ID)
- **filter <RADIO-MAC>**: Optional. Provides additional filters
  - `<RADIO-MAC>` – Uses MAC address to filter radios
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

- **on <DEVICE-OR-DOMAIN-NAME>**: Optional. After specifying the radio MAC address, further refine the search by specifying a device or RF Domain.
  - `<DEVICE-OR-DOMAIN-NAME>` – Optional. Displays detailed radio operation status for all or a specified radio on a specified device or RF Domain.
### SHOW Commands

**Usage Guidelines**

The customize command enables you to customize the `show > wireless` command output.

```bash
rfs7000-37FABE(config)#customize ?
hostname-column-width Customize hostname column width
show-adoption-status Customize the output of (show adoption status) command
show-wireless-client Customize the output of (show wireless client) command
show-wireless-client-stats Customize the output of (show wireless client stats) command
show-wireless-client-stats-rf Customize the output of (show wireless client stats rf) command
show-wireless-legacy-mesh-client-stats Customize the output of (show wireless mint client stats) command
show-wireless-legacy-mesh-client-stats-detail Customize the output of (show wireless mint client stats detail) command
show-wireless-legacy-mesh-client-stats-rf Customize the output of (show wireless mint client stats rf) command
show-wireless-meshpoint Customize the output of (show wireless meshpoint) command
show-wireless-meshpoint-accelerated-multicast Customize the output of (show wireless meshpoint accelerated-multicast) command
show-wireless-meshpoint-neighbor-stats Customize the output of (show wireless meshpoint neighbor stats) command
show-wireless-meshpoint-neighbor-stats-rf Customize the output of (show wireless meshpoint neighbor stats rf) command
show-wireless-radio Customize the output of (show wireless radio) command
show-wireless-radio-stats Customize the output of (show wireless radio stats) command
show-wireless-radio-stats-rf Customize the output of (show wireless radio stats rf) command
```

rfs7000-37FABE(config)#
The default setting for the `show > wireless > client` command is as follows:

```bash
rfs7000-37FABE(config)#show wireless client
```

<table>
<thead>
<tr>
<th>MAC</th>
<th>IPv4</th>
<th>VENDOR</th>
<th>RADIO-ID</th>
<th>WLAN</th>
<th>VLAN</th>
<th>STATE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Total number of wireless clients displayed: 0

```
rfs7000-37FABE(config)#
```

The above output can be customized, using the `customize > show-wireless-client` command, as follows:

```bash
rfs7000-37FABE(config)#customize show-wireless-client mac ip vendor vlan radio-id state wlan location radio-alias radio-type
rfs7000-37FABE(config)#commit
```

```bash
rfs7000-37FABE(config)#show wireless client
```

<table>
<thead>
<tr>
<th>MAC</th>
<th>IP</th>
<th>VENDOR</th>
<th>VLAN</th>
<th>RADIO-ID</th>
<th>STATE</th>
<th>WLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Total number of wireless clients displayed: 0

```
rfs7000-37FABE(config)#
```

For more information on the `customize` command, see.

**Examples**

```bash
nx9500-6C8809(config)#show wireless wlan config
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>ENABLE</th>
<th>SSID</th>
<th>ENCRYPTION</th>
<th>AUTHENTICATION</th>
<th>VLAN</th>
<th>BRIDGING MODE</th>

6.1.66 wwan

Displays wireless WAN status

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}

Parameters

- show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>wwan</th>
<th>Displays wireless WAN configuration and status details</th>

+--------------------------------------------------+
6.1.67 slot

Displays Peripheral Component Interconnect (PCI) express slot statistics. Use this command to view if the slots have been used for Team-Centro VM or WiNG support.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax
show slot

Parameters
- show slot

show slot | Shows PCI express card statistics

Examples
nx4500-5CFA2B>show slot
-------------------------------
SLOT  TYPE MODULE  STATUS
-------------------------------
 1     [ ] wing  Enabled
 2     [ ] wing  Enabled
 3     [ ] wing  Enabled
 4     [ ] wing  Enabled
-------------------------------
nx4500-5CFA2B>
6.1.68 **smart-cache**

- **show commands**

Displays details on the cached entry for a specific URL or all URLs

---

**NOTE:** Smart content caching is a licensed feature and can be enabled only if a license is procured and applied to the device. For more information, see `smart-cache-policy`.

---

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show smart-cache [active-requests|clients|purge-requests|statistics content-type|storage] {on <DEVICE-NAME>}
```

**Parameters**

- `show smart-cache [active-requests|clients|purge-requests|statistics content-type|storage] {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>smart-cache</th>
<th>Displays smart-cache related information</th>
</tr>

### 6.1.69 virtual-machine

- **show commands**

  Displays the `virtual-machine` (VM) configuration, logs, and statistics

  Supported in the following platforms:
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

**Syntax**

- `show virtual-machine [configuration|debugging|export|statistics]
- `show virtual-machine [configuration|statistics] {<VM-NAME>|team-urc|team-rls|team-vowlan} {(on <DEVICE-NAME>)}
- `show virtual-machine debugging {level|on}
- `show virtual-machine debugging {level {debug|error|info|warning}} {on <DEVICE-NAME>}
- `show virtual-machine export <VM-NAME> {on <DEVICE-NAME>}

The NX9500 and NX9510 series service platforms support ADSP and TEAM-CMT virtual machines only. The following show commands are specific to the NX9500 and NX9510 devices:

- `show virtual-machine [configuration|statistics] {<VM-NAME>|adsp|team-cmt}

**Parameters**

- `show virtual-machine [configuration|statistics] {<VM-NAME>|team-urc|team-rls|team-vowlan} {(on <DEVICE-NAME>)}

<table>
<thead>
<tr>
<th>configuration</th>
<th>Displays detailed VM configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>statistics</td>
<td>Displays VM statistics</td>
</tr>
<tr>
<td><code>&lt;VM-NAME&gt;</code></td>
<td>The following keywords are common to the 'configuration' and 'statistics' parameters:</td>
</tr>
<tr>
<td>team-urc</td>
<td>• <code>&lt;VM-NAME&gt;</code> – Optional. Displays VM configuration or statistics for the virtual machine identified by the <code>&lt;VM-NAME&gt;</code> keyword. Specify the VM name.</td>
</tr>
<tr>
<td>team-rls</td>
<td>• team-urc – Optional. Displays TEAM-URC (IP-PBX) VM configuration/statistics</td>
</tr>
<tr>
<td>team-vowlan</td>
<td>• team-rls – Optional. Displays TEAM-RLS (Radio Link Server) VM configuration/statistics</td>
</tr>
<tr>
<td></td>
<td>• team-vowlan – Optional. Displays TEAM-VoWLAN (Voice over WLAN) VM configuration/statistics</td>
</tr>
<tr>
<td><code>&lt;DEVICE-NAME&gt;</code></td>
<td>Specifying the name of the device on which the command is executed.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the service platform.</td>
</tr>
</tbody>
</table>

- `show virtual-machine [configuration|statistics] {<VM-NAME>|adsp|team-cmt} {(on <DEVICE-NAME>)}

<table>
<thead>
<tr>
<th>configuration</th>
<th>Displays detailed VM configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>statistics</td>
<td>Displays VM statistics</td>
</tr>
</tbody>
</table>
The following keywords are common to the 'configuration' and 'statistics' parameters:

- `<VM-NAME>` – Optional. Displays VM configuration or statistics for the virtual machine identified by the `<VM-NAME>` keyword. Specify the VM name.
- `adsp` – Optional. Displays Air-Defense Services Platform (ADSP) VM configuration/statistics
- `team-cmt` – Optional. Displays TEAM-CMT VM configuration/statistics

**Note:** These keywords are specific to the NX9500 and NX9510 service platforms.

Specifies the name of the device on which the command is executed
- `<DEVICE-NAME>` – Specify the name of the service platform.

Optional. Displays VM logs based on the level selected. The available options are:
- `debug` – Displays VM logs of level debug and above
- `error` – Displays VM logs of level error
- `info` – Displays VM logs of level info and above
- `warning` – Displays VM logs of level warning and above

**Note:** The NX9500 and NX9510 series service platforms will display ADSP and TEAM-CMT VM debugging logs.

Specifies the name of the device on which the command is executed
- `<DEVICE-NAME>` – Specify the name of the service platform.

Displays VM configuration export related information
- `<VM-NAME>` – Specify the VM name.

**Note:** The NX9500 and NX9510 series service platforms will display ADSP and TEAM-CMT VM configuration export information

**Examples**

```
nx4500-5CFA2B#show virtual-machine configuration team-urc
VM: team-urc
  autostart : start
  bootloader : /usr/bin/pygrub
  cpus : ["3","2"]

6.1.70 **mirroring**

- **show commands**

  Displays the port mirroring sessions

  For more information on configuring port mirroring sessions, see *mirror*.

  Supported in the following platforms:

  - Service Platforms — NX4524, NX6524

**Syntax**

`show mirroring`

**Parameters**

- `show mirroring`

| show mirroring | Displays the port mirroring sessions |

**Examples**

```
nx4524-470984# show mirroring

+-------------+-----------------+-----------------+----------+
| Session     | Source          | Destination     | Direction |
|-------------+-----------------+-----------------+----------+
| 1           | ge3             | ge24            | any      |
| 2           | ge7             | ge24            | inbound  |
| 3           | ge5             | ge24            | outbound |

nx4524-470984#  ```
6.1.71 raid

- show commands

Displays Redundant Array of Independent Disks (RAID) related information, such as array status, consistency check status, and RAID log.

Use this command to assess the RAID array's drive utilization and whether the drives are currently online. Since there is only one RAID array controller reporting status to the service platform, it is important to know if other drives house hot spare drives as additional resources should one of the dedicated drives fail. This command also displays whether a physical within the RAID array has a drive installed, and whether the drive is currently online.

For more information on configuring RAID, see raid.

Supported in the following platforms:
- Service Platforms — NX9500

Syntax

```
show raid {on <DEVICE-NAME>}
```

Parameters

- show raid {on <DEVICE-NAME>}

Examples

```
nx9500-6C874D(config)#show raid
Logical drive info:
  Size 930 GB, State optimal
  Alarm enabled
  Last check: Sat Aug 10 02:56:54 2013
  Last check result: ending

  Physical drive info:
  Drive 0: online
  Drive 1: online
  Drive 2: not-installed
  Drive 3: not-installed
  Drive 4: not-installed

nx9500-6C874D(config)#
```
Profiles enable administrators to assign a common set of configuration parameters, policies, WLANs, wireless parameters, and
security parameters to service platforms, wireless controllers, and access points across a large, multi segment, site. The
configuration parameters within a profile are based on the hardware model the profile was created to support.

The service platforms, wireless controllers, and access points support both default and user-defined profiles. Each default and
user-defined profile contains policies and configurations that are applied to devices assigned to the profile. Changes made to
these configurations are automatically inherited by the assigned devices. Therefore, the central benefit of a profile is its ability
to update devices collectively without having to modify individual device configurations.

Default profiles are system maintained and are automatically applied to service platforms and wireless controllers. The default
AP profile is automatically applied to a AP (discovered by a wireless controller or service platform) unless an AP auto
provisioning policy is defined specifically assigning the AP to a user-defined profile. After adoption, changes made to a profile’s
parameters are reflected across all devices using the profile. Default profiles are ideal for single site deployments where
service platforms, wireless controllers, and access points share a common configuration.

User-defined profiles, on the other hand, are manually created for each supported service platform, wireless controller, and
access point model. The use of user-defined profiles is recommended in larger deployments when groups of devices (on
different floors, buildings or sites) share a common configuration. These user-defined profiles can be manually or automatically
assigned to access points using an AP auto provisioning policy. An AP auto provisioning policy provides the means to assign
profiles to access points based on model, serial number, VLAN ID, DHCP options, IP address (subnet) and MAC address. For
more information, see Chapter 9, AUTO-PROVISIONING-POLICY.

A user defined profile can be created for each of the following device type:

- **AP621** – Adds an AP621 access point profile
- **AP622** – Adds an AP622 access point profile
- **AP650** – Adds an AP650 access point profile
- **AP6511** – Adds an AP6511 access point profile
- **AP6521** – Adds an AP6521 access point profile
- **AP6522** – Adds an AP6522 access point profile
- **AP6532** – Adds an AP6532 access point profile
- **AP6562** – Adds an AP6562 access point profile
- **AP71XX** – Adds an AP71XX access point profile supporting the AP7131, AP7161, and AP7181 models
- **AP7502** – Adds an AP7502 access point profile
- AP7522 – Adds an AP7522 access point profile
- AP7532 – Adds an AP7532 access point profile
- AP81XX – Adds an AP81XX access point profile supporting the AP8122, AP8132, and AP8163 models
- AP82XX – Adds an AP82XX access point profile supporting the AP8222 and AP8232 models
- RFS4000 – Adds an RFS4000 wireless controller profile
- RFS6000 – Adds an RFS6000 wireless controller profile
- RFS7000 – Adds an RFS7000 wireless controller profile
- NX45XX – Adds an NX45XX series service platform profile supporting the NX4500 and NX4524 models
- NX65XX – Adds an NX65XX series service platform profile supporting the NX6500 and NX6524 models
- NX7500 – Adds an NX75XX series service platform profile supporting the NX7510, NX7520, and NX7530 models
- NX9XXX – Adds an NX9XXX series service platform profile supporting the NX9000, NX9500, and NX9510 models
- T5 – Adds a T5 controller profile
- vx9000 – Adds a VX9000 profile

**NOTE:** A T5 profile can be created only on the following platforms: RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, and NX9510.

**NOTE:** A VX9000 profile can be created only on the NX9000 series service platforms.

Although profiles assign a common set of configuration parameters across devices, individual devices can still be assigned unique configuration parameters that follow the flat configuration model. As individual device updates are made, these devices no longer share the profile based configuration they originally supported. Therefore, changes made to a profile are not automatically inherited by devices who have had their configuration customized. These devices require careful administration, as they cannot be tracked as profile members. Their customized configurations overwrite their profile configurations until the profile is re-applied.

**NOTE:** The commands present under ‘Profiles’ are also available under the ‘Device mode’. The additional commands specific to the ‘Device mode’ are listed separately.

This chapter is organized into the following topics:

- Profile Config Commands
- Device Config Commands
- T5 Profile Config Commands
To view the list of device profiles supported, use the following command:

```
<DEVICE>(config)#profile ?
anyap       Any access point profile
ap621       AP621 access point profile
ap622       AP622 access point profile
ap650       AP650 access point profile
ap6511      AP6511 access point profile
ap6521      AP6521 access point profile
ap6522      AP6522 access point profile
ap6532      AP6532 access point profile
ap6562      AP6562 access point profile
ap71xx      AP71XX access point profile
ap7502      AP7502 access point profile
ap7522      AP7522 access point profile
ap7532      AP7532 access point profile
ap81xx      AP81XX access point profile
ap82xx      AP82XX access point profile
containing  Specify profiles that contain a sub-string in the profile name
filter      Specify addition selection filter
nx45xx      NX45XX integrated services platform profile
nx65xx      NX65XX integrated services platform profile
nx75xx      NX75XX wireless controller profile
nx9000      NX9000 wireless controller profile
rfs4000     RFS4000 wireless controller profile
rfs6000     RFS6000 wireless controller profile
rfs7000     RFS7000 wireless controller profile
t5          T5 wireless controller profile
vx9000      VX9000 wireless controller profile
```

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
```

```
<DEVICE>(config-profile-<PROFILE-NAME>)#
```

The following example shows the commands specific to a NX45XX and NX65XX series service platform profile:

```
x4500-5CFA2B(config)#profile ?
anyap       Any access point profile
ap621       AP621 access point profile
ap622       AP622 access point profile
ap650       AP650 access point profile
ap6511      AP6511 access point profile
ap6521      AP6521 access point profile
ap6522      AP6522 access point profile
ap6532      AP6532 access point profile
ap6562      AP6562 access point profile
ap71xx      AP71XX access point profile
ap7502      AP7502 access point profile
ap7522      AP7522 access point profile
ap7532      AP7532 access point profile
ap81xx      AP81XX access point profile
ap82xx      AP82XX access point profile
containing  Specify profiles that contain a sub-string in the profile name
filter      Specify addition selection filter
nx45xx      NX45XX integrated services platform profile
nx65xx      NX65XX integrated services platform profile
rfs4000     RFS4000 wireless controller profile
rfs6000     RFS6000 wireless controller profile
rfs7000     RFS7000 wireless controller profile
t5          T5 wireless controller profile

## 7.1 Profile Config Commands

The following table summarizes profile configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>adopter-auto-provisioning-policy-lookup</td>
<td>Enables the use of a centralized auto provisioning policy on this profile</td>
<td>page 7-11</td>
</tr>
<tr>
<td>adoption</td>
<td>Configures a minimum and maximum delay time in the initiation of the device adoption process</td>
<td>page 7-12</td>
</tr>
<tr>
<td>alias</td>
<td>Configures network, network-group, network-service, VLAN, and string aliases on this profile</td>
<td>page 7-13</td>
</tr>
<tr>
<td>analytics</td>
<td>Enables analytics in the NX9000 profile/device configuration context</td>
<td>page 7-18</td>
</tr>
<tr>
<td>area</td>
<td>Sets the system's area of location (the area name)</td>
<td>page 7-19</td>
</tr>
<tr>
<td>arp</td>
<td>Configures static address resolution protocol</td>
<td>page 7-20</td>
</tr>
<tr>
<td>auto-learn-staging-config</td>
<td>Enables network configuration learning of devices</td>
<td>page 7-22</td>
</tr>
<tr>
<td>autogen-uniqueid</td>
<td>Autogenerates a unique local ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device.</td>
<td>page 7-23</td>
</tr>
<tr>
<td>autoinstall</td>
<td>Configures the automatic install feature</td>
<td>page 7-25</td>
</tr>
<tr>
<td>bluetooth-detection</td>
<td>Enables detection of Bluetooth devices. These are devices using the Bluetooth USB module.</td>
<td>page 7-26</td>
</tr>
<tr>
<td>bridge</td>
<td>Configures bridge specific parameters</td>
<td>page 7-28</td>
</tr>
<tr>
<td>captive-portal</td>
<td>Configures captive portal advanced Web page upload on a device profile</td>
<td>page 7-54</td>
</tr>
<tr>
<td>cdp</td>
<td>Enables Cisco Discovery Protocol (CDP) on a device</td>
<td>page 7-55</td>
</tr>
<tr>
<td>cluster</td>
<td>Configures a cluster name</td>
<td>page 7-56</td>
</tr>
<tr>
<td>configuration-persistence</td>
<td>Enables persistence of configuration across reloads</td>
<td>page 7-59</td>
</tr>
<tr>
<td>controller</td>
<td>Configures a wireless controller or service platform</td>
<td>page 7-60</td>
</tr>
<tr>
<td>critical-resource</td>
<td>Monitors resources that are critical to the health of the service platform, wireless controller, or access point managed network. These critical resources are identified by their configured IP addresses.</td>
<td>page 7-64</td>
</tr>
<tr>
<td>crypto</td>
<td>Configures data encryption related protocols and settings</td>
<td>page 7-67</td>
</tr>
<tr>
<td>device-upgrade</td>
<td>Configures device firmware upgrade settings on this profile</td>
<td>page 7-129</td>
</tr>
<tr>
<td>dot1x</td>
<td>Configures 802.1x standard authentication controls</td>
<td>page 7-131</td>
</tr>
</tbody>
</table>
The following table summarizes the profile configuration commands and their descriptions:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>dscp-mapping</td>
<td>Configures an IP DSCP to 802.1p priority mapping for untagged frames</td>
<td>page 7-133</td>
</tr>
<tr>
<td>email-notification</td>
<td>Configures e-mail notification settings</td>
<td>page 7-134</td>
</tr>
<tr>
<td>enforce-version</td>
<td>Enables checking of a device’s firmware version before attempting adoption or clustering</td>
<td>page 7-136</td>
</tr>
<tr>
<td>environmental-sensor</td>
<td>Configures the environmental sensor settings on this profile (applicable to AP8132 model access point only)</td>
<td>page 7-137</td>
</tr>
<tr>
<td>events</td>
<td>Enables system event logging and message generation. This command also configures event message forwarding settings.</td>
<td>page 7-139</td>
</tr>
<tr>
<td>export</td>
<td>Enables export of startup.log file after every boot</td>
<td>page 7-140</td>
</tr>
<tr>
<td>floor</td>
<td>Sets the floor name where the system is located</td>
<td>page 7-141</td>
</tr>
<tr>
<td>gre</td>
<td>Enables Generic Routing Encapsulation (GRE) tunneling on this profile</td>
<td>page 7-142</td>
</tr>
<tr>
<td>http-analyze</td>
<td>Configures HTTP analysis settings</td>
<td>page 7-154</td>
</tr>
<tr>
<td>http-analyze (NX45XX, NX65XX, and NX9000)</td>
<td>Configures HTTP analysis settings on a NX series service platform</td>
<td>page 7-155</td>
</tr>
<tr>
<td>interface</td>
<td>Configures an interface (VLAN, radio, GE etc.)</td>
<td>page 7-158</td>
</tr>
<tr>
<td>ip</td>
<td>Configures IPv4 components</td>
<td>page 7-325</td>
</tr>
<tr>
<td>ipv6</td>
<td>Configures IPv6 components</td>
<td>page 7-334</td>

</tr>
<tr>
<td><code>offline-duration</code></td>
<td>Sets the duration, in minutes, for which a device remains unadopted before it generates offline event</td>
<td>page 7-379</td>
</tr>
<tr>
<td><code>power-config</code></td>
<td>Configures the power mode</td>
<td>page 7-380</td>
</tr>
<tr>
<td><code>preferred-controller-group</code></td>
<td>Specifies the wireless controller or service platform group preferred for adoption</td>
<td>page 7-382</td>
</tr>
<tr>
<td><code>preferred-tunnel-controller</code></td>
<td>Configures the tunnel wireless controller or service platform preferred by the system to tunnel extended VLAN traffic</td>
<td>page 7-383</td>
</tr>
<tr>
<td><code>radius</code></td>
<td>Configures device-level RADIUS authentication parameters</td>
<td>page 7-384</td>
</tr>
<tr>
<td><code>raid</code></td>
<td>Enables alarm on the array. This command is supported only on the NX9500 and NX9510 series service platform profile/device config modes.</td>
<td>page 7-443</td>
</tr>
<tr>
<td><code>remove-override</code></td>
<td>Removes device-specific overrides. This command specifically removes the overrides applied on a device relating to the blue-tooth-detection and offline-duration options.</td>
<td>page 7-385</td>
</tr>
<tr>
<td><code>rf-domain-manager</code></td>
<td>Enables devices using this profile to be elected as RF Domain manager. Also sets the priority value for devices using this profile in the RF Domain manager election process.</td>
<td>page 7-386</td>
</tr>
</tbody>
</table>
### Table 7.1 Profile-Config Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>router</td>
<td>Configures dynamic router protocol settings</td>
<td>page 7-387</td>
</tr>
<tr>
<td>spanning-tree</td>
<td>Configures spanning tree related settings</td>
<td>page 7-389</td>
</tr>
<tr>
<td>traffic-class-mapping</td>
<td>Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority</td>
<td>page 7-392</td>
</tr>
<tr>
<td>tunnel-controller</td>
<td>Configures the name of tunneled WLAN (extended VLAN) wireless controller or service platform</td>
<td>page 7-394</td>
</tr>
<tr>
<td>use</td>
<td>Uses pre configured policies with this profile</td>
<td>page 7-395</td>
</tr>
<tr>
<td>vrrp</td>
<td>Configures Virtual Router Redundancy Protocol (VRRP) group settings</td>
<td>page 7-399</td>
</tr>
<tr>
<td>vrrp-state-check</td>
<td>Publishes interface via OSPF or BGP based on VRRP status</td>
<td>page 7-403</td>
</tr>
<tr>
<td>wep-shared-key-auth</td>
<td>Enables support for 802.11 WEP shared key authentication</td>
<td>page 7-404</td>
</tr>
<tr>
<td>service</td>
<td>Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode</td>
<td>page 7-405</td>
</tr>
<tr>
<td>slot</td>
<td>Assigns a physical slot for running Team-Centro VM on this profile/device. This feature is support only on the NX45XX and NX65XX series service platforms.</td>
<td>page 7-410</td>
</tr>
</tbody>
</table>

---

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS.*
7.1.1 adopter-auto-provisioning-policy-lookup

Profile Config Commands

Enables the use of a centralized auto provisioning policy on this profile or device. This option is applicable in an hierarchically managed (HM) network. When enabled, the auto-provisioning policy applied on the NOC gets precedence over the one applied at the site controller level. Optionally, use the 'evaluate-always' option to set flag to run centralized auto-provisioning policy every time a device (access point/controller) is adopted. The device’s previous adoption status is not taken into consideration.

When applied on devices adopted by a controller, this profile allows the devices to use a centralized auto provisioning policy.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

adopter-auto-provisioning-policy-lookup {evaluate-always}

Parameters

- adopter-auto-provisioning-policy-lookup {evaluate-always}

| adopter-auto-provisioning-policy-lookup {evaluate-always} | Enables the use of a centralized auto provisioning policy on this profile or device
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>evaluate-always</td>
<td>Optional. Sets flag to run centralized auto-provisioning policy every time a device (access point/controller) is adopted.</td>
</tr>
</tbody>
</table>

| no | Enables the application of centralized auto provisioning policy on this profile or device |
### 7.1.2 adoption

#### Profile Config Commands

Configures a minimum and maximum delay time in the initiation of the device adoption process. When configured, devices do not attempt adoption immediately on coming up. The process is initiated after the lapse of a specified period of time (configured using this command as the *start-delay minimum* time).

Once configured and applied, this setting is applicable on all devices using this profile. This option is also available in the device-configuration mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
adoption start-delay min <0-30> max <0-30>
```

**Parameters**

- adoption start-delay min <0-30> max <0-30>

  Delays start of device adoption process

  - min <0-30> — Configures the minimum time to lapse before a device attempts adoption. Specify a value from 0 - 30 seconds. A device, on coming up, attempts adoption only after the lapse of the time specified here. The default is 5 seconds.

  - max <0-30> — Configures the maximum time to lapse before a device attempts adoption. Specify a value from 0 - 30 seconds. The default is 20 seconds.

**Examples**

```
rfs7000-6DCD4B(config-profile-default-rfs7000)#adoption start-delay min 10 max 30
rfs7000-6DCD4B(config-profile-default-rfs7000)#profile rfs7000 default-rfs7000
profile rfs7000 default-rfs7000
autoinstall configuration
autoinstall firmware
crypto ikev1 policy ikev1-default
    isakmp-proposal default encryption aes-256 group 2 hash sha
    ..............................................................
    interface ge2
    interface ge3
    interface ge4
    interface pppoe1
    use firewall-policy default
    service pm sys-restart
    adopter-auto-provisioning-policy-lookup evaluate-always
    router ospf
    adoption start-delay min 10 max 30
rfs7000-6DCD4B(config-profile-default-rfs7000)#
```

**Related Commands**

- no

  Removes the configured minimum start-delay value. When removed, devices attempt adoption immediately on coming up.
7.1.3 alias

Profile Config Commands

Confugures network, VLAN, and service aliases. The aliases defined on this profile applies to all devices using this profile. Aliases can be also defined at the device level.

NOTE: You can apply overrides to aliases at the device level. For more information on aliases, see alias. Overrides applied at the device level take precedence.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX9000, NX9500, NX9510

Syntax

alias [address-range|host|network|network-group|network-service|string|vlan]

alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

alias host <HOST-ALIAS-NAME> <HOST-IP>

alias network <NETWORK-ALIAS-NAME> <HOST-IP>

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP>] {<STARTING-IP> to <ENDING-IP>}{<HOST-IP>}{<NETWORK-ADDRESS/MASK>}

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [0-254]|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp |(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport|ssh|telnet|tftp|www}

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [0-254]|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp |(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport <1-65535>|<WORD>|ssh|telnet|tftp|www}

alias string <STRING-ALIAS-NAME> <LINE>

alias vlan <VLAN-ALIAS-NAME> <1-4094>

Parameters

- alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

| address-range | Creates a new address-range alias for this profile. Or associates an existing address-range alias with this profile. An address-range alias maps a name to a range of IP addresses. |  |
| ADDRESS-RANGE-ALIAS-NAME |  |
| <ADDRESS-RANGE-ALIAS-NAME> |  |
| <STARTING-IP> to <ENDING-IP> | Associates a range of IP addresses with this address range alias |  |
| <STARTING-IP> | Specify the first IP address in the range. |  |
| to <ENDING-IP> | Specify the last IP address in the range. |  |
| Note: Alias name should begin with '$'. |  |
| Note: If using an existing address-range alias, you can apply overrides to the alias at the profile level. |  |
### alias host `<HOST-ALIAS-NAME>` `<HOST-IP>`

**host `<HOST-ALIAS-NAME>`**
- Creates a new host alias for this profile. Or associates an existing host alias with this profile. A host alias maps a name to a single network host.
- `<HOST-ALIAS-NAME>` – Specify the host alias name.

**Note:** Alias name should begin with `$`.

**<HOST-IP>**
- Associates the network host’s IP address with this host alias
- `<HOST-IP>` – Specify the network host’s IP address.

**Note:** If using an existing host alias, you can apply overrides to the alias at the profile level.

### alias network `<NETWORK-ALIAS-NAME>` `<NETWORK-ADDRESS/MASK>`

**network `<NETWORK-ALIAS-NAME>`**
- Creates a new network alias for this profile. Or associates an existing network alias with this profile. A network alias maps a name to a single network address.
- `<NETWORK-ALIAS-NAME>` – Specify the network alias name.

**Note:** Alias name should begin with `$`.

**<NETWORK-ADDRESS/MASK>**
- Associates a single network with this network alias
- `<NETWORK-ADDRESS/MASK>` – Specify the network’s address and mask.

**Note:** If using an existing network alias, you can apply overrides to the alias at the profile level.

### alias network-group `<NETWORK-GROUP-ALIAS-NAME>` [address-range `<STARTING-IP>` to `<ENDING-IP>`] [host `<HOST-IP>`]

**network `<NETWORK-GROUP-ALIAS-NAME>`**
- Creates a new network-group alias for this profile. Or associates an existing network-group alias with this profile.
- `<NETWORK-GROUP-ALIAS-NAME>` – Specify the network-group alias name.

**Note:** Alias name should begin with `$`.

**Note:** The network-group aliases are used in ACLs, to define the network-specific components. ACLs using aliases can be used across sites by re-defining the network-group alias elements at the device or profile level.

After specifying the name, specify the following: a range of IP addresses, host addresses, or a range of network addresses.

**Note:** If using an existing network-group alias, you can apply overrides to the alias at the profile level.

**address-range `<STARTING-IP>` to `<ENDING-IP>`**
- Associates a range of IP addresses with this network-group alias
- `<STARTING-IP>` – Specify the first IP address in the range.
- to `<ENDING-IP>` – Specify the last IP address in the range.
  - `<STARTING-IP>` to `<ENDING-IP>` – Optional. Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured.

**host `<HOST-IP>`**
- Associates a single or multiple hosts with this network-group alias
- `<HOST-IP>` – Specify the hosts’ IP address.
  - `<HOST-IP>` – Optional. Specifies more than one host. A maximum of eight (8) hosts can be configured.
| network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>} | Associates a single or multiple networks with this network-group alias  
- <NETWORK-ADDRESS/MASK> – Specify the network’s address and mask.  
- <NETWORK-ADDRESS/MASK> – Optional. Specifies more than one network. A maximum of eight (8) networks can be configured. |
| --- | --- |
| alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|tftp|www}) | Creates a new network-service alias for this profile. Or associates an existing network-service alias with this profile. A network-service alias maps a name to network services and the corresponding source and destination software ports.  
- <NETWORK-SERVICE-ALIAS-NAME> – Specify a network-service alias name.  
**Note:** Alias name should begin with `$`.  
**Note:** The network-service aliases are used in ACLs, to define the service-specific components. ACLs using aliases can be used across sites by re-defining the network-service alias elements at the device or profile level.  
**Note:** If using an existing network-service alias, you can apply overrides to the alias at the profile level. |
| proto [<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|tftp|www}) | Use one of the following options to associate an Internet protocol with this network-service alias:  
- <0-254> – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the *Protocol* field of the IPv4 header and the *Next Header* field of IPv6 header. For example, the *User Datagram Protocol*’s (UDP) designated number is 17.  
- <WORD> – Identifies the protocol by its name. Specify the protocol name.  
  - gre – Selects *Generic Routing Encapsulation* (GRE). The protocol number is 47.  
  - ospf – Selects *Open Shortest Path First* (OSPF). The protocol number is 89.  
  - vrrp – Selects *Virtual Router Redundancy Protocol* (VRRP). The protocol number is 112. |
|  
After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports.  
- <1-65535> – Optional. Configures a destination port number from 1 - 65535  
- <WORD> – Optional. Identifies the destination port by the service name provided. For example, the *secure shell* (SSH) service uses TCP port 22.  
  - bgp – Optional. Configures the default *Border Gateway Protocol* (BGP) services port (179)  
  - dns – Optional. Configures the default *Domain Name System* (DNS) services port (53)  
  - ftp – Optional. Configures the default *File Transfer Protocol* (FTP) control services port (21)  
  - ftp-data – Optional. Configures the default FTP data services port (20)  
  - gopher – Optional. Configures the default gopher services port (70)  
  - https – Optional. Configures the default HTTPS services port (443) |

**Contd..**
• **Idap** – Optional. Configures the default Lightweight Directory Access Protocol (LDAP) services port (389)
• **nntp** – Optional. Configures the default Newsgroup (NNTP) services port (119)
• **ntp** – Optional. Configures the default Network Time Protocol (NTP) services port (123)
• **POP3** – Optional. Configures the default Post Office Protocol (POP3) services port (110)
• **proto** – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step.
• **sip** – Optional. Configures the default Session Initiation Protocol (SIP) services port (5060)
• **smtp** – Optional. Configures the default Simple Mail Transfer Protocol (SMTP) services port (25)
• **sourceport** [1-65535|<WORD>] – Optional. After specifying the destination port, you may specify a single or range of source ports.
  • 1-65535 – Specify the source port from 1 - 65535.
  • <WORD> – Specify the source port range, for example 1-10.
• **ssh** – Optional. Configures the default SSH services port (22)
• **telnet** – Optional. Configures the default Telnet services port (23)
• **tftp** – Optional. Configures the default Trivial File Transfer Protocol (TFTP) services port (69)
• **www** – Optional. Configures the default HTTP services port (80)

```
alias string <STRING-ALIAS-NAME> <LINE>
```

**alias string**

* <STRING-ALIAS-NAME>*

Creates a new string alias for this profile. Or associates an existing string alias with this profile. String aliases map a name to an arbitrary string value. For example, alias string $DOMAIN test.example_company.com'. In this example, the string alias name is: $DOMAIN and the string value it is mapped to is: test.example_company.com. In this example, the string alias refers to a domain name

  • <VLAN-ALIAS-NAME> – Specify the string alias name.
  • <LINE> – Specify the string value.

**Note:** Alias name should begin with ‘$’.

**Note:** If using an existing string alias, you can apply overrides to the alias at the RF Domain level.

```
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

**alias vlan**

* <VLAN-ALIAS-NAME>*

Creates a new VLAN alias for this profile. Or associates an existing VLAN alias with this profile. A VLAN alias maps a name to a VLAN ID.

  • <VLAN-ALIAS-NAME> – Specify the VLAN alias name.

**Note:** Alias name should begin with ‘$’.

* <1-4094>*

Maps the VLAN alias to a VLAN ID

  • <1-4094> – Specify the VLAN ID from 1 - 4094.

**Note:** If using an existing VLAN alias, you can apply overrides to the alias at the profile level.
Examples
The following example shows the global aliases configured. Note the network-service alias ‘$kerberos’ settings.

```
rfs4000-229D58(config)#show context

! Configuration of RFS4000 version 5.7.0.0-025D

!
version 2.3
!
alias network-group $TestNetGrpAlias network 192.168.13.0/24 192.168.16.0/24
alias network-group $TestNetGrpAlias address-range 192.168.13.7 to 192.168.13.16 192.168.13.20 to 192.168.13.25
!
alias network $TestNetworkAlias 192.168.13.0/24
!
alias host $TestHostAlias 192.168.13.10
!
alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
!
alias network-service $NetworkServAlias proto udp
!
alias network-service $kerberos proto tcp 749 750 80 proto udp 68 sourceport 67
!
alias vlan $TestVLANAlias 1
--More--
rfs4000-229D58(config)#
```

The following examples show the overrides applied to the network-service alias ‘$kerberos’ at the profile level:

```
rfs4000-229D58(config-profile-TestRFS4000)#alias network-service $kerberos proto tcp 88 proto udp 80
rfs4000-229D58(config-profile-TestRFS4000)#
```

The following example shows the overrides applied to the network-service alias ‘$kerberos’ at the profile level:

```
rfs4000-229D58(config-profile-TestRFS4000)#show context
profile rfs4000 TestRFS4000
   no autoinstall configuration
   no autoinstall firmware
   ...............................................................
   service pm sys-restart
   router ospf
   alias network-service $kerberos proto tcp 88 proto udp 80
rfs4000-229D58(config-profile-TestRFS4000)#
```

### 7.1.5 area

**Profile Config Commands**

Sets the system’s area of location (the area name)

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

area <WORD>

**Parameters**

- area <WORD>

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000)#area Ecospace
```

```
rfs7000-37FABE(config-profile-default-rfs7000)#show context

```

**Related Commands**

| no | Resets the configured area name |
7.1.6 arp

Profile Config Commands

Adds a static Address Resolution Protocol (ARP) IP address in the ARP cache

The ARP protocol maps an IP address to a hardware MAC address recognized on the network. ARP provides protocol rules for making this correlation and providing address conversion in both directions.

When an incoming packet destined for a host arrives, ARP finds a physical host or MAC address that matches the IP address. ARP looks in its ARP cache and, if it finds the address, provides it so the packet can be converted to the right packet length, formatted, and sent to its destination. If no entry is found for the IP address, ARP broadcasts a request packet in a special format on the LAN to locate a device that recognizes the IP address. A device that recognizes the IP address as its own returns a reply indicating it. ARP updates the ARP cache for future reference and then sends the packet to the MAC address that replied.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

arp [<IP>|timeout]

arp <IP> <MAC> arpa [<L3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1|serial <1-4> <1-1> <1-1> <1-1>

{dhcp-server|router}

arp timeout <15-86400>

Parameters

- arp <IP> <MAC> arpa [<L3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1|serial <1-4> <1-1> <1-1> <1-1>
  {dhcp-server|router}

<table>

<td>&lt;1-1&gt; – Specify the port ID</td>
</tr>
<tr>
<td></td>
<td>&lt;1-1&gt; – Specify the Channel group ID.</td>
</tr>
</tbody>
</table>

The serial interface is applicable for the NX45XX and NX65XX series service platforms only.
The following keywords are common to all the above interface types:

- `dhcp-server` – Optional. Sets ARP entries for a DHCP server
- `router` – Optional. Sets ARP entries for a router

**arp timeout <15-86400>**

Sets ARP entry timeout

- `<TIME>` – Sets the ARP entry timeout in seconds. Specify a value from 15 - 86400 seconds. The default is 3600 seconds.

Examples

```
arp timeout 2000
```

```
rfs7000-37FABE(config-profile-default-rfs7000)#show context
profile rfs7000 default-rfs7000

7.1.8 autogen-uniqueid

Profile Config Commands

Autogenerates a unique ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device.

A device's unique ID is a combination of a user-defined string (prefix, suffix, or both) and a substitution token. The WiNG implementation provides two built-in substitution tokens: $SN and $MiNT-ID that represent the device's serial number and MiNT-ID respectively. The value referenced by these substitution tokens are internally retrieved and combined with the user-defined string to auto generate a unique identity for the device.

The general format of this command is: `<PREFIX><SUBSTITUTION-TOKEN><SUFFIX>`. You can provide both (prefix and suffix) or just a prefix or suffix.

For example, given the following set of inputs:
- user-defined prefix – TestAP6522
- substitution token – $SN

The unique ID is generated using TestAP6522$SN, where $SN is replaced with the device's serial number.

When executed on an AP6522 (having serial number B4C7996C8809), the autogen-uniqueid TestAP6522$SN command generates the unique ID: TestAP6522

B4C7996C8809. When configured on an AP6522 profile, all AP6522s using the profile autogenerate a unique ID in which the device's serial number is preceded by the string 'TestAP6522'.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

autogen-uniqueid <WORD>

Parameters
- autogen-uniqueid <WORD>

| autogen-uniqueid <WORD> | Autogenerates a device's unique ID (not exceeding 64 characters in length) The ID generated is a combination of the text provided and the value referenced through the substitution token $SN or $MiNT-ID. Where ever the autogen-uniqueid is used the device's serial number OR MiNT-ID is referenced depending on the substitution token used.
- `<WORD>` – Specify a auto generate unique ID format using one of the following substitution tokens:
  - Available tokens:
    - $SN - references SERIAL NUMBER of the device
    - $MiNT-ID - references MiNT-ID of the device
  - For example, Test-$SN-TechPubs. In this example 'Test' and 'TechPubs' represent the user-defined prefix and suffix respectively. And $SN is the substitution token. |

Examples

nx4500-5CFA2B(config-profile-testAP6522)#autogen-uniqueid TestAP6522$SN

nx4500-5CFA2B(config-profile-testAP6522)#show context

```
profile ap621 testAP6522
  autogen-uniqueid TestAP6522$SN
  no autoinstall configuration
  no autoinstall firmware
  interface radio1
  interface ge1
  use firewall-policy default
  service pm sys-restart
```

  interface up1
    no shutdown
    switchport mode access
    switchport access vlan 1
  interface vlan1
    ip address 192.168.13.12/24
    logging on
    logging console warnings
    logging buffered warnings
```

nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B)#

Related Commands

```
no
```

When executed in the device configuration mode, removes the device’s autogen-uniqueid. When executed in the profile configuration mode, removes the autogen-uniqueid on all devices using the profile.
### 7.1.9 autoinstall

**Profile Config Commands**

Automatically installs firmware image and startup configuration parameters on to the selected device.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

autoinstall [configuration|firmware|start-interval <WORD>]

**Parameters**

- autoinstall [configuration|firmware|start-interval <WORD>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Autoinstalls startup configuration. Setup parameters are automatically configured on devices using this profile</td>
</tr>
<tr>
<td>firmware</td>
<td>Autoinstalls firmware image. Firmware images are automatically installed on devices using this profile</td>
</tr>
<tr>
<td>start-interval</td>
<td>Configures the interval between system boot and start of autoinstall process (this is the time, from system boot, after which autoinstall should start)</td>
</tr>
<tr>
<td>&lt;WORD&gt;</td>
<td>- Specify the interval in minutes. Note: Zero (0) implies firmware or startup configuration installation can start any time.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-profile-default-rfs7000)#autoinstall configuration

</tbody>
</table>
7.1.11.1 bridge

Configures VLAN Ethernet bridging parameters. Use this command to configure a Bridge NAT or Bridge VLAN settings.

Configuring bridge Network Address Translation (NAT) parameters, allows management of Internet traffic originating at a remote site. In addition to traditional NAT functionality, bridge NAT provides a means of configuring NAT for bridged traffic through an access point. NAT rules are applied to bridged traffic through the access point, and matching packets are NATed to the WAN link instead of being bridged on their way to the router. Using bridge NAT, a tunneled VLAN (extended VLAN) is created between the NoC and a remote location. When a remote client needs to access the Internet, Internet traffic is routed to the NoC, and from there routed to the Internet. This increases the access time for the end user on the client. To resolve latency issues, bridge NAT identifies and segregates traffic heading towards the NoC and forwards towards the Internet. Traffic towards the NoC is allowed over the secure tunnel. Traffic towards the Internet is switched to a local WLAN link with access to the Internet.

A Virtual LAN (VLAN) is a separately administered virtual network within the same physical managed network. VLANs are broadcast domains defined within wireless controllers or service platforms to allow control of broadcast, multicast, unicast, and unknown unicast within a layer 2 device. For example, say several computers are used in conference room X and some in conference Y. The systems in conference room X can communicate with one another, but not with the systems in conference room Y. The VLAN enables the systems in conference rooms X and Y to communicate with one another even though they are on separate physical subnets. The systems in conference rooms X and Y are managed by the same single wireless controller or service platform, but ignore the systems that are not using the same VLAN ID. Administrators often need to route traffic between different VLANs. Bridging VLANs are only for non-routable traffic, like tagged VLAN frames destined to some other device, which will untag it. When a data frame is received on a port, the VLAN bridge determines the associated VLAN based on the port of reception. Using forwarding database information, the bridge VLAN forwards the data frame on the appropriate port(s). VLANs are useful to set separate networks to isolate some computers from others, without actually having to have separate cabling and Ethernet switches. Controllers can do this on their own, without need for the computer or other gear to know itself what VLAN it is on (this is called port-based VLAN, since it is assigned by port of the switch). Another common use is to put specialized devices like VoIP Phones on a separate network for easier configuration, administration, security, or quality of service.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Switch Note:** For more information on the interface types and the devices supporting them, see `interface`.

### Syntax

```plaintext
bridge [nat|vlan]

bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500> interface 
[<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [{address|interface|overload|pool <NAT-POOL-NAME>}] 

bridge vlan [<1-4094>|<VLAN-ALIAS-NAME>] 
```
Parameters

- **bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500> interface [<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [(address|interface|overload|pool <NAT-POOL-NAME>)]**

  **nat**
  Configures bridge NAT parameters

  **source**
  Configures NAT source addresses

  **list <IP-ACCESS-LIST-NAME> precedence <1-500>**
  Associates an access control list (ACL) with this bridge NAT policy. The ACL specifies the IP address permit/deny rules applicable to this bridge NAT policy.
  - **<IP-ACCESS-LIST-NAME>** – Specify access list name.
  - **precedence <1-500>** – Specifies a precedence value for this bridge NAT policy.

  **interface [<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1]**
  Selects one of the following as the primary interface (between the source and destination points):
  - **<LAYER3-INTERFACE-NAME>** – A router interface. Specify interface name.
  - **pppoe1** – A PPP over Ethernet interface.
  - **vlan <1-4094>** – A VLAN interface. Specify the VLAN interface index from 1 - 4094.
  - **wwan1** – A Wireless WAN interface.

  **[(address|interface|overload|pool <NAT-POOL-NAME>)]**
  The following keywords are recursive and common to all interface types:
  - **address** – Configures the interface IP address used for NAT
  - **interface** – Configures the failover interface (default setting)
  - **overload** – Enables use of one global address for multiple local addresses (terminates command)
  - **pool <NAT-POOLNAME>** – Configures the NAT pool used with this bridge NAT policy. Specify the NAT pool name. For more information on configuring a NAT pool, see `nat-pool-config-instance`.

- **bridge vlan [<1-4094>|<VLAN-ALIAS-NAME>]**

  **vlan <1-4094>**
  Configures the numerical identifier for the Bridge VLAN when it was initially created.
  - **<1-4094>** – Specify a VLAN index from 1 - 4094.

  **vlan <VLAN-ALIAS-NAME>**
  Configures the VLAN alias (should be existing and configured) identifying the bridge VLAN
  - **<VLAN-ALIAS-NAME>** – Specify a VLAN alias name.

Usage Guidelines

Creating customized filter schemes for bridged networks limits the amount of unnecessary traffic processed and distributed by the bridging equipment.

If a bridge does not hear *Bridge Protocol Data Units* (BPDUs) from the root bridge within the specified interval, defined in the `max-age (seconds)` parameter, assume the network has changed and recomputed the spanning-tree topology.
Examples

rfs7000-37FABE(config-profile-default-rfs7000)#bridge vlan 1
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)##?

Bridge VLAN Mode commands:

- **bridging-mode**: Configure how packets on this VLAN are bridged
- **captive-portal**: Captive Portal
- **description**: Vlan description
- **edge-vlan**: Enable edge-VLAN mode
- **firewall**: Enable vlan firewall (IPv4)
- **http-analyze**: Forward URL and Data to controller
- **ip**: Internet Protocol (IP)
- **ipv6**: Internet Protocol version 6 (IPv6)
- **l2-tunnel-broadcast-optimization**: Enable broadcast optimization
- **no**: Negate a command or set its defaults
- **stateful-packet-inspection-l2**: Enable stateful packet inspection in layer2 firewall
- **tunnel**: Vlan tunneling settings
- **tunnel-over-level2**: Tunnel extended VLAN traffic over level 2 MiNT links
- **use**: Set setting to use
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

</tbody>
</table>
7.1.11.2.1 bridging-mode

 Configures how packets are bridged on the selected VLAN

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

bridging-mode [auto|isolated-tunnel|local|tunnel]

**Parameters**

- bridging-mode [auto|isolated-tunnel|local|tunnel]

<table>
<thead>
<tr>
<th>bridging-mode</th>
<th>Configures the VLAN bridging mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Automatically selects the bridging mode to match the WLAN, VLAN and bridging mode configurations. When selected, the controller or access point determines the best bridging mode for the VLAN. (default setting)</td>
</tr>
<tr>
<td>isolated-tunnel</td>
<td>Bridges packets between local Ethernet ports and local radios, and passes tunneled packets through without de-tunneling. Select this option for a dedicated tunnel for bridging VLAN traffic.</td>
</tr>
<tr>
<td>local</td>
<td>Bridges packets normally between local Ethernet ports and local radios (if any). Local mode is typically configured in remote branch offices where traffic on remote private LAN segments need to be bridged locally. Local mode implies that traffic, wired and wireless, is to be bridged locally.</td>
</tr>
<tr>
<td>tunnel</td>
<td>Bridges packets between local Ethernet ports, local radios, and tunnels to other APs, wireless controllers, or service platforms. Select this option to use a shared tunnel for bridging VLAN traffic. In tunnel mode, the traffic at the AP is always forwarded through the best path. The APs decide the best path to reach the destination and forward packets accordingly. Setting the VLAN to tunnel mode ensures packets are bridged between local Ethernet ports, any local radios, and tunnels to other APs, wireless controllers, and service platforms.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

ACLs can only be used with tunnel or isolated-tunnel modes. They do not work with the local and automatic modes.

**Examples**

rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#bridging-mode isolated-tunnel

rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#show context bridge vlan 1
bridging-mode isolated-tunnel
ip igmp snooping
ip igmp snooping querier
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#

</table>
7.1.11.2.2 captive-portal

*bridge-vlan-mode commands*

Enables IP packet snooping on wired captive portals, and also configures the subnet to snoop. When enabled, IP packets received from wired captive portal clients, on the specified subnet, are snooped to learn IP to MAC mapping.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controller
- Access Points — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M> {excluded-address <IPv4|IPv6>}

**Parameters**

- **captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M> {excluded-address <IPv4|IPv6>}
  - Enables snooping of IPv4 or IPv6 packets (based on the option selected) for wired captive portal clients
  - **subnet <IPv4/M|IPv6/M>** — Enables IPv4 or IPv6 packet snooping on a specified subnet
    - **<IPv4/M|IPv6/M>** — Specify the subnet address in the A.B.C.D/M or X:X::X:X/M format to identify an IPv4 or IPv6 subnet respectively.
  - **excluded-address <IPv4|IPv6>** — Optional. Configures the IPv4 or IPv6 address excluded from snooping
    - **<IPv4|IPv6>** — Specify the IPv4 or IPv6 address. Use this parameter to configure the gateway's address.

**Examples**

```
nx9500-6C8809(config-profile NX9000Test-bridge-vlan-4)#captive-portal ip-snooping subnet 192.168.13.0/24 excluded-address 192.168.13.7
```

```
nx9500-6C8809(config-profile NX9000Test-bridge-vlan-4)#show context bridge vlan 4
  captive-portal ip-snooping subnet 192.168.13.0/24 excluded-address 192.168.13.7
  ip igmp snooping
  ip igmp snooping querier
  ipv6 mld snooping
  ipv6 mld snooping querier
```

**Related Commands**

| no | Disables IP packet snooping on wired captive portals |
### 7.1.12.3 description

**Bridge-vlan-mode commands**

Configures VLAN bridge description

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

description <WORD>

**Parameters**

- description <WORD>

<table>
<thead>
<tr>
<th>description &lt;WORD&gt;</th>
<th>Configures a description for this VLAN bridge</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt; – Enter a description. The description should be unique to the VLAN’s specific configuration to help differentiate it from other VLANs with similar configurations.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#description "This is a description for the bridged VLAN"

rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#show context

```
bridge vlan 1
description This is a description for the bridged VLAN
bridging-mode isolated-tunnel
ip igmp snooping
ip igmp snooping querier
```

rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#

**Related Commands**

| no | Removes VLAN bridge description |
7.1.1.2.4 edge-vlan

Enables the edge VLAN mode. In the edge VLAN mode, a protected port does not forward traffic to another protected port on the same wireless controller or service platform. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

default-vlan

Parameters

None

Examples

```
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#edge-vlan
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#
```

</tbody>
</table>
### 7.11.2.5 firewall

**bridge-vlan-mode commands**

Enables IPv4 firewall on this bridge VLAN interface. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
topology bridge-vlan-mode
```

**Parameters**

None

**Examples**

```plaintext
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#firewall
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#
```

7.1.11.2.6 http-analyze

**bridge-vlan-mode commands**

Enables the analysis of URLs and data traffic on this Bridge VLAN. When enabled, URLs and data are forwarded to the controller running the HTTP analytics engine.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
http-analyze {filter [images|post|query-string]}
```

**Parameters**

- `http-analyze {filter [images|post|query-string]}`

| http-analyze filter [images|post|query-string] | Enables URL and HTTP data analysis. Optionally use the filter keyword to filter out specific URLs |
|-----------------------------------------------|---------------------------------------------------------------------------------------------|
|                                               | • filter — Optional. Filters out specific URLs                                               |
|                                               | • images — Filters out URLs referring to images                                              |
|                                               | • post — Filters out URLs referring to POSTs                                                 |
|                                               | • query-string — Filters out query strings received from URLs                                |

**Examples**

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-bridge-vlan-4)#http-analyze filter images
```

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-bridge-vlan-4)#show context bridge vlan 4
  http-analyze filter images
rfs4000-229D58(config-device 00-23-68-22-9D-58-bridge-vlan-4)#
```

**Related Commands**

- `no` Disables forwarding of URLs and data to the controller running the HTTP analytics engine
### 7.1.11.2.7 ip

**bridge-vlan-mode commands**

Configures VLAN bridge IP components

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip [arp</td>
<td>dhcp</td>
</tr>
<tr>
<td>ip [arp</td>
<td>dhcp] trust</td>
</tr>
<tr>
<td>Trust — Trusts ARP responses on the VLAN bridge</td>
<td></td>
</tr>
<tr>
<td>ip igmp snooping {forward-unknown-multicast</td>
<td>mrouter</td>
</tr>
<tr>
<td>ip igmp snooping {forward-unknown-multicast}</td>
<td></td>
</tr>
<tr>
<td>ip igmp snooping {mrouter [interface</td>
<td>learn]}</td>
</tr>
<tr>
<td>ip igmp snooping {mrouter [interface INTERFACE-&lt;LIST&gt;</td>
<td>learn pim-dvmrp]}</td>
</tr>
<tr>
<td>ip igmp snooping [querier] {address</td>
<td>max-response-time</td>
</tr>
<tr>
<td>ip igmp snooping [querier] {address &lt;IP&gt;</td>
<td>max-response-time &lt;1-25&gt;</td>
</tr>
</tbody>
</table>

**Parameters**

- **ip [arp|dhcp] trust**

### ip Configures the VLAN bridge IP parameters

- **arp trust**

  Configures the ARP trust parameter. Trusted ARP packets are used to update the DHCP snoop table to prevent IP spoof and arp-cache poisoning attacks. This option is disabled by default.

  - Trust — Trusts ARP responses on the VLAN bridge

- **dhcp trust**

  Configures the DHCP trust parameter. Uses DHCP packets, from a DHCP server, as trusted and permissible within the access point, wireless controller, or service platform managed network. DHCP packets are used to update the DHCP snoop table to prevent IP spoof attacks. This feature is enabled by default.

  - Trust — Trusts DHCP responses on the VLAN bridge

- **ip igmp snooping {forward-unknown-multicast}**

  Configures Internet Group Management Protocol (IGMP) snooping parameters. IGMP snooping is enabled by default. IGMP establishes and maintains multicast group memberships for interested members. Multicasting allows a networked device to listen to IGMP network traffic and forward IGMP multicast packets to radios on which the interested hosts are connected. The device also maintains a map of the links that require multicast streams, thereby reducing unnecessary flooding of the network with multicast traffic.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>forward-unknown-multicast</td>
<td>Optional. Enables forwarding of multicast packets from unregistered multicast groups. If disabled, the unknown multicast forward feature is also disabled for individual VLANs. This option is enabled by default.</td>
</tr>
</tbody>
</table>

- **ip igmp snooping** `{mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}`

- **ip** Configures the VLAN bridge IP parameters
- **igmp snooping** Configures the IGMP snooping parameters
- **mrouter** Optional. Configures the multicast router parameters
- **interface** `<INTERFACE-LIST>` Configures the multicast router interfaces. This option is disabled by default.
  - `<INTERFACE-LIST>` – Specify a comma-separated list of interface names.
- **learn pim-dvmrp** Configures the multicast router learning protocols. This option is disabled by default.
  - `pim-dvmrp` – Enables Protocol-Independent Multicast (PIM) and Distance-Vector Multicast Routing Protocol (DVMRP) snooping of packets

- **ip igmp snooping** `{querier} [address <IP>|max-response-time <1-25>|timer expiry <60-300>|version <1-3}]`

- **ip** Configures the VLAN bridge IP parameters
- **igmp snooping** Configures the IGMP snooping parameters
- **querier** Optional. Configures the IGMP querier parameters. This option is disabled by default.
  - Enables IGMP querier. IGMP snoop querier keeps host memberships alive. It is primarily used in a network where there is a multicast streaming server and hosts subscribed to the server and no IGMP querier present. The access point, wireless controller, or service platform performs the IGMP querier role. An IGMP querier sends out periodic IGMP query packets. Interested hosts reply with an IGMP report packet. IGMP snooping is only conducted on wireless radios. IGMP multicast packets are flooded on wired ports. IGMP multicast packet are not flooded on the wired port. IGMP membership is also learnt on it and only if present, then it is forwarded on that port.
  - `<IP>` – Specify the IGMP querier source IP address.
  - `<1-25>` – Specify the maximum response time from 1 - 25 seconds.
  - `<60-300>` – Specify the IGMP querier timeout from 60 - 300 seconds.

- **address <IP>** Optional. Configures the IGMP querier source IP address. This address is used as the default VLAN querier IP address.
  - `<IP>` – Specify the IGMP querier source IP address.

- **max-response-time** `<1-25>` Optional. Configures the IGMP querier maximum response time. This option is disabled by default.
  - `<1-25>` – Specify the maximum response time from 1 - 25 seconds.

  The access point, wireless controller, or service platform forwards multicast packets only to radios present in the snooping table. IGMP reports from wired ports are forwarded to the multicast router ports.

  If no reports are received from a radio, it is removed from the snooping table. The radio then stops receiving multicast packets.

- **timer expiry** `<60-300>` Optional. Configures the IGMP querier expiry time. The value specified is used as the timeout interval for other querier resources. This option is disabled by default.
  - `<60-300>` – Specify the IGMP querier timeout

  The access point, wireless controller, or service platform forwards multicast packets only to radios present in the snooping table. IGMP reports from wired ports are forwarded to the multicast router ports.

  If no reports are received from a radio, it is removed from the snooping table. The radio then stops receiving multicast packets.
**version <1-3>**  
Optional. Configures the IGMP version. This option is disabled by default.  
- `<1-3>`– Specify the IGMP version. The versions are 1-3.

7.1.11.2.8 ipv6

**bridge-vlan-mode commands**

Configures this VLAN bridge’s IPv6 components

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
ipv6 [dhcpv6|firewall|mld|nd]
```

```
ipv6 dhcpv6 trust
```

```
ipv6 firewall
```

```
ipv6 mld snooping {forward-unknown-multicast|mrouter|querier}
```

```
ipv6 mld snooping {forward-unknown-multicast}
```

```
ipv6 mld snooping {mrouter [interface|learn]}
```

```
ipv6 mld snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}
```

```
ipv6 mld snooping {querier} {max-response-time|timer|version}
```

```
ipv6 mld snooping {querier} {max-response-time <1-25000>|timer expiry <60-300>}
```

```
ipv6 nd raguard
```

**Parameters**

- `ipv6 dhcpv6 trust`

<table>
<thead>
<tr>
<th>ipv6</th>
<th>Configures the VLAN bridge IPv6 parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcpv6 trust</td>
<td>Enables the DHCPv6 trust option. When enabled all DHCPv6 responses are trusted on this bridge VLAN. This option is enabled by default.</td>
</tr>
<tr>
<td></td>
<td>• trust – Trusts DHCPv6 responses on this bridge VLAN</td>
</tr>
</tbody>
</table>

- `ipv6 firewall`

<table>
<thead>
<tr>
<th>ipv6</th>
<th>Configures the VLAN bridge IPv6 parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>firewall</td>
<td>Enables IPv6 firewall on this bridge VLAN. This option is enabled by default.</td>
</tr>
<tr>
<td></td>
<td>Devices utilizing IPv6 addressing require firewall protection unique to IPv6 traffic.</td>
</tr>
<tr>
<td></td>
<td>IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons.</td>
</tr>
<tr>
<td></td>
<td>IPv6 hosts can configure themselves automatically when connected to an IPv6 network using the <em>neighbor discovery</em> (ND) protocol via ICMPv6 router discovery messages. When first connected to a network, a host sends a link-local router solicitation multicast request for its configuration parameters. Routers respond to such a request with a <em>router advertisement</em> (RA) packet that contains Internet layer configuration parameters.</td>
</tr>
</tbody>
</table>
- **ipv6 mld snooping** *{forward-unknown-multicast}*

<table>
<thead>
<tr>
<th>ipv6</th>
<th>Configures the VLAN bridge IPv6 parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>mld snooping</td>
<td>Configures Multicast Listener Discovery Protocol (MLD) snooping parameters. MLD snooping enables an access point, wireless controller, or service platform to examine MLD packets and make forwarding decisions based on the content. MLD is used by IPv6 devices to discover devices wanting to receive multicast packets destined for specific multicast addresses. MLD uses multicast listener queries and multicast listener reports to identify which multicast addresses have listeners and join multicast groups. MLD snooping caps the flooding of IPv6 multicast traffic on controller, service platform or access point VLANs. When enabled, MLD messages between hosts and multicast routers are examined to identify the hosts receiving multicast group traffic. The access point, wireless controller, or service platform forward multicast traffic only to those interfaces connected to interested receivers instead of flooding traffic to all interfaces. This option is enabled by default.</td>
</tr>
<tr>
<td>forward-unknown-multicast</td>
<td>Optional. Enables forwarding of multicast packets from unregistered multicast groups. If disabled, the unknown multicast forward feature is also disabled for individual VLANs. This option is enabled by default.</td>

no use [captive-portal|ip-access-list|ipv6-access-list|mac-access-list] tunnel out

Parameters

- no <PARAMETERS>

no <PARAMETERS> Resets or reverts this bridge VLAN’s settings based on the parameters passed

Examples

The following example displays bridge VLAN 20 settings before the ‘no’ commands are executed:

nx4500-5CFCA2B(config-profile default-nx45xx-bridge-vlan-20)#show context bridge vlan 20
  ip igmp snooping
  ip igmp snooping querier
  ipv6 mld snooping
  ipv6 mld snooping querier

nx4500-5CFCA2B(config-profile default-nx45xx-bridge-vlan-20)#
nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20)#no ip igmp snooping
nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20)#no ipv6 mld snooping querier

The following example displays bridge VLAN 20 settings after the 'no' commands are executed:

nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20)#show context bridge vlan 20
  no ip igmp snooping
  ip igmp snooping querier
  ipv6 mld snooping
  no ipv6 mld snooping querier
nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20)#
7.1.11.2.11 stateful-packet-inspection-l2

- bridge-vlan-mode commands

Enables a stateful packet inspection at the layer 2 firewall

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

stateful-packet-inspection-l2

Parameters

None

Examples

rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#stateful-packet-inspection-l2
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#

7.1.11.2.12 tunnel

**bridge-vlan-mode commands**

Enables tunneling of unicast messages, to unknown MAC destinations, on the selected VLAN bridge

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

tunnel [rate-limit|unknown-unicast]

tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024>
   {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}

tunnel unknown-unicast

**Parameters**

- **tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024>
  {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}**

<table>
<thead>
<tr>
<th>tunnel rate-limit level2 rate &lt;50-1000000&gt; max-burst-size &lt;2-1024&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures a rate-limit parameters (max-burst-size and rate) for tunneled VLAN traffic over level 2 MiNT links</td>
</tr>
<tr>
<td>• rate – Optional. Configures the data rate, in kilobits per second, for the incoming and outgoing extended VLAN traffic tunneled over MiNT level 2 links</td>
</tr>
<tr>
<td>• &lt;50-1000000&gt; – Specify a value from 50 - 1000000 kbps. The default is 5000 kbps.</td>
</tr>
<tr>
<td>• max-burst-size – Optional. Configures the maximum burst size</td>
</tr>
<tr>
<td>• &lt;2-1024&gt; – Specify the maximum burst size from 2 - 1024 kbytes. The default is 320 kbytes.</td>
</tr>
</tbody>
</table>

After specifying the max-burst-size, optionally specify the red-threshold value for the different traffic class. The red-threshold is configured as a % of the specified max-burst-size.

- **red-threshold – Optional. Configures the random early detection threshold for the different traffic class**
  - background – Configures the red-threshold for low priority traffic from 0 -100. The default is 50% of the specified max-burst-size.
  - best-effort – Configures the red-threshold for normal priority traffic from 0 -100. The default is 50% of the specified max-burst-size.
  - video – Configures the red-threshold for video traffic from 0 -100. The default is 25% of the specified max-burst-size.
  - voice – Configures the red-threshold for voice traffic from 0 -100. The default is 0% of the specified max-burst-size.

- **tunnel unknown-unicast**

7.11.2.14 use

**bridge-vlan-mode commands**

Associates a captive-portal, access control list (IPv4, IPv6, or MAC), and/or a URL filter with this bridge VLAN.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

use [captive-portal|ip-access-list|ipv6-access-list|mac-access-list]

use captive-portal <CAPTIVE-PORTAL-NAME>

use [ip-access-list|ipv6-access-list|mac-access-list] tunnel out <IP/IPv6/MAC-ACCESS-LIST-NAME>

use url-filter <URL-FILTER-NAME>

**Parameters**

- **use captive-portal <CAPTIVE-PORTAL-NAME>**

  Applies an existing captive portal configuration to restrict access to the bridge VLAN configuration.

  A captive portal is an access policy for providing temporary and restrictive access using a standard Web browser. Captive portals provide authenticated access by capturing and re-directing a wireless user’s Web browser session to a captive portal login page where the user must enter valid credentials to access to the network. Once logged into the captive portal, additional terms and agreement, welcome, fail, and no-service pages provide the administrator with a number of options on captive portal screen flow and user appearance.

  - `<CAPTIVE-PORTAL-NAME>` – Specify the captive portal name.

- **use [ip-access-list|ipv6-access-list|mac-access-list] tunnel out <IP/IPv6/MAC-ACCESS-LIST-NAME>**

  The following keywords are common to the ‘IPv4/IPv6 access list’ and ‘MAC access list’ parameters:

  - `tunnel` – Applies IPv4/IPv6 access list or MAC access list to all packets going into the tunnel
  - `out` – Applies IPv4/IPv6 access list or MAC access list to all outgoing packets

  - `<IP/IPv6/MAC-ACCESS-LIST-NAME>` – Specify the IP/IPv6 access list or MAC access list name.
### use url-filter `<URL-FILTER-NAME>`

7.1.12 captive-portal

Profile Config Commands

Configures captive portal advanced Web page uploads on this profile. These Web pages are uploaded to access points supporting the captive portal.

A captive portal is a means of providing guests temporary and restrictive access to the controller managed wireless network. A captive portal provides secure authenticated controller access by capturing and re-directing a wireless user’s Web browser session to a captive portal login page, where the user must enter valid credentials. Once the user is authenticated and logged into the controller managed network, additional agreement, welcome, and fail pages provide the administrator with options to control the captive portal’s screen flow and user appearance.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

captive-portal page-upload count <1-20>

Parameters

- captive-portal page-upload count <1-20>

<table>
<thead>
<tr>
<th>page-upload</th>

no | Disables CDP on this profile
7.1.14 **cluster**

- **Profile Config Commands**

Sets the cluster configuration

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
cluster [force-configured-state|force-configured-state-delay|handle-stp|
master-priority|member|mode|name|radius-counter-db-sync-time]

cluster [force-configured-state|force-configured-state-delay <3-1800>|handle-stp|
master-priority <1-255>]

cluster member [ip|vlan]
cluster member [ip <IP> {level [1|2]}|vlan <1-4094>]

cluster mode [active|standby]

circle radius-counter-db-sync-time <1-1440>
```

**Parameters**

- **force-configured-state**
  
  Forces adopted APs to auto revert when a failed wireless controller or service platform (in a cluster) restarts

  When an active controller (wireless controller, or service platform) fails, a standby controller in the cluster takes over APs adopted by the failed active controller. If the failed active controller were to restart, it starts a timer based on the ‘force-configured-state-delay’ interval specified. At the expiration of this interval, the standby controller releases all adopted APs and goes back to a monitoring mode. If the active controller fails during this interval, the ‘force-configured-state-delay’ timer is stopped. The timer restarts as soon as the active controller comes back up. This feature is disabled by default.

- **force-configured-state-delay <3-1800>**

  Forces cluster transition to the configured state after a specified interval

  - `<3-1800>` – Specify a delay from 3-1800 minutes. The default is 5 minutes.

  This is the interval a standby controller waits before releasing adopted APs when a failed primary controller becomes active again.

- **handle-stp**

  Enables/disables *Spanning Tree Protocol* (STP) convergence handling. This feature is disabled by default.

  In layer 2 networks, this protocol is enabled to prevent network looping. If enabled, the network forwards data only after STP convergence. Enabling STP convergence delays the redundancy state machine execution until the STP convergence is completed (the standard protocol value for STP convergence is 50 seconds). Delaying the state machine is important to load balance APs at startup.
### Profiles

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **master-priority** <1-255> | Configures cluster master priority  
  - `<1-255>` – Specifies cluster master election priority. Assign a value from 1 - 255. Higher the value higher is the precedence. The default is 128. |
| **cluster member [ip <IP> {level [1|2]}|vlan <1-4094>]** | Adds a member to the cluster. It also configures the cluster VLAN where members can be reached. |
| **ip <IP> level [1|2]** | Adds IP address of the new cluster member  
  - `<IP>` – Specify the IP address.  
  - level – Optional. Configures routing level for the new member. Select one of the following routing levels:  
    - 1 – Level 1, local routing  
    - 2 – Level 2, In-site routing |
| **vlan <1-4094>** | Configures the cluster VLAN where members can be reached  
  - `<1-4094>` – Specify the VLAN ID from 1 - 4094. |
| **mode [active|standby]** | Configures cluster member’s mode as active or standby  
  - active – Configures cluster mode as active. This is the default setting.  
  - standby – Configures cluster mode as standby  
  A member can be in either an Active or Standby mode. All active member controllers can adopt access points. Standby members only adopt access points when an active member has failed or sees an access point not adopted by a controller. |
| **cluster name <CLUSTER-NAME>** | Configures the cluster name  
  - `<CLUSTER-NAME>` – Specify the cluster name. |
| **cluster radius-counter-db-sync-time <1-1440>** | Configures the interval, in minutes, at which the RADIUS counter database is synchronized with the dedicated NTP server resource.  
  - `<1-1440>` – Specify a value from 1 - 1440 minutes. The default is 5 minutes.  
  **Note:** Use the `show > cluster > configuration` command to view RADIUS counter DB sync time. |

### Examples

7.1.16 controller

Profile Config Commands

Configures the WiNG controller (wireless controller or service platform) adoption settings

Adoption is the process a controller or service platform uses to discover available access points and/or peer controllers/service platforms, establish an association and provision the adopted device. Adoption settings are configurable and supported within a profile and applied to all devices supported by the profile.

Use this command to add a controller to a pool and group. This command also enables and disables adoption on controllers, and specifies the device types that can be adopted by a controller.

In an hierarchically managed (HM) network, devices (controllers and access points) are deployed across three levels. This results in devices that are either adoptee or adopters. For more information on HM network, see device-upgrade.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

controller [adopted-devices|adoption|group|hello-interval|vlan|host]
controller adopted-devices [aps {controllers} | controllers {aps} | external-devices]
controller adoption
controller [group <CONTROLLER-GROUP-NAME> | vlan <1-4094>]
controller hello-interval <1-120> adjacency-hold-time <2-600>
controller host [IPv4|IPv6] <HOSTNAME> [ipsec-secure|level|pool|remote-vpn-client]
{ipsec-secure [gw [IPv4|HOSTNAME]]} [remote-vpn-client]

Parameters

- controller adopted-devices [aps {controllers} | controllers {aps} | external-devices]

<table>
<thead>
<tr>
<th>controller adopted-devices</th>
<th>Configures the WLAN's controller adoption settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>adopted-devices</td>
<td>Enables the adoption of device (AP/controller) this controller can adopt</td>
</tr>
<tr>
<td>aps {controllers}</td>
<td>Enables the adoption of access points by this controller. This is the default setting.</td>
</tr>
<tr>
<td>controllers {aps}</td>
<td>Enables the adoption of controllers by this controller</td>
</tr>
</tbody>
</table>

A controller cannot be configured as an adoptee and an adopter simultaneously. In other words, an adopted controller (adoptee) cannot be configured to adopt another controller.

Use the no > controller > adopted-devices command to remove this setting.
### external-devices

Enables adoption of external devices by this controller. When enabled, a WiNG controller can adopt and manage T5 controllers (using the IPX operating system) within a WiNG managed device subnet. This setting is disabled by default. To disable T5 CPE adoption, use the `no > controller > external-devices` command.

**Note:** This feature is supported only on RFS4000, RFS7000, NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510 platforms.

### controller adoption

Enables the adoption of the logged device (wireless controller or service platform) by other controllers. Use the `no > controller > adoption` command to disable adoption.

### controller [group <CONTROLLER-GROUP-NAME> | vlan <1-4094>]

- **controller**
  - Configures the WLAN's controller adoption settings.
- **group <CONTROLLER-GROUP-NAME>**
  - Configures the wireless controller or service platform group.
    - `<CONTROLLER-GROUP-NAME>` – Specify the wireless controller or service platform group name.
- **vlan <1-4094>**
  - Configures the wireless controller or service platform VLAN.
    - `<1-4094>` – Specify a VLAN ID from 1 - 4094.

### controller hello-interval <1-120> adjacency-hold-time <2-600>

- **controller**
  - Configures the WLAN's controller settings.
- **hello-interval <1-120>**
  - Configures the hello-interval in seconds. This is the interval between consecutive hello packets exchanged between AP and wireless controller or service platform.
    - `<1-120>` – Specify a value from 1 - 120 seconds.
- **adjacency-hold-time <2-600>**
  - Configures the adjacency hold time in seconds. This is the time since the last received hello packet, after which the adjacency between wireless controller or service platform and AP is lost, and the link is re-established.
    - `<2-600>` – Specify a value from 2 - 600 seconds.

### controller host [<IPv4>|<IPv6>|<HOSTNAME>] {ipsec-secure} {gw [<IP>|<HOSTNAME>]}

- **controller**
  - Configures the WLAN's controller adoption settings.
- **host [<IPv4>|<IPv6>|<HOSTNAME>]**
  - Configures wireless controller or service platform's IPv4/IPv6 address or hostname.
    - `<IPv4>` – Configures wireless controller or service platform’s IPv4 address
    - `<IPv6>` – Configures wireless controller or service platform’s IPv6 address
    - `<HOSTNAME>` – Configures wireless controller or service platform’s hostname
controller host [IPv4|IPv6|HOSTNAME] {level [1|2]|pool <1-2> level [1|2]} {ipsec-secure {gw [IP|HOSTNAME]}|remote-vpn-client}

**controller**

Configures the WLAN’s controller adoption settings

| host [IPv4|IPv6|HOSTNAME] | Configures wireless controller or service platform’s IPv4/IPv6 address or name |
|--------------------------|------------------------------------------------------------------------------|
|                          | • IPv4 – Configures wireless controller or service platform’s IPv4 address |
|                          | • IPv6 – Configures wireless controller or service platform’s IPv6 address |
|                          | • HOSTNAME – Configures wireless controller or service platform’s name       |

| level [1|2] | The following keywords are common to the ‘IP’, ‘IPv6’, and ‘hostname’ parameters: |
|-----------|--------------------------------------------------------------------------------|
|           | Optional. After providing the wireless controller or service platform’s address, optionally select one of the following routing levels: |
|           | • 1 – Optional. Level 1, local routing |
|           | • 2 – Optional. Level 2, inter-site routing |
|           | **Note:** After specifying the routing level, you can, optionally enable IPSec Secure authentication and remote VPN client. |

| pool <1-2> level [1|2] | The following keywords are common to the ‘IP’, ‘IPv6’, and ‘hostname’ parameters: |
|------------------------|--------------------------------------------------------------------------------|
|                        | Optional. Sets the wireless controller or service platform’s pool |
|                        | • <1-2> – Select either 1 or 2 as the pool. The default is 1. After selecting the pool, optionally select one of the following two routing levels: |
|                        | • 1 – Optional. Level 1, local routing |
|                        | • 2 – Optional. Level 2, inter-site routing |
|                        | **Note:** After specifying the routing level and or device’s pool, you can optionally specify the following: |
|                        | • ipsec-secure – Optional. Enables IPSec peer authentication on the connection (link) between the adopting devices. This option is disabled by default. |
|                        | • gw – Optional. Specifies a IPSec gateway other than the wireless controller or service platform |
|                        | • <IP> – Use this option to specify the IPSec gateway’s IP address. |
|                        | • <HOSTNAME> – Use this option to specify the IPSec gateway’s hostname. |
|                        | **Note:** If the gateway’s IP address or hostname is not specified, the system assumes the logged controller as the IPSec gateway. |
|                        | • remote-vpn-client – Forces MiNT link creation protocol (MLCP) to use remote VPN connection on the controller |
|                        | The controller uses remote VPN tunnel for this traffic. If multiple controller hosts are configured, either all the hosts should use remote-vpn-client or none. |
|                        | **Note:** When enabled, an MLCP connection is not initiated until remote VPN connection is UP and virtual IP, DNS server, source route etc. are installed on the AP. |
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {remote-vpn-client}

<table>
<thead>
<tr>
<th>controller</th>
<th>Configures the WLAN's controller settings</th>
</tr>
</thead>
</table>
| host [<IPv4>|<IPv6>|<HOSTNAME>] | Configures wireless controller or service platform's IPv4/IPv6 address or hostname
- `<IPv4>` – Configures wireless controller or service platform's IPv4 address
- `<IPv6>` – Configures wireless controller or service platform's IPv6 address
- `<HOSTNAME>` – Configures wireless controller or service platform's name
| remote-vpn-client | Forces MiNT link creation protocol (MLCP) to use remote VPN connection on the controller
The controller uses remote VPN tunnel for this traffic. If multiple controller hosts are configured, either all the hosts should use remote-vpn-client or none.
When enabled, an MLCP connection is not initiated until remote VPN connection is UP and virtual IP, DNS server, source route etc. are installed on the AP.

7.1.17 critical-resource

Profile Config Commands

Enables monitoring of resources critical to the health of the service platform, wireless controller, or access point managed network. These critical resources are identified by their configured IP addresses. When enabled, the system monitors these devices regularly and logs their status. Use this command to create a critical resource monitoring (CRM) policy.

A critical resource can be a gateway, AAA server, WAN interface, any hardware, or a service on which the stability of the network depends. Monitoring these resources is therefore essential. When enabled, this feature pings critical resources regularly to ascertain their status. If there is a connectivity issue, an event is generated stating a critical resource is unavailable. By default, there is no enabled critical resource policy and one needs to be created and implemented.

Critical resources can be monitored directly through the interfaces on which they are discovered. For example, a critical resource on the same subnet as an AP8132 access point can be monitored by its IP address. However, a critical resource located on a VLAN must continue to be monitored on that VLAN.

Critical resource monitoring can be enabled on service platforms, wireless controllers, and access points through their respective device profiles.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

critical-resource [CRM-POLICY-NAME]|monitor |
critical-resource crm-POLICY-NAME monitor [direct|via] |
critical-resource CRM-POLICY-NAME monitor direct [all|any] [<IP>|sync-adoptees] {<IP>|arp-only vlan <1-4094> {<IP>|port [LAYER2-IF-NAME]|ge <1-4>|port-channel <1-2>}} |
critical-resource CRM-POLICY-NAME monitor via [<IP]|LAYER3-INTERFACE-NAME|pppoel|vlan|wwan1] |
critical-resource CRM-POLICY-NAME monitor via [<IP]|LAYER3-INTERFACE-NAME|pppoel|vlan <1-4094>|wwan1 [all|any] [<IP]|sync-adoptees {<IP>|arp-only vlan <1-4094> {<IP>|port [LAYER2-IF-NAME]|ge <1-4>|port-channel <1-2>}} |
critical-resource monitor interval <5-86400>

Parameters

- critical-resource CRM-POLICY-NAME monitor direct [all|any] [<IP]|sync-adoptees {<IP>|arp-only vlan <1-4094> {<IP>|port [LAYER2-IF-NAME]|ge <1-4>|port-channel <1-2>}}

| <CRITICAL-RESRC-NAME> | Creates a critical resource monitoring policy, identified by the <CRM-POLICY-NAME> keyword. Provide the CRM policy name. |
| monitor | Enables critical resource(s) monitoring |
| **direct** [all|any] [<IP>|sync-adoptees] | Monitors critical resources using the default routing engine  
| | • all – Monitors all resources that are going down (generates an event when all specified critical resources are unreachable)  
| | • any – Monitors any resource that is going down (generates an event when any one of the specified critical resource is unreachable)  
| | • <IP> – Configures the IP address of the critical resource being monitored (for example, the DHCP or DNS server). Specify the IP address in the A.B.C.D format.  
| | • sync-adoptees – Syncs adopted access points with the controller. In the stand-alone AP scenario, where the CRM policy is running on the AP, the AP is directly intimated in case a critical resource goes down. On the other hand, when an AP is adopted to a controller (running the CRM policy), it is essential to enable the sync-adoptees option in order to sync the AP with the controller regarding the latest CRM status.  
| **arp-only vlan <1-4094> {<IP>|[port [<LAYER2-IFNAME>|ge|port-channel]]}** | The following keywords are common to the 'all' and 'any' parameters:  
| | • arp-only vlan <1-4094> – Optional. Uses ARP to determine if the IP address is reachable (use this option to monitor resources that do not have IP addresses). ARP is used to resolve hardware addresses when only the network layer address is known.  
| | • vlan <1-4094> – Specifies the VLAN ID on which to send the probing ARP requests. Specify the VLAN ID from 1 - 4094.  
| | • <IP> – Optional. Limits ARP to a device specified by the <IP> parameter  
| | • port [<LAYER2-IFNAME>|ge|port-channel] – Optional. Limits ARP to a specified port

| **<CRITICAL-RESRC-NAME>** | Creates a critical resource monitoring policy, identified by the **<CRM-POLICY-NAME>** keyword. Provide the CRM policy name.  
| **monitor** | Enables critical resource(s) monitoring  
| **via** | Specifies the interface or next-hop via which the ICMP pings should be sent.  
| | Configures the interface or next-hop via which ICMP pings are sent. This does not apply to IP addresses configured for arp-only. For interfaces which learn the default-gateway dynamically (like DHCP clients and PPP interfaces), use an interface name for VIA, or use an IP address.  
| **<IP>** | Specify the IP address of the next-hop via which the critical resource(s) are monitored.  
| | Configures up to four IP addresses for monitoring. All the four IP addresses constitute critical resources.  
| **<LAYER3-INTERFACE-NAME>** | Specify the layer 3 Interface name (router interface)  
| **pppoe1** | Specifies PPP over Ethernet interface  
| **vlan <1-4094>** | Specifies the wireless controller or service platform’s VLAN interface. Specify VLAN ID from 1 - 4094.  
| **wwan1** | Specifies Wireless WAN interface
[all|any]
[<IP>|sync-adoptees]

</tbody>
</table>
7.1.18.1 crypto

Use the crypto command to define a system-level local ID for ISAKMP negotiation and enter the ISAKMP policy, ISAKMP client, or ISAKMP peer configuration mode.

A crypto map entry is a single policy that describes how certain traffic is secured. There are two types of crypto map entries: ipsec-manual and ipsec-ike entries. Each entry is given an index (used to sort the ordered list).

When a non-secured packet arrives on an interface, the crypto map associated with that interface is processed (in order). If a crypto map entry matches the non-secured traffic, the traffic is discarded.

When a packet is transmitted on an interface, the crypto map associated with that interface is processed. The first crypto map entry that matches the packet is used to secure the packet. If a suitable Security Association (SA) exists, it is used for transmission. Otherwise, IKE is used to establish a SA with the peer. If no SA exists (and the crypto map entry is “respond only”), the packet is discarded.

When a secured packet arrives on an interface, its Security Parameter Index (SPI) is used to look up a SA. If a SA does not exist (or if the packet fails any of the security checks), it is discarded. If all checks pass, the packet is forwarded normally.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
crypto [auto-ipsec-secure|enable-ike-uniqueids|ike-version|ikev1|ikev2|ipsec|

<td>Configures load management for platforms using software cryptography</td>
</tr>
<tr>
<td>• crypto ike-version [ikev1-only</td>
<td>ikev2-only]</td>
</tr>
</tbody>
</table>
| ike-version [ikev1-only|ikev2-only] | • ikev1-only – Enables support for IKEv1 tunnels only  
|                | • ikev2-only – Enables support for IKEv2 tunnels only                                                  |
| • crypto ikev1 [dpd-keepalive <10-3600>|dpd-retries <1-100>|nat-keepalive <10-3600>|peer <IKEV1-PEER>|policy <IKEV1-POLICY-NAME>|remote-vpn] | Configures the IKE version 1 parameters                                                               |
| ikev1                        |                                                                                                        |
| dpd-keepalive <10-3600>      | Sets the global Dead Peer Detection (DPD) keep alive interval from 10 - 3600 seconds. This is the interval between successive IKE keep alive messages sent to detect if a peer is dead or alive. The default is 30 seconds. |
| dpd-retries <1-1000>         | Sets the global DPD retries count from 1- 1000. This is the number of keep alive messages sent to a peer before the tunnel connection is declared as dead. The default is 5. |
| nat-keepalive <10-3600>      | Sets the global NAT keep alive interval from 10 - 3600 seconds. This is the interval between successive NAT keep alive messages sent to detect if a peer is dead or alive. The default is 20 seconds. |
| peer <IKEV1-PEER>            | Specify the name/Identifier for the IKEV1 peer. For IKEV1 peer configuration commands, see crypto-ikev1/ikev2-peer commands. |
| policy <IKEV1-POLICY-NAME>   | Configures an ISKAMP policy. Specify the name of the policy. The local IKE policy and the peer IKE policy must have matching group settings for successful negotiations. For IKEV1 policy configuration commands, see crypto-ikev1/ikev2-policy commands. |
| remote-vpn                   | Specifies the IKEV1 remote-VPN server configuration (responder only)                                    |
| • crypto ikev2 [cookie-challenge-threshold <1-100>|dpd-keepalive <10-3600>|dpd-retries <1-100>|nat-keepalive <10-3600>|peer <IKEV2-PEER>|policy <IKEV2-POLICY-NAME>|remote-vpn] | Configures the IKE version 2 parameters                                                               |
| ikev2                        |                                                                                                        |
| cookie-challenge-threshold <1-100> | Starts the cookie challenge mechanism after the number of half open IKE SAs exceeds the specified limit. Specify the limit from 1 - 100. The default is 5. |
| dpd-keepalive <10-3600>      | Sets the global DPD keepalive interval from 10 - 3600 seconds. The default is 30 seconds.               |
| dpd-retries <1-100>          | Sets the global DPD retries count from 1 - 100. The default is 5.                                        |
| nat-keepalive <10-3600>      | Sets the global NAT keep alive interval from 10 - 3600 seconds. The default is 20 seconds.               |
| peer <IKEV2-PEER>            | Specify the name/Identifier for the IKEv2 peer                                                          |

</tbody>
</table>

### Crypto Map Configuration

- `crypto map <CRYPTO-MAP-TAG> <1-1000> [ipsec-isakmp {dynamic}|ipsec-manual]`

- `map <CRYPTO-MAP-TAG>`
  - Configures the crypto map, a software configuration entity that selects data flows that require security processing. The crypto map also defines the policy for these data flows.
  - `<CRYPTO-MAP-TAG>` – Specify a name for the crypto map. The name should not exceed 32 characters. For crypto map configuration commands, see *Crypto-Map-IPSec-Manual Commands*. |

- `<1-1000>`
  - Defines the crypto map entry sequence. Each crypto map uses a list of entries, each entry having a specific sequence number. Specifying multiple sequence numbers within the same crypto map provides the flexibility to connect to multiple peers from the same interface. Specify a value from 1 - 1000.

- `ipsec-isakmp {dynamic}`
  - Configures IPSEC w/ISAKMP.
  - `dynamic` – Optional. Configures dynamic map entry (remote VPN configuration) for XAUTH with mode-config or ipsec-l2tp configuration.

- `ipsec-manual`
  - Configures IPSEC w/manual keying. Remote configuration is not allowed for manual crypto map.

### PKI Configuration

- `crypto pki import crl <TRUSTPOINT-NAME> <URL> <1-168>`

- `pki`
  - Configures certificate parameters. The *Public Key Infrastructure* (PKI) protocol creates encrypted public keys using digital certificates from certificate authorities.

- `import`
  - Imports a trustpoint related configuration.

- `crl <TRUSTPOINT-NAME>`
  - Imports a *Certificate Revocation List* (CRL). Imports a trustpoint including either a private key and server certificate or a CA certificate or both.
  - `<TRUSTPOINT-NAME>` – Specify the trustpoint name.
<URL> Specify the CRL source address in the following format. Both IPv4 and IPv6 address formats are supported.
- tftp://<hostname|IPv4 or IPv6>:<port>/path/file
- ftp://<user>:<passwd>@<hostname|IPv4 or IPv6>:<port>/path/file
- sftp://<user>:<passwd>@<hostname|IPv4 or IPv6>:<port>/path/file
- http://<hostname|IPv4 or IPv6>:<port>/path/file
- cf:/path/file
- usb<n>:/path/file

<1-168> Sets command replay duration from 1 - 168 hours

- **crypto plain-text-deny-acl-scope [global|interface]**
  - plain-text-deny-acl-scope Configures plain-text-deny-acl-scope parameters
  - global Applies the plain text deny ACL globally. This is the default setting.
  - interface Applies the plain text deny ACL to the interface only

- **crypto remote-vpn-client**
  - remote-vpn-client Configures remote VPN client settings. For more information, see [crypto-remote-vpn-client commands](#).

**Examples**

7.1.18.2 crypto-auto-ipsec-tunnel commands

Create an auto IPSec tunnel and changes the mode to auto-ipsec-secure mode for further configuration.

Auto IPSec tunneling provides a secure tunnel between two networked peer controllers or service platforms and associated access points that are within a range of valid IP addresses. You can define which packets are sent within the tunnel, and how they are protected. When a tunnelled peer sees a sensitive packet, it creates a secure tunnel and sends the packet through the tunnel to its remote peer destination or associated access point.

Tunnels are sets of SA between two peers. SAs define the protocols and algorithms applied to sensitive packets and specify the keying mechanisms used by tunnelled peers. SAs are unidirectional and exist in both the inbound and outbound direction. SAs are established per the rules and conditions of defined security protocols (AH or ESP).

The IKE protocol is a key management protocol used in conjunction with IPSec. IKE enhances IPSec by providing additional features, flexibility, and configuration simplicity for the IPSec standard. IKE enables secure communications without time consuming manual pre-configuration for auto IPSec tunneling.

```
rfs7000-37FABE(config-profile-default-rfs7000)#crypto auto-ipsec-secure
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#?
```

</table>
7.1.18.2.1 groupid

- **crypto-auto-ipsec-tunnel commands**

Specifies the identity string used for IKE authentication.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
groupid <WORD> [psk|rsa]
groupid <WORD> [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]
```

**Parameters**

- **groupid <WORD> [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]**

  | <WORD> | Specify a string not exceeding 64 characters. This is the group identity used for IKE exchange for auto IPSec secure peers. After providing a group ID, specify the authentication method used to authenticate peers on the auto IPSec secure tunnel. The options are: psk and rsa. |
  | psk [0 <WORD>|2 <WORD>|<WORD>] | Configures the pre-shared key (PSK) |
  | 0 <WORD> | Configures a clear text key |
  | 2 <WORD> | Configures an encrypted key |
  | <WORD> | Specify a string value from 8 - 21 characters. |
  | rsa | Configures the Rivest-Shamir-Adleman (RSA) key. |
  | RSA is an algorithm for public key cryptography. It is the first algorithm known to be suitable for signing, as well as encryption. This is the default setting. |

**NOTE:** Only one group ID is supported on the controller or service platform. All APs, controllers, and service platform must use the same group ID.

**Examples**

```plaintext
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#groupid testgroup@123 rsa
```

```plaintext
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
groupid testgroup@123 rsa
```

```plaintext
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#
```
### 7.1.18.2.2 ip

#### crypto-auto-ipsec-tunnel commands

Enables the controller to uniquely identify APs and the hosts present in the AP's subnet. This allows the controller to correctly identify the destination host and create a dynamic site-to-site VPN tunnel between the host and the private network behind the controller.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```plaintext
ip nat crypto
```

#### Parameters

- `ip nat crypto`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ip nat crypto</strong></td>
<td>Enables unique identification of APs and the hosts present in each AP's subnet</td>
</tr>
</tbody>
</table>

Providing a unique ID enables the access point, wireless controller, or service platform to uniquely identify the destination device. This is essential in networks where there are multiple APs behind a router, or when two (or more) APs behind two (or more) different routers have the same IP address. Further, the same subnet exists behind these APs.

For example, let us consider a scenario where there are two APs (A and B) behind two routers (1 and 2). AP ‘A’ is behind router ‘1’. And AP ‘B’ is behind router ‘2’. Both these APs have the same IP address (192.168.13.8). The subnet behind APs A and B is also the same (100.1.1.0/24). In such a scenario the controller fails to uniquely identify the hosts present in either AP’s subnet.

For more information, see `remotegw` and `crypto`.

#### Examples

```plaintext
rfs4000-229D58(config-profile-test)RFS4000-crypto-auto-ipsec-secure)#ip nat crypto
rfs4000-229D58(config-profile-test)RFS4000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
  remotegw ike-version ikev2 uniquiid
rfs4000-229D58(config-profile-test)RFS4000-crypto-auto-ipsec-secure)#
```
7.18.2.3 ike-lifetime

**crypto-auto-ipsec-tunnel commands**

Configures the IKE SA's key lifetime in seconds

The lifetime defines how long a connection (encryption/authentication keys) should last, from successful key negotiation to expiration. Two peers need not exactly agree on the lifetime, though if they do not, there is some clutter for a superseded connection on the peer defining the lifetime as longer.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

ike-lifetime <600-86400>

**Parameters**

- ike-lifetime <600-86400>

<table>
<thead>
<tr>
<th>ike-lifetime &lt;600-86400&gt;</th>
<th>Sets the IKE SA's key lifetime in seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;600-86400&gt; – Specify a value from 600 - 86400 seconds. The default is 8600 seconds.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-auto-ipsec-secure)#ike-lifetime 800
rfs4000-229D58 (config-profile-testRFS4000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
  ike-lifetime 800
rfs4000-229D58 (config-profile-testRFS4000-crypto-auto-ipsec-secure)#
```
7.1.18.2.4 ikev2

- **crypto-auto-ipsec-tunnel commands**

Enables/disables the forced IKEv2 peer re-authentication. This option is disabled by default.

In most IPSec tunnel configurations, the lifetime of IKE SAs between peers is limited. Once the IKE SA key expires it is renegotiated. In such a scenario, the IKEv2 tunnel peers may or may not re-authenticate themselves. When enabled, IKE tunnel peers have to re-authenticate each time the IKE SA is renegotiated.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
ikev2 peer reauth

**Parameters**
- ikev2 peer reauth

| ikev2 peer reauth | Enables IKEv2 peer re-authentication. When enabled, IKE tunnel peers are forced to re-authenticate each time the IKE key is renegotiated. |

**Examples**
rfs4000-229D58 (config-profile-testRFS4000-crypto-auto-ipsec-secure)#ikeyv2 peer reauth
### 7.1.18.2.5 remotegw

#### crypto-auto-ipsec-tunnel commands

Defines the IKE version used for auto IPSEC tunnel negotiation with the IPSec remote gateway other than the controller

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
remotegw ike-version [ikev1-aggr|ikev1-main|ikev2] {uniqueid}
```

**Parameters**

- **remotegw ike-version [ikev1-aggr|ikev1-main|ikev2] {uniqueid}**

```
remotegw
ike-version
ikev1-aggr
ikev1-main
ikev2
uniqueid
```

- **ikev1-aggr**
  Aggregation mode is used by the auto IPSec tunnel initiator to set up the connection

- **ikev1-main**
  Main mode is used by the auto IPSec tunnel initiator to establish the connection

- **ikev2**
  IKEv2 is the preferred method when wireless controller/AP only is used

- **uniqueid**
  This keyword is common to all of the above parameters.
  - **uniqueid** — Optional. Enables the assigning of a unique ID to APs (using this profile) behind a router by prefixing the MAC address to the groupid

Providing a unique ID enables the access point, wireless controller, or service platform to uniquely identify the destination device. This is essential in networks where there are multiple APs behind a router, or when two (or more) APs behind two (or more) different routers have the same IP address. For example, let us consider a scenario where there are two APs (A and B) behind two routers (1 and 2). AP ‘A’ is behind router ‘1’. And AP ‘B’ is behind router ‘2’. Both these APs have the same IP address (192.168.13.8). In such a scenario, the controller fails to establish an Auto IPSEC VPN tunnel to either APs, because it is unable to uniquely identify them. After enabling unique ID assignment, enable IKE unique ID check. For more information, see `crypto`

**Examples**

```
remotegw ike-version ikev2 uniqueid
```

```
remotegw ike-version ikev2 uniqueid
```
7.1.18.2.6 no

- **crypto-auto-ipsec-tunnel commands**

Removes or resets this auto IPSec tunnel settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
no [groupid|ike-lifetime|ikev2 peer reauth|ip nat crypto]
```

**Parameters**

- no <PARAMETERS>

---

**Examples**

The following example shows the Auto IPSec VLAN bridge settings before the ‘no’ command is executed:

```
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
groupid testpassword@123 rsa
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#no groupid
```

The following example shows the Auto IPSec VLAN bridge settings after the ‘no’ command is executed:

```
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#
nx4500-5CFA2B(config-profile-testRFS4000-crypto-auto-ipsec-secure)#no ikev2 peer reauth
nx4500-5CFA2B(config-profile-testRFS4000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
  no ikev2 peer reauth
  ike-lifetime 800
nx4500-5CFA2B(config-profile-testRFS4000-crypto-auto-ipsec-secure)#
nx4500-5CFA2B(config-profile-testRFS4000-crypto-auto-ipsec-secure)#no ike-lifetime
nx4500-5CFA2B(config-profile-testRFS4000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
  no ikev2 peer reauth
```

- no <PARAMETERS> Removes or resets this auto IPSec tunnel's settings based on the parameters passed
7.1.18.3 crypto-ikev1/ikev2-policy commands

Defines crypto-IKEv1/IKEv2 commands in detail

IKE protocol is a key management protocol standard used in conjunction with IPSec. IKE enhances IPSec by providing additional features, flexibility, and configuration simplicity for the IPSec standard. IKE automatically negotiates IPSec SAs and enables secure communications without time consuming manual pre-configuration.

Use the (config) instance to configure IKEv1/IKEv2 policy configuration commands.

To navigate to the IKEv1/IKEv2 policy config instance, use the following commands:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto ikev1/ikev2 policy
<DEVICE>(config-profile-default-rfs7000)#crypto ikev1 policy ikev1-testpolicy
```

**Crypto IKEv1 Policy Configuration commands:**
- dpd-keepalive: Set Dead Peer Detection interval in seconds
- dpd-retries: Set Dead Peer Detection retries count
- isakmp-proposal: Configure ISAKMP Proposals
- lifetime: Set lifetime for ISAKMP security association
- mode: IKEv1 mode (main/aggressive)
- no: Negate a command or set its defaults
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)#?
```

**Crypto IKEv2 Policy Configuration commands:**
- dpd-keepalive: Set Dead Peer Detection interval in seconds
- isakmp-proposal: Configure ISAKMP Proposals
- lifetime: Set lifetime for ISAKMP security association
- no: Negate a command or set its defaults
- sa-per-acl: Setup single SA for all rules in the ACL (ONLY APPLICABLE FOR SITE-TO-SITE VPN)
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-profile-test-ikev2-policy-ikev2-testpolicy)#?
```

**NOTE:** IKEv2 being an improved version of the original IKEv1 design, is recommended in most deployments. IKEv2 provides enhanced cryptographic mechanisms, NAT and firewall traversal, attack resistance etc.
The following table summarizes crypto IKEv1/iKEv2 configuration mode commands:

**Table 7.6 Crypto-IKEv1/IKEv2-Policy Commands**

### 7.1.18.3.1 dpd-keepalive

*crypto-ikev1/ikev2-policy commands*

Sets the DPD keep-alive packet interval

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
dpd-keepalive <10-3600>

**Parameters**
- dpd-keepalive <10-3600>

| <10-3600> | Specifies the interval, in seconds, between successive DPD keep alive packets. The IKE keep alive message is used to detect a dead peer on the remote end of the IPSec VPN tunnel. Specify the time from 10 - 3600 seconds. The default is 30 seconds. |

**Examples**
```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)#dpd-keepalive 11
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#show context crypto ikev1 policy testpolicy
  dpd-keepalive 11
  isakmp-proposal default encryption aes-256 group 2 hash sha
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#
```
7.1.18.3.2 dpd-retries

- crypto-ikev1/ikev2-policy commands

Sets the maximum number of times DPD keep alive packets are sent to a peer. Once this value is exceeded, without a response from the peer, the VPN tunnel connection is declared dead. This option is available only for the IKEV1 policy.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

dpd-retries <1-100>

Parameters
- dpd-retries <1-100>

<table>
<thead>
<tr>
<th>&lt;1-100&gt;</th>
<th>Declares a peer dead after the specified number of retries. Specify a value from 1 - 100. The default is 5.</th>
</tr>
</thead>
</table>

Examples

rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#dpd-retries 10

rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#show context crypto ikev1 policy testpolicy
dpd-keepalive 11

dpd-retries 10
  isakmp-proposal default encryption aes-256 group 2 hash sha
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#
### 7.1.18.3.3 isakmp-proposal

- **crypto-ikev1/ikev2-policy commands**

Configures ISAKMP proposals and their parameters

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
```

**Parameters**

<table>
<thead>
<tr>
<th>&lt;WORD&gt;</th>
<th>Assigns the target peer (tunnel destination) a 32 character maximum name to distinguish it from others with a similar configuration.</th>
</tr>
</thead>
</table>
| encryption [3des|aes|aes-192|aes-256] | Configures the encryption method used by the tunneled peers to securely interoperate  
  • 3des – Configures triple data encryption standard  
  • aes – Configures AES (128 bit keys)  
  • aes-192 – Configures AES (192 bit keys)  
  • aes-256 – Configures AES (256 bit keys). This is the default setting. |
| group [14|2|5] | Specifies the **Diffie-Hellman (DH)** group identifier used by VPN peers to derive a shared secret password without having to transmit. DH groups determine the strength of the key used in key exchanges. The higher the group number, the stronger and more secure the key. Options include 2, 5 and 14.  
  • 14 – Configures DH group 14  
  • 2 – Configures DH group 2. This is the default setting.  
  • 5 – Configures DH group 5 |
| hash [md5|sha] | Specifies the **hash** algorithm used to authenticate data transmitted over the IKE SA. The hash algorithm specified here is used by VPN peers to exchange credential information.  
  • md5 – Uses **Message Digest 5 (MD5)** hash algorithm  
  • sha – Uses **Secure Hash Authentication (SHA)** hash algorithm. This is the default setting. |

**Examples**

```plaintext
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)#isakmp-proposal testproposal encryption aes group 2 hash sha
```

```plaintext
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)#show context crypto ikev1 policy testpolicy
dpd-keepalive 11
dpd-retries 10
isakmp-proposal testproposal encryption aes-256 group 2 hash sha
```

```plaintext
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)#
```
7.1.18.3.4 lifetime

crypto-ikev1/ikev2-policy commands

Specifies how long an IKE SA (encryption/authentication keys) is valid. The value specified is the validity period of the IKE SA from successful key negotiation to expiration.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
lifetime <600-86400>

Parameters
- lifetime <600-86400>

<table>
<thead>
<tr>
<th>lifetime &lt;600-86400&gt;</th>
<th>Specifies how many seconds an IKE SA lasts before it expires. Set a time stamp from 600 - 86400 seconds.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;600-86400&gt; – Specify a value from 600 - 86400 seconds. The default is 86400 seconds.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-test-ikev1policy)#lifetime 655
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#show context
  crypto ikev1 policy testpolicy
dpd-keepalive 11
dpd-retries 10
  lifetime 655
  isakmp-proposal default encryption aes-256 group 2 hash sha
  isakmp-proposal testproposal encryption aes group 2 hash sha
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#
7.1.18.3.5 mode

crypto-ikev1/ikev2-policy commands

Configures the IPSec mode of operation for the IKEV1 policy. This option is not available for IKEV2 policy.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

mode [aggresive|main]

Parameters

- mode [aggresive|main]

| mode [aggresive|main] | Sets the mode of the tunnels |
|----------------------|----------------------------|
|                       | • aggressive – Initiates the aggressive mode |
|                       | • main – Initiates the main mode |

**Note:** If configuring the IKEV1 IPSec policy, define the IKE mode as either `main` or `aggressive`. In the aggressive mode, 3 messages are exchanged between the IPSec peers to setup the SA. On the other hand, in the main mode, 6 messages are exchanged. The default setting is main.

Examples

rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#mode aggressive

rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#show context crypto ikev1 policy testpolicy
dpd-keepalive 11
dpd-retries 10
lifetime 655
isakmp-proposal default encryption aes-256 group 2 hash sha
isakmp-proposal testproposal encryption aes group 2 hash sha

crypto ikev1 policy testpolicy#mode aggressive

rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#
7.1.18.3.6 no

- crypto-ikev1/ikev2-policy commands

Removes or reverts IKEv1/IKEv2 policy settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [dpd-keepalive|dpd-retries|isakmp-proposal <WORD>|lifetime|mode]

Parameters

- no <PARAMETERS>

Examples

The following example shows the IKEV1 Policy settings before the 'no' commands are executed:

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#show context crypto ikev1 policy testpolicy
dpd-keepalive 11
dpd-retries 10
lifetime 655
isakmp-proposal default encryption aes-256 group 2 hash sha
isakmp-proposal testproposa1 encryption aes group 2 hash sha
mode aggressive
```

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#no mode
```

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#no dpd-keepalive
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#no dpd-retries
```

The following example shows the IKEV1 Policy settings after the 'no' commands are executed:

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#show context crypto ikev1 policy testpolicy
lifetime 655
isakmp-proposal default encryption aes-256 group 2 hash sha
isakmp-proposal testproposa1 encryption aes group 2 hash sha
```

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#
```
7.1.18.4 crypto-ikev1/ikev2-peer commands

Use the (config) instance to configure IKEv1/IKEv2 peer configuration commands. To navigate to the IKEv1/IKEv2 peer config instance, use the following commands:

```plaintext
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto ikev1/ikev2 peer <IKEV1/IKEV2-PEER-NAME>
```

```
rfs7000-37FAEBE(config-profile-default-rfs7000)#crypto ikev1 peer peer1
rfs7000-37FAEBE(config-profile-default-rfs7000-ikev1-peer-peer1)#?
```

Crypto IKEV1 Peer Configuration commands:
- **authentication** Configure Authentication credentials
- **ip** Configure peer address/fqdn
- **localid** Set local identity
- **no** Negate a command or set its defaults
- **remoteid** Configure remote peer identity
- **use** Set setting to use

```

7.1.18.4.1 authentication

- **crypto-ikev1/ikev2-peer commands**

Configures IKEv1/IKEv2 peer’s authentication mode and the pre-shared key

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9511, NX9512

**Syntax**

```
authentication [psk|rsa]
```

```
authentication psk [0 <WORD>|2 <WORD>|<WORD>] {local|remote}
```

```
authentication rsa
```

**Parameters**

- **authentication psk [0 <WORD>|2 <WORD>|<WORD>] {local|remote}**

| psk [0 <WORD>|2 <WORD>|<WORD>] {local|remote} | Configures the authentication mode as **pre-shared key** (PSK). The PSK is a string, 8 - 12 characters long. It is shared by both ends of the VPN tunnel connection. If using IKEv2, both a local and remote string must be specified for handshake validation at both ends (local and remote) of the VPN connection.  
  - 0 <WORD> – Configures a clear text key  
  - 2 <WORD> – Configures an encrypted key  
  - <WORD> – Configures the pre-shared key  

The following keywords are available only in the IKEv2 peer configuration mode:
- **local** – Optional. Uses the specified key for local peer authentication only  
- **remote** – Optional. Uses the specified key for remote peer authentication only  

**Note:** In case the peer type is not specified, this string is used for authenticating both local and remote peers.

- **authentication rsa**

| rsa | Configures the authentication mode as **Rivest, Shamir, and Adleman** (RSA) This is the default setting. |

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#authentication rsa
```

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#authentication psk 0 key@123456
```

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#show context/crypto ikev2 peer peer1  
  authentication psk 0 key@123456 local  
  authentication psk 0 key@123456 remote
```

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#
```
7.18.4.2 ip

**crypto-ikev1/ikev2-peer commands**

Sets the IP address or Fully Qualified Domain Name (FQDN) of the IPSec VPN peer used in the tunnel setup

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
ip [address <IP>|fqdn <WORD>]
```

**Parameters**

- **ip [address <IP>|fqdn <WORD>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address &lt;IP&gt;</td>
<td>Specify the peer device’s IP address.</td>
</tr>
<tr>
<td>fqdn &lt;WORD&gt;</td>
<td>Specify the peer device’s FQDN hostname.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#ip address 172.16.10.12
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#show context crypto ikev1 peer peer1
 ip address 172.16.10.12
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#

rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#ip address 192.168.10.6
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#show context crypto ikev2 peer peer1
 ip address 192.168.10.6
 authentication psk 0 test@123456 local
 authentication psk 0 test@123456 remote
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#
```
**7.18.4.3 localid**

> **crypto-ikev1/ikev2-peer commands**

Sets a IKEv1/IKEv2 peer’s local identity. This local identifier is used with this peer configuration for an IKE exchange with the target VPN IPSec peer.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
localid [address|autogen-uniqueid|dn|email|fqdn|string]
localid [address <IP>|autogen-uniqueid <WORD>|dn <WORD>|email <WORD>|fqdn <WORD>|
    string <WORD>]
```

**Parameters**
- `localid [address <IP>|dn <WORD>|email <WORD>|fqdn <WORD>|string <WORD>]`
  - **address <IP>** Configures the peer’s IP address. The IP address is used as local identity.
  - **autogen-uniqueid <WORD>** Generates a localid using the device’s unique identity. The system prefixes the device’s unique identity to the string provided here. The device’s unique identity should be existing and configured. For more information on configuring a device’s unique identity, see `autogen-uniqueid`.  
    - `<WORD>` – Provide the string.
  - **dn <WORD>** Configures the peer’s distinguished name. (for example, “C=us ST=<state> L=<location> O=<organization> OU=<org unit>”. The maximum length is 128 characters.
  - **email <WORD>** Configures the peer’s e-mail address. The maximum length is 128 characters.
  - **fqdn <WORD>** Configures the peer’s FQDN. The maximum length is 128 characters.
  - **string <WORD>** Configures the peer’s identity string. The maximum length is 128 characters. This is the default setting.

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#localid email bob@examplecompany.com
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#show context crypto ikev1 peer peer1
  ip address 172.16.10.12
  localid email bob@examplecompany.com
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#
```
7.18.4.4 remoteid

crypto-ikev1/ikev2-peer commands

Configures a IKEv1/IKEV2 peer’s remote identity. This remote identifier is used with this peer configuration for an IKE exchange with the target VPN IPSec peer.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
remoteid [address <IP>|dn <WORD>|email <WORD>|fqdn <WORD>|string <WORD>]

Parameters
- remoteid [address <IP>|dn <WORD>|email <WORD>|fqdn <WORD>|string <WORD>]

| address <IP> | Configures the remote IKEv1/IKEV2 peer’s IP address. The IP address is used as the peer’s remote identity. |
| dn <WORD> | Configures the remote peer’s distinguished name. For example, "C=us ST=<state> L=<location> O=<organization> OU=<org unit>". The maximum length is 128 characters. |
| email <WORD> | Configures the remote peer’s e-mail address. The maximum length is 128 characters. |
| fqdn <WORD> | Configures a peer’s FQDN. The maximum length is 128 characters. |
| string <WORD> | Configures a peer’s identity string. The maximum length is 128 characters. |

Examples
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#remoteid dn SanJose
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#show context crypto ikev1 peer peer1
ip address 172.16.10.12
do not show crypto ikev1 peer peer1

rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#
7.1.18.4.5 use

Associates IKEv1/IKEv2 policy with the IKEv1/IKEv2 peer respectively

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
use ikev1-policy <IKEV1-POLICY-NAME>
use ikev2-policy <IKEV2-POLICY-NAME>

Parameters
- use ikev1-policy <IKEV1-POLICY-NAME>
  Specify the IKEv1 policy name.
  The local IKEv1 policy and the peer IKEv1 policy must have matching group settings for successful negotiations.

- use ikev2-policy <IKEV2-POLICY-NAME>
  Specify the IKEv2 policy name.
  The local IKEv2 policy and the peer IKEv2 policy must have matching group settings for successful negotiations.

Examples
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)# use ikev1-policy test-ikev1policy
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)# show context
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)# use ikev2-policy test-ikev2policy
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)# show context
7.1.18.4.6 no

- crypto-ikev1/ikev2-peer commands

Removes or reverts IKEv1/IKEv2 peer settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [authentication|ip|localid|remoteid|use <IKEv1/IKEv2-POLICY-NAME>]

Parameters

- no <PARAMETERS>

Examples

The following example shows the Crypto IKEV1 peer1 settings before the 'no' commands are executed:

```
no localid
no remoteid
```

The following example shows the Crypto IKEV1 peer1 settings after the 'no' commands are executed:

```
no use ikev2-policy
```

The following example shows the Crypto IKEV2 peer1 settings before the 'no' commands are executed:

```
no use ikev2-policy
```

The following example shows the Crypto IKEV2 peer1 settings after the 'no' commands are executed:

```
no use ikev2-policy
```
7.1.18.5 crypto-map-config-commands

This section explains crypto map configuration mode commands in detail. A crypto map entry is a single policy that describes how certain traffic is secured. There are two types of crypto map entries: ipsec-manual and ipsec-ike. Each entry is given an index (used to sort the ordered list).

IPSec VPN provides a secure tunnel between two networked peers. Administrators can define which packets are sent within the tunnel, and how they’re protected. When a tunneled peer sees a sensitive packet, it creates a secure tunnel and sends the packet through the tunnel to its remote peer destination.

Tunnels are sets of SA between two peers. SAs define the protocols and algorithms applied to sensitive packets and specify the keying mechanisms used by tunneled peers. SAs are unidirectional and exist in both the inbound and outbound direction. SAs are established per the rules and conditions of defined security protocols (AH or ESP).

IKE is a key management protocol standard used in conjunction with IPSec. IKE enhances IPSec by providing additional features, flexibility, and configuration simplicity for the IPSec standard. IKE automatically negotiates IPSec SAs, and enables secure communications without time consuming manual pre-configuration.

Use crypto maps to configure IPSec VPN SAs. Crypto maps combine the elements comprising IPSec SAs. Crypto maps also include transform sets. A transform set is a combination of security protocols, algorithms and other settings applied to IPSec protected traffic. One crypto map is utilized for each IPsec peer, however for remote VPN deployments one crypto map is used for all the remote IPsec peers.

Use the (config) instance to enter the crypto map configuration mode. To navigate to the crypto-map configuration instance, use the following commands:

In the device-config mode:
```
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000>
[ipsec-isakmp {dynamic}|ipsec-manual]
```

In the profile-config mode:
```
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000>
[ipsec-isakmp {dynamic}|ipsec-manual]
```

There are three different configurations defined for each listed crypto map: site-to-site manual (ipsec-manual), site-to-site-auto tunnel (ipsec-isakmp), and remote VPN client (ipsec-isakmp dynamic). With site-to-site deployments, an IPSEC tunnel is deployed between two gateways, each at the edge of two different remote networks. With remote VPN, an access point located at remote branch defines a tunnel with a security gateway. This facilitates the end points in the branch office to communicate with the destination endpoints (behind the security gateway) in a secure manner.

Each crypto map entry is given an index (used to sort the ordered list).
```
rfs7000-37FABE(config-profile-default-rfs7000)#crypto map map1 1 ipsec-manual
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#?
```

Manual Crypto Map Configuration commands:
```
local-endpoint-ip     Use this IP as local tunnel endpoint address, instead of the interface IP (Advanced Configuration)
mode                  Set the tunnel mode
no                    Negate a command or set its defaults
peer                  Set peer
security-association  Set security association parameters
session-key           Set security session key parameters
use                   Set setting to use
clrscr                Clears the display screen
commit                Commit all changes made in this session
do                    Run commands from Exec mode
end                   End current mode and change to EXEC mode
exit                  End current mode and down to previous mode
help                  Description of the interactive help system
revert                Revert changes
service               Service Commands
show                  Show running system information
```
write  Write running configuration to memory or terminal

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#

The following table summarizes crypto map configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto-map auto-vpn-tunnel/remote-vpn-client instance</td>
<td>Configures an auto site-to-site VPN or remote VPN client</td>
<td>page 7-99</td>
</tr>
<tr>
<td>crypto-map-ipse-manual-instance</td>
<td>Configures a manual site-to-site VPN</td>
<td>page 7-113</td>
</tr>
</tbody>
</table>
7.18.6 crypto-map auto-vpn-tunnel/remote-vpn-client instance

To navigate to the auto site-to-site VPN tunnel configuration instance, use the following command:

In the device-config mode:
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-isakmp

In the profile-config mode:
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-isakmp

rfs4000-229D58(config-device-00-23-68-22-9D-58)#crypto map test 1 ipsec-isakmp
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#?

Site to Site Crypto Map Configuration commands:
- ip
- local-endpoint-ip
- no
- peer
- pfs
- security-association
- transform-set
- use
- clrscr
- commit
- do
- end
- exit
- help
- revert
- service
- show
- write

To navigate to the remote VPN client configuration instance, use the following command:

In the device-config mode:
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-isakmp {dynamic}

In the profile-config mode:
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-isakmp {dynamic}

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#?

Dynamic Crypto Map Configuration commands:
- local-endpoint-ip
- modeconfig
- no
- peer
- pfs
- remote-type
- security-association
- transform-set
- use
- clrscr
- commit
- do
- end
- exit
- help

</table>
7.18.6.1 ip

*crypto-map auto-vpn-tunnel/remote-vpn-client instance*

Enables this setting to utilize IP/Port NAT on this auto site-to-site VPN tunnel. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
ip nat crypto
```

**Parameters**

- `ip nat crypto`

<table>
<thead>
<tr>
<th>ip nat crypto</th>
<th>Enables this setting to utilize IP/Port NAT on the site-to-site VPN tunnel. This setting is disabled by default.</th>
</tr>
</thead>
</table>

**Examples**

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#ip nat crypto
```

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context crypto map test 1 ipsec-isakmp
   ip nat crypto
```

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```
7.18.6.2 local-endpoint-ip

- crypto-map auto-vpn-tunnel/remote-vpn-client instance

Uses the configured IP as local tunnel endpoint address, instead of the interface IP.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

local-endpoint-ip <IP>

**Parameters**

- local-endpoint-ip <IP>

<table>
<thead>
<tr>
<th>local-endpoint-ip &lt;IP&gt;</th>
<th>Configures the local VPN tunnel’s (site-to-site VPN tunnel or remote VPN client) endpoint IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;IP&gt; – Specify the IP address. The specified IP address must be available on the interface.</td>
</tr>
</tbody>
</table>

**Examples**

**Site-to-site VPN tunnel:**

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#local-endpoint-ip 192.168.13.10

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
   crypto map test 1 ipsec-isakmp
   local-endpoint-ip 192.168.13.10
   ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#

**Remote VPN client:**

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#local-endpoint-ip 157.235.204.62

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
   crypto map test 2 ipsec-isakmp dynamic
   local-endpoint-ip 157.235.204.62
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
7.1.18.6.3 modeconfig

Configures the mode config method (pull or push) associated with the remote VPN client

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
modeconfig [pull|push]

Parameters
- modeconfig [pull|push]

| modeconfig [pull|push] | Configures the mode config method associated with a remote VPN client. The options are: pull and push. The mode (pull or push) defines the method used to assign a virtual IP. This setting is relevant for IKEv1 only, since IKEv2 always uses the configuration payload in pull mode. The default setting is push. |

Examples
Remote VPN client:

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#modeconfig pull
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
modeconfig pull
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)
7.1.18.6.4 peer

**crypto-map auto-vpn-tunnel/remote-vpn-client instance**

Configures the IKEv1 or IKEv2 peer for the auto site-to-site VPN tunnel or remote VPN client. The peer device can be specified either by its hostname or by its IP address. A maximum of three peers can be configured.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
peer <1-3> [ikev1|ikev2] <IKEv1/IKEv2-PEER-NAME>
```

**Parameters**

- **peer <1-3> [ikev1|ikev2] <IKEv1/IKEv2-PEER-NAME>**
  - `peer <1-3>` Creates a new peer and configures the peer's priority level. Peer '1' is the primary peer, and peer '3' is redundant.
  - `ikev1 <IKEv1-PEER-NAME>` Configures an IKEv1 peer
    - `<IKEv1-PEER-NAME>` — Specify the IKEv1 peer's name.
  - `ikev2 <IKEv2-PEER-NAME>` Configures an IKEv2 peer
    - `<IKEv2-PEER-NAME>` — Specify the IKEv2 peer's name.

**Examples**

**Site-to-site tunnel:**

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#peer 1 ikev2 ikev2Peer1
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context crypto map test 1 ipsec-isakmp peer 1 ikev2 ikev2Peer1 local-endpoint-ip 192.168.13.10 ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

**Remote VPN client:**

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#peer 1 ikev1 RemoteIKEv1Peer1
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context crypto map test 2 ipsec-isakmp dynamic peer 1 ikev1 RemoteIKEv1Peer1 local-endpoint-ip 157.235.204.62
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```
7.18.6.5 pfs

`crypto-map auto-vpn-tunnel/remote-vpn-client instance`

Configures Perfect Forward Secrecy (PFS) for the auto site-to-site VPN tunnel or remote VPN client.

PFS is the key-establishment protocol, used to secure VPN communications. If one encryption key is compromised, only data encrypted by that specific key is compromised. For PFS to exist, the key used to protect data transmissions must not be used to derive any additional keys. Options include 2, 5 and 14. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`pfs [14|2|5]`

**Parameters**
- `pfs [14|2|5]`

| pfs [14|2|5] | Configures PFS |
|--------------|----------------|
| 14 – Configures D-H Group14 (2048-bit modp) |
| 2 – Configures D-H Group2 (1024-bit modp) |
| 5 – Configures D-H Group5 (1536-bit modp) |

**Examples**

**Site-to-site VPN tunnel:**

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#pfs 5
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context crypto map test 1 ipsec-isakmp
  peer 1 ikev2 ikev2Peer1
  local-endpoint-ip 192.168.13.10
  pfs 5
  ip nat crypto
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

**Remote VPN client:**

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#pfs 14
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context crypto map test 2 ipsec-isakmp dynamic
  peer 1 ikev1 RemoteIKEv1Peer1
  local-endpoint-ip 157.235.204.62
  pfs 14
  ip nat crypto
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```
7.1.18.6.6 remote-type

crypto-map auto-vpn-tunnel/remote-vpn-client instance

Configures the remote VPN client type as either None or XAuth

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
remote-type [none|xauth]

Parameters
- remote-type [none|xauth]

remote-type [none|xauth]  Specify the remote VPN’s client type
  - none – Configures remote VPN client with No XAUTH
  - xauth – Configures remote VPN client as using XAUTH (applicable only for IKEv1). This is the default setting.

Note: XAuth (extended authentication) provides additional authentication validation by permitting an edge device to request extended authentication information from an IPSec host. This forces the host to respond with additional authentication credentials. The edge device respond with a failed or passed message.

Examples
Remote VPN client:

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#remote-type none
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context crypto map test 2 ipsec-isakmp dynamic peer 1 ikev1 RemoteIKEv1Peer1 local-endpoint-ip 157.235.204.62 pfs 14 remote-type none
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
7.1.18.6.7 security-association

**crypto-map auto-vpn-tunnel/remote-vpn-client instance**

Defines the IPSec SA's (created by this auto site-to-site VPN tunnel or remote VPN client) settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
security-association [inactivity-timeout|level|lifetime]
security-association [inactivity-timeout <120-86400>|level perhost]
security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]
```

**Parameters**

- **security-association [inactivity-timeout <120-86400>|level perhost]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inactivity-timeout &lt;120-86400&gt;</td>
<td>Specifies an inactivity period, in seconds, for this IPSec VPN SA. Once the set value is exceeded, the association is timed out.</td>
</tr>
<tr>
<td></td>
<td>* &lt;120-86400&gt; – Specify a value from 120 - 86400 seconds. The default is 900 seconds.</td>
</tr>
<tr>
<td>level perhost</td>
<td>Specifies the granularity level for this IPSec VPN SA</td>
</tr>
<tr>
<td></td>
<td>* perhost – Sets the IPSec VPN SA's granularity to the host level</td>
</tr>
</tbody>
</table>

- **security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lifetime</td>
<td>Defines the IPSec SA's lifetime (in kilobytes and/or seconds). Values can be entered in both kilobytes and seconds. Which ever limit is reached first, ends the security association.</td>
</tr>
<tr>
<td>kilobytes &lt;500-2147483646&gt;</td>
<td>* Defines volume based key duration. Specify a value from 500 - 2147483646 kilobytes. Select this option to define a connection volume lifetime (in kilobytes) for the duration of the IPSec VPN SA. Once the set volume is exceeded, the association is timed out. This option is disabled by default.</td>
</tr>
<tr>
<td>seconds &lt;120-86400&gt;</td>
<td>* Defines time based key duration. Specify the time frame from 120 - 86400 seconds. Select this option to define a lifetime (in seconds) for the duration of the IPSec VPN SA. Once the set value is exceeded, the association is timed out. This option is disabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

Site-to-site tunnel:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#security-association
inactivity-timeout 200
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#security-association
level perhost

rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
7.1.18.6.8 transform-set

Applies a transform set (encryption and hash algorithms) to site-to-site VPN tunnel or remote VPN client. This command allows you to provide customized data protection for each crypto map can be customized with its own data protection and peer authentication schemes.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

transform-set <TRANSFORM-SET-TAG>

Parameters

- transform-set <TRANSFORM-SET-TAG>

<table>
<thead>
<tr>
<th>transform-set &lt;TRANSFORM-SET-TAG&gt;</th>
<th>Applies a transform set. The transform set should be existing and configured.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;TRANSFORM-SET-TAG&gt;</td>
<td>&lt;TRANSFORM-SET-TAG&gt; — Specify the transform set's name.</td>
</tr>
</tbody>
</table>

Examples

Site-to-site VPN tunnel:

rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#transform-set AutoVPN

crypto map test 1 ipsec-isakmp
security-association level perhost
peer 1 ikev2 ikev2Peer1
local-endpoint-ip 192.168.13.10
pfs 5
security-association lifetime kilobytes 250000
security-association inactivity-timeout 200
transform-set AutoVPN
ip nat crypto
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#

Remote VPN client:

rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#transform-set RemoteVPN

crypto map test 2 ipsec-isakmp dynamic
peer 1 ikev1 RemoteIKEv1Peer1
local-endpoint-ip 157.235.204.62
pfs 14
security-association lifetime seconds 10000
transform-set RemoteVPN
remote-type none
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#
7.18.6.9 use

Applies an existing and configured IP access list to the auto site-to-site VPN tunnel or remote VPN client. Based on the IP access list's settings traffic is permitted or denied across the VPN tunnel.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
use ip-access-list <IP-ACCESS-LIST-NAME>
```

Parameters

```
- use ip-access-list <IP-ACCESS-LIST-NAME>
```

<table>
<thead>
<tr>
<th><code>ip-access-list &lt;IP-ACCESS-LIST-NAME&gt;</code></th>
<th>Specify the IP access list name.</th>
</tr>
</thead>
</table>

Examples

Site-to-site VPN tunnel:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#use ip-access-list test
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
  crypto map test 1 ipsec-isakmp
    use ip-access-list test
    security-association level perhost
    peer 1 ikev2 ikev2Peer1
    local-endpoint-ip 192.168.13.10
    pfs 5
    security-association lifetime kilobytes 250000
    security-association inactivity-timeout 200
    transform-set AutoVPN
    ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

Remote VPN client:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#use ip-access-list test1
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
  crypto map test 2 ipsec-isakmp dynamic
    use ip-access-list test1
    peer 1 ikev1 RemoteIKEv1Peer1
    local-endpoint-ip 157.235.204.62
    pfs 14
    security-association lifetime seconds 10000
    transform-set RemoteVPN
    remote-type none
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```
7.1.18.6.10 no

crypto-map auto-vpn-tunnel/remote-vpn-client instance

Removes or reverts the auto site-to-site VPN tunnel or remote VPN client settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
no [ip|local-endpoint-ip|modeconfig|peer|pfs|remote-type|security-association|transform-set|use]

Parameters
- no <PARAMETERS>

| no <PARAMETERS> | Removes or resets this auto site-to-site/remote VPN settings based on the parameters passed |

Examples
The following example shows the IPSec site-to-site VPN tunnel ‘test’ settings before the ‘no’ commands are executed:
```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
  use ip-access-list test
  security-association level perhost
  peer 1 ikev2 ikev2Peer1
  local-endpoint-ip 192.168.13.10
  pfs 5
  security-association lifetime kilobytes 250000
  security-association inactivity-timeout 200
  transform-set AutoVPN
  ip nat crypto
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#no use ip-access-list
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#no security-association level perhost
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#no ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#no pfs
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#no local-endpoint-ip
```

The following example shows the IPSec site-to-site VPN tunnel ‘test’ settings after the ‘no’ commands are executed:
```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
  peer 1 ikev2 ikev2Peer1
  security-association lifetime kilobytes 250000
  security-association inactivity-timeout 200
  transform-set AutoVPN
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

The following example shows the IPSec remote VPN client ‘test’ settings before the ‘no’ commands are executed:
```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
  use ip-access-list test2
  peer 1 ikev1 RemoteIKEv1Peer1
  local-endpoint-ip 157.235.204.62
  pfs 14
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#no use ip-access-list
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#no security-association level perhost
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#no ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#no pfs
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#no local-endpoint-ip
```

The following example shows the IPSec remote VPN client ‘test’ settings after the ‘no’ commands are executed:
```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
  peer 1 ikev1 RemoteIKEv1Peer1
  local-endpoint-ip 157.235.204.62
  pfs 14
```
The following example shows the IPSec remote VPN 'test' settings after the 'no' commands are executed:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
  local-endpoint-ip 157.235.204.62
  pfs 14
  security-association lifetime seconds 10000
  remote-type none
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```
7.1.18.7 crypto-map-ipsec-manual-instance

To navigate to the automatic IPSec manual VPN tunnel configuration instance, use the following command:

In the device-config mode:

```
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-manual
```

In the profile-config mode:

```
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-manual
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58)#crypto map test 3 ipsec-manual
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#3)#?
```

Manual Crypto Map Configuration commands:

- **local-endpoint-ip**: Use this IP as local tunnel endpoint address, instead of the interface IP (Advanced Configuration)
- **mode**: Set the tunnel mode
- **no**: Negate a command or set its defaults
- **peer**: Set peer
- **security-association**: Set security association parameters
- **session-key**: Set security session key parameters
- **use**: Set setting to use
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#3)#
```

The following table summarizes IPSec manual VPN tunnel configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</table>
7.1.18.7.1 local-endpoint-ip

- crypto-map-ipsec-manual-instance

Uses the configured IP as local tunnel endpoint address, instead of the interface IP (Advanced Configuration)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

local-endpoint-ip <IP>

**Parameters**

- local-endpoint-ip <IP>

<table>
<thead>
<tr>
<th>local-endpoint-ip &lt;IP&gt;</th>
<th>Uses the configured IP as local tunnel's endpoint address</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;IP&gt; — Specify the IP address. The specified IP address must be available on the interface.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE (config-profile-default-rfs7000-cryptomap-map1#1)#local-endpoint-ip 172.16.10.3
### 7.1.18.7.2 mode

Sets the crypto map tunnel mode

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
```
mode [transport|tunnel]
```

**Parameters**
- **mode [transport|tunnel]**

| mode [transport|tunnel] | Sets the mode of the tunnel for this crypto map |
|------------------------|-----------------------------------------------|
|                        | • transport – Initiates transport mode        |
|                        | • tunnel – Initiates tunnel mode (default setting) |

**Examples**
```
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#mode transport

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context crypto map map1 1 ipsec-manual
   mode transport
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#
```
7.1.18.7.3 peer

Sets the peer device’s IP address. This can be set for multiple remote peers. The remote peer can be an IP address.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
peer <IP>

Parameters
- peer <IP>

<table>
<thead>
<tr>
<th>peer &lt;IP&gt;</th>
<th>Enter the peer device’s IP address. If not configured, it implies respond to any peer.</th>
</tr>
</thead>
</table>

Examples

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#peer 172.16.10.12

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context crypto map map1 1 ipsec-manual
peer 172.16.10.12

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#
7.1.18.7.4 security-association

Defines the lifetime (in kilobytes and/or seconds) of IPSec SAs created by this crypto map.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]

Parameters
- security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]

<table>
<thead>
<tr>
<th>lifetime</th>
<th>Values can be entered in both kilobytes and seconds. Which ever limit is reached first, ends the security association.</th>
</tr>
</thead>
<tbody>
<tr>
<td>[kilobytes &lt;500-2147483646&gt;</td>
<td>seconds &lt;120-86400&gt;]</td>
</tr>
<tr>
<td></td>
<td>• seconds &lt;120-86400&gt; – Defines time based key duration. Specify the time frame from 120 - 86400 seconds.</td>
</tr>
</tbody>
</table>

NOTE: This command is not applicable to the ipsec-manual crypto map.

Examples
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map2#2)#security-association lifetime seconds 123

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map2#2)#show context
Command not applicable to this crypto map
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map2#2)#
7.1.18.7.5 session-key

- crypto-map-ipsec-manual-instance

Defines encryption and authentication keys for this crypto map

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX8524, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
session-key [inbound|outbound] ah <256-4294967295> [0|2]authenticator [md5|sha] <WORD>
```

Parameters

- session-key [inbound|outbound] ah <256-4294967295> [0|2]authenticator [md5|sha] <WORD>
  - Defines the manual inbound and outbound security association key parameters
  - `ah <256-4294967295>`: Configures `authentication header` (AH) as the security protocol for the security session
    - `<256-4294967295>` — Sets the SPI for the security association from 256 - 4294967295
    - The SPI (in combination with the destination IP address and security protocol) identifies the security association.
  - `[0|2]authenticator [md5|sha] <WORD>`: Specifies the key type
    - `0` — Sets a clear text key
    - `2` — Sets an encrypted key
    - `authenticator` — Sets AH authenticator details
      - `md5 <WORD>` — AH with MD5 authentication
      - `sha <WORD>` — AH with SHA authentication
      - `<WORD>` — Sets security association key value. The following key lengths (in hex characters) are required (w/o leading 0x).AH-MD5: 32, AH-SHA: 40

  - Defines the manual inbound and outbound security association key parameters
  - `esp <256-4294967295>`: Configures `Encapsulating Security Payloads` (ESP) as the security protocol for the security session. This is the default setting.
    - `<256-4294967295>` — Sets the SPI for the security association from 256 - 4294967295
    - The SPI (in combination with the destination IP address and security protocol) identifies the security association.
Examples

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#session-key inbound esp 273 cipher esp-null authenticator sha 58768979

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context
  crypto map map1 1 ipsec-manual
    peer 172.16.10.2
    mode transport
    session-key inbound esp 273 0 cipher esp-null authenticator sha 58768979
7.1.18.7.6 use

Associates an existing IP access list with this crypto map. The ACL protects the VPN traffic.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
use ip-access-list <IP-ACCESS-LIST-NAME>

Parameters
- use ip-access-list <IP-ACCESS-LIST-NAME>

| ip-access-list <IP-ACCESS-LIST-NAME> | Specify the IP access list name. |

Examples
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#use ip-access-list test
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context
crypto map map1 1 ipsec-manual
use ip-access-list test
peer 172.16.10.12
mode transport
session-key inbound esp 273 0 cipher esp-null authenticator sha 5876897
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#
7.1.18.7 no

- **crypto-map-ipsec-manual-instance**

Removes or resets this crypto map’s settings

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
no [local-endpoint-ip|mode|peer|security-association|session-key|use]
```

**Parameters**

- **no <PARAMETERS>**

  no <PARAMETERS> Removes or resets this crypto map settings based on the parameters passed

**Examples**

```plaintext
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context crypto map map1 1 ipsec-manual
  use ip-access-list test
  peer 172.16.10.12
  mode transport
  session-key inbound esp 273 0 cipher esp-null authenticator sha 58768979
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#no use ip-access-list
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#no peer
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#no mode
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context crypto map map1 1 ipsec-manual
  session-key inbound esp 273 0 cipher esp-null authenticator sha 58768979
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#
```

7.1.18.8  crypto-remote-vpn-client commands

This section documents the IKEV2 remote VPN client configuration settings. Use this command to define the server resources used to secure (authenticate) a remote VPN connection with a target peer.

Use the profile-config instance to configure remote VPN client settings. To navigate to the remote-vpn-client configuration instance, use the following commands:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto remote-vpn-client
```

NOTE: To configure remote VPN client settings on a device, on the device’s configuration mode, use the `crypto > remote-vpn-client` command.

For example:
```
rfs4000-229D58(config-device-00-23-68-22-9D-58)#crypto remote-vpn-client
```  

NOTE: The following configuration enables a access point to adopt to a controller over the remote VPN link:

On a profile:
```
rfs4000-229D58(config-profile-testRFS4000)#controller host <HOST-IP> remote-vpn-client
```

On a device:
```
rfs4000-229D58(config-00-23-68-22-9D-58)#controller host <HOST-IP> remote-vpn-client
```

Crypto IKEV2 Remote Vpn Client Config commands:

- **dhcp-peer**: Configure parameters for peers received via DHCP option
- **no**: Negate a command or set its defaults
- **peer**: Add a remote peer
- **shutdown**: Disable remote VPN client
- **transform-set**: Specify IPSec transform to use
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

7.1.18.8.1 dhcp-peer

Configures DHCP peer’s local ID and authentication settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
dhcp-peer [authentication|localid]
```

```
dhcp-peer authentication [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]
```

```
dhcp-peer localid [autogen-uniqueid <WORD>|string <WORD>]
```

Parameters

- `dhcp-peer authentication [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]`
  - Configures the DHCP peer’s authentication type as PSK
    - `0 <WORD>` – Configures a clear text authentication key
    - `2 <WORD>` – Configures an encrypted authentication key
    - `<WORD>` – Provide a 8 - 21 character shared key password for DHCP peer authentication
- `dhcp-peer localid [autogen-uniqueid <WORD>|string <WORD>]`
  - Configures the DHCP peer’s localid using one of the following options:
    - `autogen-uniqueid` - Generates a localid using the device’s unique identity. The system prefixes the device’s unique identity to the string provided here. The device’s unique identity should be existing and configured. For more information on configuring a device’s unique identity, see `autogen-uniqueid`.
    - `<WORD>` – Provide the string.
    - `string` - Uses the value provided here as the DHCP peer’s localid.
    - `<WORD>` - Provide the string.

Examples

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#dhcp-peer
authentication psk 0 @123testing
```

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#show context crypto remote-vpn-client
   dhcp-peer authentication psk 0 @123testing
```
7.1.18.8.2 peer

crypto-remote-vpn-client commands

Configures IKEv2 peers and assigns them priorities for utilization with remote VPN client connections. A maximum of three (3) peers can be added to support redundancy.

IKEv2 uses an initial handshake in which VPN peers negotiate cryptographic algorithms, mutually authenticate, and establish a session key, creating an IKE-SAs. Additionally, a first IPsec SA is established during the initial SA creation. All IKEv2 messages are request/response pairs. It is the responsibility of the side sending the request to retransmit if it does not receive a timely response.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

peer <1-3> ikev2 <IKEV2-PEER-NAME>

Parameters

- peer <1-3> ikev2 <IKEV2-PEER-NAME>

Examples

rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#peer 1 ikev2 ikev2Peer1
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#peer 2 ikev2 ikev2Peer2
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#show context crypto remote-vpn-client
peer 1 ikev2 ikev2Peer1
peer 2 ikev2 ikev2Peer2
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
7.1.18.8.3 shutdown

Disables remote-vpn-client on this profile or device. Remote VPN client feature is enabled by default.

To enable a disabled remote VPN client execute the `no > shutdown` command.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
shutdown
```

Parameters

None

Examples

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
shutdown
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
```
7.1.18.8.4 transform-set

crypto-remote-vpn-client commands

Specifies the IPSec Transform set to use with this remote VPN client. A transform set is a combination of security protocols, algorithms, and other settings applied to IPSec protected client traffic.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
transform-set <IPSEC-XFORM-TAG>

Parameters
- transform-set <IPSEC-XFORM-TAG>

Associates an IPSec Transform (should be existing and configured) set with this remote VPN client. To configure a transform-set, use the crypto > ipsec > transform-set command in the profile or device configuration mode.

Examples
rfs4000-229D58(config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#transform-set TransformSet1
rfs4000-229D58(config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#show
crypto remote-vpn-client
peer 1 ikev2 ikev2Peer1
transform-set TransformSet1
rfs4000-229D58(config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
### 7.1.18.8.5 no

- **crypto-remote-vpn-client commands**

Removes the remote VPN client settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

- `no [dhcp-peer|peer <1-3>|shutdown|transform-set]`
- `no dhcp-peer [authentication|localid]`
- `no peer <1-3>`
- `no shutdown`
- `no transform-set`

**Parameters**

- `no <PARAMETERS>`

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes or resets this remote VPN client settings based on the parameters passed</th>
</tr>
</thead>
</table>

**Examples**

```bash
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#)#show context crypto remote-vpn-client peer 1 ikev2 peer5
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
```

```bash
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)##no peer 1
```

```bash
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#show context crypto remote-vpn-client
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
```
7.1.19 **device-upgrade**

Configures device firmware upgrade settings on this profile.

Administrators can customize profiles with unique device configuration file and firmware upgrade support. In a clustered environment, operations performed on one device are propagated to each member of the cluster and then onwards to devices managed by each cluster member. The number of concurrent device upgrades and their start times can be customized to ensure a sufficient number of devices remain in duty while upgrades are administered to others.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
device-upgrade [add-auto|auto|count|persist-images]
```

```
device-upgrade add-auto [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000]
```

```
device-upgrade auto [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx|nx9000]
```

```
device-upgrade count <1-128>
```

```
device-upgrade persist-images
```

**Parameters**

- **device-upgrade add-auto**

  This command specifies the types of devices that can be automatically upgraded (if enabled). To enable automatic device firmware upgrade, use the ‘auto’ command. When enabled, access points, wireless controllers, and service platforms, using this profile, will automatically upgrade firmware on adopted devices that match the specified device types.

  **Note:** Multiple device types can be added to the add-auto list.
### device-upgrade auto

Enables automatic firmware upgrade on specified device types. When used along with the add-auto command, the auto command allows access points, wireless controllers, and service platforms to automatically upgrade firmware on adopted devices matching the specified device types.

| device-upgrade auto { (ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx| ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx75xx| nx9000) } |
|---|
| **Optional.** Selects the device types for automatic firmware upgrade. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX75XX, NX9000. |
| **Note:** Multiple device types can be added to the auto list. |

### device-upgrade count <1-128>

Configures the maximum number of concurrent upgrades possible.

- `<1-128` – specify a value from `1` - `128`.

### device-upgrade persist-images

Configures parameters for automatic firmware upgrade of adopted devices. Use this command to select the device types and the maximum number of concurrent upgrades.

<table>
<thead>
<tr>
<th>device-upgrade</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures parameters for automatic firmware upgrade of adopted devices.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>persist-images</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables RF Domain manager to retain AP firmware image after upgrade, subject to availability of space.</td>
</tr>
</tbody>
</table>

This option is enabled for all controllers and service platforms RF Domain managers with the flash memory capacity to store firmware images for the selected access point models they provision. This feature is disabled for access point RF Domain managers that do not typically have the flash memory capacity needed.

### Examples

```
rfs4000-229D58(config-profile-default-rfs4000)#device-upgrade auto ap71xx
rfs4000-229D58(config-profile-default-rfs4000)#show context

  - Removes device firmware upgrade settings on this profile.

- **device-upgrade**
  - Displays device upgrade details.
7.1.20 dot1x

Profile Config Commands

Configures 802.1x standard authentication controls

Dot1x (or 802.1x) is an IEEE standard for network authentication. It enables media-level (layer 2) access control, providing the capability to permit or deny connectivity based on user or device identity. Dot1x allows port-based access using authentication. An dot1x enabled port can be dynamically enabled or disabled depending on user identity or device connection.

Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

Before authentication, the endpoint is unknown, and traffic is blocked. Upon authentication, the endpoint is known and traffic is allowed. The controller or service platform uses source MAC filtering to ensure only the authenticated endpoint is allowed to send traffic.

Supported in the following platforms:
- Access Points — ES6510, AP6511, AP71XX, AP7502, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530

Syntax

dot1x [guest-vlan|holdtime|system-auth-control|use]
dot1x holdtime <0-600>
dot1x system-auth-control
dot1x guest-vlan supplicant
dot1x use aaa-policy <AAA-POLICY-NAME>

Parameters

- **dot1x system-auth-control**
  
  Enables or disables system auth control. Enables/disables dot1x authorization globally for the controller. This feature is disabled by default.

- **dot1x holdtime <0-600>**
  
  Configures a holdtime value. This is the interval after which an authentication attempt is ignored or failed.
  - <0-600> — Specify a value from 0 - 600 seconds. A value of ‘0’ indicates no holdtime. The default is 600 seconds or 10 minutes.
  
  Adding a hold time at startup allows time for the network to converge before receiving or transmitting 802.1x authentication packets.

- **dot1x guest-vlan supplicant**
  
  Configures guest VLAN and supplicant behavior
  This feature is disabled by default.

  Allows 802.1x capable supplicant to enter guest VLAN. When enabled, this is the VLAN that supplicant's traffic is bridged on.
- `dot1x use aaa-policy <AAA-POLICY-NAME>`

<table>
<thead>
<tr>

**7.1.21 dscp-mapping**

> **Profile Config Commands**

Configures IP *Differentiated Services Code Point* (DSCP) to 802.1p priority mapping for untagged frames.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502
- AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

dscp-mapping <WORD> priority <0-7>

**Parameters**

- dscp-mapping <word> priority <0-7>

<table>
<thead>
<tr>

7.1.22 email-notification

Profile Config Commands

Configures e-mail notification settings. When a system event occurs e-mail notifications are sent (provided message logging is enabled) based on the settings configured here. Use this option to configure the outgoing SMTP server settings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

e-mail-notification [host|recipient]
e-mail-notification recipient <RECIPIENT-NAME>

e-mail-notification host <SMTP-SERVER-IP/HOSTNAME> sender <SENDER-EMAIL>
  [port|security|username]
e-mail-notification host <SMTP-SERVER-IP/HOSTNAME> sender <SENDER-EMAIL>
  [(port <1-65535>, security [none|ssl|starttls], username <SMTP-USERNAME>
  [password [2 <WORD>|<WORD>]])]

Parameters

- e-mail-notification recipient <RECIPIENT-EMAIL>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recipient</td>
<td>Defines the recipient's e-mail address. A maximum of 6 (six) e-mail addresses can be configured.</td>
</tr>
<tr>
<td>&lt;RECIPIENT-EMAIL&gt;</td>
<td>- &lt;RECIPIENT-EMAIL&gt; – Specify the recipient's e-mail address (should not exceed 64 characters in length).</td>
</tr>
</tbody>
</table>

- e-mail-notification host <SMTP-SERVER-IP/HOSTNAME> sender <SENDER-EMAIL>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Configures the host SMTP server's IP address or hostname</td>
</tr>
<tr>
<td>&lt;SMTP-SERVER-IP/HOSTNAME&gt;</td>
<td>- &lt;SMTP-SERVER-IP/HOSTNAME&gt; – Specify the SMTP server's IP address or hostname.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>Defines the sender's e-mail address. This is the from address on notification e-mails.</td>
</tr>
<tr>
<td>&lt;SENDER-EMAIL&gt;</td>
<td>- &lt;SENDER-EMAIL&gt; – Specify the sender's e-mail address (should not exceed 64 characters in length). Use the email-notification &gt; recipient &gt; EMAIL-ADDRESS command to configure the recipient's address.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>This option is recursive and applicable to the 'security' and 'username' parameters. Configures the SMTP server port. Use this option to configure a non-standard SMTP port on the outgoing SMTP server. The standard SMTP port is 25.</td>
</tr>
<tr>
<td>&lt;1-65535&gt;</td>
<td>- &lt;1-65535&gt; – Specify the port from 1 - 65535.</td>
</tr>
</tbody>
</table>
**security**
```
[none|ssl|starttls]
```
This option is recursive and applicable to the ‘port’ and ‘username’ parameters. Configures the SMTP encryption type used.
- none – No encryption used
- ssl – Uses Secure Sockets Layer (SSL) encryption between the SMTP server and the client
- starttls – Uses STARTTLS encryption between the SMTP server and the client

**username**
```
<SMTP-USERNAME>
```
**password**
```
[2 <WORD>|<WORD>]
```
This option is recursive and applicable to the ‘port’ and ‘security’ parameters. Configures the SMTP sender’s username. Many SMTP servers require users to authenticate with a username and password before sending e-mail through the server.
- `<SMTP-USERNAME>` – Specify the SMTP username (should not exceed 64 characters in length).
- password – Configures the SMTP server password. Specify the password associated with the username of the sender on the outgoing SMTP server.
  - 2 <WORD> – Configures an encrypted password
  - <WORD> – Specify the password (should not exceed 127 characters in length).

---

**Examples**
```
rfs7000-37FABE(config-profile-default-rfs7000)#email-notification recipient test@examplecompany.com

### 7.1.23 enforce-version

#### Profile Config Commands

Enables checking of a device’s firmware version before attempting adoption or clustering.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
enforce-version [adoption|cluster] [full|major|minor|none|strict]
```

#### Parameters

- **enforce-version [adoption|cluster] [full|major|minor|none|strict]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>adoption</td>
<td>Verifies firmware versions before adopting</td>
</tr>
<tr>
<td>cluster</td>
<td>Verifies firmware versions before clustering</td>
</tr>
<tr>
<td>full</td>
<td>Allows adoption or clustering when the first four octets of the firmware versions match (for example 5.7.0.0)</td>
</tr>
<tr>
<td>major</td>
<td>Allows adoption or clustering when the first two octets of the firmware versions match (for example 5.7)</td>
</tr>
<tr>
<td>minor</td>
<td>Allows adoption or clustering when the first three octets of the firmware versions match (for example 5.7.0)</td>
</tr>
<tr>
<td>none</td>
<td>Allows adoption or clustering between any firmware versions</td>
</tr>
<tr>
<td>strict</td>
<td>Allows adoption or clustering only when firmware versions exactly match (for example 5.7.0.0-028D)</td>
</tr>
</tbody>
</table>

#### Examples

```
nx4500-5CFA2B(config-profile-testNX45XX)#enforce-version cluster full

nx4500-5CFA2B(config-profile-testNX45XX)#enforce-version adoption major
```

### 7.1.24 environmental-sensor

> **Profile Config Commands**

Configures the environmental sensor settings

An AP8132 sensor module is a USB environmental sensor extension to an AP8132 model access point. It provides a variety of sensing mechanisms, allowing the monitoring and reporting of the AP8132’s radio coverage area.

Supported in the following platforms:
- Access Points — AP8132

**Syntax**

- `environmental-sensor [humidity|motion|polling-interval|temperature]`
- `environmental-sensor light {holdtime|radio-shutdown [threshold]}
- `environmental-sensor light {holdtime <10-201>|radio-shutdown [all|radio-1|radio-2]}
- `environmental-sensor light {holdtime <10-201>|radio-shutdown [threshold [high <100-10000]|low <0-1000>]}`

**Parameters**

- `environmental-sensor [humidity|motion|polling-interval <1-100>|temperature]

<table>
<thead>
<tr>
<th>parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>environmental-sensor</td>
<td>Configures environmental sensor settings on this profile</td>
</tr>
<tr>
<td>humidity</td>
<td>Enables (turns on) humidity sensors. This setting is enabled by default.</td>
</tr>
<tr>
<td>motion</td>
<td>Enables (turns on) motion sensors. This setting is enabled by default.</td>
</tr>
</tbody>
</table>
| polling-interval <1-100> | Configures polling interval, in seconds, on all sensors. This is the interval after which the sensor module polls its environment to assess the various parameters, such as light intensity.  
  - `<1-100>` – Specify a value from 1 - 100 seconds. The default is 5 seconds. |
| temperature        | Enables (turns on) temperature sensors. This setting is enabled by default. |

- `environmental-sensor light {holdtime <10-201>|radio-shutdown [all|radio-1|radio-2]}

<table>
<thead>
<tr>
<th>parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>environmental-sensor</td>
<td>Configures environmental sensor settings on this profile</td>
</tr>
</tbody>
</table>
| light              | Enables (turns on) light sensors and specifies its settings  
  When enabled, the sensor module polls the environment to determine the light intensity. Based on the reading, the system determines whether the AP8132’s deployment location has lights on or off. Light intensity also helps determine whether the access point’s deployment location is currently populated with clients. |
| holdtime <10-201>  | Optional. Configures a holdtime, in seconds, for the light sensor  
  - `<10-201>` – Specify a value from 10 - 201 seconds. The default value is 11 seconds. |
| radio-shutdown [all|radio1|radio2] | Optional. Shuts down the sensor’s radios  
  - `all` – Shuts down all radios. This is the default setting.  
  - `radio1` – Shuts down radio 1  
  Contd.. |
### environmental-sensor light {threshold [high <100-10000>|low <0-1000>]}  

<table>
<thead>
<tr>
<th>environmental-sensor</th>
<th>Configures environmental sensor settings on this profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>light</td>
<td>Enables (turns on) light sensors and specifies its settings</td>
</tr>
<tr>
<td>threshold</td>
<td>Optional. Configures the upper and lower thresholds for the amount of light in the environment</td>
</tr>
<tr>
<td>high &lt;100-10000&gt;</td>
<td>Specifies the upper threshold from 100 - 10000 lumens. This value determines whether lighting is on in the AP8132's deployment location. The radios are turned off if the average reading value is lower than the value set here. The default is 400 lux. <strong>Note:</strong> The light sensor triggers an event if the amount of light exceeds the specified value.</td>
</tr>
<tr>
<td>low &lt;0-1000&gt;</td>
<td>Specifies the lower threshold from 0 - 1000 lumens. This value determines whether lighting is off in the AP8132's deployment location. The radios are turned on when the average value is higher than the value set here. The default is 200 lux. <strong>Note:</strong> The light sensor triggers an event if the amount of light drops below the specified value.</td>
</tr>
</tbody>
</table>

### Examples

### 7.1.27 floor

**Profile Config Commands**

Sets the floor name where the target device (access point, wireless controller, or service platform using this profile) is physically located. Assigning a building floor name helps in grouping devices within the same general coverage area.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
floor <WORD> {<1-4094>}
```

**Parameters**

- **floor <WORD> {<1-4094>}**

  - **<WORD>** — Specify the floor name (should not exceed 64 characters in length).
  - **<1-4094>** — Optional. Configures the floor number from 1 - 4094. The default is 1.

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000)#floor fifth
rfs7000-37FABE(config-profile-default-rfs7000)#show context

<td></td>
</tr>
<tr>
<td>gre-config-instance</td>
<td>Summarizes GRE tunnel configuration mode commands</td>
<td>page 7-145</td>
</tr>
</tbody>
</table>
7.1.28.1 gre

Enables Generic Routing Encapsulation (GRE) tunneling on this profile, and creates a new GRE tunnel or modifies an existing GRE tunnel.

The GRE protocol allows encapsulation of one protocol over another. It is a tunneling protocol that transports any layer 3 protocol over an IP network. When enabled, a payload packet is first encapsulated in the GRE protocol. The GRE encapsulated payload is then encapsulated in another IP packet before being forwarded to the destination.

GRE tunneling can be configured to bridge Ethernet packets between WLANs and a remote WLAN gateway over an IPv4 GRE tunnel. The tunneling of 802.3 packets using GRE is an alternative to MiNT or L2TPv3. Related features like ACLs for extended VLANs are still available using layer 2 tunneling over GRE.

Using GRE, access points map one or more VLANs to a tunnel. The remote end point is a user-configured WLAN gateway IP address, with an optional secondary IP address should connectivity to the primary GRE peer be lost. VLAN traffic is expected in both directions in the GRE tunnel. A WLAN mapped to these VLANs can be either open or secure. Secure WLANs require authentication to a remote RADIUS server available within your deployment using standard RADIUS protocols. Access Points can reach both the GRE peer as well as the RADIUS server using IPv4.

The WiNG software now supports for both IPv4 or IPv6 tunnel endpoints. However, a tunnel needs to contain either IPv4 or IPv6 formatted device addresses and cannot be mixed. With the new IPv6 tunnel implementation, all outbound packets are encapsulated with the GRE header, then the IPv6 header. The source IP address of the IPv6 address of tunnel interface, and the destination address of the tunnel. All inbound packets are de-capsulated by removing the IPv6 and GRE header before sending it to the IP stack.

Syntax

gre tunnel <GRE-TUNNEL-NAME>

Parameters

- gre tunnel <GRE-TUNNEL-NAME>

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

NOTE: Only one GRE tunnel can be created for every profile.
Examples

```

## 7.1.28.2.1 dscp

- **gre-config-instance**

Sets the GRE tunnel's DSCP / 802.1q priority value from encapsulated packets to the outer packet IPv4 header.

This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

dscp [0-63]|reflect

### Parameters
- **dscp [0-63]|reflect**

<table>
<thead>
<tr>
<th>dscp 0-63&gt;</th>
<th>Specifies the DSCP 802.1q priority value for outer packets from 0 - 63. The default is 1.</th>
</tr>
</thead>
<tbody>
<tr>
<td>dscp reflect</td>
<td>Copies the DSCP 802.1q value from inner packets</td>
</tr>
</tbody>
</table>

### Examples

```plaintext
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#dscp 20
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#show context
gre tunnel testGRETunnel
dscp 20
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#
```

The following example configures a GRE tunnel on a profile:

```plaintext
nx4500-5CFA2B(config-profile testNX45XX-gre-tunnel-testGRETunnel)#dscp 20
nx4500-5CFA2B(config-profile testNX45XX-gre-tunnel-testGRETunnel)#show context
gre tunnel testGRETunnel
dscp 20
nx4500-5CFA2B(config-profile testNX45XX-gre-tunnel-testGRETunnel)#
```

### Related Commands

- **no** Removes the GRE tunnel settings based on the parameters passed
7.1.28.2.2 establishment-criteria

*gre-config-instance*

Configures the GRE tunnel establishment criteria.

In a multi-controller RF domain, it is always the master node that establishes the tunnel. The tunnel is created only if the tunnel device is designated as one of the following: vrrp-master, cluster-master, or rf-domain-manager.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]
```

**Parameters**

- **establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]**

**Examples**

```
nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#establishment-criteria rf-domain-manager
```

```
nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#show context gre tunnel testGREtunnel establishment-criteria rf-domain-manager
```

```
nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#
```

---

Configures the GRE tunnel establishment criteria. The options are:

- **always** — Always automatically establishes tunnel (default setting). The tunnel device need not be a cluster master, RF Domain manager, or VRRP master to establish the GRE tunnel.
- **cluster-master** — Establishes tunnel only if the tunnel device is designated as the cluster master.
- **rf-domain-manager** — Establishes tunnel only if the tunnel device is designated as the RF Domain manager.
- **vrrp-master <1-255>** — Establishes tunnel only if the tunnel device is designated as the Virtual Router Redundancy (VRRP) master.
  - `<1-255>` — Configures the VRRP group ID from 1 - 255. A VRRP group enables the creation of a group of routers as a default gateway for redundancy. Clients can point to the IP address of the VRRP virtual router as their default gateway and utilize a different group member if a master becomes unavailable.
7.1.28.2.3 failover

**gre-config-instance**

Enables periodic pinging of the primary gateway to assess its availability. When enabled, the system continues pinging an unreachable gateway, for a specified number of times and at the specified interval.

This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
failover interval <1-250> retry <0-10>
```

**Parameters**

- **failover interval <1-250> retry <0-10>**

  Specifies the interval, in seconds, between two successive pings to the primary gateway. If the primary gateway is unreachable, the system pings it at intervals specified here.

  - `<1-250>` – Specify a value from 1 - 250 seconds.
  - `retry` – Specifies the maximum number attempts made to ping the primary gateway before the session is terminated.
    - `<0-10>` – Specify a value from 0 - 10.

**Examples**

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#failover interval 200 retry 5
```

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#show context
gre tunnel testGRETunnel
dscp 20
   failover interval 200 retry 5
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#
```

**Related Commands**

- **no**
  Removes the GRE tunnel settings based on the parameters passed
7.1.28.2.4 mtu

*gre-config-instance*

Configures the maximum transmission unit (MTU) for IPv4/IPv6 L2GRE tunnel endpoints

The MTU is the largest physical packet size (in bytes) transmittable within the tunnel. Any messages larger than the configured MTU are divided into smaller packets before transmission. Larger the MTU greater is the efficiency because each packet carries more user data, while protocol overheads, such as headers or underlying per-packet delays remain fixed; the resulting higher efficiency means a slight improvement in bulk protocol throughput. A larger MTU results in the processing of fewer packets for the same amount of data.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
mtu [ipv4 <900-1476>|ipv6 <1236-1456>]
```

**Parameters**

- mtu [ipv4 <900-1476>|ipv6 <1236-1456>]

| mtu [ipv4 <900-1476>]
<table>
<thead>
<tr>
<th>ipv6 &lt;1236-1456&gt;</th>
<th>Configures the MTU for L2GRE tunnel endpoints</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4 &lt;900-1476&gt;</td>
<td>- Configures IPv4 L2GRE tunnel endpoint MTU from 900 - 1476. The default is 1476.</td>
</tr>
<tr>
<td>ipv6 &lt;1236-1456&gt;</td>
<td>- Configures IPv6 L2GRE tunnel endpoint MTU from 1236 - 1456. The default is 1456.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#mtu ipv4 1200
nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#mtu ipv6 1300
nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#show context

  mtu ipv4 1200
  mtu ipv6 1300
  establishment-criteria rf-domain-manager
nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#
```
7.1.28.2.5 native

Configure native trunking settings for this GRE tunnel

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

native [tagged|vlan <1-4094>]

Parameters

- native [tagged|vlan <1-4094>]

<table>
<thead>
<tr>
<th>native tagged</th>
<th>Enables/disables native VLAN tagging</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The IEEE 802.1Q specification is supported for tagging frames and coordinating VLANs between devices. IEEE 802.1Q adds four bytes to each frame identifying the VLAN ID for upstream devices that the frame belongs. If the upstream Ethernet device does not support IEEE 802.1Q tagging, it does not interpret the tagged frames. When VLAN tagging is required between devices, both devices must support tagging and be configured to accept tagged VLANs. When a frame is tagged, the 12 bit frame VLAN ID is added to the 802.1Q header so upstream Ethernet devices know which VLAN ID the frame belongs to. The device reads the 12 bit VLAN ID and forwards the frame to the appropriate VLAN. When a frame is received with no 802.1Q header, the upstream device classifies the frame using the default or native VLAN assigned to the Trunk port. The native VLAN allows an Ethernet device to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. This feature is disabled by default.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>native vlan &lt;1-4094&gt;</th>
<th>Specifies a numerical VLAN ID (1 - 4094) for the native VLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The native VLAN allows an Ethernet device to associate untagged frames to a VLAN, when no 802.1q frame is included in the frame. Additionally, the native VLAN is the VLAN untagged traffic is directed over when using a port in trunk mode.</td>
</tr>
</tbody>
</table>

Examples

nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#native tagged

nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#native vlan 20

Related Commands

no | Removes the GRE tunnel settings based on the parameters passed
7.1.28.2.6 no

Removes or resets the GRE tunnel settings based on the parameters passed.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [dscp|establishment-criteria|failover|mtu|native|peer|tunneled-vlan]
no [dscp|establishment-criteria|failover|tunneled-vlan]
no mtu [ipv4|ipv6]
no native [tagged|vlan]
no peer <1-2>

Parameters

- no <PARAMETERS>

Examples

The following example shows the GRE tunnel 'testGRETunnel' settings before the no commands are executed:

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#show context
gre tunnel testGRETunnel
peer 1 ip 192.168.13.6
native vlan 1
tunneled-vlan 1,10
native tagged
dscp 20
failover interval 200 retry 5
```

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#no dscp
```

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#no native vlan
```

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#no tunneled-vlan
```

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#no failover
```

The following example shows the GRE tunnel 'testGRETunnel' settings after the no commands are executed:

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#show context
gre tunnel testGRETunnel
peer 1 ip 192.168.13.6
native tagged
```

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#
```
7.1.28.2.7 peer

*gre-config-instance*

Adds the GRE tunnel’s end-point peers. A maximum of two peers, representing the tunnel’s end points, can be added for each GRE tunnel.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

peer <1-2> ip <IPv4/IPv6>

**Parameters**

- peer <1-2> ip <IPv4/IPv6>

| peer <1-2> ip <IPv4/IPv6> | Configures the tunnel’s end-point peers
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-2&gt;</td>
<td>– Specify a numeric index for each peer to help differentiate the tunnel end points.</td>
</tr>
<tr>
<td>ip</td>
<td>– Specify the IP address (IPv4/IPv6) of the added GRE peer to serve as a network address identifier.</td>
</tr>
<tr>
<td>&lt;IPv4/IPv6&gt;</td>
<td>– Specify the peer’s IPv4 or IPv6 address.</td>
</tr>
</tbody>
</table>

**Examples**

```
peer 1 ip 192.168.13.6
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#show context gre tunnel testGRETunnel
peer 1 ip 192.168.13.6
native tagged
dscp 20
failover interval 200 retry 5
```

**Related Commands**

- *no* Removes the GRE tunnel settings based on the parameters passed
7.1.28.2.8 tunneled-vlan

Defined on the VLAN that connected clients use to route GRE tunneled traffic within their respective WLANs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
tunneled-vlan <VLAN-ID>
```

Parameters

- `tunneled-vlan <VLAN-ID>`

<table>
<thead>
<tr>
<th>tunneled-vlan &lt;VLAN-ID&gt;</th>
<th>Specifies the VLANs associated with this GRE tunnel</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;VLAN-ID&gt;</td>
<td>• &lt;VLAN-ID&gt; – Specify the VLAN IDs. Specify a comma-separated list of IDs, to specify multiple VLANs. For example, 1,10,12,16-20.</td>
</tr>
</tbody>
</table>

Examples

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#tunneled-vlan 10
```

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#show context

tunneled-vlan 1,10
  native tagged
dscp 20
  failover interval 200 retry 5
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#
```

Related Commands

```
no
```
Removes the GRE tunnel settings based on the parameters passed
7.1.29 http-analyze

Profile Config Commands

Enables HTTP analysis on this profile. Use this command to configure the mode and interval at which data is sent to the controller (running the HTTP analytics engine).

In a hierarchically organized network, HTTP analytics data forwarding is a simple and transparent process. The site controllers (RFS4000, RFS6000, RFS7000, NX45XX, and NX65XX) receive the HTTP data from adopted APs. This data is compressed and forwarded to the Network Operations Center (NOC) controller. The NOC controller caches, formats, and uploads this information to the external analytics engine. There is no need for a separate configuration to enable this feature.

For more information on the hierarchical network, see `device-upgrade`.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

```
http-analyze [compress|update-interval <1-3600>]
```

Parameters

- `http-analyze [compress|update-interval <1-3600>]`

Examples

```
rfs7000-37FABE(config-profile-default-rfs7000)#http-analyze compress
rfs7000-37FABE(config-profile-default-rfs7000)#http-analyze update-interval 200
```

Related Commands

- `no` Disables HTTP analyze settings
7.1.30 http-analyze (NX45XX, NX65XX, and NX9000)

Profile Config Commands

Enables forwarding of HTTP request related data to the HTTP analytics engine.

Wireless clients (MUs) connect to APs and route their HTTP requests through the APs. These APs extract and forward HTTP request packets, through MiNT, to the NX series controller. The NX series controller uses a new analytic daemon to cache, format, and forward information to the analytics engine. Currently the analytics daemon is supported only on the NX series service platform. Therefore, it is essential that all APs should use an NX series service platform as controller.

In a hierarchically organized network, HTTP analytics data forwarding is a simple and transparent process. The site controllers (RFS4000, RFS6000, RFS7000, NX45XX, and NX65XX) receive the HTTP data from adopted APs adopted. This data is compressed and forwarded to the Network Operations Center (NOC) controller. There is no need for a separate configuration to enable this feature.

Use this command to configure the mode and interval at which data is sent to the controller and the external analytics engine. This command also configures the external engine’s details, such as URL, credentials etc.

A NX9500 and NX9510 model service platforms (NOC) can provide granular and robust analytic reporting for a RFS4000, RFS6000 or RFS7000 controller managed network or a NX45XX/NX65XX service platform managed network. You can use the analytics feature Using analytics, data is collected at administrator defined intervals.

Analytics can parse and process Smart RF events within the NOC managed network as events are received. When a Smart RF event occurs, the analytics engine parses the new channel and power information from the Smart RF event, as opposed to retrieving the event from the devices themselves.

The analytics user interface populates information within a data store, with multiple displays partitioned by performance function. The data store is a customizable display managed with just the content the administrator wants viewed. The data store is purged after 90 days if no administration is conducted sooner.

A separate hot spare analytics license is enforced at the NOC. The license restricts the number of Access Point streams processed at the NOC or forwarded to partner systems for further processing. The analytics feature can be turned on at select APs by enabling them in configuration. This way the customer can enable analytics on a select set of APs and not the entire system as long as the number of APs on which it is enabled is less than or equal to the total number of AP analytics licenses available at the NOC controller.

**NOTE:** The Analytics module helps gather data about customer behavior such as web sites visited, search terms used, mobile device types, number of new users vs. repeat users. This data provides a better understanding of pricing strategies and promotions being run by competitors.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
http-analyze [compress|controller|external-server|update-interval]

http-analyze [compress|controller|update-interval <1-3600>]

http-analyze external-server [password|proxy|update-interval|url|user-name|validate-server-certificate]
```

```
http-analyze external-server [password <WORD>|proxy <URL>|update-interval <1-3600>|url <URL>|username <WORD>|validate-server-certificate]
```
Parameters

- **http-analyze [compress|controller|update-interval <1-3600>]**

7.1.31.1 interface

interface

Selects an interface to configure

A profile’s interface configuration can be defined to support separate physical Ethernet configurations both unique and specific to RFS4000, RFS6000, RFS7000 controllers and NX4500, NX6500, NX7500 and NX9000 series service platforms. Ports vary depending on the platform, but controller or service platform models do have some of the same physical interfaces.

A controller or service platform requires its virtual interface be configured for layer 3 (IP) access or layer 3 service on a VLAN. A virtual interface defines which IP address is associated with each VLAN ID the controller or service platform is connected to.

If the profile is configured to support an access point radio, an additional radio interface is available, unique to the access point’s radio configuration.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax Service Platforms

```bash
interface [<INTERFACE-NAME>|fe <1-4>|ge <1-24>|me1|port-channel <1-4>|pppoe1|radio [1|2|3]|serial <1-4>|t1e1 <1-4>|up <1-2>|vlan <1-4094>|vmif <1-12>|wwan1|xge <1-4>]
```

Syntax Access Points and Wireless Controllers

```bash
interface [<INTERFACE-NAME>|fe <1-4>|ge <1-8>|me1|port-channel <1-4>|pppoe1|radio [1|2|3]|up1|vlan <1-4094>|wwan1|xge <1-4>]
```

Parameters

- **interface [ <INTERFACE-NAME> | fe <1-4> | ge <1-8> | me1 | port-channel <1-4> | pppoe1 | radio [1|2|3] | serial <1-4> | t1e1 <1-4> | up <1-2> | vlan <1-4094> | vmif <1-12> | wwan1 | xge <1-4> ]**

<table>
<thead>
<tr>
<th><strong>&lt;INTERFACE-NAME&gt;</strong></th>
<th>Enters the configuration mode of the interface identified by the <strong>&lt;INTERFACE-NAME&gt;</strong> keyword</th>
</tr>
</thead>
</table>
| **fe <1-4>**         | Selects a FastEthernet interface  
  • <1-4> – Specify the interface index from 1 - 4.  
  This interface is applicable only for AP6511 model controller. |
| **ge <1-24>**        | Selects a GigabitEthernet interface  
  • <1-24> – Specify the interface index from 1 - 24. (4 for RFS7000 and 8 for RFS6000).  
  The NX45XX and NX65XX series service platforms have 24 GigabitEthernet interface ports. |
| **me1**              | Selects a management interface  
  Not applicable for RFS4000  
  The management interface is applicable only for RFS6000 and RFS7000 model controllers |
| **port-channel <1-4>** | Selects the port channel interface  
  • <1-4> – Specify the interface index from 1 - 4. |
| **pppoe1**           | Selects the PPP over Ethernet interface to configure |
Usage Guidelines

The ports available on a device vary depending on the model. The following ports are available on RFS4000, RFS6000 and RFS7000 model wireless controllers:

- RFS4000 - ge1, ge2, ge3, ge4, ge5, up1
- RFS6000 - ge1, ge2, ge3, ge4, ge5, ge6, ge7, ge8, me1, up1
- RFS7000 - ge1, ge2, ge3, ge4, me1

GE ports are RJ-45 supporting 10/100/1000Mbps. GE ports on the RFS7000 can be RJ-45 or fiber ports supporting 10/100/1000Mbps.

ME ports are available on RFS6000 and RFS7000 platforms. ME ports are out-of-band management ports used to manage the controller via CLI or Web UI, even when the other ports on the controller are unreachable.

The ports available on service platforms also vary depending on the model. The following ports are available on NX series service platforms:

- NX4500 - up1, up2
- NX4524 - ge1-ge24, up1, up2

### Table of Port Selections

<tr>
<td>xge &lt;1-4&gt;</td>
<td>Selects a TenGigabitEthernet interface</td>
<td>NX45XX, NX65XX, NX9XXX</td>
</tr>
</tbody>
</table>
GE ports are available on RFS4000, RFS6000 and RFS7000 controllers and NX4524 and NX6524 model service platforms. GE ports are RJ-45 supporting 10/100/1000Mbps. GE ports on the RFS7000 can be RJ-45 or fiber ports supporting 10/100/1000Mbps.

ME ports are available on RFS6000 and RFS7000 platforms. ME ports are out-of-band management ports used to manage the controller via CLI or Web UI, even when the other ports on the controller are unreachable.

UP ports are available on RFS4000 and RFS6000 platforms. A UP port is used to connect to the backbone network. UP ports are available on RFS4000 and RFS6000 controllers and NX4500 and NX6500 series service platforms. A UP port supports either RJ-45 or fiber. The UP port is the preferred means to connect to the backbone as it has a non-blocking 1gbps connection unlike the GE ports.

The following ports are available on access points:

- **AP6511** - fe1, fe2, fe3, fe4, up1
- **AP6521** - GE1/POE (LAN)
- **AP6522** - GE1/POE (LAN)
- **AP6532** - GE1/POE
- **AP6562** - GE1/POE
- **AP7131** - GE1/POE (LAN), GE2 (WAN)
- **AP7161** - GE1/POE (LAN), GE2 (WAN)
- **AP7181** - GE1/POE (LAN), GE2 (WAN)
- **AP81XX** - GE1/POE (LAN), GE2 (WAN)
- **AP82XX** - GE1/POE (LAN), GE2 (WAN)

**NOTE:** For a NX7500 model service platform, there are options for either a 2 port or 4 port network management card. Either card can be managed using WiNG. If the 4 port card is used, ports ge7-ge10 are available. If the 2 port card is used, ports xge1-xge2 are available.

**Examples**

```
rfst000-37FABE(config-profile-default-rfst000-if-vlan44)#
rfst000-37FABE(config-profile-default-rfst000-if-vlan44)#?
```

SVI configuration commands:
- **crypto** Encryption module
- **description**_vlan description
- **dhcp** Dynamic Host Configuration Protocol (DHCP)
- **dhcp-relay-incoming** Allow on-board DHCP server to respond to relayed DHCP packets on this interface
- **ip** Interface Internet Protocol config commands
- **ipv6** Internet Protocol version 6 (IPv6)
- **no** Negate a command or set its defaults
- **shutdown** Shutdown the selected interface
- **use** Set setting to use
- **clrscr** Clears the display screen
- **commit** Commit all changes made in this session
- **do** Run commands from Exec mode
- **end** End current mode and change to EXEC mode
- **exit** End current mode and down to previous mode
- **help** Description of the interactive help system
- **revert** Revert changes

</table>
7.1.3.12 interface-config-instance

Use the config-profile-<PROFILE-_NAME> instance to configure the Ethernet, VLAN and tunnel associated with the access point, wireless controller, or service platform.

To switch to this mode, use the following command:

```
<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)# interface [fe <1-4> | ge <1-24> | me1 | port-channel <1-4> | pppoe1 | radio [1|2|3] | up1 | vlan <1-4094> | wwan1 | xge <1-4>]
<DEVICE>(config-profile-default-rfs7000)# ge 1
```

The following example uses the config-profile-default-rfs7000 instance to configure a GigabitEthernet interface:

```
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#?
Interface configuration commands:
captive-portal-enforcement Enable captive-portal enforcement on this port
cdp Cisco Discovery Protocol
channel-group Channel group commands
description Interface specific description
dot1x 802.1X
duplex Set duplex to interface
ipv6 Internet Protocol version 6 (IPv6)
lldp Link Local Discovery Protocol
mac-auth Enable mac-auth for this port
no Negate a command or set its defaults
power PoE Command
qos Quality of service
shutdown Shutdown the selected interface
spanning-tree Spanning tree commands
speed Configure speed
switchport Set switching mode characteristics
use Set setting to use
clearscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal
```

```
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#
```

---

**NOTE:** The NX45XX and NX65XX series service platforms have 24 GigabitEthernet ports.

---

</tbody>
</table>
7.1.31.2.1 captive-portal-enforcement

- **interface-config-instance**

Enables/disables application of captive portal access permission rules to data transmitted over this specific Ethernet port. This setting is disabled by default.

Captive portal enforcement allows users on the wired network to pass traffic through the captive portal without being redirected to an authentication page. Authentication instead takes place when the RADIUS server is queried against the wired user’s MAC address. If the MAC address is in the RADIUS server’s user database, the user can pass traffic on the captive portal.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
captive-portal-enforcement {fall-back}

**Parameters**
- captive-portal-enforcement {fall-back}

<table>
<thead>
<tr>
<th>captive-portal-enforcement</th>
<th>Enables/disables captive-portal enforcement on this Ethernet port</th>
</tr>
</thead>
<tbody>
<tr>
<td>fall-back</td>
<td>fall-back – Optional. Enforces captive portal validation only if port authentication fails. When selected, captive portal policies are enforced only when RADIUS authentication of the client MAC address is not successful. If this option is not selected, captive portal policies are enforced regardless of the client’s MAC address being in the RADIUS server’s user database or not.</td>
</tr>
</tbody>
</table>

**Examples**
rfs7000-6DCD4B(config-device-B4-C7-99-6D-CD-4B-if-ge2)#captive-portal-enforcement

rfs7000-6DCD4B(config-device-B4-C7-99-6D-CD-4B-if-ge2)#show context

  interface ge2
  captive-portal-enforcement

rfs7000-6DCD4B(config-device-B4-C7-99-6D-CD-4B-if-ge2)#

**Related Commands**

| no | Disables captive-portal enforcement on this interface |
7.1.31.2.2 `cdp`

- `interface-config-instance`

Enables CDP on the selected GE port

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
cdp [receive|transmit]
```

**Parameters**

- `cdp [receive|transmit]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>receive</td>
<td>Enables CDP packet snooping on this interface. When enabled, the port receives periodic interface updates from a multicast address. This option is enabled by default.</td>
</tr>
<tr>
<td>transmit</td>
<td>Enables CDP packet transmission on this interface. When enabled, the port sends out periodic interface updates to a multicast address to advertise its presence to neighbors. This option is enabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#cdp transmit
```

**Related Commands**

```
no
```

Disables CDP packet snooping on the controller or service platform's selected GE ports
### 7.1.31.2.3 channel-group

Assigns this Ethernet port to a channel group. Ethernet ports can be aggregated to form a channel group. For example, an RFS7000 has four (4) Ethernet ports (1, 2, 3, & 4). These can be aggregated to form a minimum of one and maximum of two channel groups. A port can be a member of only one channel group at a time.

The maximum number of channel groups supported on a device depends on the number of Ethernet ports available.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
channel-group <1-4>
```

#### Parameters

- `channel-group <1-4>`

#### Examples

```bash
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#channel-group 1
```

```bash
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#show context interface ge1
ip dhcp trust
qos trust dscp
qos trust 802.1p
channel-group 1
```

#### Related Commands

```
no
```

Removes the channel group to which this port belongs.
7.1.31.2.4 description

- interface-config-instance

Configures a description for this Ethernet port

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

description [<LINE>|<WORD>]

Parameters

- description [<LINE>|<WORD>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;LINE&gt;</td>
<td>Configures the maximum length (number of characters) of the interface description</td>
</tr>
<tr>
<td>&lt;WORD&gt;</td>
<td>Configures a unique description for this interface. The description should not exceed the length specified by the &lt;LINE&gt; parameter.</td>
</tr>
</tbody>

7.1.31.2.5 dot1x (authenticator)

Configures 802.1X authenticator settings

Dot1x (or 802.1x) is an IEEE standard for network authentication. It enables media-level (layer 2) access control, providing the capability to permit or deny connectivity based on user or device identity. Dot1x allows port-based access using authentication. An dot1x enabled port can be dynamically enabled or disabled depending on user identity or device connection.

Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

Before authentication, the endpoint is unknown, and traffic is blocked. Upon authentication, the endpoint is known and traffic is allowed. The controller or service platform uses source MAC filtering to ensure only the authenticated endpoint is allowed to send traffic.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

```
dot1x authenticator 
    [guest-vlan|host-mode|max-reauth-req|port-control|reauthenticate|
    timeout]
dot1x authenticator [guest-vlan <1-4094>|host-mode [multi-host|single-host]|
    max-reauth-req <1-10>|port-control [auto|force-authorized|force-unauthorized]|
    reauthenticate|timeout [quiet-period|reauth-period] <1-65535>]
```

**Parameters**

- **dot1x authenticator** Configures 802.1x authenticator settings
- **guest-vlan <1-4094>** Configures the guest VLAN for this interface. This is the VLAN, traffic is bridged on if this port is unauthorized and the guest VLAN is globally enabled. Select the VLAN index from 1 - 4094.
- **host-mode [multi-host|single-host]** Configures the host mode for this interface
  - multi-host — Configures multiple host mode
  - single-host — Configures single host mode. This is the default setting.
- **max-reauth-req <1-10>** Configures maximum number of re-authorization retries for the supplicant. This is the maximum number of re-authentication attempts made before this port is moved to unauthorized.
  - <1-10> — Specify a value from 1 -10. The default is 2.
### Examples

```none
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#dot1x authenticator guest-vlan 2

7.1.31.2.7 duplex

Configures duplex mode (for the flow of packets) on this Ethernet port

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
duplex [auto|half|full]

Parameters
- duplex [auto|half|full]

Example
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#duplex full

rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#show context

7.1.31.2.8 ip

**interface-config-instance**

Sets the ARP and DHCP components for this Ethernet port

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
ip [arp|dhcp]

ip [arp [header-mismatch-validation|trust]|dhcp trust]
```

**Parameters**

- **ip [arp [header-mismatch-validation|trust]|dhcp trust]**

| arp [header-mismatch-validation|trust] | Configures ARP packet settings |
|---------------------------------------|-------------------------------|
| • header-mismatch-validation — Enables matching of source MAC address in the ARP and Ethernet headers to check for mismatch. This option is disabled by default. |
| • trust — Enables trust state for ARP responses on this interface. When enabled, ARP packets received on this port are considered trusted and information from these packets is used to identify rogue devices within the network. This option is disabled by default. |

| dhcp trust | Enables trust state for DHCP responses on this interface. When enabled, only DHCP responses are trusted and forwarded on this port, and a DHCP server can be connected only to a DHCP trusted port. This option is enabled by default. |

**Examples**

```plaintext
rfs7000-37FABE(config-profile-default-rfs7000-if-gel)#ip dhcp trust
rfs7000-37FABE(config-profile-default-rfs7000-if-gel)#ip arp header-mismatch-validation

```

**Related Commands**

| no | Removes the ARP and DHCP components configured for this interface |
### 7.1.31.2.9 ipv6

**interface-config-instance**

Sets the DHCPv6 and ICMPv6 *neighbor discovery* (ND) components for this interface.

The ICMPv6 ND protocol uses ICMP messages and solicited multicast addresses to track neighboring devices on the same local network. These messages are used to discover a neighbor’s link layer address and to verify if a neighboring device is reachable.

The ICMP messages are *neighbor solicitation* (NS) and *neighbor advertisement* (NA) messages. When a destination host receives an NS message from a neighbor, it replies back with a NA. The NA contains the following information:

- **Source address** – This is the IPv6 address of the device sending the NA.
- **Destination address** – This is the IPv6 address of the device from whom the NS message is received.
- **Data portion** – Includes the link layer address of the device sending the NA.

NS messages are used to verify a neighbor’s (whose link layer address is known) reachability. To confirm a neighbor’s reachability, a node sends an NS message in which the neighbor’s unicast address is specified as the destination address. If the neighbor sends back an acknowledgment on receipt of the NS message, it is considered reachable.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
ipv6 [dhcpv6|nd]
ipv6 dhcpv6 trust
ipv6 nd [header-mismatch-validation|raguard|trust]
```

**Parameters**

- **ipv6 dhcpv6 trust**
  
  Enables trust state for DHCPv6 responses on this interface. When enabled, all DHCPv6 responses received on this port are trusted and forwarded. This option is enabled by default. **Note:** A DHCPv6 server can be connected to a DHCPv6 trusted port.

- **ipv6 nd [header-mismatch-validation|raguard|trust]**
  
  Configures IPv6 ND settings.

<table>

### 7.1.31.2.10 lldp

**interface-config-instance**

Configures Link Local Discovery Protocol (LLDP) parameters on this Ethernet port.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
lldp [receive|transmit]
```

**Parameters**

- **lldp [receive|transmit]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>receive</td>
<td>Enables LLDP Protocol Data Units (PDUs) snooping. When enabled, the port receives periodic updates from a multicast address informing about presence of neighbors. This option is enabled by default.</td>
</tr>
<tr>
<td>transmit</td>
<td>Enables LLDP PDU transmission. When enabled, the port sends out periodic interface updates to a multicast address to advertise its presence to neighbors. This option is enabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#lldp transmit
```

**Related Commands**

```
no
```

Disables or reverts interface settings to their default.
### 7.1.31.2.11 mac-auth

#### Interface config-instance

Enables authentication of MAC addresses on the selected wired port. When enabled, this feature authenticates the MAC address of a device, connecting to this interface, with a RADIUS server. When successfully authenticated, packets from the source are processed. Since only one MAC address is supported per wired port, packets from all other sources are dropped.

For more information on enabling this feature see, `mac-auth`.

Enable port MAC authentication in conjunction with Wired 802.1x settings to configure a MAC authentication AAA policy. This option is also available in the device configuration mode.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000

#### Syntax

```
mac-auth
```

#### Parameters

None

#### Examples

```
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#mac-auth

no switchport [access vlan|mode|trunk native tagged]

no use [ip-access-list|ipv6-access-list|mac-access-list] in

Parameters

- no <PARAMETERS>

no <PARAMETERS> Removes or reverts this Ethernet port settings based on the parameters passed

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#no cdp

rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#no duplex
### 7.1.31.2.13 power

*interface-config-instance*

Configures PoE settings on this interface

When configured, this option allows the selected port to use Power over Ethernet. When enabled, the controller supports 802.3af PoE on each of its ge ports. PoE allows users to monitor port power consumption and configure power usage limits and priorities for each ge port.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**
```
power {best-effort|limit <0-40>|priority [critical|high|low]}
```

**Parameters**
- **power {best-effort|limit <0-40>|priority [critical|high|low]}**
  - **power** Configures power related thresholds for this interface
  - **best-effort** Enables power when the device is not operating from 802.3at class 4 power source
  - **limit <0-40>** Optional. Configures the PoE power limit from 0 - 40 Watts. The default is 30 Watts.
  - **priority [critical|high|low]** Optional. Configures the PoE power priority on this interface. This is the priority assigned to this port versus the power requirements of the other ports available on the controller.
    - **critical** – Sets PoE priority as critical
    - **high** – Sets PoE priority as high
    - **low** – Sets PoE priority as low. This is the default setting.

**Examples**
```
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#power limit 30
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#power priority critical
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#show context
  interface ge1
    ip dhcp trust
    qos trust dscp
    qos trust 802.1p
    power limit 30
    power priority critical
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#
```

**Related Commands**
- **no** Removes PoE settings on this interface
7.1.31.2.14 qos

interface-config-instance

Defines Quality of Service (QoS) settings on this Ethernet port

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
qos trust [802.1p|cos|dscp]

Parameters
- qos trust [802.1p|cos|dscp]

| trust [802.1p|cos|dscp] | Trusts QoS values ingressing on this interface |
|------------------------|---------------------------------------------|
| 802.1p | Trusts 802.1p COS values ingressing on this interface |
| cos | Trusts 802.1p COS values ingressing on this interface. This option is enabled by default. |
| dscp | Trusts IP DSCP QOS values ingressing on this interface. This option is enabled by default. |

Examples
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#qos trust dscp
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#qos trust 802.1p

| no | Removes QoS settings on the selected interface |
7.1.31.2.15 shutdown

interface-config-instance

Shuts down (disables) an interface. The interface is administratively enabled unless explicitly disabled using this command.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

shutdown

Parameters

None

Examples

rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#shutdown

Related Commands

| no          | Disables or reverts interface settings to their default |
7.1.31.2.16 spanning-tree

`interface-config-instance`

Configures spanning tree parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
spanning-tree [bpdufilter|bpduguard|force-version|guard|link-type|mst|
port-cisco-interoperability|portfast]
```

```
spanning-tree [force-version <0-3>|guard root|portfast]
```

```
spanning-tree [bpdufilter|bpduguard] [default|disable|enable]
```

```
spanning-tree link-type [point-to-point|shared]
```

```
spanning-tree mst <0-15> [cost <1-200000000>|port-priority <0-240>]
```

```
spanning-tree port-cisco-interoperability [disable|enable]
```

Parameters

- `spanning-tree [force-version|guard root|portfast]`

<table>
<thead>
<tr>
<th>force-version &lt;0-3&gt;</th>
<th>Specifies the spanning tree force version. A version identifier of less than 2 enforces the spanning tree protocol. Select one of the following versions:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Spanning Tree Protocol (STP)</td>
</tr>
<tr>
<td>1</td>
<td>Not supported</td>
</tr>
<tr>
<td>2</td>
<td>Rapid Spanning tree Protocol (RSTP)</td>
</tr>
<tr>
<td>3</td>
<td>Multiple Spanning Tree Protocol (MSTP). This is the default setting</td>
</tr>
</tbody>
</table>

- `guard root` Enables Root Guard for the port

  The Root Guard disables superior Bridge Protocol Data Unit (BPDU) reception. The Root Guard ensures the enabled port is a designated port. If the Root Guard enabled port receives a superior BPDU, it moves to a discarding state (root-inconsistent STP state). This state is equivalent to a listening state, and data is not forwarded across the port. Therefore, enabling the guard root enforces the root bridge position. Use the no parameter with this command to disable the Root Guard.

- `portfast` Enables rapid transitions. Enabling PortFast allows the port to bypass the listening and learning states.

- `spanning-tree [bpdufilter|bpduguard] [default|disable|enable]`

  - `bpdufilter [default|disable|enable]` Sets a PortFast BPDU filter for the port

    Use the no parameter with this command to revert the port BPDU filter to its default. The spanning tree protocol sends BPDUs from all ports. Enabling the BPDU filter ensures PortFast enabled ports do not transmit or receive BPDUs.
### bpdu guard

**[default|disable|enable]**

<table>
<thead>
<tr>
<th>bpdu guard</th>
<th>Enables or disables BPDU guard on a port</th>
</tr>
</thead>
<tbody>
<tr>
<td>bpdu guard</td>
<td>Use the no parameter with this command to set BPDU guard to its default.</td>
</tr>
<tr>
<td>bpdu guard</td>
<td>When the BPDU guard is set for a bridge, all PortFast-enabled ports that have the BPDU guard set to default shut down upon receiving a BPDU. If this occurs, the BPDU is not processed. The port can be brought back either manually (using the no shutdown command), or by configuring the errdisable-timeout to enable the port after a specified interval.</td>
</tr>
</tbody>
</table>

### spanning-tree link-type

**[point-to-point|shared]**

<table>
<thead>
<tr>
<th>link-type</th>
<th>Enables or disables point-to-point or shared link types</th>
</tr>
</thead>
<tbody>
<tr>
<td>point-to-point</td>
<td>Enables rapid transition. This option indicates the port should be treated as connected to a point-to-point link. A port connected to a controller is a point-to-point link.</td>
</tr>
<tr>
<td>shared</td>
<td>Disables rapid transition. This option indicates this port should be treated as having a shared connection. A port connected to a hub is on a shared link,</td>
</tr>
</tbody>
</table>

### spanning-tree mst

**<0-15> [cost <1-200000000>|port-priority <0-240>]**

<table>
<thead>
<tr>
<th>mst &lt;0-15&gt;</th>
<th>Configures MST on a spanning tree</th>
</tr>
</thead>
<tbody>
<tr>
<td>cost &lt;1-200000000&gt;</td>
<td>Defines path cost for a port from 1 - 200000000. The default path cost depends on the speed of the port. The cost helps determine the role of the port in the MSTP network. The designated cost is the cost for a packet to travel from this port to the root in the MSTP configuration. The slower the media, the higher the cost.</td>
</tr>
<tr>
<td>port-priority &lt;0-240&gt;</td>
<td>Defines port priority for a bridge from 1 - 240. Lower the priority greater is the likelihood of the port becoming a designated port. Applying a higher value impacts the port’s likelihood of becoming a designated port.</td>
</tr>
</tbody>
</table>

### spanning-tree port-cisco-interoperability

**[disable|enable]**

<table>
<thead>
<tr>
<th>port-cisco-interoperability</th>
<th>Enables or disables interoperability with Cisco’s version of MSTP (which is incompatible with standard MSTP)</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables CISCO Interoperability</td>
</tr>
<tr>
<td>disable</td>
<td>Disables CISCO Interoperability. The default is disabled.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#spanning-tree bpdufilter disable
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#spanning-tree bpduguard enable
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#spanning-tree force-version 1

</tbody>
</table>
7.1.31.2.17 speed

Specifies the speed of a FastEthernet (10/100) or GigabitEthernet (10/100/1000) port. This is the speed at which the port can receive and transmit the data.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
speed [10|100|1000|auto]

Parameters
- speed [10|100|1000|auto]

<table>
<thead>
<tr>
<th>Speed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Forces 10 Mbps operation</td>
</tr>
<tr>
<td>100</td>
<td>Forces 100 Mbps operation</td>
</tr>
<tr>
<td>1000</td>
<td>Forces 1000 Mbps operation</td>
</tr>
<tr>
<td>auto</td>
<td>Port automatically detects its operational speed based on the port at the other end of the link. Auto negotiation is a requirement for using 1000BASE-T[3] according to the standard (default setting).</td>
</tr>
</tbody>
</table>

Usage Guidelines
Set the interface speed to auto detect and use the fastest speed available. Speed detection is based on connected network hardware.

Examples
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#speed 10
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#show context

ip dhcp trust
ip arp header-mismatch-validation
qos trust dscp
qos trust 802.1p
channel-group 1
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#

Related Commands
- no — Resets speed to default (auto)
### 7.1.31.2.18 switchport

Sets switching mode characteristics for the selected interface.

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
switchport [access|mode|trunk]
switchport access vlan [<1-4094>|<VLAN-ALIAS-NAME>]
switchport mode [access|trunk]
switchport trunk [allowed|native]
switchport trunk allowed vlan [<VLAN-ID>|add <VLAN-ID>|none|remove <VLAN-ID>]
switchport trunk native [tagged|vlan [<1-4094>|<VLAN-ALIAS-NAME>]]
```

**Parameters**

- **switchport access vlan [<1-4094>|<VLAN-ALIAS-NAME>]**
  
  Sets the VLAN when interface is in the access mode. You can either directly specify the native VLAN ID or use a VLAN alias to identify the native VLAN.

  - `<1-4094>` — Specify the SVI VLAN ID from 1 - 4094.
  - `<VLAN-ALIAS-NAME>` — Specify the VLAN alias name (should be existing and configured).

  An Ethernet port in the access mode accepts packets only from the native VLAN. Frames are forwarded out the port untagged with no 802.1Q header. All frames received on the port are expected as untagged and are mapped to the native VLAN.

- **switchport mode [access|trunk]**

  Sets the interface’s switching mode to access or trunk (can only be used on physical - layer 2 - interfaces)

  - **access** — If access mode is selected, the access VLAN is automatically set to VLAN1. In this mode, only untagged packets in the access VLAN (vlan1) are accepted on this port. All tagged packets are discarded.

  - **trunk** — If trunk mode is selected, tagged VLAN packets are accepted. The native VLAN is automatically set to VLAN1. Untagged packets are placed in the native VLAN by the wireless controller or service platform. Outgoing packets in the native VLAN are sent untagged. The default mode for both ports is trunk.

- **switchport trunk allowed vlan [<VLAN-ID>|add <VLAN-ID>|none|remove <VLAN-ID>]**

  Sets trunking mode, allowed VLANs characteristics of the port. Use this option to add VLANs that exclusively send packets over the listed port.
### Profiles 7 - 187

#### switchport trunk native [tagged|vlan [<1-4094>|<VLAN-ALIAS-NAME>]]

Sets trunking mode characteristics of the switchport

| native [tagged] vlan [<1-4094>|<VLAN-ALIAS-NAME>] |
|------------------------------------------------------|
| Configures the native VLAN ID for the trunk-mode port |
| The native VLAN allows an Ethernet device to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. Additionally, the native VLAN is the VLAN untagged traffic is directed over when using a port in trunk mode. |
| • tagged – Tags the native VLAN. When a frame is tagged, the 12 bit frame VLAN ID is added to the 802.1Q header enabling upstream Ethernet devices to know which VLAN ID the frame belongs to. The device reads the 12 bit VLAN ID and forwards the frame to the appropriate VLAN. When a frame is received with no 802.1Q header, the upstream device classifies the frame using the default or native VLAN assigned to the Trunk port. A native VLAN allows an Ethernet device to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. |
| • vlan [<1-4094>|<VLAN-ALIAS-NAME>] – Sets the native VLAN for classifying untagged traffic when the interface is in trunking mode. |
| • <1-4094> – Specify a value from 1 - 4094. |
| • <VLAN-ALIAS-NAME> – Specify the VLAN alias name used to identify the VLANs. The VLAN alias should be existing and configured. |

#### vlan [<VLAN-ID>]

Sets allowed VLAN options. The options are:

- <VLAN-ID> – Allows a group of VLAN IDs. Specify the VLAN IDs, can be either a range (55-60) or a comma-separated list (35, 41 etc.)
- none – Allows no VLANs to transmit or receive through the layer 2 interface
- add <VLAN-ID> – Adds VLANs to the current list
  - <VLAN-ID> – Specify the VLAN IDs. Can be either a range of VLAN (55-60) or a list of comma separated IDs (35, 41 etc.)
- remove <VLAN-ID> – Removes VLANs from the current list
  - <VLAN-ID> – Specify the VLAN IDs. Can be either a range of VLAN (55-60) or a list of comma separated IDs (35, 41 etc.)

**Note:** Allowed VLANs are configured only when the switching mode is set to “trunk”.

### Usage Guidelines

Interfaces ge1 - ge4 can be configured as trunk or in access mode. An interface configured as “trunk” allows packets (from the given list of VLANs) to be added to the trunk. An interface configured as “access” allows packets only from native VLANs.

Use the [no] switchport (access|mode|trunk) to undo switchport configurations.
Examples
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#switchport trunk native tagged
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#switchport access vlan 1

### 7.1.31.2.19 use

**interface-config-instance**

Specifies the IP (IPv4 and IPv6) access list and MAC access list used with this Ethernet port

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```plaintext
use [ip-access-list in <IPv4-ACCESS-LIST-NAME>|ipv6-access-list <IPv6-ACCESS-LIST-NAME>|mac-access-list in <MAC-ACCESS-LIST-NAME>]
```

#### Parameters

- **use [ip-access-list in <IPv4-ACCESS-LIST-NAME>|ipv6-access-list <IPv6-ACCESS-LIST-NAME>|mac-access-list in <MAC-ACCESS-LIST-NAME>]**

| ip-access-list in <IPv4-ACCESS-LIST-NAME> | Associates an IPv4 access list with this Ethernet port  
|------------------------------------------|---------------------------------------------------|
|                                           | • in – Applies the IPv4 ACL on incoming packets  
|                                           |   • <IPv4-ACCESS-LIST-NAME> – Specify the IPv4 access list name (it should be an existing and configured).  

| ipv6-access-list in <IPv6-ACCESS-LIST-NAME> | Associates an IPv6 access list with this Ethernet port  
|---------------------------------------------|---------------------------------------------------|
|                                            | • in – Applies the IPv6 ACL on incoming packets  
|                                            |   • <IPv6-ACCESS-LIST-NAME> – Specify the IPv6 access list name (it should be an existing and configured).  

| mac-access-list in <MAC-ACCESS-LIST-NAME> | Associates a MAC access list with this Ethernet port  
|-------------------------------------------|---------------------------------------------------|
|                                           | • in – Applies the MAC ACL on incoming packets  
|                                           |   • <MAC-ACCESS-LIST-NAME> – Specify the MAC access list name (it should be an existing and configured).  

#### Examples

```plaintext
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#use mac-access-list in test  
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#use ip-access-list in test  
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#show context  
interface ge1  
  description This\ is\ GigabitEthernet\ interface\ for\ Royal\ King  
speed 10  
duplex full  
switchport mode access  
switchport access vlan 1  
use ip-access-list in test  
use mac-access-list in test  
spanning-tree bpduguard enable  
spanning-tree bpdufilter disable  
spanning-tree force-version 1  
--More--  
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#
```

#### Related Commands

| no | Disassociates the IP access list or MAC access list from the interface |
7.1.31.3 interface-config-vlan-instance

Use the config-profile-<DEVICE-PROFILE-NAME> mode to configure Ethernet, VLAN and tunnel settings.

To switch to this mode, use the following commands:

```
<DEVICE>(config-profile-default-<DEVICE-TYPE>)#interface [<INTERFACE-NAME>|fe <1-4>|ge <1-24>|me1|port-channel <1-4>|pppoe1|radio [1|2|3]| up1|vlan <1-4094>|wwan1|xge <1-24>]
```

The following example uses the config-profile-default-rfs7000 instance to configure a VLAN interface:

```
rfs7000-37FABE(config-profile-default-rfs7000)#interface vlan 8
```

The following table summarizes interface VLAN configuration commands:

<table>
<thead>
<tr>
<th>Commands</th>

</tbody>
</table>
7.1.31.3.1 crypto

ribbon interface-config-vlan-instance

Associates an existing and configured VPN crypto map with this VLAN interface.

Crypto map entries are sets of configuration parameters for encrypting packets that pass through the VPN tunnel. For more information on crypto maps, see crypto-map-config-commands.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
crypto map <CRYPTO-MAP-NAME>

Parameters
- crypto map <CRYPTO-MAP-NAME>

Examples
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#crypto map map1
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context
interface vlan8
  crypto map map1
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#

Related Commands
- no | Disables or reverts interface VLAN settings to their default
7.1.31.3.2 description

Defines this VLAN interface’s description. Use this command to provide additional information about the VLAN.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

description <WORD>

Parameters

- description <WORD>

<table>
<thead>
<tr>
<th>description &lt;WORD&gt;</th>
<th>Configures a description for this VLAN interface (should not exceed 64 characters in length)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>• Specify a description unique to the VLAN’s specific configuration, to help differentiate it from other VLANs with similar configurations.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#description "This VLAN interface is configured for the Sales Team"

rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context interface vlan8
   description This VLAN interface is configured for the Sales Team
   crypto map map1

rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#

Related Commands

- no
  Removes the VLAN interface description
7.1.3.3.3 dhcp

* interface-config-vlan-instance

Enables inclusion of optional fields (client identifier) in DHCP client requests. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
dhcp client include client-identifier

**Parameters**
- dhcp client include client-identifier

| dhcp client include client-identifier | Enables inclusion of client identifier in DHCP client requests |

**Examples**
```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#dhcp client include client-identifier
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context
    interface vlan8
    dhcp client include client-identifier
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#
```

**Related Commands**
- **no** Disables inclusion of client identifier in DHCP client requests
7.1.31.3.4 dhcp-relay-incoming

- interface-config-vlan-instance

Allows an onboard DHCP server to respond to relayed DHCP packets

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
dhcp-relay-incoming

Parameters
None

Examples
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#dhcp-relay-incoming
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context interface vlan8
description This VLAN interface is configured for the Sales Team
crypto map map1
dhcp-relay-incoming
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#

Related Commands

| no | Disables or reverts interface VLAN settings to their default |
7.1.31.3.5 ip

Configures the VLAN interface’s IP settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ip [address|dhcp|helper-address|nat|ospf]

ip helper-address <IP>

ip address [<IP/M>|dhcp|zeroconf]

ip address [<IP/M> {secondary}|dhcp|zeroconf {secondary}]

ip dhcp client request options all

ip nat [inside|outside]

ip ospf [authentication|authentication-key|bandwidth|cost|message-digest-key|priority]

ip ospf authentication {message-digest|null|simple-password}

ip ospf authentication-key simple-password [0 <WORD>|2 <WORD>]

ip ospf [bandwidth <1-10000000>|cost <1-65535>|priority <0-255>]

ip ospf message-digest-key key-id <1-255> md5 [0 <WORD>|2 <WORD>]

Parameters

- **ip helper-address <IP>**
  
  Enables DHCP and BOOTP forwarding for a set of clients. Configure a helper address on the VLAN interface connected to the client. The helper address should specify the address of the BOOTP or DHCP servers. If you have multiple servers, configure one helper address for each server.
  
  - `<IP>` – Specify the IP address of the DHCP or BOOTP server.

- **ip address [<IP/M> {secondary}|dhcp|zeroconf {secondary}]**
  
  `<IP>` Sets the VLAN interface IP address
  
  `<IP/M>` Specifies the interface IP address in the A.B.C.D/M format
  
  - **secondary** – Optional. Sets the specified IP address as a secondary address

- **dhcp**
  
  Uses a DHCP client to obtain an IP address for this interface

- **zeroconf {secondary}**
  
  Uses Zero Configuration Networking (zeroconf) to generate an IP address for this interface
  
  - **secondary** – Optional. Sets the generated IP address as a secondary address

- **ip dhcp client request options all**
  
  Uses a DHCP client to configure a request on this VLAN interface

- **client**
  
  Configures a DHCP client

- **request**
  
  Configures DHCP client request
### ip nat [inside|outside]

**nat [inside|outside]**

Defines NAT settings for the VLAN interface. NAT is disabled by default.

- **inside** – Enables NAT on the inside interface. The inside network is transmitting data over the network to the intended destination. On the way out, the source IP address is changed in the header and replaced by the (public) IP address.
- **outside** – Enables NAT on the outside interface. Packets passing through the NAT on the way back to the managed LAN are searched against the records kept by the NAT engine. There, the destination IP address is changed back to the specific internal private class IP address in order to reach the LAN over the network.

### ip ospf authentication [message-digest|null|simple-password]

**ospf authentication**

Configures OSPF authentication scheme. Options are message-digest, null, and simple-password.

- **message-digest**
  - Configures md5 based authentication
- **null**
  - No authentication required
- **simple-password**
  - Configures simple password based authentication

### ip ospf authentication-key simple-password [0 <WORD>|2 <WORD>]

**ospf authentication-key**

Configures an OSPF authentication key

- **simple-password**
  - Configures a simple password OSPF authentication key
  - **0 <WORD>** – Configures clear text key
  - **2 <WORD>** – Configures encrypted key

### ip ospf [bandwidth <1-10000000>|cost <1-65535>|priority <0-255>]

**bandwidth <1-10000000>**

Configures bandwidth for the physical port mapped to this layer 3 interface

- **<1-10000000>** – Specify the bandwidth from 1 - 10000000.

**cost <1-65535>**

Configures OSPF cost

- **<1-65535>** – Specify OSPF cost value from 1 - 65535.

**priority <0-255>**

Configures OSPF priority

- **<0-255>** – Specify OSPF priority value from 0 - 255.

### ip ospf message-digest-key key-id <1-255> md5 [0 <WORD>|2 <WORD>]

**ospf message-digest**

Configures message digest authentication parameters

- **key-id <1-255>**
  - Configures message digest authentication key ID from 0 - 255.
- **md5**
  - Configures md5 key
  - **0 <WORD>** – Configures clear text key
  - **2 <WORD>** – Configures encrypted key
Examples

7.1.31.3.6 ipv6

`interface-config-vlan-instance`

Configures the VLAN interface’s IPv6 settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
ipv6 [accept|address|dhcp|enable|enforce-dad|mtu|redirects|request-dhcpv6-options|router-advertisements]
```

```
ipv6 accept ra { (no-default-router|no-hop-limit|no-mtu)}
```

```
ipv6 address [<IPv6/M>|autoconfig|eui-64|link-local|prefix-from-provider]
```

```
ipv6 address [<IPv6/M>|autoconfig]
```

```
ipv6 address eui-64 [<IPv6/M>|prefix-from-provider <WORD> <IPv6-PREFIX/PREFIX-LENGTH>]
```

```
ipv6 address prefix-from-provider <WORD> <HOST-PORTION/LENGTH>
```

```
ipv6 address link-local <LINK-LOCAL-ADD>
```

```
ipv6 dhcp [client [information|prefix-from-provider <WORD>]|relay destination <DEST-IPv6-ADD>]
```

```
ipv6 [enable|enforce-dad|mtu <1280-1500>|redirects|request-dhcpv6-options]
```

```
ipv6 routerAdvertisements [prefix <IPv6-PREFIX>|prefix-from-provider <WORD>] {no-autoconfig|off-link|site-prefix|valid-lifetime}
```

Parameters

- **ipv6 accept ra** { (no-default-router|no-hop-limit|no-mtu)}

  **ipv6 accept ra** Enables processing of `router advertisements` (RAs) on this VLAN interface. This option is enabled by default.

  **no-default-router** Optional. Disables inclusion of routers on this interface in the default router selection process. This option is disabled by default.

  **no-hop-limit** Optional. Disables the use of RA advertised hop-count value on this interface. This option is disabled by default.

  **no-mtu** Optional. Disables the use of RA advertised MTU value on this interface. This option is disabled by default.

- **ipv6 address [<IPv6/M>|autoconfig]**

  **ipv6 address** Configures IPv6 address related settings on this VLAN interface

  - **<IPv6>** – Specify the non-link local static IPv6 address and prefix length of the interface in the `X:X::X:X/M` format.

  - **autoconfig** – Enables/disables stateless auto-configuration of IPv6 address, based on the prefixes received from RAs with auto-config flag set. These prefixes are used to auto-configure the IPv6 address. This option is enabled by default. Use the `no > ipv6 > address > autoconfig` command to negate the use of prefixes received in RAs.
ipv6 address eui-64  [<IPv6/M>|prefix-from-provider <WORD> <IPv6-PREFIX/PREFIX-LENGTH>]

ipv6 address eui-64

Configures the IPv6 prefix and prefix length. This prefix is used to auto-generate the static IPv6 address (for this interface) in the modified Extended Unique Identifier (EUI)-64 format. Implementing the IEEE’s 64-bit EUI64 format enables a host to automatically assign itself a unique 64-bit IPv6 interface identifier, without manual configuration or DHCP. This is accomplished on a virtual interface by referencing the already unique 48-bit MAC address, and reformatting it to match the EUI-64 specification.

Note: In the EUI-64 IPv6 address the prefix and host portions are each 64 bits in length.

<IPv6/M>

Specify the IPv6 prefix and prefix length. This configured value is used as the prefix portion of the auto-generated IPv6 address, and the host portion is derived from the MAC address of the interface.

Note: Any bits of the configured value exceeding the prefix-length "M" are ignored and replaced by the host portion derived from the MAC address.

For example:
Prefix portion provided using this command: ipv6 > address > eui-64 > 2004:b055:15:dead::1111/64.
Host portion derived using the interface’s MAC address (00-15-70-37-FB-5E): 215:70ff:fe37:fb5e
Auto-configured IPv6 address using the above prefix and host portions: 2004:b055:15:dead:215:70ff:fe37:fb5e/64

In this example, the host part "::1111" is ignored and replaced with the modified eui-64 formatted host address.

prefix-from-provider <WORD> <IPv6-PREFIX/PREFIX-LENGTH>

Configures the “prefix-from-provider” named object and the associated IPv6 prefix and prefix length. This configured value is used as the prefix portion of the auto-generated IPv6 address, and the host portion is derived from the MAC address of the interface.

- <WORD> – Specify the IPv6 “prefix-from-provider” object’s name. This is the IPv6 general prefix (32 character maximum) name provided by the service provider.
- <IPv6-PREFIX/PREFIX-LENGTH> – Specify the IPv6 address subnet and host parts along with prefix length (site-renumbering).

For example:
Prefix portion provided using this command: ipv6 > address > eui-64 > prefix-from-provider > ISP1-prefix > 2002::/64
Host portion derived using the interface’s MAC address (00-15-70-37-FB-5E): 215:70ff:fe37:fb5e
Auto-configured IPv6 address using the above prefix and host portions: 2002::215:70ff:fe37:fb5e/64
### ipv6 address prefix-from-provider <WORD> <HOST-PORTION/LENGTH>

**ipv6 address** Configures the IPv6 address related settings on this VLAN interface

**prefix-from-provider**

- **<WORD>** – Provide the “prefix-from-provider” object’s name. This is the IPv6 general prefix (32 character maximum) name provided by the service provider.
- **<HOST-PORTION/LENGTH>** – Provide the subnet number, host portion, and prefix length used to form the actual address along with the prefix derived from the “prefix-from-provider” object identified by the <WORD> keyword.

### ipv6 address link-local <LINK-LOCAL-ADD>

**ipv6 address** Configures the IPv6 address related settings on this VLAN interface

**link-local**

- **<LINK-LOCAL-ADD>** – Configures IPv6 link-local address on this interface. The configured value overrides the default link-local address derived from the interface’s MAC address. Use the `no ipv6 link-local` command to restore the default link-local address derived from MAC address.

**Note:** It is mandatory for an IPv6 interface to always have a link-local address.

### ipv6 dhcp [client [information|prefix-from-provider <WORD>]]

**ipv6 dhcp** Configures DHCPv6 client-related settings on this VLAN interface

**client**

- **information** – Configures stateless DHCPv6 client on this interface. When enabled, the device can request configuration information from the DHCPv6 server using stateless DHCPv6. This option is disabled by default.
- **prefix-from-provider** – Configures prefix-delegation client on this interface. Enter the IPv6 general prefix (32 character maximum) name provided by the service provider. This option is disabled by default.

### relay destination <DEST-IPv6-ADD>

**relay destination** Enables DHCPv6 packet forwarding on this VLAN interface

- **destination** – Forwards DHCPv6 packets to a specified DHCPv6 relay
- **<DEST-IPv6-ADD>** – Specify the destination DHCPv6 relay’s address.

**Note:** DHCPv6 relay enhances an extended DHCP relay agent by providing support in IPv6. DHCP relays exchange messages between a DHCPv6 server and client. A client and relay agent exist on the same link. When a DHCP request is received from the client, the relay agent creates a relay forward message and sends it to a specified server address. If no addresses are specified, the relay agent forwards the message to all DHCP server relay multicast addresses. The server creates a relay reply and sends it back to the relay agent. The relay agent then sends back the response to the client.

### ipv6 [enable|enforce-dad|mtu <1280-1500>|redirects|request-dhcp-options]

**ipv6** Configures IPv6 settings on this VLAN interface

- **enable** – Enables IPv6 on this interface. This option is disabled by default.
- **enforce-dad** – Enforces Duplicate Address Detection (DAD) on wired ports. This option is enabled by default.
<table>

</tr>
</tbody>
</table>

```
ipv6 router-advertisements [prefix <IPv6-PREFIX>|prefix-from-provider <WORD>] {no-autoconfig|off-link|site-prefix <SITE-PREFIX>|valid-lifetime}
```

- ipv6 router-advertisements Configures IPv6 RA related settings on this VLAN interface.
- prefix <IPv6-PREFIX> Configures a static prefix and its related parameters. The configured value is advertised on RAs. <IPv6-PREFIX> – Specify the IPv6 prefix.
- prefix-from-provider <WORD> Configures a static “prefix-from-provider” named object and its related parameters on this VLAN interface. The configured value is advertised on RAs. <WORD> – Specify the “prefix-from-provider” named object's name.
- no-autoconfig This parameter is common to the “general-prefix”, “prefix”, and “prefix-from-provider” keywords. no-autoconfig – Optional. Disables the setting of the auto configuration flag in the prefix. When configured, the configured prefixes are not used for IPv6 address generation. The autoconfiguration option is enabled by default. Using no-autoconfig disables it.
- off-link This parameter is common to the “general-prefix”, “prefix”, and “prefix-from-provider” keywords. off-link – Optional. Disables the setting of the on-link flag in the prefix. The on-link option is enabled by default. Using off-link disables it.
- site-prefix <SITE-PREFIX> This parameter is common to the “general-prefix”, “prefix”, and “prefix-from-provider” keywords. site-prefix <SITE-PREFIX> – Configures subnet (site) prefix.
- valid-lifetime [<30-4294967294>|at(infinite)] (preferred-lifetime) This parameter is common to the “general-prefix”, “prefix”, and “prefix-from-provider” keywords. valid-lifetime – Configures the valid lifetime for the prefix. preferred-lifetime – Configures preferred lifetime for the prefix. <30-4294967294> – Configures the valid/preferred lifetime in seconds. at – Configures expiry time and date of the valid/preferred lifetime infinite – Configures the valid/preferred lifetime as infinite.

**Examples**

```
rfs7000-6DCD4B (config-profile-test-if-vlan4)#ipv6 enable
rfs7000-6DCD4B (config-profile-test-if-vlan4)#ipv6 accept ra no-mtu
rfs7000-6DCD4B (config-profile-test-if-vlan4)#ipv6 address eui-64 prefix-from-provider ISP1-prefix 2002::/64
```
rfs7000-6DCD4B(config-profile-test-if-vlan4)#show context
  interface vlan4
    ipv6 enable
    ipv6 address eui-64 prefix-from-provider ISP1-prefix 2002::/64
    ipv6 accept ra no-mtu
rfs7000-6DCD4B(config-profile-test-if-vlan4)#

7.1.31.3.7 no

Negates a command or reverts to defaults. The no command, when used in the Config Interface VLAN mode, negates VLAN interface settings or reverts them to their default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
no [crypto|description|dhcp|dhcp-relay-incoming|ip|ipv6|shutdown|use]

no dhcp client include client-identifier

no [crypto map|description|dhcp-relay-incoming|shutdown]

no ip [address|dhcp|helper-address|nat|ospf]
no [helper-address <IP>|nat]
no ip address [<IP/M> {secondary}] dhcp|zeroconf {secondary}]
no ip dhcp client request options all
no ip ospf [authentication|authentication-key|bandwidth|cost|message-digest-key|priority]

no ipv6 [accept|address|dhcp|enable|enforce-dad|mtu|redirects|request-dhcpv6-options|router-advertisements]

no ipv6 [accept ra|enable|enforce-dad|mtu|redirects|request-dhcpv6-options]
no ipv6 address [<IP6/M>|autoconfig|eui-64|link-local|prefix-from-provider>
no ipv6 dhcp [client|relay]
no ipv6 router-advertisements [prefix <WORD>|prefix-from-provider <WORD>]

no use [bonjour-gw-discovery-policy>|ip-access-list in|ipv6-access-list in|
ipv6-router-advertisement-policy|url-filter]

Parameters
- no <PARAMETERS>

no <PARAMETERS> Removes or reverts this VLAN interface’s settings based on the parameters passed

Examples
The following example shows the VLAN interface settings before the ‘no’ commands are executed:

rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context
interface vlan8
  description This\ VLAN\ interface\ is\ configured\ for\ the\ Sales\ Team
  ip address 10.0.0.1/8
  ip dhcp client request options all
  ip helper-address 172.16.10.3
  ip nat inside
  crypto map map1
dhcp-relay-incoming

rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#

rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#no crypto map
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#no description
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#no dhcp-relay-incoming
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#no ip dhcp client request options all
The following example shows the VLAN interface settings after the 'no' commands are executed:

```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context interface vlan8
  ip address 10.0.0.1/8
  ip helper-address 172.16.10.3
  ip nat inside
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#
```
7.1.3.8 shutdown

))[interface-config-vlan-instance]

Shuts down the selected interface. Use the no shutdown command to enable an interface.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

shutdown

Parameters

None

Examples

rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#shutdown

rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context
interface vlan8
    ip address 10.0.0.1/8
    ip helper-address 172.16.10.3
        shutdown

  ip address 10.0.0.1/8
  use ip-access-list in test
  ip helper-address 172.16.10.3

Related Commands

no Disables or reverts interface VLAN settings to their default
7.1.31.4 **interface-config-radio-instance**

This section documents radio interface configuration parameters applicable only to the access point profiles and the RFS4011 profile.

The access point radio interface can be radio1, radio2, or radio3. Legacy AP71XX models contain either a single or a dual radio configuration. Newer AP71XXN model access points support single, dual, or triple radio configurations. An AP650 model access point is available in either single or dual radio models. The remainder of the access point portfolio are dual-radio models.

To enter the AP/RFS4000 profile > radio interface context, use the following commands:

```plaintext
<DEVICE>(config)#profile RFS4000 <RFS4000-PROFILE-NAME>
<DEVICE>(config)#profile <AP-TYPE> <PROFILE-NAME>
```

```plaintext
rfs7000-37FABE(config)#profile ap71xx 71xxTestProfile
rfs7000-37FABE(config-profile-71xxTestProfile)#

rfs7000-37FABE(config-profile-71xxTestProfile)#interface radio 1
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

Radio Mode commands:

- **aeroscout** Aeroscout Multicast MAC/Enable
- **aggregation** Configure 802.11n aggregation related parameters
- **airtime-fairness** Enable fair access to medium for clients based on their usage of airtime
- **antenna-diversity** Transmit antenna diversity for non-11n transmit rates
- **antenna-downtilt** Enable ADEPT antenna mode
- **antenna-gain** Specifies the antenna gain of this radio
- **antenna-mode** Configure the antenna mode (number of transmit and receive antennas) on the radio
- **assoc-response** Configure transmission parameters for Association Response frames
- **association-list** Configure the association list for the radio
- **beacon** Configure beacon parameters
- **channel** Configure the channel of operation for this radio
- **data-rates** Specify the 802.11 rates to be supported on this radio
- **description** Configure a description for this radio
- **dfs-rehome** Revert to configured home channel once dfs evacuation period expires
- **dynamic-chain-selection** Automatic antenna-mode selection (single antenna for non-11n transmit rates)
- **ekahau** Ekahau Multicast MAC/Enable
- **extended-range** Configure extended range
- **fallback-channel** Configure the channel to be used for falling back in the event of radar being detected on the current operating channel
- **guard-interval** Configure the 802.11n guard interval
- **ldpc** Configure support for Low Density Parity Check Code
- **lock-rf-mode** Retain user configured rf-mode setting for this radio
- **max-clients** Maximum number of wireless clients allowed to associate subject to AP limit
- **mesh** Configure radio mesh parameters
- **meshpoint** Enable meshpoints on this radio
- **no** Negate a command or set its defaults
- **non-unicast** Configure handling of non-unicast frames
- **off-channel-scan** Enable off-channel scanning on the radio
- **placement** Configure the location where this radio is operating
- **power** Configure the transmit power of the radio
- **preamble-short** Use short preambles on this radio
probe-response              Configure transmission parameters for Probe Response frames  
radio-resource-measurement Configure support for 802.11k Radio Resource Measurement
radio-share-mode            Configure the radio-share mode of operation for this radio
rate-selection              Default or Opportunistic rate selection
remove-override             Negate a command or set its defaults
rf-mode                     Configure the rf-mode of operation for this radio
rifs                        Configure Reduced Interframe Spacing (RIFS) parameters
rts-threshold               Configure the RTS threshold
shutdown                    Shutdown the selected radio interface
smart-rf                    Configure radio specific smart-rf settings
sniffer-redirect            Capture packets and redirect to an IP address running a packet capture/analysis tool
stbc                        Configure Space-Time Block Coding (STBC) parameters
transmit-beamforming        Enable Transmit Beamforming
use                         Set setting to use
wips                        Wireless intrusion prevention related configuration
wireless-client             Configure wireless client related parameters

7.1.31.4.1 aeroscout

Enables Aeroscout multicast packet forwarding. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax
aeroscout [forward|mac <MAC>]

Parameters
- aeroscout [forward|mac <MAC>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>

Related Commands
- no Disable Aeroscout Multicast packet forwarding
### 7.1.31.4.2 aggregation

```plaintext
interface-config-radio-instance
```

Configures 802.11n frame aggregation parameters. Frame aggregation increases throughput by sending two or more data frames in a single transmission. There are two types of frame aggregation: *MAC Service Data Unit* (MSDU) aggregation and *MAC Protocol Data Unit* (MPDU) aggregation. Both modes group several data frames into one large data frame.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

#### Syntax

- `aggregation [ampdu|amsdu]
- `aggregation ampdu [rx-only|tx-only|tx-rx|none]
- `aggregation ampdu max-aggr-size [rx|tx]
- `aggregation amsdu [rx-only|tx-rx]

#### Parameters

<td></td>
</tr>
<tr>
<td>max-aggr-size</td>
<td>Configures AMPDU packet size limits. Configure the packet size limit on packets both transmitted and received.</td>
</tr>
</tbody>
</table>
aggregation

ampdu

max-aggr-size

rx [8191|16383|32767|65535]

Configures the maximum limit (in bytes) advertised for received frames
- 8191 – Advertises a maximum of 8191 bytes
- 16383 – Advertises a maximum of 16383 bytes
- 32767 – Advertises a maximum of 32767 bytes
- 65535 – Advertises a maximum of 65535 bytes (default setting)

aggregation ampdu max-aggr-size tx <2000-65535>

rx

aggregation

ampdu Configures 802.11n frame aggregation parameters

AMPDU aggregation collects Ethernet frames addressed to a single destination. It wraps each
frame in an 802.11n MAC header. This aggregation mode is less efficient, but more reliable in
environments with high error rates. It enables the acknowledgement and retransmission of each
aggregated data frame individually.

max-aggr-size Configures AMPDU packet size limits. Configure the packet size limit on packets both
transmitted and received.

aggregation Configures AMPDU aggregation parameters

ampdu Configures AMPDU frame aggregation parameters

AMPDU aggregation collects Ethernet frames addressed to a single destination. It wraps each
frame in an 802.11n MAC header. This aggregation mode is less efficient, but more reliable in
environments with high error rates. It enables the acknowledgement and retransmission of each
aggregated data frame individually.

tx <2000-65535> Configures the maximum size (in bytes) for AMPDU aggregated transmitted frames
- <2000-65535> – Sets the limit from 2000 - 65535 bytes. The default is 65535 bytes.

aggregation Configures 802.11n frame aggregation parameters

aggregation amsdu [rx-only|tx-rx]

aggregation

amsdu Configures Aggregated MAC Service Data Unit (AMSDU) frame aggregation parameters.
AMSDU aggregation collects Ethernet frames addressed to a single destination. But, unlike
AMPDU, it wraps all frames in a single 802.11n frame.
### Examples

```plaintext
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#aggregation ampdu tx-only
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context interface radio1
  aggregation ampdu tx-only
  aeroscout forward
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

7.1.31.4.3 airtime-fairness

interface-config-radio-instance

Enables fair access to the medium for wireless clients based on their airtime usage (i.e. regardless of whether the client is a high-throughput (802.11n) or legacy client). This option is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax
airtime-fairness {prefer-ht} {weight <1-10>}

Parameters
- airtime-fairness {prefer-ht} {weight <1-10>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>airtime-fairness</td>
<td>Enables fair access to the medium for wireless clients based on their airtime usage</td>
</tr>
<tr>
<td>prefer-ht</td>
<td>Optional. Prioritizes high throughput (802.11n) clients over clients with slower throughput (802.11 a/b/g) and legacy clients</td>
</tr>
<tr>
<td>weight &lt;1-10&gt;</td>
<td>Optional. Configures the relative weightage for 11n clients over legacy clients.</td>
</tr>
<tr>
<td></td>
<td>- &lt;1-10&gt; – Sets a weightage ratio for 11n clients from 1 - 10</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#airtime-fairness prefer-ht weight 6

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context
interface radio1
aggregation ampdu tx-only
aeroscout forward
airtime-fairness prefer-ht weight 6
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#

Related Commands
no Disables fair access for wireless clients (provides access on a round-robin mode)
7.1.31.4.4 **antenna-diversity**

- **interface-config-radio-instance**

Configures transmit antenna diversity for non-11n transmit rates

Antenna diversity uses two or more antennas to increase signal quality and strength. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
antenna-diversity
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#antenna-diversity
```

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context interface radio1
  aggregation ampdu tx-only
  aeroscout forward
  antenna-diversity
  airtime-fairness prefer-ht weight 6
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

**Related Commands**

| **no**     | Uses single antenna for non-11n transmit rates |
7.1.31.4.5 antenna-downtilt

`interface-config-radio-instance` Enables the Advanced Element Panel Technology (ADEPT) antenna mode. The ADEPT mode increases the probability of parallel data paths enabling multiple spatial data streams. This option is disabled by default.

Supported in the following platforms:

- Access Point — AP71XX

**NOTE:** This feature is not supported on AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP7502, AP7522, AP7532, AP81XX, AP82XX, and RFS4011.

**Syntax**

`antenna-downtilt`

**Parameters**

None

**Examples**

```
rls7000-37FABE(config-profile-71xxTestProfile-if-radio1)#antenna-downtilt
rls7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context interface radio1
  antenna-gain 12.0
  aggregation ampdu tx-only
  aeroscout forward
  antenna-diversity
  airtime-fairness prefer-ht weight 6
  antenna-downtilt
rls7000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

**Related Commands**

</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Disables the ADEPT antenna mode</td>
</tr>
</tbody>
</table>
7.1.31.4.6 antenna-gain

    interface-config-radio-instance

Configures the antenna gain for the selected radio

Antenna gain is the ability of an antenna to convert power into radio waves and vice versa. The access point or wireless controller’s *Power Management Antenna Configuration File* (PMACF) automatically configures the access point or wireless controller’s radio transmit power based on the antenna type, its antenna gain (provided here) and the deployed country’s regulatory domain restrictions. Once provided, the access point or wireless controller calculates the power range. Antenna gain relates the intensity of an antenna in a given direction to the intensity that would be produced ideally by an antenna that radiates equally in all directions (isotropically), and has no losses. Although the gain of an antenna is directly related to its directivity, its gain is a measure that takes into account the efficiency of the antenna as well as its directional capabilities. It is recommended that only a professional installer set the antenna gain.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

antenna-gain <0.0-15.0>

**Parameters**

- antenna-gain <0.0-15.0>

| <0.0-15.0> | Sets the antenna gain from 0.0 - 15.0 dBi. The default is 0.00 dBi. |

**Examples**

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#antenna-gain 12.0

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context
interface radio1
    antenna-gain 12.0
    aggregation ampdu tx-only
    aeroscout forward
    antenna-diversity
    airtime-fairness prefer-ht weight 6
    antenna-downtilt
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#

**Related Commands**

- no |
  Resets the radio’s antenna gain parameter
7.1.31.4.7 antenna-mode

Configure the antenna mode (the number of transmit and receive antennas) on the access point.

This command sets the number of transmit and receive antennas on the access point. The 1x1 mode is used for transmissions over just the single -A- antenna, 1xALL is used for transmissions over the -A- antenna and all three antennas for receiving. The 2x2 mode is used for transmissions and receipts over two antennas for dual antenna models. The default setting is dynamic based on the access point model deployed and its transmit power settings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax
antenna-mode [1*1|1*ALL|2*2|default]

Parameters
- antenna-mode [1*1|1*ALL|2*2|default]

Usage Guidelines
To support STBC feature on AP71XX profile, the antenna-mode should not be configured to 1*1.

Examples
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#antenna-mode 2x2
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context interface radio1
  antenna-gain 12.0
  aggregation ampdu tx-only
  aeroscout forward
  antenna-mode 2x2
  antenna-diversity
  airtime-fairness prefer-ht weight 6
  antenna-downtilt

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#

Related Commands
- no
  Resets the radio antenna mode (the number of transmit and receive antennas) to its default
7.1.31.4.8 assoc-response

*interface-config-radio-instance*

Configures the parameters determining whether the access point ignores or responds to an association/authorization request

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**
assoc-response rssi-threshold <-128--40>

**Parameters**
- assoc-response rssi-threshold <-128--40>

<table>
<thead>
<tr>
<th>assoc-response rssi-threshold &lt;-128--40&gt;</th>
<th>Configures the parameters determining whether the access point ignores/responds to an association/authorization request</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• rssi-threshold – Configures the RSSI threshold, based on which an association/authorization request is either ignored or responded. The association/authorization request is ignored if the received RSSI is lower than the configured threshold.</td>
</tr>
<tr>
<td></td>
<td>• &lt;128--40&gt; – Specify the RSSI threshold from -128 - -40 dBi.</td>
</tr>
</tbody>
</table>

**Examples**
rfs7000-37FABE(config-profile-71XXTestProfile-if-radio1)#assoc-response rssi-threshold -128

rfs7000-37FABE(config-profile-71XXTestProfile-if-radio1)#show context interface radio1
   assoc-response rssi-threshold -128
rfs7000-37FABE(config-profile-71XXTestProfile-if-radio1)#

**Related Commands**

| no | Removes the RSSI threshold, based on which an association/authorization request is either ignored or responded. |
7.1.31.4.9 association-list

Associates an existing global association list with this radio interface

An association ACL is a policy-based access control list (ACL) that either prevents or allows wireless clients from connecting to a managed access point radio. An ACL is a sequential collection of permit and deny rules that apply to incoming and outgoing packets. When a packet is received on an interface, the controller, service platform, or access point compares the fields in the packet against the applied ACLs to verify the packet has the required permissions to be forwarded. If a packet does not meet any of the criteria specified in the ACL, it is dropped.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

association-list global <GLOBAL-ASSOC-LIST-NAME>

Parameters

- association-list global <GLOBAL-ASSOC-LIST-NAME>

Examples

rfs4000-880DA7(config-profile-test-if-radio1)#association-list global test

rfs4000-880DA7(config-profile-test-if-radio1)#show context interface radio1
association-list global test
rfs4000-880DA7(config-profile-test-if-radio1)#

Related Commands

no | Removes the global association list associated with this radio interface
7.1.31.4.10 beacon

`interface-config-radio-instance`

Configures radio beacon parameters

A beacon is a packet broadcasted by adopted radios to keep the network synchronized. Included in a beacon is information, such as the WLAN service area, the radio address, the broadcast destination addresses, a time stamp, and indicators about traffic and delivery such as a Delivery Traffic Indication Message (DTIM). Increase the DTIM/beacon settings (lengthening the time) to let nodes sleep longer and preserve battery life. Decrease these settings (shortening the time) to support streaming multicast audio and video applications that are jitter sensitive.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

`beacon [dtim-period|period]`

`beacon dtim-period [<1-50>|bss <1-16> <1-50>]`

`beacon period [50|100|200]`

**Parameters**

- `beacon dtim-period [<1-50>|bss <1-8> <1-50>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>beacon</td>
<td>Configures radio beacon parameters</td>
</tr>
<tr>
<td>dtim-period</td>
<td>Configures the radio DTIM interval. A DTIM is a message that informs wireless clients about the presence of buffered multicast or broadcast data. These are simple data frames that require no acknowledgement, so nodes sometimes miss them. Increase the DTIM/beacon settings (lengthening the time) to let nodes sleep longer and preserve their battery life. Decrease these settings (shortening the time) to support streaming multicast audio and video applications that are jitter-sensitive.</td>
</tr>
<tr>
<td>&lt;1-50&gt;</td>
<td>Configures a single value to use on the radio. Specify a value between 1 and 50.</td>
</tr>
<tr>
<td>bss &lt;1-16&gt; &lt;1-50&gt;</td>
<td>Configures a separate DTIM for a Basic Service Set (BSS) on this radio interface</td>
</tr>
</tbody>
</table>

- `<1-16>` – Sets the BSS number from 1 - 16
- `<1-50>` – Sets the BSS DTIM from 1 - 50. The default is 2.

- `beacon period [50|100|200]`

<table>

</table>
7.1.31.4.11 channel

*interface-config-radio-instance*

Configures a radio's channel of operation

Only a trained installation professional should define the radio channel. Select Smart for the radio to scan non-overlapping channels listening for beacons from other access points. After the channels are scanned, the radio selects the channel with the fewest access points. In case of multiple access points on the same channel, it selects the channel with the lowest average power level.

**NOTE:** Channels with a “w” appended to them are unique to the 40 MHz band. Channels with a “ww” appended to them are 802.11ac specific, and appear only when using an AP8232, and are unique to the 80 MHz band.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

`channel [smart|acs|random|1|2|3|4|-------]`

**Parameters**

- `channel [smart|acs|random|1|2|3|4|-------]`

| [smart|acs|1|2|3|4|-------] | Configures a radio's channel of operation. The options are: |
|---------------------------|---------------------------------------------------------------|
|                           | - **smart** – Uses Smart RF to assign a channel (uses uniform spectrum spreading if Smart RF is not enabled). This is the default setting. |
|                           | - **acs** – Uses *automatic channel selection* (ACS) to assign a channel |
|                           | - **random** – Randomly assigns a channel |
|                           | - **1** — Channel 1 in 20 MHz mode |
|                           | - **2** — Channel 1 in 20 MHz mode |

**Examples**

```plaintext
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#channel 1
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context
  interface radio1
    channel 1
    beacon period 50
    beacon dtim-period bss 1 5
    beacon dtim-period bss 2 2
    ... ..........................................................
    beacon dtim-period bss 14 5
    beacon dtim-period bss 15 5
    beacon dtim-period bss 16 5
    antenna-gain 12.0
    aggregation ampdu tx-only
    aeroscout forward
    antenna-mode 2x2
    antenna-diversity

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

**Related Commands**

| `no` | Resets a radio's channel of operation |
7.1.31.4.12 data-rates

Configures the 802.11 data rates on this radio

This command sets the rate options depending on the 802.11 protocol and the radio band selected. If 2.4 GHz is selected as the radio band, select separate 802.11b, 802.11g and 802.11n rates and define how they are used in combination. If 5.0 GHz is selected as the radio band, select separate 802.11a and 802.11n rates then define how they are used together.

If dedicating the radio to either 2.4 or 5.0 GHz support, use the custom keyword to set an 802.11n modulation and coding scheme (MCS) in respect to the radio’s channel width and guard interval. A MCS defines (based on RF channel conditions) an optimal combination of rates, bonded channels, multiple spatial streams, different guard intervals and modulation types. Clients can associate as long as they support basic MCS (as well as non-11n basic rates).

Data rates are fixed and not user configurable for radios functioning as sensors.

**NOTE:** Use the rf-mode command to configure a radio’s mode of operation.

**NOTE:** The MCS-1s and MCS-2s options are available for each supported access point. However, the MCS-3s option is only available to the AP8232 model access point, and its ability to provide 3x3x3 MIMO support.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
data-rates [b-only|g-only|a-only|bg|bgn|gn|an|default|custom|mcs]
data-rates [b-only|g-only|a-only|bg|bgn|gn|an|default]
data-rates custom [1|2|5.5|6|9|11|12|18|24|36|48|54|mcs-1s|mcs-2s|mcs-3s|basic-1|basic-2|basic-5.5|basic-6|basic-9|basic-11|basic-12|basic-18|basic-24|basic-36|basic-48|basic-54|basic-mcs-1s]
data-rates mcs qam-only
```

**Parameters**

- `data-rates [b-only|g-only|a-only|bg|bgn|gn|an|default]`

**Related Commands**

no Removes a radio's description
7.1.31.4.14 dfs-rehome

Reverts to configured home channel once the Dynamic Frequency Selection (DFS) evacuation period expires

NOTE: This option is applicable only if the radio’s RF mode is set to ‘5GHz-wlan’.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax
dfs-rehome {holdtime <30-3600>}

Parameters
- dfs-rehome {holdtime <30-3600>}

<table>
<thead>
<tr>
<th>dfs-rehome {holdtime &lt;30-3600&gt;}</th>
<th>Enables the radio to revert to the configured home channel once the DFS evacuation period expires</th>
</tr>
</thead>
<tbody>
<tr>
<td>holdtime – Optional. Specifies the duration, in minutes, to stay in the new channel</td>
<td></td>
</tr>
<tr>
<td>&lt;30-3600&gt; – Specify the holdtime from 30 - 3600 minutes. The default is 90 minutes.</td>
<td></td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#dfs-rehome holdtime 500
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context interface radio1
dfs-rehome holdtime 500
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#

Related Commands
- no | Stays on DFS elected channel after evacuation period expires
7.1.31.4.15 dynamic-chain-selection

- interface-config-radio-instance

Enables/disables automatic antenna mode selection. When enabled, the radio can dynamically change the number of transmit chains used (uses a single chain/antenna for frames at non-11n transmit rates). This option is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6512, AP6521, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax
dynamic-chain-selection

Parameters
None

Examples
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#dynamic-chain-selection
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#

</tbody>
</table>
7.31.4.16 ekahau

`interface-config-radio-instance`

Enables Ekahau multicast packet forwarding. When enabled, Ekahau small, battery powered Wi-Fi tags are attached to tracked assets or assets carried by people. Ekahau processes locations, rules, messages, and environmental data and turns the information into locationing maps, alerts and reports.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

```
ekahau [forward ip <IP> port <0-65535>|mac <MAC>]
```

Parameters

- `forward ip <IP> port <0-65535>|mac <MAC>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>forward ip &lt;IP&gt;</code></td>
<td>Enables multicast packet forwarding to the Ekahau engine</td>
</tr>
<tr>
<td><code>ip &lt;IP&gt;</code></td>
<td>Configures the IP address of the Ekahau engine in the A.B.C.D format</td>
</tr>
<tr>
<td><code>port &lt;0-65535&gt;</code></td>
<td>Specifies the TaZman Sniffer Protocol (TZSP) port on Ekahau engine from 0 - 65535</td>
</tr>
<tr>
<td><code>mac &lt;MAC&gt;</code></td>
<td>Configures the multicast MAC address to forward the Ekahau multicast packets</td>
</tr>
<tr>
<td><code>&lt;MAC&gt;</code></td>
<td>Specify the MAC address in the AA-BB-CC-DD-EE-FF format.</td>
</tr>
</tbody>
</table>

TZSP is an encapsulation protocol, which is generally used to wrap 802.11 wireless packets.

Examples

```bash
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#ekahau forward ip 172.16.10.1 port 3

### 7.1.31.4.17 extended-range

*interface-config-radio-instance*

Enables the extended range capability for AP71XX and AP81XX model devices. When enabled, these access points can exchange signals with their clients at greater distances without being timed out. This option is disabled by default.

Supported in the following platforms:
- Access Point — AP71XX, AP81XX

**Syntax**

```plaintext
extended-range <1-25>
```

**Parameters**

- `extended-range <1-25>`

**Examples**

```plaintext
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#extended-range 15
```

```plaintext
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context interface radio1

**Related Commands**

- `no` Resets the extended range to default (7 km for 2.4 GHz and 5 km for 5.0 GHz)
### 7.1.31.4.18 fallback-channel

#### Syntax
```
fallback-channel [100|100w|100ww|104|104w|104ww|108|108w...............]
```

#### Parameters
- **fallback-channel [100|100w|100ww|104|104w|104ww|108|108w...............]**
  - Configures the fallback channel. This is the channel the radio switches to in case a radar is detected on the radio's current operating channel.
  - **[100|100w|100ww|...]** – Select the fallback channel from the available options.

**Note:** Channels with a “w” appended to them are unique to the 40 MHz band. Channels with a “ww” appended to them are 802.11ac specific, and appear only when using an AP8232, and are unique to the 80 MHz band.

#### Examples
```
nx9500-6C8809(config-profile-testAP81XX-if-radio2)#fallback-channel 104
```

**NOTE:** Functionality is supported only in the US regulatory domain and only a non-dfs channel can be configured as a fallback channel.

```
nx9500-6C8809(config-profile-testAP81XX-if-radio2)#show context
   interface radio2
     fallback-channel 104
```

#### Related Commands
```
no
```
- Removes the fallback-channel configuration
7.1.31.4.19 guard-interval

```
interface-config-radio-instance
```

Configures the 802.11n guard interval. A guard interval ensures distinct transmissions do not interfere with one another. It provides immunity to propagation delays, echoes and reflection of radio signals.

The guard interval is the space between transmitted characters. The guard interval eliminates *inter symbol interference* (ISI). ISI which occurs when echoes or reflections from one symbol interferes with another. Adding time between transmissions allows echoes and reflections to settle before the next symbol is transmitted. A shorter guard interval results in shorter symbol times, which reduces overhead and increases data rates by up to 10%.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

guard-interval [any|long]

**Parameters**

- guard-interval [any|long]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>Enables the radio to use any short (400nSec) or long (800nSec) guard interval</td>
</tr>
<tr>
<td>long</td>
<td>Enables the use of long guard interval (800nSec). This is the default setting.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#guard-interval long

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

7.1.31.4.20 ldpc

*interface-config-radio-instance*

Enables support for *Low Density Parity Check* (LDPC) on the radio interface.

LDPC consists of forward error correcting codes that enable error control in data transmission.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX
- Wireless Controllers — RFS4011

**Syntax**

```
ldpc
```

**Parameters**

None

**Examples**

```
rfs4000-229D58(config-profile-Test81XX-if-radio1)#ldpc

- noResets the maximum number of wireless clients allowed to associate with a radio
7.1.31.4.23 mesh

Use this command to configure radio mesh parameters. A Wireless Mesh Network (WMN) is a network of radio nodes organized in a mesh topology. It consists of mesh clients, mesh routers, and gateways.

Each radio setting can have a unique mesh mode and link configuration. This provides a customizable set of connections to other mesh supported radios within the same radio coverage area.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**
```
mesh [client|links|portal|preferred-peer|psk]
```
```
mesh [client|links <1-6>|portal|preferred-peer <1-6> <MAC>|psk [0 <LINE>|2 <LINE>|<LINE>]]
```

**Parameters**
- `mesh [client|links <1-6>|portal|preferred-peer <1-6> <MAC>|psk [0 <LINE>|2 <LINE>| <LINE>]]`

**7.1.31.4.24 meshpoint**

Maps an existing meshpoint to this radio

Use this command to assign each WLAN its own BSSID. If using a single-radio access point, there are 8 BSSIDs available. If using a dual-radio access point there are 8 BSSIDs for the 802.11b/g/n radio and 8 BSSIDs for the 802.11a/n radio.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**
meshpoint <MESHPOINT-NAME> {bss <1-16>}

**Parameters**
- meshpoint <MESHPOINT-NAME> {bss <1-16>}

<table>
<thead>
<tr>
<th>meshpoint &lt;MESHPOINT-NAME&gt;</th>
<th>Maps a meshpoint to this radio. Specify the meshpoint name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>bss &lt;1-16&gt;</td>
<td>Optional. Specifies the radio’s BSS where this meshpoint is mapped</td>
</tr>
</tbody>
</table>

**Examples**
rfs7000-37FABE(config-profile-ap71xxTest-if-radio1)#meshpoint test bss 7
rfs7000-37FABE(config-profile-ap71xxTest-if-radio1)#show context interface radio1
Meshpoint test bss 7
rfs7000-37FABE(config-profile-ap71xxTest-radio1)#

**Related Commands**
- **no** Disables meshpoint on the selected radio
7.1.31.4.25 no

*interface-config-radio-instance*

Negates a command or resets settings to their default. When used in the profile/device > radio interface configuration mode, the no command disables or resets radio interface settings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

no <PARAMETERS>

**Parameters**

- no <PARAMETERS>

| no <PARAMETERS> | Removes or reverts this radio interface's settings based on the parameters passed |

**Usage Guidelines**

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

rfs7000-37FABE(config-profile-ap71xxTest-if-radio1)#no ?

- aeroscout: Use Default Aeroscout Multicast MAC Address
- aggregation: Configure 802.11n aggregation related parameters
- airtime-fairness: Disable fair access to medium for clients, provide access in a round-robin mode
- antenna-diversity: Use single antenna for non-11n transmit rates
- antenna-downtilt: Reset ADEPT antenna mode
- antenna-gain: Reset the antenna gain of this radio to default
- antenna-mode: Reset the antenna mode (number of transmit and receive antennas) on the radio to its default
- association-list: Configure the association list for the radio
- beacon: Configure beacon parameters
- channel: Reset the channel of operation of this radio to default
- data-rates: Reset radio data rate configuration to default
- description: Reset the description of the radio to its default
- dfs-rehome: Stay on dfs elected channel after evacuation period expires
- dynamic-chain-selection: Use the configured transmit antenna mode for all clients
- ekahau: Use Default Ekahau Multicast MAC Address
- extended-range: Reset extended range to default
- fallback-channel: Clear the DFS fallback channel for this radio
- guard-interval: Configure default value of 802.11n guard interval (long: 800nSec)
- ldpc: Configure support for Low Density Parity Check Code
- lock-rf-mode: Allow smart-rf to change rf-mode setting for this radio
- max-clients: Maximum number of wireless clients allowed to associate
- mesh: Disable mesh mode operation of the radio
- meshpoint: Disable a meshpoint from this radio
- non-unicast: Configure handling of non-unicast frames
- off-channel-scan: Disable off-channel scanning on the radio
- placement: Reset the placement of the radio to its default
- power: Reset the transmit power of this radio to default
- preamble-short: Disable the use of short-preamble on this radio
**Probe Configuration**

- **probe-response**: Configure transmission parameters for Probe Response frames.
- **radio-resource-measurement**: Configure support for 802.11k Radio Resource Measurement.
- **radio-share-mode**: Configure the radio-share mode of operation for this radio.
- **rate-selection**: Monotonic rate selection.
- **rf-mode**: Reset the RF mode of operation for this radio to default (2.4GHz on radio1, 5GHz on radio2, sensor on radio3).
- **rifs**: Configure Reduced Interframe Spacing (RIFS) parameters.
- **rts-threshold**: Reset the RTS threshold to its default (65536).
- **shutdown**: Re-enable the selected interface.
- **smart-rf**: Reset smart-rf related configuration to default.
- **sniffer-redirect**: Disable capture and redirection of packets.
- **stbc**: Configure Space-Time Block Coding (STBC) parameters.
- **transmit-beamforming**: Disable Transmit Beamforming.
- **use**: Set setting to use.
- **wips**: Wireless intrusion prevention related configuration.
- **wireless-client**: Configure wireless client related parameters.
- **wlan**: Disable a wlan from this radio.
- **service**: Service Commands.

### 7.1.31.4.26 non-unicast

*interface-config-radio-instance*

Configures support for forwarding of non-unicast (multicast and broadcast) frames on this radio.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

#### Syntax

- `non-unicast [forwarding|queue|tx-rate]`
- `non-unicast forwarding [follow-dtim|power-save-aware]`
- `non-unicast queue [<1-200>|bss]`
- `non-unicast queue [<1-200] bss <1-16> <1-200]`
- `non-unicast tx-rate [bss <1-16]|dynamic-all|dynamic-basic|highest-basic|lowest-basic]`
- `non-unicast tx-rate bss <1-16> [dynamic-all|dynamic-basic|highest-basic|lowest-basic]`

#### Parameters

- **non-unicast forwarding [follow-dtim|power-save-aware]**
  - Enables non-unicast frame forwarding on this radio. Once enabled, select one of the available options to specify whether these frames should always follow DTIM, or only follow DTIM when using power save aware mode.
  - **follow-dtim**: Specifies frames always wait for the DTIM interval to time out. The DTIM interval is configured using the `beacon` command. This is the default setting.
  - **power-save-aware**: Enables immediate forwarding of frames only if all associated wireless clients are in the power save mode.

- **non-unicast queue [<1-200]|bss <1-16> <1-200]**
  - Enables non-unicast frame forwarding on this radio. Once enabled, specify the number of broadcast packets queued per BSS on this radio. This option is enabled by default.
  - This command also enables you to override the default on a specific BSS.
  - **<1-200>**: Specify a number from 1 - 200. This value applies to all BSSs. The default is 50 frames per BSS.
  - **bss <1-16> <1-200>**: Specifies the BSS number from 1 - 16 and the number of broadcast packets queued for the selected BSS from 1 - 200.

- **non-unicast tx-rate [bss <1-16]|dynamic-all|dynamic-basic|highest-basic|lowest-basic]**
  - Enables non-unicast frame forwarding on this radio. Once enabled, use one of the available options to configure the rate at which these frames are transmitted.
  - **bss <1-16>**: Overrides the default on a specified BSS.
    - **<1-16>**: Select the BSS number from 1 - 16.
    - **<1-200>**: Specify the number of broadcast packets queued for the selected BSS from 1 - 200.
**Examples**

```
Example 1:

Resets the handling of non-unicast frames to its default
### 7.1.31.4.27 off-channel-scan

*interface-config-radio-instance*

Enables off channel scanning on this radio. This option is disabled by default.

Channel scanning uses the access point’s resources and is time consuming. Therefore, enable this option only if the radio has the bandwidth to support channel scan without negatively impacting client support.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
off-channel-scan {channel-list|max-multicast|scan-interval|sniffer-redirect}
off-channel-scan {channel-list [2.4Ghz|5Ghz]} {<CHANNEL-LIST>}
off-channel-scan {max-multicast <0-100>|scan-interval <2-100>}
off-channel-scan {sniffer-redirect tzsp <IP>}
```

**Parameters**

- `off-channel-scan {channel-list [2.4Ghz|5Ghz]} {<CHANNEL-LIST>}`
  
  Enables off-channel scanning and configures related parameters. These parameters are optional, and the system configures default settings if no values are specified.

- `channel-list [2.4GHz|5GHz]`
  
  Optional. Selects the 2.4GHz or 5GHz access point radio band. Restricting off channel scans to specific channels frees bandwidth otherwise utilized for scanning across all channels.
  
  - `2.4GHz` – Selects the 2.4 GHz band
  - `5GHz` – Selects the 5.0 GHz band

- `<CHANNEL-LIST>`
  
  Optional. Specifies a list of 20 MHz, 40 MHz, or 80 MHz channels for the selected band (the channels are separated by commas or hyphens)

- `off-channel-scan {max-multicast <0-100>|scan-interval <2-100>}`
  
  Enables off-channel scanning and configures related parameters. These parameters are optional, and the system configures default settings if no values are specified.

- `max-multicast <0-100>`
  
  Optional. Configures the maximum multicast/broadcast messages used to perform OCS
  
  - `<0-100>` – Specify a value from 0 - 100. The default is 4.

- `scan-interval <2-100>`
  
  Optional. Configures the scan interval in dtims
  
  - `<2-100>` – Specify a value from 2 - 100. The default is 20 dtims.

- `off-channel-scan {sniffer-redirect tzsp <IP>}`
  
  Enables off-channel scanning and configures related parameters. These parameters are optional, and the system configures default settings if no values are specified.

- `sniffer-redirect tzsp <IP>`
  
  Optional. Captures and redirects packets to a host running a packet capture/analysis tool. Use this command to configure the IP address of the host.
  
  - `tzsp` – Encapsulates captured packets in TZSP before redirecting to the specified host
  - `<IP>` – Specify the destination device IP address.

**7.1.31.4.28 placement**

`interface-config-radio-instance`

Defines the radio's location (whether the radio is deployed indoors or outdoors). The radio's placement should depend on the country of operation selected and its regulatory domain requirements for radio emissions.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
placement [indoor|outdoor]
```

**Parameters**

- `placement [indoor|outdoor]`

<table>
<thead>
<tr>
<th>indoor</th>
<th>Radio is deployed indoors (uses indoor regulatory rules). This is the default setting.</th>
</tr>
</thead>
<tbody>
<tr>
<td>outdoor</td>
<td>Radio is deployed outdoors (uses outdoor regulatory rules)</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#placement outdoor
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

```

Resets a radio's deployment location
7.1.31.4.29 power

`interface-config-radio-instance`

Configures the radio’s transmit power setting

The transmit power control (TPC) mechanism automatically reduces the used transmission output power when other networks are within range. Reduced power results in reduced interference issues and increased battery capacity.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4011

**Syntax**

```
power [<1-30>|smart]
```

**Parameters**

- **power [<1-30>|smart]**

<table>
<thead>
<tr>
<th>power</th>
<th>Configures a radio’s transmit power</th>

7.1.31.4.30 preamble-short

```
interface-config-radio-instance
```

Enables short preamble on this radio. If using an 802.11bg radio, enable short preamble. Short preambles improve throughput. However, some devices (SpectraLink phones) require long preambles. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

**7.1.31.4.31 probe-response**

> **interface-config-radio-instance**

Configures transmission parameters for probe response frames

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```bash
probe-response [rate|retry|rssi-threshold]
```

```bash
probe-response retry
probe-response rate [follow-probe-request|highest-basic|lowest-basic]
probe-response rssi-threshold <-128--40>
```

**Parameters**

- **probe-response retry**
  - Enables/disables retransmission of probe-response frames if no acknowledgement is received from the client. This option is enabled by default.

- **probe-response rate [follow-probe-request|highest-basic|lowest-basic]**
  - Configures the rates used for transmission of probe response frames.
  - The tx-rate options available for transmitting probe response frames are: follow-probe-request, highest-basic, lowest-basic.

- **follow-probe-request**
  - Transmits probe responses at the same rate as the received request (default setting)

- **highest-basic**
  - Uses the highest configured basic rate

- **lowest-basic**
  - Uses the lowest configured basic rate

- **probe-response rssi-threshold <-128--40>**
  - Ignores probe request from client if the received signal strength is less than the RSSI threshold specified here
  - **<-128--40>** — Specify a value from -128 - -40.

**Examples**

```bash
nx9500-6C8809(config-profile-testAP71XX-if-radio1)#probe-response rate highest-basic
nx9500-6C8809(config-profile-testAP71XX-if-radio1)#probe-response retry
nx9500-6C8809(config-profile-testAP71XX-if-radio1)#probe-response rssi-threshold -60

### 7.1.31.4.32 radio-resource-measurement

#### interface-config-radio-instance

Enables 802.11k radio resource measurement. When enabled, the radio station sends channel and neighbor reports.

The IEEE 802.11 Task Group k defined a set of specifications regarding radio resource measurements. These specifications specify the radio resources to be measured and the mechanism used to communicate measurement requests and results.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

#### Syntax

```
radio-resource-measurement [attenuation-threshold <1-199>|max-entries <1-12>]
```

#### Parameters

- **radio-resource-measurement [attenuation-threshold <1-199>|max-entries <1-12>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attenuation-threshold &lt;1-199&gt;</td>
<td>Configures the neighbor attenuation threshold, considered when generating channel and neighbor reports</td>
</tr>
<tr>
<td>max-entries &lt;1-12&gt;</td>
<td>Configures the maximum number of entries to include in channel and neighbor reports</td>
</tr>
</tbody>
</table>

#### Examples

```
rfs4000-229D58(config-device-00-23-68-22-9D-587-if-radio1)#radio-resource-measurement attenuation-threshold 20
rfs4000-229D58(config-device-00-23-68-22-9D-587-if-radio1)#radio-resource-measurement max-entries 10
rfs4000-229D58(config-device-00-23-68-22-9D-587-if-radio1)#show context interface radio1
  radio-resource-measurement max-entries 10
  radio-resource-measurement attenuation-threshold 20
rfs4000-229D58(config-device-00-23-68-22-9D-587-if-radio1)#
```

#### Related Commands

- **no** Disables 802.11k radio resource measurement support
7.1.31.4.33 radio-share-mode

*interface-config-radio-instance*

 Configures the radio’s mode of operation as radio share. A radio operating in the radio share mode services clients and also performs sensor functions (defined by the radio’s AirDefense Services Platform (ADSP) licenses and profiles).

**NOTE:** The sensor capabilities of the radio are restricted to the channel and WLANs defined on the radio.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

`radio-share-mode [inline|off|promiscuous]`

**Parameters**

- `radio-share-mode [inline|off|promiscuous]`

<table>
<thead>
<tr>
<th>radio-share-mode</th>
<th>Enables sharing of packets, switched by this radio, with the WIPS sensor module. There are two radio-share modes, these are: inline and promiscuous</th>
</tr>
</thead>
<tbody>
<tr>
<td>inline</td>
<td>Enables sharing of all WLAN packets (matching the BSSID of the radio) serviced by the radio with the WIPS sensor module.</td>
</tr>
<tr>
<td>off</td>
<td>Disables radio share (no packets shared with the WIPS sensor module).</td>
</tr>
<tr>
<td>promiscuous</td>
<td>Enables the <em>promiscuous radio share</em> mode. In this mode the radio is configured to receive all packets on the channel irrespective of whether the destination address is the radio or not, and shares these packets with the WIPS sensor module for analysis (i.e. without filtering based on BSSID).</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#radio-share-mode promiscuous

7.1.31.4.36 rf-mode

`interface-config-radio-instance`

Configures the radio’s RF mode of operation

This command sets the mode to either 2.4 GHz WLAN or 5.0 GHz WLAN support depending on the radio’s intended client support. If you are currently licensed to use 4.9 GHz, configure the 4.9 GHz-WLAN option.

Set the mode to sensor if using the radio for rogue device detection. The radio cannot support rogue detection when one of the other radios is functioning as a WIPS sensor. To set a radio as a detector, disable sensor support on the other access point radios.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

`rf-mode [2.4GHz-wlan|4.9GHz-wlan|5GHz-wlan|scan-ahead|sensor]`

Parameters

- `rf-mode [2.4GHz-wlan|4.9GHz-wlan|5GHz-wlan|scan-ahead|sensor]`

<table>

</tr>
<tr>
<td>scan-ahead</td>
<td>Enables this radio to operate as a scan-ahead radio</td>
</tr>
<tr>
<td>A radio functioning in the scan-ahead mode is used for forward scanning only. The radio does not support WLAN or mesh services. The scan ahead feature is used in Dynamic Frequency Selection (DFS) aware countries for infrastructure devices, static, and vehicular mounted modems (VMMs). It enables a secondary radio to scan ahead for an active channel for backhaul transmission, in the event of a radar trigger on the primary radio. The device then switches radios allowing transmission to continue. This is required in environments where handoff is required and DFS triggers are common. With a secondary radio dedicated for forward scanning, the primary radio, in case of radar hit, hands over the channel availability check (CAC) function to the secondary radio. This avoids a break in data communication, which would have resulted if the primary radio was to do CAC itself. The secondary radio periodically does a scan of the configured channel list, searching for the other available meshpoint roots. When configured on the root meshpoint, the scan-ahead feature also scans for cleaner channels.</td>
<td></td>
</tr>
<tr>
<td>sensor</td>
<td>Operates as a sensor radio. Configures this radio to function as a scanner, providing scanning services on both 2.4 GHz and 5.0 GHz bands. The radio does not provide WLAN services.</td>
</tr>

7.1.31.4.37 rifs

**interface-config-radio-instance**

Configures Reduced Interframe Spacing (RIFS) parameters on this radio

This value determines whether interframe spacing is applied to access point transmitted or received packets, both, or none. Inter-frame spacing is the interval between two consecutive Ethernet frames that enable a brief recovery between packets and allow target devices to prepare for the reception of the next packet.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
    rifs [none|rx-only|tx-only|tx-rx]
```

**Parameters**

- `rifs [none|rx-only|tx-only|tx-rx]`

<table>

```

**Related Commands**

- `no` Disables radio's RIFS parameters
7.1.31.4.38 rts-threshold

- interface-config-radio-instance

Configures the Request to Send (RTS) threshold value on this radio.

RTS is a transmitting station’s signal that requests a Clear To Send (CTS) response from a receiving client. This RTS/CTS procedure clears the air where clients are contending for transmission time. Benefits include fewer data collisions and better communication with nodes that are hard to find (or hidden) because of other active nodes in the transmission path.

The RTS threshold controls RTS/CTS by initiating an RTS/CTS exchange for data frames larger than the threshold, and sends (without RTS/CTS) any data frames smaller than the threshold.

Consider the trade-offs when setting an appropriate RTS threshold for the WLAN’s access point radios. A lower RTS threshold causes more frequent RTS/CTS exchanges. This consumes more bandwidth because of additional latency (RTS/CTS exchanges) before transmissions can commence. A disadvantage is the reduction in data-frame throughput. An advantage is quicker system recovery from electromagnetic interference and data collisions. Environments with more wireless traffic and contention for transmission make the best use of a lower RTS threshold.

A higher RTS threshold minimizes RTS/CTS exchanges, consuming less bandwidth for data transmissions. A disadvantage is less help to nodes that encounter interference and collisions. An advantage is faster data-frame throughput. Environments with less wireless traffic and contention for transmission make the best use of a higher RTS threshold.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

rts-threshold <0-65536>

Parameters

- rts-threshold <0-65536>

Examples

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#rts-threshold 100

Related Commands

no

Resets a radio’s RTS threshold to its default
**7.1.31.4.39 service**

*interface-config-radio-instance*

Enables/disables dynamic control function. This dynamic function controls performance of the radio receiver’s *low noise amplifiers* (LNAs).

When enabled, the control function, in the presence of very strong received signals, improves the receiver’s performance on radio 1. Strong signals are caused if the distance between the WiFi client and the AP is within two (2) meters. When disabled, the control function is a useful debug tool in case the uplink throughput is less than expected and the AP-to-client separation is greater than two (2) meters. Disabling the control function does not affect the receive sensitivity of the radio.

Supported in the following platforms:
- Access Points — AP622, AP6522, AP6562

**Syntax**
```
service radio-lna [agc|ms]
```

**Parameters**
- `service radio-lna [agc|ms]`

| radio-lna [agc|ms] | Enables/disables dynamic control function |
|--------------------|-------------------------------------------|
| agc                | Enables dynamic LNA control function. This is the default setting. |
| ms                 | Disables dynamic LNA control function |

**Examples**
```
nx9500-6C8809(config-profile-testAP6522-if-radio1)#service radio-lna ms

nx9500-6C8809(config-profile-testAP6522-if-radio1)#show context
interface radio1
  service radio-lna ms

7.1.31.4.43 stbc

```interface-config-radio-instance```

Configures the radio’s Space Time Block Coding (STBC) mode. STBC is a pre-transmission encoding scheme providing an improved SNR ratio (even at a single RF receiver). STBC transmits multiple data stream copies across multiple antennas. The receiver combines the copies into one to retrieve data from the signal. These transmitted data versions provide redundancy to increase the odds of receiving data streams with a good data decode (especially in noisy environments).

**NOTE:** STBC requires the radio has at least two antennas with the capability to transmit two streams. If the antenna mode is configured to 1x1 (or falls back to 1x1 for some reason), STBC support is automatically disabled.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
stbc [auto|none|tx-only]
```

**Parameters**

- **auto**
  - `stbc [auto|none|tx-only]`
  - Autoselects STBC settings based on the platform type and other radio interface settings
- **none**
  - `stbc [auto|none|tx-only]`
  - Disables STBC support (default setting)
- **tx-only**
  - `stbc [auto|none|tx-only]`
  - Configures the AP radio to format and broadcast the special stream (enables STBC support for transmit only)

**Examples**

```
rfs7000-37FABE(config-profile-81xxTestProfile-if-radio1)#stbc tx-only
```

```
rfs7000-37FABE(config-profile-81xxTestProfile-if-radio1)#show context
interface radio1
    stbc tx-only
```rfs7000-37FABE(config-profile-81xxTestProfile-if-radio1)#

**Related Commands**

- **no**
  - Disables STBC support
7.1.31.4.44 transmit-beamforming

Enables transmit beamforming on this radio interface. This option is disabled by default.

When enabled, this option steers signals to peers in a specific direction to enhance signal strength and improve throughput amongst meshed devices (not clients). Each access point radio supports up to 16 beamforming capable mesh peers. When enabled, a beamformer steers its wireless signals to its peers. A beamformee device assists the beamformer with channel estimation by providing a feedback matrix. The feedback matrix is a set of values sent by the beamformee to assist the beamformer in computing a steering matrix. A steering matrix is an additional set of values used to steer wireless signals at the beamformer so constructive signals arrive at the beamformee for better SNR and throughput. Any beamforming capable mesh peer connecting to a radio whose capacity is exhausted cannot enable beamforming itself.

Supported in the following platforms:
- Access Points — AP8122, AP8132, AP8163

Syntax
transmit-beamforming

Parameters
None

Examples
nx9500-6C8809(config-profile-testAP81XX-if-radio1)#transmit-beamforming

### 7.1.31.45 `use`

**interface-config-radio-instance**

Applies an association ACL policy and a radio QoS policy on this radio interface.

An association ACL is a policy-based *Access Control List* (ACL) that either prevents or allows wireless clients from connecting to a controller managed access point radio. An ACL is a sequential collection of permit and deny conditions that apply to controller packets. When a packet is received on an interface, the controller compares the fields in the packet against any applied ACLs to verify the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. If a packet does not meet any of the criteria specified in the ACL, the packet is dropped.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4011

**Syntax**

```
use [association-acl-policy|radio-qos-policy]
use [association-acl-policy <ASSOC-ACL-POLICY-NAME>|radio-qos-policy <RADIO-QoS-POLICY-NAME>]
```

**Parameters**

- **use [association-acl-policy <ASSOC-ACL-POLICY-NAME>|radio-qos-policy <RADIO-QoS-POLICY-NAME>]**

<table>
<thead>
<tr>
<th>association-acl-policy</th>
<th>Uses a specified association ACL policy with this radio interface</th>

```

**Related Commands**

- **no** Dissociates the specified association ACL policy and radio QoS policy
7.1.31.4.46 wips

```
interface-config-radio-instance
```

Enables access point to change its channel of operation in order to terminate rogue devices. The radio should be configured to provide WLAN service.

This option is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

---

**NOTE:** AP7522 and AP7532 access points use Smart RF to perform off-channel scans. Therefore, ensure that a Smart RF policy is configured and applied to AP7522 and AP7532 access points RF Domains to enable them perform rogue detection and termination.

---

**Syntax**

```
wips airtime-termination allow-channel-change
```

**Parameters**

- `wips airtime-termination allow-channel-change`

<table>
<thead>
<tr>
<th>Syntax</th>

7.1.31.4.48 wlan

*interface-config-radio-instance*

Enables a WLAN on this radio

Use this command to configure WLAN/BSS mappings for an existing access point deployment. Administrators can assign each WLAN its own BSSID. If using a single-radio access point, there are 8 BSSIDs available. If using a dual-radio access point there are 8 BSSIDs for the 802.11b/g/n radio and 8 BSSIDs for the 802.11a/n radio.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

wlan <WLAN-NAME> {bss|primary}

wlan <WLAN-NAME> {bss <1-16>} {primary}

**Parameters**

- wlan <WLAN-NAME> {bss <1-16>} {primary}

<table>
<thead>
<tr>
<th>&lt;WLAN-NAME&gt; {bss &lt;1-16&gt;} {primary}</th>
<th>Specify the WLAN name (it must have been already created and configured)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>bss &lt;1-16&gt; – Optional. Specifies a BSS for the radio to map the WLAN</td>
</tr>
<tr>
<td></td>
<td>&lt;1-16&gt; – Specify the BSS number from 1 - 16.</td>
</tr>
<tr>
<td></td>
<td>primary – Optional. Uses the specified WLAN as the primary WLAN, when multiple WLANs exist on the BSS</td>
</tr>
<tr>
<td></td>
<td>primary – Optional. Uses the specified WLAN as the primary WLAN, when multiple WLANs exist on the BSS</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#wlan TestWLAN primary

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

*no* Enables a WLAN on a radio
7.1.31.5 interface-config-wwan-instance

A Wireless Wide Area Network (WWAN) card is a specialized network interface card that allows a network device to connect, transmit and receive data over a cellular WAN. AP7131 model access points, RFS4000 and RFS6000 controllers utilize a PCI express card slot that supports 3G WWAN cards. The WWAN card uses point-to-point protocol (PPP) to connect to the Internet Service Provider (ISP) and gain access to the Internet. PPP establishes internet links over dial-up modems, DSL connections, and many other types of point-to-point communications. PPP packages your system’s TCP/IP packets and forwards them to the serial device where they can be put on the network. PPP is a full-duplex protocol used on various physical media, including twisted pair or fiber optic lines or satellite transmission. It uses a variation of High Speed Data Link Control (HDLC) for packet encapsulation.

To switch to the WWAN Interface configuration mode, use the following command:

<DEVICE>(config)#profile <DEVICE-TYPE> <DEVICE-PROFILE-NAME>

rfs4000-229D58(config)#profile rfs4000 testRFS4000
rfs4000-229D58(config-profile-testRFS4000)#

rfs4000-229D58(config-profile-<DEVICE-PNAME>-if-wwan1)#?

Interface configuration commands:
- apn          Enter the access point name provided by the service provider
- auth-type    Type of authentication, Eg chap, pap
- crypto       Encryption Module
- description  Port description
- ip           Internet Protocol (IP)
- no           Negate a command or set its defaults
- password     Enter password provided by the service provider
- shutdown     Disable wireless wan feature
- use          Set setting to use
- username     Enter username provided by the service provider
- clrscr       Clears the display screen
- commit       Commit all changes made in this session
- do           Run commands from Exec mode
- end          End current mode and change to EXEC mode
- exit         End current mode and down to previous mode
- help         Description of the interactive help system
- revert       Revert changes
- service      Service Commands
- show         Show running system information
- write        Write running configuration to memory or terminal

rfs4000-229D58(config-profile-<PROFILE-PNAME>-if-wwan1)#

---

**NOTE:** The WWAN interface is supported only on the AP7131, RFS4000, RFS6000 platforms.

The following table summarizes WWAN interface configuration commands:

*Table 7.18 Interface-Config-WWAN1-Interface Commands*
7.1.31.5.1 `apn`

```
*interface-config-wwan-instance*
```

Configures the cellular data provider’s name. This setting is needed in areas with multiple cellular data providers using the same protocols, such as Europe and Asia.

Supported in the following platforms:
- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

**Syntax**

```
apn <WORD>
```

**Parameters**

- `apn <WORD>`

**Examples**

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#apn AT&T
```

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
   interface wwan1
   apn AT&T
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

**Related Commands**

```
no
```

Removes the configured access point name.
7.1.31.5.2 auth-type

Configure the authentication type used by the cellular data provider.

Supported in the following platforms:
- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
auth-type [chap|mschap|mschap-v2|pap]
```

Parameters

- `auth-type [chap|mschap|mschap-v2|pap]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chap</td>
<td>Configures <code>Challenge-Handshake Authentication Protocol</code> (CHAP). This is the default value.</td>
</tr>
<tr>
<td>mschap</td>
<td>Configures <code>Microsoft Challenge-Handshake Authentication Protocol</code> (MSCHAP)</td>
</tr>
<tr>
<td>mschapv2</td>
<td>Configures <code>Microsoft Challenge-Handshake Authentication Protocol</code> version 2</td>
</tr>
<tr>
<td>pap</td>
<td>Configures <code>Password Authentication Protocol</code> (PAP)</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#auth-type mschap-v2
```

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
   interface wwan1
   apn AT&T
   auth-type mschap-v2
```

Related Commands

- `no` Removes the authentication protocol configured on this interface.
7.1.31.5.3 crypto

 Associates a crypto map with this interface

Supported in the following platforms:

- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

Syntax

crypto map <CRYPTO-MAP-NAME>

Parameters

- crypto map <CRYPTO-MAP-NAME>

Examples

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#crypto map test

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  apn AT&T
  auth-type mschap-v2
  crypto map test
```

Related Commands

- no
  Removes the crypto map associated with this interface
### 7.1.31.5.4 ip

*interface-config-wwan-instance*

Configures IP related settings on this interface

Supported in the following platforms:
- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

**Syntax**

```
ip [default-gateway|nat]
ip default-gateway priority <1-8000>
ip nat [inside|outside]
```

**Parameters**

- `ip default-gateway priority <1-8000>`
  - Configures the default-gateway's (learned by the wireless WAN) priority.
  - `<1-8000>` – Specify a value from 1 - 8000. The default is 3000.

- `ip nat [inside|outside]`
  - Configures IP related settings on this interface
  - `inside` – Marks this WWAN interface as NAT inside. The inside network is transmitting data over the network to its intended destination. On the way out, the source IP address is changed in the header and replaced by the (public) IP address.
  - `outside` – Marks this WWAN interface as NAT outside. Packets passing through the NAT on the way back to the controller or service platform managed LAN are matched against the records kept by the NAT engine. There, the destination IP address is changed back to the specific internal private class IP address in order to reach the LAN over the network.

**Examples**

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#ip nat inside
```

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
  interface wwan1
  apn AT&T
  auth-type mschap-v2
  crypto map test
  ip nat inside
  ip default-gateway priority 1
```

**Related Commands**

```
no
```

Removes IP related settings on this interface
7.1.31.5.5 no

- interface-config-wwan-instance
  Removes or reverts the WWAN interface settings

Supported in the following platforms:
- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

Syntax
no [all|apn|auth-type|crypto|description|ip|password|shutdown|use|username]
no [all|apn|description|password|shutdown|username]
no crypto map
no ip [default-gateway priority|nat]
no use ip-access-list in

Parameters
- no <PARAMETERS>

| no <PARAMETERS> | Removes or reverts this WWAN interface’s settings based on the parameters passed |

Usage Guidelines
The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples
The following example displays the WWAN interface settings before the ‘no’ commands are executed:
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  apn AT&T
  auth-type mschap-v2
  crypto map test
  ip nat inside
  ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#no apn
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#no auth-type

The following example displays the WWAN interface settings after the ‘no’ commands are executed:
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  crypto map test
  ip nat inside
  ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
7.1.31.5.6 password

Interface-Config-Wwan-Instance

Configures a password for this WWAN interface. The configured value is used for authentication support by the cellular data carrier.

Supported in the following platforms:
- Access Points — AP71XX
- Wireless Controllers — RFS4000, RFS6000

Syntax

password [2 <WORD>|<WORD>]

Parameters

- password [2 <WORD>|<WORD>]

2 <WORD> Configures an encrypted password. Use this option when copy pasting the password from another device.

<WORD> Enter the password string (should not exceed 32 characters in length.

Examples

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#password 2 TechPubsTesting@123

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context

interface wwan1
  password TechPubsTesting@123
  crypto map test
  ip nat inside
  ip default-gateway priority 1

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#

Related Commands

no Removes the configured password
interface-config-wwan-instance

Shuts down this WWAN interface. Use the no > shutdown command to re-start the WWAN interface.

Supported in the following platforms:
- Access Points — AP71XX
- Wireless Controllers — RFS4000, RFS6000

Syntax
shutdown

Parameters
None

Examples
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#shutdown

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
  interface wwan1
  shutdown

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#

Related Commands

| no          | Re-starts the WWAN interface |
### 7.1.31.5.8 `use`

- `interface-config-wwan-instance`

Associates an IP ACL with this interface. The ACL should be existing and configured.

The ACL applies an IP based firewall to all incoming packets. The ACL identifies a single IP or a range of IPs that are to be allowed or denied access on this interface.

Supported in the following platforms:

- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

**Syntax**

```
use ip-access-list in <ACCESS-LIST-NAME>
```

**Parameters**

- `use ip-access-list in <ACCESS-LIST-NAME>`

**Examples**

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#use ip-access-list in test

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
  interface  wwan1
    password TechPubsTesting@123
    crypto map test
    ip nat inside
    use ip-access-list in test
    ip default-gateway priority 1

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

**Related Commands**

- `no` | Removes the IP ACL associated with this interface
### 7.1.31.5.9 username

- **interface-config-wwan-instance**

Configures the names of users accessing this interface

Supported in the following platforms:
- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

**Syntax**

`username <WORD>`

**Parameters**

- `username <WORD>`

**Examples**

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#username TechPubsUser1

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  username TechPubsUser1
  password TechPubsTesting@123
  crypto map test
  ip nat inside
  use ip-access-list in test
  ip default-gateway priority 1
```

**Related Commands**

- `no` Removes the configured username
This section describes the serial interface configuration commands.

Use the (config-profile-<DEVICE-PROFILE-NAME>) instance to configure the serial interface associated with the service platform.

To switch to this mode, use the following command:

```
<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#interface ?
```

The following example uses the config-profile-default-nx45xx instance to configure a serial interface:

```
nx4500-5CFA2B(config-profile-default-nx45xx)#interface ?
WORD Interface name
fe Select a FastEthernet interface
ge Select a GigabitEthernet interface
mel Select the management interface
port-channel Select a port channel interface
pppoe1 Select the PPP Over Ethernet interface
radio Select a radios
serial Select a serial interface (virtual interface)
tel Select a T1 or E1 interface
up Select the Uplink GigabitEthernet interface
vlan Select a vlan interface (switched virtual interface)
vif Select the virtual interface
wwan1 Select the wireless wan interface
xge Select a TenGigabitEthernet interface
```

```
nx4500-5CFA2B(config-profile-default-nx45xx)#interface
```
```
nx4500-5CFA2B(config-profile-default-nx45xx)#interface |serial-<1-4>/1:1|
```
```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#?
```

Interface configuration commands:

- **authentication** Type of authentication, Eg chap, pap
- **description** Enter description provided by the service provider
- **encapsulation** The type of traffic that this group handles.
- **ip** Internet Protocol (IP)
- **local-ip-address** IP address assigned to the local system
- **no** Negate a command or set its defaults
- **password** Enter password provided by the service provider
- **remote-ip-subnet** IP subnet assigned to the remote system along with subnet in CIDR notation
- **remove-override** Remove override from the device
- **shutdown** Disable serial interface
- **use** Set setting to use
- **username** Enter username provided by the service provider
- **clrscr** Clears the display screen
- **commit** Commit all changes made in this session
- **do** Run commands from Exec mode
- **end** End current mode and change to EXEC mode
- **exit** End current mode and down to previous mode
- **help** Description of the interactive help system
- **revert** Revert changes
- **service** Service Commands
- **show** Show running system information
- **write** Write running configuration to memory or terminal

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

### 7.1.31.6.1 authentication

#### interface-config-serial-instance

Configures the type of authentication used for this serial interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

#### Syntax

```
authentication [chap|none|pap]
```

#### Parameters

- `authentication [chap|none|pap]`

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>authentication chap</code></td>
<td>Configures the authentication mode as CHAP</td>
</tr>
<tr>
<td><code>authentication none</code></td>
<td>Configures no authentication mode</td>
</tr>
<tr>
<td><code>authentication pap</code></td>
<td>Configures the authentication mode as PAP</td>
</tr>
</tbody>
</table>

#### Examples

```bash
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#authentication pap
```

```bash
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context interface serial-1/1:1
authentication pap
```

#### Related Commands

</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Disables or reverts serial interface settings to their default</td>
</tr>
</tbody>
</table>
7.31.6.2 description

*interface-config-serial-instance*

Configures a string that describes the serial interface (supplied by the service provider)

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

description <WORD>

**Parameters**

- description <WORD>

<table>
<thead>
<tr>
<th>description &lt;WORD&gt;</th>
<th>Configures the serial interface's description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;WORD&gt; – Provide a unique description for this serial interface (should not exceed 32 characters in length)</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#description "This interface is for the Sales Team"

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context interface serial-1/1:1
  authentication pap
  description "This interface is for the Sales Team"

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#

**Related Commands**

| no | Removes the serial interface's description |
7.1.3.1.6.3 encapsulation

`interface-config-serial-instance`

Defines the data encapsulation protocol used on this serial interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

`encapsulation [chdlc|ppp]`

**Parameters**
- `encapsulation [chdlc|ppp]`

<table>
<thead>
<tr>
<th>encapsulation</th>
<th>Configures the data encapsulation protocol used</th>
</tr>
</thead>
<tbody>
<tr>
<td>chdlc</td>
<td>Configures the encapsulation type as <em>Cisco High-Level Data Link Control</em> (CHDLC). CHDLC is a Cisco proprietary protocol that uses HDLC to send data over synchronous serial links.</td>
</tr>
<tr>
<td>ppp</td>
<td>Configures the encapsulation type as <em>Point-to-Point Protocol</em> (PPP)</td>
</tr>
</tbody>
</table>

**Examples**

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#encapsulation chdlc
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context interface serial-1/1:1
  encapsulation chdlc
  authentication pap
  description "This interface is for the Sales Team"
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

**Related Commands**

- `no` | Disables or reverts serial interface settings to their default
### 7.1.31.6.4 ip

#### interface-config-serial-instance

Configures serial interface IP to use NAT. NAT allows for multiple devices on a LAN with private IP addresses to share a single public IP address.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

#### Syntax

```
ip nat [inside|outside]
```

#### Parameters

- `ip nat [inside|outside]`

<table>
<thead>
<tr>
<th>nat</th>
<th>Enables the use of NAT on this serial interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>inside</td>
<td>Marks this serial interface as NAT inside interface</td>
</tr>
<tr>
<td>outside</td>
<td>Marks this serial interface as NAT outside interface</td>
</tr>
</tbody>
</table>

#### Examples

```plaintext
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#ip nat inside

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context
  interface serial-1/1:1
  encapsulation chdlc
  authentication pap
  ip nat inside
  description "This interface is for the Sales Team"

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

#### Related Commands

| no       | Disables or reverts serial interface settings to their default |
7.1.31.6.5 local-ip-address

Assigns a local IP address for this serial interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
local-ip-address <IP>
```

**Parameters**

- `local-ip-address <IP>`

<table>
<thead>
<tr>
<th>local-ip-address &lt;IP&gt;</th>
<th>Specify the IP address in the A.B.C.D format</th>
</tr>
</thead>
</table>

**Examples**

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#local-ip-address 192.168.13.7
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context interface serial-1/1:1
  encapsulation chdlc
  authentication pap
  **local-ip-address 192.168.13.7**
  ip nat inside
  description "This interface is for the Sales Team"
```

**Related Commands**

<table>
<thead>
<tr>
<th>no</th>
<th>Disables or reverts serial interface settings to their default</th>
</tr>
</thead>
</table>
7.1.31.6.6 no

- **interface-config-serial-instance**

Removes or resets this serial interface’s settings

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

no [authentication|description|ip|local-ip-address|password|
remote-ip-address|shutdown|use|username]

no [authentication|description|local-ip-address|password|remote-ip-address|shutdown|
username]

no ip nat

no use ip-access-list in

**Parameters**

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes or reverts this serial interface’s settings based on the parameters passed</th>
</tr>
</thead>
</table>

**Usage Guidelines**

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#no ?

- authentication Type of authentication. Eg chap, pap
- description Delete the description of this interface
- ip Internet Protocol (IP)
- local-ip-address IP address assigned to the local system
- password Enter password provided by the service provider
- remote-ip-subnet IP subnet assigned to the remote system along with subnet in CIDR notation
- shutdown Enable serial interface
- use Set setting to use
- username Enter username provided by the service provider

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
7.1.31.6.7 password

Configure the serial interface’s password (supplied by the service provider)

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**
```plaintext
password <WORD>
```

**Parameters**
- `password <WORD>`

| password <WORD> | Configures the serial interface’s password (the password is provided by the service provider, and should not exceed 32 characters in length) |

**Examples**
```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#password testing@1234
```
```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context
interface serial-1/1:1
 encapsulation chdlc
 authentication pap
 password testing@1234
 local-ip-address 192.168.13.7
 ip nat inside
 description "This interface is for the Sales Team"
```
```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

**Related Commands**
```
no
```
Disables or reverts serial interface settings to their default
7.1.31.6.8 **remote-ip-subnet**

**interface-config-serial-instance**

Configures the remote system's IP address and subnet in the *classes inter-domain routing* (CIDR) format.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

`remote-ip-subnet <IP/M>`

**Parameters**
- `remote-ip-subnet <IP/M>`

<table>
<thead>
<tr>
<th>remote-ip-subnet &lt;IP/M&gt;</th>
<th>Defines a IP subnet assigned to the remote system along with subnet. Specify the IP address and subnet value in the A.B.C.D/M format.</th>
</tr>
</thead>
</table>

**Examples**

```
x4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#remote-ip-subnet 192.168.0.10/24

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context
interface serial-1/1:1
  encapsulation chdlc
  authentication pap
  password testing@1234
  local-ip-address 192.168.13.7
  remote-ip-subnet 192.168.13.10/24
  ip nat inside
  description "This interface is for the Sales Team"
```

**Related Commands**

<table>
<thead>
<tr>
<th><strong>no</strong></th>
<th>Disables or reverts serial interface settings to their default</th>
</tr>
</thead>
</table>
7.1.31.6.9 remove-override

Removes device overrides

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

\[
\text{remove-override} \ [\text{authentication}|\text{description}|\text{encapsulation}|\text{ip}|\text{local-ip-address}|\text{password}|\text{remote-ip-subnet}|\text{shutdown}|\text{username}] \\
\text{remove-override} \ [\text{authentication}|\text{description}|\text{encapsulation}|\text{local-ip-address}|\text{password}|\text{remote-ip-subnet}|\text{shutdown}|\text{username}] \\
\text{remove-override} \ \text{ip nat} \\
\text{remove-override use ip-access-list in}
\]

Parameters

- remove-override <PARAMETERS>

<table>
<thead>
<tr>
<th>remove-override &lt;PARAMETERS&gt;</th>
<th>Removes serial interface related overrides applied on the device to enable profile settings take effect</th>
</tr>
</thead>
</table>

Examples

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#remove-override ?
authentication Remove override for authentication
description Remove override for description
encapsulation Remove override for encapsulation
ip Internet Protocol (IP)
local-ip-address Remove override for local-ip-address
password Remove override for password
remote-ip-subnet Remove override for remote-ip-subnet
shutdown Remove override for serial interface
username Remove override for username

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#

7.1.31.6.10 shutdown

    interface-config-serial-instance

Shuts down the serial interface. Use the no shutdown command to re-start a serial interface.

Supported in the following platforms:
  • Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax
shutdown

Parameters
None

Examples
nx4500-5CFA2B(config-profile-default-nx6500-if-serial-1/1:1)#shutdown

### 7.1.31.6.12 username

**interface-config-serial-instance**

Configures the names of users accessing this serial interface (provided by the service provider)

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
username <WORD>
```

**Parameters**

- `username <WORD>`

**Examples**

```bash
nx4500-5CFA2B(config-profile-default-nx6500-if-serial-1/1:1)#username SalesPerson1
```

```bash
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context
interface serial-1/1:1
  authentication pap
  username SalesPerson1
  password testing@1234
  local-ip-address 192.168.13.7
  remote-ip-subnet 192.168.13.10/24
  ip nat inside
  use ip-access-list in BROADCAST-MULTICAST-CONTROL
  description "This interface is for the Sales Team"
```

**Related Commands**

- `no` Disables or reverts serial interface settings to their default
7.1.31.7 interface-config-t1e1-instance

The T1/E1 interfaces are physical layer interfaces that support data, voice, or a combination of data and voice applications. Use the (config-profile-<DEVICE-PROFILE-NAME>) instance to configure the T1E1 interface associated with the service platform.

To switch to this mode, use the following command:

<DEVICE>(config)#profile <DEVICE-TYPE> <DEVICE-PROFILE-NAME>
<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#interface ?

The following example uses the config-profile-default-nx65xx instance to configure a T1E1 interface:

nx6500-31FABE(config-profile-default-nx6500)#interface t1e1 1 1
nx6500-31FABE(config-profile-default-nx6500-if-t1e1-1/1)#

nx6500-31FABE(config-profile-default-nx6500-if-t1e1-1/1)#?

Interface Configuration commands:

- channel-group: Channel group for this interface
- clock-mode: The mode for the clock
- description: Description for this interface
- high-impedance: High impedance
- line-build-out: Line build out in decibels (dB) or feet (ft)
- line-encoding: Line encoding type
- media: The media type for the physical interface
- no: Negate a command or sets its defaults
- remove-override: Remove override from the device
- rx-sensitivity-level: Receive sensitivity level in decibels (dB)
- shutdown: Disable t1 interface
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

The following table summarizes T1E1 interface configuration commands:

<table>

</tbody>
</table>
7.1.31.7.1 channel-group

```
- interface-config-t1e1-instance
```

Creates a channel group on the selected interface. Channel groups are created to provide WAN data services.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
channel-group <1-1> timeslots [<TIMESLOT-LIST>|all]
```

**Parameters**
- channel-group <1-1> timeslots [<TIMESLOT-LIST>|all]

<table>
<thead>
<tr>
<th>channel-group &lt;1-1&gt;</th>
<th>Specify the channel group index</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeslots</td>
<td>Configures timeslots for the specified channel group</td>
</tr>
</tbody>
</table>
| [<TIMESLOT-LIST>|all] | • <TIMESLOT-LIST> – Specifies a list of timeslot IDs in the following format: 10-20, 25, 30-31
|                      | • all – Configures all timeslots for the specified channel group |

**Examples**

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#channel-group 1 timeslots all

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1
  channel-group 1 timeslots all

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```

**Related Commands**

- **no** Removes the channel group configured on the T1E1 interface
7.1.31.7.2 clock-mode

> interface-config-t1e1-instance

Configures the mode for the clock on the selected T1E1 interface. A synchronized clock mode ensures smooth clock extraction and data transfer.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**
clock-mode [master|normal]

**Parameters**
- clock-mode [master|normal]

| clock-mode [master|normal] | Sets the mode for the clock on this T1E1 interface  |
|---------------------------|-----------------------------------------------|
|                           | • master – Use for one end when connected via a T1 crossover cable |
|                           | • normal – Use when connected to a carrier network. This is the default setting. |

**Examples**

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#clock-mode master

nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-t1e1-1/1)#show context interface t1e1-1/1
clock-mode master
channel-group 1 timeslots all
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#

**Related Commands**

no | Reverts the T1E1 interface clock mode to default (normal)
7.1.31.7.3 description

- **interface-config-t1e1-instance**

Configures the selected T1E1 interface’s description

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

`description <LINE>`

**Parameters**

- `description <LINE>`

<table>
<thead>
<tr>
<th>Description</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provide a unique description for this T1E1 interface. The description should not exceed 64 characters in length and should help identify the interface.</td>
<td>description &lt;LINE&gt;</td>
</tr>
</tbody>
</table>

**Examples**

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#description "t1 interface slot 1 Main Office"
nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-t1e1-1/1)#show context
    interface_t1e1-1/1
    clock-mode master
    channel-group 1 timeslots all
    description "t1 interface slot 1 Main Office"
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```

**Related Commands**

- `no` Removes or resets the T1E1 interface description
7.1.31.7.4 high-impedance

Enables or disables high impedance monitoring on the selected T1E1 interface. High impedance interfaces imply low current and high voltage.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

high-impedance [disable|enable]

Parameters

- high-impedance [disable|enable]

| high-impedance [disable|enable] | Enables or disables high-impedance |
|---------------------------------|-----------------------------------|
| disable                         | Disables high-impedance           |
| enable                          | Enables high-impedance            |

Examples

nx4500-5CFA2B(config-profile-testNX45XX-if-tle1-1/1)#high-impedance enable

nx4500-5CFA2B(config-profile-testNX45XX-if-tle1-1/1)#show context
interface tle1-1/1
    clock-mode master
    high-impedance enable
    channel-group 1 timeslots all
description "tl interface slot 1 Main Office"
nx4500-5CFA2B(config-profile-testNX45XX-if-tle1-1/1)#

Related Commands

- no
  Resets the high impedance setting to either enable or disable
7.1.31.7.5 line-build-out

`interface-config-t1e1-instance`

Defines the line build out in decibels (dB), ohms (OH), or feet (ft). This command specifies the distance to the next repeater.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

`line-build-out [dB|OH|ft]`

`line-build-out [0-110ft|0dB|110-220ft|120OH|22.5dB|220-330ft|330-440ft|440-550ft|550-660ft|7.5dB|75OH]`

**Parameters**

- `line-build-out [0-110ft|0dB|110-220ft|120OH|22.5dB|220-330ft|330-440ft|440-550ft|550-660ft|7.5dB|75OH]`

| line-build-out [dB|OH|ft] | Defines the line build out in decibels (dB), ohms (OH), or feet (ft) |
|-------------------------|---------------------------------------------------------------------|
| 0-110ft – 0-110 feet (0-33 meters) |
| 0dB – 0 decibels |
| 110-220ft – 110-220 feet (33-67 meters) |
| 120OH – 120 ohms default for E1 |
| 15dB – 15 decibels |
| 22.5dB – 22.5 decibels |
| 220-330ft – 20-330 feet (67-100 meters) |
| 330-440ft – 330-440 feet (100-133 meters) |
| 440-550ft – 440-550 feet (133-167 meters) |
| 550-660ft – 0-110 feet (167-200 meters) |
| 7.5dB – 7.5 decibels |
| 75OH – 75 ohms alternate for E1 |

The valid line-build-out values for media t1 are: 0dB, 7.5dB, 15dB, 22.5dB, 0-110ft, 110-220ft, 220-330ft, 330-440ft, 440-550ft, and 550-660ft. Recommended default is 0dB.

**Examples**

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#line-build-out 120OH

 nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
 interface t1e1-1/1
  clock-mode master
  line-build-out 120OH
  high-impedance enable
  channel-group 1 timeslots all
  description "t1 interface slot 1 Main Office"
 nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```

**Related Commands**

`no` Resets the T1E1 interface line-build-out setting
### 7.1.31.7.6 line-encoding

#### interface-config-t1e1-instance

Configures the line encoding type on the selected T1E1 interface.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

#### Syntax

```
line-encoding [ami|b8zs]
```

#### Parameters

- `line-encoding [ami|b8zs]`

| line-encoding [ami|b8zs] | Sets the line encoding type (designated by the service provider). The options are ami and b8zs  
|-------------------------|---------------------------------------------------------------  
| ami                     | Configures encoding type as Alternate Mark Inversion (ami). This option is commonly used for the E1 interfaces.  
| b8zs                    | Configures the encoding type as Bipolar 8-Zero Substitution (b8zs). This option is commonly used for T1 interfaces. |

#### Examples

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#line-encoding ami
```

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1
  clock-mode master
  line-encoding ami
  line-build-out 120OH
  high-impedance enable
  channel-group 1 timeslots all
  description "t1 interface slot 1 Main Office"
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```

#### Related Commands

- `no` Resets the T1E1 interface line-encoding setting
7.1.31.7.7 media

- interface-config-t1e1-instance

Configures the media type for the physical interface

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

```
media [e1|t1]
```

Parameters

- media [e1|t1]

| media [e1|t1] | Sets the media type for the physical interface. The options are: e1 and t1. |
|--------------|-------------------------------------------------------------------------------------------------|
|              | • e1 – E1 (common for Europe and worldwide)                                                   |
|              | • t1 – T1 (common for USA and Canada)                                                         |
|              | If high-impedance is set to 'enable', and media                                              |

Examples

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#media t1
```

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1

```

Related Commands

- **no**
  Resets the T1E1 interface media type setting
7.1.31.7.8 no

Negates or reverts settings to default

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

no [channel-group|clock-mode|description|high-impedance|line-encoding|
media|shutdown]

Parameters
- no <PARAMETERS>

Examples

The following example displays the t1e1 interface settings before the 'no' commands are executed:

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1
clock-mode master
line-encoding ami
line-build-out 1200H
high-impedance enable
rx-sensitivity-level 30dB
channel-group 1 timeslots all
media t1
description "t1 interface slot 1 Main Office"

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#no channel-group 1
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#no high-impedance

The following example displays the t1e1 interface settings after the 'no' commands are executed:

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1
clock-mode master
line-encoding ami
line-build-out 1200H
high-impedance disable
rx-sensitivity-level 30dB
media t1
description "t1 interface slot 1 Main Office"

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)
7.1.31.7.9 remove-override

```
interface-config-t1e1-instance
```

Removes device overrides on the selected T1E1 interface

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
remove-override [channel-group|clock-mode|description|high-impedance|line-build-out|line-encoding|media|shutdown]
```

**Parameters**

- remove-override <PARAMETERS>

<table>
<thead>
<tr>
<th>remove-override &lt;PARAMETERS&gt;</th>
<th>Removes device-level overrides based on the parameters passed</th>
</tr>
</thead>
</table>

**Examples**

```bash
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#remove-override ?
channel-group Channel-group for this interface
clock-mode Delete clock-mode
description Delete the description of this interface
high-impedance Delete high-impedance
line-encoding Delete line-encoding
media Delete media
shutdown Enable t1 interface
```

```bash
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```
7.1.31.7.10 rx-sensitivity-level

Configures the receive sensitivity level, in decibels (dB), on the selected T1E1 interface.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

rx-sensitivity-level [0dB|12dB|18dB|30dB|36dB|43dB]

Parameters
- rx-sensitivity-level [0dB|12dB|18dB|30dB|36dB|43dB]

Examples

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#rx-sensitivity-level 30dB

nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-t1e1-1/1)#show context interface t1e1-1/1 clock-mode master line-encoding ami line-build-out 1200H high-impedance enable rx-sensitivity-level 30dB channel-group 1 timeslots all media t1 description "t1 interface slot 1 Main Office" nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#

Related Commands

no

Removes or resets rx sensitivity settings.
7.1.31.7.11 shutdown

Shuts down the selected T1E1 interface. Use the no > shutdown command to re-start the interface.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
shutdown
```

**Parameters**

None

**Examples**

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#shutdown
```

7.1.31.8 interface-config-vm-instance

WiNG provides a dataplane bridge for external network connectivity for Virtual Machines (VMs). VM interfaces are layer 2 interfaces on WiNG bridge that define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two physical VM interfaces. Each VM interface can be mapped to one of eight VMIF ports for and NX4500 and NX6500 service platforms and twelve ports for NX9500 on the dataplane bridge. This mapping determines the destination for service platform routing.

By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1 is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QOS rules.

Use the (config-profile-<DEVICE-PROFILE-NAME>) instance to configure the VM interface associated with the service platform profile.

To switch to this mode, use the following commands:

<DEVICE>(config)#profile <DEVICE-TYPE> <DEVICE-PROFILE-NAME>
<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#interface ?

The following example uses the config-profile-default-nx45xx instance to configure a VM interface:

nx4500-5CFA2B(config-profile-default-nx45xx)#interface vmif ?
<1-8>  Interface index

nx4500-5CFA2B(config-profile-default-nx45xx)#interface vmif 2
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#

VM Interface Mode commands:
- description Port description
- ip Internet Protocol (IP)
- ipv6 Internet Protocol version 6 (IPv6)
- no Negate a command or set its defaults
- qos Quality of service
- switchport Set switching mode characteristics
- use Set setting to use

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#

nx9500-6C8809(config-profile-default-nx9000)#interface vmif ?
<1-12>  Interface index

nx9500-6C8809(config-profile-default-nx9000)#
nx9500-6C8809(config-profile-default-nx9000)#interface vmif 2
nx9500-6C8809(config-profile-default-nx9000-if-vmif2)#?

VM Interface Mode commands:
- `description` Port description
- `ip` Internet Protocol (IP)
- `ipv6` Internet Protocol version 6 (IPv6)
- `no` Negate a command or set its defaults
- `qos` Quality of service
- `switchport` Set switching mode characteristics
- `use` Set setting to use
- `commit` Commit all changes made in this session
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `revert` Revert changes
- `write` Write running configuration to memory or terminal

nx9500-6C8809(config-profile-default-nx9000-if-vmif2)#

The following table summarizes VM interface configuration commands:

### 7.1.31.8.1 description

- **interface-config-vm-instance**

Configures a short description of this VM interface

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

#### Syntax

description <WORD>

#### Parameters

- description <WORD>

#### Examples

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#description "This VM interface is reserved for TEAM-URC"

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context interface vmif2
description "This VM interface is reserved for TEAM-URC"

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#

#### Related Commands

- **no**

  Removes the description configured for this VM interface
### 7.1.31.8.2 ip

**interface-config-vm-instance**

Configures IP settings related to ARP and DHCP responses

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
ip [arp|dhcp]

ip arp [header-mismatch-validation|trust]

ip dhcp trust
```

**Parameters**

- **ip arp [header-mismatch-validation|trust]**
  - **header-mismatch-validation** — Enables a source MAC mismatch check in both the ARP and Ethernet headers. The option is enabled by default.
  - **trust** — Enables ARP trust on this VM interface. ARP packets received on this port are considered trusted, and information from these packets is used to identify rogue devices. The option is disabled by default.

- **ip dhcp trust**
  - **trust** — Enables DHCP trust on this VM interface. When enabled, only DHCP responses are trusted and forwarded on this VM interface, and a DHCP server can be connected only to a DHCP trusted port. The option is enabled by default.

**Examples**

```plaintext
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#ip arp trust

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#ip arp header-mismatch-validation

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context

interface vmif2
description "This VM interface is reserved for TEAM-URC"

ip arp trust

ip arp header-mismatch-validation

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Disables ARP response trust and source MAC mismatch check on this VM interface. Also disables DHCP response trust setting.</td>
</tr>
</tbody>
</table>
### 7.1.31.8.3 ipv6

> **interface-config-vm-instance**

Sets the DHCPv6 and ICMPv6 *neighbor discovery* (ND) components for this VM interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
ipv6 [dhcpv6|nd]
ipv6 dhcpv6 trust
ipv6 nd [header-mismatch-validation|raguard|trust]
```

**Parameters**

- **ipv6 dhcpv6 trust**
  - Sets the DHCPv6 trust state for DHCPv6 responses on this VM interface. When enabled, all DHCPv6 responses received on this port are trusted and forwarded. A DHCPv6 server can be connected only on a trusted port. This option is enabled by default.

- **ipv6 nd [header-mismatch-validation|raguard|trust]**
  - **header-mismatch-validation**
    - Checks for mismatch of source MAC address in the ICMPv6 ND header and Ethernet header (link layer option). This option is disabled by default.
  - **raguard**
    - Allows redirection of *router advertisements* (RAs) and ICMPv6 packets originating on this interface. Router advertisements are periodically sent either to hosts or in response to solicitation requests. The RA includes IPv6 prefixes and other subnet and host information. This option is enabled by default.
  - **trust**
    - Sets trust state for ND requests received on this interface. When enabled, only DHCPv6 responses are trusted and forwarded on this VM interface, and a DHCPv6 server can be connected only to a trusted port. DHCPv6 relay agents receive messages from clients and forward them to a DHCPv6 server. The server sends responses back to the relay agent, and the relay agent sends the responses to the client on the local link. This option is disabled by default.

**Examples**

```plaintext
nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-vmif1)#ipv6 dhcpv6 trust
nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-vmif1)#ipv6 nd trust
nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-vmif1)#show context
interface vmif1
  ipv6 dhcpv6 trust
  ipv6 nd trust
```

**Related Commands**

- **no**
  - Removes or reverts IPv6 settings on this interface
7.1.31.8.4 No

- **interface-config-vm-instance**

Removes or reverts the VM interface settings

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
no [description|ip|ipv6|qos|switchport|use]
no ip [arp|dhcp]
no ip arp [header-mismatch-validation|trust]
no ip dhcp trust
no ipv6 [dhcpv6|nd]
no ipv6 dhcpv6 trust
no ipv6 nd [header-mismatch-validation|raguard|trust]
no qos trust [802.1p|cos|dscp]
no switchport [access vlan|mode|trunk native tagged]
no use [ip-access-list|ipv6-access-list|mac-access-list] in
```

**Parameters**

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes or reverts this VM interface’s settings based on the parameters passed</th>
</tr>
</thead>
</table>

**Examples**

The following example displays the VM interface settings before the ‘no’ commands are executed:

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context
interface vmif2
    description "This VM interface is reserved for TEAM-URC"
    switchport mode trunk
    switchport trunk native vlan 200
    no switchport trunk native tagged
    switchport trunk allowed vlan 200
    use ip-access-list in BROADCAST-MULTICAST-CONTROL
    ip arp trust
    ip arp header-mismatch-validation

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#no description
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#no use ip-access-list in
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#no ip arp trust
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#no ip arp header-mismatch-validation
```

The following example displays the VM interface settings after the ‘no’ commands have been executed:

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context
interface vmif2
    switchport mode trunk
    switchport trunk native vlan 200
    no switchport trunk native tagged
    switchport trunk allowed vlan 200

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#
```
7.1.31.8.5 qos

Configures the Quality of Service (QoS) settings on this VM interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
qos trust [802.1p|cos|dscp]

Parameters
- qos trust [802.1p|cos|dscp]

| trust [802.1p|cos] | Enables trust for 802.1p Class of Service (CoS) values received on this VM interface. The option is enabled by default. CoS manages traffic by grouping similar type of traffic (for example, e-mails, videos, large document files etc.) into a class and assigning it a service priority. One of the commonly used CoS techniques is 802.1p layer 2 tagging. |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| trust dscp       | Enables trust for IP Differentiated Services Code Point (DSCP) values received on this VM interface. The option is enabled by default. DSCP values in a IP packet determines the level of service assigned to the packet. |

Examples
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#qos trust 802.1p
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#qos trust dscp
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#no qos trust cos

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context interface vmif2
switchport mode trunk
switchport trunk native vlan 200
no switchport trunk native tagged
switchport trunk allowed vlan 200
no qos trust 802.1p
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#

Related Commands
- no Removes QoS settings on this VM interface
### 7.1.31.8.6 switchport

#### interface-config-vm-instance

Defines the switching mode settings for this VM interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

#### Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`switchport [access</td>
<td>mode</td>
</tr>
</tbody>
</table>
| `switchport access vlan <1-4094>|<VLAN-ALIAS-NAME>` | Specifies the VLAN used when the switching mode is set to access. Use one of the following options to provide the VLAN ID: 
  - `<1-4094>` – Specify the VLAN ID from 1 - 4094. 
  - `<VLAN-ALIAS-NAME>` – Specify the VLAN alias name. The VLAN alias should be existing and mapped to the required VLAN interface. 
  **Note:** use the `switchport > mode > access` command to select the access mode. |
| `switchport mode [access|trunk]` | Sets the VLAN switching mode to access. This option enables the VM interface to accept packets only from the native VLAN. Frames are forwarded untagged with no 802.1Q header. All frames received on the VM port are expected as untagged and are mapped to the native VLAN. This is the default setting. 
  If selecting access, use the `switchport > access > vlan` command to specify the VLAN interfaces used in the access mode. |
| `switchport trunk [allowed|native]` | Sets the VLAN switching mode to trunk. This option enables the VM interface to allow packets from a list of VLANs added to the trunk. A VM interface configured as trunk supports multiple 802.1Q tagged VLANs and one native VLAN. The native VLAN can be tagged or untagged. 
  If selecting trunk, use the `switchport > trunk > allowed/native` command to specify the VLANs and the native VLAN. |
| `switchport trunk allowed vlan [<1-4094>|add <VLAN-ID>|none|remove <VLAN-ID>]` | Specifies the VLANs allowed when the switching mode is set to trunk 
  Creates a list of allowed VLANs (from which packets can be accepted in the trunking mode). This command also allows the modification of an existing list. |
### switchport trunk native [tagged|vlan [<1-4094>|<VLAN-ALIAS-NAME>]]

<table>
<thead>
<tr>
<th>Tag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tagged</td>
<td>Select this option to tag the native VLAN.</td>
</tr>
<tr>
<td>VLAN</td>
<td>Service Platforms support the IEEE 802.1Q specification for tagging frames and coordinating VLANs between devices. IEEE 802.1Q adds four bytes to each frame identifying the VLAN ID for upstream VMIF that the frame belongs. If the upstream VMIF does not support IEEE 802.1Q tagging, it does not interpret the tagged frames. When VLAN tagging is required between VM interface ports, both VM interfaces must support tagging and be configured to accept tagged VLANs. When a frame is tagged, a 12 bit frame VLAN ID is added to the 802.1Q header, so upstream VM interfaces know which VLAN ID the frame belongs to. The 12 bit VLAN ID is read and the frame is forwarded to the appropriate VLAN. When a frame is received with no 802.1Q header, the upstream VMIF classifies the frame using the default or native VLAN assigned to the Trunk port. The native VLAN allows a VM interface to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. This setting is disabled by default.</td>
</tr>
<tr>
<td>VLAN</td>
<td>Select this option for untagged native VLAN. An untagged native VLAN allows an Ethernet device to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. Additionally, the native VLAN is the VLAN untagged traffic will be directed over when using trunk mode. Use one of the following options to provide the native VLAN ID:</td>
</tr>
<tr>
<td>VLAN</td>
<td>• <code>&lt;1-4094&gt;</code> – Specify the native VLAN ID from 1 - 4094.</td>
</tr>
<tr>
<td>VLAN</td>
<td>• <code>&lt;VLAN-ALIAS-NAME&gt;</code> – Specify the VLAN alias name. The VLAN alias should be existing and mapped to the required native VLAN interface. The default native VLAN value is 1.</td>
</tr>
</tbody>
</table>

#### Examples

```bash
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#switchport mode trunk
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#switchport trunk native vlan 200
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context
interface vmif2
description "This VM interface is reserved for TEAM-URC"
switchport mode trunk
switchport trunk native vlan 200
no switchport trunk native tagged
switchport trunk allowed vlan 200
ip arp trust
ip arp header-mismatch-validation
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2) #
```

7.1.31.8.7 use

interface-config-vm-instance

Applies inbound IPv4, IPv6, and MAC specific firewall rules to this profile’s VM interface. The firewall inspects IP and MAC traffic flows and detects attacks typically not visible to traditional wired firewall appliances.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
use [ip-access-list|ipv6-access-list|mac-access-list] in <IP/IPv6/MAC-ACCESS-LIST-NAME>

Parameters
- use [ip-access-list|ipv6-access-list|mac-access-list] in <IP/IPv6/MAC-ACCESS-LIST-NAME>

| use ip-access-list in <IP-ACCESS-LIST-NAME> | Applies a IPv4 ACL to the inbound traffic on this VM interface. The IP ACL should be existing and configured. |
| use ipv6-access-list in <IPv6-ACCESS-LIST-NAME> | Applies a IPv6 ACL to the inbound traffic on this VM interface. The IPv6 ACL should be existing and configured. |
| use mac-access-list in <MAC-ACCESS-LIST-NAME> | Applies a MAC ACL to the inbound traffic on this VM interface. The MAC ACL should be existing and configured. |

Examples
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#use ip-access-list in BROADCAST-MULTICAST-CONTROL
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context interface vmif2
description "This VM interface is reserved for TEAM-URC"
switchport mode trunk
switchport trunk native vlan 200
no switchport trunk native tagged
switchport trunk allowed vlan 200
use ip-access-list in BROADCAST-MULTICAST-CONTROL
ip arp trust
ip arp header-mismatch-validation
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#

Related Commands

</table>
ip route <IP/M> [<IP>|<HOST-ALIAS-NAME>]

- **route**
  - Configures the static routes
- **<IP/M>**
  - Specify the IP destination prefix in the A.B.C.D/M format.
- **<IP>**
  - Specify the IP address of the gateway.
- **<HOST-ALIAS-NAME>**
  - Configures the host alias mapped to the required default gateway
  - `<HOST-ALIAS-NAME>` – Specify the host alias name (should be existing and configured). Host alias names begin with a `$`.

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000)#ip default-gateway 172.16.10.4

7.1.32.2 nat-pool-config-instance

Use the config-profile-<DEVICE-PROFILE-NAME> instance to configure Network Address Translation (NAT) pool settings.

The following example uses the config-profile-default-rfs7000 instance to configure NAT pool settings:

```
rfs7000-37FABE(config-profile-default-rfs7000)#ip nat pool pool1
rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#
```

Natural Policy Mode commands:
- `address` Specify addresses for the nat pool
- `no` Negate a command or set its defaults
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

The following table summarizes NAT pool configuration commands:

<table>
<thead>
<tr>
<th>Command</th>

<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>address</code></td>
<td>Configures NAT pool addresses</td>
<td>page 7-332</td>
</tr>
<tr>
<td><code>no</code></td>
<td>Negates a command or sets its default</td>
<td>page 7-333</td>
</tr>
</tbody>
</table>
7.1.32.2.1 address

Configures NAT pool of IP addresses

Define a range of IP addresses hidden from the public Internet. NAT modifies network address information in the defined IP range while in transit across a traffic routing device. NAT only provides IP address translation and does not provide a firewall. A branch deployment with NAT by itself will not block traffic from being potentially routed through a NAT device. Consequently, NAT should be deployed with a stateful firewall.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
address [<IP>|range <START-IP> <END-IP>]

Parameters
- address [<IP>|range <START-IP> <END-IP>]

| address <IP> | Adds a single IP address to the NAT pool |
| range <START-IP> <END-IP> | Adds a range of IP addresses to the NAT pool |
|              | • <START-IP> – Specify the starting IP address of the range. |
|              | • <END-IP> – Specify the ending IP address of the range. |

Examples
rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#address range 172.16.10.2 172.16.10.8
rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#show context
ip nat pool pool1
  address range 172.16.10.2 172.16.10.8
rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#

Related Commands
- no | Removes address(es) configured with this NAT pool |
7.1.32.2.2 no

- nat-pool-config-instance

Removes address(es) configured with this NAT pool

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
no address [IP|range <START-IP> <END-IP>]

Parameters
- no address [IP|range <START-IP> <END-IP>]

| no address [IP|range <START-IP> <END-IP>] | Removes a single IP address or a range of IP addresses from this NAT pool |

Usage Guidelines
The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples
rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#show context
  ip nat pool pool1
    address range 172.16.10.2 172.16.10.8
rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#

rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#no address range 1 72.16.10.2 172.16.10.8

rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#show context
  ip nat pool pool1
rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#

Profile Config Commands

Configures IPv6 routing components, such as default gateway, DNS server forwarding, name server, routing standards etc. These IPv6 settings are applied to all devices using this profile.

You can also configure IPv6 settings on a device, using the device’s configuration mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ipv6 [default-gateway|dns-server-forward|hop-limit|mld|name-server|nd-reachable-time|neighbor|ns-interval|ra-convert|route|ula-reject-route|unicast-routing]

ipv6 [default-gateway <IPv6> {vlan <VLAN-ID}>|dns-server-forward|hop-limit <1-255>|name-server <IPv6>|nd-reachable-time <5000-3600000>|ns-interval <1000-3600000>|ula-reject-route|unicast-routing]

ipv6 ra-convert {throttle interval <3-1800> max-RAs <1-256>}

ipv6 mld snooping {forward-unknown-multicast|querier}

ipv6 mld snooping {forward-unknown-multicast|querier} {max-response-time <1-25000>|query-interval <1-18000>|robustness-variable <1-7>|timer expiry <60-300>|version <1-2>}

ipv6 neighbor {[<IPv6>]|timeout}

ipv6 neighbor <IPv6> <MAC> [[<INTF-NAME>|pppoe1|vlan <1-4094>|wwan1] {dhcp-server|router}

ipv6 neighbor timeout <15-86400>

ipv6 route <DEST-IPv6-PREFIX/PREFIX-LENGTH> <IPv6-GATEWAY-ADDRESS> {vlan <VLAN-ID>}

Parameters
- ipv6 [default-gateway <IPv6> {vlan <VLAN-ID>}]{dns-server-forward|hop-limit <1-255>|name-server <IPv6>|nd-reachable-time <5000-3600000>|ns-interval <1000-3600000>|ula-reject-route|unicast-routing]

<table>
<thead>
<tr>
<th>default-gateway &lt;IPv6&gt; {vlan &lt;VLAN-ID&gt;}</th>
<th>Configures IPv6 default gateway’s address in the ::/0 format</th>
</tr>
</thead>
<tbody>
<tr>
<td>• vlan &lt;VLAN-ID&gt; – Optional. Specify the VLAN interface’s ID through which the default gateway is accessible.</td>
<td></td>
</tr>
</tbody>
</table>

| dns-server-forward | Enables DNS server forwarding. This command enables the forwarding of DNS queries to DNS servers outside of the network. This feature is disabled by default. |

<table>
<thead>
<tr>
<th>hop-limit &lt;1-255&gt;</th>
<th>Configures the IPv6 hop count limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;1-255&gt; – Specify a value between 1 - 255. The default is 64.</td>
<td></td>
</tr>
</tbody>
</table>
| name-server <IPv6> | Configures the IPv6 name server's address
| | • <IPv6> – Specify the address of the IPv6 name server. |
| nd-reachable-time <5000-3600000> | Configures the time, in milliseconds, that a neighbor is assumed to be reachable after having received neighbor discovery (ND) confirmation for their reachability
| | • <5000-3600000> – Specify a value from 5000 - 3600000 milliseconds. The default is 30,000 milliseconds. |
| ns-interval <1000-3600000> | Configures the interval, in milliseconds, between two consecutive retransmitted neighbor solicitation (NS) messages. NS messages are sent by a node to determine the link layer address of a neighbor, or verify a neighbor is still reachable via a cached link-layer address.
| | • <1000-3600000> – Specify a value from 1000 - 3600000. The default is 1000 milliseconds. |
| ula-reject-route | Installs a “reject” route for Unique Local Address (ULA) prefixes. This ensures that site-border routers and firewalls do not forward packets with ULA source or destination addresses outside of the site, unless explicitly configured with routing information about specific /48 or longer Local IPv6 prefixes. This option is disabled by default.
| | The ULA is an IPv6 address used in private networks for local communication within a site (for example a company, campus, or within a set of branch office networks). These site local addresses are IPv6 addresses that fall in the block fc00::/7, defined in RFC 4193. |
| unicast-routing | Enables/disables IPv6 unicast routing. This feature is enabled by default. |
| ra-convert {throttle interval <3-1800> max-RAs <1-256>} | Enables/disables conversion of multicast router advertisements (RAs) to unicast RAs at the dot11 layer. This feature is disabled by default.
| | • throttle – Optional. Throttles multicast RAs before converting to unicast
| | | • interval <3-1800> – Throttles multicast RAs for a specified time period. Specify the interval from 3 - 1800 seconds. The default is 3 seconds.
| | | • max-RAs <1-256> – Specifies the maximum number of RAs per IPv6 router during the specified throttle interval. Specify a value from 1 - 256. The default is 1. |
| mld snooping forward-unknown-multicast | Enables/disables multicast listener discovery (MLD) protocol snooping. This feature is disabled by default.
| | When enabled, IPv6 devices (access point, wireless controller, or service platform) can examine MLD messages exchanged between hosts and multicast routers to discern which hosts are receiving multicast group traffic. Based on the information gathered these devices forward multicast traffic only to those interfaces connected to interested receivers instead of flooding traffic to all interfaces. This prevents VLANs from getting flooded with IPv6 multicast traffic.
| | • forward-unknown-multicast – Optional. Enables/disables unknown multicast forwarding. This feature is enabled by default. |
| mld snooping querier | Enables/disables MLD protocol snooping
<p>| | • querier – Optional. Enables/disables the on-board MDL querier. When enabled, IPv6 devices send query messages to discover which network devices are members of a given multicast group. This option is disabled by default. |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-response-time &lt;1-25000&gt;</td>
<td>Configures the MLD querier’s maximum query response time. This is the time for which the querier waits before sending a responding report. Queriers use MLD reports to join and leave multicast groups and receive group traffic.</td>
</tr>
<tr>
<td>query-interval &lt;1-18000&gt;</td>
<td>Configures the interval, in seconds, between two consecutive MLD querier’s queries. The robustness variable is an indication of how susceptible the subnet is to lost packets. MLD can recover from robustness variable minus 1 lost MLD packets.</td>
</tr>
<tr>
<td>robustness-variable &lt;1-7&gt;</td>
<td>Configures the MLD IGMP robustness variable. This value is used by the sender of a query.</td>

<td>timer expiry &lt;60-300&gt;</td>
<td>Configures the MLD other querier (any external querier) timeout</td>
</tr>
<tr>
<td>version &lt;1-2&gt;</td>
<td>Configures the MLD querier’s version. MLD version 1 is based on IGMP version 2 for IPv4. MLD version 2 is based on IGMP version 3 for IPv4 and is fully backward compatible. IPv6 multicast uses MLD version 2.</td>
</tr>
</tbody>
</table>

- `ipv6 neighbor <IPv6> <MAC> [<INTF-NAME>|pppoe1|vlan <1-4094>|wwan1] {dhcp-server|router}`
  - Configures static IPv6 neighbor entries
  - `<IPv6>` Specify the IPv6 address for which a static neighbor entry is created.
  - `<MAC>` Specify the MAC address associated with the specified IPv6 address.
  - `[<INTF-NAME>|pppoe1|vlan <1-4094>|wwan1]` Specify the following interface settings:
    - `<INTF-NAME>` – Selects the layer 3 router interface. Specify the interface name.
    - `pppoe1` – Selects the PPP over Ethernet interface
    - `vlan <1-4094>` – Selects the VLAN interface. Specify the VLAN interface index.
    - `wwan1` – Selects the wireless WAN interface
  - `{dhcp-server|router}` After specifying interface type, you can optionally specify the device type for this neighbor solicitation.
    - `dhcp-server` – Optional. States this neighbor entry is for a DHCP server
    - `router` – Optional. States this neighbor entry is for a router

- `ipv6 neighbor timeout <15-86400>`
  - Configures static IPv6 neighbor entries
  - `timeout <15-86400>` Configures the timeout, in seconds, for the static neighbor entries
    - `<15-86400>` – Specify a value from 15 - 86400 seconds. The default is 3600 seconds.
**ipv6 route** `<DEST-IPv6-PREFIX/PREFIX-LENGTH> <IPv6-GATEWAY-ADDRESS> {vlan <VLAN-ID>}`

**Related Commands**

- `no`: Disables or reverts IPv6 settings to their default.
### 7.1.34 l2tpv3

#### Profile Config Commands

Defines the L2TPv3 settings for tunneling layer 2 payloads using VPNs.

L2TPv3 is an IETF standard that defines the control and encapsulation protocol settings for tunneling layer 2 frames in an IP network (and access point profile) between two IP nodes. Use L2TPv3 to create tunnels for transporting layer 2 frames. L2TPv3 enables WiNG supported controllers and access points to create tunnels for transporting Ethernet frames to and from bridge VLANs and physical ports. L2TPv3 tunnels can be defined between WiNG devices and other vendor devices supporting the L2TPv3 protocol.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
l2tpv3 [hostname <HOSTNAME>|inter-tunnel-bridging|logging|manual-session|router-id [<1-4294967295>|<IP>|tunnel|udp-listen-port <1024-65535>]
```

```
l2tpv3 logging ip-address [<IP>|any] hostname [<HOSTNAME>|any] router-id [<IP]|<WORD>|any]
```

#### Parameters

- **hostname <HOSTNAME>**
  - Configures the host name sent in the L2TPv3 signalling messages. Tunnel establishment involves exchanging 3 message types (SCCRQ, SCCRP and SCCN) with the peer. Tunnel IDs and capabilities are exchanged during the tunnel establishment with the host.
  - **<HOSTNAME>** – Specify the L2TPv3 specific host name.

- **inter-tunnel-bridging**
  - Enables inter tunnel bridging of packets. This feature is disabled by default.

- **manual-session**
  - Creates/modifies L2TPv3 manual sessions
  - For more information, see [l2tpv3-manual-session-commands](#).

- **router-id [<1-4294967295>|<IP>]**
  - Configures the router ID sent in the L2TPv3 signalling messages. These signalling (AVP) messages help to identify tunneled peers.
  - **<1-4294967295>** – Configures the router ID in decimal format from 1 - 4294967295
  - **<IP>** – Configures the router ID in the IP address (A.B.C.D) format

- **tunnel**
  - Creates/modifies a L2TPv3 tunnel
  - For more information, see [L2TPV3-POLICY](#).

- **udp-listen-port <1024-65535>**
  - Configures the UDP port used to listen for incoming traffic
  - **<1024-65535>** – Specify the UDP port from 1024 - 65535 (default is 1701)
l2tpv3 logging ip-address [<IP>|any] hostname [<HOSTNAME>|any] router-id [<IP>|<WORD>|any]

<table>
<thead>
<tr>
<th>l2tpv3</th>
<th>Configures L2TPv3 protocol settings for a profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>logging</td>
<td>Enables L2TPv3 tunnel event logging and debugging. When enabled, all events relating to Ethernet frames to and from bridge VLANs and physical ports on a specified IP address, host or router ID are logged. This option is disabled by default.</td>
</tr>
</tbody>
</table>

| ip-address [<IP>|any] | Configures the L2TPv3 peer tunnel IP address for which event logging is enabled. The options are: |
|------------------------|-------------------------------------------------|
| - <IP> – Specify the peer's IP address. L2TPv3 events are captured and logged for the specified peer. |
| - any – Peer's IP address is not specified. Enables event logging for all incoming connections from any IP address. |

| hostname [<HOSTNAME>|any] | Configures the L2TPv3 peer tunnel hostname for which event logging is enabled. The options are: |
|---------------------------|-------------------------------------------------|
| - <HOSTNAME> – Specify the peer's host name. L2TPv3 events are captured and logged for specified host. |
| - any – Peer's hostname is not specified. Enables debugging for all incoming connections from any host. |

| router-id [<IP>|<WORD>|any] | Configures the L2TPv3 tunnel router ID for which event logging is enabled. The options are: |
|-----------------------------|-------------------------------------------------|
| - <IP> – Specify the router ID in the IP address format. |
| - <WORD> – Specify the router ID in the form of an integer or range. For example 100-200. |
| - any – Router ID is not specified. Enables debugging for all incoming connections from any L2TPv3 router. |

Examples

rfs7000-37FABE(config-profile-default-rfs7000)#l2tpv3 hostname l2tpv3Host1
rfs7000-37FABE(config-profile-default-rfs7000)#l2tpv3 inter-tunnel-bridging
rfs7000-37FABE(config-profile-default-rfs7000)#show context profile rfs7000 default-rfs7000
  bridge vlan 1
  bridging-mode isolated-tunnel
  ip igmp snooping
  ip igmp snooping querier
  ............................................................

  l2tpv3 inter-tunnel-bridging
rfs7000-37FABE(config-profile-default-rfs7000)#

Related Commands

no | Negates a L2TPv3 tunnel settings on this profile
### 7.1.35 l3e-lite-table

**Profile Config Commands**

Configures L3e lite table aging time

The L3e Lite table stores information about destinations and their location within a specific IPSec tunnel. This enables quicker packet transmissions. The table is updated as nodes transmit packets.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
l3e-lite-table aging-time <10-1000000>
```

**Parameters**

- `l3e-lite-table aging-time <10-1000000>`

**Examples**

```plaintext
rfs7000-37FABE(config-profile-default-rfs7000)#l3e-lite-table aging-time 1000
rfs7000-37FABE(config-profile-default-rfs7000)#show context
profile rfs7000 default-rfs7000
  bridge vlan 1
    bridging-mode isolated-tunnel
    ip igmp snooping
    ip igmp snooping querier
    ..........................................................
    interface ge4
    ip dhcp trust
    qos trust dscp
    qos trust 802.1p
    interface pppoe1
    use firewall-policy default
    l3e-lite-table aging-time 1000
--More--
rfs7000-37FABE(config-profile-default-rfs7000)#
```

**Related Commands**

- `no` Removes the L3e lite table aging time configuration
7.1.36 led

Profile Config Commands

Turns on and off access point LEDs

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

led {flash-pattern}

Parameters

- led {flash-pattern}

Parameters:

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flash-pattern</td>
<td>Optional. Enables LED flashing on the device using this profile</td>
</tr>
</tbody>
</table>

Select this option to flash an access point's LEDs in a distinct manner (different from its operational LED behavior). Enabling this feature allows an administrator to validate an access point has received its configuration (perhaps remotely at the site of deployment) without having to log into the managing controller or service platform. This feature is disabled by default.

Examples

rfs7000-37FABE(config-profile-RFS7000Test)#led flash-pattern

rfs7000-37FABE(config-profile-RFS7000Test)#show context
profile rfs7000 RFS7000Test
no autoinstall configuration
no autoinstall firmware
led flash-pattern
crypto ikev1 policy ikev1-default

--More--
rfs7000-37FABE(config-profile-RFS7000Test)#

Related Commands

- no | Disables or reverts settings to their default |
### 7.1.37 led-timeout

- **Profile Config Commands**

Configures the LED-timeout timer in the device or profile configuration mode.

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`led-timeout [<15-1440>|shutdown]`

**Parameters**

- `led-timeout [<15-1440>|shutdown]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`led-timeout [&lt;15-1440&gt;</td>
<td>shutdown]`</td>
</tr>
<tr>
<td><code>&lt;15-1440&gt;</code></td>
<td>Specify a value from 15 - 1400 minutes. The default is 30 minutes.</td>
</tr>
<tr>
<td><code>shutdown</code></td>
<td>Shuts down the LED-timeout timer. The device LEDs are not turned off.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext	nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#led-timeout 25

```

Related Commands

- **no** Disables automatic legacy firmware upgrade
7.1.40 lldp

**Profile Config Commands**

Enables LLDP on this profile and configures LLDP settings.

LLDP or IEEE 802.1AB is a vendor-neutral Data Link Layer protocol used by network devices for advertising of (announcing) identity, capabilities, and interconnections on a IEEE 802 LAN network. The protocol is formally referred to by the IEEE as Station and Media Access Control Connectivity Discovery. Both LLDP snooping and ability to generate and transmit LLDP packets is provided.

Information obtained via CDP and LLDP snooping is available in the UI. Information obtained using LLDP is provided during the adoption process, so the layer 2 device detected by the access point can be used as a criteria in the provisioning policy.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
lldp [holdtime|med-tlv-select|run|timer]
lldp [holdtime <10-1800>|run|timer <5-900>]
lldp med-tlv-select [inventory-management|power-management {auto}]
```

**Parameters**

- `lldp [holdtime <10-1800>|run|timer <5-900>]`

  - **holdtime <10-1800>**
    - Sets the holdtime for transmitted LLDP PDUs. This command specifies the time a receiving device holds information before discarding.
    - `<10-1800>` – Specify a holdtime from 10 - 1800 seconds. The default is 180 seconds.

- `run`
  - Enables LLDP on this profile

- `timer <5-900>`
  - Sets the transmit interval. This command specifies the transmission frequency of LLDP updates in seconds.
  - `<5-900>` – Specify transmit interval from 5 - 900 seconds. The default is 60 seconds.

- `lldp med-tlv-select [inventory-management|power-management {auto}]`

  - **med-tlv-select [inventory-management|power-management {auto}]**
    - Provides additional media endpoint device TLVs to enable inventory and power management discovery. Specifies the LLDP MED TLVs to send or receive.
    - `inventory-management` – Enables inventory management discovery. Allows an endpoint to convey detailed inventory information about itself. This information includes details, such as manufacturer, model, and software version etc. This option is enabled by default.
    - `power-management auto` – Enables extended power via MDI discovery. Allows endpoints to convey power information, such as how the device is powered, power priority etc.
    - `auto` – Optional. Assigns default value based on device type
Examples

rfs7000-37FABE(config-profile-default-rfs7000)#lldp timer 20

rfs7000-37FABE(config-profile-default-rfs7000)#show context profile rfs7000 default-rfs7000

### 7.1.41 load-balancing

**Profile Config Commands**

Configures load balancing parameters

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
load-balancing [advanced-params|balance-ap-loads|balance-band-loads|
    balance-channel-loads|band-control-strategy|band-ratio|group-id|
    neighbor-selection-strategy]

load-balancing advanced-params [2.4GHz-load|5GHz-load|ap-load|equality-margin|
    hiwater-threshold|max-neighbors|max-preferred-band-load|min-common-clients|
    min-neighbor-rssi|min-probe-rssi]

load-balancing advanced-params [2.4GHz-load|5GHz-load|ap-load] [client-weightage|
    throughput-weightage] <0-100>
load-balancing advanced-params equality-margin [2.4GHz|5GHz|ap|band] <0-100>
load-balancing advanced-params hiwater-threshold [ap|channel-2.4GHz|channel-5GHz]
    <0-100>
load-balancing advanced-params max-preferred-band-load [2.4GHz|5GHz] <0-100>
load-balancing advanced-params [max-neighbors <0-16>|min-common-clients <0-256>|
    min-neighbor-rssi <-100-30>|min-probe-rssi <-100-30>]

load-balancing [balance-ap-loads|balance-band-loads|balance-channel-loads [2.4GHz|
    5GHz]]

load-balancing band-control-strategy [distribute-by-ratio|prefer-2.4GHz|prefer-5GHz]

load-balancing band-ratio [2.4GHz|5GHz] [0|<1-10>]

load-balancing group-id <GROUP-ID>

load-balancing neighbor-selection-strategy [use-common-clients|use-roam-notification|
    use-smart-rf]
```

**Parameters**

- **load-balancing advanced-params [2.4GHz-load|5GHz-load|ap-load] [client-weightage|
  throughput-weightage] <0-100>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>advanced-params</strong></td>
<td>Configures advanced load balancing parameters</td>
</tr>
<tr>
<td>**2.4GHz-load [client-weightage</td>
<td>throughput-weightage] &lt;0-100&gt;**</td>
</tr>
<tr>
<td></td>
<td>• <em>client-weightage</em> – Specifies weightage assigned to the client-count when calculating the 2.4 GHz load</td>
</tr>
<tr>
<td></td>
<td>• <em>throughput-weightage</em> – Specifies weightage assigned to throughput, when calculating the 2.4 GHz load</td>
</tr>
<tr>
<td></td>
<td>The following keyword is common to the ‘client-weightage’ and ‘throughput-weightage’ parameters:</td>
</tr>
<tr>
<td></td>
<td>• <em>&lt;0-100&gt;</em> – Sets the margin as a load percentage from 1 - 100. The default client-weightage is 90%. The default throughput-weightage is 10%.</td>
</tr>
</tbody>
</table>
### 5GHz-load

<table>
<thead>
<tr>
<th>[client-weightage]</th>
<th>throughput-weightage</th>
<th>&lt;0-100&gt;</th>
</tr>
</thead>
</table>

Configures 5.0 GHz load calculation weightages

- **client-weightage** – Specifies weightage assigned to the client-count when calculating the 5.0 GHz load
- **throughput-weightage** – Specifies weightage assigned to throughput, when calculating the 5.0 GHz load

The following keyword is common to the ‘client-weightage’ and ‘throughput-weightage’ parameters:

- **<0-100>** – Sets the margin as a load percentage from 1 - 100. The default client-weightage is 90%. The default throughput-weightage is 10%.

### ap-load

<table>
<thead>
<tr>
<th>[client-weightage]</th>
<th>throughput-weightage</th>
<th>&lt;0-100&gt;</th>
</tr>
</thead>
</table>

Configures AP load calculation weightages

- **client-weightage** – Specifies weightage assigned to the client-count, when calculating the AP load
- **throughput-weightage** – Specifies weightage assigned to throughput, when calculating the AP load

The following keyword is common to the ‘client-weightage’ and ‘throughput-weightage’ parameters:

- **<0-100>** – Sets the margin as a load percentage from 1 - 100. The default client-weightage is 90%. The default throughput-weightage is 10%.

### advanced-params

- **load-balancing advanced-params equality-margin [2.4GHz|5GHz|ap|band] <0-100>**

Configures advanced load balancing parameters

<table>
<thead>
<tr>
<th>equality-margin</th>
<th>&lt;0-100&gt;</th>
</tr>
</thead>
</table>

Configures the maximum load difference considered equal. The load is compared for different 2.4 GHz channels, 5.0 GHz channels, APs, or bands.

- **2.4GHz** – Configures the maximum load difference considered equal when comparing loads on different 2.4 GHz channels
- **5GHz** – Configures the maximum load difference considered equal when comparing loads on different 5.0 GHz channels
- **ap** – Configures the maximum load difference considered equal when comparing loads on different APs
- **band** – Configures the maximum load difference considered equal when comparing loads on different bands

The following keyword is common to 2.4 GHz channels, 5.0 GHz channels, APs, and bands:

- **<0-100>** – Sets the margin as a load percentage from 1 - 100. The default equality-margin for 2.5 GHz, 5.0 GHz, ap, and band loads is 1%.

### advanced-params

- **load-balancing advanced-params hiwater-threshold {ap|channel-2.4GHz|channel-5GHz} <0-100>**

Configures advanced load balancing parameters

<table>
<thead>
<tr>
<th>hiwater-threshold</th>
<th>&lt;0-100&gt;</th>
</tr>
</thead>
</table>

Configures the load beyond which load balancing is invoked
### Advanced Load Balancing Parameters

</table>
| `load-balancing advanced-params max-preferred-band-load [2.4GHz|5GHz] <0-100>` | Configures the maximum load on the preferred band, beyond which the other band is equally preferred. Select one of the following options:  
  - `2.4GHz` – Configures the maximum load on 2.4 GHz, when it is the preferred band  
  - `5GHz` – Configures the maximum load on 5.0 GHz, when it is the preferred band  
  
  The following keyword is common to the 2.4 GHz and 5.0 GHz bands:  
  - `<0-100>` – Configures the maximum load as a percentage from 0 - 100. The default value for 2.4GHz and 5.0GHz is 75%. |

</thead>
</table>
| `load-balancing advanced-params [max-neighbors <0-16>|min-common-clients <0-256>|min-neighbor-rssi <-100-30>|min-probe-rssi <-100-30>` | Configures advanced load balancing parameters. Select one of the following options:  
  - `max-neighbors <0-16>` – Specify a value from 0 - 16. Optionally configure a minimum of 0 neighbors and a maximum of 16 neighbors. The default is 16.  
  - `min-common-clients <0-256>` – Specify a value from 0 - 256. Optionally configure a minimum of 0 clients and a maximum of 256 clients. The default is 0.  
  - `min-neighbor-rssi <-100-30>` – Sets the signal strength in dBm. Specify a value from -100 - 30 dBm. The default is -65 dBm.  
  - `min-probe-rssi <-100-30>` – Sets the signal strength in dBm. Specify a value from -100 - 30 dBm. The default is -100 dBm. |
**load-balancing** [balance-ap-loads|balance-band-loads|balance-channel-loads [2.4GHz|5GHz]]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>balance-ap-loads</td>
<td>Enables neighbor AP load balancing. This option distributes the access point’s radio load amongst other controller managed access point radios. This option is disabled by default.</td>
</tr>
<tr>
<td>balance-band-loads</td>
<td>Enables balancing of the total band load amongst neighbors. This option balances the access point’s radio load by assigning a ratio to both the 2.4 GHz and 5.0 GHz bands. Balancing radio load by band ratio allows an administrator to assign a greater weight to radio traffic on either the 2.4 GHz or 5.0 GHz band. This option is disabled by default.</td>
</tr>
</tbody>
</table>
| balance-channel-loads [2.4GHz|5GHz] | Enables the following:  
- **2.4GHz** – Channel load balancing on 2.4 GHz band. This option is disabled by default. Balances the access point’s 2.4 GHz radio load across channels supported within the country of deployment. This can prevent congestion on the 2.4 GHz radio if a channel is over utilized.  
- **5GHz** – Channel load balancing on 5.0 GHz band. This option is disabled by default. Balances the access point’s 5.0 GHz radio load across channels supported within the country of deployment. This can prevent congestion on the 5.0 GHz radio if a channel is over utilized. |

**load-balancing band-control-strategy** [distribute-by-ratio|prefer-2.4GHz|prefer-5GHz]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| band-control-strategy      | Configures a band control strategy  
By default, this option steers 5.0 GHz-capable clients to the 5.0 GHz band. When an access point hears a request from a client to associate on both the 2.4 GHz and 5.0 GHz bands, it knows the client is capable of operation in 5.0 GHz. Band steering steers the client by responding only to the 5.0 GHz association request and not the 2.4 GHz request. Consequently, the client only associates in the 5.0 GHz band. |
| distribute-by-ratio        | Distributes clients to either band according to the band-ratio                                                                                                                                         |
| prefer-2.4GHz              | Nudges all dual-band clients to 2.4 GHz band                                                                                                                                                           |
| prefer-5GHz                | Nudges all dual-band clients to 5.0 GHz band. This is the default setting.                                                                                                                                |

**load-balancing band-ratio** [2.4GHz|5GHz] [0|<1-10>]

<table>
<thead>

7.1.42 logging

Profile Config Commands

Enables message logging and configures logging settings. This command can also be executed in the device configuration mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

logging [aggregation-time | buffered | console | facility | forward | host | on | syslog]

logging [aggregation-time <1-60>|host [<IPv4>|<IPv6>]|on]
logging [buffered|console|syslog|forward] [<0-7>|emergencies|alerts|critical|errors|warnings|notifications|informational|debugging]
logging facility [local0|local1|local2|local3|local4|local5|local6|local7]

Parameters

- logging [aggregation-time <1-60>|host [<IPv4>|<IPv6>]|on]

  aggregation-time
  <1-60> Sets the number of seconds for aggregating repeated messages. This is the interval at which system events are logged on behalf of this profile. The shorter the interval, the sooner the event is logged.
  • <1-60> – Specify a value from 1 - 60 seconds. The default value is 0.

  host [<IPv4>|<IPv6>] Configures a remote host to receive log messages. Defines numerical (non DNS) IPv4 or IPv6 addresses for external resources where logged system events can be sent on behalf of the controller profile. A maximum of four entries can be made.
  • <IPv4> – Specify the IPv4 address of the remote host.
  • <IPv6> – Specify the IPv6 address of the remote host.

  on Enables the logging of system messages

- logging [buffered|console|syslog|forward] [<0-7>|emergencies|alerts|critical|errors|warnings|notifications|informational|debugging]

  buffered Sets the buffered logging level

  console Sets the console logging level

  syslog Sets the syslog server’s logging level

  forward Forwards system debug messages to the wireless controller or service platform

  [<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings] The following keywords are common to the buffered, console, syslog, and forward parameters. All incoming messages have different severity levels based on their importance. The severity level is fixed on a scale of 0 - 7.
  • <0-7> – Sets the message logging severity level on a scale of 0 - 7
  • emergencies – Severity level 0: System is unusable

  Contd..
logging facility [local0|local1|local2|local3|local4|local5|local6|local7]

Enables the syslog to decide where to send the incoming message. There are 8 logging facilities, from syslog0 to syslog7.

- local0 – Syslog facility local0
- local1 – Syslog facility local1
- local2 – Syslog facility local2
- local3 – Syslog facility local3
- local4 – Syslog facility local4
- local5 – Syslog facility local5
- local6 – Syslog facility local6
- local7 – Syslog facility local7

Examples
rfs7000-37FABE(config-profile-default-rfs7000)#logging facility local4
rfs7000-37FABE(config-profile-default-rfs7000)#show context profile rfs7000 default-rfs7000

### 7.1.43 mac-address-table

**Profile Config Commands**

Configures the MAC address table. Use this command to create MAC address table entries by assigning a static address to the MAC address table.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
mac-address-table [aging-time|static]
mac-address-table aging-time [0|<10-1000000>]
mac-address-table static <MAC> vlan <1-4094> interface [<L2-INTERFACE>|ge <1-4>|
port-channel <1-2>]
```

**Parameters**

- **mac-address-table aging-time [0|<10-1000000>]**
  - **aging-time**
    - `[0|<10-1000000>]`
      - Sets the duration a learned MAC address persists after the last update
      - **0** – Entering the value ‘0’ disables the aging time
      - **<10-1000000>** – Sets the aging time from 10 - 100000 seconds. The default is 300 seconds.

- **mac-address-table static <MAC> vlan <1-4094> interface [<L2-INTERFACE>|ge <1-4>|
  port-channel <1-2>]
  - **static <MAC>**
    - Creates a static MAC address table entry
    - **<MAC>** – Specifies the static address to add to the MAC address table. Specify the MAC address in the AA-BB-CC-DD-EE-FF, AA:BB:CC:DD:EE:FF, or AABB.CCDD.EEFF format.
  - **vlan <1-4094>**
    - Assigns a static MAC address to a specified VLAN port
    - **<1-4094>** – Specify the VLAN index from 1 - 4094.
  - **interface [<L2-INTERFACE>|
    - ge <1-4>|
    - port-channel <1-2>**
    - Specifies the interface type. The options are: layer 2 Interface, GigabitEthernet interface, and a port channel interface
    - **<L2-INTERFACE>** – Specify the layer 2 interface name.
    - **ge** – Specifies a GigabitEthernet interface
      - **<1-4>** – Specify the GigabitEthernet interface index from 1 - 4.
    - **port-channel** – Specifies a port channel interface
      - **<1-2>** – Specify the port channel interface index from 1 - 2.

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000)#mac-address-table static 00-40-96-B0-BA-2A vlan 1 interface ge1
rfs7000-37FABE(config-profile-default-rfs7000)#show context profile rfs7000 default-rfs7000
  bridge vlan 1
  ..........................................................
  logging facility local4
  mac-address-table static 00-40-96-B0-BA-2A vlan 1 interface ge1
  ip nat pool pool1
  --More--
```
rfs7000-37FABE(config-profile-default-rfs7000)#

7.1.44 mac-auth

Profile Config Commands

Enables or disables authentication of a client's MAC address on wired ports. When configured, MAC authentication will be enabled on devices using this profile.

To enable MAC address authentication on a device, enter the device's configuration mode and execute the `mac-auth` command.

When enabled, the source MAC address of a device, connected to the specified wired port, is authenticated with the RADIUS server. Once authenticated the device is permitted access to the managed network and packets from the authenticated source are processed. If not authenticated the device is either denied access or provided guest access through the guest VLAN (provided guest VLAN access is configured on the port).

Enabling MAC authentication requires you to first configure a AAA policy specifying the RADIUS server. Configure the client's MAC address on the specified RADIUS server. Attach this AAA policy to a profile or a device. Finally, enable MAC authentication on the desired wired port of the device or device-profile.

Only one MAC address is supported for every wired port. Consequently, when one source MAC address is authenticated, packets from all other sources are dropped.

To enable client MAC authentication on a wired port:

1. Configure the user on the RADIUS server. The following examples create a RADIUS server user entry.
   a. `<DEVICE>(config)#radius-group <RAD-GROUP-NAME>`
      `<DEVICE>(config-radius-group-<RAD-GROUP-NAME>)#policy vlan <VLAN-ID>`
   b. `<DEVICE>(config)#radius-user-pool-policy <RAD-USER-POOL-NAME>`
      `<DEVICE>(config-radius-user-pool-<RAD-USER-POOL-NAME>)#user <USER-NAME> password <PASSWORD> group <RAD-GROUP-OF-STEP-A>`
      
      Note: The `<USER-NAME>` and `<PASSWORD>` should be the client's MAC address. This address will be matched against the MAC address of incoming traffic at the specified wired port.
   c. `<DEVICE>(config)#radius-server-policy <RAD-SERVER-POL-NAME>`
      `<DEVICE>(config-radius-server-policy-<RAD-SERVER-POL-NAME>)#use radius-user-pool-policy <RAD-USER-POOL-OF-STEP-B>`

2. Configure a AAA policy exclusively for wired MAC authentication and specify the authentication (RADIUS) server settings. The following example creates a AAA policy 'macauth' and enters its configuration mode:
   `<DEVICE-A>(config)#aaa-policy macauth
   <DEVICE-A>(config-aaa-policy-macauth)#...`
   
   Specify the RADIUS server details.
   `<DEVICE-A>(config)#aaa-policy macauth
   <DEVICE-A>(config-aaa-policy-macauth)#authentication server 1-6 [host <IP>|onboard]`
   
   Attach the AAA policy to the device or profile. When attached to a profile, the AAA policy is applied to all devices using this profile.
   `<DEVICE>(config-device-aa-bb-cc-dd-ee)#mac-auth use aaa-policy macauth`
   `<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#mac-auth use aaa-policy macauth`

3. Enable mac-auth on the device's desired GE port. When enabled on a profile, MAC address authentication is enabled, on the specified GE port, of all devices using this profile.
   `<DEVICE>(config-device-aa-bb-cc-dd-ee)#interface ge x`
   `<DEVICE>(config-device-aa-bb-cc-dd-ee-gex)#mac-auth`
   `<DEVICE>(config-profile-<PROFILE-NAME>)#interface ge x`
   `<DEVICE>(config-profile-<PROFILE-NAME>)#mac-auth`
Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax
mac-auth use aaa-policy <AAA-POLICY-NAME>

Parameters
- mac-auth use aaa-policy <AAA-POLICY-NAME>

<table>
<thead>
<tr>
<th>mac-auth</th>
<th>Enables 802.1X authentication of MAC addresses on this profile. Use the device configuration mode to enable this feature on a device.</th>
</tr>
</thead>
</table>
| use aaa-policy <AAA-POLICY-NAME> | Associates an existing AAA policy with this profile (or device)  
  • <AAA-POLICY NAME> – Specify the AAA policy name.  
The AAA policy used should be created especially for MAC authentication. |

Examples
The following examples demonstrate the configuration of authentication of MAC addresses on wired ports:

```

### 7.1.45 memory-profile

**Profile Config Commands**

Configures memory profile used on the device

Supported in the following platforms:
- Access Points — AP621, AP6511, AP6521

**Syntax**

```
memory-profile [adopted|standalone]
```

**Parameters**

- `memory-profile [adopted|standalone]`

<table>
<thead>
<tr>
<th>adopted</th>
<th>Configures adopted mode (no GUI and higher MiNT routes, firewall flows)</th>
</tr>
</thead>
<tbody>
<tr>
<td>standalone</td>
<td>Configures standalone mode (GUI and fewer MiNT routes, firewall flows)</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-profile-testAP6511)#memory-profile adopted
```

Note: memory-profile change will take effect after device reboot

```
nx9500-6C8809(config-profile-testAP6511)#
```

**Related Commands**

- `no` Resets device's memory profile configuration
7.1.46 meshpoint-device

Profile Config Commands

Configures meshpoint device parameters. This feature is configurable in the profile and device configuration modes.

Supported in the following platforms:
- Access Points — AP622, AP650, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX

Syntax

meshpoint-device <MESHPOINT-NAME>

Parameters

- meshpoint-device <MESHPOINT-NAME>

Usage Guidelines

For Vehicular Mounted Modem (VMM) access points or other mobile devices, set the path selection method as mobile-snr-leaf in the config-meshpoint-device mode. For more information, see path-method.

Examples

rfs7000-37FABE(config-profile-testAP71XX)#meshpoint-device test

rfs7000-37FABE(config-profile-testAP71XX-meshpoint-test)##

Mesh Point Device Mode commands:
- acs Configure auto channel selection parameters
- exclude Exclude neighboring Mesh Devices
- hysteresis Configure path selection SNR hysteresis values
- monitor Event Monitoring
- no Negate a command or set its defaults
- path-method Path selection method used to find a root node
- preferred Configure preferred path parameters
- root Set this meshpoint as root
- root-select Root selection method parameters
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-profile-testAP71XX-meshpoint-test)##

Related Commands

- no Removes a specified meshpoint

NOTE: For more information on the meshpoint-device configuration parameters, see Chapter 26, MESHPOINT.
### 7.1.47 meshpoint-monitor-interval

**Profile Config Commands**

Configures the meshpoint monitoring interval. This is the interval, in seconds, at which the meshpoint status is checked.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

meshpoint-monitor-interval <1-65535>

**Parameters**

- meshpoint-monitor-interval <1-65535>

| meshpoint-monitor-interval <1-65535> | Configures the meshpoint monitoring interval in seconds
|---------------------------------------|--------------------------------------------------|
| <1-65535> | Specify the interval from 1 - 65535 seconds. The default is 30 seconds.

**Examples**

rfs7000-37FABE(config-profile-default-rfs7000)#meshpoint-monitor-interval 100

rfs7000-37FABE(config-profile-default-rfs7000)#show context
profile rfs7000 default-rfs7000
  bridge vlan 1
  bridging-mode isolated-tunnel
  ip igmp snooping
  ip igmp snooping querier
  meshpoint-monitor-interval 100
  ip default-gateway 172.16.10.4
  --More--
rfs7000-37FABE(config-profile-default-rfs7000)#

**Related Commands**

| no | Resets the meshpoint monitoring interval to default (30 seconds) |
7.1.48 min-misconfiguration-recovery-time

Profile Config Commands

Configures the minimum device connectivity verification time

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

min-misconfiguration-recovery-time <60-3600>

Parameters
- min-misconfiguration-recovery-time <60-3600>

7.1.49 mint

Profile Config Commands

Configures MiNT protocol parameters required for MiNT creation and adoption.

MiNT links are required for adoption of a device (APs, wireless controller, and service platform) to a controller. The MiNT link is created on both the adoptee and the adopter. WiNG provides several commands to configure MiNT links and establish adoption for both IPv4 and IPv6 addresses.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP8132
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

mint [dis|level|link|mlcp|rate-limit|spf-latency|tunnel-controller-load-balancing]
mint dis [priority-adjustment <-255-255> | strict-evis-reachability]
mint level 1 area-id <1-16777215>
mint link [force|ip|listen|vlan]
mint link force ip [<IPv4>|<IPv6>] [<1-65535>|level 2|level 2] {adjacency-hold-time <2-600>|cost <1-10000>|hello-interval <1-120}|ipsec-secure {gw [<IP>|<HOST-NAME>]} }
mint link [listen ip [<IPv4>|<IPv6>|<HOST-ALIAS-NAME>]|vlan <1-4094>]
   {adjacency-hold-time <2-600>|cost <1-10000>|hello-interval <1-120}|ipsec-secure {gw [<IP>|<HOST-NAME>]}|level [1|2]}
mint link ip [<IPv4>|<IPv6>|<HOST-ALIAS-NAME>] {<1-65535>|adjacency-hold-time <2-600>|cost <1-10000>|hello-interval <1-120}|ipsec-secure {gw [<IP>|<HOST-NAME>]}|level [1|2]}
mint mlcp [ip|ipv6|vlan]
mint rate-limit level2 [link|mlcp]
   {mlcp [ip|ipv6|vlan]|rate <50-10000000>|max-burst-size <2-1024>}
   {red-threshold [background|best-effort|video|voice] <0-100>}
mint spf-latency <0-60>
mint tunnel-controller-load-balancing level1

Parameters

- **dis priority-adjustment <-255-255> | strict-evis-reachability**

<tr>
<td>hello-interval (&lt;1-120&gt;)</td>
<td>Optional. Specifies the interval, in seconds, between successive hello packets</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-120&gt; – Specify a value from 1 - 120 seconds. The default is 15 seconds.</td>
</tr>
</tbody>
</table>

### mint link [listen ip \([<IPv4>|<IPv6>|<HOST-ALIAS-NAME>]\) \[vlan \(<1-4094>\)\] \{adjacency-hold-time \(<2-600>\)|cost \(<1-10000>|hello-interval \(<1-120>\)|level \([1|2]\)|ipsec-security \{gw \[<IP>|<HOST-NAME>\}\}\}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link listen ip ([&lt;IPv4&gt;</td>
<td>&lt;IPv6&gt;</td>
</tr>
<tr>
<td></td>
<td>• listen – Creates a MiNT listening link</td>
</tr>
<tr>
<td></td>
<td>• ip – Creates a MiNT listening link over UDP/IP or IPv6</td>
</tr>
<tr>
<td></td>
<td>• &lt;IPv4&gt; – Specify the IPv4 address of the listening UDP/IP link.</td>
</tr>
<tr>
<td></td>
<td>• &lt;IPv6&gt; – Specify the IPv6 address of the listening UDP/IP link.</td>
</tr>
</tbody>
</table>

Contd...
**<HOST-_ALIAS-NAME>** – Specify the host alias identifying the MiNT link address. The host alias should exist and configured.

UDP/IP links can be created by configuring a matching pair of links, one on each end point. However, that is error prone and does not scale. So UDP/IP links can also listen (in the TCP sense), and dynamically create connected UDP/IP links when contacted. The typical configuration is to have a listening UDP/IP link on the IP address S.S.S.S, and for all the APs to have a regular UDP/IP link to S.S.S.S.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

- mint mlcp [ip|ipv6|vlan]

| mlcp [ip|ipv6|vlan] | Configures the MiNT Link Creation Protocol (MLCP) using the IP address or VLAN. MLCP is used to create a UDP/IP link from the device to a neighbor. The neighboring device does not need to be a wireless controller or service platform, it can be another access point with a path to the wireless controller or service platform. |
|---------------------|-----------------------------------------------------------------------------|
| vlan                | Enables MLCP over layer 2 (VLAN) links                                       |
| ip                  | Enables MLCP over layer 3 (UDP/IP) links. When enabled, allows adoption over IPv4 address. |
| ipv6                | Enables MLCP over layer 3 (UDP/IPv6) links. When enabled, allows adoption over IPv6 address. |
mint rate-limit level2

Applies rate limits on extended VLAN traffic

Excessive traffic can cause performance issues on an extended VLAN. Excessive traffic can be caused by numerous sources including network loops, faulty devices, or malicious software. Rate limiting reduces the maximum rate sent or received per wireless client. It prevents any single user from overwhelming the wireless network, and also provides differential service for service providers. Uplink and downlink rate limits are usually configured on a RADIUS server using vendor specific attributes. Rate limits are extracted from the RADIUS server’s response. When such attributes are not present, the settings defined on the controller, service platform or access point are applied. You can set separate QoS rate limit configurations for data types transmitted from the network (upstream) and data transmitted from a wireless clients back to associated radios (downstream).

link [ip <IPv4/IPv6> <1-65535> | vlan <1-4094>]

Configures rate limit parameters applicable for all statically configured MiNT links on level2. Select the link-type as 'IP' or 'VLAN'.

- ip <IPv4/IPv6> – Configures rate limits for MiNT link traffic over UDP/IP
- <IPv4/IPv6> – Specify the MiNT peer’s IPv4 or IPv6 address in the A.B.C.D and X:X::X:X formats respectively.
- <1-65535> – Configures the virtual port used for rate limiting traffic. Specify the UDP port from 1 - 65535.
- vlan <1-4094> – Configures rate limits for MiNT link traffic on specified VLAN
- <1-4094> – Specify the VLAN ID from 1 - 4094.

mlcp [ip|ipv6|vlan]

Configures rate limit parameters applicable for MLCP

MLCP creates a UDP/IP link from the device to a neighbor. The neighboring device does not need to be a controller or service platform, it can be an access point with a path to the controller or service platform.

- ip – Configures rate-limits for MLCP over UDP/IPv4 links
- ipv6 – Configures rate-limits for MLCP over UDP/IPv6 links
- vlan – Configures rate-limits for MLCP over VLAN links

rate <50-1000000>

Configures the rate limit from 50 - 1000000 Kbps

This limit constitutes a threshold for the maximum number of packets transmitted or received (from all access categories). Traffic exceeding the defined rate is dropped and a log message is generated. The default setting is 5000 Kbps.

max-burst-size <2-1024>

Configures the maximum burst size from 0 - 1024 Kbytes

Smaller the burst size, lesser is the probability of the upstream packet transmission resulting in congestion for the WLAN’s client destinations. By trending the typical number of ARP, broadcast, multicast and unknown unicast packets over a period of time, the average rate for each access category can be obtained. Once a baseline is obtained, add a 10% margin (minimally) to allow for traffic bursts. The default burst size is 320 Kbytes.
**red-threshold**

[background][best-effort]

video|voice] <0-100>

Optional. Configures the random early detection (RED) threshold (as a percentage) for the following traffic types:

- **background** – Configures the RED threshold for low priority background traffic. Background packets are dropped and a log message generated if the rate exceeds the set value. Background traffic consumes the least bandwidth of any access category, so this value can be set to a lower value once a general upstream rate is known by the network administrator (using a time trend analysis). The default setting is 50%.

- **best-effort** – Configures the RED threshold for low priority best-effort traffic. Best-effort packets are dropped and a log message generated if the rate exceeds the set value. Best effort traffic consumes little bandwidth, so this value can be set to a lower value once a general upstream rate is known by the network administrator (using a time trend analysis). The default setting is 50%.

- **video** – Configures the RED threshold for high priority video traffic. Video packets are dropped and a log message generated if the rate exceeds the set value. Video traffic consumes significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis). The default setting is 25%.

- **voice** – Configures the RED threshold for high priority voice traffic. Voice packets are dropped and a log message generated if the rate exceeds the set value. Voice applications consume significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis). The default setting is 0%.

- `<0-100>` – After selecting the traffic type, specify the RED threshold from 0 - 100%.

**mint spf-latency <0-60>**

**spf-latency <0-60>**

Specifies the latency of SPF routing recalculation.

This option allows you to set the latency of routing recalculation option (within the Shortest Path First (SPF) field). This option is disabled by default.

- `<0-60>` – Specify the latency from 0 - 60 seconds.

**mint tunnel-controller-load-balancing level1**

**tunnel-controller-load-balancing level1**

Enables load balancing of MiNT extended VLAN traffic across tunnels.

- **level1** – Enables balancing of load of a tunnel wireless controller or service platform over VLAN links.

**Examples**

```bash
rfs7000-37FABE(config-profile-default-rfs7000)#mint level 1 area-id 88
rfs7000-37FABE(config-profile-default-rfs7000)#mint link ip 1.2.3.4 level 2
rfs7000-37FABE(config-profile-default-rfs7000)#show context profile rfs7000 default-rfs7000
  mint link ip 1.2.3.4 level 2
  mint level 1 area-id 88
  bridge vlan 1
  --More--
rfs7000-37FABE(config-profile-default-rfs7000)#
```

**Related Commands**

### 7.1.52 `neighbor-info-interval` Profile Config Commands

Configures the neighbor information exchange interval

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
```
neighbor-info-interval <1-100>
```

**Parameters**
- `neighbor-info-interval <1-100>`

| <1-100> | Sets interval from 1 - 100 seconds. The default is 10 seconds. |

**Examples**
```
rfs7000-37FABE(config-profile-default-rfs7000)#neighbor-info-interval 6
```
```
rfs7000-37FABE(config-profile-default-rfs7000)#show context

### 7.1.53 no

#### Profile Config Commands

Negates a command or resets values to their default

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
no [adopter-auto-provisioning-policy-lookup|adoption|alias|analytics|area|arp|
    auto-learn-staging-config|autogen-uniqueid|autoinstall|bluetooth-detection|
    bridge|cdp|cluster|configuration-persistence|controller|critical-resource|crypto|
    device-upgrade|dot1x|dscp-mapping|email-notification|environmental-sensor|events|
    export|floor|gre|http-analyze|interface|ip|ipv6|l2tpv3|l3e-lite-table|led|

    mac-address-table|mac-auth|memory-profile|meshpoint-device|
    meshpoint-monitor-interval|min-misconfiguration-recovery-time|mint|
    misconfiguration-recovery-time|noc|ntp|offline-duration|power-config|
    preferred-controller-group|preferred-tunnel-controller|radius|raid|
    rf-domain-manager|router|spawning-tree|traffic-class-mapping|tunnel-controller|
    use|vrrp|vrrp-state-check|wep-shared-key-auth|service]
```

**Parameters**

- `no `<PARAMETERS>`

| no `<PARAMETERS>` | Removes or reverts this profile’s settings based on the parameters passed |

**Usage Guidelines**

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

```

7.1.54 noc

Profile Config Commands

Configures Network Operations Center (NOC) statistics update interval. This is the interval at which statistical updates are sent by the RF Domain manager to its adopting controller (the NOC controller).

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

noc update-interval [<5-3600>|auto]

Parameters

- **update-interval** [<5-3600>|auto]
  
  Configures NOC statistics update interval
  
  - `<5-3600>` – Specify the update interval from 5 - 3600 seconds.
  
  - `auto` – The NOC statistics update interval is automatically adjusted by the wireless controller or service platform based on load. This option is enabled by default.

Examples

```
rfs7000-37FABE(config-profile-default-rfs7000)#noc update-interval 25
rfs7000-37FABE(config-profile-default-rfs7000)#show context
profile rfs7000 default-rfs7000
  mint link ip 1.2.3.4
  mint level 1 area-id 88
  bridge vlan 1
  bridging-mode isolated-tunnel
  ip igmp snooping
  ip igmp snooping querier
  ...................................................
  interface pppoe1
  use firewall-policy default
  misconfiguration-recovery-time 65
  noc update-interval 25
  service pm sys-restart
  router ospf
rfs7000-37FABE(config-profile-default-rfs7000)#
```

7.1.55 ntp

Profile Config Commands

Configures the Network Time Protocol (NTP) server settings.

NTP manages time and/or network clock synchronization within the network. NTP is a client/server implementation. Controllers, service platforms, and access points (NTP clients) periodically synchronize their clock with a master clock (an NTP server). For example, a controller resets its clock to 07:04:59 upon reading a time of 07:04:59 from its designated NTP server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ntp server <PEER-IP/HOSTNAME> {autokey|key|maxpoll|minpoll|prefer|version}

ntp server <PEER-IP/HOSTNAME> {autokey}

ntp server <PEER-IP/HOSTNAME> {maxpoll [1024|2048|4096|8192]}

ntp server <PEER-IP/HOSTNAME> {minpoll [1024|128|256|512|64]}

ntp server <PEER-IP> {key <1-65534> md5 [0 <WORD>|2<WORD>|<WORD>]}

ntp server <PEER-IP/HOSTNAME> {prefer version <1-4>|version <1-4> prefer}

Parameters

- ntp server <PEER-IP/HOSTNAME> {autokey} {prefer version <1-4>|version <1-4>}

| server <PEER-IP/HOSTNAME> | Configures NTP server resources that are used to obtain system time
| --- | ---
| ● <PEER-IP/HOSTNAME> — Identifies the NTP server resource by its IP address or hostname. Specify the NTP server’s IP address or hostname. |

| autokey | Optional. Enables automatic configuration of authentication key for the specified NTP server. This option is disabled by default. If not enabled, use the ‘key’ option to configure an authentication key for the NTP server. |

| maxpoll [1024|2048|4096|8192] | Optional. Configures the maximum polling interval. Once set, the specified NTP server is polled no later than the defined interval. Select one of the following options:
| --- | ---
| ● 1024 — Configures the maximum polling interval as 1024 seconds. This is the default setting. |
| ● 2048 — Configures the maximum polling interval as 2048 seconds |
| ● 4096 — Configures the maximum polling interval as 4096 seconds |
| ● 8192 — Configures the maximum polling interval as 8192 seconds |
### ntp server <PEER-IP/HOSTNAME> {minpoll [1024/128/256/512/64]}

<table>
<thead>
<tr>
<th>server &lt;PEER-IP/HOSTNAME&gt;</th>
<th>Configures NTP server resources that are used to obtain system time</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;PEER-IP/HOSTNAME&gt; – Identifies the NTP server resource by its IP address or hostname. Specify the NTP server's IP address or hostname.</td>
</tr>
</tbody>
</table>

| minpoll [1024|128|256|512|64] | Optional. Configures the minimum polling interval. Once set, the specified NTP server is polled no sooner than the defined interval. Select one of the following options: |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1024 – Configures the minimum polling interval as 1024 seconds |
| 128 – Configures the minimum polling interval as 128 seconds |
| 256 – Configures the minimum polling interval as 256 seconds |
| 512 – Configures the minimum polling interval as 512 seconds |
| 64 – Configures the minimum polling interval as 64 seconds. This is the default setting. |

### ntp server <PEER-IP/HOSTNAME> {key <1-65534> md5 [0 <WORD>|2<WORD>|<WORD>]}

<table>
<thead>
<tr>
<th>server &lt;PEER-IP/HOSTNAME&gt;</th>
<th>Configures NTP server resources that are used to obtain system time</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;PEER-IP/HOSTNAME&gt; – Identifies the NTP server resource by its IP address or hostname. Specify the NTP server's IP address or hostname.</td>
</tr>
</tbody>
</table>

| key <1-65534> md5 [0 <WORD>|2<WORD>|<WORD>] | Optional. Defines the authentication key for the specified NTP server. This option is used to configure the key when ‘autokey’ configuration is not enabled. |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1-65534> – Specify the peer key number. Should not exceed 64 characters in length. |
| • md5 – Sets MD5 authentication |
| • 0 <WORD> – Configures a clear text password |
| • 2 <WORD> – Configures an encrypted password |
| • <WORD> – Sets an authentication key |

### ntp server <PEER-IP/HOSTNAME> {prefer version <1-4>|version <1-4> prefer}

<table>
<thead>
<tr>
<th>server &lt;PEER-IP/HOSTNAME&gt;</th>
<th>Configures NTP server resources that are used to obtain system time</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;PEER-IP/HOSTNAME&gt; – Identifies the NTP server resource by its IP address or hostname. Specify the NTP server's IP address or hostname.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>prefer version &lt;1-4&gt;</th>
<th>Optional. Designates the specified NTP server as a preferred NTP resource. This setting is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>version &lt;1-4&gt; prefer</td>
<td>• version – Optional. Configures the NTP version</td>
</tr>
<tr>
<td>• &lt;1-4&gt; – Select the NTP version from 1 - 4. If not specified, the default value of ‘0’ is applied, which implies that the NTP server’s version is ignored.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>version &lt;1-4&gt;</th>
<th>Optional. Configures the version number used by the specified NTP server resource</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-4&gt; – Select the NTP version from 1 - 4. The default setting is 0. A value of ‘0’ implies that the NTP server's version is ignored.</td>
<td></td>
</tr>
<tr>
<td>prefer – Optional. Designates the specified NTP server as a preferred NTP resource. This setting is disabled by default. The NTP version number specified using the ‘version &lt;1-4&gt;’ keyword is applied to this preferred NTP resource.</td>
<td></td>
</tr>
</tbody>
</table>
Examples
rfs7000-37FABE(config-profile-default-rfs7000)#ntp server 172.16.10.10 version 1 prefer

7.1.56 offline-duration

Profile Config Commands

Sets the duration, in minutes, for which a device remains unadopted before it generates offline event. This command is also supported on the device configuration mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
offline-duration <5-43200>

Parameters
- offline-duration <5-43200>

Examples
rfs4000-229D58(config-profile-test)#offline-duration 200

rfs4000-229D58(config-profile-test)#show context
profile rfs4000 test
no autoinstall configuration
no autoinstall firmware
crypto ikev1 policy ikev1-default
   isakmp-proposal default encryption aes-256 group 2 hash sha

interface wwan1
interface pppoe1
use firewall-policy default
service pm sys-restart
router ospf
   offline-duration 200
rfs4000-229D58(config-profile-test)#

Related Commands

no
   Resets the offline-duration to default (10 minutes)
7.1.57 power-config

Profile Config Commands

Configures the power option mode. Use this command in the profile configuration mode to configure the transmit output power of access point radios. This command is also available in the device-config mode.

Single radio model access points always operate using a full power configuration. The power management configurations described in this section do not apply to single radio models. When an access point is powered on for the first time, the system determines the power budget available to the access point. If 802.3af is selected, the access point assumes 12.95 watts is available. If the mode is changed, the access point requires a reset to implement the change. If 802.3at is selected, the access point assumes 23 - 26 watts is available.

Supported in the following platforms:

- Access Points — AP71XX

Syntax

power-config [af-option|at-option|mode]

power-config [af-option|at-option] [range|throughput]

power-config mode [auto|3af]

Parameters

- power-config [af-option|at-option] [range|throughput]

### af-option [range|throughput]

Configures the 802.3.af power mode option. The options are:

- range — Configures the af power range mode. This mode provides higher power but fewer transmission (tx) chains.

Select range when range is preferred over performance for broadcast/multicast (group) traffic. The data rates used for range are the lowest defined basic rates.

- throughput — Configures the af power throughput mode. This mode provides lower power but has more tx chains. This is the default setting.

Select throughput to transmit packets at the radio’s highest defined basic rate (based on the radio’s current basic rate settings). This option is optimal in environments where transmission range is secondary to broadcast/multicast transmission performance.

### at-option [range|throughput]

Configures the 802.3 at power mode option. The options are:

- range — Configures the at power range mode. This mode provides higher power but fewer tx chains.

Select range when range is preferred over performance for broadcast/multicast (group) traffic. The data rates used for range are the lowest defined basic rates.

- throughput — Configures the at power throughput mode. This mode provides lower power but has more tx chains. This is the default setting.

Select throughput to transmit packets at the radio’s highest defined basic rate (based on the radio’s current basic rate settings). This option is optimal in environments where transmission range is secondary to broadcast/multicast transmission performance.
• **power-config mode [auto|3af]**

  | mode [auto|3af] | Configures the AP power mode |
  |---------------|-----------------------------|
  |               | • 3af – Forces an AP to power up in the 802.3af power mode |
  |               | • auto – Sets the detection auto mode (default setting) |
  |               | The automatic power-config mode enables an access point to automatically determine the best power configuration based on the available power budget. |

**Examples**

```
nx9500-6C8809(config-profile-testAP71XX)#power-config mode 3af
nx9500-6C8809(config-profile-testAP71XX)#power-config af-option range

profile ap71xx testAP71XX
  no autoinstall configuration
  no autoinstall firmware
  power-config mode 3af
  power-config af-option range
  crypto ikev1 policy ikev1-default
    isakmp-proposal default encryption aes-256 group 2 hash sha
    crypto ikev2 policy ikev2-default
    isakmp-proposal default encryption aes-256 group 2 hash sha
    crypto ipsec transform-set default esp-aes-256 esp-sha-hmac
--More--
nx9500-6C8809(config-profile-testAP71XX)#
```

**Related Commands**

- **no**
  Reverts the power mode setting on this profile to default
### 7.1.58 preferred-controller-group

**Profile Config Commands**

Specifies the controller group preferred for adoption.

At adoption, an access point solicits and receives multiple adoption responses from controllers and service platforms available on the network. These adoption responses contain loading policy information the access point uses to select the optimum controller or service platform for adoption. After selecting the controller or service platform, the access point associates with it and optionally obtains an image upgrade and configuration. By default, an auto provisioning policy generally distributes AP adoption evenly amongst available controllers and service platforms. Use this command to specify the controller or service platform preferred for adoption. Once configured, the access point adopts to the specified preferred controller or service platform.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX

**Syntax**

```
preferred-controller-group <WORD>
```

**Parameters**
- `preferred-controller-group <WORD>`

**Examples**

```
 rfs7000-37FABE(config-profile-default-rfs7000)#preferred-controller-group testGroup

 rfs7000-37FABE(config-profile-default-rfs7000)#show context

 rfs7000-37FABE(config-profile-default-rfs7000)#
```

**Related Commands**

- `no` Removes the preferred controller group configuration
7.1.59 preferred-tunnel-controller

Profile Config Commands

Configures the tunnel controller’s name preferred for tunneling extended VLAN traffic. Devices using this profile will prefer to route their extended VLAN traffic through the specified tunnel controller (wireless controller or service platform).

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX

Syntax
preferred-tunnel-controller <NAME>

Parameters
- preferred-tunnel-controller <NAME>

<table>
<thead>
<tr>
<th>preferred-tunnel-controller &lt;NAME&gt;</th>
<th>Configures the preferred tunnel name</th>
</tr>
</thead>
</table>

Examples

### 7.1.61 remove-override

*Profile Config Commands*

Removes device-level overrides and applies profile configuration. Use this command to enable the access point to detect bluetooth devices using the Bluetooth USB module.

Supported in the following platforms:

- Access Points — AP81XX

**Syntax**

`remove-override bluetooth-detection`

**Parameters**

- `remove-override bluetooth-detection`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>remove-override bluetooth-detection</code></td>
<td>Enables access point to detect bluetooth devices using the Bluetooth USB module</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-profile-testAP81XX)#remove-override bluetooth-detection
```
7.1.62 rf-domain-manager

Configures the RF Domain manager election criteria

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
rf-domain-manager [capable|priority <1-255>]

Parameters
- rf-domain-manager [capable|priority <1-255>]

  capable | Enables devices using this profile capable of being elected as the RF Domain manager. This option is enabled by default.

  priority <1-255> | Assigns a priority value for devices using this profile in the RF Domain manager election process. The higher the number set, higher is the device’s priority in the RF Domain manager election process.
  - <1-255> – Select a priority value from 1 - 255.

Examples
rfs7000-37FABE(config-profile-default-rfs7000)#rf-domain-manager priority 9
rfs7000-37FABE(config-profile-default-rfs7000)#show context

Related Commands
- no | Disables or reverts settings to their default
### 7.1.63 router

**Profile Config Commands**

Enables dynamic routing (BGP and/or OSPF) and enters the routing protocol configuration mode.

Supported in the following platforms:

- **Access Points** — AP622, AP6522, AP6532, AP6562, AP71XX, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500

### Syntax

```
routing [bgp|ospf]
```

### Parameters

- **router [bgp|ospf]**

<table>
<thead>
<tr>
<th>bgp</th>
<th>Enables BGP dynamic routing and configures relevant settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>BGP is an inter-ISP routing protocol, which establishes routing between ISPs. ISPs use BGP to exchange routing and reachability information between Autonomous Systems (AS) on the Internet. BGP uses TCP as its transport protocol, eliminating the need to implement explicit update fragmentation, retransmission, acknowledgement, and sequencing. Routing information exchanged through BGP supports destination based forwarding only. It assumes a router forwards packets based on the destination address carried in the IP header of the packet. An AS is a set of routers under the same administration that use Interior Gateway Protocol (IGP) and common metrics to define how to route packets within the AS. For more information on dynamic BGP routing configurations, see <strong>BORDER GATEWAY PROTOCOL</strong>.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ospf</th>
<th>Enables OSPF dynamic routing and configures relevant settings. Changes configuration mode to router mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSPF is a link-state IGP. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets. For more information on dynamic OSPF routing configurations, see <strong>ROUTER-MODE COMMANDS</strong>.</td>
<td></td>
</tr>
</tbody>
</table>
Examples

rfs7000-37FABE(config-profile-default-rfs7000)#router ospf

rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#?

Router OSPF Mode commands:

7.1.64 spanning-tree

Profile Config Commands

Enables spanning tree commands. Use these commands to configure the errdisable, multiple spanning tree and portfast settings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

- `spanning-tree [errdisable|mst|portfast]`
- `spanning-tree errdisable recovery [cause bpduguard|interval <10-1000000>]`
- `spanning-tree mst [<0-15>|cisco-interoperability|enable|forward-time|hello-time|instance|max-age|max-hops|region|revision]`
- `spanning-tree mst [<0-15> priority <0-61440>|cisco-interoperability [enable|disable]|enable|forward-time <4-30>|hello-time <1-10>|instance <1-15>|max-age <6-40>|max-hops <7-127>|region <LINE>|revision <0-255>]`
- `spanning-tree portfast [bpdufilter|bpduguard] default`

Parameters

- `spanning-tree errdisable recovery [cause bpduguard|interval <10-1000000>]`
- `spanning-tree mst [<0-15> priority <0-61440>|cisco-interoperability [enable|disable]|enable|forward-time <4-30>|hello-time <1-10>|instance <1-15>|max-age <6-40>|max-hops <7-127>|region <LINE>|revision <0-255>]`

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errdisable</td>
<td>Disables or shutdown ports where traffic is looping, or ports with traffic in one direction.</td>
</tr>
<tr>
<td>recovery</td>
<td>Enables the timeout mechanism for a port to be recovered. This option is disabled by default.</td>
</tr>
<tr>
<td>cause bpduguard</td>
<td>Specifies the reason for errdisable</td>
</tr>
<tr>
<td></td>
<td>bpduguard – Recovers from errdisable due to bpduguard</td>
</tr>
<tr>
<td>interval &lt;10-1000000&gt;</td>
<td>Specifies the interval after which a port is enabled</td>
</tr>
<tr>
<td></td>
<td>&lt;10-1000000&gt; – Specify a value from 10 - 1000000 seconds. The default is 300 seconds.</td>
</tr>
</tbody>
</table>

- `spanning-tree mst [<0-15> priority <0-61440>|cisco-interoperability [enable|disable]|enable|forward-time <4-30>|hello-time <1-10>|instance <1-15>|max-age <6-40>|max-hops <7-127>|region <LINE>|revision <0-255>]`

- `mst` Configures Multiple Spanning Tree (MST) commands
  - The MSTP provides an extension to STP to optimize the usefulness of VLANs. MSTP allows for a separate spanning tree for each VLAN group, and blocks all but one of the possible alternate paths within each spanning tree topology.

- `<0-15> priority <0-61440>` Specifies the number of instances required to configure MST. Select a value from 0 - 15.
  - priority – Sets the bridge priority to the specified value. This value is used to determine the root bridge. Use the no parameter with this command to restore the default bridge priority value.
  - <0-61440> – Sets the bridge priority in increments (Lower priority indicates greater likelihood of becoming root)
### Usage Guidelines

If a bridge does not hear BPDUs from the root bridge within the specified interval, assume the network has changed and recomputed the spanning-tree topology.

Generally, spanning tree configuration settings in the config mode define the configuration for bridge and bridge instances. MSTP is based on instances. An instance is a group of VLANs with a common spanning tree. A single VLAN cannot be associated with multiple instances.

Wireless Controllers or service platforms with the same instance, VLAN mapping, revision number and region names define a unique region. Wireless Controllers or service platforms in the same region exchange BPDUs with instance record information within.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cisco interoperability</td>
<td>Enables or disables CISCO interoperability. Enables/disables interoperability with CISCO’s version of MSTP, which is incompatible with standard MSTP. This setting is disabled by default.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables MST protocol.</td>
</tr>
<tr>
<td>forward-time &lt;4-30&gt;</td>
<td>Specifies the forwarding delay time in seconds.</td>
</tr>
<tr>
<td>hello-time &lt;1-10&gt;</td>
<td>Specifies the hello BDU interval in seconds.</td>
</tr>
<tr>
<td>instance &lt;1-15&gt;</td>
<td>Defines the instance ID to which the VLAN is associated.</td>
</tr>
<tr>
<td>max-age &lt;6-40&gt;</td>
<td>Defines the maximum time to listen for the root bridge.</td>
</tr>
<tr>
<td>max-hops &lt;7-127&gt;</td>
<td>Defines the maximum hops when BPDU is valid.</td>
</tr>
<tr>
<td>region &lt;LINE&gt;</td>
<td>Specifies the MST region.</td>
</tr>
<tr>
<td>revision &lt;0-255&gt;</td>
<td>Sets the MST bridge revision number. This enables the retrieval of configuration information.</td>
</tr>
<tr>
<td>portfast [bpdufilter</td>
<td>bpduguard] default</td>
</tr>
<tr>
<td></td>
<td>• bpdufilter default – Sets the BPDU filter for the port. The BPDU filter is disabled by default.</td>
</tr>
<tr>
<td></td>
<td>• bpduguard default – Guards PortFast ports against BPDU receive. The BPDU guard is disabled by default.</td>
</tr>
<tr>
<td></td>
<td>• default – Enables the BPDU filter and/or BPDU guard on PortFast enabled ports by default.</td>
</tr>
</tbody>
</table>

### 7.1.65 traffic-class-mapping

#### Profile Config Commands

Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority. This mapping is required to provide priority of service to some packets over others. For example, VoIP packets get higher priority than data packets to provide a better quality of service for high priority voice traffic. Devices use the traffic class field in the IPv6 header to set this priority. This command allows you to assign a priority for different IPv6 traffic types.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
traffic-class-mapping <IPv6-TRAFFIC-CLASS-VALUE> priority <0-7>
```

#### Parameters

- `traffic-class-mapping <IPv6-TRAFFIC-CLASS-VALUE> priority <0-7>`

<table>
<thead>
<tr>
<th>traffic-class-mapping</th>
<th>Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IPv6-TRAFFIC-CLASS-VALUE&gt;</code></td>
<td>Specify the traffic class value of incoming IPv6 untagged packet(s) (could be a single value or a list. For example, 10-20, 25, 30-35). This is the DSCP 6-bit parameter in the header of every IP packet used for packet classification.</td>
</tr>
<tr>
<td>priority <code>&lt;0-7&gt;</code></td>
<td>Specify the 802.1p priority to map with the traffic-class value specified in the previous step</td>
</tr>
</tbody>
</table>

- `<0-7>` – Specify a value from 0 - 7.

**Note:** The 802.1p priority is a 3-bit IP precedence value in the Type of Service field of the IP header used to set the priority. The valid values for this field are 0-7. Up to 64 entries are permitted. The priority values are:
- 0 – Best Effort
- 1 – Background
- 2 – Spare
- 3 – Excellent Effort
- 4 – Controlled Load
- 5 – Video
- 6 – Voice
- 7 – Network Control
**Examples**

rfs4000-229D58(config-profile-TestRFS4000)#traffic-class-mapping 25 priority 2

rfs4000-229D58(config-profile-TestRFS4000)#show context profile rfs4000 TestRFS4000

7.1.66 tunnel-controller

Profile Config Commands

Configures the tunneled WLAN (extended VLAN) wireless controller or service platform’s name.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

Profile Config Commands

Configures VRRP group settings

A default gateway is a critical resource for connectivity. However, it is prone to a single point of failure. Thus, redundancy for the default gateway is required. If WAN backhaul is available, and a router failure occurs, then the controller should act as a router and forward traffic on to its WAN link.

Define an external VRRP configuration when router redundancy is required in a network requiring high availability.

Central to VRRP configuration is the election of a VRRP master. A VRRP master (once elected) performs the following functions:

- Responds to ARP requests
- Forwards packets with a destination link layer MAC address equal to the virtual router’s MAC address
- Rejects packets addressed to the IP address associated with the virtual router, if it is not the IP address owner
- Accepts packets addressed to the IP address associated with the virtual router, if it is the IP address owner or accept mode is true.

The nodes that lose the election process enter a backup state. In the backup state they monitor the master for any failures, and in case of a failure one of the backups, in turn, becomes the master and assumes the management of the designated virtual IPs. A backup does not respond to an ARP request, and discards packets destined for a virtual IP resource.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
vrrp [<1-255>|version]

vrrp <1-255> [delta-priority|description|interface|ip|monitor|preempt|priority|
sync-group|timers]

vrrp <1-255> [delta-priority <1-253>|description <LINE>|ip <IP> {<IP>}|
   preempt {delay <1-65535>}|priority <1-254>|sync-group]

vrrp <1-255> interface vlan <1-4094>

vrrp <1-255> monitor [<IF-NAME>|critical-resource|pppoe1|vlan|wwan1]

vrrp <1-255> monitor [<IF-NAME]|pppoe1|vlan 1-4094] [vlan|wwan1] {(<IF-NAME>|critical-resource/pppoe1/vlan|wwan1)}

vrrp <1-255> monitor critical-resource <CRM-NAME1> <CRM-NAME2> <CRM-NAME3> <CRM-NAME4>
   [action [decrement-priority|increment-priority] {IF-NAME|pppoe1/vlan|wwan1}]

vrrp version [2|3]
```

Parameters

- **vrrp <1-255> [delta-priority 1-253]|description 1-LINE|vrrp ip <IP> {<IP>}
  |preempt {delay 1-65535}|priority 1-254|sync-group**

<p>| vrrp &lt;1-255&gt; | Configures the virtual router ID from 1- 255. Identifies the virtual router the packet is reporting status for. |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp &lt;1-255&gt;</td>
<td>Configures the virtual router ID from 1-255. Identifies the virtual router the packet is reporting status for.</td>
</tr>
<tr>
<td>interface vlan &lt;1-4094&gt;</td>
<td>Enables VRRP on the specified switch VLAN interface (SVI)</td>
</tr>
<tr>
<td></td>
<td>• vlan &lt;1-4094&gt; – Specify the VLAN interface ID from 1-4094.</td>
</tr>
<tr>
<td>vrrp &lt;1-255&gt; monitor</td>
<td>Configures the virtual router ID from 1-255. Identifies the virtual router the packet is reporting status for.</td>
</tr>
<tr>
<td>critical-resource &lt;CRM-NAME1&gt;</td>
<td>Enables link monitoring or Critical Resource Monitoring (CRM)</td>
</tr>
<tr>
<td></td>
<td>Specifies the name of the critical resource to monitor. VRRP can be configured to monitor maximum of four critical resources. Use the &lt;CRM-NAME2&gt;, &lt;CRM-NAME3&gt;, and &lt;CRM-NAME4&gt; to provide names of the remaining three critical resources. By default VRRP is configured to monitor all critical resources on the device.</td>
</tr>
</tbody>
</table>
action
[decrement-priority]
[increment-priority]
Sets the action on critical resource down event. It is a recursive parameter that sets the action for each of the four critical resources being monitored.
  • decrement-priority – Decrement the priority of virtual router on critical resource down event
  • increment-priority – Increment the priority of virtual router on critical resource down event

<IF-NAME>
Optional. Enables interface monitoring
  • <IF-NAME> – Specify the interface name to monitor

ppoe1
Optional. Enables Point-to-Point Protocol (PPP) over Ethernet interface monitoring

vlan <1-4094>
Optional. Enables VLAN (switched virtual interface) interface monitoring
  • <1-4094> – Specify the VLAN interface ID from 1 - 4094.

wwan1
Optional. Enables Wireless WAN interface monitoring

vrrp <1-255> timers advertise [<1-255>|centiseconds <25-4095>|msec <250-999>]
Configures the VRRP advertisements time interval. This is the interval at which a master sends out advertisements on each of its configured VLANs.
  • <1-255> – Configures the timer interval from 1- 255 seconds. (applicable for VRRP version 2 only)
  • centiseconds <25-4095> – Configures the timer interval in centiseconds (1/100th of a second). Specify a value between 25 - 4095 centiseconds (applicable for VRRP version 3 only).
  • msec <250-999> – Configures the timer interval in milliseconds (1/1000th of a second). Specify a value between 250 - 999 msec (applicable for VRRP version 2 only).
  Default is 1 second.

vrrp version [2|3]
Configures one of the following VRRP versions:
  • 2 – VRRP version 2 (RFC 3768). This is the default setting.
  • 3 – VRRP version 3 (RFC 5798 only IPV4)

The VRRP version determines the router redundancy. Version 3 supports sub-second (centisecond) VRRP failover and support services over virtual IP.

Examples
rfs7000-37FABE(config-profile-default-rfs7000)#vrrp version 3
rfs7000-37FABE(config-profile-default-rfs7000)#vrrp 1 sync-group

7.1.69 `vrrp-state-check`

Profile Config Commands

Publishes interface via OSPF or BGP based on Virtual Router Redundancy Protocol (VRRP) status. VRRP allows automatic assignment of available IP routers to participating hosts. This increases the availability and reliability of routing paths via automatic default gateway selections on an IP subnetwork. This option is enabled by default.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

```
vrrp-state-check
```

Parameters

None

Examples

```
x9500-6C8809(config-device-B4-C7-99-6C-88-09)#vrrp-state-check
```

```
x9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context
nx9000 B4-C7-99-6C-88-09

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

Related Commands

```
no
```
Disables the publishing of an interface via OSPF/BGP based on VRRP status
7.1.70 **wep-shared-key-auth**

Profile Config Commands

Enables support for 802.11 WEP shared key authentication

When enabled, devices, using this profile, use a WEP key to access the network. The controller or service platform use the key algorithm to convert an ASCII string to the same hexadecimal number. Clients without the recommended adapters need to use WEP keys manually configured as hexadecimal numbers. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

wep-shared-key-auth

**Parameters**

None

**Examples**

### 7.1.71 service

**Profile Config Commands**

Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
service [cluster|critical-resource|fast-switching|enable|global-association-list|lldp|meshpoint|pm|power-config|radius|remote-config|rss-timeout|watchdog|wireless|show]
```

```
service cluster master-election immediate
service critical-resource port-mode-source-ip <IP>
service enable [l2tpv3|pppoe|radiusd]
service global-association-list blacklist-interval <1-65535>
service lldp loop-detection
service meshpoint loop-prevention-port [<L2-INTERFACE-NAME>|ge <1-5>|port-channel <1-2]|up1]
service pm sys-restart
service power-config [3af-out|force-3at]
service radius dynamic-authorization additional-port <1-65535>
service remote-config apply-delay <0-600>
service rss-timeout <0-86400>
service watchdog

service wireless [anqp-frag-always|anqp-frag-size|ap650|client|cred-cache-sync|inter-ap-key|noise-immunity|reconfig-on-tx-stall|test|wispe-controller-port]

service wireless anqp-frag-always
service wireless anqp-frag-size <100-1500>
service wireless ap650 legacy-auto-update-image <FILE>
service wireless client tx-deauth on-radar-detect
service wireless cred-cache-sync [full|interval <30-864000>|never|partial]
service wireless test [max-rate|min-rate]
```

```
service wireless test [max-rate|min-rate] [1,2,5.5,6,11,12,18,24,36,48,54,mcs0,mcs1,............mcs23]
```

```
service wireless inter-ap-key [0 <WORD>|2 <WORD>|<WORD>]
```

```
service wireless noise-immunity
service wireless reconfig-on-rx-stall
service wireless test max-retries <0-15>
```

```
service wireless wispe-controller-port <1-65535>

service show cli
```
The following command is specific to the **NX45XX** and **NX65XX** series service platform:

```
service fast-switching
```

### Parameters
- **service cluster master-election immediate**
  - Initiates and completes cluster master election as soon as just one cluster member comes on and is active. This option is disabled by default.

- **service critical-resource port-mode-source-ip <IP>**
  - Hard codes a source IP for critical resource management. The default is 0.0.0.0

- **service enable [l2tpv3|pppoe|radiusd]**
  - Enables/disables L2TPv3 on this profile
  - Enables PPPoE features. When executed on a device, enables PPPoE on the logged device. When executed on a profile, enables PPPoE on all devices using that profile.
  - Enables RADIUS features. When executed on a device, enables RADIUS on the logged device. When executed on a profile, enables RADIUS on all devices using that profile.

- **service global-association-list blacklist-interval <1-65535>**
  - Configures the period for which a client is blacklisted. A client is considered blacklisted after being denied access by the server.
  - `<1-65535>` – Specify a value from 1 - 65535 seconds. The default is 60 seconds.

- **service lldp loop-detection**
  - Enables network loop detection via LLDP. This option is disabled by default.

- **service meshpoint loop-prevention-port [<L2-INTERFACE-NAME>|ge <1-4>|port-channel <1-2>]**
  - Limits meshpoint loop prevention to a single port
  - Limits meshpoint loop prevention on a specified Ethernet interface
    - `<L2-INTERFACE-NAME>` – Specify the layer 2 Ethernet interface name.
  - Limits meshpoint loop prevention on a specified GigabitEthernet interface
    - `ge <1-4>` – Specify the GigabitEthernet interface index from 1 - 4.
  - Limits meshpoint loop prevention on a specified port-channel interface
    - `port-channel <1-2>` – Specify the port-channel interface index from 1 - 2.

<tr>
<td>(&lt;30-864000&gt;– Specify a value from 30 - 864000 seconds. The default is 1200 seconds.</td>
<td></td>
</tr>
<tr>
<td>never</td>
<td>Disables credential cache entry synchronization for all associated clients other than roaming clients. This is the default setting.</td>
</tr>
<tr>
<td>partial</td>
<td>Enables partial synchronization of parameters for associated clients, with credential cache close to aging out</td>
</tr>
</tbody>
</table>

- **service wireless inter-ap-key [0 \(<\text{WORD}\>|2 \(<\text{WORD}\>|\text{<WORD>}\)>**

<table>
<thead>
<tr>
<th>wireless inter-ap-key</th>
<th>Configure encryption key used for securing inter-ap messages. This option is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0&lt;\text{WORD}&gt;[2&lt;\text{WORD}&gt;]&lt;\text{WORD}&gt;]</td>
<td>Specify a clear text or encrypted key.</td>
</tr>
</tbody>
</table>

- **service wireless noise-immunity**

  | wireless noise-immunity | Polls for status and reconfigures radio in case of receive stall. This option is enabled by default. |

- **service wireless reconfig-on-rx-stall**

  | wireless reconfig-on-rx-stall | Enables noise immunity on the radio |

- **service wireless test [max-rate|min-rate] [1,2,5.5,6,11,12,18,24,36,48,54,mcs0, mcs1,...mcs23]**

<table>

<table>
<thead>
<tr>
<th>wireless test</th>
<th>Configures the serviceability parameters used for testing</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-retries (&lt;0-15&gt;</td>
<td>Configures the maximum number of retries per packet from 0 - 15. The default is 0.</td>
</tr>
</tbody>
</table>
- **service wireless wispe-controller-port <1-65535>**

  **wispe-controller-port <1-65535>**
  Resets the Wireless Switch Protocol Enhanced (WISPe) controller port. This is the UDP port used to listen for WISPe.
  - `<1-65535>` – Specify a value from 1 - 65535. The default is 24756.

- **service show cli**

  **show cli**
  Displays running system configuration details
  - `cli` – Displays the CLI tree of the current mode

- **service fast-switching**

  **fast-switching**
  Enables fast switching of packets in the hardware
  Use the `no > service > fast-switching` to disable this feature.
  Fast switching can be enabled and disabled on the NX45XX and NX65XX series service platform.

**Examples**

```
rfs7000-37FABE(config-profile-testrfs7000)#service radius dynamic-authorization additional-port 1700

```

**Related Commands**

- **no**
  Removes or resets service command parameters
Assigns a Peripheral Component Interconnect expansion (PCIe) slot for Team-URC VM or WiNG support.

The NX45XX and NX65XX series service platforms support an optional NX expansion module for modular WAN and Telephony Gateway support. The NX Series Expansion Module kit (KT-NXMODC-01) allows for the installation and implementation of up to four PCIe cards. The Expansion Module kit can be installed in NX4500, NX4524, NX6500 or NX6524 model service platforms.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
slot <1-4>
```

**Parameters**

- `slot <1-4>`

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>slot &lt;1-4&gt;</td>
<td>Enables assignment of PCIe slots for TEAM-Centro or WiNG support. You can also assign the selected slot to any other VM.</td>
</tr>
<tr>
<td>&lt;1-4&gt; – Select the slot from 1 - 4. The command selects the slot and enters its configuration mode.</td>
<td></td>
</tr>
</tbody>
</table>

In the slot configuration mode, do the following:

- `assign` – Assigns the selected slot to either TEAM-Centro VM, WiNG, or other VM support
  - `team-centro` – Assigns the selected slot to TEAM-Centro VM (IP PBX)
  - `wing` – Assigns the selected slot to WiNG
  - `other` – Assigns the selected slot to other VM

**Note:** The `show > slot` command displays slots and their assignment details (type and status). Use the `no > assign` command to override the slot assignment configured.

**Examples**

```
x4500-5CFA2B(config-profile-testNX45XX)#slot 1
nx4500-5CFA2B(config-profile testNX45XX-slot-1)#
```

```
x4500-5CFA2B(config-profile testNX45XX-slot-1)#?
```

**Slot Mode commands:**

- `assign` Assign the slot
- `no` Negate a command or set its defaults
- `shutdown` Disable the slot
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
x4500-5CFA2B(config-profile testNX45XX-slot-1)#
```

```
x4500-5CFA2B(config-profile testNX45XX-slot-1)#assign team-centro
```
nx4500-5CFA2B(config-profile testNX45XX-slot-1)#show context
  slot 1
      assign team-centro
nx4500-5CFA2B(config-profile testNX45XX-slot-1)#

nx4500-5CFA2B(config-device B4-C7-99-5C-FA-2B-slot-1)#show slot
-----------------------------------
<table>
<thead>
<tr>
<th>SLOT TYPE</th>
<th>MODULE</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>team-centro</td>
<td>Enabled</td>
</tr>
<tr>
<td>2</td>
<td>wing</td>
<td>Enabled</td>
</tr>
<tr>
<td>3</td>
<td>wing</td>
<td>Enabled</td>
</tr>
<tr>
<td>4</td>
<td>wing</td>
<td>Enabled</td>
</tr>
</tbody>
</table>
-----------------------------------

nx4500-5CFA2B(config-device B4-C7-99-5C-FA-2B-slot-1)#

nx4500-5CFA2B(config-profile testNX45XX-slot-1)#no assign

nx4500-5CFA2B(config-profile testNX45XX-slot-1)#show context
  slot 1
nx4500-5CFA2B(config-profile testNX45XX-slot-1)#

Use the shutdown option to shut down the selected slot.

nx4500-5CFA2B(config-profile testNX45XX-slot-1)#shutdown

Related Commands

7.2 Device Config Commands

Profiles

Use the (config) instance to configure device specific parameters.

To navigate to this instance, use the following commands:

<DEVICE>(config)#<DEVICE-TYPE> <MAC>
<DEVICE>(config-device-<MAC>)#?

Device Mode commands:

- adoption: Adoption configuration.
- adoption-site: Set system's adoption site.
- alias: Alias.
- analytics: Enable WiNG Onboard Analytics Data.
- area: Set name of area where the system is located.
- arp: Address Resolution Protocol (ARP).
- auto-learn-staging-config: Enable learning network configuration of the devices that come for adoption.
- autogen-uniqueid: Autogenerate a unique id.
- autoinstall: Autoinstall settings.
- bluetooth-detection: Detect Bluetooth devices using the Bluetooth USB module.
- bridge: Ethernet bridge.
- captive-portal: Captive portal.
- cdp: Cisco Discovery Protocol.
- channel-list: Configure channel list to be advertised to wireless clients.
- cluster: Cluster configuration.
- configuration-persistence: Enable persistence of configuration across reloads (startup config file).
- contact: Configure the contact.
- controller: WLAN controller configuration.
- country-code: Configure the country of operation.
- crypto: Encryption related commands.
- device-upgrade: Device firmware upgrade.
- dot1x: 802.1X.
- dscp-mapping: Configure IP DSCP to 802.1p priority mapping for untagged frames.
- email-notification: Email notification configuration.
- enforce-version: Check the firmware versions of devices before interoperating.
- environmental-sensor: Environmental Sensors Configuration.
- events: System event messages.
- export: Export a file.
- floor: Set the floor within a area where the system is located.
- geo-coordinates: Configure geo coordinates for this device.
- gre: GRE protocol.
- hostname: Set system's network name.
- http-analyze: Specify HTTP-Analysis configuration.
- interface: Select an interface to configure.
- ip: Internet Protocol (IP).
- l2tpv3: L2tpv3 protocol.
- l3e-lite-table: L3e lite Table.
- layout-coordinates: Configure layout coordinates for this device.
- led: Turn LEDs on/off on the device.
- led-timeout: Configure the time for the led to
legacy-auto-downgrade
   Enable device firmware to auto
downgrade when other legacy devices
are detected

legacy-auto-update
   Auto upgrade of legacy devices
license
   License management command
lldp
   Link Layer Discovery Protocol
load-balancing
   Configure load balancing parameter
location
   Configure the location
logging
   Modify message logging facilities
mac-address-table
   MAC Address Table
mac-auth
   Configure MAC address to name
mappings
mac-name
   Memory profile to be used on the
device
meshpoint-device
   Configure meshpoint device
parameters
meshpoint-monitor-interval
   Configure meshpoint monitoring
interval
min-misconfiguration-recovery-time
   Check controller connectivity after
configuration is received
mint
   MiNT protocol
mirror
   Mirroring
misconfiguration-recovery-time
   Check controller connectivity after
configuration is received
neighbor-inactivity-timeout
   Configure neighbor inactivity
timeout
neighbor-info-interval
   Configure neighbor information
exchange interval
no
   Negate a command or set its
defaults
noc
   Configure the noc related setting
ntp
   Ntp server A.B.C.D
offline-duration
   Set duration for which a device
remains unadopted before it
generates offline event
override-wlan
   Configure RF Domain level overrides
for wlan
power-config
   Configure power mode
preferred-controller-group
   Controller group this system will
prefer for adoption
preferred-tunnel-controller
   Tunnel Controller Name this system
will prefer for tunneling extended
vlan traffic
radius
   Configure device-level radius
authentication parameters
raid
   RAID
remove-override
   Remove configuration item override
from the device (so profile value
takes effect)
rf-domain-manager
   RF Domain Manager
router
   Dynamic routing
rsa-key
   Assign a RSA key to a service
sensor-server
   AirDefense sensor server
configuration
slot
   PCI expansion Slot
spanning-tree
   Spanning tree
traffic-class-mapping
   Configure IPv6 traffic class to
802.1p priority mapping for
untagged frames
timezone
   Configure the timezone
trustpoint
   Assign a trustpoint to a service
tunnel-controller
   Tunnel Controller group this
controller belongs to
use
   Set setting to use
vrrp
   VRRP configuration
vrrp-state-check
   Publish interface via OSPF/BGP only
if the interface VRRP state is not
The following command table is a summary of device configuration mode commands:

### Table 7.24 Device-Configuration-Mode Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>adopter-auto-provisioning-policy-lookup</td>
<td>Enables the use of a centralized auto provisioning policy on this device</td>
<td>page 7-11</td>
</tr>
<tr>
<td>adoption</td>
<td>Configures a minimum and maximum delay time in the initiation of the device adoption process</td>
<td>page 7-12</td>
</tr>
<tr>
<td>adoption-site</td>
<td>Sets the device's adoption site name</td>
<td>page 7-418</td>
</tr>
<tr>
<td>alias</td>
<td>Configures network, VLAN, and service aliases on a device</td>
<td>page 7-13</td>
</tr>
<tr>
<td>analytics</td>
<td>Enables analytics in the NX9000 profile/device configuration context</td>
<td>page 7-18</td>
</tr>
<tr>
<td>area</td>
<td>Sets the name of area where the system is deployed</td>
<td>page 7-419</td>
</tr>
<tr>
<td>arp</td>
<td>Configures ARP parameters</td>
<td>page 7-20</td>
</tr>
<tr>
<td>auto-learn-staging-config</td>
<td>Enables automatic recognition of devices pending adoption</td>
<td>page 7-22</td>
</tr>
<tr>
<td>autogen-uniqueid</td>
<td>When executed in the device configuration mode, this command generates a unique ID for the logged device</td>
<td>page 7-23</td>
</tr>
<tr>
<td>autoinstall</td>
<td>Autoinstalls firmware image and configuration setup parameters</td>
<td>page 7-25</td>
</tr>
<tr>
<td>bridge</td>
<td>Configures Ethernet Bridging parameters</td>
<td>page 7-27</td>
</tr>
<tr>
<td>captive-portal</td>
<td>Configures captive portal advanced Web page upload on this profile</td>
<td>page 7-54</td>
</tr>
<tr>
<td>cdp</td>
<td>Operates CDP on the device</td>
<td>page 7-55</td>
</tr>
<tr>
<td>channel-list</td>
<td>Configures channel list advertised to wireless clients</td>
<td>page 7-420</td>
</tr>
<tr>
<td>cluster</td>
<td>Sets cluster configuration</td>
<td>page 7-56</td>
</tr>
</tbody>
</table>

<tr>
<td>mac-address-table</td>
<td>Configures the MAC address table</td>
<td>page 7-355</td>
</tr>
<tr>
<td>mac-auth</td>
<td>Enables 802.1x authentication of hosts on this device</td>
<td>page 7-357</td>
</tr>
<tr>
<td>mac-name</td>
<td>Configures MAC address to device name mappings</td>
<td>page 7-430</td>
</tr>
<tr>
<td>memory-profile</td>
<td>Configures memory profile used on the device</td>
<td>page 7-360</td>
</tr>
<tr>
<td>meshpoint-device</td>
<td>Configures meshpoint device parameters</td>
<td>page 7-361</td>
</tr>
<tr>
<td>meshpoint-monitor-interval</td>
<td>Configures meshpoint monitoring interval</td>
<td>page 7-362</td>
</tr>
<tr>
<td>min-misconfiguration-recovery-time</td>
<td>Configures the minimum device connectivity verification time</td>
<td>page 7-363</td>
</tr>
<tr>
<td>mint</td>
<td>Configures MiNT protocol settings</td>
<td>page 7-364</td>
</tr>
<tr>
<td>misconfiguration-recovery-time</td>
<td>Verifies device connectivity after a configuration is received</td>
<td>page 7-370</td>
</tr>
<tr>
<td>neighbor-inactivity-timeout</td>
<td>Configures neighbor inactivity timeout value</td>
<td>page 7-371</td>
</tr>
<tr>
<td>neighbor-info-interval</td>
<td>Configures the neighbor information exchange interval</td>
<td>page 7-372</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or resets values to their default settings</td>
<td>page 7-431</td>
</tr>
<tr>
<td>noc</td>
<td>Configures NOC settings</td>
<td>page 7-375</td>
</tr>
<tr>
<td>ntp</td>
<td>Configures NTP server settings</td>
<td>page 7-376</td>
</tr>
<tr>
<td>offline-duration</td>
<td>Sets the duration, in minutes, for which a device remains unadopted before it generates offline event</td>
<td>page 7-379</td>
</tr>
<tr>
<td>override-wlan</td>
<td>Configures WLAN RF Domain level overrides on the logged device</td>
<td>page 7-432</td>
</tr>
<tr>
<td>power-config</td>
<td>Configures power mode features</td>
<td>page 7-380</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>preferred-controller-group</td>
<td>Specifies the wireless controller or service platform group the system prefers for adoption</td>
<td>page 7-382</td>
</tr>
<tr>
<td>preferred-tunnel-controller</td>
<td>Configures the tunnel wireless controller or service platform preferred by the system for tunneling extended VLAN traffic</td>
<td>page 7-383</td>
</tr>
<tr>
<td>radius</td>
<td>Configures device-level RADIUS authentication parameters</td>
<td>page 7-384</td>
</tr>
<tr>
<td>remove-override</td>
<td>Removes device overrides</td>
<td>page 7-434</td>
</tr>
<tr>
<td>rf-domain-manager</td>
<td>Enables the RF Domain manager</td>
<td>page 7-386</td>
</tr>
<tr>
<td>router</td>
<td>Configures dynamic router protocol settings</td>
<td>page 7-387</td>
</tr>
<tr>
<td>rsa-key</td>
<td>Assigns a RSA key to SSH</td>
<td>page 7-436</td>
</tr>
<tr>
<td>sensor-server</td>
<td>Configures an AirDefense sensor server</td>
<td>page 7-437</td>
</tr>
<tr>
<td>spanning-tree</td>
<td>Enables spanning tree commands on the logged device</td>
<td>page 7-389</td>
</tr>
<tr>
<td>traffic-class-mapping</td>
<td>Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority</td>
<td>page 7-392</td>
</tr>
<tr>
<td>timezone</td>
<td>Configures wireless controller or service platform's time zone settings</td>
<td>page 7-438</td>
</tr>
<tr>
<td>trustpoint</td>
<td>Assigns a trustpoint to a service</td>
<td>page 7-439</td>
</tr>
<tr>
<td>tunnel-controller</td>
<td>Configures the tunneled WLAN (extended VLAN) wireless controller or service platform's name</td>
<td>page 7-394</td>
</tr>
<tr>
<td>use</td>
<td>Associates different policies and settings with this device</td>
<td>page 7-395</td>
</tr>
<tr>
<td>vrrp</td>
<td>Configures VRRP group settings</td>
<td>page 7-399</td>
</tr>
<tr>
<td>vrrp-state-check</td>
<td>Publishes interface via OSPF or BGP based on Virtual Router Redundancy Protocol (VRRP) status</td>
<td>page 7-403</td>
</tr>
<tr>
<td>wep-shared-key-auth</td>
<td>Enables support for 802.11 WEP shared key authentication</td>
<td>page 7-404</td>
</tr>
<tr>
<td>mirror</td>
<td>Enables port mirroring on GE ports. This command is supported only on the NX4524 and NX6524 series service platforms.</td>
<td>page 7-441</td>
</tr>
<tr>
<td>raid</td>
<td>Enables alarm on the array. This command is supported only on the NX9500 series service platform.</td>
<td>page 7-443</td>
</tr>
<tr>
<td>slot</td>
<td>Assigns a physical slot for running Team-URC VM on this profile/device. This feature is support only on the NX45XX and NX65XX series service platforms.</td>
<td>page 7-410</td>
</tr>
</tbody>
</table>
### 7.2.1 adoption-site

*Device Config Commands*

Sets the device’s adoption site name

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
adoption-site <SITE-NAME>
```

**Parameters**

- adoption-site <SITE-NAME>

| adoption-site <SITE-NAME> | Sets the device’s adoption site name |

**Examples**

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58)#adoption-site SanJoseMainOffice
```

**Related Commands**

| no | Disables or reverts settings to their default |
7.2.2 area

Device Config Commands

Sets the physical area where the device (controller, service platform, or access point) is deployed. This can be a building, region, campus or other area that describes the deployment location of the device. Assigning an area name is helpful when grouping devices in RF Domains and profiles, as devices in the same physical deployment location may need to share specific configuration parameters in respect to radio transmission and interference requirements specific to that location.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

area <AREA-NAME>

Parameters

- area <AREA-NAME>

Examples

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#area RMZEcospace

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context
ap71xx 00-04-96-4A-A7-08
  use profile default-ap71xx
  use rf-domain default
  hostname ap7131-4AA708
area RMZeCospace
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#

Related Commands

no

Disables or reverts settings to their default
7.2.3 channel-list

Configure the channel list advertised to wireless clients

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
channel-list [2.4GHz|5GHz|dynamic]
channel-list [2.4GHz <CHANNEL-LIST>|5GHz <CHANNEL-LIST>|dynamic]
```

Parameters

- `channel-list [2.4GHz <CHANNEL-LIST>|5GHz <CHANNEL-LIST>|dynamic]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.4GHz &lt;CHANNEL-LIST&gt;</td>
<td>Configures the channel list advertised by radios operating in 2.4 GHz</td>
</tr>
<tr>
<td>5GHz &lt;CHANNEL-LIST&gt;</td>
<td>Configures the channel list advertised by radios operating in 5.0 GHz</td>
</tr>
<tr>
<td>dynamic</td>
<td>Enables dynamic (neighboring access point based) update of configured channel list</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#channel-list 2.4GHz 1,2
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context
ap71xx 00-04-96-4A-A7-08
  use profile default-ap71xx
  use rf-domain default
  hostname ap7131-4AA708
  area RMZEcospace
  channel-list 2.4GHz 1,2
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#
```

Related Commands

- `no` Resets the channel list configuration
7.2.4 contact

- **Device Config Commands**

Defines an administrative contact for a deployed device (controller, service platform, or access point)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`contact <WORD>`

**Parameters**

- `contact <WORD>`

**Examples**

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#contact Bob+1-631-738-5200
```
```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context
```
```
ap71xx 00-04-96-4A-A7-08
  use profile default-ap71xx
  use rf-domain default
  hostname ap7131-4AA708
  area RMZeCospace
  contact Bob+1-631-738-5200
  channel-list 2.4GHz 1,2
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#
```

**Related Commands**

- `no`
  - Resets the administrative contact name
7.2.5 country-code

- Device Config Commands

Defines the two digit country code for legal device deployment.

Configuring the correct country is central to legal operation. Each country has its own regulatory restrictions concerning electromagnetic emissions and the maximum RF signal strength that can be transmitted.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

country-code <WORD>

Parameters
- country-code <COUNTRY-CODE>

Examples

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#country-code us

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context
ap71xx 00-04-96-4A-A7-08
use profile default-ap71xx
use rf-domain default
hostname ap7131-4AA708
area RMZEcospace
contact Bob+1-631-738-5200
country-code us
channel-list 2.4GHz 1,2
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#

Related Commands

no | Removes the configured country code
--- | ---
7.2.6 floor

**Device Config Commands**

Sets the building floor name representative of the location within the area or building the device (controller, service platform, or access point) is physically deployed. Assigning a building floor name is helpful when grouping devices in RF Domains and profiles, as devices on the same physical building floor may need to share specific configuration parameters in respect to radio transmission and interference requirements specific to that location.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

diver <FLOOR-NAME> <1-4094>

**Parameters**

- floor <FLOOR-NAME> <1-4094>

<table>
<thead>
<tr>
<th>&lt;FLOOR-NAME&gt;</th>
<th>&lt;1-4094&gt;</th>
<th>Sets the building floor name where the device is deployed</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;FLOOR-NAME&gt;</td>
<td>&lt;1-4094&gt;</td>
<td>Sets a numerical floor designation in respect to the floor's actual location within a building. Specify a value from 1 - 4094. The default setting is the 1st floor.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#floor 5thfloor
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context
ap71xx 00-04-96-4A-A7-08
use profile default-ap71xx
use rf-domain default
hostname ap7131-4AA708
area RMZEcospacelfloor 5thfloor
contact Bob+1-631-738-5200
country-code us
channel-list 2.4GHz 1,2
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#
```

**Related Commands**

- no Removes device’s location floor name
### 7.2.7 geo-coordinates

**Device Config Commands**

Configures the geographic coordinates for this device. Specifies the exact location of this device in terms of latitude and longitude coordinates.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
geographic coordinates <-90.0000-90.0000> <-180.0000-180.0000>
```

**Parameters**

- **geographic coordinates <-90.0000-90.0000> <-180.0000-180.0000>**

<table>
<thead>
<tr>
<th>geographic coordinates</th>
<th>Configures the geographic coordinates for this device</th>
</tr>
</thead>
<tbody>
<tr>
<td>-90.0000-90.0000</td>
<td>Specify the device's latitude coordinate from -90.0000 to 90.0000. When looking at a floor map, latitude lines specify the east-west position of a point on the Earth's surface.</td>
</tr>
<tr>
<td>-180.0000-180.0000</td>

### 7.2.10 license

**Device Config Commands**

Adds a license pack on the device for the specified feature (AP/AAP/ADSEC/HTANLT/SMART-CACHE/WEBF).

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single *Network Operations Center* (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

The NOC controllers and/or site controllers can both have license packs installed. Adoption of APs by the NOC and site controllers depends on the number of licenses available on each of these controllers.

The NOC controllers and/or site controllers can both have license packs installed. When a AP is adopted by a site controller, the site controller pushes a license on to the AP. The various possible scenarios are:

- **AP licenses installed only on NOC controller:**
  
  The NOC controller provides the site controllers with AP licenses, ensuring that per platform limits are not exceeded.

- **AP licenses installed on site controller:**

  The site controller uses its installed licenses, and then asks the NOC controller for additional licenses in case of a shortage.

  In a hierarchical and centrally managed network, the NOC controller can pull unused AP licenses from site controllers and relocate to other site controllers when required.

- **AP licenses installed on any member of a site cluster:**

  The site controller shares installed and borrowed (from the NOC) licenses with other controllers within a site cluster.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
license <WORD> <LICENSE-KEY>
```

**Parameters**

- `license <WORD> <LICENSE-KEY>`

### 7.2.12 mac-name

#### Device Config Commands

Configures a client name to MAC address mapping. Use this command to assign a user-friendly name to the device (controller, service platform, or access point) and map it to the device’s MAC address.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
mac-name <MAC> <NAME>
```

#### Parameters

- `mac-name <MAC> <NAME>`

<table>
<thead>
<tr>
<th>mac-name &lt;MAC&gt; &lt;NAME&gt;</th>
<th>Maps a user-friendly name to the device’s MAC address</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;MAC&gt; – Specify the device’s MAC address.</td>
<td></td>
</tr>
<tr>
<td>&lt;NAME&gt; – Specify the ‘friendly’ name used for the specified MAC address. This is the name used in events and statistics logs.</td>
<td></td>
</tr>
</tbody>
</table>

#### Examples

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#mac-name 00-04-96-4A-A7-08 5.7TestAP
```

  rf-domain-manager|router|rsa-key|sensor-server|slot|spanning-tree|timezone|
  trustpoint|tunnel-controller|use|vrrp|wep-shared-key-auth|service]
```

**Parameters**

- **no <PARAMETERS>**

  Removes or resets the logged device’s settings based on the parameters passed

**Usage Guidelines**

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated

**Examples**

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#no area
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#no contact
```
7.2.14 override-wlan

Device Config Commands

Configures WLAN's RF Domain level overrides

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

override-wlan <WLAN> [shutdown|ssid|vlan-pool|wep128|wpa-wpa2-psk]
override-wlan <WLAN> [shutdown|ssid <SSID>|vlan-pool <1-4094> {limit <0-8192>}] | wpa-wpa2-psk <WORD>
override-wlan <WLAN> wep128 [key <1-4> hex [0<WORD>|2 <WORD>]|transmit-key <1-4>]

Parameters

- override-wlan <WLAN> [shutdown|ssid <SSID>|vlan-pool <1-4094> {limit <0-8192>}] | wpa-wpa2-psk <WORD>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</tr>
<tr>
<td>{limit &lt;0-8192&gt;}</td>
<td>• &lt;1-4094&gt; – Specifies a VLAN pool ID from 1 - 4094.</td>
</tr>
<tr>
<td>wpa-wpa2-psk &lt;WORD&gt;</td>
<td>Configures the WLAN WPA-WPA2 key or passphrase for the selected WLAN</td>
</tr>
<tr>
<td>&lt;WORD&gt;</td>
<td>• &lt;WORD&gt; – Specify a WPA-WPA2 key or passphrase.</td>
</tr>
</tbody>
</table>

Contd...

Wired Equivalent Privacy (WEP) is a security protocol specified in the IEEE Wireless Fidelity (Wi-Fi) standard. WEP 128 uses a 104 bit key, which is concatenated with a 24-bit initialization vector (IV) to form the RC4 traffic key. This results in a level of security and privacy comparable to that of a wired LAN.
**Examples**

```bash
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#override-wlan test vlan-pool 8

### 7.2.15 remove-override

**Device Config Commands**

Removes device overrides in order to enable profile settings to take effect.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

#### Syntax

`remove-override <PARAMETERS>`

#### Parameters

- `remove-override <PARAMETERS>`

<table>
<thead>
<tr>
<th><code>remove-override &lt;PARAMETERS&gt;</code></th>
<th>Removes settings configured at the device level based on the parameters passed. The profile (applied to the device) settings take effect once the device-level overrides are removed.</th>
</tr>
</thead>

Device Config Commands

Assigns an SSH RSA key

SSH keys are a pair of cryptographic keys used to authenticate users instead of, or in addition to, a username/password. One key is private and the other is public key. Secure Shell (SSH) public key authentication can be used by a requesting client to access resources, if properly configured. The RSA key pair must be generated on the client. The public portion of the key pair resides with the controller, service platform, or access point locally, while the private portion remains on a secure area of the client.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
rsa-key ssh <RSA-KEY-NAME>

Parameters
- rsa-key ssh <RSA-KEY-NAME>

Examples
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#rsa-key ssh rsa-key1

7.2.17 sensor-server

Device Config Commands

Configures an AirDefense sensor server resource for client terminations and WIPS event logging. This is the server that supports WIPS events on behalf of the controller or service platform.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

sensor-server <1-3> ip <IP/HOSTNAME> {port [443]<1-65535>}

Parameters

- sensor-server <1-3> ip <IP/HOSTNAME> {port [443]<1-65535>}

<table>
<thead>
<tr>
<th>sensor-server &lt;1-3&gt;</th>
<th>Sets a numerical index to differentiate this AirDefense sensor server from other servers. A maximum of 3 (three) sensor server resources can be defined.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip &lt;IP/HOSTNAME&gt;</td>
<td>Configures the AirDefense sensor server’s IP address or hostname</td>
</tr>
<tr>
<td>port [443]&lt;1-65535&gt;]</td>
<td>Optional. Configures the port. The options are:</td>
</tr>
<tr>
<td></td>
<td>- 443 – The default port used by the AirDefense server</td>
</tr>
<tr>
<td></td>
<td>- &lt;1-65535&gt; – Manually sets the port number of the AirDefense server from 1 - 65535</td>
</tr>
</tbody>
</table>

7.2.19 trustpoint

Configures the parameters necessary for obtaining certificate for this device.

A certificate links identity information with a public key enclosed in the certificate.

A certificate authority (CA) is a network authority that issues and manages security credentials and public keys for message encryption. The CA signs all digital certificates it issues with its own private key. The corresponding public key is contained within the certificate and is called a CA certificate. A browser must contain the CA certificate in its Trusted Root Library so it can trust certificates signed by the CA's private key.

Depending on the public key infrastructure, the digital certificate includes the owner’s public key, the certificate expiration date, the owner’s name and other public key owner information.

Each certificate is digitally signed by a trustpoint. The trustpoint signing the certificate can be a certificate authority, corporation or individual. A trustpoint represents a CA/identity pair containing the identity of the CA, CA-specific configuration parameters, and an association with an enrolled identity certificate.

SSH keys are a pair of cryptographic keys used to authenticate users instead of, or in addition to, a username/password. One key is private and the other is public key. Secure Shell (SSH) public key authentication can be used by a requesting client to access resources, if properly configured. A RSA key pair must be generated on the client. The public portion of the key pair resides with the controller or access point locally, while the private portion remains on a secure area of the client.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
trustpoint [https|radius-ca|radius-ca-ldaps|radius-server|radius-server-ldaps] <TRUSTPOINT>
```

Parameters

- `https <TRUSTPOINT>`
  - Uses an existing certificate/trustpoint for this device
    - `<TRUSTPOINT>` – Specify the trustpoint name.
- `radius-ca-ldaps <TRUSTPOINT>`
  - Uses an existing trustpoint as the certificate authority for validating external LDAP server
    - `<TRUSTPOINT>` – Specify the trustpoint name.
- `radius-ca <TRUSTPOINT>`
  - Uses an existing trustpoint as the certificate authority for validating client certificates in EAP
    - `<TRUSTPOINT>` – Specify the trustpoint name.
- `radius-server <TRUSTPOINT>`
  - Uses an existing trustpoint for RADIUS server certificate. Install the trustpoint using PKI commands in the enable mode.
    - `<TRUSTPOINT>` – Specify the trustpoint name.
- `radius-server-ldaps <TRUSTPOINT>`
  - Uses an existing trustpoint for RADIUS server certificate for the external LDAP server
    - `<TRUSTPOINT>` – Specify the trustpoint name.
Examples

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#trustpoint radius-ca trust2

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context

## 7.2.20 mirror

### Device Config Commands

Port mirroring enables forwarding of copies of incoming and/or outgoing packets from one or more ports in the switch to a specified destination port. The destination port serves as a duplicate image of the source ports and can be used to send packets to a network diagnostic tool without disrupting the behavior on the original port. Common diagnostic tools include network analyzers, remote monitoring probes, and IDS/IPS security devices. This feature facilitates network monitoring.

The NX4524 and NX6524 series service platforms support port mirroring. These devices mirror data packets transmitted or received on any of their GE ports (GE port 1 - 24). Both transmit and receive packets can be mirrored from a source to a destination port as needed to provide traditional spanning functionality on the 24 GE ports.

Supported in the following platforms:
- Service Platforms — NX4524, NX6524

### Syntax

```
mirror interface [<INTERFACE-NAME>|ge <1-24>] to interface [<INTERFACE-NAME>|ge <1-24>] {direction [any|inbound|outbound]}
```

### Parameters

- **mirror interface [<INTERFACE-NAME>|ge <1-24>] to interface [<INTERFACE-NAME>|ge <1-24>] {direction [any|inbound|outbound]}**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mirror interface [&lt;INTERFACE-NAME&gt;</td>
<td>ge &lt;1-24&gt;]</td>
</tr>
<tr>
<td>ge &lt;1-24&gt;</td>
<td>Specifies the source GE port index</td>
</tr>
<tr>
<td>&lt;INTERFACE-NAME&gt;</td>
<td>Specifies the source port name</td>
</tr>
<tr>
<td>Note:</td>
<td>A source port cannot be a destination port.</td>
</tr>
<tr>
<td>Note:</td>
<td>The source ports can be on the same or different VLANs.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>to interface [&lt;INTERFACE-NAME&gt;</td>
<td>ge &lt;1-24&gt;]</td>
</tr>
<tr>
<td>ge &lt;1-24&gt;</td>
<td>Specifies the destination GE port index</td>
</tr>
<tr>
<td>&lt;INTERFACE-NAME&gt;</td>
<td>Specifies the destination port name</td>
</tr>
<tr>
<td>The destination port serves as a duplicate image of the source port and can be used to send packets to a network diagnostic without disrupting the behavior on the original port. The destination port transmits only mirrored traffic and does not forward received traffic. Additionally, address learning is disabled on the destination port. The destination port is also referred to as the Mirror-to-Port (MTP).</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>direction [any</td>
<td>inbound</td>
</tr>
<tr>
<td>any</td>
<td>Spans packets in either direction (inbound and outbound)</td>
</tr>
<tr>
<td>inbound</td>
<td>Spans received packets only</td>
</tr>
<tr>
<td>outbound</td>
<td>Spans transmitted packets only</td>
</tr>
</tbody>
</table>

### NOTE: Port mirroring is not supported on NX4500 or NX6500 models, as they only support GE ports 1 - 2. Additionally, port mirroring is not supported on uplink (up) ports or wired ports on any controller or service platform model.
Usage Guidelines
All mirroring sessions must use the same destination port for packet capture.

Examples
nx4524-470984(config-device-B6-22-D9-47-09-84)#mirror interface ge 3 to interface ge 24 direction any

nx4524-470984(config-device-B6-22-D9-47-09-84)#mirror interface ge 5 to interface ge 24 direction inbound

nx4524-470984(config-device-B6-22-D9-47-09-84)#mirror interface ge 7 to interface ge 24 direction outbound

nx4524-470984#show mirroring
Session Source Destination Direction
1   ge3   ge24   any
2   ge7   ge24   inbound
3   ge5   ge24   outbound

nx4524-470984#

Related Commands

no
Disables data packets mirroring on GE ports
7.2.21 raid

- **Device Config Commands**

  Enables/disables chassis alarm that sounds when events are detected that degrade RAID support (drive content mirroring) on a service platform.

  The NX9000 (NX9000, NX9500 and NX9510) series service platforms include a single Intel MegaRAID controller (virtual drive) with RAID-1 mirroring support enabled. The online virtual drive supports up to two physical drives that could require hot spare substitution if a drive were to fail. The WiNG software allows you to manage the RAID controller event alarm and syslogs supporting the array hardware from the service platform user interface without rebooting the service platform BIOS.

  Although RAID controller drive arrays are available only on the NX9000 series service platforms, they can be administrated on behalf of a NX9000 profile by a different model service platform or wireless controller.

  For more information on RAID, see `raid`.

  Supported in the following platforms:
  - Service Platforms — NX9000, NX9500, NX9510

**Syntax**

```
raid alarm enable
```

**Parameters**

- `raid alarm enable`

  Enables audible alarm, which is triggered a RAID drives fails. When triggered the alarm can be disabled by executing the `raid > silence` command in the device’s Priv Exec mode.

**Examples**

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#raid alarm enable

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context
nx9000 B4-C7-99-6C-88-09
use profile default-nx9000

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```

**Related Commands**

- `no` Disables RAID alarm
7.3 T5 Profile Config Commands

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The Customer Premises Equipment (CPEs) are the T5 controller managed radio devices using the IPX operating system. These CPEs use a Digital Subscriber Line (DSL) as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.

To navigate to this instance, use the following commands:

<DEVICE>(config-profile-<PROFILE-NAME>)#?

T5 Profile Mode commands:
cpe T5 CPE configuration
interface Select an interface to configure
ip Internet Protocol (IP)
no Negate a command or set its defaults
ntp Configure NTP
t5 T5 configuration
t5-logging Modify message logging facilities
use Set setting to use
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

<DEVICE>(config-profile-<PROFILE-NAME>)#

The following table summarizes T5 profile configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>

## 7.3.2 interface

### T5 Profile Config Commands

Configures the T5 controller's interfaces

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

### Syntax

```
interface [<WORD>|dsl|fe|ge|radio|vlan]
```

### Parameters

- `interface [<WORD>|dsl|fe|ge|radio|vlan]`

<table>
<thead>
<tr>
<th>&lt;WORD&gt;</th>
<th>Description</th>
</tr>
</thead>
</table>
| dsl <1-24> | Configures the specified Digital Subscriber Line (DSL) interface. A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.  
  - `<1-24>` – Specify the DSL port index from 1 - 24. |
| fe <1-24> <1-2> | Configures the specified FastEthernet interface. The T5 controller has the following FastEthernet port designations: fe1-fe2 (fe1-fe2 are for up to 24 CPE devices managed by a T5 controller).  
  - `<1-24>` – Specify the DSL port index from 1 - 24.  
  - `<1-2>` – Specify the FastEthernet interface to configure.  
  
  **Note:** In the FastEthernet interface configuration mode, specify the interface settings. |
| ge <1-2> | Configures the specified GigabitEthernet interface.  
  T5 controllers have two Ethernet port designations, These are ge1 and ge2.  
  The GE ports can be RJ-45 or fiber ports supporting 10/100/1000Mbps.  
  - `<1-2>` – Specify the interface index from 1 - 2.  
  
  **Note:** In the GigabitEthernet interface configuration mode, specify the interface settings. |
| radio <1-24> | Configures the specified radio interface. T5 controller managed CPE device radios can have their radio configurations overridden once their radios have successfully associated and have been provisioned by the adopting controller, service platform, or peer model AP controller access point.  
  - `<1-2>` – Specify the radio interface index from 1 - 24. |
| vlan <1-4094> | Configures the specified VLAN interface. Once configured, the VLAN interface provides layer 3 (IP) T5 controller access or provides layer 3 service on a VLAN. The VLAN interface defines which IP address is associated with each VLAN ID a T5 controller is connected to. A VLAN interface is created for the default VLAN (VLAN 1) to enable remote administration. This interface is also used to map VLANs to IP4 and IPv6 formatted IP address ranges. This mapping determines the destination for routing.  
  - `<1-4094>` – Specify the VLAN interface index from 1 - 4094.  
  
  **Note:** In the VLAN configuration mode, specify the interface’s primary IP address in the A.B.C.D/M format. Optionally specify the secondary IP address. |
Examples

rfs7000-37FABE(config-profile-t5Profile)#interface dsl 1

rfs7000-37FABE(config-profile-t5Profile-if-dsl1)#?

Interface configuration commands:
- **description** Port description
- **ds-interleaver** Enable impulse noise protection in the downstream direction
- **ds-max-datarate** Configure maximum allowed downstream rate for the interface
- **ds-min-margin** Configure the minimum downstream signal-to-noise (SNR) ratio margin
- **ds-target-margin** Configure the desired downstream signal-to-noise (SNR) ratio margin
- **duplex** Set duplex to interface
- **flowcontrol** Set flowcontrol to interface
- **line-power** Use the line-power command to apply power to the interface
- **no** Negate a command or set its defaults
- **qos** QoS settings
- **shutdown** Shutdown the selected interface
- **speed** Configure speed
- **switchport** Set switching mode characteristics
- **us-interleaver** Enable impulse noise protection in the upstream direction
- **us-max-datarate** Configure maximum allowed upstream rate for the interface
- **us-min-margin** Configure the minimum upstream signal-to-noise (SNR) ratio margin
- **us-target-margin** Configure the desired upstream signal-to-noise (SNR) ratio margin
- **clrscr** Clears the display screen
- **commit** Commit all changes made in this session
- **do** Run commands from Exec mode
- **end** End current mode and change to EXEC mode
- **exit** End current mode and down to previous mode
- **help** Description of the interactive help system
- **revert** Revert changes
- **service** Service Commands

**T5 Profile Config Commands**

Removes or reverts this T5 controller profile settings

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

no [interface|ntp|t5-logging|use]

no interface vlan <2-4094>

no ntp server <IP>

no t5-logging host <IP>

no use management-policy

**Parameters**

- no [interface|ntp|use]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no interface</td>
<td>Removes the VLAN interface configured on the T5 profile</td>
</tr>
<tr>
<td>no ntp server</td>
<td>Removes the NTP server associated with this T5 profile</td>
</tr>
<tr>
<td>no t5-logging host</td>
<td>Modifies T5 event message logging severity and facility levels</td>
</tr>
<tr>
<td>no use</td>
<td>Removes the management policy used with this T5 profile</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
nx9500-6C8809(config-profile-t5Profile)#show context
profile t5 t5Profile
  ip default-gateway 192.168.13.7
  no autoinstall configuration
  no autoinstall firmware
  interface vlan1
  interface vlan4090

....................................................
  use firewall-policy default
  ntp server 192.168.13.2
  service pm sys-restart

nx9500-6C8809(config-profile-t5Profile)#no ntp server 192.168.13.2

nx9500-6C8809(config-profile-t5Profile)#show context
profile t5 t5Profile
  ip default-gateway 192.168.13.7
  no autoinstall configuration
  no autoinstall firmware
  interface vlan1
  interface vlan4090

....................................................
  use firewall-policy default
  service pm sys-restart

nx9500-6C8809(config-profile-t5Profile)#
```
### 7.3.5 ntp

#### T5 Profile Config Commands

Configures the NTP server associated with this T5 profile. T5 controllers, using this profile, will obtain their system time from the specified NTP server resources.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
ntp server <IP>
```

**Parameters**

- `ntp server <IP>`

**Examples**

```plaintext
nx9500-6C8809(config-profile-t5Profile)#ntp server 192.168.13.2
```

```plaintext
nx9500-6C8809(config-profile-t5Profile)#show context
profile t5 t5Profile
  ip default-gateway 192.168.13.7
  no autoinstall configuration
  no autoinstall firmware
  interface dsl 5
  use firewall-policy default
  ntp server 192.168.13.2
  service pm sys-restart
```

**Related Commands**

- `no` Removes the NTP server's IP address
7.3.6 t5

**T5 Profile Config Commands**

Configures this T5 controller’s country of operation

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
t5 country-code <WORD>
```

**Parameters**

- `t5 country-code <WORD>`

| country-code <WORD> | Configures the 2 letter ISO-3166 country code for this T5 controller |

**Examples**

```
nx9500-6C8809(config-profile-T5TestProfile)#t5 country-code us

nx9500-6C8809(config-profile-T5TestProfile)#show context
profile t5 T5TestProfile
  no autoinstall configuration
  no autoinstall firmware
  interface vlan1
  interface vlan4090
  interface fe 5 2

 .................................................................
  interface fe 9 1
  use firewall-policy default
  service pm sys-restart
  t5 country-code US
  cpe address vlan 200 192.168.13.26 192.168.13.30
nx9500-6C8809(config-profile-T5TestProfile)#
```
### 7.3.7 t5-logging

**T5 Profile Config Commands**

Configures a maximum of 5 (five) remote hosts capable of receiving syslog messages from this selected T5 controller.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
t5-logging host <IP> severity [error|info|notice|trace|warning] facility [local0|local1|local2|local3|local4|local5|local6|local7]
```

**Parameters**

- **t5-logging host <IP> severity [error|info|notice|trace|warning]**
  - Configures the syslog message filtering severity level. The options are:
    - Error – Only forwards error and above syslog event messages.
    - Info – Only forwards informational and above syslog event messages.
    - notice – Only forwards syslog notices relating to general device operational events. These are events that are of more interest than the “info” events.
    - trace – Only forwards trace routing event messages
    - warning – Only forwards warnings and above syslog event messages

- **facility [local0|local1|local2|local3|local4|local5|local6|local7]**
  - Configures the facility level for log messages sent to the syslog server. The facility level specifies the type of program logging the message. Specifying the facility level allows the configuration file to specify that message handling will vary with varying facility type. The options are: local0, local1, local2, local3, local4, local5, local6, local7. The default value is local7.

**Examples**

```
x9500-6C8809(config-profile-T5TestProfile)#t5-logging host 192.168.13.10 severity warning facility local6

nx9500-6C8809(config-profile-T5TestProfile)#show context profile t5 T5TestProfile
  t5-logging host 192.168.13.10 severity warning facility local6
  no autoinstall configuration
  no autoinstall firmware
  t5 country-code US
cpe address vlan 200 192.168.13.26 192.168.13.30
nx9500-6C8809(config-profile-T5TestProfile)#
```

**Related Commands**

- **no**
  - Modifies message logging severity level and facilities
7.3.8 use

T5 Profile Config Commands

Associates a management policy with this T5 profile. The specified policy is applied to all T5 controllers using this profile. Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

use management-policy <POLICY-NAME>

Parameters

- use management-policy <POLICY-NAME>

<table>
<thead>
<tr>
<th>use management-policy &lt;POLICY-NAME&gt;</th>
<th>Associates a management policy with this T5 profile (should be existing and configured)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;POLICY-NAME&gt; – Specify the management policy's name.</td>
</tr>
</tbody>
</table>

Examples

nx9500-6C8809(config-profile-t5Profile)#use management-policy default
Trustpoints HTTPS Server and RSA keys for SSH can be configured with 'trustpoint' and 'rsa-key' commands in device context
nx9500-6C8809(config-profile-t5Profile)#

Related Commands

- no

Removes the management policy used with this T5 profile
This chapter summarizes the Authentication, Authorization, and Accounting (AAA) policy commands in the CLI command structure.

A AAA policy enables administrators to define access control settings governing network permissions. External RADIUS and LDAP servers (AAA servers) also provide user database information and user authentication data. Each WLAN maintains its own unique AAA configuration.

AAA provides a modular way of performing the following services:

Authentication — Provides a means for identifying users, including login and password dialog, challenge and response, messaging support and (depending on the security protocol), encryption. Authentication is the technique by which a user is identified before allowed access to the network. Configure AAA authentication by defining a list of authentication methods, and then applying the list to various interfaces. The list defines the authentication schemes performed and their sequence. The list must be applied to an interface before the defined authentication technique is conducted.

Authorization — Authorization occurs immediately after authentication. Authorization is a method for remote access control, including authorization for services and individual user accounts and profiles. Authorization functions through the assembly of attribute sets describing what the user is authorized to perform. These attributes are compared to information contained in a database for a given user and the result is returned to AAA to determine the user’s actual capabilities and restrictions. The database could be located locally or be hosted remotely on a RADIUS server. Remote RADIUS servers authorize users by associating attribute-value (AV) pairs with the appropriate user. Each authorization method must be defined through AAA. When AAA authorization is enabled it’s applied equally to all interfaces.

Accounting — Collects and sends security server information for billing, auditing, and reporting user data; such as start and stop times, executed commands (such as PPP), number of packets, and number of bytes. Accounting enables wireless network administrators to track the services users are accessing and the network resources they are consuming. When accounting is enabled, the network access server reports user activity to a RADIUS security server in the form of accounting records. Each accounting record is comprised of AV pairs and is stored locally on the access control server. The data can be analyzed for network management, client billing, and/or auditing. Accounting methods must be defined through AAA. When AAA accounting is activated, it is applied equally to all interfaces on the access servers.
Use the (config) instance to configure AAA policy commands. To navigate to the config-aaa-policy instance, use the following commands:

```
<DEVICE>(config)#aaa-policy <POLICY-NAME>
```

```
rfs7000-37FABE(config)#aaa-policy test
```

```
rfs7000-37FABE(config-aaa-policy-test)#?
```

AAA Policy Mode commands:
- **accounting**: Configure accounting parameters
- **attribute**: Configure RADIUS attributes in access and accounting requests
- **authentication**: Configure authentication parameters
- **health-check**: Configure server health-check parameters
- **mac-address-format**: Configure the format in which the MAC address must be filled in the Radius-Request frames
- **no**: Negate a command or set its defaults
- **proxy-attribute**: Configure radius attribute behavior when proxying through controller or rf-domain-manager
- **server-pooling-mode**: Configure the method of selecting a server from the pool of configured AAA servers
- **use**: Set setting to use

```
clrscr: Clears the display screen
commit: Commit all changes made in this session
do: Run commands from Exec mode
end: End current mode and change to EXEC mode
exit: End current mode and down to previous mode
help: Description of the interactive help system
revert: Revert changes
service: Service Commands
show: Show running system information
write: Write running configuration to memory or terminal
```

```
rfs7000-37FABE(config-aaa-policy-test)#
```
### 8.1 aaa-policy

<td>page 8-23</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
8.1.1 accounting

➥ aaa-policy

Configures the server type and interval at which interim accounting updates are sent to the server. A maximum of 6 accounting servers can be configured.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

accounting [interim|server|type]

accounting interim interval <60-3600>

accounting server [<1-6>|preference]

accounting server preference [auth-server-host|auth-server-number|none]

accounting server <1-6> [dscp|host|nai-routing|onboard|proxy-mode|retry-timeout-factor|timeout]

accounting server <1-6> [dscp <0-63>|retry-timeout-factor <50-200>]

accounting server <1-6> host <IP/HOSTNAME/HOST-ALIAS> secret [0 <SECRET>|2 <SECRET>|<SECRET>] {port <1-65535>}

accounting server <1-6> nai-routing realm-type [prefix|suffix] realm <REALM-TEXT> {strip}

accounting server <1-6> onboard [centralized-controller|self|controller]

accounting server <1-6> proxy-mode [none|through-centralized-controller|through-controller|through-mint-host <HOSTNAME/MINT-ID>|through-rf-domain-manager]

accounting server <1-6> timeout <1-60> {attempts <1-10>}

accounting type [start-interim-stop|start-stop|stop-only]

Parameters
- accounting interim interval <60-3600>

| interim | Configures the interim accounting interval |
| interval <60-3600> | Specify the interim interval from 60 - 3600 seconds. The default is 1800 seconds. |

- accounting server preference [auth-server-host|auth-server-number|none]

| server | Configures a RADIUS accounting server’s settings |
| preference | Configures the accounting server’s preference mode. Authentication requests are forwarded to a accounting server, from the pool, based on the preference mode selected. |
| auth-server-host | Sets the authentication server as the accounting server. This is the default setting. This parameter indicates the same server is used for authentication and accounting. The server is identified by its hostname. |
| auth-server-number | Sets the authentication server as the accounting server. This parameter indicates the same server is used for authentication and accounting. The server is identified by its index or number. |
| none | Indicates the accounting server is independent of the authentication server |
server <1-6> Configures an accounting server. Up to 6 accounting servers can be configured.

Accounting server <1-6> [dscp <0-63>|retry-timeout-factor <50-200>]

dscp <0-63> Sets the Differentiated Services Code Point (DSCP) value for Quality of Service (QOS) monitoring. This value is used in generated RADIUS packets.
- <0-63> – Sets the DSCP value from 0 - 63. The default value is 34.

retry-timeout-factor <50-200> Sets the scaling factor for retransmission timeouts. The timeout at each attempt is a function of this retry-timeout factor and the attempt number.
- <50-200> – Specify a value from 50 - 200. The default is 100.
If the scaling factor is 100, the interval between two consecutive retries remains the same, irrespective of the number of retries.
If the scaling factor is less than 100, the interval between two consecutive retries reduces with subsequent retries.
If this scaling factor is greater than 100, the interval between two consecutive retries increases with subsequent retries.

Accounting server <1-6> host <IP/HOSTNAME/HOST-ALIAS> secret [0 <SECRET>|2 <SECRET>|<SECRET>] [port <1-65535>]

server <1-6> Configures an accounting server. Up to 6 accounting servers can be configured.

host <IP/HOSTNAME/HOST-ALIAS> Configures the accounting server’s hostname IP address, or host-alias
Note: The host alias should be existing and configured.

secret [0 <SECRET>|2 <SECRET>|<SECRET>] Configures a common secret key used to authenticate with the accounting server
- 0 <SECRET> – Configures a clear text secret key
- 2 <SECRET> – Configures an encrypted secret key
- <SECRET> – Specify the secret key. This shared secret should not exceed 127 characters.

port <1-65535> Optional. Configures the accounting server’s UDP port (the port used to connect to the accounting server)
- <1-65535> – Sets the port number from 1 - 65535 (default port is 1813)

Accounting server <1-6> nai-routing realm-type [prefix|suffix] realm <REALM-TEXT> (strip)

server <1-6> Configures an accounting server. Up to 6 accounting servers can be configured.

nai-routing Enables Network Access Identifier (NAI) routing. This option is disabled by default.
The NAI is a character string in the format of an e-mail address as either user or user@ (it need not be a valid e-mail address or a fully qualified domain name (FQDN). The NAI can be used either in a specific or generic form. The specific form, which must contain the user portion and may contain the @ portion, identifies a single user. The generic form allows to be configured on a single command line. Each user still needs a unique security association, but these associations can be stored on a AAA server. The original purpose of NAI was to support roaming between dial up ISPs. Using NAI, each ISP need not have all the accounts for all of its roaming partners in a single RADIUS database. RADIUS servers can proxy requests to remote servers.

realm-type Specifies whether the prefix or suffix of the username is used as the match criteria. For example, if the option selected is prefix, the username’s prefix is matched to the realm.
| **[prefix|suffix]** | Select one of the following options:  
| | • prefix – Matches the prefix of the username (For example, username is of type `DOMAIN/user1`, `DOMAIN/user2`). This is the default setting.  
| | • suffix – Matches the suffix of the username (For example, `user1@DOMAIN`, `user2@DOMAIN`) |
| **realm <REALM-TEXT>** | Configures the text matched against the username. Enter the realm name (should not exceed 50 characters). When the RADIUS accounting server receives a request for a user name, the server references a table of user names. If the user name is known, the server proxies the request to the RADIUS server.  
| | • `<REALM-TEXT>` – Specifies the matching text including the delimiter (a delimiter is typically `'` or `@`) |
| **strip** | Optional. When enabled, strips the realm from the username before forwarding the request to the RADIUS server. This option is disabled by default. |

- accounting server <1-6> onboard [centralized-controller|self|controller]

| server <1-6> | Configures an accounting server. Up to 6 accounting servers can be configured. |
| onboard | Selects an onboard server instead of an external host |
| centralized-controller | Configures the server on the centralized controller managing the network |
| self | Configures the onboard server on an AP, wireless controller, or service platform (where the client is associated) |
| controller | Configures local RADIUS server settings |

- accounting server <1-6> proxy-mode [none|through-centralized-controller|through-controller|through-mint-host <HOSTNAME/MINT-ID>|through-rf-domain-manager]

| server <1-6> | Configures an accounting server. Up to 6 accounting servers can be configured. |
| proxy-mode | Select the mode used to proxy requests. The options are: none, through-controller, and through-rf-domain-manager. |
| none | No proxy required. Sends the request directly using the IP address of the device. This is the default setting. |
| through-centralized-controller | Proxy requests through the centralized controller that is configuring and managing the network |
| through-controller | Proxies requests through the controller (access point, wireless controller, or service platform) configuring the device |
| through-mint-host <HOSTNAME/MINT-ID> | Proxies requests through a neighboring MiNT device. Provide the device’s MiNT ID or hostname. |
| through-rf-domain-manager | Proxies requests through the local RF Domain Manager |
### AAA-POLICY 8 - 7

**accounting server <1-6> timeout <1-60> {attempts <1-10>}

<table>
<thead>
<tr>
<th>server &lt;1-6&gt;</th>
<th>Configures an accounting server. Up to 6 accounting servers can be configured.</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout &lt;1-60&gt;</td>
<td>Configures the timeout for each request sent to the RADIUS server</td>
</tr>
<tr>
<td>attempts &lt;1-10&gt;</td>
<td>Optional. Specifies the number of times a transmission request is attempted</td>
</tr>
</tbody>
</table>

- <1-60> – Specify a value from 1 - 60 seconds. The default is 5 seconds.
- <1-10> – Specify a value from 1 - 10. The default is 3.

**accounting type [start-interim-stop|start-stop|stop-only]

<table>
<thead>
<tr>
<th>type</th>
<th>Configures the type of RADIUS accounting packets sent. The options are: start-interim-stop, start-stop, and stop-only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>start-interim-stop</td>
<td>Sends accounting-start and accounting-stop messages when the session starts and stops. This parameter also sends interim accounting updates.</td>
</tr>
<tr>
<td>start-stop</td>
<td>Sends accounting-start and accounting-stop messages when the session starts and stops. This is the default setting.</td>
</tr>
<tr>
<td>stop-only</td>
<td>Sends an accounting-stop message when the session ends</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-aaa-policy-test)#accounting interim interval 65  
rfs7000-37FABE(config-aaa-policy-test)#accounting server 2 host 172.16.10.10 secret test1 port 1  
rfs7000-37FABE(config-aaa-policy-test)#accounting server 2 timeout 2 attempts 2  
rfs7000-37FABE(config-aaa-policy-test)#accounting type start-stop  
rfs7000-37FABE(config-aaa-policy-test)#accounting server preference auth-server-number  
rfs7000-37FABE(config-aaa-policy-test)#show context  
```

**Related Commands**

| no | Removes or resets accounting server parameters |
8.1.2 attribute

> aaa-policy

Configures RADIUS Framed-MTU attribute used in access and accounting requests. The Framed-MTU attribute reduces the Extensible Authentication Protocol (EAP) packet size of the RADIUS server. This command is useful in networks where routers and firewalls do not perform fragmentation.

To ensure network security, some firewall software drop UDP fragments from RADIUS server EAP packets. Consequently, the packets are large. Using Framed MTU reduces the packet size. EAP authentication uses Framed MTU to notify the RADIUS server about the Maximum Transmission Unit (MTU) negotiation with the client. The RADIUS server communications with the client do not include EAP messages that cannot be delivered over the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

attribute [acct-delay-time|acct-multi-session-id|chargeable-user-identity|cisco-vsa|framed-ip-address|framed-mtu|location-information|nas-ipv6-address|operator-name|service-type]

attribute acct-delay-time
attribute acct-multi-session-id
attribute chargeable-user-identity
attribute cisco-vsa audit-session-id
attribute framed-ip-address
attribute framed-mtu <100-1500>
attribute location-information [include-always|none|server-requested]
attribute nas-ipv6-address
attribute operator-name <OPERATOR-NAME>
attribute service-type [framed|login]

Parameters
- attribute acct-delay-time

acct-delay-time Enables support for accounting-delay-time attribute in accounting requests. When enabled, this attribute indicates the number of seconds the client has been trying to send a request to the accounting server. By subtracting this value from the time the packet is received by the server, the system is able to calculate the time of a request-generating event. Note, the network transit time is ignored. This option is disabled by default.

**Note:** Including the acct-delay-time attribute in accounting requests updates the acct-delay-time value whenever the packet is retransmitted, This changes the content of the attributes field, requiring a new identifier and request authenticator.

- attribute acct-multi-session-id

acct-multi-session-id Enables support for accounting-multi-session-id attribute. When enabled, it allows linking of multiple related sessions of a roaming client. This option is useful in scenarios where a client roaming between access points sends multiple RADIUS accounting requests to different access points. This option is disabled by default.

- attribute chargeable-user-identity

chargeable-user-identity Enables support for chargeable-user-identity attribute. This option is disabled by default.
### attribute cisco-vsa audit-session-id

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
</table>
| cisco-vsa audit-session-id | Configures the CISCO Vendor Specific Attribute (VSA) attribute included in access requests. This feature is disabled by default.  
This VSA allows CISCO's Identity Services Engine (ISE) to validate a requesting client's network compliance, such as the validity of virus definition files (antivirus software or definition files for an anti-spyware software application).  
- **audit-session-id** – Includes the audit session ID attribute in access requests  
**Note**: The audit session ID is included in access requests when Cisco ISE is configured as an authentication server.  
**Note**: If the Cisco VSA attribute is enabled, configure an additional UDP port to listen for dynamic authorization messages from the Cisco ISE server. For more information, see service. |

### attribute framed-ip-address

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>framed-ip-address</td>
<td>Enables inclusion of framed IP address attribute in access requests. This option is disabled by default.</td>
</tr>
</tbody>
</table>

### attribute framed-mtu <100-1500>

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
</table>
| framed-mtu <100-1500> | Configures Framed-MTU attribute used in access requests  
- **<100-1500>** – Specify the Framed-MTU attribute from 100 - 1500. The default value is 1400. |

### attribute location-information [include-always|none|server-requested]

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
</table>
| location-information | Enables/disables support for RFC5580 location information attribute, based on the option selected. The various options are:  
- **include-always** – Always includes location information in RADIUS authentication and accounting messages  
- **none** – Disables sending of location information in RADIUS authentication and accounting messages. This is the default setting.  
- **server-requested** – Includes location information in RADIUS authentication and accounting messages only when requested by the server  
**Note**: When enabled, location information is exchanged in authentication and accounting messages. |

### attribute nas-ipv6-address

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
</table>
| nas-ipv6-address     | Enables support for NAS IPv6 address. This option is disabled by default.  
When enabled, IPv6 addresses are assigned to hosts. The length of IPv4 and IPv6 addresses is 32-bit and 128-bit respectively. Consequently, an IPv6 address requires a larger address space. |

### attribute operator-name <OPERATOR-NAME>

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
</table>
| operator-name <OPERATOR-NAME> | Enables support for RFC5580 operator name attribute. When enabled, the network operator’s name is included in all RADIUS authentication and accounting messages and uniquely identifies the access network owner. This option is disabled by default.  
- **<OPERATOR-NAME>** – Specify the network operator’s name (should not exceed 63 characters in length). |
attribute service-type [framed|login]

<table>
<thead>
<tr>
<th>Service-Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>framed</td>
<td>Sets service-type to framed (2) in the authentication packets. When enabled, a framed protocol, Point-to-Point Protocol (PPP) or Serial Line Internet Protocol (SLIP), is started for the client. This is the default setting.</td>
</tr>
<tr>
<td>login</td>
<td>Sets service-type to login (1) in the authentication packets. When enabled, the client is connected to the host.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-aaa-policy-test)#attribute framed-mtu 110
rfs7000-37FABE(config-aaa-policy-test)#show context
    aaa-policy test
    accounting server 2 host 172.16.10.10 secret 0 test1 port 1
    accounting server 2 timeout 2 attempts 2
    accounting interim interval 65
    accounting server preference auth-server-number
    attribute framed-mtu 110
rfs7000-37FABE(config-aaa-policy-test1)#attribute cisco-vsa audit-session-id
rfs7000-37FABE(config-aaa-policy-test1)#show context
    aaa-policy test
    attribute cisco-vsa audit-session-id
rfs7000-37FABE(config-aaa-policy-test1)#

8.1.3 authentication

aaa-policy

Configures user authentication parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

authentication [eap|protocol|server]

authentication eap wireless-client [attempts <1-10>|identity-request-retry-timeout <10-5000>|identity-request-timeout <1-60>|retry-timeout-factor <50-200>|timeout <1-60>]

authentication protocol [chap|mschap|mschapv2|pap]

authentication server <1-6> [dscp|host|nac|nai-routing|onboard|proxy-mode|retry-timeout-factor|timeout]

authentication server <1-6> dscp <0-63>
authentication server <1-6> host <IP/HOSTNAME/HOST-ALIAS> secret [0 <SECRET>|2 <SECRET>]
authentication server <1-6> nac
authentication server <1-6> nai-routing realm-type [prefix|suffix] realm <REALM-NAME> {strip}
authentication server <1-6> onboard [centralized-controller|controller|self]
authentication server <1-6> proxy-mode [none|through-centralized-controller|through-controller|through-mint-host <HOSTNAME/MINT-ID>|through-rf-domain-manager]
authentication server <1-6> retry-timeout-factor <50-200>
authentication server <1-6> timeout <1-60> {attempts <1-10>}

Parameters

- authentication eap wireless-client [attempts <1-10>|identity-request-retry-timeout <10-5000>|identity-request-timeout <1-60>|retry-timeout-factor <50-200>|timeout <1-60>]

<table>
<thead>
<tr>
<th>eap</th>
<th>Configures EAP authentication parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>wireless-client</td>
<td>Configures wireless client’s EAP parameters</td>
</tr>
<tr>
<td>attempts &lt;1-10&gt;</td>
<td>Configures the maximum number of attempts allowed to authenticate a wireless client</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-10&gt; – Specify a value from 1 - 10. The default is 3.</td>
</tr>
<tr>
<td>identity-request-retry-timeout &lt;10-5000&gt;</td>
<td>Configures the interval, in milliseconds, after which an EAP-identity request to the wireless client is retried</td>
</tr>
<tr>
<td></td>
<td>• &lt;10-5000&gt; – Specify a value from 10 - 5000 milliseconds. The default is 1000 milliseconds.</td>
</tr>
<tr>
<td>identity-request-timeout &lt;1-60&gt;</td>
<td>Configures the timeout, in seconds, after the last EAP-identity request message retry attempt (to allow time to manually enter user credentials)</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-60&gt; – Specify a value from 1 - 60 seconds. The default is 30 seconds.</td>
</tr>
</tbody>
</table>
### Configure the Spacing Between Successive EAP Retries

**retry-timeout-factor**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;50-200&gt;</td>
<td>Configures the spacing between successive EAP retries</td>
</tr>
<tr>
<td></td>
<td>- Specify a value from 50 - 200. The default is 100.</td>
</tr>
</tbody>
</table>

- A value of 100 indicates the interval between two consecutive retries remains the same irrespective of the number of retries.
- A value lesser than 100 indicates the interval between two consecutive retries reduces with each successive retry.
- A value greater than 100 indicates the interval between two consecutive retries increases with each successive retry.

### Configure the Interval Between Successive EAP-Identity Request Sent to a Wireless Client

**timeout**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-60&gt;</td>
<td>Configures the interval, in seconds, between successive EAP-identity request sent to a wireless client</td>
</tr>
<tr>
<td></td>
<td>- Specify a value from 1 - 60 seconds. The default is 3 seconds.</td>
</tr>
</tbody>
</table>

### Configure One of the Following Protocols for Non-EAP Authentication

**protocol**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[chap</td>
<td>mschap</td>
</tr>
<tr>
<td></td>
<td>- chap – Uses Challenge Handshake Authentication Protocol (CHAP)</td>
</tr>
<tr>
<td></td>
<td>- mschap – Uses Microsoft Challenge Handshake Authentication Protocol (MS-CHAP)</td>
</tr>
<tr>
<td></td>
<td>- mschapv2 – Uses MS-CHAP version 2</td>
</tr>
<tr>
<td></td>
<td>- pap – Uses Password Authentication Protocol (PAP) (default authentication protocol used)</td>
</tr>
</tbody>
</table>

### Configure a RADIUS Authentication Server

**server**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-6&gt;</td>
<td>Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.</td>
</tr>
<tr>
<td></td>
<td>- Specify the RADIUS server index from 1 - 6.</td>
</tr>
</tbody>
</table>

**dscp**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;0-63&gt;</td>
<td>Configures the Differentiated Service Code Point (DSCP) quality of service parameter generated in RADIUS packets. The DSCP value specifies the class of service provided to a packet, and is represented by a 6-bit parameter in the header of every IP packet. The default is 46.</td>
</tr>
</tbody>
</table>

### Configure the RADIUS Authentication Server’s Secret

**secret**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[0 &lt;SECRET&gt;</td>
<td>2 &lt;SECRET&gt;]&lt;SECRET&gt;]</td>
</tr>
<tr>
<td></td>
<td>- 0 &lt;SECRET&gt; – Configures a clear text secret</td>
</tr>
<tr>
<td></td>
<td>- 2 &lt;SECRET&gt; – Configures an encrypted secret</td>
</tr>
<tr>
<td></td>
<td>- &lt;SECRET&gt; – Specify the secret key. The shared key should not exceed 127 characters in length.</td>
</tr>
</tbody>
</table>

**port**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-65535&gt;</td>
<td>Optional. Specifies the RADIUS authentication server’s UDP port (this port is used to connect to the RADIUS server)</td>
</tr>
<tr>
<td></td>
<td>- Specify a value from 1 - 65535. The default port is 1812.</td>
</tr>
<tr>
<td><strong>authentication server &lt;1-6&gt; nac</strong></td>
<td></td>
</tr>
<tr>
<td>-----------------------------------</td>
<td></td>
</tr>
<tr>
<td>server &lt;1-6&gt;</td>
<td>Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.</td>
</tr>
<tr>
<td>• &lt;1-6&gt; – Specify the RADIUS server index from 1 - 6.</td>
<td></td>
</tr>
<tr>
<td>nac</td>
<td>Enables Network Access Control (NAC) on the RADIUS authentication server identified by the &lt;1-6&gt; parameter. Using NAC, the controller hardware and software grant access to specific network resources. NAC performs a user and client authorization check for resources that do not have a NAC agent. NAC verifies the client’s compliance with the controller’s security policy. The controller supports only the EAP/802.1x type of NAC. However, the controller also provides a means to bypass NAC authentication for clients that do not have NAC 802.1x support (printers, phones, PDAs etc.).</td>
</tr>
</tbody>
</table>

| **accounting server <1-6> nai-routing realm-type [prefix|suffix] realm <REALM-NAME> {strip}** |
|------------------------------------------|
| server <1-6> | Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured. |
| • <1-6> – Specifies the RADIUS server index from 1 - 6. |
| nai-routing | Enables NAI routing. When enabled, AAA servers identify clients using NAI. This option is disabled by default. The NAI is a character string in the format of an e-mail address as either user or user@ but it need not be a valid e-mail address or a fully qualified domain name. The NAI can be used either in a specific or generic form. The specific form, which must contain the user portion and may contain the @ portion, identifies a single user. The generic form allows all users in a given or without a to be configured on a single command line. Each user still needs a unique security association, but these associations can be stored on a AAA server. The original purpose of the NAI was to support roaming between dial up ISPs. Using NAI, each ISP need not have all the accounts for all of its roaming partners in a single RADIUS database. RADIUS servers can proxy requests to remote servers for each. |
| realm-type [prefix|suffix] | Configures the realm-type used for NAI authentication |
| • prefix – Sets the realm prefix. For example, in the realm name ‘AC\JohnTalbot’, the prefix is ‘AC’ and the user name ‘JohnTalbot’. |
| • suffix – Sets the realm suffix. For example, in the realm name ‘JohnTalbot@AC.org’ the suffix is ‘AC.org’ and the user name is ‘JohnTalbot’. |
| realm <REALM-NAME> | Sets the realm information used for RADIUS authentication. The realm name should not exceed 64 characters in length. When the wireless controller or access point’s RADIUS server receives a request for a user name the server references a table of usernames. If the user name is known, the server proxies the request to the RADIUS server. |
| • <REALM-NAME> – Sets the realm used for authentication. This value is matched against the user name provided for RADIUS authentication. Example: |
| Prefix - AC\JohnTalbot |
| Suffix - JohnTalbot@AC.org |
| strip | Optional. Indicates the realm name must be stripped from the user name before sending it to the RADIUS server for authentication. For example, if the complete username is ‘AC\JohnTalbot’, then with the strip parameter enabled, only the ‘JohnTalbot’ part of the complete username is sent for authentication. This option is disabled by default. |
- **authentication server <1-6> onboard [centralized-controller|controller|self]**

  | server <1-6> | Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.  
  |             | • <1-6> – Specify the RADIUS server index from 1 - 6.  

  | onboard [centralized-controller|controller|self] | Selects the onboard RADIUS server for authentication instead of an external host  
  |             | • centralized-controller – Configures the server on the centralized controller managing the network  
  |             | • controller – Configures the wireless controller, to which the AP is adopted, as the onboard wireless controller  
  |             | • self – Configures the onboard server on the device (AP or wireless controller) where the client is associated as the onboard wireless controller  

- **authentication server <1-6> proxy-mode [none|through-centralized-controller|through-controller|through-mint-host <HOSTNAME/MINT-ID>|through-rf-domain-manager]**

  | server <1-6> | Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.  
  |             | • <1-6> – Sets the RADIUS server index between 1 - 6  

  | proxy-mode [none|through-centralized-controller|through-controller|through-mint-host <HOSTNAME/MINT-ID>|through-rf-domain-manager] | Configures the mode for proxying a request  
  |             | • none – Proxying is not done. The packets are sent directly using the IP address of the device. This is the default setting.  
  |             | • through-centralized-controller – Traffic is proxied through the centralized controller that is configuring and managing the network.  
  |             | • through-controller – Traffic is proxied through the wireless controller configuring this device.  
  |             | • through-mint-host <HOSTNAME/MINT-ID> – Traffic is proxied through a neighboring MiNT device. Provide the device’s hostname or MiNT ID.  
  |             | • through-rf-domain-manager – Traffic is proxied through the local RF Domain manager.  

- **authentication server <1-6> retry-timeout-factor <50-200>**

  | server <1-6> | Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.  
  |             | • <1-6> – Specify the RADIUS server index from 1 - 6.  

  | retry-timeout-factor <50-200> | Configures the scaling of timeouts between two consecutive RADIUS authentication retries  
  |             | • <50-200> – Specify the scaling factor from 50 - 200. The default is 100.  
  |             | A value of 100 indicates the interval between two consecutive retries remains the same irrespective of the number of retries.  
  |             | A value lesser than 100 indicates the interval between two consecutive retries reduces with each successive retry.  
  |             | A value greater than 100 indicates the interval between two consecutive retries increases with each successive retry.  

- **authentication server <1-6> timeout <1-60> {attempts <1-10>}**

  | server <1-6> | Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.  
  |             | • <1-6> – Specify the RADIUS server index from 1 - 6.  

  | timeout <1-60> {attempts <1-10>} | Configures the timeout period for the RADIUS server  
  |             | • <1-60> – Specify the timeout period from 1 - 60 seconds.  
  |             | • {attempts <1-10>} – Specify the number of attempts from 1 - 10.
### Examples

```
rfs7000-37FABE(config-aaa-policy-test)#authentication server 5 host 172.16.10.10 secret 0 test1 port 1
rfs7000-37FABE(config-aaa-policy-test)#authentication server 5 timeout 10 attempts 3
rfs7000-37FABE(config-aaa-policy-test)#authentication protocol chap
rfs7000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test1 port 1
  authentication server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  accounting server 2 timeout 2 attempts 2
  authentication protocol chap
  accounting interim interval 65
  accounting server preference auth-server-number
  attribute framed-mtu 110
rfs7000-37FABE(config-aaa-policy-test)#
```

### Related Commands

  Resets authentication parameters on this AAA policy
8.1.4 health-check

aaa-policy

An AAA server could go offline. When a server goes offline, it is marked as down. This command configures the interval after which a server marked as down is checked to see if it has come back online and is reachable.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

health-check interval <60-86400>

Parameters

- health-check interval <60-86400>

<table>
<thead>
<tr>
<th>interval &lt;60-86400&gt;</th>
<th>Configures an interval (in seconds) after which a down server is checked to see if it is reachable again</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;60-86400&gt;</td>
<td>Specify a value from 60 - 86400 seconds. The default is 3600 seconds.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-aaa-policy-test)#health-check interval 4000

rfs7000-37FABE(config-aaa-policy-test)#show context

aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test1 port 1
  authentication server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  accounting server 2 timeout 2 attempts 2
  authentication protocol chap
  accounting interim interval 65
  accounting server preference auth-server-number
  health-check interval 4000
  attribute framed-mtu 110
rfs7000-37FABE(config-aaa-policy-test)#

Related Commands

| no | Resets the health-check interval for AAA servers |
8.1.5 mac-address-format

`aaa-policy`

Configures the format MAC addresses are filled in RADIUS request frames

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot]
mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot]
    case [lower|upper] attributes [all|username-password]
```

**Parameters**
- `mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot]`
- `case [lower|upper] attributes [all|username-password]`

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>middle-hyphen</td>
<td>Configures the MAC address format as AABBCC-DDEEFF</td>
</tr>
<tr>
<td>no-delim</td>
<td>Configures the MAC address format as AABBCCDDEEFF (without delimiters)</td>
</tr>
<tr>
<td>pair-colon</td>
<td>Configures the MAC address format as AA:BB:CC:DD:EE:FF</td>
</tr>
<tr>
<td>pair-hyphen</td>
<td>Configures the MAC address display format as AA-BB-CC-DD-EE-FF</td>
</tr>
<tr>
<td>quad-dot</td>
<td>Configures the MAC address display format as AA.BB-CC-DD-EE-FF</td>
</tr>
<tr>
<td>case [lower</td>
<td>upper]</td>
</tr>
<tr>
<td>attributes [all</td>
<td>username-password]</td>
</tr>
<tr>
<td></td>
<td>• all – Applies to all attributes with MAC addresses such as username, password, calling-station-id, and called-station-id</td>
</tr>
<tr>
<td></td>
<td>• username-password – Applies only to the username and password fields (default setting)</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-aaa-policy-test)#mac-address-format quad-dot case upper attributes username-password

rfs7000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
authentication server 5 host 172.16.10.10 secret 0 test1 port 1
authentication server 5 timeout 10
accounting server 2 host 172.16.10.10 secret 0 test1 port 1
accounting server 2 timeout 2 attempts 2
mac-address-format quad-dot case upper attributes username-password
authentication protocol chap
--More--
rfs7000-37FABE(config-aaa-policy-test)#
```
### Related Commands

<table>

<tbody>
<tr>
<td><code>no</code></td>
<td>Resets the MAC address format to default (pair-hyphen)</td>
</tr>
</tbody>
</table>
### 8.1.6 no

Negates a AAA policy command or sets its default

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

```plaintext
no [accounting|attribute|authentication|health-check|mac-address-format|
proxy-attribute|server-pooling-mode|use]

no accounting interim interval
no accounting server preference
no accounting server <1-6> {dscp|nai-routing|proxy-mode|retry-timeout-factor|timeout}
no accounting type

no attribute [acct-delay-time|acct-multi-session-id|chargeable-user-identity|
cisco-vsa audit-session-id|framed-ip-address|framed-mtu|location-information|
nas-ipv6-address|operator-name|service-type]

no authentication [eap|protocol|server]
no authentication eap wireless-client [attempts|identity-request-retry-timeout|
identity-request-timeout|retry-timeout-factor|timeout]
no authentication protocol
no authentication server <1-6> {dscp|nac|nai-routing|proxy-mode|retry-timeout-factor|
timeout}

no health-check interval
no mac-address-format
no proxy-attribute [nas-identifier|nas-ip-address]
no server-pooling-mode
no use nac-list
```

### Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Negates a AAA policy command or sets its default |

### Examples

The following example shows the AAA policy ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test1 port 1
  authentication server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  accounting server 2 timeout 2 attempts 2
  mac-address-format quad-dot case upper attributes username-password
  authentication protocol chap
  accounting interim interval 65
  accounting server preference auth-server-number
  health-check interval 4000
  attribute framed-mtu 110
rfs7000-37FABE(config-aaa-policy-test)#
```
The following example shows the AAA policy 'test' settings after the 'no' commands are executed:

```
rfs7000-37FABE(config-aaa-policy-test)#no accounting server 2 timeout 2
rfs7000-37FABE(config-aaa-policy-test)#no accounting interim interval
rfs7000-37FABE(config-aaa-policy-test)#no health-check interval
rfs7000-37FABE(config-aaa-policy-test)#no attribute framed-mtu
rfs7000-37FABE(config-aaa-policy-test)#no authentication protocol

rfs7000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test1 port 1
classic accounting server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  accounting server preference auth-server-number
  mac-address-format quad-dot case upper attributes username-password
  health-check interval 4000
rfs7000-37FABE(config-aaa-policy-test)#
```
8.1.7 proxy-attribute

aaa-policy

Configures RADIUS server’s attribute behavior when proxying through a wireless controller or a RF Domain Manager

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP75XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
proxy-attribute [nas-identifier|nas-ip-address]
proxy-attribute [nas-identifier [originator|proxier]|nas-ip-address [none|proxier]]

Parameters
- proxy-attribute [nas-identifier [originator|proxier]|nas-ip-address [none|proxier]]

| nas-identifier [originator|proxier] | Uses NAS identifier |
|------------------------------------|---------------------|
| • originator — Configures the NAS identifier as the originator of the RADIUS request. The originator could be an AP, or a wireless controller with radio. This is the default setting. |
| • proxier — Configures the proxying device as the NAS identifier. The device could be a controller or a RF Domain manager. |

| nas-ip-address [none|proxier] | Uses NAS IP address |
|-------------------------------|---------------------|
| • none — NAS IP address attribute is not filled |
| • proxier — NAS IP address is filled by the proxying device. The device could be a controller or a RF Domain manager. This is the default setting. |

Examples
rfs7000-37FABE(config-aaa-policy-test)#proxy-attribute nas-ip-address proxier
rfs7000-37FABE(config-aaa-policy-test)#proxy-attribute nas-identifier originator

Related Commands
no
Resets RADIUS server’s proxying attributes
8.1.8 server-pooling-mode

aaa-policy

Configures the server selection method from a pool of AAA servers. The available methods are *failover* and *load-balance*.

In the failover scenario, when a configured AAA server goes down, the server with the next higher index takes over for the failed server.

In the load-balance scenario, when a configured AAA server goes down, the remaining servers distribute the load amongst themselves.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`server-pooling-mode [failover|load-balance]`

**Parameters**

- `server-pooling-mode [failover|load-balance]`

<table>
<thead>
<tr>
<th></th>
<th>Sets the pooling mode to failover. This is the default setting. When a configured AAA server fails, the server with the next higher index takes over the failed server's load.</th>
</tr>
</thead>
<tbody>
<tr>
<td>load-balance</td>
<td>Sets the pooling mode to load balancing. When a configured AAA server fails, all servers in the pool share the failed server's load transmitting requests in a round-robin fashion.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-aaa-policy-test)#server-pooling-mode load-balance
rfs7000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test2 port 1
  authentication server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  server-pooling-mode load-balance
  mac-address-format quad-dot case upper attributes username-password
  accounting server preference auth-server-number
  health-check interval 4000
rfs7000-37FABE(config-aaa-policy-test)#
```

**Related Commands**

- `no` Resets the method of selecting a server, from the pool of configured AAA servers
8.1.9 use

*aaa-policy*

Associates a Network Access Control (NAC) with this AAA policy. This allows only the set of configured devices to use the configured AAA servers.

For more information on creating a NAC list, see `nac-list`.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
use nac-list <NAC-LIST-NAME>
```

**Parameters**

- `use nac-list <NAC-LIST-NAME>`

<table>
<thead>
<tr>
<th><code>nac-list &lt;NAC-LIST-NAME&gt;</code></th>
<th>Associates a NAC list with this AAA policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;NAC-LIST-NAME&gt;</td>
<td>Specify the NAC list name (should be existing and configured).</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-aaa-policy-test)#use nac-list test1
rfs7000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test1 port 1
  authentication server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  server-pooling-mode load-balance
  mac-address-format quad-dot case upper attributes username-password
  accounting server preference auth-server-number
  health-check interval 4000
  use nac-list test1
rfs7000-37FABE(config-aaa-policy-test)#
```

**Related Commands**

| `no` | Resets set values or disables commands |
| `nac-list` | Creates a NAC list |
This chapter summarizes the auto provisioning policy commands in the CLI command structure.

Wireless devices can adopt and manage other wireless devices. For example, a wireless controller can adopt multiple access points. When a device is adopted, the device configuration is provisioned by the adopting device. Since multiple configuration policies are supported, an adopting device uses auto provisioning policies to determine which configuration policies are applied to an adoptee based on its properties. For example, a configuration policy could be assigned based on MAC address, IP address, CDP snoop strings, etc.

Auto provisioning or adoption is the process by which an access point discovers controllers in the network, identifies the most desirable controller, associates with the identified controller, and optionally obtains an image upgrade, obtains its configuration and considers itself provisioned.

At adoption, an access point solicits and receives multiple adoption responses from controllers available on the network. These adoption responses contain loading policy information the access point uses to select the optimum controller for adoption. An auto-provisioning policy maps a new AP to a profile and RF Domain based on various parameters related to the AP and where it is connected. By default a new AP will be mapped to the default profile and default RF Domain. Modify existing auto-provisioning policies or create a new one as needed to meet the configuration requirements of a device.

An auto-provisioning policy enables an administrator to define rules for the supported access points capable of being adopted by a controller. The policy determines which configuration policies are applied to an adoptee based on its properties. For example, a configuration policy could be assigned based on MAC address, IP address, *CISCO Discovery Protocol* (CDP) snoop strings, etc. Once created an auto provisioning policy can be used in profiles or device configuration objects. The policy contains a set of rules (ordered by precedence) that either deny or allow adoption based on potential adoptee properties and a catch-all variable that determines if the adoption should be allowed when none of the rules is matched. All rules (both deny and allow) are evaluated sequentially starting with the rule with the lowest precedence. The evaluation stops as soon as a rule has been matched, no attempt is made to find a better match further down in the set.

For example,

rule #1 adopt ap7131 10 profile default vlan 10
rule #2 adopt ap650 20 profile default vlan 20
rule #3 adopt ap7131 30 profile default serial-number
rule #4 adopt ap7131 40 p d mac aa bb

AP7131 L2 adoption, VLAN 10 - will use rule #1
AP7131 L2 adoption, VLAN 20 - will not use rule #2 (wrong type), may use rule #3 if the serial number matched, or rule #4
If aa<= MAC <= bb, or else default.

With the implementation of the *hierarchically managed* (HM) network, the auto-provisioning policy has been modified to enable controllers to adopt other controllers in addition to access points.
The new WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single *Network Operations Center* (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

All adopted devices (access points and second-level controllers) are referred to as the ‘adoptee’. The adopting devices are the ‘adopters’.

A controller cannot be configured as an adoptee and a controller adopter simultaneously. In other words, a controller can either be an adopter (adopts another controller) or an adoptee (is adopted by another controller). Therefore, a site controller, which has been adopted by a NOC controller, cannot adopt another controller. But it can adopt access points. For more information on HM network, see `device-upgrade`.

A controller should be configured to specify the device types (APs and/or controllers) that it can adopt. For more information on configuring the adopted-device types for a controller, see `controller`.

---

**NOTE:** The adoption capabilities of a controller depends on:

- Whether the controller is deployed at the NOC or site
- A NOC controller can adopt site controllers and access points
- A site controller can adopt access points only
- The controller device type, which determines the number and type of devices it can adopt

The NOC controller can adopt a site controller with a capacity equal to or lower than its own. The following table displays the NOC controllers and the corresponding site-level controllers supported by each:

<table>
<thead>
<tr>
<th>Site Controllers supported by each NOC controller</th>
<th>NOC Controllers</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RFS7000</td>
</tr>
<tr>
<td>RFS4000</td>
<td>X</td>
</tr>
<tr>
<td>RFS6000</td>
<td>X</td>
</tr>
<tr>
<td>RFS7000</td>
<td>X</td>
</tr>
<tr>
<td>NX45XX</td>
<td>-</td>
</tr>
<tr>
<td>NX65XX</td>
<td>-</td>
</tr>
<tr>
<td>NX7500</td>
<td>-</td>
</tr>
<tr>
<td>NX9000</td>
<td>-</td>
</tr>
<tr>
<td>NX9XXX</td>
<td>-</td>
</tr>
</tbody>
</table>

**NOTE:** Some access points can be configured as virtual controllers. When configured as a virtual controller, an AP can only adopt another AP of the same type. In such a scenario, an auto provisioning policy is required to enable adoption of a specific device identified by its MAC address, IP address, serial number, model number etc.
Use the (config) instance to configure an auto-provisioning policy. To navigate to the auto-provisioning-policy configuration instance, use the following command:

```plaintext
<DEVICE>(config)#auto-provisioning-policy <POLICY-NAME>
```

rfs7000-37FABE(config)#auto-provisioning-policy test
rfs7000-37FABE(config-auto-provisioning-policy-test)#?

Auto-Provisioning Policy Mode commands:
- `adopt` Add rule for device adoption
- `default-adoption` Adopt devices even when no matching rules are found.
- `deny` Add rule to deny device adoption
- `evaluate-always` Set the flag to evaluate the policy everytime, regardless of previous adoption status
- `no` Negate a command or set its defaults
- `redirect` Add rule to redirect device adoption
- `upgrade` Add rule for device upgrade

`clrscr` Clears the display screen
`commit` Commit all changes made in this session
`do` Run commands from Exec mode
`end` End current mode and change to EXEC mode
`exit` End current mode and down to previous mode
`help` Description of the interactive help system
`revert` Revert changes
`service` Service Commands
`show` Show running system information
`write` Write running configuration to memory or terminal

rfs7000-37FABE(config-auto-provisioning-policy-test)#
9.1 auto-provisioning-policy

9.1.1 adopt

**auto-provisioning-policy**

Adds device adoption rules

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
adopt [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000|vx9000]

adopt [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000|vx9000] precedence <1-10000> [profile|rf-domain]

adopt [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> [profile <DEVICE-PROFILE-NAME>]

rf-domain <RF-DOMAIN-NAME>]

any

rf-domain <RF-DOMAIN-NAME>]

area <AREA-NAME>

rf-domain <RF-DOMAIN-NAME>]

cdp-match <LOCATION-SUBSTRING>

rf-domain <RF-DOMAIN-NAME>]

dhcp-option <DHCP-OPTION>

rf-domain <RF-DOMAIN-NAME>]

floor <FLOOR-NAME>

rf-domain <RF-DOMAIN-NAME>]

fqdn <FQDN>

rf-domain <RF-DOMAIN-NAME>]

ip <IP/MASK>

rf-domain <RF-DOMAIN-NAME>]

rf-domain <RF-DOMAIN-NAME>]

model-number <MODEL-NUMBER>

rf-domain <RF-DOMAIN-NAME>]

serial-number

rf-domain <RF-DOMAIN-NAME>]

vlan <VLAN-ID>
```

**Parameters**

- **adopt** [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> [profile <DEVICE-PROFILE-NAME>] rf-domain <RF-DOMAIN-NAME> any

**Note:** "anyap" is used in auto provisioning policies to create rules that are applicable to any AP regardless of the type.

---

**Adopt**

Adds an adopt device rule. The rule applies to the selected device types. Specify the device type and assign a precedence to the rule.

The different device types are: anyap, AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX7500, NX7510, NX7520, NX7530 and NX9000.

**preference <1-10000>**

Sets the rule precedence from 1 - 10000. A rule with a lower value has a higher precedence.
<table>
<thead>
<tr>
<th>profile &lt;DEVICE-PROFILE-NAME&gt;</th>
<th>Sets the device profile for this provisioning policy. The selected device profile must be appropriate for the device being provisioned. For example, use an AP650 device profile for an AP650. Using an inappropriate device profile can result in unpredictable results. Provide a device profile name. Provide a device profile name. Or a template with appropriate substitution tokens, such as ‘campus-$MODEL[1:6]’, ‘FQDN[1:4]:indoor’. Please see the Usage Guidelines section Built-in Tokens &amp; Alias for the different types of built in tokens available in the system.</th>

<td>Sets the RF Domain for this auto provisioning policy. The provisioning policy is only applicable to devices that try to become a part of the specified RF Domain. Provide the full RF Domain name or an alias. Or a template with appropriate substitution tokens, such as <code>${CDP}[1:7]</code>, <code>${DNS-SUFFIX}[1:5]</code>. Please see the Usage Guidelines section Built-in Tokens &amp; Alias for the different types of built in tokens available in the system. <strong>Note:</strong> Use the built-in string alias or a user-defined string alias. String aliases allow you to configure APs in the same RF Domain as the adopting controller. A string alias maps a name to an arbitrary string value, for example, ‘alias string $DOMAIN test.example_company.com’. In this example, the string-alias $DOMAIN is mapped to the string: test.example_company.com. For more information, see alias.</td>
</tr>
<tr>
<td>area &lt;AREA-NAME&gt;</td>
<td>Matches the area of deployment. This option is not applicable to the ‘rf-domain’ parameter.</td>
</tr>
<tr>
<td>cdp-match &lt;LOCATION-SUBSTRING&gt;</td>
<td>Matches a substring in a list of CDP snoop strings (case insensitive). For example, if an access point snooped 3 devices: controller1.example.com, controller2.example.com, and controller3.example.com, ‘controller1’, ‘example’, ‘example.com’, are examples of the substrings that will match.</td>
</tr>
<tr>
<td>dhcp-option &lt;DHCP-OPTION&gt;</td>
<td>Matches the value found in DHCP vendor option 191 (case insensitive). DHCP vendor option 191 can be setup to communicate various configuration parameters to an AP. The value of the option in a string in the form of tag=value separated by a semicolon, for example ‘tag1=value1;tag2=value2;tag3=value3’. The access point includes the value of tag ‘rf-domain’, if present.</td>
</tr>
<tr>
<td>floor &lt;FLOOR-NAME&gt;</td>
<td>Matches the floor name. This option is not applicable to the ‘rf-domain’ parameter.</td>
</tr>
<tr>
<td>fqdn &lt;FQDN&gt;</td>
<td>Matches a substring to the Fully Qualified Domain Name (FQDN) of a device (case insensitive) FQDN is a domain name that specifies its exact location in the DNS hierarchy. It specifies all domain levels, including its top-level domain and the root domain. This parameter allows a device to adopt based on its FQDN value.</td>
</tr>
<tr>
<td>ip [&lt;START-IP&gt; &lt;END-IP&gt;]</td>
<td>Adopts a device if its IP address matches the specified IPv4 address or is within the specified IP address range. Or if the device is a part of the specified subnet.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;START-IP&gt;</code> – Specify the first IPv4 address in the range.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;END-IP&gt;</code> – Specify the last IPv4 address in the range.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;IP/MASK&gt;</code> – Specify the IPv4 subnet and mask to match against the device’s IP address.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| ipv6     | Adopts a device if its IP v6 address matches the specified IPv6 address or is within the specified IP address range. Or if the device is a part of the specified subnet.  
  * `<START-IP>` – Specify the first IPv6 address in the range.  
  * `<END-IP>` – Specify the last IPv6 address in the range.  
  * `<IP/MASK>` – Specify the IPv6 subnet and mask to match against the device’s IPv6 address. |
| lldp-match | Matches a substring in a list of Link Layer Discovery Protocol (LLDP) snoop strings (case insensitive). For example, if an access point snooped 3 devices: controller1.example.com, controller2.example.com, and controller3.example.com, ‘controller1’, ‘example’, ‘example.com’, are examples of the substrings that will match.  
  * `<LLDP-STRING>` – Specify the LLDP string. Devices matching the specified value are adopted. |
| mac      | Adopts a device if its MAC address matches the specified MAC address or is within the specified MAC address range  
  * `<START-MAC>` – Specify the first MAC address in the range. Provide this MAC address if you want to match for a single device.  
  * `<END-MAC>` – Optional. Specify the last MAC address in the range. |
| model-number | Adopts a device if its model number matches `<MODEL-NUMBER>`  
  * `<MODEL-NUMBER>` – Specify the model number. |
| rf-domain | Adopts a device if its RF Domain matches `<RF-DOMAIN-NAME>`  
  * `<RF-DOMAIN-NAME>` – Specify the RF Domain name. You can use a string alias to specify a RF Domain.  
  Provide the full RF Domain name or an alias. Or a template with appropriate substitution tokens, such as `$CDP[1:7]`, `$DNS-SUFFIX[1:5]`  
  Please see the Usage Guidelines section *Built-in Tokens & Alias* for the different types of built in tokens available in the system.  
  **Note:** Use the built-in string alias or a user-defined string alias. String aliases allow you to configure APs in the same RF Domain as the adopting controller. A string alias maps a name to an arbitrary string value, for example, ‘alias string $DOMAIN test.example_company.com’. In this example, the string-alias `$DOMAIN` is mapped to the string: `test.example_company.com`. For more information, see *alias*. |
| serial-number | Adopts a device if its serial number matches `<SERIAL-NUMBER>`  
  * `<SERIAL-NUMBER>` – Specify the serial number. |
| vlan      | Adopts a device if its VLAN matches `<VLAN-ID>`  
  * `<VLAN-ID>` – Specify the VLAN ID. |
Usage Guidelines Built-in Tokens & Alias

Following are the built-in tokens that can be used to identify the devices to adopt:

$FQDN           - references FQDN of adopting device
$CDP             - references CDP Device Id of wired switch to which adopting device is connected
$LLDP            - references LLDP System Name of wired switch to which adopting device is connected
$DHCP            - references DHCP Option Value received by the adopting device
$SN              - references SERIAL NUMBER of adopting device
$MODEL           - references MODEL NUMBER of adopting device
$DNS-SUFFIX      - references FQDN excluding the hostname of the adopting device
$CDP-SUFFIX      - references CDP excluding the hostname of the adopting device
$LLDP-SUFFIX     - references LLDP excluding the hostname of the adopting device

Following is the built-in alias that can be used to identify the RF Domain of devices to adopt:

$_builtin_rf-domain - rf-domain of adopting device

Examples

rfs4000-229D58(config-auto-provisioning-policy-test)#adopt ap81xx precedence 1 profile default-ap81xx vlan 1

9.1.2 default-adoption

- auto-provisioning-policy

Adopts devices, even when no matching rules are defined. Assigns a default profile and default RF Domain.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

default-adoption

Parameters

None

Examples

rfs4000-229D58(config-auto-provisioning-policy-test)#default-adoption

### 9.1.3 deny

**auto-provisioning-policy**

Defines a deny device adoption rule

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9000, NX9500, NX9510

#### Syntax

```plaintext
deny [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> [any|cdp-match|dhcp-option|fqdn|ip|ipv6|lldp-match|mac|model-number|serial-number|vlan]
deny [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> any
```

#### Parameters

- **deny [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> any**

*Adds a deny adoption rule. The rule applies to the selected device types. Specify the device type and assign a precedence to the rule.*

The different device types are: anyap, AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX75XX, and NX9000 series.

**Note:** ‘anyap’ is used in auto provisioning policies to create rules that are applicable to any AP regardless of the type.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>precedence &lt;1-10000&gt;</td>
<td>Sets the rule precedence. A rule with a lower value has a higher precedence.</td>
</tr>
<tr>
<td>any</td>
<td>Indicates any device. Any device seeking adoption is denied adoption.</td>
</tr>
</tbody>
</table>

deny Adds a deny adoption rule. The rule applies to the selected device types. Specify the device type and assign a precedence to the rule.

The different device types are: anyap, AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX75XX, NX7510, NX7520, NX7530, and NX9000.

precedence <1-10000> Sets the rule precedence. A rule with a lower value has a higher precedence.

After specifying the rule precedence, specify the match criteria. Devices matching the specified criteria are denied adoption.

cdp-match <LOCATION-SUBSTRING> Matches a substring in a list of CDP snoop strings (case insensitive). For example, if an access point snooped 3 devices: controller1.example.com, controller2.example.com and controller3.example.com, ‘controller1’, ‘example’, ‘example.com’, are examples of the substrings that will match.

• <LOCATION-SUBSTRING> – Specify the value to match. Devices matching the specified value are denied adoption.

dhcp-option <DHCP-OPTION> Matches the value found in DHCP vendor option 191 (case insensitive). DHCP vendor option 191 can be setup to communicate various configuration parameters to an AP. The value of the option in a string in the form of tag=value separated by a semicolon, for example ‘tag1=value1;tag2=value2;tag3=value3’. The access point includes the value of tag ‘rf-domain’, if present.

• <DHCP-OPTION> – Specify the DHCP option value to match. Devices matching the specified value are denied adoption.

fqdn <FQDN> Matches a substring to the FQDN of a device (case insensitive) FQDN is a domain name that specifies its exact location in the DNS hierarchy. It specifies all domain levels, including its top-level domain and the root domain.

• <FQDN> – Specify the FQDN. Devices matching the specified value are denied adoption.

ip [<START-IP> <END-IP>|<IP/MASK>] Denies adoption if a device’s IP address matches the specified IPv4 address or is within the specified IP address range

• <START-IP> – Specify the first IPv4 address in the range.
• <END-IP> – Specify the last IPv4 address in the range.
• <IP/MASK> – Specify the IPv4 subnet and mask to match against the device’s IP address.

ipv6 [<START-IP> <END-IP>|<IP/MASK>] Denies adoption if a device’s IPv6 address matches the specified IPv6 address or is within the specified IP address range

• <START-IP> – Specify the first IPv6 address in the range.
• <END-IP> – Specify the last IPv6 address in the range.
• <IP/MASK> – Specify the IPv6 subnet and mask to match against the device’s IP address.
### Examples

```
rfs4000-229D58(config-auto-provisioning-policy-test)#deny ap71xx precedence 2 model-number AP7131N
rfs4000-229D58(config-auto-provisioning-policy-test)#deny ap71xx precedence 3 ip 192.168.13.23 192.168.13.23
rfs4000-229D58(config-auto-provisioning-policy-test)#show context auto-provisioning-policy test
  adopt ap81xx precedence 1 profile default-ap81xx vlan 1
deny ap71xx precedence 2 model-number AP7131N
deny ap71xx precedence 3 ip 192.168.13.23 192.168.13.23
rfs4000-229D58(config-auto-provisioning-policy-test)#
```

9.1.4 **evaluate-always**

* auto-provisioning-policy

Sets flag to run this auto-provisioning policy every time an access point is adopted. The access point's previous adoption status is not taken into consideration.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

9.1.5 redirect

`auto-provisioning-policy`

Adds a rule redirecting device adoption to another controller within the system. Devices seeking adoption are redirected to a specified controller based on the redirection parameters specified.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
redirect [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000]
redirect [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> controller [<CONTROLLER-IP>|<CONTROLLER-HOSTNAME>]
redirect [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> controller [<CONTROLLER-IP>|<CONTROLLER-HOSTNAME>|ipv6]

**Parameters**

- `redirect [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> controller [<CONTROLLER-IP>|<CONTROLLER-HOSTNAME>|ipv6] any

redirect Adds a redirect adoption rule. The rule applies to the device type selected. Specify the device type and assign a precedence to the rule.

The different device types are: anyap, AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, NX75XX, and NX9000 series.

**Note:** 'anyap' is used in auto provisioning policies to create rules that are applicable to any AP regardless of the type.

**Note:** An adoptee controller, such as RFS4000, RFS6000, and RFS7000, can be redirected to another controller (configured to adopt controllers) with a capacity equal to or higher than its own. For more information, see controller.

**precedence <1-10000>** Sets the rule precedence. Rules with lower values get precedence over rules with higher values.
### redirect

```
redirect [ap621|ap622|ap650|ap6511|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522
ap7532|ap81xx|ap82xx|rf4000|rf6000|rf7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|
nx9000] precedence <1-1000> controller [<CONTROLLER-IP>|<CONTROLLER-HOSTNAME>|ipv6]
```

**Configures the controller to which the adopting devices are redirected. Specify the controller's IP address or hostname.**

- `<CONTROLLER-IP>` – Specifies the controller's IP address
- `<CONTROLLER-HOSTNAME>` – Specifies the controller's hostname
- `ipv6` – Specify the controller's IPv6 address

**Note:** An adoptee controller, such as RFS4000, RFS6000, and RFS7000, can be redirected to another controller (configured to adopt controllers) with a capacity equal to or higher than its own. For more information, see `controller`.

### precedence

```
precedence <1-10000>
```

**Sets the rule precedence. Rules with lower values get precedence over rules with higher values.**

### controller

```
controller [<CONTROLLER-IP>|<CONTROLLER-HOSTNAME>|ipv6]
```

**Configures the controller to which the adopting devices are redirected. Specify the controller's IP address or hostname.**

- `<CONTROLLER-IP>` – Specifies the controller's IP address
- `<CONTROLLER-HOSTNAME>` – Specifies the controller's hostname
- `ipv6` – Specify the controller's IPv6 address

After specifying the rule precedence and the controller, specify the match criteria.

### cdp-match

```
cdp-match <LOCATION-SUBSTRING>
```

**Configures the device location to match, based on CDP snoop strings**

- `<LOCATION-SUBSTRING>` – Specify the location. Devices matching the specified string are redirected.

### dhcp-option

```
dhcp-option <DHCP-OPTION>
```

**Configures the DHCP options to match**

DHCP options identify the vendor and DHCP client functionalities. This information is used by the client to convey to the DHCP server that the client requires extra information in a DHCP response.

- `<DHCP-OPTION>` – Specify the DHCP option value. Devices matching the specified value are redirected.

### fqdn

```
fqdn <FQDN>
```

**Configures the FQDN to match**

FQDN is a domain name that specifies its exact location in the DNS hierarchy. It specifies all domain levels, including its top-level domain and the root domain.

- `<FQDN>` – Specify the FQDN. Devices matching the specified value are redirected.

9.1.6 upgrade

- auto-provisioning-policy

Adds a device upgrade rule to this auto provisioning policy

When applied to a controller, the upgrade rule ensures adopted devices, of the specified type, are upgraded automatically.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, RFS7000, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

upgrade [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000]

Parameters

- upgrade [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> any
- upgrade [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> [cdp-match|dhcp-option|fqdn|ip|ipv6|lldp-match|mac|model-number|serial-number|vlan]
- upgrade [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> [cdp-match|dhcp-option|fqdn|ip|ipv6|lldp-match|mac|model-number|serial-number|vlan]

Parameters

- upgrade [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000] precedence <1-10000> any

<tr>
<td>upgrade</td>
<td>Adds a device upgrade rule. The rule applies to the device type selected. Specify the device type and assign a precedence to the rule. The different device types are: anyap, AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, and NX9000 series.</td>
</tr>
<tr>
<td>precedence &lt;1-10000&gt;</td>
<td>Sets the rule precedence. Rules with lower values get precedence over rules with higher values.</td>
</tr>
<tr>
<td>any</td>
<td>Indicates any device. Any device, of the selected type, is upgraded. For example, if the device type selected is AP621, any AP621 device is upgraded.</td>
</tr>
</tbody>
</table>
### upgrade

### redirect

Adds a device upgrade rule. The rule applies to the device type selected. Specify the device type and assign a precedence to the rule.

The different device types are: anyap, AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, and NX75XX, NX9000 series.

**Note:** ‘anyap’ is used in auto provisioning policies to create rules that are applicable to any AP regardless of the type.

### precedence

- `precedence <1-10000>`

Sets the rule precedence. Rules with lower values get precedence over rules with higher values.

### cdp-match

- `cdp-match <LOCATION-SUBSTRING>`

Configures the device location to match, based on CDP snoop strings

- `<LOCATION-SUBSTRING>` – Specify the location. Devices matching the specified string are upgraded.

### dhcp-option

- `dhcp-option <DHCP-OPTION>`

Configures the DHCP options to match

DHCP options identify the vendor and DHCP client functionalities. This information is used by the client to convey to the DHCP server that the client requires extra information in a DHCP response.

- `<DHCP-OPTION>` – Specify the DHCP option value. Devices matching the specified value are upgraded.

### fqdn

- `fqdn <FQDN>`

Configures the FQDN to match

FQDN is a domain name that specifies its exact location in the DNS hierarchy. It specifies all domain levels, including its top-level domain and the root domain.

- `<FQDN>` – Specify the FQDN. Devices matching the specified value are upgraded.

### ip

- `ip [<START-IP> <END-IP>|<IP/MASK>]`

Configures a range of IP addresses and subnet address. Devices having IPv4 addresses within the specified range or are part of the specified subnet are upgraded.

- `<START-IP>` – Specify the first IPv4 address in the range.
- `<END-IP>` – Specify the last IPv4 address in the range.
- `<IP/MASK>` – Specify the IPv4 subnet and mask to match against the device’s IP address.

### ipv6

- `ipv6 [<START-IP> <END-IP>|<IP/MASK>]`

Upgrades if a device’s IPv6 address matches the specified IP address or is within the specified IP address range

- `<START-IP>` – Specify the first IPv6 address in the range.
- `<END-IP>` – Specify the last IPv6 address in the range.
- `<IP/MASK>` – Specify the IPv6 subnet and mask to match against the device’s IP address.

### lldp-match

- `lldp-match <LLDP-STRING>`

Configures the device location to match, based on LLDP snoop strings

LLDP is a vendor neutral link layer protocol used to advertise a network device’s identity, capabilities, and neighbors on a local area network.

- `<LLDP-STRING>` – Specify the location. Devices matching the specified string are upgraded.
Examples

rfs4000-229D58 (config-auto-provisioning-policy-test)#upgrade ap621 precedence 1 any
rfs4000-229D58 (config-auto-provisioning-policy-test)#upgrade rfs4000 precedence 2 ip 192.168.13.1 192.168.13.5
rfs4000-229D58 (config-auto-provisioning-policy-test)#show context auto-provisioning-policy test
  upgrade ap621 precedence 1 any
  upgrade rfs4000 precedence 2 ip 192.168.13.1 192.168.13.5
rfs4000-229D58 (config-auto-provisioning-policy-test)#

Related Commands

no | Removes an upgrade rule
9.1.7 no

Removes a deny, permit, or redirect rule from the specified auto provisioning policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [adopt|default-adoption|deny|evaluate-always|redirect|upgrade]

no adopt precedence <1-10000>
no deny precedence <1-10000>
no evaluate-always
no default-adoption
no redirect precedence <1-10000>
no upgrade precedence <1-10000>

Parameters

- no <PARAMETERS>

Examples

The following example shows the auto-provisioning-policy ‘test’ settings before the ‘no’ commands are executed:

rfs4000-229D58 (config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
default-adoption
adopt ap81xx precedence 1 profile default-ap81xx vlan 1
deny ap71xx precedence 2 model-number AP7131N
deny ap71xx precedence 3 ip 192.168.13.23 192.168.13.23
redirect ap81xx precedence 5 controller 192.168.13.10 model-number AP-8132-66040-US

rfs4000-229D58 (config-auto-provisioning-policy-test)#

The following example shows the auto-provisioning-policy ‘test’ settings after the ‘no’ commands are executed:

rfs4000-229D58 (config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
adopt ap81xx precedence 1 rf-domain TechPubs vlan 1

rfs4000-229D58 (config-auto-provisioning-policy-test)#

rfs4000-229D58 (config-auto-provisioning-policy-test)#show context
upgrade ap621 precedence 1 any

rfs4000-229D58 (config-auto-provisioning-policy-test)#show context
upgrade rfs4000 precedence 2 ip 192.168.13.1 192.168.13.5

rfs4000-229D58 (config-auto-provisioning-policy-test)#
This chapter summarizes the association ACL policy commands in the CLI command structure. An association ACL is a policy-based Access Control List (ACL) that either prevents or allows wireless clients from connecting to a controller managed WLAN.

System administrators can use an association ACL to grant or restrict wireless clients access to the WLAN by specifying client MAC addresses or range of MAC addresses to either include or exclude from controller connectivity. Association ACLs are applied to WLANs as an additional access control mechanism.

Use the (config) instance to configure the association ACL policy. To navigate to the association-acl-policy instance, use the following commands:

```bash
<DEVICE>(config)#association-acl-policy <POLICY-NAME>
rfs7000-37FABE(config)#association-acl-policy test
rfs7000-37FABE(config-assoc-acl-test)#
```

**Association ACL Mode commands:**
- `deny` Specify MAC addresses to be denied
- `no` Negate a command or set its defaults
- `permit` Specify MAC addresses to be permitted
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```bash
rfs7000-37FABE(config-assoc-acl-test)#
```

---

**NOTE:** If creating an new association ACL policy, provide a name specific to its function. Avoid naming it after a WLAN it may support. The name cannot exceed 32 characters.
Before defining an association ACL policy and applying it to a WLAN, refer to the following deployment guidelines to ensure the configuration is optimally effective:

- The name and configuration of an association ACL policy should meet the requirements of the WLANs it may map to. However, be careful not to name ACLs after specific WLANs, as individual ACL policies can be used by more than one WLAN.

- You cannot apply more than one MAC based ACL to a layer 2 interface. If a MAC ACL is already configured on a layer 2 interface, and a new MAC ACL is applied to the interface, the new ACL replaces the previously configured one.
10.1 association-acl-policy

The following table summarizes association ACL policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Specifies a range of MAC addresses denied access to the WLAN</td>
<td>page 10-4</td>
</tr>
<tr>
<td>no</td>
<td>Removes a deny or permit rule from this association ACL policy</td>
<td>page 10-6</td>
</tr>
<tr>
<td>permit</td>
<td>Specifies a range of MAC addresses allowed access to the WLAN</td>
<td>page 10-7</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
10.1.1 deny

*association-acl-policy*

Creates a list of devices denied access to the managed network. Devices are identified by their MAC address. A single MAC address or a range of MAC addresses can be denied access. This command also sets the precedence on how deny rules are applied. Up to a thousand (1000) deny rules can be defined for every association ACL policy. Each rule has a unique sequential precedence value assigned, and are applied to packets on the basis of this precedence value. Lower the precedence of a rule, higher is its priority. This results in the rule with the lowest precedence being applied first. No two rules can have the same precedence. The default precedence is 1, so be careful to prioritize ACLs accordingly as they are added.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

deny <STARTING-MAC> [<ENDING-MAC>|precedence]
deny <STARTING-MAC> precedence <1-1000>
deny <STARTING-MAC> <ENDING-MAC> precedence <1-1000>

**Parameters**
- **deny <STARTING-MAC> precedence <1-1000>**
  - *deny* Adds a single device or a set of devices to the deny list
  - *<STARTING-MAC>* To add a single device, enter its MAC address in the <STARTING-MAC> parameter.
  - *precedence <1-1000>* Sets a precedence rule. Rules are applied in an increasing order of precedence.
    - <1-1000> – Specify a precedence value from 1 - 1000.

- **deny <STARTING-MAC> <ENDING-MAC> precedence <1-1000>**
  - *deny* Adds a single device or a set of devices to the deny list
  - *<STARTING-MAC>* To add a set of devices, provide the range of MAC addresses.
  - *<ENDING-MAC>* Specify the first MAC address in the range.
  - *<ENDING-MAC>* Specify the last MAC address in the range.
  - *precedence <1-1000>* Sets a precedence rule. Rules are applied in an increasing order of precedence.
    - <1-1000> – Specify a value from 1 - 1000.

**Usage Guidelines**
Every rule has a unique sequential precedence value. You cannot add two rules with the same precedence. Rules are applied in an increasing order of precedence. That means the rule with precedence 1 is applied first, then the rule with precedence 2 and so on.
Examples

rfs7000-37FABE(config-assoc-acl-test)#deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150

rfs7000-37FABE(config-assoc-acl-test)#deny 11-22-33-44-56-01 11-22-33-44-56-01 precedence 160

rfs7000-37FABE(config-assoc-acl-test)#show context association-acl-policy test
  deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
  deny 11-22-33-44-56-01 11-22-33-44-56-01 precedence 160
rfs7000-37FABE(config-assoc-acl-test)#

10.1.2 no

Removes a deny or permit rule from this association ACL policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [deny|permit]

no deny <STARTING-MAC> precedence <1-1000>
no deny <STARTING-MAC> <ENDING-MAC> precedence <1-1000>

no permit <STARTING-MAC> precedence <1-1000>
no permit <STARTING-MAC> <ENDING-MAC> precedence <1-1000>

Parameters

- no <PARAMETERS>

Examples

The following example shows the association ACL policy ‘test’ settings before the ‘no’ commands is executed:

rfs7000-37FABE(config-assoc-acl-test)#show context
association-acl-policy test
deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
deny 11-22-33-44-56-01 11-22-33-44-56-01 precedence 160
rfs7000-37FABE(config-assoc-acl-test)#

rfs7000-37FABE(config-assoc-acl-test)#no deny 11-22-33-44-56-01 11-22-33-44-56-FF precedence 160

The following example shows the association ACL policy ‘test’ settings after the ‘no’ commands is executed:

rfs7000-37FABE(config-assoc-acl-test)#show context
association-acl-policy test
deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
rfs7000-37FABE(config-assoc-acl-test)#
10.1.3 permit

associate-acl-policy

Creates a list of devices allowed access to the managed network. Devices are permitted access based on their MAC address. A single MAC address or a range of MAC addresses can be specified. This command also sets the precedence on how permit list rules are applied. Up to a thousand (1000) permit rules can be defined for every association ACL policy. Each rule has a unique sequential precedence value assigned, and are applied to packets on the basis of this precedence value. Lower the precedence of a rule, higher is its priority. This results in the rule with the lowest precedence being applied first. No two rules can have the same precedence. The default precedence is 1, so be careful to prioritize ACLs accordingly as they are added.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

permit <STARTING-MAC> [<ENDING-MAC>|precedence]
permit <STARTING-MAC> precedence <1-1000>
permit <STARTING-MAC> <ENDING-MAC> precedence <1-1000>

Parameters

- permit <STARTING-MAC> precedence <1-1000>
- permit <STARTING-MAC> <ENDING-MAC> precedence <1-1000>

Usage Guidelines

Every rule has a unique sequential precedence value. You cannot add two rules with the same precedence. Rules are applied to packets in an increasing order of precedence. That means the rule with precedence 1 is applied first, then the rule with precedence 2 and so on.

Examples

rfs7000-37FABE(config-associ-acl-test)# permit 11-22-33-44-66-01 11-22-33-44-66-FF precedence 170
rfs7000-37FABE(config-associ-acl-test)# permit 11-22-33-44-67-01 precedence 180
rfs7000-37FABE(config-assoc-acl-test)#show context
association-acl-policy test
deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
permit 11-22-33-44-66-01 11-22-33-44-66-FF precedence 170
permit 11-22-33-44-67-01 11-22-33-44-67-01 precedence 180
rfs7000-37FABE(config-assoc-acl-test)#

CHAPTER 11
ACCESS-LIST

This chapter summarizes IPv4, IPv6, and MAC access list commands in the CLI command structure.

Access lists control access to the managed network using a set of rules also known as Access Control Entries (ACEs). Each rule specifies an action taken when a packet matches that rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed. A set of deny and/or permit rules based on IP (IPv4 and IPv6) addresses constitutes a IP Access Control List (ACL). Similarly, a set of deny and/or permit rules based on MAC addresses constitutes a MAC ACL.

Within a managed network, IP ACLs (IPv4 and IPv6) are used as firewalls to filter packets, and may also mark packets, based on the IP address from which they arrive, as opposed to filtering packets on layer 2 ports. IP based firewall rules are specific to the source and destination IP addresses and have unique precedence orders assigned. Both IP and non-IP traffic on the same layer 2 or port interface can be filtered by applying an IP ACL.

MAC ACLs are firewalls that filter or mark packets based on the MAC address from which they arrive, as opposed to filtering packets on layer 2 ports. Optionally filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to controller managed packet traffic.

Once defined, a IP and/or MAC ACL (consisting of a set of firewall rules) must be applied to an interface to be a functional filtering tool.

Firewall supported devices (access points, wireless controllers, and service platforms) process firewall rules (within an IP/MAC ACL) sequentially, in ascending order of their precedence value. When a packet (network traffic) matches a rule, the firewall applies the action specified in the rule to determine whether the traffic is allowed or denied. Once a match is made, the firewall does not process subsequent rules in the ACL.

The WiNG software enables the configuration of IP SNMP ACLs. These ACLs control access by combining IP ACLs with SNMP server community strings.

The following ACLs are supported:

- `ip-access-list`
- `mac-access-list`
- `ipv6-access-list`
- `ip-snmp-access-list`

Use IP and MAC commands under the global configuration to create an access list.

- When the access list is applied on an Ethernet port, it becomes a port ACL
- When the access list is applied on a VLAN interface, it becomes a router ACL
Use the (config) instance to configure a new ACL or modify an existing ACL. To navigate to the (config-access-list) instance, use the following commands:

<DEVICE>(config)#ip access-list <IP-ACCESS-LIST-NAME>
<DEVICE>(config)#mac access-list <MAC-ACCESS-LIST-NAME>
<DEVICE>(config)#ipv6 access-list <IPv6-ACCESS-LIST-NAME>
<DEVICE>(config)#ip snmp-access-list <SNMP-ACCESS-LIST-NAME>

**NOTE:** If creating a new ACL policy, provide a name that uniquely identifies its purpose. The name cannot exceed 32 characters.

**ip-access-list**

rfs7000-37FABE(config)#ip access-list test  
rfs7000-37FABE(config-ip-acl-test)##
ACL Configuration commands:
- deny Specify packets to reject
- disable Disable rule if not needed
- insert Insert this rule (instead of overwriting a existing rule)
- no Negate a command or set its defaults
- permit Specify packets to forward
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-ip-acl-test)#

**mac-access-list**

rfs7000-37FABE(config)#mac access-list test  
rfs7000-37FABE(config-mac-acl-test)##
MAC Extended ACL Configuration commands:
- deny Specify packets to reject
- disable Disable rule if not needed
- insert Insert this rule (instead of overwriting a existing rule)
- no Negate a command or set its defaults
- permit Specify packets to forward
- clrscr Clears the display screen
- commit Commit all changes made in this session

- **show** Show running system information
- **write** Write running configuration to memory or terminal

`nx9500-6C8809(config-ip-snmp-acl-test)#`
11.1 ip-access-list

The following table summarizes IP access list configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Creates a deny access rule or modifies an existing rule. A deny access rule rejects packets from specified address(es) and/or destined for specified address(es).</td>
<td>page 11-5</td>
</tr>
<tr>
<td>disable</td>
<td>Disables an existing deny or permit rule without removing it from the ACL</td>
<td>page 11-16</td>
</tr>
<tr>
<td>insert</td>
<td>Inserts a rule in an IP ACL without overwriting or replacing an existing rule having the same precedence</td>
<td>page 11-19</td>
</tr>
<tr>
<td>no</td>
<td>Removes a deny and/or a permit access rule from a IP ACL</td>
<td>page 11-21</td>
</tr>
<tr>
<td>permit</td>
<td>Creates a permit access rule or modifies an existing rule. A permit access rule accepts packets from specified address(es) and/or destined for specified address(es).</td>
<td>page 11-22</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
11.1.1 deny

ip-access-list

Creates a deny rule that rejects packets from a specified source IP and/or to a specified destination IP. You can also use this command to modify an existing deny rule.

NOTE: Use a decimal value representation to implement a permit/deny designation for a packet. The command set for IP ACLs provides the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

deny [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|tcp|udp]
deny <NETWORK-SERVICE-ALIAS-NAME> [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>|<NETWORK-GROUP-ALIAS-NAME>] (log,mark [8021p <0-7>|dscp <0-63>], rule-precedence <1-5000>) {rule-description <LINE>}
deny dns-name [contains|exact|suffix] dns-name [contains|exact|suffix] <WORD> (log,rule-precedence <1-5000>) {rule-description <LINE>}
deny icmp [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>|<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any] (log,rule-precedence <1-5000>) {rule-description <LINE>}
deny ip [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>|<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any] (log,rule-precedence <1-5000>) {rule-description <LINE>}
deny proto [<PROTOCOL-NUMBER>|<PROTOCOL-NAME>|eigrp|gre|igmp|igp|ospf|vrrp] [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>|<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any] (log,rule-precedence <1-5000>) {rule-description <LINE>}

NOTE: Use a decimal value representation to implement a permit/deny designation for a packet. The command set for IP ACLs provides the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.
Parameters

- deny <NETWORK-SERVICE-ALIAS-NAME> [ [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any] from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>] [ [<DEST-IP/MASK>|any|host <DEST-HOST-IP>| <NETWORK-GROUP-ALIAS-NAME>] (log,mark [8021p <0-7>|dscp <0-63>],rule-precedence <1-5000>) {(rule-description <LINE>)}

**<NETWORK-SERVICE-ALIAS-NAME>**

Applies this deny rule to packets based on service protocols and ports specified in the network-service alias

- **<NETWORK-SERVICE-ALIAS-NAME>** – Specify the network-service alias name (should be existing and configured).

A network-service alias defines service protocols and ports to match. When used with an ACL, the network-service alias defines the service-specific components of the ACL deny rule.

**Note:** For more information on configuring network-service alias, see alias.

**<SOURCE-IP/MASK>**

Specifies the source IP address and mask (A.B.C.D/M) to match. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified network are dropped.

**<NETWORK-GROUP-ALIAS-NAME>**

Applies a network-group alias to identify the source IP addresses. Packets, matching the service protocols and ports specified in the network-service alias, received from the addresses identified by the network-group alias are dropped.

- **<NETWORK-GROUP-ALIAS-NAME>** – Specify the network-group alias name (should be existing and configured).

A network-group alias defines a single or a range of addresses of devices, hosts, and networks. When used with an ACL, the network-group alias defines the network-specific component of the ACL rule (permit/deny).

**any**

Specifies the source as any source IP address. Packets, matching the service protocols and ports specified in the network-service alias, received from any source are dropped.

**from-vlan <VLAN-ID>**

Specifies a single VLAN or a range of VLANs as the match criteria. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified VLAN(s) are dropped.

- **<VLAN-ID>** – Specify the VLAN ID. To configure a range of VLANs, enter the start and end VLAN IDs separated by a hyphen (for example, 12-20).

**Note:** Use this option with WLANs and port ACLs.

**host <SOURCE-HOST-IP>**

Identifies a specific host (as the source to match) by its IP address. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified host are dropped.

- **<SOURCE-HOST-IP>** – Specify the source host’s exact IP address in the A.B.C.D format.

**<DEST-IP/MASK>**

Specifies the destination IP address and mask (A.B.C.D/M) to match. Packets, matching the service protocols and ports specified in the network-service alias, addressed to the specified network are dropped.

**any**

Specifies the destination as any destination IP address. Packets, matching the service protocols and ports specified in the network-service alias, addressed to any destination are dropped.

**host <DEST-HOST-IP>**

Identifies a specific host (as the destination to match) by its IP address. Packets, matching the service protocols and ports specified in the network-service alias, addressed to the specified host are dropped.

- **<DEST-HOST-IP>** – Specify the destination host’s exact IP address in the A.B.C.D format.
| **<NETWORK-GROUP-ALIAS-NAME>** | Applies a network-group alias to identify the destination IP addresses. Packets, matching the service protocols and ports specified in the network-service alias, destined for the addresses identified by the network-group alias are dropped.  
- `<NETWORK-GROUP-ALIAS-NAME>` – Specify the network-group alias name (should be existing and configured). |
| **log** | Logs all deny events matching this entry. If a source and/or destination IP address is matched (i.e. if any specified type of packet is received from a specified IP address and/or is destined for a specified IP address), an event is logged. |
| **mark [8021p <0-7> | dscp <0-63>]** | Specifies packets to mark  
- `8021p <0-7>` – Marks packets by modifying 802.1p VLAN user priority  
- `dscp <0-63>` – Marks packets by modifying DSCP TOS bits in the header |
| **rule-precedence <1-5000>** | The following keywords are recursive and common to all of the above parameters:  
- `rule-precedence` – Assigns a precedence for this deny rule  
- `<1-5000>` – Specify a value from 1 - 5000.  
**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.  
- `rule-description` – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| **deny dns-name [contains | exact | suffix] <WORD> (log, rule-precedence <1-5000>) { (rule-description <LINE> )}** | Applies this deny rule to packets based on dns-names specified in the network-service  
- `dns-name` – Applies this deny rule to packets based on dns-names specified in the network-service  
- `contains` – Matches any hostname which has this DNS label. (for example * .test.* )  
- `exact` – Matches an exact hostname as specified in the network-service  
- `suffix` – Matches any hostname as suffix (for example * .test)  
- `<WORD>` – Identifies a specific host (as the source to match) by its domain name. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified host are dropped.  
- `log` – Logs all deny events matching this dns entry. If a dns-name is matched an event is logged.  
- `rule-precedence <1-5000>` – Assigns a precedence for this deny rule  
- `<1-5000>` – Specify a value from 1 - 5000.  
**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.  
- `rule-description` – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| **deny icmp [<SOURCE-IP/MASK>|<NETWORK-GROUP-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>] [[<DEST-IP/MASK>|<NETWORK-GROUP-NAME>|any|host <DEST-HOST-IP>] { <ICMP-TYPE> <ICMP-CODE>, log, rule-precedence <1-5000> ) { (rule-description <LINE> )}** | Applies this deny rule to Internet Control Message Protocol (ICMP) packets only  
- `icmp` – Applies this deny rule to Internet Control Message Protocol (ICMP) packets only  
- `<ICMP-TYPE> <ICMP-CODE>` – The following keywords are recursive and common to all of the above parameters:  
- `rule-precedence` – Assigns a precedence for this deny rule  
- `<1-5000>` – Specify a value from 1 - 5000.  
**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.  
- `rule-description` – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;SOURCE-IP/MASK&gt;</code></td>
<td>Specifies the source IP address and mask (A.B.C.D/M) to match. ICMP packets received from the specified sources are dropped.</td>
</tr>
</tbody>
</table>
| `<NETWORK-GROUP-ALIAS-NAME>` | Applies a network-group alias to identify the source IP addresses. ICMP packets received from the addresses identified by the network-group alias are dropped.  
* - `<NETWORK-GROUP-ALIAS-NAME>` – Specify the network-group alias name (should be existing and configured). |
| `any` | Specifies the source as any IP address. ICMP packets received from any source are dropped. |
| `from-vlan <VLAN-ID>` | Specifies a single VLAN or a range of VLANs as the match criteria. ICMP packets received from the VLANs identified here are dropped.  
* - `<VLAN-ID>` – Specify the VLAN ID. To configure a range of VLANs, enter the start and end VLAN IDs separated by a hyphen (for example, 12-20).  
**Note:** Use this option with WLANs and port ACLs. |
| `host <SOURCE-HOST-IP>` | Identifies a specific host (as the source to match) by its IP address. ICMP packets received from the specified host are dropped.  
* - `<SOURCE-HOST-IP>` – Specify the source host’s exact IP address in the A.B.C.D format. |
| `<DEST-IP/MASK>` | Specifies the destination IP address and mask (A.B.C.D/M) to match. ICMP packets addressed to specified destinations are dropped. |
| `<NETWORK-GROUP-ALIAS-NAME>` | Applies a network-group alias to identify the destination IP addresses. ICMP packets destined for addresses identified by the network-group alias are dropped.  
* - `<NETWORK-GROUP-ALIAS-NAME>` – Specify the network-group alias name (should be existing and configured). |
| `any` | Specifies the destination as any IP address. ICMP packets addressed to any destination are dropped. |
| `host <DEST-HOST-IP>` | Identifies a specific host (as the destination to match) by its IP address. ICMP packets addressed to the specified host are dropped.  
* - `<DEST-HOST-IP>` – Specify the destination host’s exact IP address in the A.B.C.D format. |
| `<ICMP-TYPE>` | Defines the ICMP packet type  
For example, an ICMP type 0 indicates it is an ECHO REPLY, and type 8 indicates it is an ECHO. |
| `<ICMP-CODE>` | Defines the ICMP message type  
For example, an ICMP code 3 indicates “Destination Unreachable”, code 1 indicates “Host Unreachable”, and code 3 indicates “Port Unreachable.”  
**Note:** After specifying the source and destination IP address(es), the ICMP message type, and the ICMP code, specify the action taken in case of a match. |
| `log` | Logs all deny events matching this entry. If a source and/or destination IP address is matched (i.e. a ICMP packet is received from a specified IP address and/or is destined for a specified IP address), an event is logged. |
The following keywords are recursive and common to all of the above parameters:

- **rule-precedence** – Assigns a precedence for this deny rule
- **<1-5000>** – Specify a value from 1 - 5000.
- **rule-description** – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length).

# WiNG 5.7 CLI Reference Guide

## deny proto <PROTOCOL-NUMBER>|<PROTOCOL-NAME>|eigrp|gre|igmp|igp|ospf|vrrp|host <SOURCE-HOST-IP>/<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID> host <DEST-HOST-IP>/<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any |rule-precedence <1-5000> |log rule-precedence <1-5000> rule-precedence <1-5000> rule-description <LINE> rule-description <LINE> {rule-description <LINE>}

### proto
- Configures the ACL for additional protocols
- Additional protocols (other than IP, ICMP, TCP, and UDP) must be configured using this parameter

### <PROTOCOL-NUMBER>
- Filters protocols using their Internet Assigned Numbers Authority (IANA) protocol number
- Specify the protocol number.

### <PROTOCOL-NAME>
- Filters protocols using their IANA protocol name
- Specify the protocol name.

### eigrp
- Identifies the Enhanced Internet Gateway Routing Protocol (EIGRP) protocol (number 88)
- EIGRP enables routers to maintain copies of neighbors’ routing tables. Routers use this information to determine the fastest route to a destination. When a router fails to find a route in its stored route tables, it sends a query to neighbors who in turn query their neighbors till a route is found. EIGRP also enables routers to inform neighbors of changes in their routing tables.

### gre
- Identifies the General Routing Encapsulation (GRE) protocol (number 47)
- GRE is a tunneling protocol that enables transportation of protocols (IP, IPX, DEC net, etc.) over an IP network. GRE encapsulates the packet at the source and removes the encapsulation at the destination.

### igmp
- Identifies the Internet Group Management Protocol (IGMP) protocol (number 2)
- IGMP establishes and maintains multicast group memberships to interested members.
- Multicastr +a allows a networked computer to send content to multiple computers who have registered to receive the content. IGMP snooping is for listening to IGMP traffic between an IGMP host and routers in the network to maintain a map of the links that require multicast streams.
- Multicast traffic is filtered out for those links which do not require them.

### igp
- Identifies any private internal gateway (primarily used by CISCO for their IGRP) (number 9)
- IGP enables exchange of information between hosts and routers within a managed network.
- The most commonly used interior gateway protocol (IGP) protocols are: Routing Information Protocol (RIP) and Open Shortest Path First (OSPF)

### ospf
- Identifies the OSPF protocol (number 89)
- OSPF is a link-state interior gateway protocol (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets.
<table>
<thead>
<tr>
<th>vrrp</th>
<th>Identifies the Virtual Router Redundancy Protocol (VRRP) protocol (number 112). VRRP allows a pool of routers to be advertised as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address.</th>
</tr>

```
• deny [tcp|udp] [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>| host <SOURCE-HOST-IP>] [<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|eq <SOURCE-PORT>| host <DEST-HOST-IP>|range <START-PORT> <END-PORT>] [eq [<1-65535>|<SERVICE-NAME>|bgp| dns|ftp|ftp-data|gopher|https|ldap|ntp|nntp|pop3|sip|smtp|ssh|telnet|tftp|www]| range <START-PORT> <END-PORT>] (log,rule-precedence <1-5000>) {<LINE>}
```

tcp  | Applies this deny rule to TCP packets only |
udp  | Applies this deny rule to UDP packets only |

**<SOURCE-IP/MASK>*:**

This keyword is common to the `tcp` and `udp` parameters. Specifies the source IP address and mask (A.B.C.D/M) to match. TCP/UDP packets received from the specified sources are dropped.

**<NETWORK-GROUP-ALIAS-NAME>*:**

This keyword is common to the `tcp` and `udp` parameters. Applies a network-group alias to identify the source IP addresses. TCP/UDP packets received from the VLANs identified here are dropped.

- `<NETWORK-ALIAS-GROUP-NAME>` – Specify the network-group alias name (should be existing and configured).

After specifying the source and destination IP address(es), specify the action taken in case of a match.

**any**

This keyword is common to the `tcp` and `udp` parameters. Specifies the source as any IP address. TCP/UDP packets received from any source are dropped.

**from-vlan <VLAN-ID>*:**

This keyword is common to the `tcp` and `udp` parameters. Specifies a single VLAN or a range of VLANs as the match criteria. TCP/UDP packets received from the VLANs identified here are dropped.

- `<VLAN-ID>` – Specify the VLAN ID. To configure a range of VLANs, enter the start and end VLAN IDs separated by a hyphen (for example, 12-20).

**Note:** Use this option with WLANs and port ACLs.

**host**

*<SOURCE-HOST-IP>*:

Identifies a specific host (as the source to match) by its IP address. TCP/UDP packets received from the specified host are dropped.

- `<SOURCE-HOST-IP>` – Specify the source host’s exact IP address in the A.B.C.D format.

**<DEST-IP/MASK>*:**

This keyword is common to the `tcp` and `udp` parameters. Sets the destination IP address and mask (A.B.C.D/M) to match. TCP/UDP packets addressed to the specified destinations are dropped.

**any**

This keyword is common to the `tcp` and `udp` parameters. Specifies the destination as any destination IP address. TCP/UDP packets received from any destination are dropped.
| eq <SOURCE-PORT> | Identifies a specific source port  
| | • <SOURCE-PORT> – Specify the exact source port. |
| host <DEST-HOST-IP> | Identifies a specific host (as the destination to match) by its IP address. TCP/UDP packets addressed to the specified host are dropped.  
| | • <DEST-HOST-IP> – Specify the destination host’s exact IP address in the A.B.C.D format. |
| <NETWORK-GROUP-ALIAS-NAME> | This keyword is common to the ‘tcp’ and ‘udp’ parameters. Applies a network-group alias to identify the destination IP addresses. TCP/UDP packets destined to the addresses identified in the network-group alias are dropped.  
| | • <NETWORK-ALIAS-GROUP-NAME> – Specify the network-group alias name (should be existing and configured). |
| range <START-PORT> <END-PORT> | Specifies a range of source ports  
| | • <START-PORT> – Specify the first port in the range.  
| | • <END-PORT> – Specify the last port in the range. |
| eq [<1-65535> <SERVICE-NAME> | Identifies a specific destination or protocol port to match  
| | • <1-65535> – The destination port is designated by its number  
| | • <SERVICE-NAME> – Specifies the service name  
| | • bgp – The designated Border Gateway Protocol (BGP) protocol port (179)  
| | • dns – The designated Domain Name System (DNS) protocol port (53)  
| | • ftp – The designated File Transfer Protocol (FTP) protocol port (21)  
| | • ftp-data – The designated FTP data port (20)  
| | • gropher – The designated GROPHER protocol port (70)  
| | • https – The designated HTTPS protocol port (443)  
| | • ldap – The designated Lightweight Directory Access Protocol (LDAP) protocol port (389)  
| | • nntp – The designated Network News Transfer Protocol (NNTP) protocol port (119)  
| | • ntp – The designated Network Time Protocol (NTP) protocol port (123)  
| | • pop3 – The designated POP3 protocol port (110)  
| | • sip – The designated Session Initiation Protocol (SIP) protocol port (5060)  
| | • smtp – The designated Simple Mail Transfer Protocol (SMTP) protocol port (25)  
| | • ssh – The designated Secure Shell (SSH) protocol port (22)  
| | • telnet – The designated Telnet protocol port (23)  
| | • tftp – The designated Trivial File Transfer Protocol (TFTP) protocol port (69)  
| | • www – The designated www protocol port (80) |
| range <START-PORT> <END-PORT> | Specifies a range of destination ports  
| | • <START-PORT> – Specify the first port in the range.  
| | • <END-PORT> – Specify the last port in the range. |
| log | Logs all deny events matching this entry. If a source and/or destination IP address or port is matched (i.e. a TCP/UDP packet is received from a specified IP address and/or is destined for a specified IP address), an event is logged.
Usage Guidelines

Use this command to deny traffic between networks/hosts based on the protocol type selected in the access list configuration. The following protocols are supported:

- IP
- ICMP
- TCP
- UDP
- PROTO (any Internet protocol other than TCP, UDP, and ICMP)

The last access control entry (ACE) in the access list is an implicit deny statement.

Whenever the interface receives the packet, its content is checked against the ACEs in the ACL. It is allowed or denied based on the ACL configuration.

- Filtering TCP/UDP allows you to specify port numbers as filtering criteria
- Select ICMP as the protocol to allow or deny ICMP packets. Selecting ICMP filters ICMP packets based on ICMP type and code.

**NOTE:** The log option is functional only for router ACL's. The log option displays an informational logging message about the packet that matches the entry sent to the console.
Examples

rfs7000-37FABE(config-ip-acl-test)#deny proto vrrp any any log rule-precedence 600
rfs7000-37FABE(config-ip-acl-test)#deny proto ospf any any log rule-precedence 650
rfs7000-6DCD4B(config-ip-acl-acl)#deny dns-name contains rfs7000 log rule-precedence 1
rfs7000-6DCD4B(config-ip-acl-acl)#show context
ip access-list acl
  deny dns-name contains rfs7000 log rule-precedence 1
rfs7000-6DCD4B(config-ip-acl-acl)#

rfs7000-37FABE(config-ip-acl-test)#show context
ip access-list test
  deny proto vrrp any any log rule-precedence 600
deny proto ospf any any log rule-precedence 650
rfs7000-37FABE(config-ip-acl-test)#

Using aliases in IP access list.
The following examples show the usage of network-group aliases:
rfs4000-229D58(config)#ip access-list bar
Example 1:
rfs4000-229D58(config-ip-acl-bar)#permit ip $foo any rule-precedence 10
Example 2
rfs4000-229D58(config-ip-acl-bar)#permit tcp 192.168.100.0/24 $foobar eq ftp rule-precedence 20
Example 3
rfs4000-229D58(config-ip-acl-bar)#deny ip $guest $lab rule-precedence 30
  • In example1, network-group alias $foo is used as a source
  • In example 2, network-group alias $foobar is used as a destination
  • In example 3, network-group aliases $guest and $lab are used as source and destination respectively.

The following examples show the usage of network-service aliases:
Example 4
rfs4000-229D58(config-ip-acl-bar)# permit $kerberos 10.60.20.0/24 $kerberos-servers log rule-precedence 40
Example 5
rfs4000-229D58(config-ip-acl-bar)#permit $Tandem 10.60.20.0/24 $Tandem-servers log rule-precedence 50
In examples 4, and 5:
  • The network-service aliases ($kerberos and $Tandem) define the destination protocol-port combinations
  • The source network is 10.60.20.0/24
  • The destination network-address combinations are defined by the network-group aliases ($kerberos-servers and $Tandem-servers)

### 11.1.2 disable

Disables an existing deny or permit rule without removing it from the ACL. A disabled rule is inactive and is not used to filter packets.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
disable [deny|insert|permit] [deny|insert|permit] [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|tcp|udp]
```

```
[<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>][<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-HOST-IP>][log,mark [8021p <0-7>|dscp <0-63>],rule-precedence]
```

#### Parameters

- **disable [deny|insert|permit] [deny|insert|permit]**
  - Disables a deny or permit access rule without removing it from the ACL
  - This command also enables the insertion of a disable deny or permit rule without overwriting an existing rule in the IP ACL.
  - **Note:** To disable an existing deny/permit rule, provide the exact values used to configure the deny or permit rule.

- **<NETWORK-SERVICE-ALIAS-NAME>**
  - Specifies the network-service alias, identified by the `<NETWORK-SERVICE-ALIAS-NAME>` keyword, associated with the deny/permit rule

- **dns-name [contains|exact|suffix]**
  - Specifies the packets to reject based on the dns-name match. Applies this deny rule to packets based on dns-names specified in the network-service

- **icmp**
  - Disables a rule applicable to ICMP packets only

- **ip**
  - Disables a rule applicable to IP packets only

- **proto <PROTOCOL-OPTIONS>**
  - Disables a rule applicable to any Internet protocol other than TCP, UDP, or ICMP packets
  - **<PROTOCOL-OPTIONS>** — Identify the Internet protocol using the options available.

- **tcp**
  - Disables a rule applicable to TCP packets only

- **udp**
  - Disables a rule applicable to UDP packets only
  - **Note:** After specifying the packet type, specify the source and destination devices and network address(es) to match.

</tbody>
</table>

**Examples**

The following example shows the ‘auto-tunnel-acl’ settings before the disable command is executed:

```
rfs7000-37FABE(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
   permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2
   permit ip host 200.200.200.99 any rule-precedence 3
rfs7000-37FABE(config-ip-acl-auto-tunnel-acl)#
```

```
rfs7000-37FABE(config-ip-acl-auto-tunnel-acl)#disable permit ip host 200.200.200.99 any rule-precedence 3
rfs7000-37FABE(config-ip-acl-auto-tunnel-acl)#
```

The following example shows the ‘auto-tunnel-acl’ settings after the disable command is executed:

```
rfs7000-37FABE(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
   disable permit ip host 200.200.200.99 any rule-precedence 3
rfs7000-37FABE(config-ip-acl-auto-tunnel-acl)#
```

```
rfs4000-229D58(config-ip-acl-test)#deny icmp any any log rule-precedence 1
rfs4000-229D58(config-ip-acl-test)#show context
deny icmp any any rule-precedence 1
rfs4000-229D58(config-ip-acl-test)#
```

```
rfs4000-229D58(config-ip-acl-test)#disable deny icmp any any rule-precedence 1
```

```
rfs4000-229D58(config-ip-acl-test)#
```

### 11.1.3 insert

*ip-access-list*

Enables the insertion of a rule in an IP ACL without overwriting or replacing an existing rule having the same precedence.

The insert option allows a new rule to be inserted within an IP access list. Consider an IP ACL consisting of rules having precedences 1, 2, 3, 4, 5, and 6. You want to insert a new rule with precedence 4, without overwriting the existing precedence 4 rule. Using the insert option inserts the new rule prior to the existing one. The existing precedence 4 rule’s precedence changes to 5, and the change cascades down the list of rules within the ACL. That means rule 5 becomes rule 6, and rule 6 becomes rule 7.

**NOTE:** NOT using `insert` when creating a new rule having the same precedence as an existing rule, overwrites the existing rule.

**Supported in the following platforms:**

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
insert [deny|permit] <PARAMETERS> {log,mark [8021p <0-7]|dscp <0-63>,
rule-precedence <1-5000>}
```

**Parameters**

- `insert [deny|permit] <PARAMETERS>`
- `{log,mark [8021p <0-7]|dscp <0-63>,
rule-precedence <1-5000>}

| `[deny|permit]` | Inserts a deny or a permit rule within an IP ACL |
|----------------|-----------------------------------------------|
| `<PARAMETERS>` | Provide the match criteria for this deny/permit rule. Packets will be filtered based on the criteria set here. For more information on the deny rule, see `deny`. For more information on the permit rule, see `permit`. |
| `log`         | After specifying the match criteria, specify the action taken for filtered packets. Logs all deny/permit events matching this entry. If a source and/or destination IP address is matched an event is logged. |
| `mark [8021p <0-7] dscp <0-63>]` | Specifies packets to mark:  
- `8021p <0-7>` — Marks packets by modifying 802.1.p VLAN user priority  
- `dscp <0-63>` — Marks packets by modifying DSCP TOS bits in the header |
| `rule-precedence <1-5000>` | Assigns a precedence for this deny/permit rule  
- `<1-5000>` — Specify a value from 1 - 5000. |
| `rule-description <LINE>` | **Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.  
- `rule-description` — Optional. Configures a description for this new rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
**Examples**

```plaintext
rfs4000-229D58(config-ip-acl-test)#deny tcp from-vlan 1 any any rule-precedence 1
rfs4000-229D58(config-ip-acl-test)#permit icmp any host 192.168.13.7 1 1 rule-precedence 2
rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
  deny tcp from-vlan 1 any any rule-precedence 1
  permit icmp any host 192.168.13.7 1 1 rule-precedence 2
rfs4000-229D58(config-ip-acl-test)#
```

In the following example a new rule is inserted between the rules having precedences 1 and 2. The precedence of the existing precedence '2' rule changes to precedence 3.

```plaintext
rfs4000-229D58(config-ip-acl-test)#insert deny ip any any rule-precedence 2
rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
  deny tcp from-vlan 1 any any rule-precedence 1
  deny ip any any rule-precedence 2
  permit icmp any host 192.168.13.7 1 1 rule-precedence 3
rfs4000-229D58(config-ip-acl-test)#
```

**Related Commands**

| alias | Creates and configures aliases (network, VLAN, and service) |
11.1.4 no

- ip-access-list

Removes a deny, permit, or disable rule

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [deny|disable|permit]

no [deny|permit] [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|tcp|udp] <RULE-PARAMETERS>

no disable [deny|permit] [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|tcp|udp] <RULE-PARAMETERS>

Parameters

- no <PARAMETERS>

no <PARAMETERS> Removes a deny, permit, or disable rule

Usage Guidelines

Removes an access list control entry. Provide the rule-precedence value when using the no command.

Examples

The following example shows the ACL ‘test’ settings before the ‘no’ commands are executed:

```plaintext
rfs7000-37FABE(config-ip-acl-test)#show context
ip access-list test
  deny proto vrrp any any log rule-precedence 600
  deny proto ospf any any log rule-precedence 650
rfs7000-37FABE(config-ip-acl-test)#
```

```plaintext
rfs7000-37FABE(config-ip-acl-test)#no deny proto vrrp any any rule-precedence 600
rfs7000-37FABE(config-ip-acl-test)#no deny proto ospf any any rule-precedence 650
```

The following example shows the ACL ‘test’ settings after the ‘no’ commands are executed:

```plaintext
rfs7000-37FABE(config-ip-acl-test)#show context
ip access-list test
rfs7000-37FABE(config-ip-acl-test)#
```
### 11.1.5 permit

*ip-access-list*

Creates a permit rule that marks packets (from a specified source IP and/or to a specified destination IP) for forwarding. You can also use this command to modify an existing permit rule.

**Supported in the following platforms:**

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
permit [NETWORK-SERVICE-ALIAS-NAME]|dns-name|icmp|ip|proto|tcp|udp]
permit [NETWORK-SERVICE-ALIAS-NAME]|dns-name [contains|exact|suffix]
permit [NETWORK-SERVICE-ALIAS-NAME]|dns-name [contains|exact|suffix] WORD
permit [NETWORK-SERVICE-ALIAS-NAME]|dns-name exact WORD
permit [TCP|UDP] [SOURCE-IP/MASK]|NETWORK-GROUP-ALIAS-NAME|any|from-vlan VLAN-ID|host SOURCE-HOST-IP|NETWORK-GROUP-ALIAS-NAME|any|eq SOURCE-PORT|host DEST-HOST-IP|range START-PORT END-PORT]
```
**Parameters**

- **permit** `<NETWORK-SERVICE-ALIAS-NAME>` | `<SOURCE-IP/MASK>` | `<NETWORK-GROUP-ALIAS-NAME>` | any | from-vlan `<VLAN-ID>` | host `<SOURCE-HOST-IP>` | `<DEST-IP/MASK>` | any | host `<DEST-HOST-IP>` | `<NETWORK-GROUP-ALIAS-NAME>` | log, mark | 8021p `<0-7>` | dscp `<0-63>` | rule-precedence `<1-5000>` | (rule-description `<LINE>`)

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td><code>&lt;SOURCE-IP/MASK&gt;</code></td>
<td>Specifies the source IP address and mask (A.B.C.D/M) to match. ICMP packets received from the specified sources are permitted.</td>
</tr>
</tbody>
</table>
| `<NETWORK-GROUP-ALIAS-NAME>` | Applies a network-group alias to identify the source IP addresses. ICMP packets received from the addresses identified by the network-group alias are permitted.  
  - `<NETWORK-GROUP-ALIAS-NAME>` – Specify the network-group alias name (should be existing and configured). |
| `any`                      | Specifies the source as any source IP address. ICMP packets received from any source are permitted. |
| `from-vlan <VLAN-ID>`      | Specifies a single VLAN or a range of VLANs as the match criteria. ICMP packets received from the VLANs identified here are permitted.  
  - `<VLAN-ID>` – Specify the VLAN ID. To configure a range of VLANs, enter the start and end VLAN IDs separated by a hyphen (for example, 12-20). |
| `host <SOURCE-HOST-IP>`   | Identifies a specific host (as the source to match) by its IP address. ICMP packets received from the specified host are permitted.  
  - `<SOURCE-HOST-IP>` – Specify the source host’s exact IP address in the A.B.C.D format. |
| `<DEST-IP/MASK>`           | Specifies the destination IP address and mask (A.B.C.D/M) to match. ICMP packets addressed to specified destinations are permitted. |
| `<NETWORK-GROUP-ALIAS-NAME>` | Applies a network-group alias to identify the destination IP addresses. ICMP packets destined for addresses identified by the network-group alias are permitted.  
  - `<NETWORK-GROUP-ALIAS-NAME>` – Specify the network-group alias name (should be existing and configured). |
| `any`                      | Specifies the destination as any destination IP address. ICMP packets addressed to any destination are permitted. |
| `host <DEST-HOST-IP>`      | Identifies a specific host (as the destination to match) by its IP address. ICMP packets addressed to the specified host are permitted.  
  - `<DEST-HOST-IP>` – Specify the destination host’s exact IP address in the A.B.C.D format. |
| `<ICMP-TYPE>`              | Defines the ICMP packet type  
  For example, an ICMP type 0 indicates it is an ECHO REPLY, and type 8 indicates it is an ECHO. |
| `<ICMP-CODE>`              | Defines the ICMP message type  
  For example, an ICMP code 3 indicates “Destination Unreachable”, code 1 indicates “Host Unreachable”, and code 3 indicates “Port Unreachable.”  
  **Note:** After specifying the source and destination IP address(es), the ICMP message type, and the ICMP code, specify the action taken in case of a match. |
| `log`                      | Logs all permit events matching this entry. If a source and/or destination IP address is matched (i.e. a ICMP packet is received from a specified IP address and/or is destined for a specified IP address), an event is logged. |
 rule-precedence
| <1-5000> |

| rule-description | <LINE> |

The following keywords are recursive and common to all of the above parameters:
- rule-precedence – Assigns a precedence for this permit rule
- <1-5000> – Specify a value from 1 - 5000.

**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.
- rule-description – Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length).

```
• permit ip [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>] [<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-HOST-IP>] {log,rule-precedence <1-5000>} {rule-description <LINE>}
```

</tbody>
</table>

**proto**

- Filters protocols using their IANA protocol number
- <NUMBER> – Specify the protocol number.

**<PROTOCOL-NUMBER>**

- Filters protocols using their IANA protocol number
- <PROTOCOL-NUMBER> – Specify the protocol number.

**<PROTOCOL-NAME>**

- Filters protocols using their IANA protocol name
- <PROTOCOL-NAME> – Specify the protocol name.

**eigrp**

- Identifies the EIGRP protocol (number 88)
- EIGRP enables routers to maintain copies of neighbors’ routing tables. Routers use this information to determine the fastest route to a destination. When a router fails to find a route in its stored route tables, it sends a query to neighbors who in turn query their neighbors till a route is found. EIGRP also enables routers to inform neighbors of changes in their routing tables.

**gre**

- Identifies the GRE protocol (number 47)
- GRE is a tunneling protocol that enables transportation of protocols (IP, IPX, DEC net, etc.) over an IP network. GRE encapsulates the packet at the source and removes the encapsulation at the destination.

**igmp**

- Identifies the IGMP protocol (number 2)
- IGMP establishes and maintains multicast group memberships to interested members. Multicasting allows a networked computer to send content to multiple computers who have registered to receive the content. IGMP snooping is for listening to IGMP traffic between an IGMP host and routers in the network to maintain a map of the links that require multicast streams. Multicast traffic is filtered out for those links which do not require them.

**igp**

- Identifies any private internal gateway (primarily used by CISCO for their IGRP) (number 9)
- IGP enables exchange of information between hosts and routers within a managed network. The most commonly used interior gateway protocol (IGP) protocols are: Routing Information Protocol (RIP) and Open Shortest Path First (OSPF)

**ospf**

- Identifies the OSPF protocol (number 89)
- OSPF is a link-state interior gateway protocol (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets.
VRRP allows a pool of routers to be advertised as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address.

</tr>
</tbody>
</table>
### Usage Guidelines

Use this command to permit traffic between networks/hosts based on the protocol type selected in the access list. The following protocols are supported:

- IP
- ICMP
- ICP
- UDP
- PROTO (any Internet protocol other than TCP, UDP, and ICMP)

The last ACE in the access list is an implicit deny statement.

Whenever the interface receives the packet, its content is checked against all the ACEs in the ACL. The packet is allowed or denied based on the ACL configuration.

- Filtering on TCP or UDP allows you to specify port numbers as filtering criteria.
- Select ICMP to allow/deny packets. Selecting ICMP filters ICMP packets based on ICMP type and code.

**NOTE:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.

- rule-description — Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length).

**Examples**

```bash
rfs7000-37FABE(config-ip-acl-test)#show context
ip access-list test
rfs7000-37FABE(config-ip-acl-test)#

rfs7000-37FABE(config-ip-acl-test)#permit ip 172.16.10.0/24 any log rule-precedence 750
rfs7000-37FABE(config-ip-acl-test)#permit tcp 172.16.10.0/24 any log rule-precedence 800
rfs7000-37FABE(config-ip-acl-test)#show context
ip access-list test
    permit ip 172.16.10.0/24 any log rule-precedence 750
    permit tcp 172.16.10.0/24 any log rule-precedence 800
rfs7000-37FABE(config-ip-acl-test)#
```

**Related Commands**

- **no** Removes a specified IP permit access rule
- **alias** Creates and configures aliases (network, VLAN, and service)
11.2 mac-access-list

ACCESS-LIST

The following table summarizes MAC Access list configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Creates a new deny access rule or modifies an existing rule. A deny access rule marks packets for rejection.</td>

<td>page 11-41</td>
</tr>
</tbody>
</table>
11.2.1 deny

mac-access-list

Creates a deny rule that marks packets (from a specified source MAC and/or to a specified destination MAC) for rejection. You can also use this command to modify an existing deny rule.

**NOTE:** Use a decimal value representation to implement a permit/deny designation for a packet. The command set for MAC ACLs provide the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
deny [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>]
(dot1p <0-7>,type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],
 vlan <1-4095>,log,rule-precedence <1-5000>) { (rule-description <LINE>) }
```

**Parameters**

- **deny [ <SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>]**
  (dot1p <0-7>,type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],
  vlan <1-4095>,log,rule-precedence <1-5000>) { (rule-description <LINE>) }

| <SOURCE-MAC> <SOURCE-MAC-MASK> | Configures the source MAC address and mask to match
| <SOURCE-MAC> – Specify the source MAC address to match.
| <SOURCE-MAC-MASK> – Specify the source MAC address mask. Packets received from the specified MAC addresses are dropped.
| any | Identifies all devices as the source to deny access. Packets received from any source are dropped.
| host <SOURCE-HOST-MAC> | Identifies a specific host as the source to deny access
| <SOURCE-HOST-MAC> – Specify the source host’s exact MAC address to match. Packets received from the specified host are dropped.
| <DEST-MAC> <DEST-MAC-MASK> | Configures the destination MAC address and mask to match
| <DEST-MAC> – Specify the destination MAC address to match.
| <DEST-MAC-MASK> – Specify the destination MAC address mask to match. Packets addressed to the specified MAC addresses are dropped.
| any | Identifies all devices as the destination to deny access. Packets addressed to any destination are dropped.
| host <DEST-HOST-MAC> | Identifies a specific host as the destination to deny access
| <DEST-HOST-MAC> – Specify the destination host’s exact MAC address to match. Packets addressed to the specified host are dropped.
Usage Guidelines

The deny command disallows traffic based on layer 2 (data-link layer) data. The MAC access list denies traffic from a particular source MAC address or any MAC address. It can also disallow traffic from a list of MAC addresses based on the source mask.

The MAC access list can disallow traffic based on the VLAN and EtherType.

- ARP
- WISP
- IP
- 802.1q

NOTE: MAC ACLs always take precedence over IP based ACLs.
The last ACE in the access list is an implicit deny statement. Whenever the interface receives the packet, its content is checked against all the ACEs in the ACL. It is allowed or denied based on the ACL's configuration.

Examples

```
rfs4000-229D58(config-mac-acl-test)#deny 41-85-45-89-66-77 ff-ff-ff-00-00-00 any
   vlan 1 rule-precedence 1
rfs4000-229D58(config-mac-acl-test)#deny host 00-01-ae-00-22-11 any rule-precedence 2
rfs4000-229D58(config-mac-acl-test)#show context
   mac access-list test
       deny 41-85-45-89-66-77 FF-FF-FF-00-00-00 any vlan 1 rule-precedence 1
       deny host 00-01-AE-00-22-11 any rule-precedence 2
rfs4000-229D58(config-mac-acl-test)#
```

The MAC ACL (in the example below) denies traffic from any source MAC address to a particular host MAC address:

```
rfs7000-37FABE(config-mac-acl-test)#deny any host 00:01:ae:00:22:11
```

The following example denies traffic between two hosts based on MAC addresses:

```
rfs7000-37FABE(config-mac-acl-test)#deny host 01:02:fe:45:76:89 host 01:02:89:78:78:45
```

<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes a specified MAC deny access rule</td>
</tr>
</tbody>
</table>
11.2.2 disable

Disables a MAC deny or permit rule without removing it from the ACL. A disabled rule is inactive and is not used to filter packets.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

disable [deny|insert|permit]

disable [deny|permit] [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>, mark [8021p <0-7>|dscp <0-63>], type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp], vlan <1-4095>) log (rule-precedence <1-5000>) {(rule-description <LINE>)}
disable insert [deny|permit]

Parameters
- disable [deny|permit] [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>, mark [8021p <0-7>|dscp <0-63>], type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp], vlan <1-4095>) log (rule-precedence <1-5000>) {(rule-description <LINE>)}

| disable [deny|insert|permit] | Disables a deny, insert or permit access rule without removing it from the MAC ACL |
|-----------------------------|----------------------------------------------------------------------------------|
| <SOURCE-MAC> <SOURCE-MAC-MASK> | Specifies the source MAC address and mask to match |
| any | Select ‘any’ if the rule is applicable to any source MAC address |
| host <SOURCE-HOST-MAC> | Specify the source host’s exact MAC address |
| <DEST-MAC> <DEST-MAC-MASK> | Specifies the destination MAC address and mask to match |
| any | Select ‘any’ if the rule is applicable to any destination MAC address |
| host <DEST-HOST-MAC> | Specify the destination host’s exact MAC address |
| log | The following keyword defines the action taken when a packet matches any or all of the above specified criteria |
| log | Logs a record. when a packet matches the specified criteria |

Note: Provide the exact values used to configure the deny or permit rule that is to be disabled.
**Examples**

The following example shows the MAC access list 'test' settings before the 'disable' command is executed:

```
rfs4000-229D58(config-mac-acl-test)#show context
mac access-list test
deny 41-85-45-89-66-77 FF-FF-FF-00-00-00 any vlan 1 rule-precedence 1
deny host 00-01-AE-00-22-11 any rule-precedence 2
rfs4000-229D58(config-mac-acl-test)#
```

The following example shows the MAC access list 'test' settings after the 'disable' command is executed:

```
rfs4000-229D58(config-mac-acl-test)#disable deny host 00-01-AE-00-22-11 any rule-precedence 2
rfs4000-229D58(config-mac-acl-test)#
```

</tbody>
</table>
### 11.2.3 insert

*mac-access-list*

Enables the insertion of a rule in an MAC ACL without overwriting or replacing an existing rule having the same precedence. The insert option allows a new rule to be inserted within a MAC ACL. Consider an MAC ACL consisting of rules having precedences 1, 2, 3, 4, 5, and 6. You want to insert a new rule with precedence 4, without overwriting the existing precedence 4 rule. Using the insert option inserts the new rule prior to the existing one. The existing precedence 4 rule's precedence changes to 5, and the change cascades down the list of rules within the ACL. That means rule 5 becomes rule 6, and rule 6 becomes rule 7.

---

**NOTE:** NOT using insert when creating a new rule having the same precedence as an existing rule, overwrites the existing rule.

---

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
insert [deny|permit] <PARAMETERS> {deny|permit} (dot1p <0-7>, mark [8021p <0-7>|dscp <0-63>],
    type [8021q|<1-65535>|aarp|appletalk|arp|ip|ip6|x|mint|rarp|wisp],vlan <1-4095>,
    log,rule-precedence <1-5000>) {(rule-description <LINE>)}
```

**Parameters**

- `insert [deny|permit] <PARAMETERS>`
- `<PARAMETERS>`
  - Provide the match criteria for this deny/permit rule. Packets will be filtered based on the criteria set here. For more information on the deny rule, see *deny*. For more information on the permit rule, see *permit*.

- `dot1p <0-7>`
  - Configures the 802.1p priority value. Sets the service classes for traffic handling
    - `<0-7>` – Specify 802.1p priority from 0 - 7.

- `mark [8021p <0-7>|dscp <0-63>],`
  - Marks/modifies packets that match the criteria specified here
    - `8021p <0-7>` – Modifies 802.1p VLAN user priority from 0 - 7
    - `dscp <0-63>` – Modifies DSCP TOS bits in the IP header from 0 - 63

**Note:** This option is applicable only to the insert > permit MAC ACL rule.
### Examples

```
rfs4000-229D58(config-mac-acl-test1)#deny 11-22-33-44-55-66 11-22-33-44-55-77 any rule-precedence 1
rfs4000-229D58(config-mac-acl-test1)#deny host B4-C7-99-6D-CD-9B any rule-precedence 2
rfs4000-229D58(config-mac-acl-test1)#show context
mac access-list test1
deny 11-22-33-44-55-66 11-22-33-44-55-77 any rule-precedence 1
deny host B4-C7-99-6D-CD-9B any rule-precedence 2
rfs4000-229D58(config-mac-acl-test1)#
```

In the following example a new rule is inserted between the rules having precedences 1 and 2. The precedence of the existing precedence ‘2’ rule changes to precedence 3.

```
rfs4000-229D58(config-mac-acl-test1)#insert permit host B4-C7-99-6D-B5-D6 host B4-C7-99-6D-CD-9B rule-precedence 2
rfs4000-229D58(config-mac-acl-test1)#show context
mac access-list test1
deny 11-22-33-44-55-66 11-22-33-44-55-77 any rule-precedence 1

deny host B4-C7-99-6D-CD-9B any rule-precedence 3
rfs4000-229D58(config-mac-acl-test1)#
```
11.2.4 no

Negates a command or sets its default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
no [deny|disable|permit]
no [deny|permit] [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>]
   [<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>]
   (dot1p <0-7>,mark [8021p <0-7]|dscp <0-63>,type [8021q|<1-65535>|aarp|appletalk|arp|
   ip|ipv6|ipx|mint|rarp|wisp],vlan <1-4095>) log (rule-precedence <1-5000>)
   {rule-description <LINE>}
no disable [deny|permit] <RULE-PARAMETERS>
```

Parameters

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes a deny or permit rule from the MAC ACL</th>
</tr>
</thead>
</table>

Examples

```
rfs7000-37FABE(config-mac-acl-test)#show context

   permit host 11-22-33-44-55-66 any log mark 8021p 3 rule-precedence 600
   permit host 22-33-44-55-66-77 host 11-22-33-44-55-66 type ip log rule-precedence 610
```
### 11.2.5 permit

**mac-access-list**

Creates a permit rule that marks packets (from a specified source MAC and/or to a specified destination MAC) for forwarding. You can also use this command to modify an existing permit rule.

---

**NOTE:** Use a decimal value representation to implement a permit/deny designation for a packet. The command set for MAC ACLs provide the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.

---

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX9000, NX7510, NX7520, NX7530, NX9500, NX9510

#### Syntax

```
permit [ <SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC> ] [ <DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC> ]
  (dot1p <0-7>,mark [8021p <0-7>,dscp <0-63>,type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan <1-4095>) log (rule-precedence <1-5000>)
  { (rule-description <LINE>) }
```

#### Parameters

- **permit [ <SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC> ] [ <DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC> ]**
  (dot1p <0-7>,mark [8021p <0-7>,dscp <0-63>,type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan <1-4095>) log (rule-precedence <1-5000>)
  { (rule-description <LINE>) }

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| <SOURCE-MAC> <SOURCE-MAC-MASK> | Configures the source MAC address and mask to match
  - <SOURCE-MAC> – Specify the source MAC address to match.
  - <SOURCE-MAC-MASK> – Specify the source MAC address mask.
  Packets addressed to the specified MAC addresses are forwarded. |
| any | Identifies all devices as the source to permit access. Packets addressed from any source are forwarded. |
| host <SOURCE-HOST-MAC> | Identifies a specific host as the source to permit access
  - <SOURCE-HOST-MAC> – Specify the source host’s exact MAC address to match. Packets addressed to the specified host are forwarded. |
| <DEST-MAC> <DEST-MAC-MASK> | Configures the destination MAC address and mask to match
  - <DEST-MAC> – Specify the destination MAC address to match.
  - <DEST-MAC-MASK> – Specify the destination MAC address mask to match.
  Packets addressed to the specified MAC addresses are forwarded. |
<p>| DEST-MAC-MASK | Specifies the destination MAC address mask to match |
| any | Identifies all devices as the destination to permit access. Packets addressed to any destination are forwarded. |</p>
<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
</table>
| host <DEST-HOST-MAC> | Identifies a specific host as the destination to permit access  
- `<DEST-HOST-MAC>` – Specify the destination host’s exact MAC address to match. Packets addressed to the specified host are forwarded. |
| dotp1p <0-7>   | Configures the 802.1p priority value. Sets the service classes for traffic handling  
- `<0-7>` – Specify 802.1p priority from 0 - 7. |
| mark [8021p <0-7>, dscp <0-63>] | Marks/modifies packets that match the criteria specified here  
- `8021p <0-7>` – Modifies 802.1p VLAN user priority from 0 - 7  
- `dscp <0-63>` – Modifies DSCP TOS bits in the IP header from 0 - 63  
**Note:** This option is applicable only to the MAC ACL permit rule. |
| type [8021q|<1-65535>| aarp|appletalk| arp|ip|ipv6|ipx|mint| rarp|wisp] | Configures the EtherType value  
An EtherType is a two-octet field in an Ethernet frame that indicates the protocol encapsulated in the payload of the frame. The EtherType values are:  
- `8021q` – Indicates a 802.1q payload (0x8100)  
- `<1-65535>` – Indicates the EtherType protocol number  
- `aarp` – Indicates the Appletalk Address Resolution Protocol (ARP) payload (0x80F3)  
- `appletalk` – Indicates the Appletalk Protocol payload (0x809B)  
- `arp` – Indicates the ARP payload (0x0806)  
- `ip` – Indicates the Internet Protocol, Version 4 (IPv4) payload (0x0800)  
- `ipv6` – Indicates the Internet Protocol, Version 6 (IPv6) payload (0x86DD)  
- `ipx` – Indicates the Novell’s IPX payload (0x8137)  
- `mint` – Indicates the MiNT protocol payload (0x8783)  
- `rarp` – Indicates the reverse Address Resolution Protocol (ARP) payload (0x8035)  
- `wisp` – Indicates the Wireless Internet Service Provider (WISP) payload (0x8783) |
| vlan <1-4095> | Configures the VLAN ID  
- `<1-4095>` – Specify the VLAN ID from 1 - 4095. |
| log             | Logs all permit events matching this entry. If a source and/or destination MAC address is matched (i.e. a packet is addressed to a specified MAC address or is destined for a specified MAC address), an event is logged. |
| rule-precedence <1-5000> | The following keywords are recursive and common to all of the above parameters:  
- `rule-precedence` – Assigns a precedence for this permit rule  
- `<1-5000>` – Specify a value from 1 - 5000.  
**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.  
- `rule-description` – Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
Usage Guidelines
The permit command in the MAC ACL allows traffic based on layer 2 (data-link layer) information. A MAC access list permits traffic from a source MAC address or any MAC address. It also has an option to allow traffic from a list of MAC addresses (based on the source mask).

The MAC access list can be configured to allow traffic based on VLAN information, or Ethernet type. Common types include:

- ARP
- WISP
- IP
- 802.1q

Layer 2 traffic is not allowed by default. To adopt an access point through an interface, configure an ACL to allow an Ethernet WISP.

Use the mark option to specify the type of service (tos) and priority value. The tos value is marked in the IP header and the 802.1p priority value is marked in the dot1q frame.

Whenever the interface receives the packet, its content is checked against all the ACEs in the ACL. It is marked based on the ACL's configuration.

**NOTE:** To apply an IP based ACL to an interface, a MAC access list entry is mandatory to allow ARP. A MAC ACL always takes precedence over IP based ACLs.

Examples

```plaintext
rfs7000-37FABE(config-mac-acl-test)#permit host 11-22-33-44-55-66 any log mark 8021p 3 rule-precedence 600
rfs7000-37FABE(config-mac-acl-test)#permit host 22-33-44-55-66-77 host 11-22-33-44-55-66 type ip log rule-precedence 610
rfs7000-37FABE(config-mac-acl-test)#show context
mac access-list testPF
  permit host 11-22-33-44-55-66 any log mark 8021p 3 rule-precedence 600
  permit host 22-33-44-55-66-77 host 11-22-33-44-55-66 type ip log rule-precedence 610
rfs7000-37FABE(config-mac-acl-test)#
```

11.3 ipv6-access-list

ACCESS-LIST

Configures an IPv6 ACL

An IPv6 ACL defines a set of rules that filter IPv6 packets flowing through a port or interface. Each rule specifies the action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

The WiNG software supports IPv6 only on VLAN interfaces. Therefore, IPv6 ACLs can be applied only on the VLAN interface.

The following table summarizes IPv6 access list configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Creates a deny access rule or modifies an existing rule. A deny access rule rejects IPv6 packets from specified address(es) and/or destined for specified address(es).</td>
<td>page 11-45</td>
</tr>
<tr>
<td>no</td>
<td>Removes a deny and/or a access rule from a IPv6 ACL</td>
<td>page 11-51</td>
</tr>
<tr>
<td>permit</td>
<td>Creates a permit access rule or modifies an existing rule. A permit access rule accepts IPv6 packets from specified address(es) and/or destined for specified address(es).</td>
<td>page 11-52</td>
</tr>
</tbody>
</table>
11.3.1 deny

`ipv6-access-list`

Creates a deny rule that rejects packets from a specified IPv6 source and/or to a specified IPv6 destination. You can also use this command to modify an existing deny rule.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
deny [icmpv6|ipv6|proto|tcp|udp]

deny icmpv6 [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK>] [code [eq <ICMPv6-CODE>|range <STARTING-ICMPv6-CODE> <ENDING-ICMPv6-CODE>]] [type [eq <ICMPV6-TYPE>|range <STARTING-ICMPv6-TYPE> <ENDING-ICMPv6-TYPE>]] (log|rule-precedence <1-5000>) {rule-description <LINE>}

deny ipv6 [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK>] [any|host <DEST-HOST-IPv6>] (log,rule-precedence <1-5000>) {rule-description <LINE>}

```

**Parameters**

- **deny icmpv6**  
  - `<SOURCE-IPv6/MASK>`: Specifies a range of IPv6 source address (network) to match. ICMPv6 packets received from any source in the specified network are dropped.
  - `any`: Specifies the source as any IPv6 address. ICMPv6 packets received from any source are dropped.
  - `host <SOURCE-HOST-IPv6>`: Identifies a specific host (as the source to match) by its IPv6 address. ICMPv6 packets received from the specified host are dropped.
  - `<SOURCE-HOST-IPv6>` – Specify the source host’s exact IPv6 address.
  - `<DEST-IPv6/MASK>`: Specifies a range of IPv6 destination address (network) to match. ICMPv6 packets addressed to any destination within the specified network are dropped.
  - `any`: Specifies the destination as any IPv6 address. ICMPv6 packets addressed to any destination are dropped.

- **deny ipv6**
  - `<SOURCE-IPv6/MASK>`: Specifies a range of IPv6 source address (network) to match. ICMPv6 packets received from any source in the specified network are dropped.
  - `any`: Specifies the source as any IPv6 address. ICMPv6 packets received from any source are dropped.
  - `host <SOURCE-HOST-IPv6>`: Identifies a specific host (as the source to match) by its IPv6 address. ICMPv6 packets received from the specified host are dropped.
  - `<SOURCE-HOST-IPv6>` – Specify the source host’s exact IPv6 address.
  - `<DEST-IPv6/MASK>`: Specifies a range of IPv6 destination address (network) to match. ICMPv6 packets addressed to any destination within the specified network are dropped.
  - `any`: Specifies the destination as any IPv6 address. ICMPv6 packets addressed to any destination are dropped.
### deny ipv6

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| host <DEST-HOST-IPv6>       | Identifies a specific host (as the destination to match) by its IPv6 address. ICMPv6 packets addressed to the specified host are dropped.  
  - <DEST-HOST-IPv6> – Specify the destination host’s exact IPv6 address. |
| <ICMPv6-TYPE> [eq|range]   | Defines the ICMPv6 type field filter                                         |
  - eq – Configures a specific ICMPv6 type. Specify the ICMPv6 type value.  
  - range – Configures a range of ICMPv6 types. Specify the starting and ending ICMPv6 type values.  
  **Note:** ICMPv6 packets with type field value matching the values specified here are dropped. |
| <ICMPv6-CODE>               | Defines the ICMPv6 code field filter                                         |
  - eq – Configures a specific ICMPv6 code. Specify the ICMPv6 code value.  
  - range – Configures a range of ICMPv6 code. Specify the starting and ending ICMPv6 code values.  
  **Note:** ICMPv6 packets with code field value matching the values specified here are dropped. |
| log                         | Logs all deny events matching this entry                                     |
| rule-precedence <1-5000>    | Assigns a precedence for this deny rule                                      |
  - <1-5000> – Specify a value from 1 - 5000.  
  **Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
| rule-description <LINE>     | Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

### Example

```bash
```
| **rule-precedence** | Assigns a precedence for this deny rule  
| <1-5000> | • <1-5000> – Specify a value from 1 - 5000  

**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
<p>| <strong>rule-description</strong> | Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| <strong>&lt;SOURCE-IPv6/MASK&gt;</strong> | Specifies a range of IPv6 source address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source in the specified network are dropped. |</p>
<table>
<thead>
<tr>
<th>any</th>
<th>Specifies the source as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source are dropped.</th>
</tr>
</thead>
</table>
| host <SOURCE-HOST-IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the specified host are dropped.  
• <SOURCE-HOST-IP> – Specify the source host's exact IPv6 address. |
| <DEST-IPv6/MASK> | Specifies a range of IPv6 destination address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination within the specified network are dropped. |
| any          | Specifies the destination as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination are dropped. |
| host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to the specified host are dropped.  
• DEST-HOST-IP> – Specify the destination host's exact IPv6 address. |
| log          | Logs all deny events matching this entry |
| rule-precedence <1-5000> | Assigns a precedence for this deny rule  
• <1-5000> – Specify a value from 1 - 5000.  
**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
| rule-description <LINE> | Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

```
```

tcp          | Applies this deny rule to TCP packets only |
udp          | Applies this deny rule to UDP packets only |

<SOURCE-IPv6/MASK> | This keyword is common to the ‘tcp’ and ‘udp’ parameters.  
Specifies a range of IPv6 source address (network) to match. TCP/UDP packets received from any source in the specified network are dropped. |
any          | This keyword is common to the 'tcp' and 'udp' parameters.  
Specifies the source as any IPv6 address. TCP/UDP packets received from any source are dropped. |
host <SOURCE-HOST-IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. TCP/UDP packets received from the specified host are dropped.  
• <SOURCE-HOST-IP> – Specify the source host's exact IPv6 address. |
<DEST-IPv6/MASK> | This keyword is common to the 'tcp' and 'udp' parameters.  
Specifies a range of IPv6 destination address (network) to match. TCP/UDP packets addressed to any destination within the specified network are dropped. |
any          | This keyword is common to the 'tcp' and 'udp' parameters.  
Specifies the destination as any destination IPv6 address. TCP/UDP packets received from any destination are dropped. |
| **eq <SOURCE-PORT>** | Identifies a specific source port  
  • `<SOURCE-PORT>` – Specify the exact source port. |
|----------------------|--------------------------------------------------------------------------------------------------|
| **host <DEST-HOST-IP>** | Identifies a specific host (as the destination to match) by its IPv6 address. TCP/UDP packets addressed to the specified host are dropped.  
  • `<DEST-HOST-IP>` – Specify the destination host’s exact IP address. |
| **range <START-PORT> <END-PORT>** | Specifies a range of source ports  
  • `<START-PORT>` – Specify the first port in the range.  
  • `<END-PORT>` – Specify the last port in the range. |
| **eq [<1-65535>|<SERVICE-NAME>|bgp|dns|ftp|ftp-data|groper|https|ldap|nntp|ntp|pop3|sip|smtp|ssh|telnet|tftp|www]** | Identifies a specific destination or protocol port to match  
  • `<1-65535>` – The destination port is designated by its number  
  • `<SERVICE-NAME>` – Specifies the service name  
  • bgp – The designated BGP protocol port (179)  
  • dns – The designated DNS protocol port (53)  
  • ftp – The designated FTP protocol port (21)  
  • ftp-data – The designated FTP data port (20)  
  • groper – The designated GROPHER protocol port (70)  
  • https – The designated HTTPS protocol port (443)  
  • ldap – The designated LDAP protocol port (389)  
  • nntp – The designated NNTP protocol port (119)  
  • ntp – The designated NTP protocol port (123)  
  • pop3 – The designated POP3 protocol port (110)  
  • sip – The designated SIP protocol port (5060)  
  • smtp – The designated SMTP protocol port (25)  
  • ssh – The designated SSH protocol port (22)  
  • telnet – The designated Telnet protocol port (23)  
  • tftp – The designated TFTP protocol port (69)  
  • www – The designated www protocol port (80) |
| **range <START-PORT> <END-PORT>** | Specifies a range of destination ports  
  • `<START-PORT>` – Specify the first port in the range.  
  • `<END-PORT>` – Specify the last port in the range. |
| **log** | Logs all deny events matching this entry |
| **rule-precedence <1-5000>** | Assigns a precedence for this deny rule  
  • `<1-5000>` – Specify a value from 1 - 5000.  
  **Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
| **rule-description <LINE>** | Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
Examples
rfs7000-6DCD4B(config-ipv6-acl-test)#deny icmpv6 any any type eq 1 code eq 0 log rule-precedence 1
rfs7000-6DCD4B(config-ipv6-acl-test)#show context ipv6 access-list test
deny icmpv6 any any type eq destination-unreachable code eq router-renumbering-command log rule-precedence 1
rfs7000-6DCD4B(config-ipv6-acl-test)#

</tbody>
</table>
11.3.2 **no**

- **ipv6-access-list**

Removes a deny or permit rule

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
no [deny|permit]
no [deny|permit] [icmpv6|ipv6|proto|tcp|udp] <RULE-PARAMETERS>
{(rule-description <LINE>)}
```

**Parameters**

- **no <PARAMETERS>**

  no <PARAMETERS> Removes a deny or permit rule from the selected IPv6 access list

**Examples**

The following example shows the ACL ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-6DCD4B(config-ipv6-acl-test)#show context
ipv6 access-list test
deny icmpv6 any any type eq destination-unreachable code eq router-renumbering-command
log rule-precedence 1
permit proto gre any any log rule-precedence 2
rfs7000-6DCD4B(config-ipv6-acl-test)#

11.3.3 permit

`ipv6-access-list`

Creates a permit rule that accepts packets from a specified IPv6 source and/or to a specified IPv6 destination. You can also use this command to modify an existing permit rule.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
permit [icmpv6|ipv6|proto|tcp|udp]

**Parameters**

<table>
<thead>
<tr>
<th>icmpv6</th>
<th>Applies this permit rule to ICMPv6 packets only</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;SOURCE-IPv6/MASK&gt;</td>
<td>Specifies a range of IPv6 source address (network) to match. ICMPv6 packets received from any source in the specified network are accepted.</td>
</tr>
<tr>
<td>any</td>
<td>Specifies the source as any IPv6 address. ICMPv6 packets received from any source are accepted.</td>
</tr>
<tr>
<td>host &lt;SOURCE-HOST-IPv6&gt;</td>
<td>Identifies a specific host (as the source to match) by its IPv6 address. ICMPv6 packets received from the specified host are accepted.</td>
</tr>
<tr>
<td>&lt;DEST-IPv6/MASK&gt;</td>
<td>Specifies a range of IPv6 destination address (network) to match. ICMPv6 packets addressed to any destination within the specified network are accepted.</td>
</tr>
<tr>
<td>any</td>
<td>Specifies the destination as any IPv6 address. ICMPv6 packets addressed to any destination are accepted.</td>
</tr>
</tbody>
</table>
| host \(<\text{DEST-HOST-IPv6}\)> | Identifies a specific host (as the destination to match) by its IPv6 address. ICMPv6 packets addressed to the specified host are accepted.  
| | • \(<\text{DEST-HOST-IPv6}\>) – Specify the destination host’s exact IPv6 address. |
| \(<\text{ICMPv6-TYPE}\>) \([eq|range]\) | Defines the ICMPv6 type field filter  
| | • eq – Configures a specific ICMPv6 type. Specify the ICMPv6 type value.  
| | • range – Configures a range of ICMPv6 types. Specify the starting and ending ICMPv6 type values.  
| | **Note:** ICMPv6 packets with type field value matching the values specified here are forwarded. |
| \(<\text{ICMPv6-CODE}\>) | Defines the ICMPv6 code field filter  
| | • eq – Configures a specific ICMPv6 code. Specify the ICMPv6 code value.  
| | • range – Configures a range of ICMPv6 code. Specify the starting and ending ICMPv6 code values.  
| | **Note:** ICMPv6 packets with code field value matching the values specified here are forwarded. |
| log | Logs all permit events matching this entry |
| rule-precedence \(<1-5000>\) | Assigns a precedence for this permit rule  
| | • \(<1-5000>\) – Specify a value from 1 - 5000.  
| | **Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
| rule-description \(<\text{LINE}\>) | Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

```
• permit ipv6 \(<\text{SOURCE-IPv6/MASK}|\text{any}|\text{host} <\text{SOURCE-HOST-IPv6}>\) \([<\text{DEST-IPv6/MASK}|\text{any}|\text{host} <\text{DEST-HOST-IPv6}>]\) \(\text{log,rule-precedence}<1-5000>\) \{(\text{rule-description} <\text{LINE}>\)}
```

| ipv6 | Applies this permit rule to IPv6 packets only |
| \(<\text{SOURCE-IPv6/MASK}\>) | Specifies a range of IPv6 source address (network) to match. IPv6 packets received from any source in the specified network are forwarded. |
| any | Specifies the source as any IPv6 address. IPv6 packets received from any source are forwarded. |
| host \(<\text{SOURCE-HOST-IPv6}\>) | Identifies a specific host (as the source to match) by its IPv6 address. IPv6 packets received from the specified host are forwarded.  
| | • \(<\text{SOURCE-HOST-IPv6}\>) – Specify the source host’s exact IPv6 address. |
| \(<\text{DEST-IPv6/MASK}\>) | Specifies a range of IPv6 destination address (network) to match. IPv6 packets addressed to any destination within the specified network are forwarded. |
| any | Specifies the destination as any IPv6 address. IPv6 packets addressed to any destination are forwarded. |
| host \(<\text{DEST-HOST-IPv6}\>) | Identifies a specific host (as the destination to match) by its IPv6 address. IPv6 packets addressed to the specified host are forwarded.  
| | • \(<\text{DEST-HOST-IPv6}\>) – Specify the destination host’s exact IPv6 address. |
| log | Logs all permit events matching this entry |
| **rule-precedence**<br>**<1-5000>** | Assigns a precedence for this permit rule  
- **<1-5000>** – Specify a value from 1 - 5000  
**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>rule-description</strong>&lt;br&gt;<strong>&lt;LINE&gt;</strong></td>
<td>Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length).</td>
</tr>
</tbody>
</table>

```plaintext
```

| **proto** | Configures the ACL for additional protocols  
Additional protocols (other than IP, ICMP, TCP, and UDP) must be configured using this parameter. |
|---|---|
| **<PROTOCOL-NUMBER>** | Filters protocols using their Internet Assigned Numbers Authority (IANA) protocol number  
- **<PROTOCOL-NUMBER>** – Specify the protocol number. |
| **<PROTOCOL-NAME>** | Filters protocols using their IANA protocol name  
- **<PROTOCOL-NAME>** – Specify the protocol name. |
| **eigrp** | Identifies the EIGRP protocol (number 88)  
EIGRP enables routers to maintain copies of neighbors’ routing tables. Routers use this information to determine the fastest route to a destination. When a router fails to find a route in its stored route tables, it sends a query to neighbors who in turn query their neighbors till a route is found. EIGRP also enables routers to inform neighbors of changes in their routing tables. |
| **gre** | Identifies the GRE protocol (number 47)  
GRE is a tunneling protocol that enables transportation of protocols (IP, IPX, DEC net, etc.) over an IP network. GRE encapsulates the packet at the source and removes the encapsulation at the destination. |
| **igp** | Identifies any private internal gateway (primarily used by CISCO for their IGRP) (number 9)  
IGP enables exchange of information between hosts and routers within a managed network. The most commonly used IGP protocols are: RIP and OSPF. |
| **ospf** | Identifies the OSPF protocol (number 89)  
OSPF is a link-state IGP. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets. |
| **vrrp** | Identifies the VRRP protocol (number 112)  
VRRP allows a pool of routers to be advertized as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address. |
| **<SOURCE-IPv6/MASK>** | Specifies a range of IPv6 source address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source in the specified network are forwarded. |
any  | Specifies the source as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source are forwarded.
---|---
host <SOURCE-HOST-IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the specified host are forwarded.
  • <SOURCE-HOST-IP> – Specify the source host's exact IPv6 address.
<DEST-IPv6/MASK> | Specifies a range of IPv6 destination address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination within the specified network are forwarded.
any  | Specifies the destination as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination are forwarded.
host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to the specified host are forwarded.
  • <SOURCE-HOST-IP> – Specify the destination host's exact IPv6 address.
log  | Logs all permit events matching this entry
rule-precedence <1-5000> | Assigns a precedence for this permit rule
  • <1-5000> – Specify a value from 1 - 5000.
  Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.
rule-description <LINE> | Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length).

tcp  | Applies this permit rule to TCP packets only
udp  | Applies this permit rule to UDP packets only
<SOURCE-IPv6/MASK> | This keyword is common to the ‘tcp’ and ‘udp’ parameters. Specifies a range of IPv6 source address (network) to match. TCP/UDP packets received from any source in the specified network are forwarded.
any  | This keyword is common to the 'tcp' and 'udp' parameters. Specifies the source as any IPv6 address. TCP/UDP packets received from any source are forwarded.
host <SOURCE-HOST-IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. TCP/UDP packets received from the specified host are forwarded.
  • <SOURCE-HOST-IP> – Specify the source host's exact IPv6 address.
<DEST-IPv6/MASK> | This keyword is common to the ‘tcp’ and ‘udp’ parameters. Specifies a range of IPv6 destination address (network) to match. TCP/UDP packets addressed to any destination within the specified network are forwarded.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>any</code></td>
<td>This keyword is common to the 'tcp' and 'udp' parameters. Specifies the destination as any destination IPv6 address. TCP/UDP packets received from any destination are forwarded.</td>
</tr>
</tbody>
</table>
| `eq <SOURCE-PORT>` | Identifies a specific source port  
  * `<SOURCE-PORT>` – Specify the exact source port. |
| `host <DEST-HOST-IP>` | Identifies a specific host (as the destination to match) by its IPv6 address. TCP/UDP packets addressed to the specified host are forwarded.  
  * `<DEST-HOST-IP>` – Specify the destination host's exact IP address. |
| `range <START-PORT> <END-PORT>` | Specifies a range of source ports  
  * `<START-PORT>` – Specify the first port in the range.  
  * `<END-PORT>` – Specify the last port in the range. |
| `eq [1-65535]|<SERVICE-NAME>|bgp|dns|ftp|ftp-data|gropher|https|ldap|nntp|ntp|pop3|sip|smtp|ssh|telnet|tftp|www]` | Identifies a specific destination or protocol port to match  
  * `<1-65535>` – The destination port is designated by its number  
  * `<SERVICE-NAME>` – Specifies the service name  
  * bgp – The designated BGP protocol port (179)  
  * dns – The designated DNS protocol port (53)  
  * ftp – The designated FTP protocol port (21)  
  * ftp-data – The designated FTP data port (20)  
  * gropher – The designated GROPER protocol port (70)  
  * https – The designated HTTPS protocol port (443)  
  * ldap – The designated LDAP protocol port (389)  
  * nntp – The designated NNTP protocol port (119)  
  * ntp – The designated NTP protocol port (123)  
  * pop3 – The designated POP3 protocol port (110)  
  * sip – The designated SIP protocol port (5060)  
  * smtp – The designated SMTP protocol port (25)  
  * ssh – The designated SSH protocol port (22)  
  * telnet – The designated Telnet protocol port (23)  
  * tftp – The designated TFTP protocol port (69)  
  * www – The designated www protocol port (80) |
| `range <START-PORT> <END-PORT>` | Specifies a range of destination ports  
  * `<START-PORT>` – Specify the first port in the range.  
  * `<END-PORT>` – Specify the last port in the range. |
| `log` | Logs all permit events matching this entry |
| `rule-precedence <1-5000>` | Assigns a precedence for this permit rule  
  * `<1-5000>` – Specify a value from 1 - 5000. |

**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.
Examples
rfs7000-6DCD4B(config-ipv6-acl-test)#permit proto gre any any log rule-precedence 2

</tbody>
</table>
11.4 ip-snmp-access-list

SNMP performs network management functions using a data structure called a Management Information Base (MIB). SNMP is widely implemented but not very secure, since it uses only text community strings for accessing controller or service platform configuration files.

Use SNMP ACLs to help reduce SNMP’s vulnerabilities, as SNMP traffic can be exploited to produce a denial of service (DoS). The following table summarizes SNMP access list configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Creates a deny SNMP MIB object traffic rule</td>
<td>page 11-59</td>
</tr>
<tr>
<td>permit</td>
<td>Creates a permit SNMP MIB object traffic rule</td>
<td>page 11-60</td>
</tr>
<tr>
<td>no</td>
<td>Removes a deny or permit SNMP MIB object traffic rule</td>
<td>page 11-61</td>
</tr>
</tbody>
</table>
### 11.4.1 deny

*ip-snmp-access-list*

Creates a deny SNMP MIB object traffic rule. Use this command to specify the match criteria based on which SNMP traffic is denied.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

deny [<IP/M>|any|host <IP>]

**Parameters**

- deny [<IP/M>|any|host <IP>]

| deny [<IP/M>|any|host <IP>] | Configures the match criteria for this deny rule |
|-----------------------------|-----------------------------------------------|
| • <IP/M> – Specifies a network address and mask in the A.B.C.D/M format. Packets received or destined for this network are dropped. |
| • any – Specifies the match criteria as any. Packets received or destined from any address are dropped. |
| • host <IP> – Identifies a host by its IP address. Packets received or destined for this host are dropped. |

**Examples**

```
rfs7000-6DCD4B(config-ip-snmp-acl-test)#deny 192.168.13.0/24
```

```
rfs7000-6DCD4B(config-ip-snmp-acl-test)#show context
ip snmp-access-list test
deny 192.168.13.0/24
rfs7000-6DCD4B(config-ip-snmp-acl-test)#
```

**Related Commands**

- **no** | Removes this deny rule form the IP SNMP ACL
11.4.2 permit

*ip-snmp-access-list*

Creates a permit SNMP MIB object traffic rule. Use this command to specify the match criteria based on which SNMP traffic is permitted.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
permit [<IP/M>|any|host <IP>]
```

**Parameters**

- **permit [<IP/M>|any|host <IP>]**
  
  | permit [<IP/M>|any|host <IP>] | Configures the match criteria for this permit rule |
  |------------------------------|-----------------------------------------------|
  | <IP/M> - Specifies a network address and mask in the A.B.C.D/M format. Packets received or destined for this network are forwarded. |
  | any - Specifies the match criteria as any. Packets received or destined from any address are forwarded. |
  | host <IP> - Identifies a host by its IP address. Packets received or destined for this host are forwarded. |

**Examples**

```
rfs7000-6DCD4B(config-ip-snmp-acl-test)#permit host 192.168.13.13
```

```
rfs7000-6DCD4B(config-ip-snmp-acl-test)#show context
ip_snmp-access-list test
permit host 192.168.13.13
deny 192.168.13.0/24
```

**Related Commands**

```
no
```

Removes this permit rule form the IP SNMP ACL
11.4.3 no

- ip-snmp-access-list

Removes a deny or permit rule from the IP SNMP ACL. Use this command to remove IP SNMP ACL as they become obsolete for filtering network access permissions.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
no [deny|permit] [<IP/M>|any|host <IP>]

Parameters
- no <PARAMETERS>

Examples
rfs7000-6DCD4B(config-ip-snmp-acl-test)#show context
ip snmp-access-list test
  permit host 192.168.13.13
  deny 192.168.13.0/24
rfs7000-6DCD4B(config-ip-snmp-acl-test)#

rfs7000-6DCD4B(config-ip-snmp-acl-test)#no permit host 192.168.13.13
rfs7000-6DCD4B(config-ip-snmp-acl-test)#show context
ip snmp-access-list test
  deny 192.168.13.0/24
rfs7000-6DCD4B(config-ip-snmp-acl-test)#
This chapter summarizes Dynamic Host Control Protocol (DHCP) server policy commands in the CLI command structure. DHCP automatically assigns network IP addresses to requesting clients to enable them access to network resources. DHCP tracks IP address assignments, their lease times and their availability. Each subnet can be configured with its own address pool. Whenever a DHCP client requests an IP address, the DHCP server assigns an IP address from that subnet’s address pool. When the controller’s (wireless controller, service platform, or access point) onboard DHCP server allocates an address to a DHCP client, the client is assigned a lease, which expires after a pre-determined interval. Before a lease expires, wireless clients (with assigned leases) are expected to renew them to continue using the addresses. Once the lease expires, the client is no longer permitted to use the leased IP address. The controller’s DHCP server policy ensures all IP addresses are unique, and no IP address is assigned to a second client while the first client’s assignment is valid (its lease has not expired). IP address management is conducted by a controller’s DHCP server and not by an administrator.

The controller’s internal DHCP server groups wireless clients based on defined user-class options. Clients with a defined set of user-class values are segregated by class. A DHCP server can associate multiple classes to each pool. Each class in a pool is assigned an exclusive range of IP addresses. DHCP clients are compared against classes. If the client matches one of the classes assigned to the pool, it receives an IP address from the range assigned to the class. If the client doesn’t match any of the classes in the pool, it receives an IP address from a default pool range (if defined). Multiple IP addresses for a single VLAN allow the configuration of multiple IP addresses, each belonging to different subnets. Class configuration allows a DHCP client to obtain an address from the first pool to which the class is assigned.

Use the (config) instance to configure DHCP/DHCPv6 server policy parameters. To navigate to the config DHCP server policy instance, use the following commands:

```
<DEVICE>(config)#dhcp-server-policy <POLICY-NAME>
```

```
rfs7000-37FABE(config)#dhcp-server-policy test
```

```
rfs7000-37FABE(config-dhcp-server-policy-test)#
```

```
rfs7000-37FABE(config-dhcp-policy-test-test)#?
```

DHCP policy Mode commands:
- **bootp**: BOOTP specific configuration
- **dhcp-class**: Configure DHCP class (for address allocation using DHCP user-class options)
- **dhcp-pool**: Configure DHCP server address pool
- **dhcp-server**: Activating dhcp server based on criteria
- **no**: Negate a command or set its defaults
- **option**: Define DHCP server option
- **ping**: Specify ping parameters used by DHCP Server
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
end          End current mode and change to EXEC mode
exit         End current mode and down to previous mode
help         Description of the interactive help system
revert       Revert changes
service      Service Commands
show         Show running system information
write        Write running configuration to memory or terminal

rfs7000-37FABE(config-dhcp-policy-test)#

To navigate to the config DHCPv6 server policy instance, use the following commands:
<DEVICE>(config)#dhcpv6-server-policy <POLICY-NAME>

rfs7000-37FABE(config)#dhcpv6-server-policy test
rfs7000-37FABE(config-dhcpv6-server-policy-test)#

rfs7000-37FABE(config-dhcpv6-server-policy-test)##?
DHCPv6 server policy Mode commands:
dhcpv6-pool              Configure DHCPV6 server address pool
no                       Negate a command or set its defaults
option                   Define DHCPv6 server option
restrict-vendor-options  Restrict vendor specific options to be sent in server reply
server-preference        Server preference value sent in the reply, by the server to client
clrscr                   Clears the display screen
commit                   Commit all changes made in this session
do                       Run commands from Exec mode
end                      End current mode and change to EXEC mode
exit                     End current mode and down to previous mode
help                     Description of the interactive help system
revert                   Revert changes
service                  Service Commands
show                     Show running system information
write                    Write running configuration to memory or terminal

rfs7000-37FABE(config-dhcpv6-server-policy-test)#

This chapter is organized as follows:

- **dhcp-server-policy**
- **dhcpv6-server-policy**
### 12.1 dhcp-server-policy

The following table summarizes DHCP server policy configuration commands:

**Table 12.1 DHCP-Server-Policy-Config Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>bootp</td>
<td>Configures a BOOTP specific configuration</td>
<td>page 12-4</td>
</tr>
<tr>
<td>dhcp-class</td>
<td>Configures a DHCP server class</td>
<td>page 12-5</td>
</tr>
<tr>
<td>dhcp-pool</td>
<td>Configures a DHCP server address pool</td>
<td>page 12-11</td>
</tr>
<tr>
<td>dhcp-server</td>
<td>Configures the activation-criteria that triggers dynamic activation of DHCP service running on a redundancy device</td>
<td>page 12-54</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or sets its default</td>
<td>page 12-56</td>
</tr>
<tr>
<td>option</td>
<td>Defines the DHCP option used in DHCP pools</td>
<td>page 12-57</td>
</tr>
<tr>
<td>ping</td>
<td>Specifies ping parameters used by a DHCP server</td>
<td>page 12-58</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS.*
12.1.1 bootp

```
bootp ignore
```

Enables controllers to ignore BOOTP requests.

Examples

```
rfs7000-37FABE(config-dhcp-policy-test)#bootp ignore
rfs7000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
  bootp ignore
rfs7000-37FABE(config-dhcp-policy-test)#
```

Related Commands

```
no
```

Disables the ignore BOOTP requests option.
12.1.2 dhcp-class

A DHCP user class applies different DHCP settings to a set of wireless clients. Wireless clients using the same DHCP settings are grouped under one DHCP class. Grouping users into classes facilitates the provision of differentiated service.

The following table summarizes DHCP class configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp-class</td>
<td>Creates a DHCP class and enters its configuration mode</td>
<td>page 12-6</td>
</tr>
<tr>
<td>dhcp-class-mode</td>
<td>Invokes DHCP class configuration commands</td>
<td>page 12-7</td>

</tbody>
</table>
12.1.2.1 dhcp-class

```
+ dhcp-class

Creates a DHCP server class and enters its configuration mode. Use this command to configure user class option values. Once defined, the controller's internal DHCP server uses the configured values to group wireless clients into DHCP classes. Therefore, each user class consists of wireless clients sharing the same set of user class values.

You can also use this command to modify an existing DHCP user class settings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

dhcp-class <DHCP-CLASS-NAME>

Parameters

- dhcp-class <DHCP-CLASS-NAME>

<table>
<thead>
<tr>
<th>&lt;DHCP-CLASS-NAME&gt;</th>
<th>Creates a DHCP user class</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DHCP-CLASS-NAME&gt;</td>
<td>Specify a name that appropriately identifies this class of wireless clients. If the class does not exist, it is created. The class name should not exceed 32 characters in length.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-dhcp-policy-test)#dhcp-class dhcpclass1

rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#?

DHCP class Mode commands:

- multiple-user-class Enable multiple user class option
- no Negate a command or set its defaults
- option Configure DHCP Server options

- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#

Related Commands

- **no** Removes a configured DHCP user class policy
12.1.2.2 dhcp-class-mode commands

Use DHCP class mode commands to configure the parameters of the DHCP user class.

The following table summarizes DHCP user class configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>multiple-user-class</td>
<td>Enables or disables multiple user class option for this DHCP user class policy</td>

<td>Configures DHCP user class options for this DHCP user class policy</td>
<td>page 12-10</td>
</tr>
</tbody>
</table>
12.1.2.2.1 multiple-user-class

**dhcp-class-mode commands**

Enables or disables multiple user class option for this DHCP user class policy. Enabling this option allows this user class to transmit multiple option values to other DHCP servers also supporting multiple user class options.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`multiple-user-class`

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-dhcp-policy-test-class-class1)#multiple-user-class
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#show context
  dhcp-class dhcpclass1
  multiple-user-class
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#
```

12.1.3 dhcp-pool

The DHCP pool command creates and manages a pool of IP addresses. These IP addresses are assigned to devices using the DHCP protocol. IP addresses have to be unique for each device in the network. Since IP addresses are finite, DHCP ensures that every device, in the network, is issued a unique IP address by tracking the issue, release, and reissue of IP addresses.

The DHCP pool command configures a finite set of IP addresses that can be assigned whenever a device joins a network.

The following table summarizes DHCP pool configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp-pool</td>
<td>Creates a DHCP pool and enters its configuration mode</td>
<td>page 12-12</td>
</tr>
<tr>
<td>dhcp-pool-mode</td>
<td>Summarizes DHCP pool configuration mode commands</td>
<td>page 12-14</td>
</tr>
</tbody>
</table>
12.1.3.1 dhcp-pool

Configures a DHCP server address pool

DHCP services are available for specific IP interfaces. A pool (or range) of IP network addresses and DHCP options can be created for each IP interface defined. This range of addresses is available to DHCP enabled wireless devices on either a permanent or leased basis. This enables the reuse of limited IP address resources for deployment in any network. DHCP options are provided to each DHCP client with a DHCP response and provides DHCP clients information required to access network resources (default gateway, domain name, DNS server and WINS server configuration). An option exists to identify the vendor and functionality of a DHCP client. The information is a variable-length string of characters (or octets) with a meaning specified by the vendor of the DHCP client.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

dhcp-pool <POOL-NAME>

Parameters

- dhcp-pool <POOL-NAME>

<table>
<thead>
<tr>
<th>&lt;POOL-NAME&gt;</th>
<th>Creates a DHCP server address pool</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;POOL-NAME&gt;</td>
<td>-- Specify a name that appropriately identifies this DHCP address pool. If the pool does not exist, it is created. The pool name cannot be modified as part of the edit process. However, an obsolete address pool can be deleted.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-dhcp-policy-test)#dhcp-pool pool1

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1)#?

DHCP pool Mode commands:

address Configure network pool's included addresses
bootfile Boot file name
ddns Dynamic DNS Configuration
default-router Default routers

</table>
12.1.3.2.1 address

- **dhcp-pool-mode commands**

Adds IP addresses to the DHCP address pool. These IP addresses are assigned to each device joining the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
address [<IP>|<HOST-ALIAS-NAME>|range]
address [<IP>|<HOST-ALIAS-NAME>|range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]] {class <DHCP-CLASS-NAME>}
```

**Parameters**

- **address [<IP>|<HOST-ALIAS-NAME>|range]**

```
<IP> Adds a single IP address to the DHCP address pool
<HOST-ALIAS-NAME> Adds a single host mapped to the specified host alias. The host alias should be existing and configured.

*Note:* A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is `$HOST` and it maps to a single host `1.1.1.100`. For more information, see `alias`.

range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]
```

```
Adds a range of IP addresses to the DHCP address pool. Use one of the following options to provide the first IP address in the range:
- `<START-IP>` – Specifies the first IP address in the range
- `<START-HOST-ALIAS-NAME>` – Specifies a host alias, mapped to the first IP address in the range

Use one of the following options to provide the last IP address in the range:
- `<END-IP>` – Specifies the last IP address in the range
- `<END-HOST-ALIAS-NAME>` – Specifies a host alias, mapped to the last IP address in the range

*Note:* The host aliases should be existing and configured.

- **class <DHCP-CLASS-NAME>**

Optional. Applies additional DHCP options, or a modified set of options to those available to wireless clients. For more information, see `dhcp-class`.
- `<DHCP-CLASS-NAME>` – Sets the DHCP class.

**Examples**

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#address 192.168.13.4 class dhcpclass1
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes the DHCP pool’s configured IP addresses</td>
</tr>
<tr>
<td>dhcp-class</td>
<td>Creates and configures the DHCP class parameters</td>
</tr>
<tr>
<td>alias</td>
<td>Creates and configures a network, VLAN, host, string, and network-service aliases</td>
</tr>
</tbody>
</table>
12.1.3.2.2 bootfile

* dhcp-pool-mode commands

The Bootfile command provides a diskless node path to the image file while booting up. Only one file can be configured for each DHCP pool.

For more information on the BOOTP protocol with reference to the DHCP policy, see `bootp`.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
bootfile <IMAGE-FILE-PATH>
```

Parameters

- `bootfile <IMAGE-FILE-PATH>`

<table>
<thead>
<tr>
<th>&lt;IMAGE-FILE-PATH&gt;</th>
<th>Sets the path to the boot image for BOOTP clients. The file name can contain letters, numbers, dots and hyphens. Consecutive dots and hyphens are not permitted.</th>
</tr>
</thead>
</table>

Examples

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#bootfile test.txt
```

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
  bootfile test.txt
```

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

Related Commands

```
no
bootp
```

Resets the boot image path for BOOTP clients

Configures BOOTP protocol parameters
12.1.3.2.3 ddns

* dhcp-pool-mode commands

Configures *Dynamic Domain Name Service* (DDNS) parameters. Dynamic DNS provides a way to access an individual device in a DHCP serviced network using a static device name.

Depending on the DHCP server's configuration, the IP address of a device changes periodically. To ensure continuous accessibility to a device (having a dynamic IP address), the device's current IP address is published to a DDNS server that resolves the static device name (used to access the device) with a changing IP address.

The DDNS server must be accessible from outside the network and must be configured as an address resolver.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
ddns [domainname|multiple-user-class|server|ttl]
ddns domainname <DDNS-DOMAIN-NAME>
ddns multiple-user-class
ddns server [<IP>|<HOST-ALIAS-NAME>]
{<IP1>|<HOST-ALIAS-NAME1>}
ddns ttl <1-864000>
```

**Parameters**

- **ddns domainname <DDNS-DOMAIN-NAME>**
  - Sets the domain name used for DNS updates
  - The controller uses DNS to convert human readable host names into IP addresses. Host names are not case sensitive and can contain alphabetic or numeric letters or a hyphen. A *Fully Qualified Domain Name* (FQDN) consists of a host name plus a domain name. For example, `computername.domain.com`.

- **ddns multiple-user-class**
  - Enables the multiple user class options with this DDNS domain

- **ddns server [<IP>|<HOST-ALIAS-NAME>]
{<IP1>|<HOST-ALIAS-NAME1>}**
  - Configures the primary DDNS server used by this DHCP profile

  - **<IP>|<HOST-ALIAS-NAME>**
    - Configures the primary DDNS server. This is the default server.
    - Use one of the following options to specify the primary DDNS server:
      - `<IP>` — Specifies the primary DDNS server’s IP address
      - `<HOST-ALIAS-NAME>` — Specifies a host alias, mapped to the primary DDNS server’s IP address. The host alias should be existing and configured.

  **Note:** A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is `$HOST` and it maps to a single host `1.1.1.100`. For more information, see `alias`.
ddns ttl <1-864000>

Examples
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#ddns domainname WID
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#ddns multiple-user-class
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#ddns server 192.168.13.9
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
ddns domainname WID
ddns multiple-user-class
bootfile test.txt
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#

Related Commands
no

  Resets or disables a DHCP pool’s DDNS settings
12.1.3.2.4 default-router

- **dhcp-pool-mode commands**

Configures a default router or gateway IP address for a network pool

After a DHCP client has booted, the client begins sending packets to its default router. Set the IP address of one or a group of routers the controller uses to map host names into IP addresses available to DHCP supported clients. Up to 8 default router IP addresses are supported.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
default-router [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}
```

**Parameters**
- `default-router [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}`
  - Configures the primary default router, using one of the following options:
    - `<IP>` – Specifies the primary default router's IP address
    - `<HOST-ALIAS-NAME>` – Specifies a host alias, mapped to the primary default router’s IP address
  - Optional. Configures the secondary default router, using one of the following options:
    - `<IP1>` – Specifies the secondary default router’s IP address
    - `<HOST-ALIAS-NAME1>` – Specifies a host alias, mapped to the secondary default router’s IP address. If the primary default router is unavailable, the secondary router is used.

  **Note:** A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is `$HOST` and it maps to a single host ‘1.1.1.100’. For more information, see `alias`.

  **Note:** A maximum of 8 default routers can be configured.

**Usage Guidelines**

The IP address of the router should be on the same subnet as the client subnet.

**Examples**

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#default-router 192.168.13.8 192.168.13.9
```

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
ddns domainname WID
ddns multiple-user-class
bootfile test.txt
default-router 192.168.13.8 192.168.13.9
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#
```

**Related Commands**

```
no
```

Removes the default router settings
12.1.3.2.5 dns-server

**dhcp-pool-mode commands**

Configures a network’s DNS server. The DNS server supports all clients connected to networks supported by the DHCP server. For DHCP clients, the DNS server’s IP address maps the hostname to an IP address. DHCP clients use the DNS server’s IP address based on the order (sequence) configured.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

dns-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

**Parameters**
- **dns-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}**

| [<IP>|<HOST-ALIAS-NAME>] | Configures the primary DNS server, using one of the following options: |
|-------------------------|---------------------------------------------------------------------|
|                         | • <IP> – Specifies the primary DNS server’s IP address               |
|                         | • <HOST-ALIAS-NAME> – Specifies a host alias, mapped to the primary DNS server’s IP address |

**Note:** A maximum of 8 DNS servers can be configured.

**Note:** To enable redirection of DNS queries to OpenDNS it is necessary that the DNS server IP address provided here should point to the OpenDNS IP address. OpenDNS is a proxy DNS server that provides additional functionality, such as Web filtering, reporting, and performance enhancements. When configured on a WLAN, DNS queries from wireless clients are redirected to OpenDNS. For more information on configuring OpenDNS on a WLAN, see [opendns](#).

| {<IP1>|<HOST-ALIAS-NAME1>} | Optional. Configures the secondary DNS server, using one of the following options: |
|---------------------------|-----------------------------------------------------------------------------------|
|                          | • <IP1> – Specifies the secondary DNS server’s IP address                         |
|                          | • <HOST-ALIAS-NAME1> – Specifies a host alias, mapped to the secondary DNS server’s IP address. If the primary DNS server is unavailable, the secondary server is used. |

**Note:** A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is `$HOST` and it maps to a single host ‘1.1.1.100’. For more information, see [alias](#).

**Note:** A maximum of 8 DNS servers can be configured.

**Examples**
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#dns-server 192.168.13.19

dhcpc-class class dhcpclass1
address 192.168.13.4
default-router 192.168.13.8 192.168.13.9

dns-server 192.168.13.19
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#

12.1.3.2.6 domain-name

Sets the domain name for the DHCP pool

Provides the domain name used by the controller with this pool

Domain names are not case sensitive and can contain alphabetic or numeric letters or a hyphen. The FQDN consists of the host name and the domain name. For example, comptuername.domain.com.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

domain-name <DOMAIN-NAME>

Parameters
- domain-name <DOMAIN-NAME>

Examples

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#domain-name documentation
```
```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
  ddns server 192.168.13.9
  ddns domainname WID
  ddns multiple-user-class
  domain-name documentation
  bootfile test.txt
  default-router 192.168.13.8 192.168.13.9
  dns-server 192.168.13.19
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

Related Commands

| no | Removes a DHCP pool's domain name |
12.1.3.2.7 excluded-address

- dhcp-pool-mode commands

Identifies a single IP address or a range of IP addresses, included in the DHCP address pool, that cannot be assigned to clients by the DHCP server.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

excluded-address [<IP>|<HOST-ALIAS-NAME>|range]

excluded-address <IP>
excluded-address <HOST-ALIAS-NAME>
excluded-address range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]

Parameters

- excluded-address <IP>
  - <IP> Adds a single IP address to the excluded address list

- excluded-address <HOST-ALIAS-NAME>
  - <HOST-ALIAS-NAME> Adds a host alias. The host alias is mapped to a host’s IP address. The host identified by the host alias is added to the excluded address list. The host alias should be existing and configured.
  - Note: A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see alias.

- excluded-address range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]
  - range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>] Adds a range of IP addresses to the excluded address list. Use one of the following options to provide the first IP address in the range:
    - <START-IP> – Specifies the first IP address in the range
    - <START-HOST-ALIAS-NAME> – Specifies a host alias, mapped to the first IP address in the range
  - Use one of the following options to provide the last IP address in the range:
    - <END-IP> – Specifies the last IP address in the range
    - <END-HOST-ALIAS-NAME> – Specifies a host alias, mapped to the last IP address in the range
  - Note: The host aliases should be existing and configured.
Examples

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#excluded-address range 192.168.13.25 192.168.13.28

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context dhcp-pool testPool
  network 192.168.13.0/24
  address 192.168.13.4 class dhcpclass1
  ddns server 192.168.13.9
  ddns domainname WID
  ddns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
  domain-name documentation
  bootfile test.txt
  default-router 192.168.13.8 192.168.13.9
  dns-server 192.168.13.19

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#

12.1.3.2.8 lease

**dhcp-pool-mode commands**

A lease is the duration a DHCP issued IP address is valid. Once a lease expires, and if the lease is not renewed, the IP address is revoked and is available for reuse. Generally, before an IP lease expires, the client tries to get the same IP address issued for the next lease period. This feature is enabled by default, with a lease period of 24 hours (1 day).

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
lease [<0-365>|infinite]
lease infinite
lease `<0-365>` {0-23} {0-59} {0-59}
```

**Parameters**

- `infinite` The lease never expires (equal to a static IP address assignment)
- `lease `<0-365>` {0-23} {0-59} {0-59}`

<table>
<thead>
<tr>
<th><code>&lt;0-365&gt;</code></th>
<th>Configures the lease duration in days</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;0-23&gt;</code></td>
<td>Optional. Sets the lease duration in hours</td>
</tr>
<tr>
<td><code>&lt;0-59&gt;</code></td>
<td>Optional. Sets the lease duration in minutes</td>
</tr>
<tr>
<td><code>&lt;0-59&gt;</code></td>
<td>Optional. Sets the lease duration in seconds</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If lease parameter is not configured on the DHCP pool, the default is used. The default is 24 hours.

**Examples**

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#lease 100 23 59 59
```

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
   network 192.168.13.0/24
   address 192.168.13.4 class dhcpclass1
   lease 100 23 59 59
   dns server 192.168.13.9
dns domainname WID
dns multiple-user-class
   excluded-address range 192.168.13.25 192.168.13.28
domain-name documentation
   bootfile test.txt
   default-router 192.168.13.8 192.168.13.9
dns-server 192.168.13.19
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

**Related Commands**

- `no` Resets values or disables the DHCP pool lease settings
12.1.3.2.9 netbios-name-server

Configures the NetBIOS (WINS) name server's IP address. This server is used to resolve NetBIOS host names.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
netbios-name-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

Parameters
- netbios-name-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

| [<IP>|<HOST-ALIAS-NAME>] | Configures the primary NetBIOS name server, using one of the following options:
| | • `<IP>` — Specifies the primary NetBIOS name server’s IP address
| | • `<HOST-ALIAS-NAME>` — Specifies a host alias, mapped to the primary NetBIOS name server’s IP address
| {<IP1>|<HOST-ALIAS-NAME1>} | Optional. Configures the secondary NetBIOS name server, using one of the following options:
| | • `<IP1>` — Specifies the secondary NetBIOS name server's IP address
| | • `<HOST-ALIAS-NAME1>` — Specifies a host alias, mapped to the secondary NetBIOS name server’s IP address. If the primary NetBIOS name server is unavailable, the secondary server is used.

Note: A network host alias maps a name to a single network host. For example, ‘alias host `$HOST 1.1.1.100`’. In this example the host alias is `$HOST` and it maps to a single host ‘1.1.1.100’. For more information, see alias.

Examples
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#netbios-name-server 192.168.13.25
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#

Related Commands

`no` Removes the NetBIOS name server settings
12.1.3.2.10 netbios-node-type
dhcp-pool-mode commands

Defines the predefined NetBIOS node type. The NetBIOS node type resolves NetBIOS names to IP addresses.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522,
  AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500,
  NX9510

Syntax
netbios-node-type [b-node|h-node|m-node|p-node]

Parameters
- netbios-node-type [b-node|h-node|m-node|p-node]

| [b-node|h-node| m-node|p-node] | Defines the netbios node type |
|----------------------------------|------------------------------|
|                                  | b-node — Sets the node type as broadcast. Uses broadcasts to query nodes on the network for the owner of a NetBIOS name. |
|                                  | h-node — Sets the node type as hybrid. Uses a combination of two or more nodes. |
|                                  | m-node — Sets the node type as mixed. A mixed node uses broadcast queries to find a node, and failing that, queries a known p-node name server for the address. |
|                                  | p-node — Sets the node type as peer-to-peer. Uses directed calls to communicate with a known NetBIOS name server (such as a WINS server), for the IP address of a NetBIOS machine. |

Examples
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#netbios-node-type b-node

rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#show context

* dhcp-pool-mode commands

Configures the DHCP server’s network settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`network [<IP/M>|<NETWORK-ALIAS-NAME>]`

**Parameters**

- `network [<IP/M>|<NETWORK-ALIAS-NAME>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IP/M&gt;</code></td>
<td>Configures the network number and mask (for example, 192.168.13.0/24)</td>
</tr>
<tr>
<td><code>&lt;NETWORK-ALIAS-NAME&gt;</code></td>
<td>Configures a network alias to identify the network number and mask</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;NETWORK-ALIAS-NAME&gt;</code> – Specify the network alias name. It should be existing and configured.</td>
</tr>
</tbody>
</table>

**Note:** A network alias defines a single network address. For example, `alias network $NET 1.1.1.0/24`. In this example, the network alias name is: `$NET` and the network it is mapped to is: 1.1.1.0/24. For more information see, `alias`.

**Examples**

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#network 192.168.13.0/24

12.1.3.2.12 next-server

dhcp-pool-mode commands

Configures the next server in the boot process

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

next-server [<IP>|<HOST-ALIAS-NAME>]

Parameters
- next-server [<IP>|<HOST-ALIAS-NAME>]
- <IP>
  - Configures the next server's (the first server in the boot process) IP address
- <HOST-ALIAS-NAME>
  - Configures a host alias, mapped to the next server's IP address
  - <HOST-ALIAS-NAME> — Specify the host alias name. It should be existing and configured.
  - Note: A host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’.
  - For more information, see alias.

Examples

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no bootfile
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no network
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no default-router
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no next-server
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no domain-name
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no ddns domainname
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#no lease

The following example shows the DHCP pool settings after the 'no' commands are executed:

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
   address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
ddns multiple-user-class
excluded-address range 192.168.13.25 192.168.13.28
netbios-node-type b-node
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
12.1.3.2.14 option

*dhcp-pool-mode commands*

Configures raw DHCP options. The DHCP option must be configured under the DHCP server policy. The options configured under the DHCP pool/DHCP server policy can also be used in static-bindings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
option <OPTION-NAME> [ <DHCP-OPTION-IP> | <DHCP-OPTION-ASCII> ]
```

**Parameters**

- **option <OPTION-NAME> [ <DHCP-OPTION-IP> | <DHCP-OPTION-ASCII> ]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;OPTION-NAME&gt;</td>
<td>Sets the name of the DHCP option</td>
</tr>
<tr>
<td>&lt;DHCP-OPTION-IP&gt;</td>
<td>Sets DHCP option as an IP address</td>
</tr>
<tr>
<td>&lt;DHCP-OPTION-ASCII&gt;</td>
<td>Sets DHCP option as an ASCII string</td>
</tr>
</tbody>
</table>

**NOTE:** An option name in ASCII format accepts backslash (\) as an input but is not displayed in the output (Use `show running config` to view the output). Use a double backslash to represent a single backslash.

**Examples**

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)# option option1 157.235.208.80
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)# show context
dhcp-pool testPool
 address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
ddns multiple-user-class
 excluded-address range 192.168.13.25 192.168.13.28
 netbios-node-type b-node
dns-server 192.168.13.19
 netbios-name-server 192.168.13.25
 option option1 157.235.208.80
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#
```
### 12.1.3.2.15 static-route

#### dhcp-pool-mode commands

Configures a static route for a DHCP pool. Static routes define a gateway for traffic intended for other networks. This gateway is always used when an IP address does not match any route in the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
static-route <IP/M> <IP>
```

#### Parameters
- **<IP/M>**<IP>
  - `<IP/M>` Specifies the IP destination prefix (for example, 10.0.0.0/8)
  - `<IP>` Specifies the gateway IP address

#### Examples

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#static-route 192.168.13.0/24 192.168.13.7
```

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
ddns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
netbios-node-type b-node
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
  option option1 157.235.208.80
  respond-via-unicast
  static-route 192.168.13.0/24 192.168.13.7

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

#### Related Commands

- **no** Removes static route settings
12.1.3.2.16 respond-via-unicast

```
* dhcp-pool-mode commands
```

Sends DHCP offer and acknowledgement as unicast messages

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
respond-via-unicast
```

**Parameters**

None

**Examples**

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#respond-via-unicast

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
  dns server 192.168.13.9
  dns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
  netbios-node-type b-node
  dns-server 192.168.13.19
  netbios-name-server 192.168.13.25
  option option1 157.235.208.80 respond-via-unicast
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

**Related Commands**

```
no
```

Disables sending of a DHCP offer and DHCP Ack as unicast messages. When disabled, sends offer and acknowledgement as broadcast messages.
12.1.3.2.17 update

dhcp-pool-mode commands

Controls the use of the DDNS service

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

update dns {override}

Parameters

- update dns {override}

<table>
<thead>
<tr>
<th>dns {override}</th>
<th>Configures Dynamic DNS parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>override</td>
<td>Optional. Enables Dynamic DNS updates on an onboard DHCP server</td>
</tr>
</tbody>
</table>

Usage Guidelines

A DHCP client cannot perform updates for RR’s A, TXT and PTR resource records. Use update (dns) (override) to enable the internal DHCP server to send DDNS updates for resource records. The DHCP server can override the client, even if the client is configured to perform the updates.

In the DHCP server’s DHCP pool, FQDN is configured as the DDNS domain name. This is used internally in DHCP packets between the DHCP server and the DNS server.

Examples

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#update dns override

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
  update dns override
ddns server 192.168.13.9
ddns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
netbios-node-type b-node
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
option option1 157.235.208.80
respond-via-unicast
static-route 192.168.13.0/24 192.168.13.7
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#

Related Commands

no Removes dynamic DNS service control
12.1.3.3 static-binding

* dhcp-pool-mode commands

Configures static IP address information for a particular device. Static address binding is executed on the device’s hostname, client identifier, or MAC address. Static bindings allow the configuration of client parameters, such as DHCP server, DNS server, default routers, fixed IP address etc.

The following table summarizes static binding configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>static-binding</td>
<td>Creates a static binding policy and enters its configuration mode</td>
<td>page 12-38</td>
</tr>
<tr>
<td>static-binding-mode</td>
<td>Invokes static binding configuration commands</td>
<td>page 12-40</td>
</tr>
</tbody>
</table>
12.1.3.1 static-binding

**static-binding**

Configures static address bindings

A static address binding is a collection of configuration parameters, including an IP address, associated with, or bound to, a DHCP client. Bindings are managed by DHCP servers. DHCP bindings automatically map a device MAC address to an IP address using a pool of DHCP supplied addresses. Static bindings assign IP addresses without creating numerous host pools with manual bindings. Static host bindings use a text file the DHCP server reads. It eliminates the need for a lengthy configuration file and reduces the space required to maintain address pools.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
static-binding [client-identifier <CLIENT>|hardware-address <MAC>]
```

**Parameters**

- `client-identifier <CLIENT>` Enables a static binding configuration for a client based on its client identifier (as provided by DHCP option 61 and its key value)
  - `<CLIENT>` – Specify the client identifier (DHCP option 61).
- `hardware-address <MAC>` Enables a static binding configuration for a client based on its MAC address
  - `<MAC>` – Specify the MAC address of the client.

**Examples**

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#static-binding client-identifier test
```

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
  update dns override
ddns server 192.168.13.9
  ddns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
  netbios-node-type b-node
dns-server 192.168.13.19
  netbios-name-server 192.168.13.25
  option option1 157.235.208.80
  respond-via-unicast
  static-route 192.168.13.0/24 192.168.13.7
  static-binding client-identifier test
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```
DHCP static binding Mode commands:
- `bootfile` Boot file name
- `client-name` Client name
- `default-router` Default routers
- `dns-server` DNS Servers
- `domain-name` Configure domain-name
- `ip-address` Fixed IP address for host
- `netbios-name-server` NetBIOS (WINS) name servers
- `netbios-node-type` NetBIOS node type
- `next-server` Next server in boot process
- `no` Negate a command or set its defaults
- `option` Raw DHCP options
- `respond-via-unicast` Send DHCP offer and DHCP Ack as unicast messages
- `static-route` Add static routes to be installed on dhcp clients

12.1.3.3 bootfile

*static-binding-mode commands*

The Bootfile command provides a diskless node the path to the image file used while booting up. Only one file can be configured for each static IP binding.

For more information on the BOOTP protocol with reference to static binding, see `bootp`.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`bootfile <IMAGE-FILE-PATH>`

**Parameters**
- `bootfile <IMAGE-FILE-PATH>`

<table>
<thead>
<tr>
<th>&lt;IMAGE-FILE-PATH&gt;</th>
<th>Sets the path to the boot image for BOOTP clients. The file name can contain letters, numbers, dots and hyphens. Consecutive dots and hyphens are not permitted.</th>
</tr>
</thead>
</table>

**Examples**

```
  rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#bootfile test.txt
  rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
  static-binding client-identifier test
    bootfile test.txt
  rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

**Related Commands**

<table>
<thead>
<tr>
<th><strong>no</strong></th>
<th>Resets values or disables DHCP pool static binding settings</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bootp</code></td>
<td>Configures BOOTP protocol parameters</td>
</tr>
</tbody>
</table>
12.1.3.3.4 client-name

*static-binding-mode commands*

Configures the client’s name

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
```
client-name <NAME>
```

**Parameters**
- `client-name <NAME>`

**Examples**
```bash
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#client-name RFID
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context static-binding client-identifier test
  client-name RFID
  bootfile test.txt
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

**Related Commands**

- `no`
  Resets values or disables DHCP pool static binding settings
12.1.3.5 default-router

`static-binding-mode commands`

Configures a default router or gateway IP address for the static binding configuration

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
default-router [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}
```

**Parameters**
- default-router [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

| [<IP>|<HOST-ALIAS-NAME>] | Configures the primary default router, using one of the following options: |
|--------------------------|-------------------------------------------------------------------------|
| [<IP>]|<HOST-ALIAS-NAME> | - Specifies the primary default router’s IP address
| [<HOST-ALIAS-NAME>] | - Specifies a host alias, mapped to the primary default router’s IP address |

| {<IP1>|<HOST-ALIAS-NAME1>}] | Optional. Configures the secondary default router, using one of the following options: |
|--------------------------|-------------------------------------------------------------------------|
| {<IP1>]|<HOST-ALIAS-NAME1> | - Specifies the secondary default router’s IP address |
| [<HOST-ALIAS-NAME1>]} | - Specifies a host alias, mapped to the secondary default router’s IP address. If the primary default router is unavailable, the secondary router is used. |

**Note:** A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see alias.

**Usage Guidelines**

The IP address of the router should be on the same subnet as the client subnet.

**Examples**

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#default-router 172.16.10.8 172.16.10.9

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context static-binding client-identifier test client-name RFID bootfile test.txt default-router 172.16.10.8 172.16.10.9

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

**Related Commands**

- `no` Resets values or disables DHCP pool static binding settings
12.1.3.3.6 dns-server

`static-binding-mode commands`

Configures the DNS server for this static binding configuration. This DNS server supports the client for which the static binding has been configured.

For this client, the DNS server's IP address maps the host name to an IP address. DHCP clients use the DNS server's IP address based on the order (sequence) configured.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

dns-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[&lt;IP&gt;</td>
<td>&lt;HOST-ALIAS-NAME&gt;]</td>
</tr>
<tr>
<td></td>
<td>• &lt;IP&gt; – Specifies the primary DNS server's IP address</td>
</tr>
<tr>
<td></td>
<td>• &lt;HOST-ALIAS-NAME&gt; – Specifies a host alias, mapped to the primary DNS server's IP address</td>
</tr>
<tr>
<td>{&lt;IP1&gt;</td>
<td>&lt;HOST-ALIAS-NAME1&gt;}</td>
</tr>
<tr>
<td></td>
<td>• &lt;IP1&gt; – Specifies the secondary DNS server's IP address</td>
</tr>
<tr>
<td></td>
<td>• &lt;HOST-ALIAS-NAME1&gt; – Specifies a host alias, mapped to the secondary DNS server's IP address. If the primary DNS server is unavailable, the secondary DNS server is used.</td>
</tr>
</tbody>
</table>

**Note:** A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see alias.

**Examples**

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#dns-server 172.16.10.7

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context static-binding client-identifier test client-name RFID bootfile test.txt default-router 172.16.10.8 172.16.10.9 dns-server 172.16.10.7
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

12.1.3.7 domain-name

Sets the domain name for the static binding configuration

Domain names are not case sensitive and contain alphabetic or numeric letters (or a hyphen). A fully qualified domain name (FQDN) consists of a host name plus a domain name. For example, computername.domain.com

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
domain-name <DOMAIN-NAME>

Parameters
- domain-name <DOMAIN-NAME>

Examples
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#domain-name documentation
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context static-binding client-identifier test
client-name RFID
domain-name documentation
bootfile test.txt
default-router 172.16.10.8 172.16.10.9
dns-server 172.16.10.7
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

12.1.3.3.8 ip-address

### static-binding-mode commands

Configures a fixed IP address for a host

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
ip-address [<IP>|<HOST-ALIAS-NAME>]
```

**Parameters**

- **<IP>|<HOST-ALIAS-NAME>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>Configures a fixed IP address (in dotted decimal format) of the client using this host pool</td>
</tr>
<tr>
<td>&lt;HOST-ALIAS-NAME&gt;</td>
<td>Configures a host alias identifying the fixed IP address of the client using this host pool</td>
</tr>
</tbody>
</table>

**Note:** A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is `$HOST` and it maps to a single host `1.1.1.100`. For more information, see alias.

**Examples**

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#ip-address 172.16.10.9
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context static-binding client-identifier test
        ip-address 172.16.10.9
        client-name RFID
        domain-name documentation
        bootfile test.txt
        default-router 172.16.10.8 172.16.10.9
        dns-server 172.16.10.7
```

**Related Commands**

- **no** Resets values or disables DHCP pool static binding settings
12.1.3.3.9 netbios-name-server

static-binding-mode commands

Configures the NetBIOS (WINS) name server’s IP address. This server is used to resolve NetBIOS host names.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
netbios-name-server [<IP>|<HOST-ALIAS-NAME>]
{<IP1>|<HOST-ALIAS-NAME1>}

Parameters
- netbios-name-server [<IP>|<HOST-ALIAS-NAME>]
{<IP1>|<HOST-ALIAS-NAME1>}

| [<IP>|<HOST-ALIAS-NAME>] | Configures the primary NetBIOS server, using one of the following options: |
|--------------------------|--------------------------------------------------------------------------|
| <IP> – Specifies the primary NetBIOS name server’s IP address               |
| <HOST-ALIAS-NAME> – Specifies a host alias, mapped to the primary NetBIOS name server’s IP address |

| {<IP1>|<HOST-ALIAS-NAME1>} | Optional. Configures the secondary NetBIOS name server, using one of the following options: |
|---------------------------|-----------------------------------------------------------------------------------------------|
| <IP1> – Specifies the secondary NetBIOS name server’s IP address          |
| <HOST-ALIAS-NAME1> – Specifies a host alias, mapped to the secondary NetBIOS name server’s IP address. If the primary NetBIOS name server is unavailable, the secondary server is used. |

**Note:** A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is "$HOST" and it maps to a single host ‘1.1.1.100’. For more information, see alias.

Examples
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#netbios-name-server 172.16.10.23

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context static-binding client-identifier test
  ip-address 172.16.10.9
  client-name RFID
  domain-name documentation
  bootfile test.txt
default-router 172.16.10.8 172.16.10.9
dns-server 172.16.10.7
netbios-name-server 172.16.10.23
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

Related Commands

| no | Resets values or disables DHCP pool static binding settings |
12.1.3.3.10 netbios-node-type

static-binding-mode commands

Configures different predefined NetBIOS node types. The NetBIOS node defines the way a device resolves NetBIOS names to IP addresses.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

netbios-node-type [b-node|h-node|m-node|p-node]

Parameters
- netbios-node-type [b-node|h-node|m-node|p-node]

| [b-node|h-node| m-node|p-node] | Defines the netbios node type |
|--------------------------------|-------------------------------|
| b-node                        | Sets the node type as broadcast. Uses broadcasts to query nodes on the network for the owner of a NetBIOS name. |
| h-node                        | Sets the node type as hybrid. Uses a combination of two or more nodes. |
| m-node                        | Sets the node type as mixed. A mixed node uses broadcast queries to find a node, and failing that, queries a known p-node name server for the address. |
| p-node                        | Sets the node type as peer-to-peer. Uses directed calls to communicate with a known NetBIOS name server (such as a WINS server), for the IP address of a NetBIOS machine. |

Examples

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#netbios-node-type b-node

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
  static-binding client-identifier test
  client-name RFID
  domain-name documentation
  netbios-node-type b-node
  bootfile test.txt
  default-router 172.16.10.9 172.16.10.9
  dns-server 172.16.10.7
  netbios-name-server 172.16.10.23

Related Commands

no

  Resets values or disables DHCP pool static binding settings
12.1.3.3.11 next-server

 Configures the next server utilized in the boot process

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

next-server [IP]\|<HOST-ALIAS-NAME>]

Parameters

- next-server [IP]\|<HOST-ALIAS-NAME>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP</td>
<td>Configures the next server's (the first server in the boot process) IP address</td>
</tr>
<tr>
<td>&lt;HOST-ALIAS-NAME&gt;</td>
<td>Configures a host alias, mapped to the next server's IP address</td>
</tr>
</tbody>
</table>

Note: A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see alias.

Examples

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#next-server 172.16.10.24

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context

static-binding client-identifier test
  ip-address 172.16.10.9
  client-name RFID
  domain-name documentation
  netbios-node-type b-node
  bootfile test.txt
  default-router 172.16.10.8 172.16.10.9
  dns-server 172.16.10.7
  netbios-name-server 172.16.10.23

next-server 172.16.10.24
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

Related Commands

no

Resets values or disables DHCP pool static binding settings
12.1.3.3.12 no

Negates or reverts static binding settings for the selected DHCP server policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
no [bootfile|client-name|default-router|dns-server|domain-name|ip-address|
    netbios-name-server|netbios-node-type|next-server|option|respond-via-unicast|
    static-route]
```

```
no option <OPTION-NAME>
```

```
no static-route <IP/MASK> <GATEWAY-IP>
```

Parameters

- **no <PARAMETERS>**

| no <PARAMETERS> | Negates or reverts static binding settings for the selected DHCP server policy |

Examples

The following example shows the DHCP pool static binding settings before the 'no' commands are executed:

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
    static-binding client-identifier test
    ip-address 172.16.10.9
    client-name RFID
    domain-name documentation
    netbios-node-type b-node
    bootfile test.txt
    default-router 172.16.10.8 172.16.10.9
    dns-server 172.16.10.7
    netbios-name-server 172.16.10.23
    next-server 172.16.10.24
```

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no bootfile
```

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no ip-address
```

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no default-router
```

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no dns-server
```

The following example shows the DHCP pool static binding settings after the 'no' commands are executed:

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
    static-binding client-identifier test
    client-name RFID
    domain-name documentation
    netbios-node-type b-node
    netbios-name-server 172.16.10.23
    next-server 172.16.10.24
```

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```
12.1.3.13 option

Configures the raw DHCP options in the DHCP policy. The DHCP options can be used only in static bindings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```plaintext
option <OPTION-NAME> [ <DHCP-OPTION-IP> | <DHCP-OPTION-ASCII> ]
```

Parameters

- `<OPTION-NAME>` Sets the DHCP option name
- `<DHCP-OPTION-IP>` Sets the DHCP option as an IP address
- `<DHCP-OPTION-ASCII>` Sets the DHCP option as an ASCII string

Usage Guidelines

Defines non standard DHCP option codes (0-254)

**NOTE:** An option name in ASCII format accepts a backslash (\) as an input, but is not displayed in the output (Use `show running config` to view the output). Use a double backslash to represent a single backslash.

Examples

```plaintext
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#option option1 172.16.10.10
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context static-binding client-identifier test client-name RFID domain-name documentation netbios-node-type b-node netbios-name-server 172.16.10.23 next-server 172.16.10.24 option option1 172.16.10.10
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```
12.1.3.3.14 respond-via-unicast

- **static-binding-mode commands**

Sends a DHCP offer and DHCP acknowledge as unicast messages

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
respond-via-unicast

**Parameters**
None

**Examples**
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#respond-via-unicast

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
  static-binding client-identifier test
  client-name RFID
  domain-name documentation
  netbios-node-type b-node
  netbios-name-server 172.16.10.23
  next-server 172.16.10.24
  option option1 172.16.10.10
respond-via-unicast
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

**Related Commands**

| no | Resets values or disables DHCP pool static binding settings |
12.1.3.3.15 static-route

% static-binding-mode commands

Adds static routes to the static binding configuration

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
static-route <IP/MASK> <GATEWAY-IP>

Parameters
- static-route <IP/MASK> <GATEWAY-IP>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/MASK&gt;</td>
<td>Sets the subnet for which the static route is configured</td>
</tr>
<tr>
<td>&lt;GATEWAY-IP&gt;</td>
<td>Specify the gateway’s IP address</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-1)#static-route 10.0.0.0/10 157.235.208.235

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
    static-binding client-identifier test
    client-name RFID
    domain-name documentation
    netbios-node-type b-node
    netbios-name-server 172.16.10.23
    next-server 172.16.10.24
    option option1 172.16.10.10
    respond-via-unicast
    static-route 10.0.0.0/10 157.235.208.235
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

Related Commands
- no

Resets values or disables DHCP pool static route settings
12.1.4 dhcp-server

> dhcp-server-policy

Configures the activation-criteria (run-criteria) that triggers dynamic activation of DHCP service running on a redundancy device.

In a managed wireless network, when the primary, active DHCP server fails (is unreachable), network clients are unable to access DHCP services, such as new IP address leasing and renewal of existing IP address leases. In such a scenario, the activation-criteria, when configured, triggers dynamic activation of the secondary DHCP server, allowing network clients to continue accessing DHCP services. The WiNG implementation provides activation-criteria options specific to a RF Domain, cluster setup, and a Virtual Router Redundancy Protocol (VRRP) master/client setup.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

dhcp-server activation-criteria [cluster-master|rf-domain-manager|vrrp-master]

Parameters

- dhcp-server activation-criteria [cluster-master|rf-domain-manager|vrrp-master]

Examples

rfs4000-229D58(config-dhcp-policy-test)#dhcp-server activation-criteria rf-domain-manager

rfs4000-229D58(config-dhcp-policy-test)#show context
dhcp-server-policy test

    dhcp-server activation-criteria rf-domain-manager

rfs4000-229D58(config-dhcp-policy-test)#

rfs4000-229D58(config-dhcp-policy-test)#no dhcp-server activation-criteria
rfs4000-229D58(config-dhcp-policy-test)#show context
dhcp-server-policy test
rfs4000-229D58(config-dhcp-policy-test)#

**Related Commands**

<table>

<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Removes the DHCP service activation criteria configured on this DHCP server policy</td>
</tr>
</tbody>
</table>
12.1.5 \textit{no}

Negates a command or sets its default. When used in the DHCP server configuration context, the `no` command resets or reverts the DHCP server policy settings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

\textbf{Syntax}

\texttt{no \{bootp|dhcp-class|dhcp-pool|dhcp-server|option|ping\}}

\texttt{no bootp ignore}

\texttt{no dhcp-class <DHCP-CLASS-NAME>}

\texttt{no dhcp-pool <DHCP-POOL-NAME>}

\texttt{no dhcp-server activation-criteria}

\texttt{no option <DHCP-OPTION>}

\texttt{no ping timeout}

\textbf{Parameters}

- \texttt{no <PARAMETERS>}

\texttt{no <PARAMETERS>} Negates a command or sets its default. When used in the DHCP server configuration context, the `no` command resets or reverts the DHCP server policy settings

\textbf{Examples}

The following example shows the DHCP policy 'test' settings before the 'no' commands are executed:

\begin{verbatim}
rfs7000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
  bootp ignore
dhcp-class dhcpclass1
dhcp-pool pooll
  address 1.2.3.4 class dhcpclass1
  update dns override
--More--
rfs7000-37FABE(config-dhcp-policy-test)#
\end{verbatim}

\begin{verbatim}
rfs7000-37FABE(config-dhcp-policy-test)#no bootp ignore
rfs7000-37FABE(config-dhcp-policy-test)#no dhcp-class dhcpclass1
rfs7000-37FABE(config-dhcp-policy-test)#no dhcp-pool pooll
\end{verbatim}

The following example shows the DHCP policy 'test' settings after the 'no' commands are executed:

\begin{verbatim}
rfs7000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
rfs7000-37FABE(config-dhcp-policy-test)#
\end{verbatim}
12.1.6 option

dhcp-server-policy

Configures raw DHCP options. The DHCP option has to be configured in the DHCP server policy. The options configured in the DHCP pool/DHCP server policy can also be used in static bindings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
option <OPTION-NAME> <0-254> [ascii|hexstring|ip]

Parameters
- option <OPTION-NAME> <0-254> [ascii|hexstring|ip]

<table>
<thead>
<tr>
<th>&lt;OPTION-NAME&gt;</th>
<th>Configures the option name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;0-254&gt;</td>
<td>Configures the DHCP option code from 0 - 254</td>
</tr>
<tr>
<td>ascii</td>
<td>Configures the DHCP option as an ASCII string</td>
</tr>
<tr>
<td>hexstring</td>
<td>Configures the DHCP option as a hexadecimal string</td>
</tr>
<tr>
<td>ip</td>
<td>Configures the DHCP option as an IP address</td>
</tr>
</tbody>
</table>

Usage Guidelines
Defines non standard DHCP option codes (0-254)

NOTE: An option name in ASCII format accepts a backslash (\) as an input, but is not displayed in the output (Use `show running config` to view the output). Use a double backslash to represent a single backslash.

Examples
rfs7000-37FABE(config-dhcp-policy-test)#option option1 200 ascii
rfs7000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
  option option1 200 ascii
rfs7000-37FABE(config-dhcp-policy-test)#

Related Commands
- no Removes DHCP server options
12.1.7 ping

dhcp-server-policy

Configures the DHCP server’s ping timeout interval. The controller uses the timeout to intermittently ping and discover whether a client requested IP address is available or in use.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ping timeout <1-10>

Parameters

- ping timeout <1-10>

| timeout <1-10> | Sets the ping timeout from 1 - 10 seconds. The default is 1 second. |

Examples

rfs7000-37FABE(config-dhcp-policy-test)#ping timeout 2
rfs7000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
ping timeout 2
    option option1 200 ascii
rfs7000-37FABE(config-dhcp-policy-test)#

Related Commands

no | Resets the ping interval to 1 second |

</tr>
</tbody>
</table>
12.2.1.1 dhcpv6-pool

Configures a DHCPv6 server address pool and enters its configuration mode.

A DHCPv6 IPv6 pool is a resource from which IPv6 formatted addresses can be issued on DHCPv6 client requests. IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

dhcpv6-pool <POOL-NAME>

Parameters
- dhcpv6-pool <POOL-NAME>

Examples

rfs7000-37FABE(config-dhcpv6-server-policy-test)#dhcpv6-pool DHCPv6Pool1

rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#?

DHCPv6 pool Mode commands:
- dns-server DNS Servers
- domain-name Configure domain-name
- network Network on which DHCPv6 server will be deployed
- no Negate a command or set its defaults
- option Raw DHCPv6 options
- refresh-time Upper limit specifying the timer for which client should wait before refreshing information
- sip SIP server options

12.2.1.2.1 dns-server

- dhcpv6-pool-mode commands

Configures this DHCPv6 pool's DNS server. The DNS server supports all clients connected to networks supported by the DHCPv6 server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

dns-server <IPv6> {<SECONDARY-IPv6>}

**Parameters**

- **dns-server <IPv6> {<SECONDARY-IPv6>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</tr>
<tr>
<td></td>
<td>- &lt;SECONDARY-IPv6&gt; — Specify the secondary DNS server’s IPv6 address (the server associated with this DHCP pool).</td>
</tr>
</tbody>
</table>

**Examples**

```bash
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
  dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

**Related Commands**

- **no** Removes this DHCPv6 pool's configured DNS server settings
12.2.1.2.2 domain-name

▶ dhcpv6-pool-mode commands

Configures this DHCPv6 pool’s domain name

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

domain-name <DOMAIN-NAME>

Parameters

- domain-name <DOMAIN-NAME>

<table>
<thead>
<tr>
<th>&lt;DOMAIN-NAME&gt;</th>
<th>Specify the DHCP pool’s hostname or hostnames of the domain or domains</th>
</tr>
</thead>
</table>

Examples

rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#domain-name TechPubs

rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context

Related Commands

| no | Removes this DHCPv6 pool’s domain name |
### 12.2.1.2.3 network

**dhcpv6-pool-mode commands**

Configures this DHCPv6 pool's network. Use this command to configure the address of the network on which this DHCP server is deployed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
network [IPv6/M] [NETWORK-ALIAS-NAME]
```

**Parameters**

- `network [IPv6/M] [NETWORK-ALIAS-NAME]`

**Examples**

```
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#network 2002::/64
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
    network 2002::/64
    domain-name TechPubs
    dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

</tbody>
</table>
12.2.1.2.4 no

Negates a command or sets its default. When used in the DHCPv6 pool configuration context, the ‘no’ command resets or reverts the DHCPv6 pool’s settings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
no [dns-server|domain-name|network|option|refresh-time|sip]

Parameters
- no <PARAMETERS>

Examples
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
network 2002::/64

12.2.1.2.5 option

### dhcpv6-pool-mode commands

Configures this DHCPv6 pool's raw DHCPv6 options. This is the vendor-specific option used in this DHCPv6 pool.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

```
option <OPTION-NAME> [ <DHCPv6-OPTION-IP> | <DHCPv6-OPTION-ASCII> ]
```

### Parameters

- **option <OPTION-NAME> [ <DHCPv6-OPTION-IP> | <DHCPv6-OPTION-ASCII> ]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;OPTION-NAME&gt;</td>
<td>Sets the name of the DHCPv6 option</td>
</tr>
<tr>
<td>&lt;DHCPv6-OPTION-IP&gt;</td>
<td>Sets DHCPv6 option as an IPv6 address</td>
</tr>
<tr>
<td>&lt;DHCPv6-OPTION-ASCII&gt;</td>
<td>Sets DHCPv6 option as an ASCII string</td>
</tr>
</tbody>
</table>

### Example

```
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#option DHCPv6Pool1Option 60
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context dhcpv6-pool DHCPv6Pool1
network 2002::/64
domain-name TechPubs
dns-server 2002::1
option DHCPv6Pool1Option 60
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

### Related Commands

- **no** Removes this DHCPv6 pool's DHCP option settings
**12.2.1.6 refresh-time**

* dhcpv6-pool-mode commands

Configures this DHCPv6 pool's refresh time in seconds. This is the interval between two successive DHCP pool refreshes. The DHCP refresh process refreshes IPv6 client information.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
refresh-time <600-4294967295>
```

**Parameters**

- `refresh-time <600-4294967295>`

<table>
<thead>
<tr>
<th>refresh-time</th>
<th>Specify this DHCPv6 pool's refresh time from 600-4294967295 seconds.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;600-4294967295&gt;</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#refresh-time 1000
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
    network 2002::/64
    refresh-time 1000
    domain-name TechPubs
dns-server 2002::1
    option DHCPv6Pool1Option 60
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

**Related Commands**

```
no
Removes or reverts the configured DHCPv6 pool's refresh time
```
12.2.1.2.7 sip

**dhcpv6-pool-mode commands**

Configures this DHCPv6 pool's *Session Initiation Protocol (SIP)* server setting.

Configures the domain name or domain names associated with the SIP servers. The SIP server is used to prioritize voice and video traffic on the network. SIP is an application-layer control protocol that can establish, modify and terminate multimedia sessions or calls. A SIP system has several components (user agents, proxy servers, redirect servers, and registrars). User agents can contain SIP clients; proxy servers always contain SIP clients.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
sip [address <IPv6>|domain-name <DOMAIN-NAME>]
```

**Parameters**

- `sip [address <IPv6>|domain-name <DOMAIN-NAME>]`

**Examples**

```
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#sip domain-name TechPubsSIP
```
```
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context dhcpv6-pool DHCPv6Pool1
  network 2002::/64
  refresh-time 1000
  domain-name TechPubs
  sip domain-name TechPubsSIP
  dns-server 2002::1
  option DHCPv6Pool1option 60
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

**Related Commands**

- `no` Removes this DHCPv6 pool’s SIP server setting
12.2.2 option

Configures this DHCPv6 server policy’s DHCP option settings, such as enterprise (vendor) ID.

DHCPv6 services are available for specific IP interfaces. A pool (or range) of IPv6 network addresses and DHCPv6 options can be created for each IPv6 interface defined. This range of addresses can be made available to DHCPv6 enabled devices on either a permanent or leased basis. DHCPv6 options are provided to each client with a DHCPv6 response and provide DHCPv6 clients information required to access network resources (default gateway, domain name, DNS server and WINS server configuration). An option exists to identify the vendor and functionality of a DHCPv6 client. The information is a variable-length string of characters (or octets) with a meaning specified by the vendor of the DHCPv6 client.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
option <OPTION-NAME> <0-254> [ascii|hexstring|ipv6] <1-4294967295>
```

Parameters

- `<option <OPTION-NAME> <0-254> [ascii|hexstring|ipv6] <1-4294967295>`

<table>
<thead>
<tr>
<th>option &lt;OPTION-NAME&gt;</th>
<th>Specify a unique name for this DHCP option. The name should describe option's function.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;0-254&gt;</code></td>
<td>Specify a DHCP option code for this option.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;0-254&gt;</code> -- Specify a value from 0-254.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The system allows only one code, of the same value, for each DHCP option used in each DHCPv6 server policy.</td>
</tr>
<tr>
<td>ascii</td>
<td>Specifies the option type as ASCII (sends an ASCII compliant string to the client)</td>
</tr>
<tr>
<td>hexstring</td>
<td>Specifies the option type as a string of hexadecimal characters (sends a hexadecimal string to the client)</td>
</tr>
<tr>
<td>ipv6</td>
<td>Specifies the option type as IPv6 address (sends an IPv6 compatible address to the client)</td>
</tr>
<tr>
<td><code>&lt;1-4294967295&gt;</code></td>
<td>This parameter is common to all option types.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;1-4294967295&gt;</code> -- Specifies the enterprise (vendor) ID. Specify a value from 1-4294967295. The option code (1) is reserved for subnet-mask and cannot be used.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Each vendor should have a unique vendor ID used by the DHCP server to issue vendor-specific DHCP options.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-dhcpv6-server-policy-test)#option DHCPServerOption1 10 ascii 50
```
```plaintext
rfs7000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
  option DHCPServerOption1 10 ascii 50
  dhcpv6-pool DHCPv6Pool1
    network 2002::/64
    domain-name TechPubs
  sip domain-name TechPubsSIP
  dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test)#
```

12.2.3 restrict-vendor-options

Restricts the use of vendor-specific DHCP options on this DHCPv6 server policy. When restricted, vendor-specific DHCP options, configured on this DHCPv6 server policy, are not included in the DHCPv6 server replies to IPv6 clients.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

restrict-vendor-options

Parameters

None

Examples

rfs7000-37FABE(config-dhcpv6-server-policy-test)#restrict-vendor-options

rfs7000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test

<td>Removes restriction on sending of vendor-specific options in DHCPv6 server replies to IPv6 clients</td>
</tr>
</tbody>
</table>
12.2.4 server-preference

Configures this DHCPv6 server's preference value. When configured, the server preference value is included in the DHCPv6 server's replies to IPv6 clients.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

server-preference <0-255>

Parameters

- server-preference <0-255>

server-preference <0-255>  
| Configures this DHCP server's preference value  
| <0-255> – Specify a value from 0 - 255.

Examples

rfs7000-37FABE(config-dhcpv6-server-policy-test)#server-preference 1

rfs7000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
  option DHCPServerOption1 10 ascii 50
dhcpv6-pool DHCPv6Pool1
  network 2002::/64
  domain-name TechPubs
  sip domain-name TechPubsSIP
dns-server 2002::1
  server-preference 1
  restrict-vendor-options

rfs7000-6DCD4B(config-dhcpv6-server-policy-test)#

Related Commands

no  
| Removes this DHCPv6 server's preference value
12.2.5 no

Negates or reverts this DHCPv6 server policy’s settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [dhcpv6-pool|option|restrict-vendor-options|server-preference]

Parameters

- no <PARAMETERS>

Examples

rfs7000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
  option DHCPServerOption1 10 ascii 50
dhcpv6-pool DHCPv6Pool1
    network 2002::/64
domain-name TechPubs
  sip domain-name TechPubsSIP
dns-server 2002::1
server-preference 1
restrict-vendor-options

rfs7000-37FABE(config-dhcpv6-server-policy-test)#no restrict-vendor-options
rfs7000-37FABE(config-dhcpv6-server-policy-test)#no server-preference

rfs7000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
  option DHCPServerOption1 10 ascii 50
dhcpv6-pool DHCPv6Pool1
    network 2002::/64
domain-name TechPubs
  sip domain-name TechPubsSIP
dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test)#
This chapter summarizes the firewall policy commands in the CLI command structure.

A firewall protects a network from attacks and unauthorized access from outside the network. Simultaneously, it allows authorized users to access required resources. Firewalls work on multiple levels. Some work at layers 1, 2 and 3 to inspect each packet. The packet is either passed, dropped or rejected based on rules configured on the firewall.

Firewalls use application layer filtering to enforce compliance. These firewalls can understand applications and protocols and can detect if an unauthorized protocol is being used, or an authorized protocol is being abused in any malicious way.

The third set of firewalls, ‘Stateful Firewalls’, consider the placement of individual packets within each packet in the series of packets being transmitted. If there is a packet that does not fit into the sequence, it is automatically identified and dropped.

Use (config) instance to configure firewall policy commands. To navigate to the `config-fw-policy` instance, use the following commands:

```
<DEVICE>(config)#firewall-policy <POLICY-NAME>
```

```
rfs7000-37FABE(config)#firewall-policy test
rfs7000-37FABE(config-fw-policy-test)#?
```

Firewall policy Mode commands:

- `acl-logging`  
  Log on flow creating traffic
- `alg`  
  Enable ALG
- `clamp`  
  Clamp value
- `dhcp-offer-convert`  
  Enable conversion of broadcast dhcp offers to unicast
- `dns-snoop`  
  DNS Snooping
- `firewall`  
  Wireless firewall
- `flow`  
  Firewall flow
- `ip`  
  Internet Protocol (IP)
- `ip-mac`  
  Action based on ip-mac table
- `ipv6`  
  Internet Protocol version 6 (IPv6)
- `ipv6-mac`  
  Action based on ipv6-mac table
- `logging`  
  Firewall enhanced logging
- `no`  
  Negate a command or set its defaults
- `proxy-arp`  
  Enable generation of ARP responses on behalf of another device
- `proxy-nd`  
  Enable generation of ND responses (for IPv6) on behalf of another device
- `stateful-packet-inspection-l2`  
  Enable stateful packet inspection in layer2 firewall
- `storm-control`  
  Storm-control
- `virtual-defragmentation`  
  Enable virtual defragmentation for IPv4 packets (recommended for proper functioning of firewall)
- `clrscr`  
  Clears the display screen
commit  Commit all changes made in this session
do      Run commands from Exec mode
end     End current mode and change to EXEC mode
exit    End current mode and down to previous mode
help    Description of the interactive help system
revert  Revert changes
service Service Commands
show    Show running system information
write   Write running configuration to memory or terminal

rfs7000-37FABE(config-fw-policy-test)#
13.1 firewall-policy

The following table summarizes default firewall policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>

</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
### 13.1.1 acl-logging

- **firewall-policy**

Enables logging on flow creating traffic

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`acl-logging`

**Parameters**

None

**Examples**

```plaintext
rfs4000-229D58(config-fw-policy-test)#acl-logging
rfs4000-229D58(config-fw-policy-test)#no acl-logging
rfs4000-229D58(config-fw-policy-test)#show context firewall-policy test
  no ip dos tcp-sequence-past-window
  no acl-logging
rfs4000-229D58(config-fw-policy-test)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>no</strong></td>
<td>Disables logging on flow creating traffic</td>
</tr>
</tbody>
</table>
13.1.2 alg

*firewall-policy*

Enables traffic filtering at the application layer using the *Application Layer Gateway (ALG)* feature.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
alg [dns|facetime|ftp|pptp|sccp|sip|tftp]
```

**Parameters**

- `alg [dns|facetime|ftp|pptp|sccp|sip|tftp]`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>alg</code></td>
<td>Enables traffic filtering at the application layer. The ALG provides filters for the following common protocols: DNS, Facetime, FTP, PPTP, SCCP, SIP, and TFTP</td>
</tr>
<tr>
<td><code>dns</code></td>
<td>Allows <em>Domain Name System (DNS)</em> traffic through the firewall using its default ports. This option is enabled by default.</td>
</tr>
<tr>
<td><code>facetime</code></td>
<td>Allows FaceTime traffic through the firewall using its default ports. This option is disabled by default.</td>
</tr>
<tr>
<td><code>ftp</code></td>
<td>Allows <em>File Transfer Protocol (FTP)</em> traffic through the firewall using its default ports. This option is enabled by default.</td>
</tr>
<tr>
<td><code>pptp</code></td>
<td>Allows <em>Point-to-Point Tunneling Protocol (PPTP)</em> traffic through the firewall using its default ports. PPTP, a network protocol, enables secure transfer of data from a remote client to an enterprise server by encapsulating PPP packets into IP datagrams for transmission over the Internet or other public TCP/IP-based networks. This option is enabled by default.</td>
</tr>
<tr>
<td><code>sccp</code></td>
<td>Allows <em>Skinny Call Control Protocol (SCCP)</em> traffic through the firewall using its default ports. This option is disabled by default.</td>
</tr>
<tr>
<td><code>sip</code></td>
<td>Allows <em>Session Initiation Protocol (SIP)</em> traffic through the firewall using its default ports. This option is enabled by default.</td>
</tr>
<tr>
<td><code>tftp</code></td>
<td>Enables the <em>Trivial File Transfer Protocol (TFTP)</em> algorithm. The default is enabled. Allows <em>Trivial File Transfer Protocol (TFTP)</em> traffic through the firewall using its default ports. This option is enabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx4500-5CFA2B(config-fw-policy-test)#alg facetime
```

```
nx4500-5CFA2B(config-fw-policy-test)#show context firewall-policy test
  no ip dos tcp-sequence-past-window
  alg facetime
```

**Related Commands**

- `no` Removes or reverts ALG related settings.
13.1.3 clamp

This option limits the TCP Maximum Segment Size (MSS) to the size of the Maximum Transmission Unit (MTU) discovered by path MTU discovery for the inner protocol. This ensures the packet traverses through the inner protocol without fragmentation. This option is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
clamp tcp-mss

Parameters
- clamp tcp-mss

<table>
<thead>
<tr>
<th>tcp-mss</th>
<th>Limits the TCP MSS size to the MTU value of the inner protocol for tunneled packets</th>
</tr>
</thead>
</table>

Examples
rfs7000-37FABE(config-fw-policy-test)#clamp tcp-mss

Related Commands
- no | Disables limiting of the TCP MSS |
13.1.4 dhcp-offer-convert

Enables the conversion of broadcast DHCP offers to unicast. Converting DHCP broadcast traffic to unicast traffic can help reduce network traffic loads. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
dhcp-offer-convert

Parameters
None

Examples
rfs7000-37FABE(config-fw-policy-test)#dhcp-offer-convert
rfs7000-37FABE(config-fw-policy-test)#show context
    firewall-policy test
    no ip dos tcp-sequence-past-window
    dhcp-offer-convert
rfs7000-37FABE(config-fw-policy-test)#

Related Commands

no | Disables the conversion of broadcast DHCP offers to unicast
13.1.5 **dns-snoop**

```
firewall-policy
```

Sets the timeout interval for DNS snoop table entries. DNS snoop entries provide information, such as client to IP address and client to default gateway(s) mappings. This information is used to detect if the client is sending routed packets to a wrong MAC address.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

dns-snoop entry-timeout <30-86400>

**Parameters**

- `dns-snoop entry-timeout <30-86400>`

<table>
<thead>
<tr>
<th>entry-timeout &lt;30-86400&gt;</th>
<th>Sets the DNS snoop table entry timeout interval from 30 - 86400 seconds. An entry is retained in the DNS snoop table only for the specified time, and is deleted once this time is exceeded. The default is 1,800 seconds.</th>
</tr>
</thead>
</table>

**Examples**

```
rfs7000-37FABE(config-fw-policy-test)#dns-snoop entry-timeout 35
rfs7000-37FABE(config-fw-policy-test)#show context
firewall-policy test
  no ip dos tcp-sequence-past-window
dhcp-offer-convert

dns-snoop entry-timeout 35
rfs7000-37FABE(config-fw-policy-test)#
```

**Related Commands**

| no | Removes the DNS snoop table entry timeout interval |
13.1.6 firewall

Enables a device's firewall

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
firewall enable

Parameters

- firewall enable

<table>
<thead>
<tr>
<th>firewall enable</th>
<th>Enables wireless firewalls</th>
</tr>
</thead>
</table>

Examples

```
 rfs7000-37FABE(config-fw-policy-default)#firewall enable
 rfs7000-37FABE(config-fw-policy-default)#
```

Related Commands

| no | Disables a device's firewall |
13.1.7 flow

Defines the session flow timeout interval for different packet types

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

flow [dhcp|timeout]

flow dhcp stateful

flow timeout [icmp|other|tcp|udp]
flow timeout [icmp|other] <1-32400>
flow timeout udp <15-32400>
flow timeout tcp [close-wait|reset|setup|stateless-fin-or-reset|stateless-general] <1-32400>
flow timeout tcp established <15-32400>

Parameters

- flow dhcp stateful

<table>
<thead>
<tr>
<th>dhcp</th>
<th>Configures DHCP packet flow</th>
</tr>
</thead>
<tbody>
<tr>
<td>stateful</td>
<td>Performs a stateful check on DHCP packets. This feature is enabled by default.</td>
</tr>
</tbody>
</table>

- flow timeout [icmp|other] <1-32400>

<table>
<thead>
<tr>
<th>timeout</th>
<th>Configures a packet timeout</th>
</tr>
</thead>
<tbody>
<tr>
<td>icmp</td>
<td>Configures the timeout for ICMP packets. The default is 30 seconds.</td>
</tr>
<tr>
<td>other</td>
<td>Configures the timeout for packets other than ICMP, TCP, or UDP. The default is 30 seconds.</td>
</tr>
<tr>
<td>&lt;1-32400&gt;</td>
<td>Configures the timeout from 1 - 32400 seconds</td>
</tr>
</tbody>
</table>

- flow timeout udp <15-32400>

<table>
<thead>
<tr>
<th>timeout</th>
<th>Configures a packet timeout</th>
</tr>
</thead>
<tbody>
<tr>
<td>udp</td>
<td>Configures the timeout for UDP packets. The default is 30 seconds.</td>
</tr>
<tr>
<td>&lt;15-32400&gt;</td>
<td>Configures the timeout from 15 - 32400 seconds</td>
</tr>
</tbody>
</table>

- flow timeout tcp [close-wait|reset|setup|stateless-fin-or-reset|stateless-general] <1-32400>

<table>
<thead>
<tr>
<th>timeout</th>
<th>Configures a packet timeout</th>
</tr>
</thead>
<tbody>
<tr>
<td>tcp</td>
<td>Configures the timeout for TCP packets</td>
</tr>
<tr>
<td>close-wait</td>
<td>Configures the closed TCP flow timeout. The default is 10 seconds.</td>
</tr>
<tr>
<td>reset</td>
<td>Configures the reset TCP flow timeout. The default is 10 seconds.</td>
</tr>
<tr>
<td>setup</td>
<td>Configures the opening TCP flow timeout. The default is 10 seconds.</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------</td>
</tr>
<tr>
<td>stateless-fin-or-reset</td>
<td>Configures stateless TCP flow timeout created with the FIN or RESET packets. The default is 10 seconds.</td>
</tr>
<tr>
<td>stateless-general</td>
<td>Configures the stateless TCP flow timeout. The default is 90 seconds (1m 30 s).</td>
</tr>
<tr>
<td>&lt;1-32400&gt;</td>
<td>Configures the timeout from 1 - 32400 seconds</td>
</tr>
</tbody>
</table>

- `flow timeout tcp established <15-32400>`

<table>
<thead>
<tr>
<th>timeout</th>
<th>Configures the packet timeout</th>
</tr>
</thead>
<tbody>
<tr>
<td>tcp</td>
<td>Configures the timeout for TCP packets</td>
</tr>
<tr>
<td>established</td>
<td>Configures the established TCP flow timeout. The default is 5400 seconds.</td>
</tr>
<tr>
<td>&lt;15-32400&gt;</td>
<td>Configures the timeout from 15 - 32400 seconds</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-rw-policy-test)#flow timeout udp 10000
rfs7000-37FABE(config-rw-policy-test)#flow timeout icmp 16000
rfs7000-37FABE(config-rw-policy-test)#flow timeout other 16000
rfs7000-37FABE(config-rw-policy-test)#flow timeout tcp established 1500
```

```
rfs7000-37FABE(config-fw-policy-test)#show context
firewall-policy test
  no ip dos tcp-sequence-past-window
  flow timeout icmp 16000
  flow timeout udp 10000
  flow timeout tcp established 1500
  flow timeout other 16000
  dhcp-offer-convert
  dns-snoop entry-timeout 35
rfs7000-37FABE(config-fw-policy-test)#
```

**Related Commands**

| no                  | Removes session timeout intervals configured for different packet types |
**13.1.8 ip**

Configures Internet Protocol (IP) components

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
ip [dos|tcp]

ip dos {ascend|broadcast-multicast-icmp|chargen|fraggle|ftp-bounce|invalid-protocol|
    ip-ttl-zero|ipsproof|land|option-route|router-advt|router-solicit|smurf|snork|
    tcp-bad-sequence|tcp-fin-scan|tcp-intercept|tcp-max-incomplete|tcp-null-scan|
    tcp-post-syn|tcp-sequence-past-window|tcp-xmas-scan|tcphdrfrag|twinge|
    udp-short-hdr|winnuke}

ip dos {ascend|broadcast-multicast-icmp|chargen|fraggle|ftp-bounce|invalid-protocol|
    ip-ttl-zero|ipsproof|land|option-route|router-advt|router-solicit|smurf|snork|
    tcp-bad-sequence|tcp-fin-scan|tcp-intercept|tcp-null-scan|tcp-post-scan|
    tcp-sequence-past-window|tcp-xmas-scan|tcphdrfrag|twinge|udp-short-hdr|winnuke}
    [log-and-drop|log-only] log-level [<0-7>|alerts|critical|debugging|emergencies|
    errors|informational|notifications|warnings]

ip dos {ascend|broadcast-multicast-icmp|chargen|fraggle|ftp-bounce|invalid-protocol|
    ip-ttl-zero|ipsproof|land|option-route|router-advt|router-solicit|smurf|snork|
    tcp-bad-sequence|tcp-fin-scan|tcp-intercept|tcp-null-scan|tcp-post-scan|
    tcp-sequence-past-window|tcp-xmas-scan|tcphdrfrag|twinge|udp-short-hdr|winnuke}
    [drop-only]

ip dos tcp-max-incomplete [high|low] <1-1000>

ip tcp [adjust-mss|optimize-unnecessary-resends|recreate-flow-on-out-of-state-syn|
    validate-icmp-unreachable|validate-rst-ack-number|validate-rst-seq-number]

ip tcp adjust-mss <472-1460>

ip tcp [optimize-unnecessary-resends|recreate-flow-on-out-of-state-syn|
    validate-icmp-unreachable|validate-rst-ack-number|validate-rst-seq-number]
```

**Parameters**

- **dos**
  - Identifies IP events as DoS events
  - **ascend**
    - Optional. Detects ASCEND DoS attacks
      - Ascend DoS attacks target known vulnerabilities in various versions of Ascend routers. Ascend routers listen on UDP port 9 for packets from Ascend’s Java Configurator. Sending a formatted packet to this port can cause an Ascend router to crash.
<table>
<thead>
<tr>
<th>Rule Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>broadcast-multicast-icmp</td>
<td>Optional. Detects broadcast or multicast ICMP DoS attacks&lt;br&gt;Broadcast or multicast ICMP DoS attacks take advantage of ICMP behavior in response to echo replies. These attacks spoof the source address of the target and send ICMP broadcast or multicast echo requests to the rest of the network, flooding the target machine with replies.</td>
</tr>
<tr>
<td>chargen</td>
<td>Optional. Detects Chargen attacks&lt;br&gt;The Character Generation Protocol (chargen) is an IP suite service primarily used for testing and debugging networks. It is also used as a source of generic payload for bandwidth and QoS measurements.&lt;br&gt;The Chargen attack establishes a Telnet connection to port 19 and attempts to use the character generator service to create a string of characters which is then directed to the DNS service on port 53 to disrupt DNS services.</td>
</tr>
<tr>
<td>fraggle</td>
<td>Optional. Detects Fraggle DoS attacks&lt;br&gt;The Fraggle DoS attack uses a list of broadcast addresses to send spoofed UDP packets to each broadcast address’ echo port (port 7). Each of those addresses that have port 7 open will respond to the request generating a lot of traffic on the network. For those that do not have port 7 open they will send an unreachable message back to the originator, further clogging the network with more traffic.</td>
</tr>
<tr>
<td>ftp-bounce</td>
<td>Optional. Detects FTP bounce attacks&lt;br&gt;A FTP bounce attack is a MIM attack that enables an attacker to open a port on a different machine using FTP. FTP requires that when a connection is requested by a client on the FTP port (21), another connection must open between the server and the client. To confirm, the PORT command has the client specify an arbitrary destination machine and port for the data connection. This is exploited by the attacker to gain access to a device that may not be the originating client.</td>
</tr>
<tr>
<td>invalid-protocol</td>
<td>Optional. Enables a check for an invalid protocol number&lt;br&gt;Attackers may use vulnerability in the endpoint implementation by sending invalid protocol fields, or may misuse the misinterpretation of endpoint software. This can lead to inadvertent leakage of sensitive network topology information, call hijacking, or a DoS attack.</td>
</tr>
<tr>
<td>ip-ttl-zero</td>
<td>Optional. Enables a check for the TCP/IP TTL field having a value of zero (0)&lt;br&gt;The TCP IP TTL Zero DoS attack sends spoofed multicast packets onto the network which have a <strong>Time to Live</strong> (TTL) of 0. This causes packets to loop back to the spoofed originating machine, and can cause the network to overload.</td>
</tr>
<tr>
<td>ipsproof</td>
<td>Optional. Enables a check for the IP spoofing DoS attacks&lt;br&gt;IP Spoof is a category of DoS attack that sends IP packets with forged source addresses. This can hide the identity of the attacker.</td>
</tr>
<tr>
<td>land</td>
<td>Optional. Detects LAND DoS attacks&lt;br&gt;A <strong>Local Area Network Denial</strong> (LAND) is a DoS attack where IP packets are spoofed and sent to a device where the source IP and destination IP of the packet are the target device’s IP, and similarly, the source port and destination port are open ports on the same device. This causes the attacked device to reply to itself continuously.</td>
</tr>
<tr>
<td>option-route</td>
<td>Optional. Enables an IP Option Record Route DoS check</td>
</tr>
<tr>
<td>Attack Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>router-advt</td>
<td>Optional. Detects router-advertisement attacks. This attack uses ICMP to redirect the network router function to some other host. If that host cannot provide router services, a DoS of network communications occurs as routing stops. This can also be modified to single out a specific system, so that only that system is subject to attack (because only that system sees the ‘false’ router). By providing router services from a compromised host, the attacker can also place themselves in a man-in-the-middle situation and take control of any open channel at will (as mentioned earlier, this is often used with TCP packet forgery and spoofing to intercept and change open TELNET sessions).</td>
</tr>
<tr>
<td>router-solicit</td>
<td>Optional. Detects router solicitation attacks. The ICMP router solicitation scan is used to actively find routers on a network. A hacker could set up a protocol analyzer to detect routers as they broadcast routing information on the network. In some instances, however, routers may not send updates. For example, if the local network does not have other routers, the router may be configured to not send routing information packets onto the local network. ICMP offers a method for router discovery. Clients send ICMP router solicitation multicasts onto the network, and routers must respond (as defined in RFC 1122). (For more information about the process of ICMP router solicitation, see “Routing Sequences for ICMP.”) By sending ICMP router solicitation packets (ICMP type 9) on the network and listening for ICMP router discovery replies (ICMP type 10), hackers can build a list of all of the routers that exist on a network segment. Hackers often use this scan to locate routers that do not reply to ICMP echo requests.</td>
</tr>
<tr>
<td>smurf</td>
<td>Optional. In this attack, a large number of ICMP echo packets are sent with a spoofed source address. This causes the device with the spoofed source address to be flooded with a large number of replies.</td>
</tr>
<tr>
<td>snork</td>
<td>Optional. This attack causes a remote Windows™ NT to consume 100% of the CPU’s resources. This attack uses a UDP packet with a destination port of 135 and a source port of 7, 9, or 135. This attack can also be exploited as a bandwidth consuming attack.</td>
</tr>
<tr>
<td>tcp-bad-sequence</td>
<td>Optional. A DoS attack that uses a specially crafted TCP packet to cause the targeted device to drop all subsequent network traffic for a specific TCP connection.</td>
</tr>
<tr>
<td>tcp-fin-scan</td>
<td>Optional. Detects TCP FIN scan attacks. Hackers use the TCP FIN scan to identify listening TCP port numbers based on how the target device reacts to a transaction close request for a TCP port (even though no connection may exist before these close requests are made). This type of scan can get through basic firewalls and boundary routers that filter on incoming TCP packets with the Finish (FIN) and ACK flag combination. The TCP packets used in this scan include only the TCP FIN flag setting. If the target device’s TCP port is closed, the target device sends a TCP RST packet in reply. If the target device’s TCP port is open, the target device discards the FIN and sends no reply.</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>tcp-intercept</td>
<td>Optional. Prevents TCP intercept attacks by using TCP SYN cookies.</td>
</tr>
<tr>
<td></td>
<td>A SYN-flooding attack occurs when a hacker floods a server with a barrage of requests for connection.</td>
</tr>
<tr>
<td></td>
<td>Because these messages have unreachable return addresses, the connections cannot be established. The resulting volume of unresolved open connections eventually overwhelms the server and can cause it to deny service to valid requests, thereby preventing legitimate users from connecting to a Web site, accessing e-mail, using FTP service, and so on.</td>
</tr>
<tr>
<td></td>
<td>The TCP intercept feature helps prevent SYN-flooding attacks by intercepting and validating TCP connection requests. In intercept mode, the TCP intercept software intercepts TCP synchronization (SYN) packets from clients to servers that match an extended access list. The software establishes a connection with the client on behalf of the destination server, and if successful, establishes the connection with the server on behalf of the client and knits the two half-connections together transparently. Thus, connection attempts from unreachable hosts will never reach the server. The software continues to intercept and forward packets throughout the duration of the connection. The number of SYNs per second and the number of concurrent connections proxied depends on the platform, memory, processor, and other factors. In the case of illegitimate requests, the software's aggressive timeouts on half-open connections and its thresholds on TCP connection requests protect destination servers while still allowing valid requests.</td>
</tr>
<tr>
<td></td>
<td>When establishing a security policy using TCP intercept, you can choose to intercept all requests or only those coming from specific networks or destined for specific servers. You can also configure the connection rate and threshold of outstanding connections. Optionally operate TCP intercept in watch mode, as opposed to intercept mode. In watch mode, the software passively watches the connection requests flowing through the router. If a connection fails to get established in a configurable interval, the software intervenes and terminates the connection attempt.</td>
</tr>
<tr>
<td>tcp-null-scan</td>
<td>Optional. Detects TCP NULL scan attacks.</td>
</tr>
<tr>
<td></td>
<td>Hackers use the TCP NULL scan to identify listening TCP ports. This scan also uses a series of strangely configured TCP packets, which contain a sequence number of 0 and no flags. Again, this type of scan can get through some firewalls and boundary routers that filter incoming TCP packets with standard flag settings.</td>
</tr>
<tr>
<td></td>
<td>If the target device’s TCP port is closed, the target device sends a TCP RST packet in reply. If the target device’s TCP port is open, the target discards the TCP NULL scan, sending no reply.</td>
</tr>
<tr>
<td></td>
<td>A remote attacker may be attempting to avoid detection by sending a SYN frame with a different sequence number than the original SYN. This can cause an Intrusion Detection System (IDS) to become unsynchronized with the data in a connection. Subsequent frames sent during the connection are ignored by the IDS.</td>
</tr>
<tr>
<td>tcp-sequence-past-window</td>
<td>Optional. Enables a TCP SEQUENCE PAST WINDOW DoS attack check. Disable this check to work around a bug in Windows XP’s TCP stack which sends data past the window when conducting a selective ACK.</td>
</tr>
<tr>
<td>tcp-xmas-scan</td>
<td>Optional. A TCP XMAS scan finds services on ports. A closed port returns a RST. This allows the attacker to identify open ports.</td>
</tr>
<tr>
<td>tcphdrfrag</td>
<td>Optional. A DoS attack where the TCP header spans IP fragments</td>
</tr>
<tr>
<td>twinge</td>
<td>Optional. A twinge attack is a flood of false ICMP packets to try and slow down a system</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>udp-short-hdr</td>
<td>Optional. Enables the identification of truncated UDP headers and UDP header length fields</td>
</tr>
<tr>
<td>winnuke</td>
<td>Optional. This DoS attack is specific to Windows™ 95 and Windows™ NT. The WINNUKE DoS attack sends a large amount of data to UDP port 137 to crash the NETBIOS service on windows and results in high CPU utilization on the target machine.</td>
</tr>
<tr>
<td>log-and-drop</td>
<td>Logs the event and drops the packet</td>
</tr>
<tr>
<td>log-only</td>
<td>Logs the event only, the packet is not dropped</td>

<td>Optional. Enables the identification of truncated UDP headers and UDP header length fields</td>
</tr>
<tr>
<td>winnuke</td>
<td>Optional. This DoS attack is specific to Windows™ 95 and Windows™ NT, causing devices to crash with a blue screen</td>
</tr>
<tr>
<td>drop-only</td>
<td>Optional. Drops a packet without logging</td>
</tr>
</tbody>
</table>
- `ip dos tcp-max-incomplete [high|low] <1-1000>`

  dos
  Identifies IP events as DoS events

  tcp-max-incomplete
  Sets the limits for the maximum number of incomplete TCP connections

  high
  Sets the upper limit for the maximum number of incomplete TCP connections

  low
  Sets the lower limit for the maximum number of incomplete TCP connections

  <1-1000>
  Sets the range limit from 1 - 1000 connections

- `ip tcp adjust-mss <472-1460>`

  tcp
  Identifies and configures TCP events and configuration items

  adjust-mss
  Adjusts the TCP Maximum Segment Size (MSS). Use this option to adjust the MSS for TCP segments on the router.

  <472-1460>
  Sets the TCP MSS value from 472 - 1460 bytes. The default is 472 bytes.

  tcp
  Identifies and configures TCP events and configuration items

  optimize-unnecessary-resends
  Enables the validation of unnecessary TCP packets

  recreate-flow-on-out-of-state-sync
  Allows a TCP SYN packet to delete an old flow in TCP_FIN_FIN_STATE, and TCP_CLOSED_STATE states and create a new flow

  validate-icmp-unreachable
  Enables the validation of the sequence number in ICMP unreachable error packets, which abort an established TCP flow

  validate-rst-ack-number
  Enables the validation of the acknowledgment number in RST packets, which abort a TCP flow

  validate-rst-seq-number
  Enables the validation of the sequence number in RST packets, which abort an established TCP flow

13.1.9 ip-mac

`firewall-policy`

Defines an action based on the device IP MAC table, and also detects conflicts between IP addresses and MAC addresses.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
ip-mac [conflict|routing]

ip-mac conflict [logfile-only]

ip-mac conflict [logfile-only] log-level [<0-7>|alerts|critical|debug|
emergencies|errors|informational|notifications|warnings]

ip-mac routing conflict drop-only

ip-mac routing [logfile-only] log-level [<0-7>|alerts|critical|debug|
emergencies|errors|informational|notifications|warnings]
```

**Parameters**

- **ip-mac conflict drop-only**
  - conflict: Action performed when a conflict exists between the IP address and MAC address. This option is enabled by default.
  - drop-only: Drops a packet without logging

- **ip-mac conflict [logfile-only] log-level [<0-7>|alerts|critical|debug|
emergencies|errors|informational|notifications|warnings]**
  - conflict: Action performed when a conflict exists between the IP address and MAC address. This option is enabled by default.
  - log-and-drop: Logs the event and drops the packet. This is the default setting.
  - log-only: Logs the event only, the packet is not dropped
  - log-level: Configures the log level
  - <0-7>: Sets the numeric logging level
  - alerts: Numerical severity 1. Indicates a condition where immediate action is required
  - critical: Numerical severity 2. Indicates a critical condition
  - debugging: Numerical severity 7. Debugging messages
  - emergencies: Numerical severity 0. System is unusable
  - errors: Numerical severity 3. Indicates an error condition
  - informational: Numerical severity 6. Indicates a informational condition

13.1.10 ipv6

- firewall-policy

Configures IPv6 components on this firewall policy

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ipv6 [dos|duplicate-options|firewall|option|rewrite-flow-label|routing-type|

strict-ext-hdr-check|unknown-options]

dos

dos {hop-limit-zero/multicast-icmpv6/tcp-intercept-mobility}

[drop-only|log-and-drop|log-only]

duplicate-options

ipv6 [duplicate-options|routing-type [one|two]|strict-ext-hdr-check|

unknown-options] [drop-only|log-and-drop|log-only]

option

ipv6 option {endpoint-identification|network-service-access-point|router-alert|

strict-hao-opt-alert|strict-padding} [drop-only|log-and-drop|log-only]

rewrite-flow-label

ipv6 [firewall enable|rewrite-flow-label]

Parameters

- ipv6 dos {hop-limit-zero/multicast-icmpv6/tcp-intercept-mobility}

[drop-only|log-and-drop|log-only]

dos

Identifies IPv6 events as DoS events

hop-limit-zero

Optional. Enables/disables checking of IPv6 hop limit field. If the IPv6 hop limit field is ZERO (0) it is considered as attack. This option is enabled by default.

multicast-icmpv6

Optional. Enables/disables detection of multicast ICMPv6 traffic as attack. This option is applicable only to ICMPv6 Echo request or reply packets. This option is enabled by default.

tcp-intercept-mobility

Optional. Enables/disables detection of IPv6 TCP packets with mobility option "HAO(Home-Address-Option)" or "RH(Routing Header) type two". When enabled, this option also detects the "don't generate TCP syn cookies" for such packets. This option is enabled by default.

drop-only

This parameter is common to all of the above keywords. Drops all packets. Drops the specified packet type (hop-limit-zero, multicast-icmpv6, and tcp-intercept-mobility).

log-and-drop

Logs the event and drops the packet. Drops the specified packet type (hop-limit-zero, multicast-icmpv6, and tcp-intercept-mobility) and logs an event.

log-only

Logs the event only, the packet is not dropped. Does not drop the specified packet type (hop-limit-zero, multicast-icmpv6, and tcp-intercept-mobility). But, an event is logged.
### log-level
If selecting the "log-and-drop" and "log-only" action type, specify the log level. The options are:
- `<0-7>` – Sets the numeric logging level
- alerts – Numerical severity 1. Indicates a condition where immediate action is required
- critical – Numerical severity 2. Indicates a critical condition
- debugging – Numerical severity 7. Debugging messages
- emergencies – Numerical severity 0. System is unusable
- errors – Numerical severity 3. Indicates an error condition
- informational – Numerical severity 6. Indicates a informational condition
- notifications – Numerical severity 5. Indicates a normal but significant condition
- warnings – Numerical severity 4. Indicates a warning condition. This is the default setting.

### duplicate-options
Enables/disables handling of duplicate options in hop-by-hop and destination option extension headers. This configuration excludes HAO handling. This option is enabled by default.

### routing-type [one|two]
Enables/disables checking of the following IPv6 routing types:
- one – Routing Type 1 (Nimrod routing). This option is disabled by default.
- two – Routing Type 2 (Mobile IP). This option is disabled by default.

### strict-ext-hdr-check
Enables/disables strict checking for out of order and number of occurrences of extension header. This option is enabled by default.

### unknown-options
Enables/disables handling unknown options in hop-by-hop and destination option extension headers. This option is enabled by default.

### drop-only
This parameter is common to all of the above keywords. Drops all packets. Drops the packet if matching any of the above specified types.

### log-and-drop
Logs the event and drops the packet. Drops the packet, if matching any of the above specified types, and logs an event.

### log-only
Logs the event only, the packet is not dropped. Does not drop the packet, if matching any of the above specified types. But an event is logged.

### log-level
If selecting the "log-and-drop" and "log-only" action type, specify the log level. The options are:
- `<0-7>` – Sets the numeric logging level
- alerts – Numerical severity 1. Indicates a condition where immediate action is required
- critical – Numerical severity 2. Indicates a critical condition
- debugging – Numerical severity 7. Debugging messages
- emergencies – Numerical severity 0. System is unusable
- errors – Numerical severity 3. Indicates an error condition
- informational – Numerical severity 6. Indicates a informational condition
- notifications – Numerical severity 5. Indicates a normal but significant condition
- warnings – Numerical severity 4. Indicates a warning condition. This is the default setting.
ipv6 option {endpoint-identification|network-service-access-point|router-alert|strict-hao-opt-alert|strict-padding} [drop-only|log-and-drop|log-only]

</tr>
</tbody>
</table>

drop-only

This parameter is common to all of the above keywords.

Drops all packets. Drops the packet if matching any of the above specified “option” types.

log-and-drop

Logs the event and drops the packet. Drops the packet, if matching any of the above specified “option” types, and logs an event.

log-only

Logs the event only, the packet is not dropped. Does not drop the packet, if matching any of the above specified “option” types. But an event is logged.

log-level

If selecting the “log-and-drop” and “log-only” action type, specify the log level. The options are:
- <0-7> – Sets the numeric logging level
- alerts – Numerical severity 1. Indicates a condition where immediate action is required
- critical – Numerical severity 2. Indicates a critical condition
- debugging – Numerical severity 7. Debugging messages
- emergencies – Numerical severity 0. System is unusable
- errors – Numerical severity 3. Indicates an error condition
- informational – Numerical severity 6. Indicates a informational condition
- notifications – Numerical severity 5. Indicates a normal but significant condition
- warnings – Numerical severity 4. Indicates a warning condition. This is the default setting.

13.1.11 ipv6-mac

`firewall-policy`

Defines an action based on conflicts detected in a device’s IPv6 and MAC addresses.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

ipv6-mac [conflict|routing]

ipv6-mac conflict [drop-only|log-and-drop|log-only]

ipv6-mac routing conflict [drop-only|log-and-drop|log-only]

**Parameters**

- ipv6-mac conflict [drop-only|log-and-drop|log-only]

  **conflict** Enables/disables detection of conflict between a device’s IPv6 and MAC addresses. This option is enabled by default.

  This command also specifies the action to be performed when a such a conflict is detected. The options are: drop-only, log-and-drop, and log-only.

- ipv6-mac routing conflict [drop-only|log-and-drop|log-only]

  **conflict** Enables/disables detection of conflict between the next-hop’s IPv6 and MAC addresses. This option is enabled by default.

  This command also specifies the action to be performed when a such a conflict is detected. The options are: drop-only, log-and-drop, and log-only.

13.1.14 proxy-arp

Enables the generation of ARP responses on behalf of another device. Proxy ARP allows the Firewall to handle ARP routing requests for devices behind the firewall. This option is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
proxy-arp

Parameters
None

Examples
rfs7000-37FABE(config-fw-policy-test)#proxy-arp
rfs7000-37FABE(config-fw-policy-test)#

### 13.1.15 proxy-nd

**firewall-policy**

Enables generation of ND responses (for IPv6) on behalf of another device

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```bash
proxy-nd
```

**Parameters**

None

**Examples**

```bash
nx9500-6C8809(config-fw-policy-fw1)#proxy-nd
nx9500-6C8809(config-fw-policy-fw1)#
```

13.1.16 stateful-packet-inspection-l2

- firewall-policy

Enables layer 2 firewall stateful packet inspection. When enabled, allows stateful packet inspection for RF Domain manager routed interfaces within the layer 2 firewall. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
stateful-packet-inspection-l2

Parameters
None

Examples
rfs7000-37FABE(config-fw-policy-test)#stateful-packet-inspection-l2
rfs7000-37FABE(config-fw-policy-test)#

13.1.17 **storm-control**

- **firewall-policy**

Enables storm control on the firewall policy

Storms are packet bombardments that exceed the high threshold value configured for an interface. During a storm, packets are throttled until the rate falls below the configured rate, severely impacting performance for the RF Domain manager interface.

Storm control limits multicast, unicast and broadcast frames accepted and forwarded by a device. Messages are logged based on their severity level.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
storm-control [arp|broadcast|multicast|unicast]
storm-control [arp|broadcast|multicast|unicast] [level|log]
storm-control [arp|broadcast|multicast|unicast] level <1-1000000> [fe <1-4>|ge <1-8>|port-channel <1-8>|up1|wlan <WLAN-NAME>]
storm-control [arp|broadcast|multicast|unicast] log [<0-7>|alerts|critical|debugging|emergencies|errors|informational|none|notifications|warnings]
```

**Parameters**

- **storm-control [arp|broadcast|multicast|unicast] level <1-1000000> [fe <1-4>|ge <1-8]|port-channel <1-8>|up1|wlan <WLAN-NAME>]

<table>

### 13.1.18 virtual-defragmentation

*firewall-policy*

Enables the virtual defragmentation of IPv4 and IPv6 packets. This parameter is required for optimal firewall functionality and is enabled by default.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
virtual-defragmentation {maximum-defragmentation-per-host <1-16384>|
maximum-fragments-per-datagram <2-8129>|minimum-first-fragment-length <8-1500>|timeout <1-60>}
```

**Parameters**

- `virtual-defragmentation {maximum-defragmentation-per-host <1-16384>|
  maximum-fragments-per-datagram <2-8129>|minimum-first-fragment-length <8-1500>|timeout <1-60>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>maximum-defragmentation-per-host</td>
<td>Optional. Configures the maximum number of active defragmentations allowed per host before it is dropped (applicable to IPv4 and IPv6 packets)</td>
<td>rfs7000-37FABE(config-fw-policy-test)#virtual-defragmentation maximum-defragmentation-per-host 10</td>
<td>8</td>
</tr>
<tr>
<td>maximum-fragments-per-datagram</td>
<td>Optional. Configures the maximum number of fragments allowed in a datagram before it is dropped (applicable to IPv4 and IPv6 packets)</td>
<td>rfs7000-37FABE(config-fw-policy-test)#virtual-defragmentation maximum-fragments-per-datagram 10</td>
<td>140</td>
</tr>
<tr>
<td>minimum-first-fragment-length</td>
<td>Optional. Defines the minimum length required for the first fragment (applicable to IPv4 and IPv6 packets)</td>
<td>rfs7000-37FABE(config-fw-policy-test)#virtual-defragmentation minimum-first-fragment-length 10</td>
<td>8 bytes</td>
</tr>
<tr>
<td>timeout</td>
<td>Optional. Configures a virtual defragmentation timeout, in seconds, applicable to both IPv4 and IPv6 packets</td>
<td>rfs7000-37FABE(config-fw-policy-test)#virtual-defragmentation timeout 10</td>
<td>1 second</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-fw-policy-test)#virtual-defragmentation maximum-fragments-per-datagram 10
rfs7000-37FABE(config-fw-policy-test)#virtual-defragmentation minimum-first-fragment-length 100
```

**Related Commands**

- `no` Resets values or disables virtual defragmentation settings
This chapter summarizes MiNT policy commands in the CLI command structure.

All communication using the MiNT transport layer can be optionally secured. This includes confidentiality, integrity and authentication of all communications. In addition, a device can be configured to communicate over MiNT with other devices authorized by an administrator.

Use the (config) instance to configure mint-policy related configuration commands. To navigate to the config MiNT policy instance, use the following command:

```
<DEVICE>(config)#mint-policy global-default
```

```
rfs7000-37FABE(config-mint-policy-global-default)#?
```

Mint Policy Mode commands:

- `level` Mint routing level
- `mtu` Configure the global Mint MTU
- `no` Negate a command or set its defaults
- `router` Mint router
- `udp` Configure mint UDP/IP encapsulation
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-mint-policy-global-default)#
```
14.1 mint-policy

The following table summarizes MiNT policy configuration commands:

</tr>
</tbody>
</table>

**NOTE**: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS*. 
14.1.1 level

- mint-policy

Configures the global MiNT routing level

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
level 2 area-id <1-16777215>

Parameters
- level 2 area-id <1-16777215>

| level 2 | Configures level 2 inter-site MiNT routing |
| area-id | Configures the routing area identifier |
| <1-16777215> | • <1-16777215> – Specify a value from 1 - 16777215. |
| | The level 2 area ID is the global MiNT area identifier. This area identifier separates two overlapping MiNT networks. Configure the level 2 area ID only if there are two MiNT networks sharing the same packet broadcast domain. |

Examples
rfs7000-37FABE(config-mint-policy-global-default)#level 2 area-id 2000
rfs7000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  level 2 area-id 2000
rfs7000-37FABE(config-mint-policy-global-default)#

Related Commands
- no Disables level 2 MiNT packet routing (inter-site packet routing)
### 14.1.2 mtu

Configures global MiNT *Multiple Transmission Unit* (MTU). Use this command to specify the maximum packet size, in bytes, for MiNT routing. Higher the MTU values, greater is the network efficiency. The user data per packet increases, while protocol overheads, such as headers or underlying per-packet delays remain the same.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
mtu <900-1500>
```

#### Parameters

- **mtu <900-1500>**

  `<900-1500>` Specifies the maximum packet size from 900 - 1500 bytes

  The maximum packet size specified is rounded down to a value using the following formula: 4 + a multiple of 8.

  The MTU setting specifies the maximum packet size used for MiNT packets. Larger packets are fragmented to fit within the specified packet size limit. You may want to configure this parameter if the MiNT backhaul network requires or recommends smaller packet sizes. The default value is 1500 bytes.

#### Examples

```
rfs7000-37FABE(config-mint-policy-global-default)#mtu 1000
rfs7000-37FABE(config-mint-policy-global-default)#show context mint-policy global-default
  mtu 996
  level 2 area-id 2
rfs7000-37FABE(config-mint-policy-global-default)#
```

#### Related Commands

- **no**

  Reverts the configured MiNT MTU value to its default (1500 bytes)

  Negates the configured maximum packet size for MiNT routing
14.1.3 router

Configures the priority for MiNT router packets (HELLO, LSP, PSNP, and EXTVLAN)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
router packet priority <0-7>

Parameters
- router packet priority <0-7>

Examples
rfs4000-229D58 (config-mint-policy-global-default)#router packet priority 4
rfs4000-229D58 (config-mint-policy-global-default)#show context
rfs4000-229D58 (config-mint-policy-global-default)#

Related Commands
- no

Reverts the MiNT router packet priority to default (5)
14.1.4 udp

`mint-policy`

Configures MiNT UDP/IP encapsulation parameters. Use this command to configure the default UDP port used for MiNT control packet encapsulation.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`udp port <2-65534>`

**Parameters**

- `udp port <2-65534>`

<table>
<thead>
<tr>
<th>Port &lt;2-65534&gt;</th>
<th>Configures default UDP port used for MiNT control packet encapsulation</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;2-65534&gt;</td>
<td>— Enter a value from 2 - 65534. This value specifies an alternate UDP port used by MiNT control packets and must be an even number. The specified port number plus 1 is used to carry MiNT data packets. The default value is 24576.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-mint-policy-global-default)#udp port 1024

rfs7000-37FABE(config-mint-policy-global-default)#show context mint-policy global-default

<table>
<thead>
<tr>
<th>udp port 1024</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtu 996</td>
</tr>
<tr>
<td>level 2 area-id 2000</td>
</tr>
<tr>
<td>sign-unknown-device</td>
</tr>
<tr>
<td>security-level control-and-data</td>
</tr>
<tr>
<td>rejoin-timeout 1000</td>
</tr>
</tbody>
</table>

rfs7000-37FABE(config-mint-policy-global-default)#

**Related Commands**

- `no` — Reverts MiNT UDP/IP encapsulation to its default
14.1.5 no

Negates a command or reverts values to their default. When used in the config MiNT policy mode, the `no` command resets or reverts the following global MiNT policy parameters: routing level, MTU, router packet priority, and UDP or IP encapsulation settings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
no [level|mtu|router|udp]
no level 2 area-id
no mtu
no router packet priority
no udp port <LINE-SINK>
```

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | The `no` command resets or reverts the following global MiNT policy parameters: routing level, MTU, router packet priority, and UDP or IP encapsulation settings. |

Examples

The following example shows the global Mint Policy parameters before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-mint-policy-global-default)#show context mint-policy global-default
udp port 1024
mtu 996
level 2 area-id 2000
sign-unknown-device
security-level control-and-data
rejoin-timeout 1000
rfs7000-37FABE(config-mint-policy-global-default)#
```
rfs7000-37FABE(config-mint-policy-global-default)#no level 2 area-id
rfs7000-37FABE(config-mint-policy-global-default)#no mtu
rfs7000-37FABE(config-mint-policy-global-default)#no udp port

The following example shows the global Mint Policy parameters after the 'no' commands are executed:

rfs7000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  sign-unknown-device
  security-level control-and-data
  rejoin-timeout 1000
rfs7000-37FABE(config-mint-policy-global-default)#
This chapter summarizes management policy commands in the CLI command structure.

A management policy contains configuration elements for managing a device, such as access control, SNMP, admin user credentials, and roles.

A controller (wireless controller, access point, or service platform) uses mechanisms to allow or deny device access to separate interfaces and protocols (HTTP, HTTPS, Telnet, SSH or SNMP). Management access can be enabled or disabled as required for unique policies. The management access functionality is not meant to function as an ACL (in routers or other firewalls), where administrators specify and customize specific IPs to access specific interfaces.

Controllers and service platforms can be managed using multiple interfaces (SNMP, CLI and Web UI). By default, management access is unrestricted, allowing management access to any enabled IP interface from any host using any enabled management service.

To enhance security, administrators can do the following:

- Restrict SNMP, CLI and Web UI access to specific hosts or subnets
- Disable un-used and insecure interfaces as required within managed access profiles. Disabling un-used management services can dramatically reduce an attack footprint and free resources on managed devices
- Provide authentication for management users
- Apply access restrictions and permissions to management users

Management restrictions can be applied to meet specific policies or industry requirements requiring only certain devices or users be granted access to critical infrastructure devices. Management restrictions can also be applied to reduce the attack footprint of the device when guest services are deployed.

Access Points utilize a single management access policy, so ensure all the intended administrative roles, permissions, authentication and SNMP settings are correctly set. If an access point is functioning as a virtual controller AP, these are the access settings used by adopted access points of the same model as the virtual controller AP.

It is recommended to disable un-used and insecure interfaces as required within managed access profiles. Disabling un-used management services can dramatically reduce an attack footprint and free resources on managed devices.

Use the (config) instance to configure a management policy. To navigate to the config management policy instance, use the following commands:

```
<DEVICE>(config)#management-policy <POLICY-NAME>
```

To commit a management-policy, the policy must have at least one admin user account configured.
<DEVICE>(config-management-policy-<POLICY-NAME>)#user admin password 0 test role superuser access all
<DEVICE>(config-management-policy-<POLICY-NAME>)#

<DEVICE>(config-management-policy-<POLICY-NAME>)#?
Management Mode commands:

- aaa-login: Set authentication for logins
- banner: Define a login banner
- ftp: Enable FTP server
- http: Hyper Text Terminal Protocol (HTTP)
- https: Secure HTTP
- idle-session-timeout: Configure idle timeout for a configuration session (GUI or CLI)
- ipv6: IPv6 Protocol
- no: Negate a command or set its defaults
- privilege-mode-password: Set the password for entering CLI privilege mode
- restrict-access: Restrict management access to the device
- snmp-server: SNMP
- ssh: Enable ssh
- t5: T5 configuration
- telnet: Enable telnet
- user: Add a user account
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

<DEVICE>(config-management-policy-<POLICY-NAME>)#
## 15.1 management-policy

The following table summarizes management policy configuration commands:

<table>

<tr>
<td>service</td>
<td>Invokes service commands to troubleshoot or debug (config-if) instance</td>
<td>page 15-29</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS.*
15.1.1 aaa-login

Configures Authentication, Authorization and Accounting (AAA) authentication mode used with this management policy. The different modes are: local authentication and external RADIUS server authentication.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
aaa-login [local|radius|tacacs]
```

#### Parameters

- **aaa-login local**
  - `local` Sets local as the preferred authentication mode. Local authentication uses the local username database to authenticate a user.
  - **Note:** The AP6511 and AP6521 platforms do not support local RADIUS resource.

- **aaa-login radius [external|fallback|policy <AAA-POLICY-NAME>]**
  - `radius` Configures the RADIUS server parameters
  - `external` Configures external RADIUS server as the preferred authentication mode
  - `fallback` Configures RADIUS server authentication as the primary authentication mode. When RADIUS server authentication fails, the system uses local authentication. This command configures local authentication as a backup mode.
  - `policy <AAA-POLICY-NAME>` Associates a specified AAA policy with this management policy. The AAA policy determines if a client is granted access to the network.
  - **Note:** For more information on configuring AAA policy, see [AAA-POLICY](#).

- **aaa-login tacacs [accounting|authentication|authorization|fallback|policy <AAA-TACACS-POLICY-NAME>]**
  - `tacacs` Configures Terminal Access Control Access-Control System (TACACS) server parameters
  - `accounting` Configures TACACS accounting
Use AAA login to determine whether management user authentication must be performed against a local user database or an external RADIUS server.

**Examples**

```
  rfs7000-37FABE(config-management-policy-test)#aaa-login radius external
  rfs7000-37FABE(config-management-policy-test)#aaa-login radius policy test
  rfs7000-37FABE(config-management-policy-test)#show context
  management-policy test
  http server
  no ssh
  aaa-login radius external
  aaa-login radius policy test
  rfs7000-37FABE(config-management-policy-test)#
```

**Related Commands**

- `no` Removes the TACACS server settings
15.1.2 banner

Configures the message of the day (motd) text. This text is displayed at login to clients connecting through Telnet or SSH.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
banner motd <LINE>
```

Parameters

- `banner motd <LINE>`

```
<LINE>
```

Sets the motd banner

- `<LINE>` – Enter the message string. The message string should not exceed 255 characters.

Examples

```
rfs7000-37FABE(config-management-policy-test)#banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#show context management-policy test
  http server
  no ssh
  aaa-login radius external
  aaa-login radius policy test
  banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#
```

Related Commands

```
no
```

Removes the motd banner
15.1.3 ftp

Enables File Transfer Protocol (FTP) on this management policy. FTP is the standard protocol for transferring files over a TCP/IP network. FTP requires administrators enter a valid username and password authenticated locally. FTP access is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ftp {password|rootdir|username}

ftp {password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>]}  
ftp {rootdir <DIR>}

ftp {username <USERNAME> password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>] rootdir <DIR>}

Parameters

- ftp {password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>]}

ftp password Optional. Configures the FTP server password

1 <ENCRYPTED-PASSWORD> Configures an encrypted password. Use this option when copy pasting the password from another device.

- <ENCRYPTED-PASSWORD> – Specify the password. The password should not exceed 63 characters in length.

<PASSWORD> Configures a clear text password

- ftp {rootdir <DIR>}

ftp rootdir <DIR> Optional. Configures the root directory for FTP logins

- <DIR> – Specify the root directory path. By default the root directory is set to flash:/

- ftp {username <USERNAME> password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>] rootdir <DIR>}

ftp username <USERNAME> Optional. Configures a new user account on the FTP server. The FTP user file lists users with FTP server access.

- <USERNAME> – Specify the username. The username should not exceed 32 characters in length.

password 1 [1 <ENCRYPTED-PASSWORD>|<PASSWORD>]

Configures an encrypted password

- <ENCRYPTED-PASSWORD> – Specifies an encrypted password (use this option if copy pasting from another device). The password should not exceed 63 characters in length.

- <PASSWORD> – Configures a clear text password

rootdir <DIR> After specifying the password, configure the FTP root directory.

- rootdir <DIR> – Configures the root directory for FTP logins. Specify the root directory path.
**Usage Guidelines**
The string size of an encrypted password (option 1, password is encrypted with a SHA1 algorithm) must be exactly 40 characters.

**Examples**
```
rfs7000-37FABE(config-management-policy-test)#ftp username superuser password test@123 rootdir dir
rfs7000-37FABE(config-management-policy-test)#show context management-policy test
   ftp username superuser password 1
   f617ca50c59f47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
   no ssh
   aaa-login radius external
   aaa-login radius policy test
   banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#
```

**Related Commands**

### 15.1.4 http

**management-policy**

Enables *Hyper Text Transport Protocol* (HTTP) on this management policy

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
http server
```

**Parameters**

- **http server**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>http server</td>
<td>Enables HTTP on this management policy. HTTP provides limited authentication and no encryption.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config-management-policy-test)#http server
rfs7000-37FABE(config-management-policy-test)#show context management-policy test
http server
ftp username superuser password 1
f617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
no ssh
aaa-login radius external
aaa-login radius policy test
banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#
```

**Related Commands**

- **no** Disables HTTP on this management policy
15.1.5 https

`management-policy`

Enables Hyper Text Transport Protocol Secure (HTTPS) on this management policy.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`https server`

**Parameters**

- `https server`

| https server | Enables HTTPS on this management policy. HTTPS provides both authentication and data encryption as opposed to just authentication. |

**Examples**

```
rfs7000-37FABE(config-management-policy-test)#https server
rfs7000-37FABE(config-management-policy-test)#show context management-policy test
http server
https server
ftp username superuser password 1
defa64c59c87f96f02a83b5f3d8f03c03ab257960b0fd127c69f02cd7f rootdir dir
no ssh
aaa-login radius external
aaa-login radius policy test
banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#
```

**Related Commands**

- `no` Disables HTTPS on this management policy
15.1.6 idle-session-timeout

Configures a session's idle timeout. An idle session is automatically terminated after the specified interval is exceeded.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
idle-session-timeout <1-4320>

Parameters
- idle-session-timeout <1-4320>

Sets the interval, in minutes, after which an idle session is timed out. Specify a value from 1-4320 minutes. The default is 30 minutes.

Examples
rfs7000-37FABE(config-management-policy-test)#idle-session-timeout 100
rfs7000-37FABE(config-management-policy-test)#show context
management-policy test
  http server
  https server
  ftp username superuser password 1
e617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
  no ssh
  aaa-login radius external
  aaa-login radius policy test
  idle-session-timeout 100
  banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#

Related Commands
- no
  Removes the configured idle session timeout value
### 15.1.7 ipv6 restrict-access

Restricts management access to specified hosts and/or subnets based on their IPv6 addresses and prefixes respectively.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
ipv6 restrict-access [host|ipv6-access-list|subnet]
ipv6 restrict-access host <IPv6> {log|subnet}
ipv6 restrict-access host <IPv6> {log [all|denied-only]}
ipv6 restrict-access host <IPv6> {subnet <IPv6-PREFIX> {log [all|denied-only]}}
```

```
ipv6 restrict-access ipv6-access-list <IPv6-ACCESS-LIST-NAME>
ipv6 restrict-access subnet <IPv6-PREFIX> {host|log}
ipv6 restrict-access subnet <IPv6-PREFIX> {log [all|denied-only]}
ipv6 restrict-access subnet <IPv6-PREFIX> {host <IPv6> {log [all|denied-only]}}
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `host <IPv6>` | Restricts management access to a specified host, based on the host’s IPv6 address.  
- `<IPv6>` – Specify the host’s IPv6 address. |
| `log [all|denied-only]` | Optional. Configures a logging policy for access requests  
- `all` – Logs all access requests, both denied and permitted  
- `denied-only` – Logs only denied access events (when a host is denied access) |
| `ipv6 restrict-access subnet <IPv6-PREFIX> {host <IPv6> {log [all|denied-only]}}` |  
- `<IPv6>` – Specify the host’s IPv6 address.  
- `<IPv6-PREFIX>` – Specify the subnet’s IPv6 prefix in the X::X::X::X/M format.  
- `log [all|denied-only]` – Logs all access requests, both denied and permitted, or logs only denied access events (when a host is denied access) |
### MANAGEMENT-POLICY 15 - 13

- **ipv6 restrict-access ipv6-access-list <IPv6-ACCESS-LIST-NAME>**

  ipv6-access-list  
  `<IPv6-ACCESS-LIST-NAME>`  
  Uses an IPv6 Access Control Lists (ACLs) to filter access requests. IPv6 ACL filter/match packets based on the IPv6 address from which they arrive. IPv6 hosts can configure themselves automatically when connected to an IPv6 network using the neighbor discovery (ND) protocol via ICMPv6 router discovery messages. These hosts require firewall packet protection unique to IPv6 traffic, as IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons. An existing IPv6 ACL can be created and used in the management policy context to permit or deny access to specific hosts and/or subnets.

  - `<IPv6-ACCESS-LIST-NAME>` – Specify the IPv6 ACL name.

- **ipv6 restrict-access subnet <IPv6-PREFIX> {log [all|denied-only]}**

  subnet `<IPv6-PREFIX>`  
  `<IPv6-PREFIX>` – Specify the subnet’s IPv6 prefix in the X:X::X:X/M format.

  log  
  `[all|denied-only]`  
  Optional. Configures a logging policy for access requests:
  - `all` – Logs all access requests, both denied and permitted
  - `denied-only` – Logs only denied access events (when a host/subnet is denied access)

- **ipv6 restrict-access subnet <IPv6-PREFIX> {host <IPv6> {log [all|denied-only]}}**

  subnet `<IPv6-PREFIX>`  
  `<IPv6-PREFIX>` – Specify the subnet’s IPv6 prefix in the X:X::X:X/M format.

  host `<IPv6>`  
  `<IPv6>` – Specify the host’s IPv6 address.

  log  
  `[all|denied-only]`  
  Optional. Configures a logging policy for access requests:
  - `all` – Logs all access requests, both denied and permitted
  - `denied-only` – Logs only denied access events (when a host/subnet is denied access)

### Examples

```
rfs7000-37FABE(config-management-policy-test)#ipv6 restrict-access host 2001:fdbc:06cf:0011::13 subnet 2001:fdbc:06cf:0011::0/64 log all
```

```
rfs7000-37FABE(config-management-policy-test)#show context  
management-policy test  
http server  
no ssh
```

```
ipv6 restrict-access host 2001:fdbc:06cf:0011::13 subnet 2001:fdbc:06cf:0011::0/64 log all
```

```
rfs7000-37FABE(config-management-policy-test)#
```

### Related Commands

- **no**  
  Removes management access restriction settings.
15.1.8 no

Negates a command or reverts values to their default. When used in the config management policy mode, the no command negates or reverts management policy settings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [aaa-login|banner|ftp|http|https|idle-session-timeout|ipv6|privilege-mode-password|restrict-access|snmp-server|ssh|t5|telnet|user|service]

no aaa-login tacacs {accounting|authentication|authorization|fallback|policy}

no banner motd

no ftp {password|rootdir}

no [http|https] server

no [idle-session-timeout|privilege-mode-password|restrict-access]

no ipv6 restrict-access

no snmp-server [community|display-vlan-info-per-radio|enable|host|manager|max-pending-requests|request-timeout|suppress-security-configuration-level|throttle|user]

no snmp-server [community <WORD>|display-vlan-info-per-radio|enable traps|host <IP> {<1-65535>]|[manager [all|v1|v2|v3]|max-pending-requests|request-timeout|suppress-security-configuration-level|throttle|user [snmpmanager|snmpoperator|snmptrap]]

no ssh {login-grace-time|port|use-key}

no t5 snmp-server [community|enable|host]

no [telnet|user <USERNAME>]

no service prompt crash-info

Parameters

- no <PARAMETERS>

no <PARAMETERS> | Removes or reverts this Management policy settings based on the parameters passed
**Examples**

The following example shows the management policy ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-management-policy-test)#show context
  management-policy test
    http server
    https server
    ftp username superuser password 1
    f617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
    no ssh
    aaa-login radius external
    aaa-login radius policy test
    idle-session-timeout 100
    banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#
```

```
rfs7000-37FABE(config-management-policy-test)#no banner motd
rfs7000-37FABE(config-management-policy-test)#no idle-session-timeout
rfs7000-37FABE(config-management-policy-test)#no http server
```

The following example shows the management policy ‘test’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-management-policy-test)#show context
  management-policy test
    no http server
    https server
    ftp username superuser password 1
    f617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
    no ssh
    aaa-login radius external
    aaa-login radius policy test
    idle-session-timeout 0
rfs7000-37FABE(config-management-policy-test)#
```
15.1.9 privilege-mode-password

Configures the CLI's privilege mode access password

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
privilege-mode-password [1 <PASSWORD>|<PASSWORD>]

Parameters

- privilege-mode-password [1 <PASSWORD>|<PASSWORD>]

Examples
rfs7000-37FABE(config-management-policy-test)#privilege-mode-password testing@1234
rfs7000-37FABE(config-management-policy-test)#show context
management-policy test
  http server
  no ssh
  privilege-mode-password 1 2e9f038ac2ed27f919ed5a4dceb3d30e32f356f2ceff6fbf26a153d0339c734f
rfs7000-37FABE(config-management-policy-test)#

Related Commands

- no
  Removes the configured CLI privilege mode access password
15.1.10 restrict-access

Restricts management access to a set of hosts or subnets.

Restricting remote access to a controller or service platform ensures only trusted hosts can communicate with enabled management services. This ensures only trusted hosts can perform management tasks and provide protection from brute force attacks from hosts attempting to break into the controller or service platform managed network.

Administrators can permit management connections to be established on any IP interface on the controller or service platform (including IP interfaces used to provide captive portal guest access). Administrators can restrict management access by limiting access to a specific host (IP address), subnet, or ACL on the controller or service platform.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

restrict-access [host|ip-access-list|subnet]
restrict-access host <IP> {log|subnet}
restrict-access host <IP> {log [all|denied-only]}
restrict-access host <IP> {subnet <IP/M> {log [all|denied-only]}}
restrict-access ip-access-list <IP-ACCESS-LIST-NAME>
restrict-access subnet <IP/M> {host|log}
restrict-access subnet <IP/M> {log [all|denied-only]}
restrict-access subnet <IP/M> {host <IP> {log [all|denied-only]}}

Parameters

- restrict-access host <IP> {log [all|denied-only]}

<table>
<thead>
<tr>
<th>host &lt;IP&gt;</th>
<th>Restricts management access to a specified host, based on the host's IPv4 address</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>Specify the host's IPv4 address.</td>
</tr>
</tbody>
</table>

| log [all|denied-only] | Optional. Configures a logging policy for access requests |
|----------------------|----------------------------------------------------------|
| all                  | Logs all access requests, both denied and permitted |
| denied-only          | Logs only denied access (when an access request is received from a host denied access, a record is logged) |

- restrict-access host <IP> {subnet <IP/M> {log [all|denied-only]}}

<table>
<thead>
<tr>
<th>host &lt;IP&gt;</th>
<th>Restricts management access to a specified host, based on the host's IPv4 address</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>Specify the host's IPv4 address.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>subnet &lt;IP/M&gt;</th>
<th>Optional. Restricts access to the host on a specified subnet</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/M&gt;</td>
<td>Specify the subnet's IPv4 address and mask in the A.B.C.D/M format.</td>
</tr>
</tbody>
</table>

| log [all|denied-only] | Optional. Configures a logging policy for access requests |
|----------------------|----------------------------------------------------------|
| all                  | Logs all access requests, both denied and permitted |
| denied-only          | Logs only denied access events (when access request received from a host is denied) |
- `restrict-access ip-access-list <IP-ACCESS-LIST-NAME>`

  **ip-access-list**  Uses an IPv4 ACL to filter access requests
  IPv4 ACLs filter/mark packets based on the IPv4 address from which they arrive. IP and non-IP traffic, on the same layer 2 interface, can be filtered by applying an IPv4 ACL. Each IPv4 ACL contains a set of deny and/or permit rules. Each rule is specific to source and destination IPv4 addresses and the unique rules and precedence definitions assigned. When the network traffic matches the criteria specified in one of these rules, the action defined in that rule is used to determine whether the traffic is allowed or denied.

  `<IP-ACCESS-LIST-NAME>`  Specify the IPv4 ACL name.

- `restrict-access subnet <IP/M> {log [all|denied-only]}`

  **subnet <IP/M>**  Restricts management access to a specified subnet
  - `<IP/M>` – Specify the subnet’s IPv4 address and mask in the A.B.C.D/M format.

  **log [all|denied-only]**  Optional. Configures a logging policy for access requests. Sets the log type generated for access requests
  - `all` – Logs all access requests, both denied and permitted
  - `denied-only` – Logs only denied access events (when access request received from a subnet is denied)

- `restrict-access subnet <IP/M> {host <IP> {log [all|denied-only]}}`

  **subnet <IP/M>**  Restricts management access to a specified subnet
  - `<IP/M>` – Specify the subnet’s IPv4 address and mask in the A.B.C.D/M format

  **host <IP>**  Optional. Uses the host IP address as a second filter
  - `<IP>` – Specify the host’s IPv4 address.

  **log [all|denied-only]**  Optional. Configures a logging policy for access requests. Sets the log type generated for access requests
  - `all` – Logs all access requests, both denied and permitted
  - `denied-only` – Logs only denied access events (when access request received from a host within the specified subnet is denied)

**Examples**

rfs7000-37FABE(config-management-policy-test)#restrict-access host 172.16.10.4 log denied-only

rfs7000-37FABE(config-management-policy-test)#show context management-policy test
  no http server
  https server
  ftp username superuser password 1
  f617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
  no ssh
  aaa-login radius external
  aaa-login radius policy test
  idle-session-timeout 0

  restrict-access host 172.16.10.4 log denied-only

rfs7000-37FABE(config-management-policy-test)#

**Related Commands**

- `no`  Removes device access restrictions
15.1.11 snmp-server

Enables the Simple Network Management Protocol (SNMP) engine settings. SNMP is an application layer protocol that facilitates the exchange of management information between the controller and a managed device. SNMP enabled devices listen on port 162 (by default) for SNMP packets from the controller’s management server. SNMP uses read-only and read-write community strings as an authentication mechanism to monitor and configure supported devices. The read-only community string gathers statistics and configuration parameters from a supported wireless device. The read-write community string is used by a management server to set device parameters. SNMP is generally used to monitor a system’s performance and other parameters.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
snmp-server [community|enable|display-vlan-info-per-radio|host|manager|
max-pending-requests|request-timeout|suppress-security-configuration-level|throttle|user]

snmp-server community [0 <WORD>|2 <WORD>|<WORD>] [ro|rw] {ip-snmp-access-list <IP-SNMP-ACL-NAME>}

snmp-server enable traps

snmp-server host <IP> [v1|v2c|v3] {<1-65535>}

snmp-server manager [all|v1|v2|v3]

snmp-server [max-pending-requests {<64-1024>}|request-timeout {<2-720>}] {display-vlan-info-per-radio|throttle <1-100>|suppress-security-configuration-level [0|1]}

snmp-server user [snmpmanager|snmpoperator|snmptrap] snmp-server user [snmpmanager|snmpoperator|snmptrap] v3 [auth|encrypted]

snmp-server user [snmpmanager|snmpoperator|snmptrap] v3 auth md5 [0 <PASSWORD>2 <ENCRYPTED-PASSWORD>|<PASSWORD>]

snmp-server user [snmpmanager|snmpoperator|snmptrap] v3 encrypted [auth md5|des auth md5] [0 <PASSWORD>2 <ENCRYPTED-PASSWORD>|<PASSWORD>]
```

Parameters

- **snmp-server community [0 <WORD>|2 <WORD>|<WORD>] [ro|rw] {ip-snmp-access-list <IP-SNMP-ACL-NAME>}

| community [0 <WORD>|2 <WORD>|<WORD>] | Sets the community string and associated access privileges. Enables SNMP access by configuring community strings that act like passwords. Configure different types of community strings, each string providing a different form of access. Provide either read-only (ro) or read-write (rw) access. |
| --- | --- |
| 0 <WORD> | Sets a clear text SNMP community string |
| 2 <WORD> | Sets an encrypted SNMP community string |
| <WORD> | Sets the SNMP community string |
After configuring the SNMP community string, assign one of the following accesses:
- **ro** – Assigns read-only access to the specified SNMP community (allows a remote device to retrieve information)
- **rw** – Assigns read and write access to the specified SNMP community (allows a remote device to modify settings)

**SNMP Trap Configuration**

**snmp-server enable traps**

- Enables trap generation (using the trap receiver configuration defined). This feature is disabled by default. Enabling this feature ensures the dispatch of SNMP notifications to all hosts.

In a managed network, the controller uses SNMP trap receivers to notify faults. SNMP traps are unsolicited notifications triggered by thresholds (or actions) on devices and are therefore an important fault management tool.

A SNMP trap receiver is the destination of SNMP messages (external to the controller). A trap is like a Syslog message, just over another protocol (SNMP). A trap is generated when a device consolidates event information and transmits the information to an external repository. The trap contains several standard items, such as the SNMP version, community etc.

SNMP trap notifications exist for most controller operations, but not all are necessary for day-to-day operation.

**snmp-server host <IP> [v1|v2c|v3] {<1-65535>]**

- **host <IP>:** Configures a host's IP address. This is the external server resource dedicated to receiving SNMP traps on behalf of the controller.

- **[v1|v2c|v3]:** Configures the SNMP version used to send the traps
  - **v1** – Uses SNMP version 1. This option is disabled by default.
  - **v2c** – Uses SNMP version 2c. This option is disabled by default.
  - **v3** – Uses SNMP version 3. This option is enabled by default.

- **<1-65535>:** Optional. Configures the virtual port of the server resource dedicated to receiving SNMP traps
  - **<1-65535>** – Optional. Specify a value from 1 - 65535. The default port is 162.

**snmp-server manager [all|v1|v2|v3]**

- **manager [all|v2|v3]:** Enables SNMP manager and specifies the SNMP version
  - **all** – Enables SNMP manager version v2 and v3
  - **v1** – Enables SNMP manager version v1 only. SNMPv1 uses a simple password (“community string”). Data is unencrypted (clear text). Consequently it provides limited security, and should be used only inside LANs behind firewalls, not in WANs.
  - **v2** – Enables SNMP manager version v2 only. SNMPv2 provides device management using a hierarchical set of variables. SNMPv2 uses Get, GetNext, and Set operations for data management. SNMPv2 is enabled by default.

Contd..
**snmp-server** [max-pending-requests \(<64-1024>\)|request-timeout \(<2-720>\)]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-pending-requests (&lt;64-1024&gt;)</td>
<td>Sets the maximum number of requests that can be pending at any given time</td>
</tr>
<tr>
<td>request-timeout (&lt;2-720&gt;)</td>
<td>Sets the interval, in seconds, after which an error message is returned for a pending request</td>
</tr>
</tbody>
</table>

**snmp-server** [display-vlan-info-per-radio|throttle \(<1-100>\)|suppress-security-configuration-level \([0|1]\)]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>display-vlan-info-per-radio</td>
<td>Enables the display of the VLAN ID along with the radio interface ID</td>
</tr>
<tr>
<td>throttle (&lt;1-100&gt;)</td>
<td>Sets CPU usage for SNMP activities. Use this command to set the CPU usage from 1 - 100.</td>
</tr>
<tr>
<td>suppress-security-configuration-level ([0</td>
<td>1])</td>
</tr>
</tbody>
</table>

**snmp-server user** [snmpmanager|snmpoperator|snmptrap] v3 auth md5 \([0 <PASSWORD>|2 <ENCRYPTED-PASSWORD>|<PASSWORD>]\)

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user [snmpmanager</td>
<td>snmpoperator</td>
</tr>
<tr>
<td>v3 auth md5</td>
<td>Uses SNMP version 3 as the security model</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[0 &lt;PASSWORD&gt;]</td>
<td>2 &lt;ENCRYPTED-PASSWORD&gt;</td>
</tr>
</tbody>
</table>

- **v3** – Enables SNMP manager version v3 only. SNMPv3 adds security and remote configuration capabilities to previous versions. The SNMPv3 architecture introduces the **User-based Security Model (USM)** for message security and the **View-based Access Control Model (VACM)** for access control. The architecture supports the concurrent use of different security, access control and message processing techniques. SNMPv3 is enabled by default.

- **max-pending-requests** \(<64-1024>\) – Optional. Specify a value from 64 - 1024. The default is 128.

- **request-timeout** \(<2-720>\) – Optional. Specify a value from 2 - 720 seconds. The default is 240 seconds.

- **v3** – Enables SNMP manager version v3 only. SNMPv3 adds security and remote configuration capabilities to previous versions. The SNMPv3 architecture introduces the **User-based Security Model (USM)** for message security and the **View-based Access Control Model (VACM)** for access control. The architecture supports the concurrent use of different security, access control and message processing techniques. SNMPv3 is enabled by default.

- **max-pending-requests** \(<64-1024>\) – Optional. Specify a value from 64 - 1024. The default is 128.

- **request-timeout** \(<2-720>\) – Optional. Specify a value from 2 - 720 seconds. The default is 240 seconds.

- **display-vlan-info-per-radio** Enables the display of the VLAN ID along with the radio interface ID

- **throttle** \(<1-100>\) Sets CPU usage for SNMP activities. Use this command to set the CPU usage from 1 - 100.

- **suppress-security-configuration-level** \([0|1]\) Sets the level of suppression of SNMP security configuration information

- **0** – If this option is selected, an empty string is returned for the SNMP request for security configuration information. Security configuration information consists of:
  - Passwords
  - Keys
  - Shared secrets

  The default setting is 0.

- **1** – Suppresses the display of the policy, IP ACL, passwords, keys and shared secrets. If this option is selected, in addition to suppression from ‘Level 0’, an empty string is returned for a SNMP request on following items:
  - Management policies
  - IP ACL
  - Tables containing user names and community strings

- **snmp-server user** [snmpmanager|snmpoperator|snmptrap] v3 auth md5 \([0 <PASSWORD>|2 <ENCRYPTED-PASSWORD>|<PASSWORD>]\)

- **user** [snmpmanager|snmpoperator|snmptrap] Defines user access to the SNMP engine

- **v3 auth md5** Uses SNMP version 3 as the security model

- **0 <PASSWORD>** – Configures clear text password

- **2 <ENCRYPTED-PASSWORD>** – Configures encrypted password

- **<PASSWORD>** – Specifies a password for authentication and privacy protocols
## snmp-server user [snmpmanager|snmperoperator|snmptrap] v3 encrypted [auth md5|des auth md5] [0 <PASSWORD>|2 <ENCRYPTED-PASSWORD>|<PASSWORD>]

| user [snmpmanager|snmperoperator|snmptrap] | Defines user access to the SNMP engine |
|---------------------------------------------|---------------------------------------|
| snmpmanager – Sets user as a SNMP manager   |
| snmperoperator – Sets user as a SNMP operator|
| snmptrap – Sets user as a SNMP trap user    |

15.1.12 ssh

Enables Secure Shell (SSH) for this management policy

SSH, like Telnet, provides a command line interface to a remote host. SSH transmissions are encrypted and authenticated, increasing the security of transmission. SSH access is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ssh {login-grace-time <60-300>|port <1-65535>}

Parameters

- ssh {login-grace-time <60-300>|port <1-65535>}

<table>
<thead>
<tr>
<th>ssh</th>
<th>Enables SSH communication between client and server</th>
</tr>
</thead>
<tbody>
<tr>
<td>login-grace-time &lt;60-300&gt;</td>
<td>Optional. Configures the login grace time. This is the interval, in seconds, after which an unsuccessful login is disconnected.</td>
</tr>
<tr>
<td>port &lt;1-65535&gt;</td>
<td>Optional. Configures the SSH port. This is the port used for SSH connections.</td>
</tr>
</tbody>
</table>

### 15.1.13 t5

*management-policy*

Configures SNMP server settings for T5 devices on this management policy.

A T5 controller is an external device that can be adopted and managed by a WiNG controller. When enabled as a supported external device, a T5 controller can provide data to WiNG to assist in its management within a WiNG supported subnet.

This command enables SNMP to communicate with T5 devices within the network. SNMP facilitates the exchange of management information between the controller or service platform and the T5 device. For more information see. `snmp-server`.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
t5 snmp-server [community|contact|enable|host|location]
t5 snmp-server community <COMMUNITY-NAME> [ro|rw] <SNMP-STATION-IP>
t5 snmp-server contact <LINE>
t5 snmp-server enable [server|traps]
t5 snmp-server host <IP>
t5 snmp-server location <LINE>
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `t5 snmp-server community <COMMUNITY-NAME> [ro|rw] <SNMP-STATION-IP>` | Defines a public or private community designation. By default, SNMPv2 community strings on most devices are set to public, for the read-only community string, and private for the read-write community string.  
  - `<COMMUNITY_NAME>` – Specify the SNMP community name, and configure the access permission for this community string (used by devices to retrieve or modify information).  
  - `ro` – Allows a remote device to retrieve information only  
  - `rw` – Allows a remote device to retrieve information and modify settings  
| `<SNMP-STATION-IP>` | Specify the SNMP management station IP address for receiving trap information |
| `t5 snmp-server contact <LINE>` | Configures the administrator of SNMP trap events for the T5 controller.  
  - `<LINE>` – Specify the administrator’s name (should not exceed 64 characters). |
| `t5 snmp-server enable [server|traps]` | Enables the following:  
  - `server` – Enables the SNMP server. When enabled, the system accepts SNMP management data. This is enabled by default.  
  - `traps` – Enables SNMP traps. When enabled, the system generates SNMP traps. This is enabled by default. |
• t5 snmp-server host <IP>

<table>

15.1.14 telnet

Enables Telnet. Telnet provides a command line interface to a remote host over TCP. Telnet provides no encryption, but it does provide a measure of authentication. Telnet access is disabled by default.

By default Telnet, when enabled, uses Transmission Control Protocol (TCP) port 23. Use this command to change the TCP port.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

telnet {port <1-65535>}

Parameters
- telnet {port <1-65535>}
  
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>telnet</td>
<td>Enables Telnet</td>
</tr>
<tr>
<td>port &lt;1-65535&gt;</td>
<td>Optional. Configures the Telnet port. This is the port used for Telnet connections.</td>
</tr>
<tr>
<td></td>
<td>- &lt;1-65535&gt; — Sets a value from 1 - 165535. The default port is 23.</td>

15.1.15 user

- **management-policy**

This command adds a new user account to the management policy.

Supported platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
```
user <USERNAME> password [0 <PASSWORD>|1 <SHA1-PASSWORD>|<PASSWORD>]
role [device-provisioning-admin|helpdesk|monitor|network-admin|security-admin|superuser|system-admin|web-user-admin] access [all|console|ssh|telnet|web]
```

**Parameters**
- **user <USERNAME> password [0 <PASSWORD>|1 <SHA1-PASSWORD>|<PASSWORD>]**
  - `<USERNAME>` — Sets the username
  - `<PASSWORD>` — Sets the password
  - `0 <PASSWORD>` — Sets a clear text password
  - `1 <SHA1-PASSWORD>` — Sets the SHA1 hash of the password

- **role [device-provisioning-admin|helpdesk|monitor|network-admin|security-admin|superuser|system-admin|web-user-admin] access [all|console|ssh|telnet|web]**
  - `device-provisioning-admin` — Device provisioning administrator. Has privileges to update (provision) device configuration files or firmware. Such updates run the risk of overwriting and losing a devices existing configuration unless the configuration is properly archived.
  - `helpdesk` — Helpdesk administrator. Performs troubleshooting tasks, such as clear statistics, reboot, create and copy technical support dumps. The helpdesk administrator can also create a guest user account and password for registration. These details can be e-mailed or sent as SMS to mobile phone.
  - `monitor` — Monitor. Has read-only access to the system. Can view configuration and statistics except for secret information
  - `network-admin` — Network administrator. Manages layer 2, layer 3, Wireless, RADIUS server, DHCP server, and Smart RF
  - `security-admin` — Security administrator. Modifies WLAN keys and passphrases
  - `superuser` — Superuser. Has full access, including halt and delete startup-config
  - `system-admin` — System administrator. Upgrades image, boot partition, time, and manages admin access
  - `web-user-admin` — Web user administrator. This role is used to create guest users and credentials. The Web user admin can access only the custom GUI screen and does not have access to the normal CLI and GUI.
access [all|console|ssh|telnet|web]

Configures the access type
- all – Allows all types of access: console, SSH, Telnet, and Web
- console – Allows console access only
- ssh – Allows SSH access only
- telnet – Allows Telnet access only
- web – Allows Web access only

Examples

This chapter summarizes the RADIUS group, server, and user policy commands in the CLI command structure.

Remote Authentication Dial-In User Service (RADIUS) is a client/server protocol and software that enables remote access servers to authenticate users and authorize their access to the network. RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients send authentication requests to the local RADIUS server containing user authentication and network service access information.

RADIUS enables centralized management of authentication data (usernames and passwords). When a client attempts to associate to a network, the authentication request is sent to the local RADIUS server. The authentication and encryption of communications takes place through the use of a shared secret password (not transmitted over the network).

The local RADIUS server stores the user database locally, and can optionally use a remote user database. It ensures higher accounting performance. It allows the configuration of multiple users, and assigns policies for group authorization.

Controllers and access points allow enforcement of user-based policies. User policies include dynamic VLAN assignment and access based on time of day. A certificate is required for EAP TTLS, PEAP, and TLS RADIUS authentication (configured with the RADIUS service).

Dynamic VLAN assignment is achieved based on the RADIUS server response. A user who associates to WLAN1 (mapped to VLAN1) can be assigned a different VLAN after RADIUS server authentication. This dynamic VLAN assignment overrides the WLAN’s VLAN ID to which the user associates.

The chapter is organized into the following sections:

- radius-group
- radius-server-policy
- radius-user-pool-policy
16.1 radius-group

This section describes RADIUS user group configuration commands.

The local RADIUS server allows the configuration of user groups with common user policies. User group names and associated users are stored in the local database. The user ID in the received access request is mapped to the associated wireless group for authentication. The configuration of groups allows enforcement of the following policies that control user access:

- Assign a VLAN to the user upon successful authentication
- Define start and end of time (HH:MM) when the user is allowed to authenticate
- Define the SSID list to which a user, belonging to this group, is allowed to associate
- Define the days of the week the user is allowed to login
- Rate limit traffic (for non-management users)

RADIUS users are categorized into three groups: normal user, management user, and guest user. A RADIUS group not configured as management or guest is a normal user group. User access and role settings depend on the RADIUS group the user belongs.

Use the (config) instance to configure RADIUS group commands. This command creates a group within the existing RADIUS group. To navigate to the RADIUS group instance, use the following commands:

```plaintext
rfs7000-37FABE(config)#radius-group <GROUP-NAME>
```

RADIUS user group configuration commands:

- guest       Make this group a Guest group
- no          Negate a command or set its defaults
- policy      Radius group access policy configuration
- rate-limit  Set rate limit for group
- clrscr      Clears the display screen
- commit      Commit all changes made in this session
- do          Run commands from Exec mode
- end         End current mode and change to EXEC mode
- exit        End current mode and down to previous mode
- help        Description of the interactive help system
- revert      Revert changes
- service     Service Commands
- show        Show running system information
- write       Write running configuration to memory or terminal

```
rfs7000-37FABE(config-radius-group-test)#
```

**NOTE:** The RADIUS group name cannot exceed 32 characters, and cannot be modified as part of the group edit process.
The following table summarizes RADIUS group configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>guest</td>
<td>Enables guest access for the newly created group</td>
<td>page 16-4</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts settings to their default</td>
<td>page 16-10</td>
</tr>
<tr>
<td>policy</td>
<td>Configures RADIUS group access policy parameters</td>
<td>page 16-5</td>
</tr>
<tr>
<td>rate-limit</td>
<td>Sets the default rate limit per user in Kbps, and applies it to all enabled WLANs</td>
<td>page 16-9</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
16.1.1 guest

Configures this group as a guest (non-management) group. A guest user group has temporary permissions to the controller’s local RADIUS server. You can configure multiple guest user groups, each having a unique set of settings. Guest user groups cannot be made management groups with access and role permissions.

Guest users and policies are used for captive portal authorization to the network.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
guest

Parameters
None

Examples
rfs7000-37FABE(config-radius-group-test)#guest
rfs7000-37FABE(config-radius-group-test)#show context radius-group test
guest
rfs7000-37FABE(config-radius-group-test)#

Related Commands

| no | Makes this group a non-guest group |
16.1.2 policy

Sets a RADIUS group's authorization settings, such as access day/time, WLANs etc.

**NOTE:** A user-based VLAN is effective only if dynamic VLAN authorization is enabled for the WLAN.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
policy [access|day|inactivity-timeout|role|ssid|time|vlan]
policy vlan <1-4094>
policy access [all|console|ssh|telnet|web] { (all|console|ssh|telnet|web)}
policy day [all|fr|mo|sa|su|th|tu|we|weekdays] { (fr|mo|sa|su|th|tu|we|weekdays)}
policy inactivity-timeout <60-86400>
policy role [device-provisioning-admin|helpdesk|monitor|network-admin|security-admin|superuser|system-admin|web-user-admin]
policy ssid <SSID>
policy time start <HH:MM> end <HH:MM>
```

**NOTE:** Access and role settings are applicable only to a management group. They cannot be configured for a RADIUS non-management group.

**Parameters**
- **policy vlan <1-4094>**

```
vlan <1-4094>  Sets the guest RADIUS group's VLAN ID from 1 - 4094. The VLAN ID is representative of the shared SSID each group member (user) employs to interoperate within the network (once authenticated by the local RADIUS server).

**Note:** This option applicable to a guest user group, which has guest access and temporary permissions to the local RADIUS server. The terms of the guest access can be set uniquely for each group. Guest user groups cannot be made management groups with unique access and role permissions.

**Note:** Enable dynamic VLAN assignment for the WLAN for the VLAN assignment to take effect.
```
<table>
<thead>
<tr>
<th>access</th>
<th>Configures access type for a management group. Management groups can be assigned unique access and role permissions.</th>
</tr>

<td>- web-user-admin – Web user administrator. This role is used to create guest users and credentials. The web-user-admin can access only the custom GUI screen and does not have access to the normal CLI and GUI.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>inactivity-timeout</th>
<th>Configures the inactivity time for this RADIUS group users. If a frame is not received from a client for the specified period, then the client’s session is removed. When defined, this value is used instead of the captive-portal inactivity timeout. If the inactivity timeout is not configured in the radius-group context or the captive-portal context, the default timeout (60 seconds) is applied.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;60-86400&gt;</td>
<td>- &lt;60-86400&gt; – Specify a value from 60 - 86400 seconds.</td>
</tr>
</tbody>
</table>
- **policy ssid <SSID>**

  **ssid <SSID>**
  
  Sets the **Service Set Identifier** (SSID) for this guest RADIUS group. Use this command to assign SSIDs that users within this RADIUS group are allowed to associate. Assign SSIDs of those WLANs only that the guest users need to access. This option is not available for a management group.

  - <SSID> – Sets a case-sensitive alphanumeric SSID, not exceeding 32 characters

- **policy day [all|fr|mo|sa|su|th|tu|we|weekdays] { (fr|mo|sa|su|th|tu|we|weekdays) }**

  **day [all|fr|mo|sa|su|th|tu|we|weekdays]**

  Configures the days on which this guest RADIUS group members can access the local RADIUS resources. The options are recursive, and you can provide access on multiple days.

  - fr – Allows access on Friday only
  - mo – Allows access on Mondays only
  - sa – Allows access on Saturdays only
  - su – Allows access on Sundays only
  - th – Allows access on Thursdays only
  - tu – Allows access on Tuesdays only
  - we – Allows access on Wednesdays only
  - weekdays – Allows access on weekdays only (Monday to Friday)

- **policy time start <HH:MM> end <HH:MM>**

  **time start<HH:MM> end <HH:MM>**

  Configures the time when this RADIUS group can access the network

  - start <HH:MM> – Sets the start time in the HH:MM format (for example, 13:30 means the user can login only after 1:30 PM). Specifies the time users, within each listed group, can access the local RADIUS resources
  - end <HH:MM> – Sets the end time in the HH:MM format (for example, 17:30 means the user is allowed to remain logged in until 5:30 PM). Specifies the time users, within each listed group, lose access to the local RADIUS resources

**Usage Guidelines**

A management group access policy provides:

- access details
- user roles
- policy's start and end time

The SSID, day, and VLAN settings are not applicable to a management user group.

**Examples**

The following example shows a RADIUS guest group settings:

```
rfs7000-37FABE(config-radius-group-test)#policy time start 13:30 end 17:30
rfs7000-37FABE(config-radius-group-test)#policy day all
rfs7000-37FABE(config-radius-group-test)#policy vlan 1
rfs7000-37FABE(config-radius-group-test)#policy ssid test
```
The following example shows a RADIUS management group settings:

```
 rfs7000-37FABE(config-radius-group-management)#show context
 radius-group management
 policy time start 9:30 end 20:30
 policy access console ssh telnet
 policy role network-admin
```

16.1.3 rate-limit

Sets the rate limit for the guest RADIUS server group

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

rate-limit [from-air|to-air] <100-1000000>

Parameters

- rate-limit [from-air|to-air] <100-1000000>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>to-air &lt;100-1000000&gt;</td>
<td>Sets the rate limit in the downlink direction, from the network to the wireless client</td>
</tr>
<tr>
<td></td>
<td>• &lt;100-1000000&gt; — Specify the rate from 100 - 1000000 Kbps.</td>
</tr>
</tbody>
</table>

<table>
<thead>

<tr>
<td></td>
<td>• &lt;100-1000000&gt; — Specify the rate from 100 - 1000000 Kbps.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-radius-group-test)#rate-limit to-air 200
rfs7000-37FABE(config-radius-group-test)#show context
radius-group test
guest
  policy vlan 1
dopolicy ssid test
do policy day mo
do policy day tu
do policy day we
do policy day th
do policy day fr
do policy day sa
do policy day su
rate-limit to-air 200
  policy time start 13:30 end 17:30
rfs7000-37FABE(config-radius-group-test)#

Related Commands

no

Removes the RADIUS guest group's rate limits
16.1.4 no

Negates a command or sets its default. Removes or modifies the RADIUS group policy settings. When used in the config RADIUS group mode, the no command removes or modifies the following settings: access type, access days, role type, VLAN ID, and SSID.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [guest|policy|rate-limit]

no policy [access|day|inactivity-timeout|role|ssid|time|vlan]

no policy [access|day|inactivity-timeout|role|ssid|time|vlan]

no policy access [all|console|ssh|telnet|web]
no policy day [all|fr|mo|sa|su|th|tu|we|weekdays]

no policy ssid [<SSID>|all]

no policy [inactivity-timeout|role|time|vlan]

no rate-limit [from-air|to-air]

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Negates a command or sets its default. Removes or modifies the RADIUS group policy settings. When used in the config RADIUS group mode, the no command removes or modifies the following settings: access type, access days, role type, VLAN ID, and SSID |

Examples

The following example shows the RADIUS guest group ‘test’ settings before the ‘no’ commands are executed:

rfs7000-37FABE(config-radius-group-test)#show context
radius-group test
guest
policy vlan 1
policy ssid test
policy day mo
policy day tu
policy day we
policy day th
policy day fr
policy day sa
policy day su
rate-limit to-air 200
policy time start 13:30 end 17:30
rfs7000-37FABE(config-radius-group-test)#

rfs7000-37FABE(config-radius-group-test)#no guest
rfs7000-37FABE(config-radius-group-test)#no rate-limit to-air
rfs7000-37FABE(config-radius-group-test)#no policy day all
The following example shows the RADIUS guest group ‘test’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-radius-group-test)#show context
radius-group test
  policy vlan 1
  policy ssid test
  policy time start 13:30 end 17:30
rfs7000-37FABE(config-radius-group-test)#
```
16.2 radius-server-policy

**RADIUS-POLICY**

Creates an onboard device RADIUS server policy and enters its configuration mode

A RADIUS server policy is a unique authentication and authorization configuration that receives user connection requests, authenticates users, and returns configuration information necessary for the RADIUS client to deliver service to the user. The client is the entity with authentication information requiring validation. The local RADIUS server has access to a database of authentication information used to validate the client’s authentication request.

The local RADIUS server uses authentication schemes like PAP, CHAP, or EAP to verify and confirm information provided by a user. The user’s proof of identification is verified, along with, optionally, other information. A local RADIUS server policy can also be configured to refer to an external Lightweight Directory Access Protocol (LDAP) resource to verify a user’s credentials.

Use the (config) instance to configure RADIUS-Server-Policy related parameters. To navigate to the RADIUS-Server-Policy instance, use the following commands:

```bash
<DEVICE>(config)#radius-server-policy <POLICY-NAME>
```

```bash
rfs7000-37FABE(config)#radius-server-policy test
rfs7000-37FABE(config-radius-server-policy-test)#?
```

**Radius Configuration commands:**

- `authentication`: Radius authentication
- `chase-referral`: Enable chasing referrals from LDAP server
- `crl-check`: Enable Certificate Revocation List (CRL) check
- `ldap-agent`: LDAP Agent configuration parameters
- `ldap-group-verification`: Enable LDAP Group Verification setting
- `ldap-server`: LDAP server parameters
- `local`: RADIUS local realm
- `nas`: RADIUS client
- `no`: Negate a command or set its defaults
- `proxy`: RADIUS proxy server
- `session-resumption`: Enable session resumption/fast reauthentication by using cached attributes
- `use`: Set setting to use
- `clrscr`: Clears the display screen
- `commit`: Commit all changes made in this session
- `do`: Run commands from Exec mode
- `end`: End current mode and change to EXEC mode
- `exit`: End current mode and down to previous mode
- `help`: Description of the interactive help system
- `revert`: Revert changes
- `service`: Service Commands
- `show`: Show running system information
- `write`: Write running configuration to memory or terminal

```bash
rfs7000-37FABE(config-radius-server-policy-test)#
```

16.2.1 authentication

- radius-server-policy

Specifies the RADIUS datasource used for user authentication. Options include local for the local user database or LDAP for a remote LDAP resource.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
authentication [data-source|eap-auth-type]

authentication data-source [ldap|local] {ssid <SSID> precedence <1-5000>}
authentication eap-auth-type [all|peap-gtc|peap-mschapv2|tls|ttls-md5|ttls-mschapv2|ttls-pap]
```

Parameters

- `data-source` The RADIUS server can either use the local database or an external LDAP server to authenticate a user. It is necessary to specify the data source. The options are: LDAP and local.
  
  **Note:** The default setting is local.

- `ldap fallback` Uses a remote LDAP server as the data source
  - `fallback` – Optional. Enables fallback to local authentication. This feature ensures that when the configured LDAP data source is unreachable, the client is authenticated against the local RADIUS resource. This option is disabled by default.

- `local` Uses the local user database to authenticate a user

- `ssid <SSID>` The following keywords are recursive and common to both `ldap` and `local` parameters:
  - `ssid` – Optional. Associates the data source, selected in the previous step, with a SSID.
  - `<SSID>` – Specify the SSID for this authentication data source. The SSID is case sensitive and should not exceed 32 characters in length. Do not use any of the following characters (`<>|"\?`).
  - `precedence <1-5000>` – Sets the precedence for this authentication rule. The precedence value allows systematic evaluation and application of rules. Rules with the lowest precedence receive the highest priority.
  - `<1-5000>` — Specify a precedence from 1 -5000.

**Note:** Specifying the SSID allows the RADIUS server to use the SSID attribute in access requests to determine the data source to use. This option is applicable to onboard RADIUS servers only.
- **authentication eap-auth-type [all|peap-gtc|peap-mschapv2|tls|ttls-md5|ttls-mschapv2|ttls-pap]**

<table>
<thead>
<tr>
<th>eap-auth-type</th>
<th>Uses Extensible Authentication Protocol (EAP), with this RADIUS server policy, for user authentication</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Enables both TTLS and PEAP authentication. This is the default setting.</td>
</tr>
<tr>

<tr>
<td>ttls-mschapv2</td>
<td>Enables TTLS with default authentication using MSCHAPv2</td>
</tr>
<tr>
<td>ttls-pap</td>
<td>Enables TTLS with default authentication using PAP</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-radius-server-policy-test)#authentication eap-auth-type tls

rfs7000-37FABE(config-radius-server-policy-test)#show context radius-server-policy test
    authentication eap-auth-type tls
rfs7000-37FABE(config-radius-server-policy-test)#

**Related Commands**

| no | Removes the RADIUS authentication settings |
16.2.2 chase-referral

Enables chasing of referrals from an external LDAP server resource.

An LDAP referral is a controller or service platform's way of indicating to a client it does not hold the section of the directory tree where a requested content object resides. The referral is the controller or service platform’s direction to the client a different location is more likely to hold the object, which the client uses as the basis for a DNS search for a domain controller. Ideally, referrals always reference a domain controller that indeed holds the object. However, it is possible for the domain controller to generate another referral, although it usually does not take long to discover the object does not exist and inform the client.

This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
chase-referral

Parameters
None

Examples
rfs7000-37FABE(config-radius-server-policy-test)#chase-referral

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables LDAP server referral chasing</td>
</tr>
</tbody>
</table>
16.2.3 **crl-check**

- **radius-server-policy**

Enables a *certificate revocation list* (CRL) check on this RADIUS server policy.

A CRL is a list of revoked certificates issued and subsequently revoked by a *Certification Authority* (CA). Certificates can be revoked for a number of reasons including failure or compromise of a device using a certificate, a compromise of a certificate key pair or errors within an issued certificate. The mechanism used for certificate revocation depends on the CA.

This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

crl-check

**Parameters**

None

**Examples**

rfs7000-37FABE(config-radius-server-policy-test)#crl-check

rfs7000-37FABE(config-radius-server-policy-test)#show context radius-server-policy test

  authentication eap-auth-type tls
  crl-check

rfs7000-37FABE(config-radius-server-policy-test)#

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Disables CRL check on a RADIUS server policy</td>
</tr>
</tbody>
</table>
16.2.4 ldap-agent

radius-server-policy

Configures the LDAP agent's settings in the RADIUS server policy context

When a user's credentials are stored on an external LDAP server, the local RADIUS server cannot successfully conduct PEAP-MSCHAPv2 authentication, since it is not aware of the user’s credentials maintained on the external LDAP server resource. Therefore, up to two LDAP agents can be provided locally so remote LDAP authentication can be successfully accomplished on the remote LDAP resource (using credentials maintained locally).

This feature is available to all controller, service platforms and access point models, with the exception of AP6511 and AP6521 models running in standalone AP or virtual controller AP mode. However, this feature is supported by dependent mode AP6511 and AP6521 model access points when adopted and managed by a controller or service platform.

Supported in the following platforms:

- Access Points — AP622, AP650, ES6510, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ldap-agent [join|join-retry-timeout|primary|secondary]

ldap-agent [join {on <DEVICE-NAME>} | join-retry-timeout <60-300>]

ldap-agent [primary|secondary] domain-name <LDAP-DOMAIN-NAME> domain-admin-user <ADMIN-USER-NAME> domain-admin-password [0 <WORD>|2 <WORD>]

Parameters

- ldap-agent [join {on <DEVICE-NAME>} | join-retry-timeout <60-300>]

<table>
<thead>
<tr>
<th>ldap-agent</th>
<th>Configures the LDAP agent’s settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>join</td>
<td>Initiates the join process, which binds the RADIUS server with the LDAP server's (Windows) domain. When successful, the hostname (name of the AP, wireless controller, or service platform) is added to the LDAP server's Active Directory.</td>
</tr>
<tr>
<td>{on &lt;DEVICE-NAME&gt;}</td>
<td>- Optional. Specifies the device name</td>
</tr>
<tr>
<td></td>
<td>- Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
<tr>
<td></td>
<td>Note: To confirm the join status of a controller, use the <code>show &gt; ldap-agent &gt; join-status</code> command.</td>
</tr>
<tr>
<td>join-retry-timeout</td>
<td>If the join process fails (i.e. the RADIUS server fails to join the LDAP server’s domain), the process is retried after a specified interval. This command configures the interval (in seconds) between two successive join attempts.</td>
</tr>
<tr>
<td>&lt;60-300&gt;</td>
<td>- Set the timeout value from 60 - 300 seconds. The default is 60 seconds.</td>
</tr>
<tr>
<td></td>
<td>Note: A retry timer is initiated as soon as the join process starts, which tracks the time lapse in case of a failure.</td>
</tr>
</tbody>
</table>

- ldap-agent [primary|secondary] domain-name <LDAP-DOMAIN-NAME> domain-admin-user <ADMIN-USER-NAME> domain-admin-password [0 <WORD>|2 <WORD>]

<table>
<thead>
<tr>
<th>ldap-agent</th>
<th>Configures the LDAP agent’s settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>primary</td>
<td>Configures the primary LDAP server details, such as domain name, user name, and password. The RADIUS server uses these credentials to bind with the primary LDAP server.</td>
</tr>
</tbody>
</table>
secondary

Configures the secondary LDAP server details, such as domain name, user name, and password. The RADIUS server uses these credentials to bind with the secondary LDAP server.

domain-name
<LDAP-DOMAIN-NAME>

This keyword is common to both the ‘primary’ and ‘secondary’ parameters.
- domain-name – Configures the primary or secondary LDAP server’s domain name
- <LDAP-DOMAIN-NAME> – Specify the domain name.

domain-admin-user
<ADMIN-USER-NAME>

This keyword is common to both the ‘primary’ and ‘secondary’ parameters.
- domain-admin-user – Configures the primary or secondary LDAP server’s admin user name
- <ADMIN-USER-NAME> – Specify the admin user’s name.

domain-admin-password [0 <WORD>| 2 <WORD>]

This keyword is common to both the ‘primary’ and ‘secondary’ parameters.
- domain-admin-password – Configures the primary or secondary LDAP server’s admin user password
- 0 <WORD> – Specifies the password in the unencrypted format
- 2 <WORD> – Specifies the password in the encrypted format

**Examples**

rfs4000-229D58(config-radius-server-policy-test)#ldap-agent primary domain-name test domain-admin-user Administrator domain-admin-password 0 test@123
rfs4000-229D58(config-radius-server-policy-test)#

rfs4000-229D58(config-radius-server-policy-test)#show context radius-server-policy test
ldap-agent primary domain-name test domain-admin-user Administrator domain-admin-password 0 test@123
rfs4000-229D58(config-radius-server-policy-test)#

**Related Commands**

no

Removes LDAP agent settings from this RADIUS server policy
16.2.5 `ldap-group-verification`

Enables LDAP group verification settings on this RADIUS server policy. This option is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
```
ldap-group-verification
```

**Parameters**
None

**Examples**
```
rfs7000-37FABE(config-radius-server-policy-test)#ldap-group-verification
rfs7000-37FABE(config-radius-server-policy-test)#
```

16.2.6 ldap-server

Configures the LDAP server’s settings. Configuring LDAP server allows users to login and authenticate from anywhere on the network.

Administrators have the option of using the local RADIUS server to authenticate users against an external LDAP server resource. Using an external LDAP user database allows the centralization of user information and reduces administrative user management overhead making RADIUS authorization more secure and efficient.

RADIUS is not just a database. It is a protocol for asking intelligent questions to a user database (like LDAP). LDAP however is just a database of user credentials used optionally with the local RADIUS server to free up resources and manage user credentials from a secure remote location. It is the local RADIUS resources that provide the tools to perform user authentication and authorize users based on complex checks and logic. A LDAP user database alone cannot perform such complex authorization checks.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ldap-server

ldap-server [dead-period|primary|secondary]

ldap-server dead-period <0-600>

ldap-server [primary|secondary] host <IP> port <1-65535> login <LOGIN-NAME>

bind-dn <BIND-DN> base-dn <BASE-DN> passwd [0 <PASSWORD>|2 <ENCRYPTED-PASSWORD>| <PASSWORD>]

passwd-attr <ATTR> group-attr <ATTR> group-filter <FILTER>

group-membership <WORD> {net-timeout <1-10>|start-tls net-timeout <1-10>|
tls-mode net-timeout <1-10>}

Parameters

- ldap-server dead-period <0-600>

  dead-period <0-600>: Set an interval, in seconds, during which the local server will not contact its LDAP server resource once its been defined as unavailable. A dead period is only implemented when additional LDAP servers are configured and available.
  - <0-600> – Specify a value from 0 - 600 seconds. The default is 300 seconds.

- ldap-server [primary|secondary] host <IP> port <1-65535> login <LOGIN-NAME>

  bind-dn <BIND-DN> base-dn <BASE-DN> passwd [0 <PASSWORD>|2 <ENCRYPTED-PASSWORD>| <PASSWORD>]

  passwd-attr <ATTR> group-attr <ATTR> group-filter <FILTER>

  group-membership <WORD> {net-timeout <1-10>|start-tls net-timeout <1-10>|
tls-mode net-timeout <1-10>}

ldap primary

Configures the primary LDAP server settings

ldap secondary

Configures the secondary LDAP server settings

host <IP>

Specifies the LDAP host IP address
  - <IP> – Specify the LDAP server’s IP address.

port <1-65535>

Configures the LDAP server port
  - <1-65535> – Specify a port between 1 - 65535.

### 16.2.7 local

- radius-server-policy

Configures a local RADIUS realm on this RADIUS server policy.

When the local RADIUS server receives a request for a user name with a realm, the server references a table of realms. If the realm is known, the server proxies the request to the RADIUS server.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
local realm <RADIUS-REALM>
```

#### Parameters

- `local realm <RADIUS-REALM>`

#### Examples

```
rfs7000-37FABE(config-radius-server-policy-test)#local realm realm1
```

```
rfs7000-37FABE(config-radius-server-policy-test)#show context radius-server-policy test
  authentication eap-auth-type tls
crl-check
  local realm realm1
  ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1" base-dn "base-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-filter "groupfilter1" group-membership groupmembership1 net-timeout 2
crl-check
```

#### Related Commands

- `no`

  Removes the RADIUS local realm
16.2.8 nas

radius-server-policy

Configures the key sent to a RADIUS client

A RADIUS client is a mechanism to communicate with a central server to authenticate users and authorize access to the controller, service platform or Access Point managed network.

The client and server share a secret (a password). That shared secret followed by the request authenticator is put through a MD5 hash algorithm to create a 16 octet value which is XORed with the password entered by the user. If the user password is greater than 16 octets, additional MD5 calculations are performed, using the previous ciphertext instead of the request authenticator. The server receives a RADIUS access request packet and verifies the server possesses a shared secret for the client. If the server does not possess a shared secret for the client, the request is dropped. If the client received a verified access accept packet, the username and password are considered correct, and the user is authenticated. If the client receives a verified access reject message, the username and password are considered to be incorrect, and the user is not authenticated.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

nas <IP/M> secret [0|2]<LINE>

Parameters

- nas <IP/M> secret [0 <LINE>|2 <LINE>|<LINE>]

Examples

rfs7000-37FABE(config-radius-server-policy-test)#nas 172.16.10.10/24 secret 0 wirelesswell

Related Commands

no Removes a RADIUS server’s client on a RADIUS server policy
**16.2.9 no**

Negates a command or reverts back to default settings. When used with in the config RADIUS server policy mode, the `no` command removes settings, such as crl-check, LDAP group verification, RADIUS client etc.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
no [authentication|chase-referral|crl-check|ldap-agent|ldap-group-verification|
ldap-server|local|nas|proxy|session-resumption|use]
```

```
no authentication [data-source|eap]
no authentication [data-source {ldap {fallback}/local|ssid}|eap configuration]
```

```
no [chase-referral|crl-check|ldap-group-verification|nas <IP/M>|session-resumption]
```

```
no ldap-agent [join-retry-timeout|primary|secondary]
```

```
no local realm [<REALM-NAME>|all]
```

```
no proxy [realm <REALM-NAME>|retry-count|retry-delay]
```

```
no ldap-server [dead-period|primary|secondary]
```

```
no use [radius-group [<RAD-GROUP-NAME>|all]|radius-user-pool-policy
[<RAD-USER-POOL-NAME>|all]]
```

**Parameters**

- `no <PARAMETERS>`

| `no <PARAMETERS>` | Negates a command or reverts back to default settings. When used with in the config RADIUS server policy mode, the `no` command removes settings, such as crl-check, LDAP group verification, RADIUS client etc |

**Examples**

The following example shows the RADIUS server policy ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
   authentication eap-auth-type tls
crl-check
   nas 172.16.10.10/24 secret 0 wirelesswell
local realm realm1
ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1" base-dn "bas-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-filter "groupfilter1" group-membership groupmembership1 net-timeout 2
ldap-server dead-period 100
```

```
rfs7000-37FABE(config-radius-server-policy-test)#
```

```
rfs7000-37FABE(config-radius-server-policy-test)#no authentication eap configuration
```

```
rfs7000-37FABE(config-radius-server-policy-test)#no crl-check
```

```
rfs7000-37FABE(config-radius-server-policy-test)#no local realm realm1
```

```
rfs7000-37FABE(config-radius-server-policy-test)#no nas 172.16.10.10/24
```

```
rfs7000-37FABE(config-radius-server-policy-test)#no ldap-server dead-period
```
The following example shows the RADIUS server policy 'test' settings after the 'no' commands are executed:

```
rfs7000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1" base-dn
"bas-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-filter
"groupfilter1" group.Membership groupMembership1 net-timeout 2
rfs7000-37FABE(config-radius-server-policy-test)#
```
16.2.10 proxy

- radius-server-policy

Configures a proxy RADIUS server based on the realm/suffix. The realm identifies where the RADIUS server forwards AAA requests for processing.

A user’s access request is sent to a proxy RADIUS server if it cannot be authenticated by the local RADIUS resources. The proxy server checks the information in the user access request and either accepts or rejects the request. If the proxy server accepts the request, it returns configuration information specifying the type of connection service required to authenticate the user.

The RADIUS proxy appears to act as a RADIUS server to NAS, whereas the proxy appears to act as a RADIUS client to the RADIUS server.

When the proxy server receives a request for a user name with a realm, the server references a table of realms. If the realm is known, the server proxies the request to the RADIUS server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
proxy [realm|retry-count|retry-delay]
proxy realm <REALM-NAME> server <IP> port <1024-65535> secret [0 <PASSWORD> | 2 <ENCRYPTED-PASSWORD> | <PASSWORD>]
proxy retry-count <3-6>
proxy retry-delay <5-10>
```

Parameters

- proxy realm <REALM-NAME> server <IP> port <1024-65535> secret [0 <PASSWORD> | 2 <ENCRYPTED-PASSWORD> | <PASSWORD>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy realm &lt;REALM-NAME&gt;</td>
<td>Configures the realm name. The name should not exceed 50 characters.</td>
</tr>
<tr>
<td>server &lt;IP&gt;</td>
<td>Configures the proxy server's IP address. This is the address of server checking the information in the user access request and either accepting or rejecting the request on behalf of the local RADIUS server.</td>
</tr>
<tr>
<td>port &lt;1024-65535&gt;</td>
<td>Configures the proxy server’s port. This is the TCP/IP port number for the server that acts as a data source for the proxy server.</td>
</tr>
<tr>
<td>secret [0 &lt;PASSWORD&gt;</td>
<td>2 &lt;ENCRYPTED-PASSWORD&gt;</td>
</tr>
<tr>
<td></td>
<td>0 &lt;PASSWORD&gt; – Sets an UNENCRYPTED password</td>
</tr>
<tr>
<td></td>
<td>2 &lt;ENCRYPTED-PASSWORD&gt; – Sets an ENCRYPTED password</td>
</tr>
<tr>
<td></td>
<td>&lt;PASSWORD&gt; – Sets the proxy server shared secret value</td>
</tr>
</tbody>
</table>
• **proxy retry-count <3-6>**

<table>
<thead>
<tr>
<th>retry-count &lt;3-6&gt;</th>
<th>Sets the proxy server’s retry count. This is the maximum number attempts made by a controllers RADIUS server to connect to the proxy server.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;3-6&gt; – Sets a value from 3 - 6 (default is 3 counts)</td>
</tr>
</tbody>
</table>

• **proxy retry-delay <5-10>**

<table>
<thead>
<tr>
<th>retry-delay &lt;5-10&gt;</th>
<th>Sets the proxy server’s retry delay count. This is the interval the controller’s RADIUS server waits before making an additional connection attempt.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;5-10&gt; – Sets a value from 5 - 10 seconds (default is 5 seconds)</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A maximum of five RADIUS proxy servers can be configured. The proxy server attempts six retries before it times out. The retry count defines the number of times RADIUS requests are transmitted before giving up. The timeout value is the defines the interval between successive retransmission of a RADIUS request (in case of no reply).

**Examples**

```plaintext
rfs7000-37FABE(config-radius-server-policy-test)#proxy realm test1 server 172.16.10.7 port 1025 secret 0 test1123
rfs7000-37FABE(config-radius-server-policy-test)#proxy retry-count 4
rfs7000-37FABE(config-radius-server-policy-test)#proxy retry-delay 8
rfs7000-37FABE(config-radius-server-policy-test)#show context radius-server-policy test
  proxy retry-delay 8
  proxy retry-count 4
  proxy realm test1 server 172.16.10.7 port 1025 secret 0 test1123
  ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1" base-dn "bas-dn1" passwd 0 test@123 passwd-attr bind-dn attr group-attr group1 group-filter "groupfilter1" group-membership groupmembership1 net-timeout 2
rfs7000-37FABE(config-radius-server-policy-test)#
```

**Related Commands**

```plaintext
no
```

Removes or resets the RADIUS proxy server’s settings
16.2.11 session-resumption

Enables session resumption or fast re-authentication by using cached attributes. This feature controls the volume and duration cached data is maintained by the server policy, upon termination of a server policy session. The availability and quick retrieval of the cached data speeds up session resumption.

This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```text
session-resumption {lifetime|max-entries}
```

```text
session-resumption {lifetime <1-24> {max-entries <10-1024>}}|max-entries <10-1024>
```

Parameters

- `session-resumption {lifetime <1-24> {max-entries <10-1024>}}|max-entries <10-1024>`

  - `lifetime <1-24>`
    - Optional. Sets the lifetime of cached entries
    - `<1-24>` — Specify the lifetime period from 1 - 24 hours (default is 1 hour)
    - `max-entries` — Optional. Configures the maximum number of entries in the cache
    - `<10-1024>` — Sets the maximum number of entries in the cache from 10 - 1024 (default is 128 entries)

  - `max-entries <10-1024>`
    - Optional. Configures the maximum number of entries in the cache
    - `<10-1024>` — Sets the maximum number of entries in the cache from 10 - 1024 (default is 128 entries)

Examples

```text
rfs7000-37FABE(config-radius-server-policy-test)#session-resumption lifetime 10 max-entries 11
rfs7000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
proxy retry-delay 8
proxy retry-count 4
proxy realm test1 server 172.16.10.7 port 1025 secret 0 test1123
ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1" base-dn "bas-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-filter "groupfilter1" group-membership groupmembership1 net-timeout 2
session-resumption lifetime 10 max-entries 11
rfs7000-37FABE(config-radius-server-policy-test)#
```

Related Commands

16.3 radius-user-pool-policy

RADIUS-POLICY

Configures a RADIUS user pool policy and enters its configuration mode.

A user pool defines policies for individual user access to the internal RADIUS resources. User pool policies define unique permissions (either temporary or permanent) that control user access to the local RADIUS resources. A pool can contain a single user or multiple users.

Use the (config) instance to configure RADIUS user pool policy commands. To navigate to the radius-user-pool-policy instance, use the following commands:

<DEVICE>(config)#radius-user-pool-policy <POOL-NAME>

rfs7000-37FABE(config)#radius-user-pool-policy testuser
rfs7000-37FABE(config-radius-user-pool-testuser)#

Radius User Pool Mode commands:
- duration Set a guest user's access duration
- no Negate a command or set its defaults
- user Radius user configuration

16.3.1 duration

radius-user-pool-policy

Modifies the duration, in minutes, that a guest user can access the captive portal

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

duration <GUEST-USER-NAME> <0-525600>

Parameters

- duration <GUEST-USER-NAME> <0-525600>

Examples

rfs4000-229D58(config-radius-user-pool-wdws)#show context
radius-user-pool-policy wdws
user guestuser1 password 0 guestuser@1 group wdws guest expiry-time 12:30 expiry-date 12/15/2014 access-duration 500
rfs4000-229D58(config-radius-user-pool-wdws)#

### 16.3.2 user

- **radius-user-pool-policy**

Configures RADIUS user parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
user <USERNAME> password [0 <UNECRYPTED-PASSWORD>|2 <ENCRYPTED-PASSWORD>|<PASSWORD>]
{group <RAD-GROUP-NAME>} {guest}
```

```
user <USERNAME> password [0 <UNECRYPTED-PASSWORD>|2 <ENCRYPTED-PASSWORD>|<PASSWORD>]
{group <RAD-GROUP-NAME>} {guest expiry-time <HH:MM> expiry-date <MM/DD/YYYY>
{access-duration <0-525600>|data-limit|email-id <EMAIL-ID>|start-time <HH:MM>
start-date <MM/DD/YYY>|telephone <TELEPHONE-NUMBER>}}
```

```
user <USERNAME> password [0 <UNECRYPTED-PASSWORD>|2 <ENCRYPTED-PASSWORD>|<PASSWORD>]
{group <RAD-GROUP-NAME>} {guest expiry-time <HH:MM> expiry-date <MM/DD/YYYY>

</tr>
</tbody>
</table>
### RADIUS-POLICY 16 - 35

**expiry-time <HH:MM>**

Specify the user account expiry time in the HH:MM format (for example, 12:30 means 30 minutes after 12:00 the user login will expire).

**expiry-date <MM:DD:YYYY>**

Specify the user account expiry date in the MM:DD:YYYY format (for example, 02:15:2014).

---

### After configuring the above user details, optionally configure the following user information:

- **access-duration <0-525600>|data-limit|email-id <EMAIL-ID>|start-time <HH:MM>|start-date <MM:DD:YYY>|telephone <TELEPHONE-NUMBER>**

After configuring the above user details, optionally configure the following user information:

- **access-duration <0-525600>** – Configures the duration, in minutes, for which this guest user can access the captive portal.
  - <0-525600> – Specify a value from 0 - 525600 minutes.
- **data-limit <1-102400>** – Configures the data limit for which this guest user can access the captive portal. Specify a value from 1-102400 bytes.
  - committed-downlink <100-1000000> – Configures committed downlink bandwidth until data limit is reached. This value represents the download speed (in kilobits per second) allocated to the guest user. When bandwidth is available, the user can download data at the specified rate. If a guest user has a bandwidth based policy and exceeds the specified data limit, the speed is throttled to the reduced downlink rate (specified using this command). Specify a value from 100-1000000 kbps.
  - reduced-downlink <100-1000000> – Configures reduced downlink bandwidth after data limit is reached. This value represents the reduced speed the guest utilizes (in kilobits per second) when exceeding the specified data limit, if applicable. If a guest user has a bandwidth based policy and exceeds the specified data limit, the speed is throttled to the reduced downlink rate specified here. Specify a value from 100-1000000 kbps.
  - reduced-uplink <100-1000000> – Configures reduced uplink bandwidth after data limit is reached. This value represents the reduced speed the guest utilizes (in kilobits per second) when exceeding the specified data limit, if applicable. If a guest user has a bandwidth based policy and exceeds the specified data limit, the speed is throttled to the reduced uplink rate specified here. Specify a value from 100-1000000 kbps.
- **email-id** – Optional. User’s e-mail ID
- **start-time** – Optional. User’s account activation time. After specifying the activation time, specify the activation date.
- **start-date** – User’s account activation date
- **telephone** – Optional. User’s telephone number (should include the area code)

**Note:** To view access details of guest users on a RADIUS server, in the Priv Executable Configuration mode, use the following command:

```bash
show > radius guest-users time
```

```
rfs7000-37FABE#show radius guest-users time
TIME (min:sec)
USED REMAINING GUEST USER
0:00  500:00  user1
Current time: 09:03:07
rfs7000-37FABE#
```
Examples

rfs4000-229D58(config-radius-user-pool-wdws)#user guestuser1 password 0 guestuser@1
group wdws guest expiry-time 12:30 expiry-date 12/15/2014 access-duration 500

<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Deletes a user from a RADIUS user pool</td>
</tr>
</tbody>
</table>
16.3.3 no

Negates a command or sets its default. When used in the RADIUS user pool policy mode, the `no` command deletes a user from a RADIUS user pool.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
```
no user <USERNAME>
```

Parameters
- `<USERNAME>`

Examples
The following example shows the RADIUS user pool 'wdws' settings before the 'no' command is executed:
```
rfs4000-229D58 (config-radius-user-pool-wdws)#show context
radius-user-pool-policy wdws
user guestuser1 password 0 guestuser@1 group wdws guest expiry-time 12:30 expiry-date 12/15/2014 access-duration 500
rfs4000-229D58 (config-radius-user-pool-wdws)#
rfs4000-229D58 (config-radius-user-pool-wdws)#no user guestuser1
```

The following example shows the RADIUS user pool 'wdws' settings after the 'no' command is executed:
```
rfs4000-229D58 (config-radius-user-pool-wdws)#show context
radius-user-pool-policy wdws
rfs4000-229D58 (config-radius-user-pool-wdws)#
```

CHAPTER 17
RADIO-QOS-Policy

This chapter summarizes the radio QoS policy in the CLI command structure.

Configuring and implementing a radio QoS policy is essential for WLANs with heavy traffic and less bandwidth. The policy enables you to provide preferential service to selected network traffic by controlling bandwidth allocation. The radio QoS policy can be applied to VLANs configured on an access point. In case no VLANs are configured, the radio QoS policy can be applied to an access point's Ethernet and radio ports.

Without a dedicated QoS policy, a network operates on a best-effort delivery basis, meaning all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped!

When configuring a QoS policy for a radio, select specific network traffic, prioritize it, and use congestion-management and congestion-avoidance techniques to provide deployment customizations best suited to each QoS policy's intended wireless client base.

A well-designed QoS policy should:

- Classify and mark data traffic to accurately prioritize and segregate it (by access category) throughout the network.
- Minimize network delay and jitter for latency-sensitive traffic.
- Ensure higher priority traffic has a better likelihood of delivery in the event of network congestion.
- Prevent ineffective utilization of access points degrading session quality by configuring admission control mechanisms within each radio QoS policy.

Within a managed wireless network, wireless clients supporting low and high priority traffic contend with one another for access and data resources. The IEEE 802.11e amendment has defined Enhanced Distributed Channel Access (EDCA) mechanisms stating high priority traffic can access the network sooner than lower priority traffic. The EDCA defines four traffic classes (or access categories); voice (highest), video (next highest), best effort, and background (lowest). The EDCA has defined a time interval for each traffic class, known as the Transmit Opportunity (TXOP). The TXOP prevents traffic of a higher priority from completely dominating the wireless medium, thus ensuring lower priority traffic is still supported.

IEEE 802.11e includes an advanced power-saving technique called Unscheduled Automatic Power Save Delivery (U-APSD) that provides a mechanism for wireless clients to retrieve packets buffered by an access point. U-APSD reduces the amount of signaling frames sent from a client to retrieve buffered data from an access point. U-APSD also allows access points to deliver buffered data frames as bursts, without backing-off between data frames. These improvements are useful for voice clients, as they provide improved battery life and call quality.

The Wi-Fi Alliance has created Wireless Multimedia (WMM) and WMM Power Save (WMM-PS) certification programs to ensure interoperability between 802.11e WLAN infrastructure implementations and wireless clients. A managed wireless...
network supports both WMM and WMM-Power Save techniques. WMM and WMM-PS (U-APSD) are enabled by default in each WLAN profile.

Enabling WMM support on a WLAN just advertises the WLAN's WMM capability and radio configuration to wireless clients. The wireless clients must also support WMM and use the values correctly while accessing the WLAN to benefit.

WMM includes advanced parameters (CWMin, CWMax, AIFSN and TXOP) specifying back-off duration and inter-frame spacing when accessing the network. These parameters are relevant to both connected access point radios and their wireless clients. Parameters impacting access point transmissions to their clients are controlled using per radio WMM settings, while parameters used by wireless clients are controlled by a WLAN's WMM settings.

Wireless network controllers (access points, controllers, and service platforms) include a Session Initiation Protocol (SIP), Skinny Call Control Protocol (SCCP) and Application Layer Gateway (ALG) enabling devices to identify voice streams and dynamically set voice call bandwidth.

Wireless network controllers also support static QoS mechanisms per WLAN to provide prioritization of WLAN traffic when legacy (non WMM) clients are deployed. When enabled on a WLAN, traffic forwarded to a client is prioritized and forwarded based on the WLAN's WMM access control setting.

Wireless network administrators can also assign weights to each WLAN in relation to user priority levels. The lower the weight, the lower the priority. Use a weighted technique to achieve different QoS levels across WLANs.

All devices rate-limit bandwidth for WLAN sessions. This form of per-user rate limiting enables administrators to define uplink and downlink bandwidth limits for users and clients. This sets the level of traffic a user or client can forward and receive over the WLAN. If the user or client exceeds the limit, excessive traffic is dropped.

Rate limits can be applied to WLANs using groups defined locally or externally from a RADIUS server using Vendor Specific Attributes (VSAs). Rate limits can be applied to users authenticating using 802.1X, captive portal authentication, and devices using MAC authentication.

Use the (config) instance to configure radios QoS policy related configuration commands. To navigate to the radio QoS policy instance, use the following commands:

```bash
<DEVICE>(config)#radio-qos-policy <POLICY-NAME>
```

rfs7000-37FABE(config)#radio-qos-policy test
rfs7000-37FABE(config-radio-qos-test)#?

Radio QoS Mode commands:

- accelerated-multicast Configure multicast streams for acceleration
- admission-control Configure admission-control on this radio for one or more access categories
- no Negate a command or set its defaults
- smart-aggregation Configure smart aggregation parameters
- wmm Configure 802.11e/Wireless MultiMedia parameters

- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-radio-qos-test)#

**NOTE:** Statistically setting a WLAN WMM access category value only prioritizes traffic to the client.

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
### 17.1.1 accelerated-multicast

*radio-qos-policy*

Configures multicast streams for acceleration. Multicasting allows group transmission of data streams.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
accelerated-multicast [client-timeout|max-client-streams|max-streams|overflow-policy|stream-threshold]
```

```
accelerated-multicast [client-timeout <5-6000>|max-client-streams <1-4>|max-streams <0-256>|overflow-policy [reject|revert]|stream-threshold <1-500>]
```

**Parameters**

- **client-timeout**
  - `<5-6000>` — Specify a value from 5 - 6000 seconds. The default is 60 seconds.
- **max-client-streams**
  - `<1-4>` — Specify a value from 1 - 4. The default is 2.
- **max-streams**
  - `<0-256>` — Specify a value from 0 - 256. The default is 25.
- **overflow-policy**
  - `[reject|revert]`  
  Specifies the policy in case too many clients register simultaneously. The radio QOS policy can be configured to follow one of the following courses of action:
  - **reject** — Rejects new clients. The default overflow policy is reject.
  - **revert** — Reverts to regular multicast delivery

**Note:** When the number of wireless clients using accelerated multicast exceeds the configured value (max-streams), the radio can either reject new wireless clients or revert existing clients to a non-accelerated state.

- **stream-threshold**
  - `<1-500>` — Specify a value from 1 - 500. The default is 25 packets per second.

**Examples**

```
rfs7000-37FABE(config-radio-qos-test)#accelerated-multicast client-timeout 500
rfs7000-37FABE(config-radio-qos-test)#accelerated-multicast stream-threshold 15
```

```
rfs7000-37FABE(config-radio-qos-test)#show context radio-qos-policy test
accelerated-multicast stream-threshold 15
accelerated-multicast client-timeout 500
```

```
rfs7000-37FABE(config-radio-qos-test)#
```

</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Reverts accelerated multicasting settings to their default</td>
</tr>
</tbody>
</table>
17.1.2 admission-control

Enables admission control across all radios for one or more access categories. Enabling admission control for an access category ensures clients associated to an access point and complete WMM admission control before using that access category.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
admission-control [background|best-effort|firewall-detected-traffic|implicit-tspec|video|voice]
```

Parameters

- admission-control [background|best-effort|video|voice]
  - max-airtime-percent <0-150>
  - max-clients <0-256>
  - max-roamed-clients <0-256>
  - reserved-for-roam-percent <0-150>

```
admission-control background
```

Enforces admission control for traffic whose access category is detected by the firewall ALG. For example, SIP voice calls. This feature is enabled by default.

When enabled, the firewall simulates reception of frames for voice traffic when the voice traffic was originated via SIP or SCCP control traffic. If a client exceeds configured values, the call is stopped and/or received voice frames are forwarded at the next non admission controlled traffic class priority. This applies to clients that do not send TSPEC frames only.

```
admission-control implicit-tspec
```

Enables implicit traffic specifiers for clients that do not support WMM TSPEC, but are accessing admission-controlled access categories. This feature is enabled by default. This feature requires wireless clients to send their traffic specifications to an access point before they can transmit or receive data. If enabled, this setting applies to this radio QoS policy. When enabled, the access point simulates the reception of frames for any traffic class by looking at the amount of traffic the client is receiving and sending. If the client sends more traffic than has been configured for an admission controlled traffic class, the traffic is forwarded at the priority of the next non admission controlled traffic class. This applies to clients that do not send TSPEC frames only.

```
admission-control best-effort
```

Configures best effort access category admission control parameters.
<table>

</tr>
</tbody>
</table>
### max-roamed-clients <0-256>
Optional. Specifies the maximum number of roaming wireless clients admitted to the selected access category
- `background` – Sets the number of low (background) supported wireless clients allowed to roam to a different access point radio
- `best-effort` – Sets the number of normal (best-effort) supported wireless clients allowed to roam to a different access point radio
- `video` – Sets the number of video supported wireless clients allowed to roam to a different access point radio
- `voice` – Sets the number of voice supported wireless clients allowed to roam to a different access point radio
The following keyword is common to all of the above traffic types:
- `<0-256>` – Specify a value from 0 - 256. This is the maximum number of roaming wireless clients admitted to the selected access category. The default is 10 roaming clients.

### reserved-for-roam-percent <0-150>
Optional. Calculates the percentage of air time, including oversubscription, allocated exclusively for roaming clients. This value is calculated relative to the configured max air time for this access category.
- `background` – Sets the roam utilization (in the form of a percentage of the radio’s bandwidth) allotted to admission control for low (background) supported clients who have roamed to a different radio.
- `best-effort` – Sets the roam utilization (in the form of a percentage of the radio’s bandwidth) allotted to admission control for normal (best-effort) supported clients who have roamed to a different radio.
- `video` – Sets the roam utilization (in the form of a percentage of the radio’s bandwidth) allotted to admission control for video supported clients who have roamed to a different radio.
- `voice` – Sets the roam utilization (in the form of a percentage of the radio’s bandwidth) allotted to admission control for voice supported clients who have roamed to a different radio.
The following keyword is common to all of the above traffic types:
- `<0-150>` – Specify a value from 0 - 150. This is the percentage of air time, including oversubscription, allocated exclusively for roaming clients associated with the selected access category. The default is 10%.

#### Examples
```plaintext
rfs7000-37FABE(config-radio-qos-test)#admission-control best-effort max-clients 200
rfs7000-37FABE(config-radio-qos-test)#admission-control voice reserved-for-roam-percent 8
rfs7000-37FABE(config-radio-qos-test)#admission-control voice max-airtime-percent 9

rfs7000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
  admission-control voice max-airtime-percent 9
  admission-control voice reserved-for-roam-percent 8
  admission-control best-effort max-clients 200
  accelerated-multicast stream-threshold 15
  accelerated-multicast client-timeout 500
rfs7000-37FABE(config-radio-qos-test)#
```

#### Related Commands
- **no**
  Reverts or resets admission control settings to their default
17.1.3 no

`radio-qos-policy`

Negates a command or resets configured settings to their default. When used in the radio QOS policy mode, the `no` command enables the resetting of accelerated multicast parameters, admission control parameters, and MultiMedia parameters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
no [accelerated-multicast|admission-control|smart-aggregation|wmm|service]
```

```
no accelerated-multicast [client-timeout|max-client-streams|max-streams|
overflow-policy|stream-threshold]
```

```
no admission-control [firewall-detected-traffic|implicit-tspec|background|
best-effort|video|voice]
```

```
no admission-control [firewall-detected-traffic|implicit-tspec]
```

```
no admission-control [background|best-effort|video|voice] {max-airtime-percent|
max-clients|max-roamed-clientsreserved-for-roam-percent}
```

```
no smart-aggregation {delay|max-mesh-hops|min-aggregation-limit}
```

```
no smart-aggregation {delay [background|best-effort|streaming-video|
video-conferencing|voice] |max-mesh-hops|min-aggregation-limit}
```

```
no wmm [background|best-effort|video|voice] [aifsn|cw-max|cw-min|txop-limit]
```

```
no service admission-control across-reassoc
```

Parameters
- `no <PARAMETERS>`

| `no <PARAMETERS>` | Negates a command or resets configured settings to their default. When used in the radio QOS policy mode, the `no` command enables the resetting of accelerated multicast parameters, admission control parameters, and MultiMedia parameters. |

Examples

The following example shows the Radio-qos-policy 'test' settings before the 'no' commands are executed:

```
rfs7000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
admission-control voice max-airtime-percent 9
admission-control voice reserved-for-roam-percent 8
admission-control best-effort max-clients 200
accelerated-multicast stream-threshold 15
accelerated-multicast client-timeout 500
```

```
rfs7000-37FABE(config-radio-qos-test)#no admission-control best-effort max-clients
rfs7000-37FABE(config-radio-qos-test)#no accelerated-multicast client-timeout
```
The following example shows the Radio-qos-policy ‘test’ settings after the ‘no’ commands are executed:

rfs7000-37FABE(config-radio-qos-test)#show context radio-qos-policy test
  admission-control voice max-airtime-percent 9
  admission-control voice reserved-for-roam-percent 8
  accelerated-multicast stream-threshold 15
rfs7000-37FABE(config-radio-qos-test)#

rfs4000-229D58(config-radio-qos-test)#show context radio-qos-policy test
  service admission-control across-reassoc
rfs4000-229D58(config-radio-qos-test)#

rfs4000-229D58(config-radio-qos-test)#no service admission-control across-reassoc
rfs4000-229D58(config-radio-qos-test)#show context radio-qos-policy test
rfs4000-229D58(config-radio-qos-test)#
## 17.1.4 smart-aggregation

Configures smart aggregation parameters on this Radio QoS policy.

Smart aggregation enhances frame aggregation by dynamically selecting the time when the aggregated frame is transmitted. In a frame’s typical aggregation, an aggregated frame is sent when:

- A pre-configured number of aggregated frames is reached
- An administrator-defined interval has elapsed since the first frame (of a set of frames to be aggregated) was received
- An administrator-defined interval has elapsed since the last frame (not necessarily the final frame) of a set of frames to be aggregated was received

With this enhancement, an aggregation delay is set uniquely for each traffic class. For example, voice traffic might not be aggregated, but sent immediately. Whereas, background data traffic is set a delay for aggregating frames, and these aggregated frames are sent.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

```
smart-aggregation {delay|max-mesh-hops|min-aggregation-limit}
smart-aggregation {delay [background|best-effort|streaming-video|video-conferencing|voice] <0-1000>}
smart-aggregation {max-mesh-hops <1-10>}
smart-aggregation {min-aggregation-limit <0-64>}
```

### Parameters

- **smart-aggregation {delay [background|best-effort|streaming-video|video-conferencing|voice] <0-1000>}**
  - Optional. Configures the maximum delay parameter for each traffic type
    - This is the maximum delay, in milliseconds, in the transmission of the first frame received.

  - **background**
    - Configures the maximum delay parameter, in milliseconds, for background traffic (250 msec)

  - **best-effort**
    - Configures the maximum delay parameter, in milliseconds, for best effort traffic (150 msec)

  - **streaming-video**
    - Configures the maximum delay parameter, in milliseconds, for streaming video traffic (150 msec)

  - **video-conferencing**
    - Configures the maximum delay parameter, in milliseconds, for video conference traffic (40 msec)

  - **voice**
    - Configures the maximum delay parameter, in milliseconds, for voice traffic (0 msec)

  - **<0-1000>**
    - This parameter is common to all of the above traffic types.
      - **<0-1000>** – Specify a value from 0 - 1000 msec.
### smart-aggregation \{max-mesh-hops <1-10>\}

**max-mesh-hops <1-10>**  
Optional. Sets the maximum number of expected hops to the destination within a mesh  
• **<1-10>** – Specify a value from 1 - 10. The default is 3 hops.

### smart-aggregation \{min-aggregation-limit <0-64>\}

**min-aggregation-limit <0-64>**  
Optional. Sets the minimum number of aggregates buffered before an aggregate is sent  
• **<0-64>** – Specify a value from 0 - 64. The default is 8 frames.

#### Examples

```
rfs7000-37FABE(config-radio-qos-test)#smart-aggregation delay voice 50
rfs7000-37FABE(config-radio-qos-test)#smart-aggregation delay background 100
```

```
rfs7000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
  smart-aggregation delay voice 50
  smart-aggregation delay background 100
rfs7000-37FABE(config-radio-qos-test)#
```

17.1.5 service

Invokes service commands in the radio QoS configuration mode

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

service [admission-control|show]

service admission-control across-reassoc

service show cli

Parameters

- service admission-control across-reassoc
  Retains previously negotiated TSPEC parameters across re-associations on the radio

  Note: For more information on admission-control parameters, see admission-control.

- service show cli
  Displays running system information
  - cli – Displays the Radio QoS mode’s CLI tree

Examples

rfs4000-229D58(config-radio-qos-test)#service admission-control across-reassoc

rfs4000-229D58(config-radio-qos-test)#show context radio-qos-policy test

rfs4000-229D58(config-radio-qos-test)#service admission-control across-reassoc

rfs4000-229D58(config-radio-qos-test)#service show cli

Radio QoS Mode mode:
  +--help [help]
    +--search
      +--WORD [help search WORD ([detailed|only-show|skip-show|skip-no])

      +--skip-no [help search WORD ([detailed|only-show|skip-show|skip-no])

Related Commands

no
  Disables retention of previously negotiated TSPEC parameters across re-associations on the radio
17.1.6 wmm

▶ radio-qos-policy

Configures 802.11e wireless multimedia (wmm) parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

wmm [background|best-effort|video|voice]

wmm [background|best-effort|video|voice] [aifsn <1-15>|cw-max <0-15>|cw-min <0-15>|
  txop-limit <0-65535>]

Parameters

- wmm [background|best-effort|video|voice] [aifsn <1-15>|cw-max <0-15>|cw-min <0-15>|
  txop-limit <0-65535>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmm background</td>
<td>Configures background access category wireless multimedia settings</td>
</tr>
<tr>
<td>wmm best-effort</td>
<td>Configures best effort access category wireless multimedia settings</td>
</tr>
<tr>
<td>wmm video</td>
<td>Configures video access category wireless multimedia settings</td>
</tr>
<tr>
<td>wmm voice</td>
<td>Configures voice access category wireless multimedia settings</td>
</tr>
<tr>
<td>aifsn &lt;1-15&gt;</td>
<td>Configures Arbitrary Inter-Frame Space Number (AIFSN) as the wait time between data frames derived from the AIFSN and slot time</td>
</tr>
</tbody>
</table>
  - background – Sets the current AIFSN for low (background) traffic. The default is 7.
  - best-effort – Sets the current AIFSN for normal (best-effort) traffic. The default is 3.
  - video – Set the current AIFSN for video traffic. Higher-priority traffic video categories should have lower AIFSNs than lower-priority traffic categories. This causes lower-priority traffic to wait longer before attempting access. The default is 1.
  - voice – Sets the current AIFSN for voice traffic. Higher-priority traffic voice categories should have lower AIFSNs than lower-priority traffic categories. This causes lower-priority traffic to wait longer before attempting access. The default is 1.

The following keyword is common to all of the above traffic types:

- <1-15> – Sets a value from 1 - 15
### cw-max <0-15>

Clients pick a number between 0 and the min contention window to wait before retransmission. Clients then double their wait time on a collision, until it reaches the maximum contention window.

- **background** – Sets CW Max for low (background) traffic. The default is 10.
- **best-effort** – Sets CW Max for normal (best effort) traffic. The default is 6.
- **voice** – Sets CW Max for voice traffic. The default is 3.
- **video** – Sets CW Max for video traffic. The default is 4.

The following keyword is common to all of the above traffic types:

- **<0-15>** – ECW: the contention window. The actual value used is \(2^{\text{ECW}} - 1\).

**Note:** Lower values are used for higher priority traffic (like video and voice) and higher values are used for lower priority traffic (like background and best-effort).

### cw-min <0-15>

Clients select a number between 0 and the min contention window to wait before retransmission. Clients then double their wait time on a collision, until it reaches the maximum contention window.

- **background** – Sets CW Min for low (background) traffic. The default is 4.
- **best-effort** – Sets CW Min for normal (best effort) traffic. The default is 4.
- **voice** – Sets CW Min for voice traffic. The default is 2.
- **video** – Sets CW Min for video traffic. The default is 3.

The following keyword is common to all of the above traffic types:

- **<0-15>** – ECW: the contention window. The actual value used is \(2^{\text{ECW}} - 1\).

**Note:** Lower values are used for higher priority traffic (like video and voice) and higher values are used for lower priority traffic (like background and best-effort).

### txop-limit <0-65535>

Set the interval, in microseconds, during which a particular client has the right to initiate transmissions

- **background** – Sets TXOP for low (background) traffic. The default is 0.
- **best-effort** – Sets TXOP for normal (best effort) traffic. The default is 4.
- **voice** – Sets TXOP for voice traffic. The default is 47.
- **video** – Sets TXOP for video traffic. The default is 94.

The following keyword is common to all of the above traffic types:

- **<0-65535>** – Specify a value from 0 - 65535 to configure the transmit opportunity limit in 32 microsecond units.

**Note:** Lower values are used for higher priority traffic (like video and voice) and higher values are used for lower priority traffic (like background and best-effort).
Usage Guidelines
Before defining a radio QoS policy, refer to the following deployment guidelines to ensure the configuration is optimally effective:

- To support QoS, each multimedia application, wireless client, and WLAN is required to support WMM.
- WMM enabled clients can co-exist with non-WMM clients on the same WLAN. Non-WMM clients are always assigned a Best Effort access category.
- Default WMM values are recommended for all deployments. Changing these values can lead to unexpected traffic blockages, and the blockages might be difficult to diagnose.
- Overloading an access point radio with too much high priority traffic (especially voice) degrades overall service quality for all users.
- TSPEC admission control is only available with newer voice over WLAN phones. Many legacy voice devices do not support TSPEC or even support WMM traffic prioritization.

Examples
rfs7000-37FABE(config-radio-qos-test)#wmm best-effort aifsn 7
rfs7000-37FABE(config-radio-qos-test)#wmm voice txop-limit 1

rfs7000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
  wmm best-effort aifsn 7
  wmm voice txop-limit 1
  admission-control voice max-airtime-percent 9
  admission-control voice reserved-for-roam-percent 8
  accelerated-multicast stream-threshold 15

This chapter summarizes the role policy commands in the CLI command structure.

A well defined role policy simplifies user management, and is a significant aspect of WLAN management. It acts as a role based firewall (much like ACLs) consisting of user-defined roles. Each role has a set of match criteria (filters) used to filter wireless clients. The action taken when a client matches the defined filters, is determined by the IP or MAC ACL associated with the user-defined role. Based on the conditions specified in the IP and/or MAC ACL, clients are granted or denied access to the controller managed network. The role policy also defines the VLAN and data rates assigned to clients provided network access.

A role policy also enables LDAP service, allowing controllers and access points to retrieve user information from the LDAP server. This information is matched with the user-defined role filters to determine if a client matches the role or not, and should be allowed or denied access to the controller managed network.

Use the (config-role-policy) instance to configure role policy related configuration commands. To navigate to the config-role instance, use the following commands:

```
rfs7000-37FABE(config)#role-policy <POLICY-NAME>
rfs7000-37FABE(config)#role-policy test
rfs7000-37FABE(config-role-policy-test)#
```

Role Policy Mode commands:
- **default-role**: Configuration for Wireless Clients not matching any role
- **ldap-deadperiod**: Ldap dead period interval
- **ldap-query**: Set the ldap query mode
- **ldap-server**: Add a ldap server
- **ldap-timeout**: Ldap query timeout interval
- **no**: Negate a command or set its defaults
- **user-role**: Create a role
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-role-policy-test)#

</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
**18.1.1 default-role**

Assigns a default role to a wireless client that fails to match any of the user-defined roles. When a wireless client accesses a network, the client’s details, retrieved from the LDAP server, are matched against all user-defined roles within the role policy. If the client fails to match any of these user-defined role filters, the client is assigned the default role. The action taken (permit or deny access) is determined by the IP and/or MAC ACL associated with the default role.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

default-role use [ip-access-list|ipv6-access-list|mac-access-list]

default-role use [ip-access-list|ipv6-access-list|mac-access-list] [in|out]

<IP/IPv6/MAC-ACCESSLIST-NAME> precedence <1-100>

**Parameters**

- **default-role use [ip-access-list|ipv6-access-list|mac-access-list] [in|out]**
  
  Associates an IP access list, IPv6 access list, or a MAC access list with this default role
  - **in** – Applies the rule (IP, IPv6, or MAC) to incoming packets
  - **out** – Applies the rule (IP, IPv6, or MAC) to outgoing packets

  **Note:** IP and MAC access control lists (ACLs) act as firewalls by blocking and/or permitting data traffic in both directions (inbound and outbound) within a managed network. IP ACLs use IP addresses for matching operations. Whereas, MAC ACLs use MAC addresses for matching operations. In case of a match (i.e. if a packet is received from or is destined for a specified IP or MAC address), an action is taken. This action is a typical allow, deny or mark designation to controller packet traffic. For more information on ACLs, see **ACCESS-LIST**.

  - **<IP/IPv6/MAC-ACCESSLIST-NAME>** – Specify the access list name.

  **Note:** The ACL applied determines the action applied to a client assigned the default role.

- **precedence <1-100>**

  The following keyword is common to all of the above parameters:
  - **precedence** – Assigns a precedence value to the ACL identified in the previous step.
  - **<1-100>** – Specify a precedence from 1 - 100.

  **Note:** ACLs are applied in increasing order of their precedence. Rules with lower precedence are given priority.
Examples

rfs7000-37FABE(config-role-policy-test)#default-role use ip-access-list in test precedence 1

rfs7000-37FABE(config-role-policy-test)#show context role-policy test
default-role use ip-access-list in test precedence 1
rfs7000-37FABE(config-role-policy-test)#

Related Commands

| no          | Removes or resets the default role configuration |
18.1.2 ldap-deadperiod

Configures the LDAP dead period interval

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ldap-deadperiod <60-300>

Parameters

- ldap-deadperiod <60-300>

Examples

rfs7000-37FABE(config-role-policy-test)#ldap-deadperiod 100
rfs7000-37FABE(config-role-policy-test)#show context role-policy test
default-role use ip-access-list in test precedence 1
ldap-deadperiod 100
rfs7000-37FABE(config-role-policy-test)#

Related Commands

no

Removes or resets the LDAP dead period interval
18.1.3 **ldap-query**

Enables LDAP service and specifies the LDAP server query mode

Configuring the LDAP server query mode automatically enables LDAP service on this role policy. By default LDAP service is disabled.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
ldap-query [self|through-controller]
```

**Parameters**

- **self**
  - Configures LDAP query mode as self. The AP directly queries the LDAP server for user information. Select 'self' to use local LDAP server resources configured using the `ldap-server` command.

- **through-controller**
  - Configures LDAP query mode as through-controller. The AP queries the LDAP server, for user information, through the controller.

  **Note:** Use this option when the AP is layer 2 adopted to the controller.

**Examples**

```
rfs7000-37FABE(config-role-policy-test)#ldap-query self

rfs7000-37FABE(config-role-policy-test)#show context role-policy test
default-role use ip-access-list in test precedence 1
ldap-query self
ldap-deadperiod 100
rfs7000-37FABE(config-role-policy-test)#
```

**Related Commands**

- **no**
  - Disables LDAP service on this role policy
18.1.4 ldap-server

 Associates a specified LDAP server with this role policy. Use this command to configure the credentials needed to bind with the LDAP server.

 When enabled, LDAP service allows the AP or controller to bind with the LDAP server and retrieve user details. This information is matched with the user-defined roles within the role policy. If a match is made, the user is assigned the role and allowed or denied access to the controller managed network.

 You can associate two LDAP servers with a role policy, allowing failover in case the primary server is unreachable.

 Supported in the following platforms:

 - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
 - Wireless Controllers — RFS4000, RFS6000, RFS7000
 - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

 Syntax

ldap-server <1-2> host [<IP>|<FQDN>] bind-dn <BIND-DN> base-dn <BASE-DN>
 bind-password <PASSWORD> {port <1-65535>} {(server-type [active-directory|openldap])}

 Parameters

 - ldap-server <1-2> Specify the LDAP server ID from 1 - 2.
 - host [<IP>|<FQDN>] Specify the LDAP server’s IP address or Fully Qualified Domain Name (FQDN).
 - bind-dn <BIND-DN> Specify the bind distinguished name (used for binding with the server).
 - base-dn <BASE-DN> Specify the base distinguished name (used for searching). This should not exceed 127 characters.
 - bind-password <PASSWORD> Specify the LDAP server password associated with the bind DN.
 - port <1-65535> Optional. Specify the LDAP server port from 1 - 65535. (default is 389).
 - server-type [active-directory|openldap] The following keywords are common to the ‘port’ parameter:
   - server-type — Optional. Specifies the LDAP server type
     - active-directory — Enables support for active directory attribute search. This is the default setting.
     - openldap — Enables support for openLDAP attribute search

 Usage Guidelines

 Use the ldap-query command to enable LDAP service on a role policy.

 Use the show > role > ldap-stats command to view LDAP server status and state.
Examples

```bash
rfs7000-37FABE(config-role-policy-test)#ldap-server 1 host 192.168.13.7 bind-dn "CN=Administrator,CN=Users,DC=TechPub,DC=com" base-dn "CN=Administrator,CN=Users,DC=TechPub,DC=com" bind-password 0 superuser port 2
rfs7000-37FABE(config-role-policy-test)#

rfs7000-37FABE(config-role-policy-test)#show context
role-policy test
  default-role use ip-access-list in test precedence 1
  ldap-query self
  ldap-deadperiod 100
  ldap-server 1 host 192.168.13.7 bind-dn "CN=Administrator,CN=Users,DC=TechPub,DC=com" base-dn "CN=Administrator,CN=Users,DC=com bind-password 0 superuser port 2
rfs7000-37FABE(config-role-policy-test)#
```

<td>no</td>
<td>Removes or resets the LDAP server settings</td>
</tr>
</tbody>
</table>
18.1.5 %name

role-policy

Configures the LDAP timeout interval. This is the interval after which a LDAP query is timed out.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
ldap-timeout <1-5>

Parameters
- ldap-timeout <1-5>

<table>
<thead>
<tr>
<th>ldap-timeout &lt;1-5&gt;</th>
<th>Configures the LDAP query timeout interval from 1 - 5 seconds (default is 2 seconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>When enabled, LDAP service allows the AP or controller to bind with the LDAP server and query it for user details. The LDAP query timeout is the interval between a request to and the response from the LDAP server. Once this interval is exceeded, the LDAP bind and query is timed out.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-role-policy-test)#ldap-timeout 1
rfs7000-37FABE(config-role-policy-test)#show context
role-policy test default-role use ip-access-list in test precedence 1
ldap-query self
ldap-timeout 1
ldap-deadperiod 100
ldap-server 1 host 192.168.13.7 bind-dn CN=Adminstrator,CN=Users,DC=TechPub,DC=com base-dn CN=Administrator,CN=Users,DC=com bind-password 0 superuser port 2
rfs7000-37FABE(config-role-policy-test)#

Related Commands
- no

Removes or resets the LDAP query timeout to default (2 seconds)
18.1.6 no

Negates a command or resets settings to their default. When used in the config role policy mode, the no command removes or resets the role policy settings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [default-role|ldap-deadperiod|ldap-query|ldap-server <1-2>|ldap-timeout|user-role]

no [ldap-deadperiod|ldap-query|ldap-server <1-2>|ldap-timeout]

no default-role use [ip-access-list|ipv6-access-list|mac-access-list]

no default-role use [ip-access-list|ipv6-access-list|mac-access-list] [in|out]

no user-role <ROLE-NAME>

Parameters

- no <PARAMETERS>

Examples

The following example shows the role policy ‘test’ setting before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-role-policy-test)#show context
role-policy test
  default-role use ip-access-list in test precedence 1
  ldap-query self
  ldap-timeout 1
  ldap-deadperiod 100
  ldap-server 1 host 192.168.13.7 bind-dn CN=Administrator, CN=Users, DC=TechPub, DC=com
  base-dn CN=Administrator, CN=Users, DC=com bind-password 0 superuser port 2
```

```
rfs7000-37FABE(config-role-policy-test)#
```

```
rfs7000-37FABE(config-role-policy-test)#no ldap-deadperiod
```

```
rfs7000-37FABE(config-role-policy-test)#no ldap-timeout
```

```
rfs7000-37FABE(config-role-policy-test)#no ldap-server 1
```

The following example shows the role policy ‘test’ setting after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-role-policy-test)#show context
role-policy test
  default-role use ip-access-list in test precedence 1
  ldap-query self
```

```
rfs7000-37FABE(config-role-policy-test)#
```
18.1.7 user-role

This command creates a user-defined role. Each user-defined role has a set of Active Directory attributes. Each attribute is matched against the information returned by the LDAP server, until a complete match of role is found.

The following table summarizes user role configuration commands:

<table>
<thead>
<tr>
<th>user-role</th>
<th>Creates a new user role and enters its configuration mode</th>
<th>page 18-12</th>
</tr>
</thead>
<tbody>
<tr>
<td>user-role commands</td>
<td>Summarizes user role configuration mode commands</td>
<td>page 18-14</td>
</tr>
</tbody>
</table>
user-role

Creates a user-defined role. Each role consists of a set of filters and action. The filters are match criteria used to filter wireless clients. And the action defines the action taken when a client matches the specified filters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

user-role <ROLE-NAME> precedence <1-10000>

Parameters

- user-role <ROLE-NAME> precedence <1-10000>

Examples

rfs7000-37FABE(config-role-policy-test)#user-role testing precedence 10
rfs7000-37FABE(config-role-policy-test)#show context
role-policy test
user-role testing precedence 10
default-role use ip-access-list in test precedence 1
rfs7000-37FABE(config-role-policy-test)#

rfs7000-37FABE(config-role-policy-test-user-role-testing)#?

Role Mode commands:
ap-location          AP Location configuration
assign               Assign parameters to the role
authentication-type  Type of Authentication
captive-portal       Captive-portal based Role Filter
city                 City configuration
client-identity      Client identity
country              Country configuration
company              Company configuration
department           Department configuration
emailid              Emailid configuration
employee-type        Employee-type configuration
employeeid           Employeeid configuration
encryption-type      Type of encryption
group                Group configuration
memberOf              MemberOf configuration
mu-mac               MU MAC address configuration
no                   Negate a command or set its defaults
radius-user          Radius-user configuration
ssid                 SSID configuration
state                State configuration
title                Title configuration
use                  Set setting to use
user-defined         User-defined configuration

<tr>
<td><code>user-defined</code></td>
<td>Defines a filter based on an attribute defined in the Active Directory or the OpenLDAP server</td>
<td>page 18-49</td>
</tr>
</tbody>
</table>
18.1.7.2.1 ap-location

User-Role Commands

Configures an AP’s deployment location based filter for this user-defined role

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

**ap-location [any|contains|exact|not-contains]**

**ap-location any**

**ap-location [contains|exact|not-contains] <WORD>**

Parameters

- **ap-location any**

<table>
<thead>
<tr>
<th>ap-location any</th>
<th>Specifies the AP location to match (in a RF Domain) or the AP’s resident configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>Defines an AP’s location as any</td>
</tr>
</tbody>
</table>

- **ap-location [contains|exact|not-contains] <WORD>**

<table>
<thead>
<tr>
<th>ap-location</th>
<th>Specifies the AP location to match (in a RF Domain) or the AP’s resident configuration. Select one of the following filter options: contains, exact, or not-contains.</th>
</tr>
</thead>
<tbody>
<tr>
<td>contains &lt;WORD&gt;</td>
<td>Applies role if the associating AP’s location contains the location string specified in the role.</td>
</tr>
<tr>
<td>exact &lt;WORD&gt;</td>
<td>Applies role if the associating AP’s location exactly matches the string specified in the role.</td>
</tr>
<tr>
<td>not-contains &lt;WORD&gt;</td>
<td>Applies role if the associating AP’s location does not contain the location string specified in the role.</td>
</tr>
</tbody>
</table>

Examples

```bash
rfs7000-37FABE(config-role-policy-test-user-role-testing)#ap-location contains office
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
    user-role testing precedence 10
    ap-location contains office
rfs7000-37FABE(config-role-policy-test-user-role-testing)#
```

Related Commands

- **no** Removes an AP’s deployment location string from this user-defined role
18.1.7.2.2 assign

user-role commands

Configures upstream/downstream rate limits and VLAN ID. Clients matching this user-defined role filters are associated with the specified VLAN, and assigned the specified data rates.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
assign [rate-limit | VLAN]
assign rate-limit [from-client | to-client] <1-65536>
assign vlan <1-4094>

Parameters
- assign rate-limit [from-client | to-client] <1-65536>
- assign vlan <1-4094>

assign rate-limit [from-client | to-client] <1-65536>
Assigns an upstream and downstream traffic rate limit
- from-client — Assigns a rate limit, in Kbps, for the upstream (from client) traffic
- to-client — Assigns a rate limit, in Kbps, for the downstream (to client) traffic
- <1-65536> — Specify upstream and/or downstream rate limits from 1 - 65536 Kbps.

Note: Wireless clients matching this user-defined role are assigned the configured rate limits.

assign vlan <1-4094>
Assigns a VLAN (identified by VLAN's ID). Clients matching this user-defined role are associated with the specified VLAN. The VLAN ID represents the shared SSID each user employs to interoperate within the network (once authenticated by the local RADIUS server). This feature is disabled by default.
- <1-4094> — Specify the VLAN ID from 1 - 4094.

Note: A wireless client that fails to match any user-defined role is assigned to the default role (configured as a role policy setting) and is mapped to the default VLAN under the WLAN.

Usage Guidelines
ACLs can only be used with tunnel or isolated-tunnel modes. They do not work with the local and automatic modes.

In case of bridge VLAN, the default bridging mode is 'auto'. Change the bridging mode to 'tunnel'. This extends the controller's existing VLAN onto the AP and ensures that wireless clients are served IP addresses.

The VLAN configured under the user-defined role need not exist under the WLAN. But, when using tunneled VLAN bridges, configure an additional bridge VLAN. If the VLAN bridging mode is 'local', no additional VLAN configuration is required.
Examples
rfs4000-229D58(config-role-policy-test-user-role-test)#assign rate-limit to-client 200
rfs4000-229D58(config-role-policy-test-user-role-test)#commit
rfs4000-229D58(config-role-policy-test-user-role-test)#show context
    user-role test precedence 1
    assign vlan 1
    assign rate-limit to-client 200
rfs4000-229D58(config-role-policy-test-user-role-test)#

The following examples define a role used to forward the IP traffic from all engineers in Test_Company, Santa Clara, USA onto VLAN 2.

Create a new role policy with name ‘test-policy’.
<DEVICE>(config)#role-policy test-policy

Specify the LDAP server used for this role policy.
<DEVICE>(config-role-policy-test-policy)#ldap-query self
<DEVICE>(config-role-policy-test-policy)#ldap-server 1 host 192.160.1.1 bind-dn CN=Administrator,CN=Users,DC=testtest,DC=com base-dn CN=Administrator,CN=Users,DC=com bind-password 0 test port 389
<DEVICE>(config-role-policy-test-policy)#ldap-timeout 2

Create a user defined role.
<DEVICE>(config-role-policy-test-policy)#user-role SCEngineer precedence 100

Define the role by adding appropriate values and match operators.
<DEVICE>(config-role-policy-test-policy-user-role-SCEngineer)#city exact santa-clara
<DEVICE>(config-role-policy-test-policy-user-role-SCEngineer)#company exact ExampleCompany
<DEVICE>(config-role-policy-test-policy-user-role-SCEngineer)#title contains engineer
<DEVICE>(config-role-policy-test-policy-user-role-SCEngineer)#assign vlan-id 2

Apply role policy to an access point.
ap7131-99BFA8(config-device-ap7131)# use role-policy test-policy

Related Commands

<table>

18.1.7.2.3 authentication-type

user-role commands

Configures the authentication type based filter for this user-defined role

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
authentication-type [any|eq|neq]
authentication-type any
authentication-type [eq|neq] [eap|kerberos|mac-auth|none] {(eap|kerberos|mac-auth|none)}
```

Parameters

- **authentication-type any**

<table>
<thead>
<tr>
<th>any</th>
<th>The authentication type is any (eq or neq). This is the default setting.</th>
</tr>
</thead>
</table>

- **authentication-type [eq|neq] [eap|kerberos|mac-auth|none] {(eap|kerberos|mac-auth|none)}**

| eq [eap|kerberos|mac-auth|none] | The role is applied only when the authentication type matches (equals) one or more than one of the following types: |
|-----------------------------------|---------------------------------------------------------------|
| eap – Extensible authentication protocol |
| kerberos – Kerberos authentication |
| mac-auth – MAC authentication protocol |
| none – no authentication used |

These parameters are recursive, and you can configure more than one unique authentication type for this user-defined role.

| neq [eap|kerberos|mac-auth|none] | The role is applied only when the authentication type does not match (not equals) any of the following types: |
|-----------------------------------|---------------------------------------------------------------|
| eap – Extensible authentication protocol |
| kerberos – Kerberos authentication |
| mac-auth – MAC authentication protocol |
| none – no authentication used |

These parameters are recursive, and you can configure more than one unique ‘not equal to’ authentication type for this user-defined role.
Examples

rfs7000-37FABE(config-role-policy-test-user-role-testing)#authentication-type eq kerberos

rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context user-role testing precedence 10  
  authentication-type eq kerberos  
  ap-location contains office
rfs7000-37FABE(config-role-policy-test-user-role-testing)#

18.1.7.2.4 captive-portal

user-role commands

Configures a captive portal based filter for this user-defined role. A captive portal is a guest access policy that provides temporary and restrictive access to the wireless network. When applied to a WLAN, a captive portal policy ensures secure guest access.

This command defines user-defined role filters based on a wireless client’s state of authentication.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

captive-portal authentication-state [any|post-login|pre-login]

Parameters
- captive-portal authentication-state [any|post-login|pre-login]

<table>
<thead>
<tr>
<th>authentication-state</th>
<th>Defines the authentication state of a client connecting to a captive portal</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>Specifies any authentication state (authenticated and pending authentication). This is the default setting. This option makes no distinction on whether authentication is conducted before or after the wireless client has logged in.</td>
</tr>
<tr>
<td>post-login</td>
<td>Specifies authentication is completed successfully This option requires the wireless client to share authentication credentials after logging into the managed network.</td>
</tr>
<tr>
<td>pre-login</td>
<td>Specifies authentication is pending This option enables captive portal client authentication before the client is logged into the controller</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-role-policy-test-user-role-testing)#captive-portal authentication-state pre-login
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context

  authentication-type eq kerberos
  ap-location contains office
  captive-portal authentication-state pre-login
rfs7000-37FABE(config-role-policy-test-user-role-testing)#

Related Commands

no Removes the captive portal based role filter settings
18.1.7.2.5 city

user-role commands

Configures a wireless client filter based on the city name

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```bash
city [any|contains|exact|not-contains]
city [any|exact <WORD>|contains <WORD>|not-contains <WORD>]
```

Parameters

- **city [any|contains|exact|not-contains]**
  - Specifies a wireless client filter based on how the 'city' name, returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contain.
- **any**
  - No specific city associated with this user-defined role. This role can be applied to any wireless client from any city.
- **contains <WORD>**
  - The role is applied only when the city name, returned by the RADIUS server, contains the string specified in the role.
  - `<WORD>` – Specify the string to match (this is case sensitive, and is compared against the city name returned by the RADIUS server). It should contain the provided expression.
- **exact**
  - The role is applied only when the city name, returned by the RADIUS server, exactly matches the string specified in the role.
  - `<WORD>` – Specify the exact string to match (this is case sensitive, and is compared against the city name returned by the RADIUS server). It should be an exact match.
- **not-contains <WORD>**
  - The role is applied only when the city name, returned by the RADIUS server, does not contain the string specified in the role.
  - `<WORD>` – Specify the string not to match (this is case sensitive, and is compared against the city name returned by the RADIUS server). It should not contain the provided expression.

Examples

```bash
rfs7000-37FABE(config-role-policy-test-user-role-testing)#city exact SanJose
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
  authentication-type eq kerberos
  ap-location contains office
captive-portal authentication-state pre-login
city exact SanJose
rfs7000-37FABE(config-role-policy-test-user-role-testing)#
```

Related Commands

  - Removes the city name configured with this user-defined role
18.1.7.2.6 client-identity

Associates a client-identity (device fingerprinting) based filter. The role is assigned to a wireless client matching any of the defined client identities.

For more information on configuring client identity fingerprints, see client-identity.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

client-identity <CLIENT-IDENTITY-NAME> {<CLIENT-IDENTITY-NAME>}

Parameters

- client-identity <CLIENT-IDENTITY-NAME> {<CLIENT-IDENTITY-NAME>}

  | client-identity <CLIENT-IDENTITY-NAME> | Specifies the client-identity fingerprint to match (should be existing and configured) |
  | Note: Multiple client identities can be configured with a role policy. |

Usage Guidelines

When associating a single or multiple client identities with a role policy, ensure that a client identity group, containing all the client identities used by the role policy, is attached to the device or profile using the role policy. In other words, group all the client identities (used in this role policy) in a client identity group, and associate this group to the profile or device using this role policy.

For more information on configuring client identities and client identity groups, see client-identity, and client-identity-group.

For more information on associating a client identity group and a role policy to a profile or a device, see use.

Examples

rfs4000-229D58(config-role-policy-test-user-role-test)#client-identity TestClientIdentity

18.1.7.2.11 employee-type

Configures a wireless client filter based on the employee type.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
employee-type [any|contains|exact|not-contains]
employee-type [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

Parameters
- employee-type [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

| employee-type | Specifies a wireless client filter based on how the 'employee type', returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains. |
| any | No specific employee type associated with this user-defined role. This role can be applied to any wireless client having any employee type (no strings to match). This is the default setting. |
| contains <WORD> | The role is applied only when the employee type, returned by the RADIUS server, contains the string specified in the role. |
| exact | The role is applied only when the employee type, returned by the RADIUS server, exactly matches the string specified in the role. |
| not-contains <WORD> | The role is applied only when the employee type, returned by the RADIUS server, does not contain the string specified in the role. |

Examples

18.1.7.2.13 encryption-type

**user-role commands**

Selects the encryption type for this user-defined role. Encryption ensures privacy between access points and wireless clients. There are various modes of encrypting communication on a WLAN, such as Counter-model CBC-MAC Protocol (CCMP), Wired Equivalent Privacy (WEP), keyguard, Temporal Key Integrity Protocol (TKIP) etc.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
encryption-type [any|eq|neq]
```

**Parameters**

- **encryption-type any**

```
any
```

The encryption type can be any one of the listed options (ccmp|keyguard|tkip|wep128|wep64). This is the default setting.

- **encryption-type [eq|neq] [ccmp|keyguard|none|tkip|wep128|wep64]**

```
{(ccmp|keyguard|none|tkip|tkip-ccmp|wep128|wep64)}
```

The role is applied only if the encryption type equals to one of the following options:
- ccmp – Encryption mode is CCMP
- keyguard – Encryption mode is keyguard. Keyguard encryption shields the master encryption keys from being discovered
- none – No encryption mode specified
- tkip – Encryption mode is TKIP
- wep128 – Encryption mode is WEP128
- wep64 – Encryption mode is WEP64

These parameters are recursive, and you can configure more than one encryption type for this user-defined role.

- **encryption-type [eq|neq] [ccmp|keyguard|none|tkip|wep128|wep64]**

```
{(ccmp|keyguard|none|tkip|tkip-ccmp|wep128|wep64)}
```

The role is applied only if encryption type is not equal to any of the following options:
- ccmp – Encryption mode is not equal to CCMP
- keyguard – Encryption mode is not equal to keyguard
- none: Encryption mode is not equal to none
- tkip – Encryption mode is not equal to TKIP
- wep128 – Encryption mode is not equal to WEP128
- wep64 – Encryption mode is not equal to WEP64

These parameters are recursive, and you can configure more than one ‘not equal to’ encryption type for this user-defined role.
Examples

rfs7000-37FABE(config-role-policy-test-user-role-testing)#encryption-type eq wep128

rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context

Configures a wireless client filter based on the RADIUS group name

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
group [any|contains|exact|not-contains]
group [any|contains <WORD>|exact <WORD>|not-contains <WORD>]
```

**Parameters**

- group [any|contains <WORD>|exact <WORD>|not-contains <WORD>]

18.1.7.2.15 memberOf

Applies an *Active Directory* (AD) group filter to this user-defined role. A wireless client can be a member of more than one group within the AD database. This command applies a AD group based firewall, which applies a role to a wireless client only if it belongs to the specified AD group.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
memberOf <AD-GROUP-NAME>
```

**Parameters**

- `memberOf <AD-GROUP-NAME>`

**Examples**

```
rfs4000-229D58 (config-role-policy-test-user-role-test)#memberOf ADTestgroup
rfs4000-229D58 (config-role-policy-test-user-role-test)#show context
    user-role test precedence 1
    assign vlan 1
    assign rate-limit to-client 200
    memberOf ADTestgroup
rfs4000-229D58 (config-role-policy-test-user-role-test)#
```

**Related Commands**

- `no` | Removes the AD group assigned to this user-defined role
18.1.7.2.16 mu-mac

## user-role commands

Configures a MAC address and mask based filter for this role policy.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

```
mu-mac [<MAC> | any]
mu-mac any
mu-mac <MAC> {mask <MAC>}
```

### Parameters

- **mu-mac any**
  - Applies role to any wireless client (no MAC address to match). This is the default setting.
- **mu-mac <MAC> {mask <MAC>}**
  - Applies role to the wireless client having specified MAC address:
    - `<MAC>` — Sets the MAC address in the AA-BB-CC-DD-EE-FF format.
  - `mask <MAC>` — Optional. After specifying the client's MAC address, specify the mask in the AA-BB-CC-DD-EE-FF format. The role is applied to the wireless client exactly matching the specified MAC address and MAC mask.

### Examples

```bash
rfs7000-37FABE(config-role-policy-test-user-role-testing)#mu-mac 11-22-33-44-55-66
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
  authentication-type eq kerberos
  encryption-type eq wep128
  ap-location contains office
  mu-mac 11-22-33-44-55-66
  group contains testgroup
  captive-portal authentication-state pre-login
  city exact SanJose
  company exact ExampleCompany
  country exact America
  department exact TnV
  emailid exact testing@examplecompany.com
  employeeid contains TnVTest1
rfs7000-37FABE(config-role-policy-test-user-role-testing)#
```

### Related Commands

- **no** — Removes the MAC address and mask for this user-defined role.
18.1.7.2.17 no

user-role commands

Negates a command or resets configured settings to their default. When used in the config role policy user-defined role mode, the no command removes or resets settings, such as AP location, authentication type, encryption type, captive portal etc.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [ap-location|assign|authentication-type|captive-portal|city|client-identity|company|country|department|emailid|employee-type|employeeid|encryption-type|group|memberOf|mu-mac|radius-user|ssid|state|title|use|user-defined]

no [ap-location|assign|authentication-type|city|client-identity|company|country|department|emailid|employee-type|employeeid|encryption-type|group|memberOf|ssid|radius-user|state|title|user-defined]

no captive-portal authentication-state

no use [ip-access-list|mac-access-list] [in|out] <IP/MAC-ACCESS-LIST-NAME>

precedence <1-100>

no use bonjour-gw-discovery-policy

Parameters

- no <parameter>

| no <parameter> | Negates a command or resets configured settings to their default. When used in the config role policy user-defined role mode, the no command removes or resets settings, such as AP location, authentication type, encryption type, captive portal etc. |

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

The following example shows the Role Policy ‘test’ User Role ‘testing’ configuration before the ‘no’ commands are executed:

rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
authentication-type eq kerberos
encryption-type eq wep128
ap-location contains office
mu-mac 11-22-33-44-55-66
group contains testgroup
captive-portal authentication-state pre-login
city exact SanJose
company exact ExampleCompany
country exact America
department exact TnV
eemailid exact testing@examplecompany.com
employeeid contains TnVTest1

rfs7000-37FABE(config-role-policy-test-user-role-testing)#no authentication-type
rfs7000-37FABE(config-role-policy-test-user-role-testing)#no encryption-type
rfs7000-37FABE(config-role-policy-test-user-role-testing)#no group
rfs7000-37FABE(config-role-policy-test-user-role-testing)#no mu-mac
The following example shows the Role Policy 'test' User Role 'testing' configuration after the 'no' commands are executed:

```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
  captive-portal authentication-state pre-login
  city exact SanJose
  company exact ExampleCompany
  country exact America
  department exact TnV
  emailid exact testing@examplecompany.com
rfs7000-37FABE(config-role-policy-test-user-role-testing)#
```
### 18.1.7.2.18 radius-user

**User-role commands**

Configures a wireless client filter based on the RADIUS user name.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
radius-user [any|contains|ends-with|exact|not-contains|starts-with]
```

**Parameters**

- **radius-user [any|contains|ends-with|exact|not-contains|starts-with]**
  - **radius-user** Specifies a wireless client filter based on how the ‘radius-user’ name, returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains.
  - **any** — No specific RADIUS user name associated with this user-defined role. This role can be applied to any wireless client (no strings to match). This is the default setting.
  - **contains <WORD>** — The role is applied only when the ‘radius-user’ name, returned by the RADIUS server, contains the string specified in the role.
    - `<WORD>` — Specify the string to match (this is case sensitive, and is compared against the ‘radius-user’ name returned by the RADIUS server). It should contain the provided expression.
    - **Note:** You can use the realm or any sub-string of the user name.
  - **ends-with <WORD>** — Enables role assignment on the basis of the wireless client’s “department” and/or “group”
    - `<WORD>` — Specify the string (could be department/group code). For example: 1005000002. In this the last three digits represent the department/group code. The remaining digits represent user’s badge number.
    - The role is applied only when the ‘radius-user’ name, returned by the RADIUS server, ends with the string specified here.
  - **exact <WORD>** — The role is applied only when the ‘radius-user’ name, returned by the RADIUS server, exactly matches the string specified in the role.
    - `<WORD>` — Specify the exact string to match (this is case sensitive, and is compared against the ‘radius-user’ name returned by the RADIUS server). It should be an exact match.
    - **Note:** Provide the complete user name along with the realm.
  - **not-contains <WORD>** — The role is applied only when the ‘radius-user’ name, returned by the RADIUS server, does not contain the string specified in the role.
    - `<WORD>` — Specify the string not to match (this is case sensitive, and is compared against the ‘radius-user’ name returned by the RADIUS server). It should not contain the provided expression.
| starts-with <WORD> | Enables role assignment on the basis of the wireless client’s “department” and/or “group” code.
|                   | • <WORD> – Specify the string (could be department/group code). For example: 0026100573. The first three digits represent the department/group code. The remaining digits represent user’s badge number. The role is applied only when the ‘radius-user’ name, returned by the RADIUS server, starts with the string specified here. |

**Examples**

```plaintext
rfs7000-37FABE(config-role-policy-test-user-role-testing)#radius-user contains test.com

rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 1
radius-user contains test.com
company exact ExampleCompany
emailid exact testing@examplecompany.com
rfs7000-37FABE(config-role-policy-test-user-role-testing)#
```

**Related Commands**

| no                      | Removes the radius-user filter |
18.1.7.2.19 ssid

Configure a SSID based filter

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ssid [any|exact|contains|not-contains]

ssid any

ssid [exact|contains|not-contains] <WORD>

Parameters

- **ssid any**
  - Specifies a wireless client filter based on how the SSID is specified in a WLAN.
  - *any* – The role is applied to any SSID location. This is the default setting.

- **ssid [exact|contains|not-contains] <WORD>**
  - Specifies a wireless client filter based on how the SSID is specified in a WLAN. This options are: contains, exact, or not-contains
  - *exact* <WORD> – The role is applied only when the SSID, returned by the RADIUS server, exactly matches the string specified in the role.
    - <WORD> – Specify the SSID string to match. The SSID is case sensitive and is compared against the SSID configured for the WLAN.
  - *contains* <WORD> – The role is applied only when the SSID, returned by the RADIUS server, contains the string specified in the role.
    - <WORD> – Specify the SSID string to match. The SSID is case sensitive and is compared against the SSID configured for the WLAN.
  - *not-contains* <WORD> – The role is applied only when the SSID, returned by the RADIUS server, does not contain the string specified in the role.
    - <WORD> – Specify the SSID string not to match. The SSID is case sensitive and is compared against the SSID configured for the WLAN.
Examples

rfs7000-37FABE(config-role-policy-test-user-role-testing)#ssid not-contains DevUser

rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
  ssid not-contains DevUser
captive-portal authentication-state pre-login
city exact SanJose
country exact America
department exact TnV
emailid exact testing@examplecompany.com
rfs7000-37FABE(config-role-policy-test-user-role-testing)#}

18.1.7.2.20 state

**user-role commands**

Configures a user role state to match with this user-defined role

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
state [any|contains|exact|not-contains]
state [any|contains <WORD>|exact <WORD>|not-contains <WORD>]
```

**Parameters**

- `state [any|contains <WORD>|exact <WORD>|not-contains <WORD>]`

<table>
<thead>
<tr>
<th>state</th>
<th>Specifies a wireless client filter option based on how the RADIUS state matches the provided expression. Select one of the following options: any, contains, exact, or not-contains.</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>This user role can fit any wireless client irrespective of the state (no strings to match).</td>
</tr>
<tr>
<td>contains &lt;WORD&gt;</td>
<td>The user role is applied only when the RADIUS state contains the string specified in the role.</td>
</tr>
<tr>
<td>exact &lt;WORD&gt;</td>
<td>The role is applied only when the RADIUS state exactly matches the string specified in the role.</td>
</tr>
<tr>
<td>not-contains &lt;WORD&gt;</td>
<td>The role is applied only when the RADIUS state does not contain the string specified in the role.</td>
</tr>
</tbody>
</table>

  - `<WORD>` — Specify the string to match (this is case sensitive, and is compared against the state returned by the RADIUS server). It should contain the provided expression.

  - `<WORD>` — Specify the exact string to match (this is case sensitive, and is compared against the state returned by the RADIUS server). It should be an exact match.

  - `<WORD>` — Specify the string not to match (this is case sensitive, and is compared against the state returned by the RADIUS server). It should not contain the provided expression.

**Examples**

```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#state exact active
```

```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context

</tr>
<tr>
<td>not-contains &lt;WORD&gt;</td>
<td>The role is applied only when the title string, returned by the RADIUS server, does not contain the string specified in the role. &lt;WORD&gt; – Specify the string not to match (this is case sensitive, and is compared against the title returned by the RADIUS server). It should not contain the provided expression.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#title any
```

Related Commands

| no | Removes the ‘title’ filter string configured with a user role |
18.1.7.2.22 use

> user-role commands

Configures an access list based firewall with this user role

A firewall is a mechanism enforcing access control, and is considered a first line of defense in protecting proprietary information within the network. The means by which this is accomplished varies, but in principle, firewalls are mechanisms both blocking and permitting data traffic based on inbound and outbound IP and MAC rules.

IP based firewall rules are specific to source and destination IP addresses and the unique rules and precedence orders assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to packet traffic.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

use [bonjour-gw-discovery-policy|ip-access-list|ipv6-access-list|mac-access-list|url-filter]

use bonjour-gw-discovery-policy <POLICY-NAME>

use [ip-access-list|ipv6-access-list] [in|out] <IP/IPv6-ACCESS-LIST-NAME> precedence <1-100>

use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME> precedence <1-100>

use url-filter <URL-FILTER-NAME>

Parameters

- use bonjour-gw-discovery-policy <POLICY-NAME>

  bonjour-gw-discovery-policy <POLICY-NAME> — Uses an existing Bonjour GW Discovery policy with a user role. When associated, the Bonjour GW Discovery policy is applied for the Bonjour requests coming from this specific user roles.
  - <POLICY-NAME> – Specify the Bonjour GW Discovery policy name (should be existing and configured).
  
  **Note:** For more information on Bonjour GW Discovery policy, see bonjour-gw-discovery-policy.

- use [ip-access-list|ipv6-access-list] [in|out] <IP/IPv6-ACCESS-LIST-NAME> precedence <1-100>

  ip-access-list [in|out] — Uses an IPv4 or IPv6 ACL with this user role
  - in – Applies the rule to incoming packets
  - out – Applies the rule to outgoing packets

  <IP/IPv6-ACCESS-LIST-NAME> — Specify the IPv4/IPv6 access list name.

- precedence <1-100> — After specifying the name of the access list, specify the precedence applied to it. Based on the packets received, a lower precedence value is evaluated first.
  - <1-100> – Sets a precedence from 1 - 100
### use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME> precedence <1-100>

# 18.1.7.2.23 user-defined

**user-role commands**

Enables you to define a filter based on an attribute defined in the Active Directory or the OpenLDAP server.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

## Syntax

```
user-defined <ATTR-STRING> [any|contains|exact|not-contains]
user-defined <ATTR-STRING> [any|contains <WORD>|exact <WORD>|not-contains <WORD>]
```

## Parameters

- user-defined <ATTR-STRING> [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

<table>
<thead>
<tr>
<th>user-defined &lt;ATTR-STRING&gt;</th>
<th>Specify a filter based on an attribute defined in the AD or OpenLDAP server.</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>No specific string to match. This role can be applied to any wireless client. This is the default setting.</td>
</tr>
<tr>
<td>contains &lt;WORD&gt;</td>
<td>The role is applied only when the user-defined attribute value, returned by the RADIUS server, contains the string specified in the role.</td>
</tr>
<tr>
<td>exact &lt;WORD&gt;</td>
<td>The role is applied only when the user-defined attribute value, returned by the RADIUS server, exactly matches the string specified in the role.</td>
</tr>
<tr>
<td>not-contains &lt;WORD&gt;</td>
<td>The role is applied only when the user-defined attribute value, returned by the RADIUS server, does not contain the string specified in the role.</td>
</tr>
</tbody>
</table>

## Examples

```
rfs4000-229D58(config-role-policy-test-user-role-user1)#user-defined office-location exact EcoSpace
```

```
rfs4000-229D58(config-role-policy-test-user-role-user1)#show context
user-role user1 precedence 1
  employee-type exact consultant
  user-defined office-location exact EcoSpace
```

## Related Commands

```
no
```

Removes the user-defined filter configured with this user role.
This chapter summarizes Self Monitoring at Run Time RF (Smart RF) management policy commands in the CLI command structure.

A Smart RF management policy defines operating and recovery parameters that can be assigned to groups of access points. A Smart RF policy is designed to scan the network to identify the best channel and transmit power for each access point radio.

A Smart RF policy reduces deployment costs by scanning the RF environment to determine the best channel and transmit power configuration for each managed radio. Smart RF policies when applied to specific RF Domains, apply site specific deployment configurations and self-healing values to groups of devices within pre-defined physical RF coverage areas.

Smart RF centralizes the decision process and makes intelligent RF configuration decisions using information obtained from the RF environment. Smart RF helps reduce ongoing management and maintenance costs through the periodic re-calibration of the network. Re-calibration can be initiated manually or can be automatically scheduled to ensure the RF configuration is optimized to factor for RF environment changes (such as new sources of interference, or neighboring access points).

Smart RF also provides self-healing functions by monitoring the network in real-time, and provides automatic mitigation from potentially problematic events such as radio interference, coverage holes and radio failures. Smart RF employs self-healing to enable a WLAN to better maintain wireless client performance and site coverage during dynamic RF environment changes, which typically require manual re-configuration to resolve.

Smart RF is supported on any RF Domain manager. In standalone environments, an individual wireless controller manages the calibration and monitoring phases. In clustered environments, a single wireless controller is elected a Smart RF master and the remaining cluster members operate as Smart RF clients. In cluster operation, the Smart RF master co-ordinates the calibration and configuration and during the monitoring phase receives information from the Smart RF clients.

Before defining a Smart RF policy, refer to the following deployment guidelines to ensure the configuration is optimally effective:

- The Smart RF calibration process impacts associated users and should not be run during business or production hours. The calibration process should be performed during scheduled maintenance intervals or non-business hours.

- For Smart RF to provide effective recovery, RF planning must be performed to ensure overlapping coverage exists at the deployment site. Smart RF can only provide recovery when access points are deployed appropriately. Smart RF is not a solution, it’s a temporary measure. Administrators need to determine the root cause of RF deterioration and fix it. Smart RF history/events can assist.

Keep in mind that if a Smart RF managed radio is operating in WLAN mode on a channel requiring DFS, it will switch channels if radar is detected.

- If Smart RF is enabled, the radio picks a channel defined in the Smart RF policy.
If Smart RF is disabled, but a Smart RF policy is mapped, the radio picks channels specified in the Smart RF policy.

If no SMART RF policy is mapped, the radio selects a random channel.

If the radio is a dedicated sensor, it stops termination on that channel if a neighboring access point detect radar. The access point attempts to come back to its original channel (statically configured or selected by Smart RF) after the channel evacuation period has expired.

Change this behavior using the `dfs-rehome` command from the controller or service platform CLI. This keeps the radio on the newly selected channel and prevents the radio from coming back to the original channel, even after the channel evacuation period.

**NOTE:** Perform RF planning to ensure overlapping coverage exists at a deployment site, for Smart RF to be a viable network performance tool. Smart RF can only provide recovery when access points are deployed appropriately. Smart RF is not a solution, it is a temporary measure. You need to determine the root cause of RF deterioration and fix it. Smart RF history/events can assist in trouble shooting.

Use the (config) instance to configure Smart RF Policy related configuration commands. To navigate to the Smart RF policy instance, use the following commands:

```
<DEVICE>(config)#smart-rf-policy <POLICY-NAME>
rfs7000-37FABE(config)#smart-rf-policy test
rfs7000-37FABE(config-smart-rf-policy-test)#?
```

Smart RF Mode commands:

- `area` Specify channel list/ power for an area
- `assignable-power` Specify the assignable power during power-assignment
- `channel-list` Select channel list for smart-rf
- `channel-width` Select channel width for smart-rf
- `coverage-hole-recovery` Recover from coverage hole
- `dfs` DFS related configuration
- `enable` Enable this smart-rf policy
- `group-by` Configure grouping parameters
- `interference-recovery` Recover issues due to excessive noise and interference
- `neighbor-recovery` Recover issues due to faulty neighbor radios
- `no` Negate a command or set its defaults
- `sensitivity` Configure smart-rf sensitivity (Modifies various other smart-rf configuration items)
- `smart-ocs-monitoring` Smart off channel scanning
- `clrscr` Clear the display screen
- `commit` Commit all changes made in this session
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-smart-rf-policy-test)#
```

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, *COMMON COMMANDS.*
19.1.1 area

**smart-rf-policy**

Configures the channel list and power for a specified area.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

area <AREA-NAME> channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

**Parameters**

- area <AREA-NAME> channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

<table>
<thead>
<tr>
<th>area &lt;AREA-NAME&gt;</th>
<th>Specify the area name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel-list [2.4GHz</td>
<td>5GHz] &lt;CHANNEL-LIST&gt;</td>
</tr>
<tr>
<td>2.4GHz – Selects the channels for the specified area in the 2.4 GHz band</td>
<td></td>

<tr>
<td>5GHz – Selects the channels for the specified area in the 5.0 GHz band</td>
<td></td>
</tr>
<tr>
<td>The following keyword is common to the 2.4 GHz and 5.0 GHz bands:</td>
<td></td>
</tr>
<tr>
<td>&lt;CHANNEL-LIST&gt; – Enter a comma-separated list of channels for the selected band.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-smart-rf-policy-test)#area test channel-list 2.4GHz 1,2,3

rfs7000-37FABE(config-smart-rf-policy-test)#show context smart-rf-policy test
  area test channel-list 2.4GHz 1,2,3
rfs7000-37FABE(config-smart-rf-policy-test)#

**Related Commands**

- **no** Removes channel list/power configuration for an area
19.1.2 assignable-power

Configures the Smart RF power settings over both 2.4 GHZ and 5.0 GHZ radios

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

assignable-power [2.4GHz|5GHz] [max|min] <1-20>

Parameters

- assignable-power [2.4GHz|5GHz] [max|min] <1-20>

| 2.4GHz [max|min] <1-20> | Assigns a power range on the 2.4 GHz band |
|--------------------------|------------------------------------------|
| max <1-20> – Sets the upper limit in the range from 1 dBm - 20 dBm (default is 17 dBm) |
| min <1-20> – Sets the lower limit in the range from 1 dBm - 20 dBm (default is 4 dBm) |

| 5GHz [max|min] <1-20> | Assigns a power range on the 5.0 GHz band |
|-----------------------|------------------------------------------|
| max <1-20> – Sets the upper limit in the range from 1 dBm - 20 dBm (default is 17 dBm) |
| min <1-20> – Sets the lower limit in the range from 1 dBm - 20 dBm (default is 4 dBm) |

Examples

rfs7000-37FABE(config-smart-rf-policy-test)#assignable-power 5GHz max 20
rfs7000-37FABE(config-smart-rf-policy-test)#assignable-power 5GHz min 8

rfs7000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
assignable-power 5GHz min 8
assignable-power 5GHz max 20
rfs7000-37FABE(config-smart-rf-policy-test)#

Related Commands

| no | Resets assignable power to its default |
### 19.1.3 channel-list

#### smart-rf-policy

Assigns a list of channels, for the selected frequency, used in Smart RF scans

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
channel-list [2.4GHz|5GHz] <WORD>
```

#### Parameters

- **channel-list [2.4GHz|5GHz] <WORD>**

<table>

</tbody>
</table>

#### Related Commands

- **no**  
  Removes the channel list for the selected frequency
**19.1.4 channel-width**

- smart-rf-policy

Selects the channel width for Smart RF configuration

---

**NOTE:** In addition to 20 MHz and 40 MHz, AP82XX also provides support for 80 MHz channels.

---

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

channel-width [2.4GHz|5GHz]

channel-width 2.4GHz [20MHz|40MHz|80MHz|auto]
channel-width 5GHz [20MHz|40MHz|80MHz|auto]

**Parameters**

- **channel-width** [2.4GHz|5GHz] [20MHz|40MHz|auto]

<table>
<thead>
<tr>
<th>2.4GHz</th>
<th>Assigns the channel width for the 2.4 GHz band</th>
</tr>
</thead>
</table>
| [20MHz|40MHz|80MHz|auto] | - 20MHz – Assigns the 20 MHz channel width. This is the default setting.  
|         | - 40MHz – Assigns the 40 MHz channel width  
|         | - 80MHz – Assigns the 80 MHz channel width (supported only on AP8232)  
|         | - auto – Assigns the best possible channel in the 20 MHz or 40 MHz channel width  |

<table>
<thead>
<tr>
<th>5GHz</th>
<th>Assigns the channel width for the 5.0 GHz band</th>
</tr>
</thead>
</table>
| [20MHz|40MHz|80MHz|auto] | - 20MHz – Assigns the 20 MHz channel width  
|       | - 40MHz – Assigns the 40 MHz channel width. This is the default setting.  
|       | - 80MHz – Assigns the 80 MHz channel width (supported only on AP8232)  
|       | - auto – Assigns the best possible channel in the 20 MHz, 40 MHz, or 80 MHz channel width |

**Usage Guidelines**

The 20/40 MHz operation allows the access point to receive packets from clients using 20 MHz, and transmit using 40 MHz. This mode is supported for 11n users on both the 2.4 GHz and 5.0 GHz radios. If an 11n user selects two channels (a primary and secondary channel), the system is configured for dynamic 20/40 operation. When 20/40 is selected, clients can take advantage of wider channels. 802.11n clients experience improved throughput using 40 MHz while legacy clients (either 802.11a or 802.11b/g depending on the radio selected) can still be serviced without interruption using 20 MHz. Select Automatic to enable automatic assignment of channels to working radios to avoid channel overlap and avoid interference from external RF sources.
Examples

rfs7000-37FABE(config-smart-rf-policy-test)#channel-width 5GHz auto

rfs7000-37FABE(config-smart-rf-policy-test)#show context smart-rf-policy test
  area test channel-list 2.4GHz 1,2,3
  assignable-power 5GHz min 8
  assignable-power 5GHz max 20
  channel-list 2.4GHz 1,12
  channel-width 5GHz auto
rfs7000-37FABE(config-smart-rf-policy-test)#

</tbody>
</table>
19.1.5 coverage-hole-recovery

*smart-rf-policy*

Enables recovery from coverage hole errors detected by Smart RF. Use this command to configure the coverage hole recovery settings.

When coverage hole recovery is enabled, on detection of a coverage hole, Smart RF first determines the power increase needed based on the *signal-to-noise ratio* (SNR) for a client as seen by the access point radio. If a client's SNR is above the specified threshold, the transmit power is increased until the SNR falls below the threshold.

**NOTE:** The coverage-hole-recovery parameters can be modified only if the sensitivity level is set to 'custom'. For more information see, *sensitivity*.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

coverage-hole-recovery {client-threshold|coverage-interval|interval|snr-threshold}

coverage-hole-recovery {client-threshold [2.4GHz|5GHz] <1-255>}

coverage-hole-recovery {coverage-interval|interval} [2.4GHz|5GHz] <1-120>

coverage-hole-recovery {snr-threshold [2.4GHz|5GHz] <1-75>}

**Parameters**

- **coverage-hole-recovery {client-threshold [2.4GHz|5GHz] <1-255>}**
  - **client-threshold** Optional. Specifies the minimum number of clients associated to a radio in order to trigger coverage hole recovery.
  - **2.4GHz <1-255>** Specifies the minimum number of clients on the 2.4 GHz band
    - <1-255> – Sets a value from 1 - 255. The default is 1.
  - **5GHz <1-255>** Specifies the minimum number of clients on the 5.0 GHz band
    - <1-255> – Sets a value from 1 - 255. The default is 1.

- **coverage-hole-recovery {coverage-interval|interval} [2.4GHz|5GHz] <1-120>**
  - **coverage-interval** Optional. Specifies the interval between the discovery of a coverage hole and the initiation of coverage hole recovery
  - **interval** Optional. Specifies the interval at which coverage hole recovery is performed even before a coverage hole is detected
### coverage-hole-recovery

| 2.4GHz <1-120> | The following keywords are common to the 'coverage-interval' and 'interval' parameters:  
| 2.4GHz <1-120> | Specifies the coverage hole recovery interval on the 2.4 GHz band  
| 2.4GHz <1-120> | Specify a value from 1 - 120 seconds.  
| Note: | coverage-interval – The default is 10 seconds.  
| Note: | interval – The default is 30 seconds.  
| 5GHz <1-120> | The following keywords are common to the 'coverage-interval' and 'interval' parameters:  
| 5GHz <1-120> | Specifies a coverage hole recovery interval on the 5.0 GHz band  
| 5GHz <1-120> | Specify a value from 1 - 120 seconds.  
| Note: | coverage-interval – The default is 10 seconds.  
| Note: | interval – The default is 30 seconds.  

| snr-threshold | Optional. Specifies the SNR threshold. This value is the SNR threshold for an associated client as seen by its associated AP radio. When the SNR threshold is exceeded, the radio increases its transmit power to increase coverage for the associated client.  
| 2.4GHz <1-75> | Specifies SNR threshold on the 2.4 GHz band  
| 2.4GHz <1-75> | Sets a value from 1 dB - 75 dB. The default is 20 dB.  
| 5GHz <1-75> | Specifies SNR threshold on the 5.0 GHz band  
| 5GHz <1-75> | Sets a value from 1 - 75. The default is 20 dB.  

#### Examples

```
rfs7000-37FABE(config-smart-rf-policy-test)#coverage-hole-recovery snr-threshold 5GHz 1
rfs7000-37FABE(config-smart-rf-policy-test)#show context smart-rf-policy test  
area test channel-list 2.4GHz 1,2,3  
sensitivity custom  
assignable-power 5GHz min 8  
assignable-power 5GHz max 20  
channel-list 2.4GHz 1,12  
channel-width 5GHz auto  
coverage-hole-recovery snr-threshold 5GHz 1
```

#### Related Commands

```
no  
```

Disables recovery from coverage hole errors
19.1.6 dfs

.smart-rf-policy

Enables a Smart RF enabled radio to avoid Dynamic Frequency Selection (DFS) regulated channels if radar is detected on those channels. Use this command to configure the period for which a radio avoids the DFS-regulated channel detected with a radar.

Certain 5.0 GHz channels are subject to FCC / ETSI DFS regulations. If a Smart RF enabled radio is on a channel subject to DFS, it switches channels if radar is detected on the assigned 5.0 GHz channel. By default the access point radio attempts to come back to its original channel after the DFS channel evacuation period has expired. To optionally disable the radio from switching back to its original channel of operation, execute the no > dfs-rehome command in the radio interface configuration mode of the access point’s profile.

Supported in the following platforms:

- Access Points — AP300, AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX9000, NX9500, NX9510

Syntax

dfs avoidance-time <30-3600>

Parameters

- dfs avoidance-time <30-3600>

<table>
<thead>
<tr>
<th>dfs avoidance-time &lt;30-3600&gt;</th>
<th>Sets the time, in minutes, for which a radio avoids a DFS-regulated channel detected with a radar</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;30-3600&gt; – Specify a value from 30 - 3600 minutes. The default is 90 minutes.</td>
</tr>
</tbody>
</table>

Examples

rfs6000-81701D(config-smart-rf-policy-test)#dfs avoidance-time 200
rfs6000-81701D(config-smart-rf-policy-test)#show context
smart-rf-policy test
dfs avoidance-time 200
rfs6000-81701D(config-smart-rf-policy-test)#

| no | Reverts the DFS regulated channel avoidance time to default (90 minutes) |
19.1.7 enable

> smart-rf-policy

Enables a Smart RF policy

Use this command to enable this Smart RF policy. Once enabled, the policy can be assigned to a RF Domain supporting a network.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
enable
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-smart-rf-policy-test)#enable
```

19.1.8 group-by

Enables grouping of APs on the basis of their location in a building (floor) or an area.

Within a large RD Domain, grouping of APs (within an area or on the same floor in a building) facilitates statistics gathering and troubleshooting.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

group-by [area|floor]

Parameters

- group-by [area|floor]

<table>
<thead>
<tr>
<th>area</th>
<th>Groups radios based on their area of location</th>
</tr>
</thead>
<tbody>
<tr>
<td>floor</td>
<td>Groups radios based on their floor location</td>
</tr>
</tbody>
</table>

Note: Both options are disabled by default.

Examples

rfs7000-37FABE(config-smart-rf-policy-test)#group-by floor

rfs7000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
group-by floor
sensitivity custom
assignable-power 5GHz min 8
assignable-power 5GHz max 20
channel-list 2.4GHz 1,12
channel-width 5GHz auto
coverage-hole-recovery snr-threshold 5GHz 1
rfs7000-37FABE(config-smart-rf-policy-test)#

### 19.1.9 interference-recovery

**smart-rf-policy**

Enables interference recovery from neighboring radios and other sources of WiFi and non-WiFi interference. Interference is the excess noise detected within the Smart RF supported radio coverage area. Smart RF provides mitigation from interfering sources by monitoring the noise levels and other RF parameters on an access point radio's current channel. When a noise threshold is exceeded, Smart RF selects an alternative channel with less interference. To avoid channel flapping a hold timer is defined, which disables interference avoidance for a specific period of time upon detection. Interference recovery is enabled by default.

**NOTE:** The interference-recovery parameters can be modified only if the sensitivity level is set to 'custom'. For more information see, sensitivity.

**Supported in the following platforms:**
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
interference-recovery {channel-hold-time|channel-switch-delta|client-threshold|
interference|neighbor-offset|noise|noise-factor}
```

```
interference-recovery {channel-switch-delta [2.4GHz|5GHz] <5-35>}
```

```
interference-recovery {channel-hold-time <0-86400>|client-threshold <1-255>|
interference|neighbor-offset <3-10>|noise|noise-factor <1.0-3.0>}
```

**Parameters**

- **interference-recovery {channel-switch-delta [2.4GHz|5GHz] <5-35>}**

<table>
<thead>
<tr>
<th>channel-switch-delta</th>
<th>Optional. Configures a threshold value for the difference between interference levels on the current channel and the prospective channel needed to trigger a channel change. If the difference in noise levels on the current channel and the prospective channel is below the configured threshold, the channel is not changed.</th>

**Related Commands**

`no` Disables recovery from excessive noise and interference

---

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| client-threshold <1-255>   | Optional. Specifies client thresholds needed to avoid channel change. If the specified threshold number of clients are connected to a radio, the radio avoids changing channels even if the Smart RF master determines that a channel change is required. 
  - `<1-255>` – Sets the number of clients from 1 - 255. The default is 50. |
| interference              | Optional. Considers external interference values to perform interference recovery. This feature allows the Smart RF policy to scan for excess interference from supported radio devices. WLANs are susceptible to sources of interference, such as neighboring radios, cordless phones, microwave ovens and Bluetooth devices. When interference for WiFi sources is detected, Smart RF supported devices can change the channel and move to a cleaner channel. This feature is enabled by default. |
| neighbor-offset <3-10>     | Optional. Configures a noise factor value, which is taken into consideration when switching channels to avoid interference from neighboring access points. Smart RF enabled access points consider the difference in noise between candidate channels. 
  - `<3-10>` – Specify a noise factor value from 3 - 10. |
| noise                      | Optional. Considers noise values to perform interference recovery. This feature allows the Smart RF policy to scan for excess noise from WiFi devices. When detected, Smart RF supported devices can change their channel and move to a cleaner channel. This feature is enabled by default. |
| noise-factor <1.0-3.0>     | Optional. Configures additional noise factor (the level of network interference detected) for non WiFi interference 
  - `<1.0-3.0>` – Specify the noise factor from 1.0 - 3.0. The default is 1.50. |
19.1.10 neighbor-recovery

- smart-rf-policy

Enables recovery from errors due to faulty neighboring radios. Enabling neighbor recovery ensures automatic recovery from failed radios within the radio coverage area. Smart RF instructs neighboring access points to increase their transmit power to compensate for the failed radio. Neighbor recovery is enabled by default when the sensitivity setting is medium.

**NOTE:** The neighbor-recovery parameters can be modified only if the sensitivity level is set to 'custom'. For more information see, [sensitivity](#).

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

neighbor-recovery {dynamic-sampling|power-hold-time|power-threshold}

neighbor-recovery {dynamic-sampling} {retries <1-10>|threshold <1-30>}

neighbor-recovery {power-hold-time <0-3600>}

neighbor-recovery {power-threshold [2.4Ghz|5Ghz] <-85--55>}

**Parameters**

- **neighbor-recovery {dynamic-sampling} {retries <1-10>|threshold <1-30>}**
  - **dynamic-sampling** Optional. Enables dynamic sampling on this Smart RF policy. Dynamic sampling allows you to define how Smart RF adjustments are triggered by locking the ‘retry’ and ‘threshold’ values. Dynamic sampling is disabled by default.
  - **retries <1-10>** Optional. Specifies the number of retries before allowing a power level adjustments to compensate for a potential coverage hole.
    - <1-10> — Sets the number of retries from 1 - 10. The default is 3.
  - **threshold <1-30>** Optional. Specifies the minimum number of sample reports before which a power change requires dynamic sampling.
    - <1-30> — Sets the minimum number of reports from 1 - 30. The default is 5.

- **neighbor-recovery {power-hold-time <0-3600>}**
  - **power-hold-time** Optional. Specifies the minimum time, in seconds, between two power changes on a radio during neighbor-recovery.
  - <0-3600> Sets the time from 0 - 3600 sec. The default is 0 seconds.
• **neighbor-recovery** `{power-threshold \[2.4GHz\|5GHz\] <-85--55>}

<table>

no group-by [area|floor]
no interference-recovery {channel-hold-time|channel-switch-delta [2.4GHZ|5GHZ]|
   client-threshold|interference|neighbor-offset|noise|noise-factor}
no neighbor-recovery {dynamic-sampling {retries|threshold}|power-hold-time|
   power-threshold [2.4GHZ|5GHZ]}
no smart-rf-monitoring {awareness-override {schedule <1-3>|threshold}|}
   client-aware [2.4GHZ|5GHZ]|extended-scan-frequency [2.4GHZ|5GHZ]|
   frequency [2.4GHZ|5GHZ]|off-channel-duration [2.4GHZ|5GHZ]|
   power-save-aware [2.4GHZ|5GHZ]|sample-count [2.4GHZ|5GHZ]|voice-aware [2.4GHZ|5GHZ]}
```

#### Parameters
- **no <PARAMETERS>**

| no <PARAMETERS> | Negates a command or sets its default. When used in the config Smart RF policy mode, the `no` command disables or resets the Smart RF policy settings. |

#### Examples

The following example shows the Smart RF policy 'test' settings before the 'no' commands are executed:

```
rfs7000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
  area test channel-list 2.4GHz 1,2,3
group-by floor
  sensitivity custom
  assignable-power 5GHz min 8
  assignable-power 5GHz max 20
  channel-list 2.4GHz 1,12
  channel-width 5GHz auto
  interference-recovery channel-switch-delta 5GHz 5
  neighbor-recovery power-threshold 5GHz -65
```
neighbor-recovery power-threshold 2.4GHz -82
coverage-hole-recovery snr-threshold 5GHz 1
rfs7000-37FABE(config-smart-rf-policy-test)#
rfs7000-37FABE(config-smart-rf-policy-test)#no interference-recovery channel-switch-delta 5GHz
rfs7000-37FABE(config-smart-rf-policy-test)#no neighbor-recovery power-threshold 2.4GHz
rfs7000-37FABE(config-smart-rf-policy-test)#no neighbor-recovery power-threshold 5GHz
rfs7000-37FABE(config-smart-rf-policy-test)#no assignable-power 5GHz min
rfs7000-37FABE(config-smart-rf-policy-test)#no assignable-power 5GHz max

The following example shows the Smart RF policy 'test' settings after the 'no' commands are executed:

rfs7000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
group-by floor
sensitivity custom
channel-list 2.4GHz 1,12
channel-width 5GHz auto
coverage-hole-recovery snr-threshold 5GHz 1
rfs7000-37FABE(config-smart-rf-policy-test)#
19.1.12 sensitivity

smart-rf-policy

Configures Smart RF sensitivity level. The sensitivity level determines Smart RF scanning and sampling aggressiveness. For example, a low sensitivity level indicates a less aggressive Smart-RF policy. This translates to fewer samples taken during off-channel scanning and short off-channel durations. When the sensitivity level is set to high, Smart-RF collects more samples, and remains off-channel longer.

The Smart RF sensitivity level options include low, medium, high, and custom. Medium is the default setting. The custom option allows an administrator to adjust the parameters and thresholds for interference recovery, coverage hole recovery, and neighbor recovery. However, the low, medium, and high settings still allow utilization of these features.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

sensitivity [custom|high|low|medium]

Parameters

- sensitivity [custom|high|low|medium]

Usage Guidelines

To enable the power and channel setting parameters, set sensitivity to custom or medium.
To enable the monitoring and scanning parameters, set sensitivity to custom.
To enable the neighbor recovery, interference and coverage hole recovery parameters, set sensitivity to custom.

Examples

rfs7000-37FABE(config-smart-rf-policy-test)#sensitivity high

rfs7000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test

  smart-ocs-monitoring frequency 2.4GHz 3
  smart-ocs-monitoring sample-count 5GHz 3
  smart-ocs-monitoring sample-count 2.4GHz 3
  --More--
rfs7000-37FABE(config-smart-rf-policy-test)
19.1.13 **smart-ocs-monitoring**

Applies smart *Off Channel Scanning* (OCS) instead of dedicated detectors

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX7500, NX9000, NX9500, NX9510

**Syntax**

```
smart-ocs-monitoring {awareness-override|client-aware|extended-scan-frequency|frequency|off-channel-duration|power-save-aware|sample-count|voice-aware}
smart-ocs-monitoring {awareness-override [schedule|threshold]}
smart-ocs-monitoring {awareness-override schedule <1-3> <START-TIME> <END-TIME> <DAY>}
smart-ocs-monitoring {awareness-override threshold <10-10000>}
smart-ocs-monitoring {client-aware [2.4GHz|5GHz] <1-255>}
smart-ocs-monitoring {extended-scan-frequency [2.4GHz|5GHz] <0-50>}
smart-ocs-monitoring {frequency [2.4GHz|5GHz] <1-120>}
smart-ocs-monitoring {off-channel-duration [2.4GHz|5GHz] <20-150>}
smart-ocs-monitoring {power-save-aware [2.4GHz|5GHz] [disable|dynamic|strict]}
smart-ocs-monitoring {sample-count [2.4GHz|5GHz] <1-15>}
smart-ocs-monitoring {voice-aware [2.4GHz|5GHz] [disable|dynamic|strict]}
```

**Parameters**

</table>
### smart-ocs-monitoring \{awareness-override threshold \(<10-10000\)\}

**awareness-override threshold \(<10-10000\>**

Optional. Use this parameter to configure client awareness settings overrides
- **threshold** – Specifies the threshold after which client awareness settings are overridden. When the specified threshold is reached, awareness settings are overridden.
  - \(<10-10000>\) – Specify a threshold value from 10 -10000. The default is 10.

### smart-ocs-monitoring \{client-aware \[2.4GHz|5GHz\] \(<1-255>\)\}

**client-aware**

Optional. Enables client aware scanning on this Smart RF policy

Use this parameter to configure a client threshold number. When the number of clients connected to a radio equals this threshold number, the radio avoids channel scanning. This feature is disabled by default.

#### 2.4GHz \(<1-255>\>

Enables client aware scanning on the 2.4 GHz band
- Avoids radio scanning when a specified minimum number of clients are present
  - \(<1-255>\) – Sets the minimum number of clients from 1 - 255. The default is 1 client.

#### 5GHz \(<1-255>\>

Enables client aware scanning on the 5.0 GHz band
- Avoids radio scanning when a specified minimum number of clients are present
  - \(<1-255>\) – Sets the minimum number of clients from 1 - 255. The default is 1 client.

### smart-ocs-monitoring \{extended-scan-frequency \[2.4GHz|5GHz\] \(<0-50>\)\}

**extended-scan-frequency**

Optional. Enables an extended scan, as opposed to a neighbor only scan, on this Smart RF policy. This is the frequency radios use to scan for non-peer radios.

#### 2.4GHz \(<0-50>\>

Enables extended scan on the 2.4 GHz band
- \(<0-50>\) – Sets the number of trails from 0 - 50. The default is 5.

#### 5GHz \(<0-50>\>

Enables extended scan on the 5.0 GHz band
- \(<0-50>\) – Sets the number of trails from 0 - 50. The default is 5.

### smart-ocs-monitoring \{frequency \[2.4GHz|5GHz\] \(<1-120>\)\}

**frequency**

Optional. Specifies the scan frequency. This is the frequency, in seconds, in which smart-ocs-monitoring changes channels for an off channel scan.

#### 2.4GHz \(<1-120>\>

Selects the 2.4 GHz band
- \(<1-120>\) – Sets a scan frequency from 1 - 120 sec. The default is 6 seconds.

#### 5GHz \(<1-120>\>

Selects the 5.0 GHz band
- \(<1-120>\) – Sets a scan frequency from 1 - 120 sec. The default is 6 seconds.

### smart-ocs-monitoring \{off-channel-duration \[2.4GHz|5GHz\] \(<20-150>\)\}

**off-channel-duration**

Optional. Specifies the duration to scan off channel
- This is the duration access point radios use to monitor devices within the network and, if necessary, perform self healing and neighbor recovery to compensate for coverage area losses within a RF Domain.
| **2.4GHz <20-150>** | Selects the 2.4 GHz band (in milliseconds)  
| | • <20-150> – Sets the off channel duration from 20 - 150 msec. The default is 50 milliseconds. |
| **5GHz <20-150>** | Selects the 5.0 GHz band (in milliseconds)  
| | • <20-150> – Sets the off channel duration from 20 - 150 msec. The default is 50 milliseconds. |

- **smart-ocs-monitoring** `{power-save-aware [2.4GHz/5GHz] [disable/dynamic/strict]}`

**power-save-aware**  
Optional. Enables power save awareness scanning mode on this Smart RF policy. The options are: disable, dynamic, and strict.  
This setting allows Smart RF to detect power save clients and take them into consideration when performing off channel scans.  
Strict disables smart monitoring as long as a power save capable client is associated to a radio. Dynamic disables smart monitoring as long as there is data buffered for a power save client at the radio.  

- **2.4GHz [disable/dynamic/strict]**  
  Sets power save awareness scanning mode on the 2.4 GHz band  
  • disable – Disables power save awareness scanning  
  • dynamic – Dynamically avoids scanning based on traffic for power save (PSP) clients  
  • strict – Strictly avoids scanning when PSP clients are present  
  **Note:** The default is dynamic.  

- **5GHz [disable/dynamic/strict]**  
  Sets power save awareness scanning mode on the 5.0 GHz band  
  • disable – Disables power save awareness scanning  
  • dynamic – Dynamically avoids scanning based on traffic for PSP clients  
  • strict – Strictly avoids scanning when PSP clients are present  
  **Note:** The default is dynamic.  

- **smart-ocs-monitoring** `{sample-count [2.4GHz/5GHz] <1-15>}`

**sample-count**  
Optional. Specifies the number of samples to collect before reporting an issue to the Smart RF master  

- **2.4GHz <1-15>**  
  Selects the 2.4 GHz band  
  • <1-15> – Specifies the number of samples to collect from 1 - 15. The default is 10.  

- **5GHz <1-15>**  
  Selects the 5.0 GHz band  
  • <1-15> – Specifies the number of samples to collect from 1 - 15. The default is 5.  

- **smart-ocs-monitoring** `{voice-aware [2.4GHz/5GHz] [disable/dynamic/strict]}`

**voice-aware**  
Optional. Enables voice awareness scanning mode on this Smart RF policy. The options are: disable, dynamic, and strict.  
Strict disables smart monitoring as long as a voice client is associated to a radio. Dynamic disables smart monitoring as long as there is data buffered for a voice client at the radio.

Disables off channel monitoring
This chapter summarizes the *Wireless Intrusion Protection Systems* (WIPS) policy commands in the CLI command structure. WIPS is an additional measure of security designed to continuously monitor the network for threats and intrusions. Along with wireless VPNs, encryptions, and authentication policies WIPS enhances the security of a WLAN.

The WIPS policy enables detection of intrusions and threats that a managed network is likely to encounter. However, the WIPS policy does not include threat mitigation configurations. These intrusions and threats are available within the WIPS policy configuration mode as pre configured, fixed events. Each event consists of a set of frames or anomalies that may be harmful to the managed network. You can enable/disable various aspects of each individual event.

Events are broadly grouped into the following three categories:

- **Excessive/Thresholdable events**: These events detect DOS attacks, like excessive deauths, EAP floods etc. Threshold limits for such events can be configured for *mobile units* (MU) and radios. Once these threshold limits are exceeded, an event is triggered. Stations triggering an event are usually filtered. You can configure a filter ageout specifying the time for which the station, triggering the event, is filtered. However, the filter ageout only applies when the MU-threshold is exceeded. When radio threshold is reached, the system raises a warning about the same and updates event history with event details.

- **Station/MU anomalies**: These events are triggered when a MU performs suspicious activities that can compromise the security and stability of the managed network. You can configure a filter ageout, similar to the above class of events, to filter the station triggering such events.

- **AP/neighbor anomalies**: These events are triggered when an AP or neighbor sends suspicious frames. The system cannot filter APs or neighbors triggering such events. However, the system warns you about such attacks, allowing you to take further actions against such APs and neighbors.

In addition to event monitoring configuration, the WIPS policy allows you to configure a list of signatures. Unlike events, signatures are not fixed. You are free to define your own signatures based on a specific set of parameters. A signature is a rule, consisting of a set of fields to match and a corresponding set of actions in case of a match. By default, whenever a signature is matched an event log is triggered. This event log is similar to the one triggered upon an event. In addition to an event log, you can also configure other actions. Signatures have all the features supported by events. In fact most events are internally implemented as signatures.

Signature rules are of the following three types:

- **ssid, ssid length rule**: This signature matches a specified SSID or SSID length. It is mandatory to configure the frame type to match for this signature. When configured, only frame types allowed are beacons, probe requests, and probe responses. Example rule: *ssid : AirJack and frame type beacon : Signature for AirJack attack.*
payload rule: This signature matches a particular payload at a particular frame offset. You can restrict these matches based on frame type. Example rule: Payload : 0x00601d Offset 3 : Netstumbler

address-match rule: This signature matches one or more address fields. The address fields supported are BSSID, source-MAC, and destination-MAC. You can also specify frame types to match. The frame types supported are assoc, auth, beacon, data, deauth, disassoc, mgmt, probe-request, and probe-response.

A WIPS policy, once configured, has to be attached to a RF Domain to take effect. Multiple WIPS policies can be configured at the same time, but only one policy can be attached to a given RF Domain at any time.

NOTE: To attach a WIPS policy to a RF Domain, in the RF Domain configuration mode, execute the use > wips-policy <WIPS-POLICY-NAME> command. For more information, see use.

NOTE: With this most recent release, AP7522 and AP7532 model Access Points can provide enhanced sensor support. AP7522 and AP7532 sensors can send data from off-channel-scans while in radio-share promiscuous/inline mode, in addition to the on-channel data captured in radio-share mode. ADSP uses the off-channel-scan data (in addition to the on-channel data) to monitor for rogue intrusions and trigger alarms. OTA Termination is triggered from ADSP to the appropriate radio-share AP to initiate termination.

NOTE: AP7522 and AP7532 models also support shared part-time scanning using WIPS in WiNG (using off-channel-scans) and no ADSP. WIPS on WiNG was enhanced to add rogue detection/classification (wired side detection based on MAC Address Offset) and over-the-air (OTA) termination for AP7522 and AP7532 deployments.

Use the (config) instance to configure WIPS policy commands. To navigate to the WIPS policy instance, use the following commands:

<DEVICE>(config)#wips-policy <POLICY-NAME>

rfs7000-37FABE(config)#wips-policy test
rfs7000-37FABE(config-wips-policy-test)#?

Wips Policy Mode commands:
ap-detection               Rogue AP detection
enable                     Enable this wips policy
event                      Configure an event
history-throttle-duration  Configure the duration for which event duplicates are not stored in history
interference-event         Specify events which will contribute to smart-rf wifi interference calculations
no                         Negate a command or set its defaults
signature                  Signature to configure
use                        Set setting to use
clrscr                     Clears the display screen
commit                     Commit all changes made in this session
do                         Run commands from Exec mode
end                        End current mode and change to EXEC mode
exit                       End current mode and down to previous mode
help                       Description of the interactive help system
revert                     Revert changes
service                    Service Commands
show                       Show running system information
write                      Write running configuration to memory or terminal

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
20.1.1 ap-detection

Enables the detection of unauthorized or unsanctioned APs. Unauthorized APs are untrusted access points connected to an access point managed network. These untrusted APs accept wireless client associations. It is important to detect such rogue APs and declare them unauthorized. Rogue AP detection is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ap-detection {age-out|air-termination|interferer-threshold <-100--10>|recurring-event-interval <0-10000>|wait-time}
ap-detection {age-out <30-86400>|wait-time <10-600>}
ap-detection air-termination {allow-channel-switch|mode [auto|manual]}

Parameters

- **age-out**
  - `<30-86400>` — Sets an ageout interval from 30 - 86400 seconds. The default is 5 minutes (300 seconds).

- **air-termination**
  - `{allow-channel-switch|mode [auto|manual]}`
  - Enables air termination of unauthorized APs. This option is disabled by default.
  - allow-channel-switch — Allows channel switch of unauthorized APs based on the channel mode. This option is disabled by default.
  - mode [auto|manual] — Select the mode as auto or manual to configure. The default setting is manual.

- **recurring-event-interval**
  - `<0-10000>` — Configures the recurring interval between 0 - 10000 seconds. The default is 300 seconds.

- **interferer-threshold**
  - `<-100--10>` — Configures the rssi threshold between -100 - -10 dBm. The default is -75 dBm.

- **wait-time**
  - `<10-600>` — Sets a wait time from 10 - 600 seconds. The default is 1 minute (60 seconds).

Examples

```bash
rfs7000-37FABE(config-wips-policy-test)#ap-detection wait-time 15
rfs7000-37FABE(config-wips-policy-test)#ap-detection age-out 50

rfs7000-37FABE(config-wips-policy-test)#ap-detection recurring-event-interval 10
```

```bash
nx4500-5CFA8E(config-wips-policy-test)#ap-detection recurring-event-interval 10
```
nx4500-5CFA8E(config-wips-policy-test)#show context wips-policy test  
ap-detection recurring-event-interval 10
nx4500-5CFA8E(config-wips-policy-test)#

20.1.2 enable

Enables this WIPS policy

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
enable

Parameters
None

Examples
rfs7000-37FABE(config-wips-policy-test)#enable
rfs7000-37FABE(config-wips-policy-test)#

Related Commands

| no       | Disables a WIPS policy |
20.1.3 event

Configures events, filters and threshold values for this WIPS policy. Events are grouped into three categories, AP anomaly, client anomaly, and excessive. WLANs are baselined for matching criteria. Any deviation from this baseline is considered an anomaly and logged as an event.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
event [ap-anomaly|client-anomaly|enable-all-events|excessive]
event ap-anomaly [ad-hoc-violation|airjack|ap-ssid-broadcast-in-beacon|asleap|
    impersonation-attack|null-probe-response|transmitting-device-using-invalid-mac|
    unencrypted-wired-leakage|wireless-bridge]
event client-anomaly [dos-broadcast-deauth|fuzzing-all-zero-macs|
    fuzzing-invalid-frame-type|fuzzing-invalid-mgmt-frames|fuzzing-invalid-seq-num|
    identical-src-and-dest-addr|invalid-8021x-frames|netstumbler-generic|
    non-conforming-data|tkip-mic-counter-measures|wellenreiter] {filter-ageout <0-86400>}
event enable-all-events

event excessive [80211-replay-check-failure|aggressive-scanning|auth-server-failures|
    decryption-failures|dos-associator-auth-flood|dos-eapol-start-storm|
    dos-unicast-deauth-or-disassoc|eap-flood|eap-nak-flood|frames-from-unassoc-station] {filter-ageout <0-86400>|threshold-client <0-65535>|threshold-radio <0-65535>}
```

Parameters

- event ap-anomaly [ad-hoc-violation|airjack|ap-ssid-broadcast-in-beacon|asleap|
    impersonation-attack|null-probe-response|transmitting-device-using-invalid-mac|
    unencrypted-wired-leakage|wireless-bridge]

- ap-anomaly Enables AP anomaly event tracking
  An AP anomaly event refers to suspicious frames sent by neighboring APs. An administrator enables or disables the filtering of each listed event and sets the thresholds for the generation of event notification and filtering.

- ad-hoc-violation Tracks ad-hoc network violations

- airjack Tracks AirJack attacks

- ap-ssid-broadcast-in-beacon Tracks AP SSID broadcasts in beacon events

- asleap Tracks ASLEAP attacks. These attacks break Lightweight Extensible Authentication Protocol (LEAP) passwords
<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>impersonation-attack</td>
<td>Tracks impersonation attacks. These are also referred to as spoofing attacks, where the attacker assumes the address of an authorized device.</td>
</tr>
<tr>
<td>null-probe-response</td>
<td>Tracks null probe response attacks</td>
</tr>
<tr>
<td>transmitting-device-using-invalid-mac</td>
<td>Tracks the transmitting device using an invalid MAC attacks</td>
</tr>
<tr>
<td>unencrypted-wired-leakage</td>
<td>Tracks unencrypted wired leakage</td>
</tr>
<tr>
<td>wireless-bridge</td>
<td>Tracks wireless bridge (WDS) frames</td>
</tr>
</tbody>
</table>

- **client-anomaly** Enables client anomaly event tracking
  These are suspicious events performed by wireless clients compromising the security of the network. An administrator can enable or disable filtering of each listed event and set the thresholds required for the generation of the event notification and filtering action applied.

- **dos-broadcast-deauth** Tracks DoS broadcast deauthentication events
- **fuzzing-all-zero-macs** Tracks Fuzzing: All zero MAC addresses observed
- **fuzzing-invalid-frame-type** Tracks Fuzzing: Invalid frame type detected
- **fuzzing-invalid-mgmt-frames** Tracks Fuzzing: Invalid management frame detected
- **fuzzing-invalid-seq-num** Tracks Fuzzing: Invalid sequence number detected
- **identical-src-and-dest-addr** Tracks identical source and destination addresses detection
- **invalid-8021x-frames** Tracks Fuzzing: Invalid 802.1x frames detected
- **netstumbler-generic** Tracks Netstumbler (v3.2.0, 3.2.3, 3.3.0) events
- **non-conforming-data** Tracks non conforming data packets
- **wellenreiter** Tracks Wellenreiter events

- **filter-ageout <0-86400>** The following keywords are common to all of the above client anomaly events:
  - `filter-ageout <0-86400> -- Optional. Configures the filter expiration interval in seconds
  - `<0-86400> -- Sets the filter ageout interval from 0 - 86400 seconds. The default is 0 seconds.``

**Note:** For each violation define a filter time in seconds, which determines how long the packets (received from an attacking device) are ignored once a violation has been triggered. Ignoring frames from an attacking device minimizes the effectiveness of the attack and the impact to the site until permanent mitigation can be performed.

**Note:** The filter ageout value is applicable across the entire RF Domain using this WIPS policy. If an MU is detected performing an attack and is filtered by one of the APs, the information is passed on to all APs and controllers within the RF Domain through the domain manager. Consequently the MU is filtered, for the specified period of time, across all devices.
### event enable-all-events

| enable-all-events | Enables tracking of all intrusion events (client anomaly and excessive events) |

### excessive

| excessive | Enables the tracking of excessive events. Excessive events are actions performed continuously and repetitively. These events can impact the performance of the controller managed network. DoS attacks come under this category. |

| 80211-replay-check-failure | Tracks 802.11 replay check failure |
| aggressive-scanning | Tracks aggressive scanning events |
| auth-server-failures | Tracks failures reported by authentication servers |
| decryption-failures | Tracks decryption failures |
| dos-assoc-or-auth-flood | Tracks DoS association or authentication floods |
| dos-eapol-start-storm | Tracks DoS EAPOL start storms |
| dos-unicast-deauth-or-disassoc | Tracks DoS dissociation or deauthentication floods |
| eap-flood | Tracks EAP floods |
| eap-nak-flood | Tracks EAP NAK floods |
| frames-from-unassoc-station | Tracks frames from unassociated clients |

| filter-ageout <0-86400> | The following keywords are common to all excessive events: |
| | • filter-ageout <0-86400> — Optional. Configures a filter expiration interval in seconds. It sets the duration for which the client is filtered. The client is added to a ACL as a special entry and frames received from this client are dropped. |
| | • <0-86400> — Sets a filter ageout interval from 0 - 86400 seconds. The default is 0 seconds. |

**Note:** This value is applicable across the RF Domain. If a client is detected performing an attack and is filtered by one of the APs, the information is passed to the domain controller. The domain controller then propagates this information to all APs and wireless controllers in the RF Domain.

| threshold-client <0-65535> | The following keywords are common to all excessive events: |
| | • threshold-client <0-65535> — Optional. Configures a client threshold value after which the filter is triggered and an event is recorded |
| | • <0-65535> — Sets a wireless client threshold value from 0 - 65535 seconds |

| threshold-radio <0-65535> | The following keywords are common to all excessive events: |
| | • threshold-radio <0-65535> — Optional. Configures a radio threshold value after which the filter is triggered and an event is recorded |
| | • <0-65535> — Sets a radio threshold value from 0 - 65535 seconds |
Examples
rfs7000-37FABE(config-wips-policy-test)#event excessive 80211-replay-check-failure
  filter-ageout 9 threshold-client 8 threshold-radio 99

rfs7000-37FABE(config-wips-policy-test)#show context

20.1.4 history-throttle-duration

*WIPS-policy*

Configures the duration event duplicates are omitted from the event history

The system maintains a history of all events that have occurred, on each device, within a RF Domain. Sometimes an event occurs for a prolonged period of time and tends to fill up the event history list. In such a scenario, duplicate information added to the event history list can be throttled for a specified period of time. Once this period is over, duplicate entries are once again allowed.

Event history statistics are periodically sent to the domain manager, which can be queried to ascertain the general health of the domain.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

history-throttle-duration <30-86400>

**Parameters**

- history-throttle-duration <30-86400>

<table>

Related Commands

*no* | Disables this WIPS policy signature as a Smart RF interference source |
20.1.6 no

Negates a command or resets configured settings to their default. When used in the config WIPS policy mode, the `no` command negates or resets filters and thresholds.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
no [ap-detection|enable|event|history-throttle-duration|interference-event|signature|use]
no [enable|history-throttle-duration]
no ap-detection {ageout {<LINE-SINK>}}|air-termination|interferer-threshold {-100--10}|recurring-event-interval <0-10000>wait-time {<LINE-SINK>}}
no event [ap-anomaly|client-anomaly|enable-all-events|excessive]
no interference-event [non-conforming-data|wireless-bridge]
no signature <WIPS-SIGNATURE>
no use device-categorization
```

**Parameters**

- **no <PARAMETERS>**

  Negates a command or resets configured settings to their default. When used in the config WIPS policy mode, the `no` command negates or resets filters and thresholds.

**Usage Guidelines**

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.
Examples

The following example shows the WIPS Policy 'test' settings before the 'no' commands are executed:

```
rfs7000-37FABE(config-wips-policy-test)#show context
wips-policy test
  history-throttle-duration 77
  event excessive 80211-replay-check-failure threshold-client 10 threshold-radio 99
  filter-ageout 9
  event client-anomaly wellenreiter filter-ageout 99
  interference-event non-conforming-data
  ap-detection-ageout 50
  ap-detection-wait-time 15
rfs7000-37FABE(config-wips-policy-test)#
rfs7000-37FABE(config-wips-policy-test)#no event client-anomaly wellenreiter filter-ageout 99
rfs7000-37FABE(config-wips-policy-test)#no interference-event non-conforming-data
rfs7000-37FABE(config-wips-policy-test)#no history-throttle-duration
```

The following example shows the WIPS Policy 'test' settings after the 'no' commands are executed:

```
rfs7000-37FABE(config-wips-policy-test)#show context
wips-policy test
  event excessive 80211-replay-check-failure threshold-client 10 threshold-radio 99
  filter-ageout 9
  no event client-anomaly wellenreiter filter-ageout 99
  ap-detection-ageout 50
  ap-detection-wait-time 15
rfs7000-37FABE(config-wips-policy-test)#
```
20.1.7 signature

Attack and intrusion patterns are identified and configured as signatures in a WIPS policy. The WIPS policy compares packets in the network with pre configured signatures to identify threats.

The following table summarizes WIPS policy signature configuration commands:

<table>
<thead>
<tr>
<th>signature</th>
<th>Configures a WIPS policy signature and enters its configuration mode</th>
<th>page 20-16</th>
</tr>
</thead>
<tbody>
<tr>
<td>signature mode commands</td>
<td>Summarizes WIPS signature configuration mode commands</td>
<td>page 20-18</td>
</tr>
</tbody>
</table>
20.1.7.1 signature

```
signature
```

Configures a WIPS policy signature

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
signature <SIGNATURE-NAME>
```

Parameters

- signature <SIGNATURE-NAME>

Examples

```
rfs7000-37FABE(config-wips-policy-test)#signature test
rfs7000-37FABE(config-test-signature-test)#
```

```
rfs7000-37FABE(config-test-signature-test)#?

20.1.7.2.1 bssid

*signature mode commands*

Configures a BSSID MAC address with this WIPS signature for matching

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
bssid <MAC>
```

**Parameters**

- `bssid <MAC>`

<table>
<thead>
<tr>
<th>bssid &lt;MAC&gt;</th>
<th>Configures a BSSID MAC address to match</th>
</tr>
</thead>
</table>

• `<MAC>` – Specify the MAC address.

**Examples**

```
rfs7000-37FABE(config-test-signature-test)#bssid 11-22-33-44-55-66
rfs7000-37FABE(config-test-signature-test)#show context signature test
bssid 11-22-33-44-55-66
rfs7000-37FABE(config-test-signature-test)#
```

**Related Commands**

- `no` Disables a WIPS signature BSS ID
20.1.7.2.2 dst-mac

*signature mode commands*

Configures a destination MAC address for the packet examined for matching

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
dst-mac <MAC>

**Parameters**
- dst-mac <MAC>

<table>
<thead>
<tr>
<th>dst-mac &lt;MAC&gt;</th>
<th>Configures a destination MAC address to match</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;MAC&gt;</td>
<td>Specify the destination MAC address.</td>
</tr>
</tbody>
</table>

**Examples**
rfs7000-37FABE(config-test-signature-test)#dst-mac 55-66-77-88-99-00

rfs7000-37FABE(config-test-signature-test)#show context signature test
  bssid 11-22-33-44-55-66
dst-mac 55-66-77-88-99-00
rfs7000-37FABE(config-test-signature-test)#

**Related Commands**

| no | Disables a WIPS signature destination MAC address |
20.1.7.2.3 filter-ageout

**signature mode commands**

Configures the filter ageout interval in seconds. This is the duration a client, triggering a WIPS event, is excluded from RF Domain manager radio association.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
filter-ageout <1-86400>
```

**Parameters**

- `filter-ageout <1-86400>`

<table>
<thead>
<tr>
<th>filter-ageout</th>
<th>Configures the filter ageout interval from 1 - 86400 seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-86400&gt;</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-test-signature-test)#filter-ageout 8
rfs7000-37FABE(config-test-signature-test)#show context
  signature test
    bssid 11-22-33-44-55-66
    dst-mac 55-66-77-88-99-00
    filter-ageout 8
rfs7000-37FABE(config-test-signature-test)#
```

**Related Commands**

- `no` Removes the configured filter ageout interval
20.1.7.2.4 frame-type

signature mode commands

Configures the frame type used for matching with this WIPS policy signature

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

frame-type [all|assoc|auth|beacon|data|deauth|disassoc|mgmt|probe-req|probe-resp|reassoc]

Parameters

- frame-type [all|assoc|auth|beacon|data|deauth|disassoc|mgmt|probe-req|probe-resp|reassoc]

<table>
<thead>
<tr>
<th>frame-type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Configures all frame type matching</td>
</tr>
<tr>
<td>assoc</td>
<td>Configures association frame matching</td>
</tr>
<tr>
<td>auth</td>
<td>Configures authentication frame matching</td>
</tr>
<tr>
<td>beacon</td>
<td>Configures beacon frame matching</td>
</tr>
<tr>
<td>data</td>
<td>Configures data frame matching</td>
</tr>
<tr>
<td>deauth</td>
<td>Configures deauthentication frame matching</td>
</tr>
<tr>
<td>disassoc</td>
<td>Configures disassociation frame matching</td>
</tr>
<tr>
<td>mgmt</td>
<td>Configures management frame matching</td>
</tr>
<tr>
<td>probe-req</td>
<td>Configures probe request frame matching</td>
</tr>
<tr>
<td>probe-resp</td>
<td>Configures probe response frame matching</td>
</tr>
<tr>
<td>reassoc</td>
<td>Configures re-association frame matching</td>
</tr>
</tbody>
</table>

Usage Guidelines

The frame type configured determines the SSID match type configured. To configure the SSID match type as SSID, the frame type must be beacon, probe-req or probe-resp.

Examples

rfs7000-37FABE(config-test-signature-test)#frame-type reassoc

rfs7000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  dst-mac 55-66-77-88-99-00
  frame-type reassoc
  filter-ageout 8
rfs7000-37FABE(config-test-signature-test)#

</table>
20.1.7.2.5 interference-event

*signature mode commands*

Configures this WIPS policy signature as Smart RF interference source

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`interference-event`

**Parameters**

None

**Examples**

```bash
rfs7000-37FABE(config-test-signature-test)#interference-event
rfs7000-37FABE(config-test-signature-test)#show context
signature test
  interference-event
  bssid 11-22-33-44-55-66
  dst-mac 55-66-77-88-99-00
  frame-type reassoc
  filter-ageout 8
rfs7000-37FABE(config-test-signature-test)#
```

**Related Commands**

| `no` | Disables this WIPS policy signature as Smart RF interference source |
### 20.1.7.2.6 mode

**signature mode commands**

Enables or disables a WIPS policy signature

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`mode enable`

**Parameters**

- `mode enable`

<table>
<thead>
<tr>
<th>mode enable</th>
<th>Enables this WIPS signature</th>
</tr>
</thead>
</table>

**Examples**

```bash
rfs7000-37FABE(config-test-signature-test)#mode enable
```

**Related Commands**

- `no` Disables a WIPS signature
20.1.7.2.7 payload

Configures payload settings. The payload command sets a numerical index pattern and offset for this WIPS signature.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
payload <1-3> pattern <WORD> offset <0-255>

Parameters
- payload <1-3> pattern <WORD> offset <0-255>

<table>
<thead>
<tr>
<th>payload &lt;1-3&gt;</th>
<th>Configures payload settings</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-3&gt; — Sets the payload index</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>pattern &lt;WORD&gt;</th>
<th>Specifies the pattern to match: hex or string</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;WORD&gt; — Sets the pattern name</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>offset &lt;0-255&gt;</th>
<th>Specifies the payload offset to start the pattern match</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;0-255&gt; — Sets the offset value</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-test-signature-test)#payload 1 pattern test offset 1
rfs7000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
dst-mac 55-66-77-88-99-00
frame-type assoc
filter-ageout 8
payload 1 pattern test offset 1
rfs7000-37FABE(config-test-signature-test)#

Related Commands
- no | Removes payload and associated settings |
20.1.7.2.8 src-mac

*signature mode commands*

Configures a source MAC address for a packet examined for matching

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

src-mac <MAC>

**Parameters**

- src-mac <MAC>

  src-mac <MAC> | Configures the source MAC address to match
  <MAC> – Specify the source MAC address.

**Examples**

```
rfs7000-37FABE(config-test-signature-test)#src-mac 00-1E-E5-EA-1D-60
rfs7000-37FABE(config-test-signature-test)#show context
  signature test
  bssid 11-22-33-44-55-66
  src-mac 00-1E-E5-EA-1D-60
  dst-mac 55-66-77-88-99-00
  frame-type assoc
  filter-ageout 8
  payload 1 pattern test offset 1
rfs7000-37FABE(config-test-signature-test)#
```

**Related Commands**

- **no** | Removes a WIPS signature source MAC address
20.1.7.2.9 ssid-match

*signature mode commands*

Configures the SSID (and its character length) used for matching.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
ssid-match [ssid|ssid-len]
```

```
ssid-match [ssid <SSID>|ssid-len <0-32>]
```

**Parameters**

- `ssid-match [ssid <SSID>|ssid-len <0-32>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ssid &lt;SSID&gt;</code></td>
<td>Specifies the SSID match string</td>
</tr>
<tr>

**20.1.7.2.10 threshold-client**

*signature mode commands*

Configures the wireless client threshold limit. When the wireless client exceeds the specified limit, an event is triggered.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
threshold-client <1-65535>
```

**Parameters**

- **threshold-client <1-65535>**

| threshold-client <1-65535> | Configures the wireless client threshold limit  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-65535&gt; — Sets the threshold limit for a 60 second window from 1 - 65535</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config-test-signature-test)#threshold-client 88
rfs7000-37FABE(config-test-signature-test)#show context
signature test

```

Removes the wireless client threshold limit configured with a WIPS policy signature.
20.1.7.2.11 threshold-radio

signature mode commands

Configures the radio’s threshold limit. When the radio exceeds the specified limit, an event is triggered.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

threshold-radio <1-65535>

Parameters

- threshold-radio <1-65535>

<table>
<thead>
<tr>
<th>threshold-radio &lt;1-65535&gt;</th>
<th>Configures the radio’s threshold limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-65535&gt;</td>
<td>– Specify the threshold limit for a 60 second window from 1 - 65535.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-test-signature-test)#threshold-radio 88

rfs7000-37FABE(config-test-signature-test)#show context
signature test

Related Commands

no

- Removes the radio’s threshold limit configured with a WIPS policy signature
20.1.7.2.12 no

**signature mode commands**

Negates a command or resets settings to their default. When used in the config WIPS policy signature mode, the `no` command resets or removes WIPS signature settings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
no [bssid|dst-mac|filter-ageout|frame-type|interference-event|mode|payload|src-mac|
    ssid-match|threshold-client|threshold-radio]

no [bssid|dst-mac|filter-ageout|frame-type|interference-event|mode enable|
    payload <1-3>|src-mac|ssid-match [ssid|ssid-len]|threshold-client|threshold-radio]
```

**Parameters**

- `no <PARAMETERS>`

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Negates a command or resets settings to their default</th>
</tr>
</thead>
</table>

**Usage Guidelines**

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

The following is the WIPS signature 'test' settings before the execution of the 'no' command:

```plaintext
rfs7000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  src-mac 00-1E-E5-EA-1D-60
  dst-mac 55-66-77-88-99-00
  frame-type beacon
  ssid-match ssid PrinterLan
  filter-ageout 8
  threshold-client 88
  threshold-radio 88
  payload 1 pattern test offset 1
rfs7000-37FABE(config-test-signature-test)#
```

The following is the WIPS signature 'test' settings after the execution of the 'no' command:

```plaintext
rfs7000-37FABE(config-test-signature-test)#no mode enable
rfs7000-37FABE(config-test-signature-test)#no bssid
rfs7000-37FABE(config-test-signature-test)#no dst-mac
rfs7000-37FABE(config-test-signature-test)#no src-mac
rfs7000-37FABE(config-test-signature-test)#no filter-ageout
rfs7000-37FABE(config-test-signature-test)#no threshold-client
rfs7000-37FABE(config-test-signature-test)#no threshold-radio
rfs7000-37FABE(config-test-signature-test)#
```

signature test
  no mode enable
  frame-type beacon
  payload 1 pattern test offset 1
rfs7000-37FABE(config-test-signature-test)
20.1.8 use

Enables device categorization on this WIPS policy. This command uses an existing device categorization list. The list categorizes devices as authorized or unauthorized.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
use device-categorization <DEVICE-CATEGORIZATION>

Parameters
- use device-categorization <DEVICE-CATEGORIZATION>

Examples
rfs7000-37FABE(config-wips-policy-test)#use device-categorization test
rfs7000-37FABE(config-wips-policy-test)#show context

  threshold-client 88
  payload 1 pattern test offset 1
  ap-detection-ageout 50
  ap-detection-wait-time 15
use device-categorization test
rfs7000-37FABE(config-wips-policy-test)#[no]

Related Commands
- no Disables the use of a device categorization policy with a WIPS policy
This chapter summarizes the WLAN QoS policy in the CLI command structure.

A WLAN QoS policy increases network efficiency by prioritizing data traffic. Prioritization reduces congestion. This is essential because of the lack of bandwidth for all users and applications. QoS helps ensure each WLAN on the wireless controller receives a fair share of the overall bandwidth, either equally or as per the proportion configured. Packets directed towards clients are classified into categories such as Video, Voice and Data. Packets within each category are processed based on the weights defined for each WLAN.

Each WLAN QoS policy has a set of parameters which it groups into categories, such as management, voice and data. Packets within each category are processed based on the weights defined for each WLAN.

Use the (config) instance to configure WLAN QoS policy commands. To navigate to the WLAN QoS policy instance, use the following commands:

```
<DEVICE>(config)#wlan-qos-policy <POLICY-NAME>
rfs7000-37FABE(config)#wlan-qos-policy test
rfs7000-37FABE(config-wlan-qos-test)#?
```

WLAN QoS Mode commands:

- `accelerated-multicast`: Configure accelerated multicast streams address and forwarding QoS classification
- `classification`: Select how traffic on this WLAN must be classified (relative prioritization on the radio)
- `multicast-mask`: Egress multicast mask (frames that match bypass the PSpQueue. This permits intercom mode operation without delay even in the presence of PSP clients)
- `no`: Negate a command or set its defaults
- `qos`: Quality of service
- `rate-limit`: Configure traffic rate-limiting parameters on a per-wlan/per-client basis
- `svp-prioritization`: Enable spectralink voice protocol support on this wlan
- `voice-prioritization`: Prioritize voice client over other client (for non-WMM clients)
- `wmm`: Configure 802.11e/Wireless MultiMedia parameters
- `clrscr`: Clears the display screen
- `commit`: Commit all changes made in this session
- `do`: Run commands from Exec mode
- `end`: End current mode and change to EXEC mode
- `exit`: End current mode and down to previous mode
- `help`: Description of the interactive help system
- `revert`: Revert changes
- `service`: Service Commands
- `show`: Show running system information
- `write`: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-wlan-qos-test)#
```
### 21.1 wlan-qos-policy

#### WLAN-QOS-POLICY

WLAN QoS configurations differ significantly from QoS policies configured for radios. WLAN QoS configurations are designed to support the data requirements of wireless clients, including the data types they support and their network permissions. Radio QoS policies are specific to the transmit and receive characteristics of the connected radio’s themselves, independent from the wireless clients these access point radios support.

The following table summarizes WLAN QoS policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>

</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS.*
### 21.1.1 accelerated-multicast

Configures the accelerated multicast stream address and forwarding QoS classification settings

Enabling this option allows the system to automatically detect and convert multicast streams to unicast streams. When a stream is converted and queued up for transmission, there are a number of classification mechanisms that can be applied to the stream. Use the classification options to specify the traffic type to prioritize.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
accelerated-multicast [<IP>|autodetect]
```

```
accelerated-multicast [<IP>|autodetect] {classification [background|best-effort|trust|video|voice]}
```

**Parameters**

- **accelerated-multicast [<IP>|autodetect] {classification [background|best-effort|trust|video|voice]}**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accelerated-multicast</td>
<td>Configures the accelerated multicast stream address and forwarding QoS classification</td>
</tr>
<tr>
<td>&lt;IP&gt;</td>
<td>Configures a multicast IP address in the A.B.C.D format. The system can configure up to 32 IP addresses for each WLAN QoS policy</td>
</tr>
<tr>
<td>autodetect</td>
<td>Allows the system to automatically detect multicast streams to be accelerated. This parameter allows the system to convert multicast streams to unicast, or to specify multicast streams converted to unicast.</td>
</tr>
<tr>
<td>classification</td>
<td>Optional. Configures the QoS classification (traffic class) settings. When the stream is converted and queued for transmission, specify the type of classification applied to the stream. The options are: background, best-effort, trust, voice, and video.</td>
</tr>
<tr>
<td>background</td>
<td>Forwards streams with background (low) priority. This parameter is common to both &lt;IP&gt; and autodetect.</td>
</tr>
<tr>
<td>best-effort</td>
<td>Forwards streams with best effort (normal) priority. This parameter is common to both &lt;IP&gt; and autodetect.</td>
</tr>
<tr>
<td>trust</td>
<td>No change to the streams forwarding traffic class. This parameter is common to both &lt;IP&gt; and autodetect.</td>
</tr>
<tr>
<td>video</td>
<td>Forwards streams with video traffic priority. This parameter is common to both &lt;IP&gt; and autodetect.</td>
</tr>
<tr>
<td>voice</td>
<td>Forwards streams with voice traffic priority. This parameter is common to both &lt;IP&gt; and autodetect.</td>
</tr>
</tbody>
</table>
Examples

rfs7000-37FABE(config-wlan-qos-test)#accelerated-multicast autodetect classification voice

rfs7000-37FABE(config-wlan-qos-test)#show context wlan-qos-policy test
  qos trust dscp
  qos trust wmm
  accelerated-multicast autodetect classification voice
rfs7000-37FABE(config-wlan-qos-test)#
21.1.2 classification

Specifies how traffic on this WLAN is classified. This classification is based on relative prioritization on the radio.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
classification [low|non-unicast|non-wmm|normal|video|voice|wmm]
classification [low|normal|video|voice|wmm]
classification non-unicast [voice|video|normal|low|default]
classification non-wmm [voice|video|normal|low]
```

Parameters

- **classification [low|normal|video|voice|wmm]**
  - low: Optimized for background traffic. Implies all traffic on this WLAN is low priority on the radio.
  - normal: Optimized for best effort traffic. Implies all traffic on this WLAN is prioritized as best effort traffic on the radio.
  - video: Optimized for video traffic. Implies all traffic on this WLAN is prioritized as video traffic on the radio.
  - voice: Optimized for voice traffic. Implies all traffic on this WLAN is prioritized as voice traffic on the radio.
  - wmm: Uses WMM based classification, using DSCP or 802.1p tags, to classify traffic into different queues. Implies WiFi Multimedia QoS extensions are enabled on this radio. This allows different traffic streams between the wireless client and the access point to be prioritized according to the type of traffic (voice, video etc). The WMM classification supports high throughput data rates required for 802.11n device support.

- **classification non-unicast [voice|video|normal|low|default]**
  - non-unicast: Optimized for non-unicast traffic. Implies all traffic on this WLAN is designed for broadcast or multiple destinations.
  - video: Optimized for non-unicast video traffic. Implies all WLAN non-unicast traffic is classified and treated as video packets.
  - voice: Optimized for non-unicast voice traffic. Implies all WLAN non-unicast traffic is classified and treated as voice packets.
  - normal: Optimized for non-unicast best effort traffic. Implies all WLAN non-unicast traffic is classified and treated as normal priority packets (best effort).
### classification non-wmm [voice|video|normal|low]

<table>
<thead>
<tr>
<th>low</th>
<th>Optimized for non-unicast background traffic. Implies all WLAN non-unicast traffic is classified and treated as low priority packets (background)</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Uses the default classification mode (same as unicast classification if WMM is disabled, normal if unicast classification is WMM)</td>
</tr>
</tbody>
</table>

- **non-wmm**
  - [voice|video|normal|low]

<table>
<thead>
<tr>
<th>non-wmm</th>
<th>Specifies how traffic from non-WMM clients is classified</th>
</tr>
</thead>
<tbody>
<tr>
<td>voice</td>
<td>Optimized for non-WMM voice traffic. Implies all WLAN non-WMM client traffic is classified and treated as voice packets</td>
</tr>
<tr>
<td>video</td>
<td>Optimized for non-WMM video traffic. Implies all WLAN non-WMM client traffic is classified and treated as video packets</td>
</tr>
<tr>
<td>normal</td>
<td>Optimized for non-WMM best effort traffic. Implies all WLAN non-WMM client traffic is classified and treated as normal priority packets (best effort)</td>
</tr>
<tr>
<td>low</td>
<td>Optimized for non-WMM background traffic. Implies all WLAN non-WMM client traffic is classified and treated as low priority packets (background)</td>
</tr>
</tbody>
</table>

### Examples

```plaintext
rfs7000-37FABE(config-wlan-qos-test)#classification wmm
rfs7000-37FABE(config-wlan-qos-test)#classification non-wmm video
rfs7000-37FABE(config-wlan-qos-test)#classification non-unicast normal
rfs7000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
  classification non-wmm video
classification non-unicast normal
qos trust dscp
qos trust wmm
accelerated-multicast autodetect classification voice
rfs7000-37FABE(config-wlan-qos-test)#
```
### 21.1.3 multicast-mask

The `multicast-mask` command configures an egress prioritization multicast mask for this WLAN QoS policy. Normally, all multicast and broadcast packets are buffered until the periodic DTIM interval (indicated in the 802.11 beacon frame), when clients in power save mode wake to check for frames. However, for certain applications and traffic types, the administrator may want the frames transmitted immediately, without waiting for the DTIM interval. By configuring a primary orsecondary prioritization multicast mask, the network administrator can indicate which packets are transmitted immediately.

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
```
multicast-mask [primary|secondary] <MAC/MASK>
```

**Parameters**
- `primary <MAC/MASK>`
  - Configures the primary egress prioritization multicast mask
  - `<MAC/MASK>` — Sets the MAC address and the mask in the `AA-BB-CC-DD-EE-FF/XX-XX-XX-XX-XX-XX-XX` format
  - **Note:** Setting masks is optional and only needed if there are traffic types requiring special handling.

- `secondary <MAC/MASK>`
  - Configures the primary egress prioritization multicast mask
  - `<MAC/MASK>` — Sets the MAC address and the mask in the `AA-BB-CC-DD-EE-FF/XX-XX-XX-XX-XX-XX-XX` format

**Examples**
```
rfs7000-37FABE(config-wlan-qos-test)#multicast-mask primary 11-22-33-44-55-66/22-33-44-55-66-77
rfs7000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
    classification non-wmm video
    multicast-mask primary 11-22-33-44-55-66/22-33-44-55-66-77
    classification non-unicast normal
    qos trust dscp
    qos trust wmm
    accelerated-multicast autodetect classification voice
rfs7000-37FABE(config-wlan-qos-test)#
```
21.1.4 no

Negates a command or resets settings to their default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
no [accelerated-multicast|classification|multicast-mask|qos|rate-limit|
    svp-prioritization|voice-prioritization|wmm]
no [accelerated-multicast |<IP>|autodetect] |classification {non-unicast|non-wmm}|
multicast-mask [primary|secondary]|qos trust [dscp|wmm]|svp-prioritization|
    voice-prioritization]
no rate-limit [client|wlan] [from-air|to-air] {max-burst-size|rate|red-threshold}
no rate-limit [client|wlan] [from-air|to-air] {max-burst-size|rate|
    red-threshold [background|best-effort|video|voice]}
no wmm [background|best-effort|power-save|qbss-load-element|video|voice]
no wmm [power-save|qbss-load-element]
no wmm [background|best-effort|video|voice] [aifsn|cw-max|cw-min|txop-limit]
```

Parameters

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Negates a command or resets settings to their default</th>
</tr>
</thead>
</table>

Examples

The following example shows the WLAN QoS Policy ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
    classification non-wmm video
    multicast-mask primary 11-22-33-44-55-66/22-33-44-55-66-77
    classification non-unicast normal
    qos trust dscp
    qos trust wmm
    accelerated-multicast autodetect classification voice
rfs7000-37FABE(config-wlan-qos-test)#
```

```
rfs7000-37FABE(config-wlan-qos-test)#no classification non-wmm
rfs7000-37FABE(config-wlan-qos-test)#no multicast-mask primary
rfs7000-37FABE(config-wlan-qos-test)#no qos trust dscp
```

The following example shows the WLAN QoS Policy ‘test’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
    classification non-unicast normal
    no qos trust dscp
    qos trust wmm
    accelerated-multicast autodetect classification voice
rfs7000-37FABE(config-wlan-qos-test)#
```
21.1.5 **qos**

- **wlan-qos-policy**

  Enables QoS on this WLAN

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

qos trust [dscp|wmm]

**Parameters**

- qos trust [dscp|wmm]

| trust [dscp|wmm] | Trusts the QoS values of ingressing packets |
|-----------------|------------------------------------------|
| dscp            | Trusts the IP DSCP values of ingressing packets |
| wmm             | Trusts the 802.11 WMM QoS values of ingressing packets |

**Examples**

```
rfs7000-37FABE(config-wlan-qos-test)#qos trust wmm
rfs7000-37FABE(config-wlan-qos-test)#qos trust dscp

rfs7000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
    classification non-unicast normal
    qos trust dscp
    qos trust wmm
    accelerated-multicast autodetect classification voice
rfs7000-37FABE(config-wlan-qos-test)#
```
21.1.6 rate-limit

Configures the WLAN traffic rate limits using the WLAN QoS policy.

Excessive traffic causes performance issues or brings down the network entirely. Excessive traffic can be caused by numerous sources including network loops, faulty devices or malicious software such as a worm or virus that has infected one or more devices at the branch. Rate limiting limits the maximum rate sent to or received from the wireless network (and WLAN) per wireless client. It prevents any single user from overwhelming the wireless network. It can also provide differential service for service providers. The uplink and downlink rate limits are usually configured on a RADIUS server using vendor specific attributes. Rate limits are extracted from the RADIUS server’s response. When such attributes are not present, settings defined on the controller (access point, wireless controller, or service platform) are applied. An administrator can set separate QoS rate limits for upstream (data transmitted from the managed network) and downstream (data transmitted to the managed network traffic).

Before defining rate limit thresholds for WLAN upstream and downstream traffic, it is recommended that you define the normal number of ARP, broadcast, multicast and unknown unicast packets that typically transmit and receive from each supported WMM access category. If thresholds are defined too low, normal network traffic (required by end-user devices) are dropped resulting in intermittent outages and performance problems.

Connected wireless clients can also have QoS rate limit settings defined in both the upstream and downstream direction.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

rate-limit [client|wlan] [from-air|to-air] {max-burst-size|rate|red-threshold}

rate-limit [client|wlan] [from-air|to-air] {max-burst-size <2-1024>|rate <50-1000000>}

rate-limit [client|wlan] [from-air|to-air] {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100> ]}

Parameters

- rate-limit [client|wlan] [from-air|to-air] {max-burst-size <2-1024>|rate <50-1000000>}

<table>

<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>max-burst-size &lt;2-1024&gt;</td>
<td>Optional. Sets the maximum burst size from 2 - 1024 kbytes. The chances of the upstream or downstream packet transmission getting congested for the WLAN’s client destination are reduced for smaller burst sizes. The default is 320 kbytes. Note: Smaller the burst, lesser are the chances of upstream packet transmission resulting in congestion for the WLAN's client destinations. By trending the typical number of ARP, broadcast, multicast and unknown unicast packets over a period of time, the average rate for each access category can be obtained. Once a baseline is obtained, administrators should then add a 10% margin (minimally) to allow for traffic bursts at the site.</td>
</tr>
<tr>
<td>rate &lt;50-1000000&gt;</td>
<td>Optional. Sets the traffic rate from 50 - 1000000 kbps. This limit is the threshold value for the maximum number of packets received or transmitted over the WLAN from all access categories. Any traffic that exceeds the specified rate is dropped and a log message is generated. The default is 5000 kbps.</td>
</tr>
</tbody>
</table>

```

</tr>
<tr>
<td>voice &lt;0-100&gt;</td>
<td>The following is common to the ‘from-air’ and ‘to-air’ parameters: Optional. Sets a percentage value for voice traffic in the upstream or downstream direction. Voice traffic exceeding the defined threshold is dropped and a log message is generated. The default threshold is 0% for traffic in both directions. 0% means no early random drops will occur.</td>
</tr>
</tbody>
</table>
Usage Guidelines
The following information should be taken into account when configuring rate limits:

- Background traffic consumes the least bandwidth, so this value can be set to a lower value once a general downstream rate is known by the network administrator (using a time trend analysis).
- Best effort traffic consumes little bandwidth, so this value can be set to a lower value once a general upstream rate is known by the network administrator (using a time trend analysis).
- Video traffic consumes significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis).
- Voice applications consume significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis).

21.1.7 **svp-prioritization**

Enables WLAN SVP support on this WLAN QoS policy. SVP support enables the identification and prioritization of traffic from Spectralink/Ploycomm phones. This gives priority to voice, with voice management packets supported only on certain legacy VOIP phones. If the wireless client classification is WMM, non-WMM devices recognized as voice devices have all their traffic transmitted at voice priority. Devices are classified as voice, when they emit SIP, SCCP, or H323 traffic. Thus, selecting this option has no effect on devices supporting WMM.

This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

21.1.9 wmm

wlan-qos-policy

Configures 802.11e/Wireless Multimedia (WMM) parameters for this WLAN QoS policy

WMM makes it possible for both home networks and Enterprises to decide which data streams are most important and assign them a higher traffic priority.

WMM’s prioritization capabilities are based on the four access categories (background, best-effort, video, and voice). Higher the Access Category (AC) higher is the transmission probability over the controller managed WLAN. ACs correspond to the 802.1d priorities, facilitating interoperability with QoS policy management mechanisms. WMM enabled controllers coexist with legacy devices (not WMM-enabled).

Packets not assigned to a specific access category are categorized as best effort by default. Applications assign each data packet to a given access category. Categorized packets are added to one of four independent transmit queues (one per access category). The client has an internal collision resolution mechanism to address collision among different queues, which selects the frames with the highest priority to transmit.

The same mechanism deals with external collision, to determine which client should be granted the Opportunity to Transmit (TXOP). The collision resolution algorithm responsible for traffic prioritization is probabilistic and depends on two timing parameters that vary for each access category. These parameters are:

- The minimum interframe space, or Arbitrary Inter-Frame Space Number (AIFSN)
- The contention window, sometimes referred to as the random back off wait

Both values are smaller for high-priority traffic. The value of the contention window varies through time. Initially the contention window is set to a value that depends on the AC. As frames with the highest AC tend to have the lowest back off values, they are more likely to get a TXOP.

After each collision the contention window is doubled until a maximum value (also dependent on the AC) is reached. After successful transmission, the contention window is reset to its initial, AC dependant value. The AC with the lowest back off value gets the TXOP.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
wmm [background|best-effort|power-save|qbss-load-element|video|voice]
wmm [power-save|qbss-load-element]
wmm [background|best-effort|video|voice] [aifs <2-15>|cw-max <0-15>|cw-min <0-15>|txop-limit <0-65535>]
```

Parameters

CHAPTER 22
L2TPV3-POLICY

This chapter summarizes Layer 2 Tunnel Protocol Version 3 (L2TPv3) policy commands in the CLI command structure.

The L2TPv3 policy defines control and encapsulation protocols for tunneling different types of layer 2 frames between two IP nodes. The L2TPv3 control protocol controls dynamic creation, maintenance, and tear down of L2TP sessions. The L2TPV3 encapsulation protocol is used to multiplex and de-multiplex L2 data streams between two L2TP nodes across an IP network.

L2TPv3 is an IETF standard used for transporting different types of layer 2 frames in an IP network (and access point profile). L2TPv3 defines control and encapsulation protocols for tunneling layer 2 frames between two IP nodes. Use L2TPv3 to create tunnels for transporting layer 2 frames. L2TPv3 enables WING supported controllers and access points to create tunnels for transporting Ethernet frames to and from bridge VLANs and physical ports. L2TPv3 tunnels can be defined between WING devices and other vendor devices supporting the L2TPv3 protocol.

Multiple pseudowires can be created within an L2TPv3 tunnel. WING supported devices support an Ethernet VLAN pseudowire type exclusively. A pseudowire is an emulation of a layer 2 point-to-point connection over a packet-switching network (PSN). A pseudowire was developed out of the necessity to encapsulate and tunnel layer 2 protocols across a layer 3 network.

Ethernet VLAN pseudowires transport Ethernet frames to and from a specified VLAN. One or more L2TPv3 tunnels can be defined between tunnel end points. Each tunnel can have one or more L2TPv3 sessions. Each tunnel session corresponds to one pseudowire. An L2TPv3 control connection (an L2TPv3 tunnel) needs to be established between the tunneling entities before creating a session.

NOTE: A pseudowire is an emulation of a layer 2 point-to-point connection over a packet-switching network (PSN). A pseudowire was developed out of the necessity to encapsulate and tunnel layer 2 protocols across a layer 3 network.

For optimal pseudowire operation, both the L2TPv3 session originator and responder need to know the pseudowire type and identifier. These two parameters are communicated during L2TPv3 session establishment. An L2TPv3 session created within an L2TPv3 connection also specifies multiplexing parameters for identifying a pseudowire type and ID.
The working status of a pseudowire is reflected by the state of the L2TPv3 session. If a L2TPv3 session is down, the pseudowire associated with it must be shut down. The L2TPv3 control connection keep-alive mechanism can serve as a monitoring mechanism for the pseudowires associated with a control connection.

**NOTE:** If connecting an Ethernet port to another Ethernet port, the pseudowire type must be *Ethernet port*, if connecting an Ethernet VLAN to another Ethernet VLAN, the pseudowire type must be *Ethernet VLAN*.

This chapter is organized into the following sections:

- `l2tpv3-policy-commands`
- `l2tpv3-tunnel-commands`
- `l2tpv3-manual-session-commands`
22.1 l2tpv3-policy-commands

Use the (config) instance to configure L2TPv3 policy parameters. To navigate to the L2TPv3 policy instance, use the following commands:

```
<DEVICE>(config)#l2tpv3 policy <L2TPV3-POLICY-NAME>
```

```
rfs7000-37FABE(config)#l2tpv3 policy L2TPV3Policy1
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#?
```

The following table summarizes L2TPv3 policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>

</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clscr, commit, help, revert, service, show, write, and exit), see Chapter 5, *COMMON COMMANDS.*
### 22.1.1 cookie-size

* **l2tpv3-policy-commands**

Configures the size of the cookie field present in each L2TPv3 data packet. L2TPv3 data packets contain a session cookie that identifies the session (pseudowire) corresponding to it. In a tunnel, the cookie is a 4-byte or 8-byte signature shared between the two tunnel endpoints. This signature is configured at both the source and destination routers. If the signature at both ends do not match, the data is dropped. All sessions within a tunnel have the same session cookie size.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
cookie-size [0|4|8]
```

**Parameters**

- `cookie-size [0|4|8]`

| cookie-size [0|4|8] | Configures the cookie-field size for each data packet. Select one of the following options: |
|---------------------|--------------------------------------------------------------------------------------------------|
| 0                   | 0 – No cookie field present in each L2TPv3 data message (this is the default setting)              |
| 4                   | 4 – 4 byte cookie field present in each L2TPv3 data message                                      |
| 8                   | 8 – 8 byte cookie field present in each L2TPv3 data message                                      |

**Examples**

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#cookie-size 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  cookie-size 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

**Related Commands**

- `no` Resets the cookie-field size to its default (0 - no cookie field present in each L2TPv3 data packet)
### 22.1.2 `failover-delay`

`l2tpv3-policy-commands`

Configures the L2TPv3 tunnel failover delay in seconds. This is the interval after which a failed over tunnel is re-established.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

`fail-over <5-60>`

#### Parameters

- `fail-over <5-60>`

<table>
<thead>
<tr>
<th>fail-over &lt;5-60&gt;</th>

#### Examples

```bash
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#failover-delay 30
```

```bash
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  failover-delay 30
  retry-attempts 10
  retry-interval 30
  cookie-size 8
  rx-window-size 9
  tx-window-size 9
  reconnect-interval 100
  reconnect-attempts 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

#### Related Commands

- `no` Resets the failover interval to its default (5 seconds)
22.1.3 force-l2-path-recovery

Enables the forced detection of servers and gateways behind the L2TPv3 tunnel. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
force-l2-path-recovery

Parameters
None

Examples
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#force-l2-path-recovery
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
failover-delay 30
retry-attempts 10
retry-interval 30
cookie-size 8
rx-window-size 9
tx-window-size 9
reconnect-interval 100
reconnect-attempts 8
force-l2-path-recovery
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

Related Commands

| no | Disables the forced detection of servers and gateways behind the L2TPv3 tunnel |
22.1.4 hello-interval

Configures the interval, in seconds, between L2TPv3 “Hello” keep-alive messages exchanged in a L2TPv3 control connection.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```plaintext
hello-interval <1-3600>
```

Parameters

- **hello-interval <1-3600>**

| hello-interval <1-3600> | Configures the interval for L2TPv3 “Hello” keep-alive messages. Specify a value from 1 - 3600 seconds (default is 60 seconds). |

Examples

```plaintext
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#hello-interval 200

rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  cookie-size 8

rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

Related Commands

- **no**
  Resets the “Hello” keep-alive message interval to its default of 60 seconds
22.1.5 no

- **l2tpv3-policy-commands**

Negates or reverts L2TPv3 policy settings to default

**Supported in the following platforms:**

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
no [cookie-size|failover-delay|force-l2-path-recovery|hello-interval|
    reconnect-attempts|reconnect-interval|retry-attempts|retry-interval|rx-window-size|
    tx-window-size]
```

**Parameters**

- no <PARAMETERS>

**Examples**

The following example shows the l2tpv3 policy 'L2TPV3Policy1' settings before the 'no' commands are executed:

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
    hello-interval 200
    retry-attempts 10
    retry-interval 30
    cookie-size 8
    reconnect-interval 100
    reconnect-attempts 50
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no hello-interval
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no reconnect-attempts
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no reconnect-interval
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no retry-attempts
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no retry-interval
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no cookie-size
```

The following example shows the l2tpv3 policy 'L2TPV3Policy1' settings after the 'no' commands are executed:

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```
22.1.6 reconnect-attempts

```
22.1.6 reconnect-attempts
```

Configures the maximum number of attempts made to re-establish a tunnel connection

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
reconnect-attempts <0-8>
```

**Parameters**

- `reconnect-attempts <0-8>`

<table>
<thead>
<tr>
<th>reconnect-attempts &lt;0-8&gt;</th>
<th>Configures the maximum number of attempts made to re-establish a tunnel connection from 0 - 8 (default is 0: configures infinite reconnect attempts)</th>
</tr>
</thead>
</table>

**Examples**

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#reconnect-attempts 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  cookie-size 8
  reconnect-attempts 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

**Related Commands**

- `no` Resets the maximum number of reconnect attempts to default (0: configures infinite reconnect attempts)
22.1.7 reconnect-interval

- l2tpv3-policy-commands

Configures the interval, in seconds, between two successive attempts to re-establish a failed tunnel connection.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, — AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
reconnect-interval <1-3600>

Parameters
- reconnect-interval <1-3600>

<table>
<thead>
<tr>
<th>reconnect-interval &lt;1-3600&gt;</th>
<th>Configures the interval between successive attempts to re-establish a failed tunnel connection. Specify a value from 1 - 3600 seconds (default is 120 seconds).</th>
</tr>
</thead>
</table>

Examples
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#reconnect-interval 100
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  cookie-size 8
  reconnect-interval 100
  reconnect-attempts 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

Related Commands

- no
  Resets the interval between successive attempts to re-establish a failed tunnel connection to default (120 seconds)
### 22.1.8 retry-attempts

▸ l2tpv3-policy-commands

Configures the maximum number of attempts made to retransmit signalling messages. Use this command to specify how many retransmission cycles occur before determining the target tunnel peer is not reachable.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530,– NX9000, NX9500, NX9510

**Syntax**

retry-attempts <1-10>

**Parameters**

- retry-attempts <1-10>

<table>
<thead>
<tr>
<th>retry-attempts</th>
<th>Configures the maximum number of attempts made to retransmit signalling messages from 1 - 10 (default is 5 attempts)</th>
</tr>
</thead>
</table>

**Examples**

rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#retry-attempts 10

rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
  retry-attempts 10
  cookie-size 8
  reconnect-interval 100
  reconnect-attempts 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

**Related Commands**

- **no**
  Resets the maximum number of retransmissions of signalling messages to default (5 attempts)
22.1.9 retry-interval

- l2tpv3-policy-commands

Configures the interval, in seconds, between two successive attempts at retransmitting a L2TPv3 signalling message

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
retry-interval <1-250>

Parameters
- retry-interval <1-250>

| retry-interval <1-250> | Configures the interval, in seconds, between two successive retransmission attempts. Specify a value from 1 - 250 seconds (default is 5 seconds). |

Examples
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#retry-interval 30

rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
retry-attempts 10
retry-interval 30
cookie-size 8
reconnect-interval 100
reconnect-attempts 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

Related Commands
- no Resets the retry interval to default (5 seconds)
22.1.10 **rx-window-size**

> l2tpv3-policy-commands

Configures the number of signalling packets received without sending an acknowledgment

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7524, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
rx-window-size <1-15>
```

**Parameters**

- `rx-window-size <1-15>`

**Examples**

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#rx-window-size 9
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  retry-attempts 10
  retry-interval 30
  cookie-size 8
  rx-window-size 9
  reconnect-interval 100
  reconnect-attempts 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

**Related Commands**

```
no
```

Resets the number of packets received without sending an acknowledgment to default (10 packets)
22.1.11 tx-window-size

- l2tpv3-policy-commands

Configures the number of signalling packets transmitted without receiving an acknowledgment.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
tx-window-size <1-15>
```

Parameters

- `tx-window-size <1-15>`

Examples

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#tx-window-size 9
```

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  retry-attempts 10
  retry-interval 30
  cookie-size 8
  rx-window-size 9
  tx-window-size 9
  reconnect-interval 100
  reconnect-attempts 8
```

Related Commands

- `no` Resets the number of packets transmitted without receiving an acknowledgment to default (10 packets).
22.2 l2tpv3-tunnel-commands

Use the (profile or device context) instance to configure a L2TPv3 tunnel. To navigate to the tunnel configuration mode, use the following command in the profile context:

```
<DEVICE>(config-profile-default-rfs7000)#l2tpv3 tunnel <TUNNEL-NAME>
```

```
rfs7000-37FABE(config-profile-default-rfs7000)#l2tpv3 tunnel Tunnel1
```

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

L2tpv3 Tunnel Mode commands:
- `establishment-criteria`: Set tunnel establishment criteria
- `hostname`: Tunnel specific local hostname
- `local-ip-address`: Configure the IP address for tunnel. If not specified, tunnel source ip address would be chosen automatically based on the tunnel peer ip address
- `mtu`: Configure the mtu size for the tunnel
- `no`: Negate a command or set its defaults
- `peer`: Configure the l2tpv3 tunnel peers. At least one peer must be specified
- `router-id`: Tunnel specific local router ID
- `session`: Create / modify the specified l2tpv3 session
- `use`: Set setting to use
- `clrscr`: Clears the display screen
- `commit`: Commit all changes made in this session
- `end`: End current mode and change to EXEC mode
- `exit`: End current mode and down to previous mode
- `help`: Description of the interactive help system
- `revert`: Revert changes
- `service`: Service Commands
- `show`: Show running system information
- `write`: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

The following table summarizes L2TPv3 tunnel configuration commands:

</table>
22.2.1 establishment-criteria

> l2tpv3-tunnel-commands

Configures L2TPv3 tunnel establishment criteria

A L2TPv3 tunnel is established from the current device to the NOC controller when the current device becomes the VRRP master, cluster master, or RF Domain manager. Similarly, the L2TPv3 tunnel is closed when the current device switches to standby or backup mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]
```

Parameters

- `establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| always          | Always establishes a L2TPv3 tunnel from the current device to the NOC controller. This is the default setting.  
  **Note:** The ‘always’ option indicates the device need not be a cluster-master, rf-domain-manager, or vrrp-master to establish a tunnel. |
| cluster-master  | Establishes a L2TPv3 tunnel from the current device to the NOC controller, only when the current device becomes the cluster master  
  **Note:** The L2TPv3 tunnel is closed when the current device switches back the standby or backup mode. |
| rf-domain-manager | Establishes a L2TPv3 tunnel from the current device to the NOC controller, only when the current device becomes the RF Domain manager  
  **Note:** The L2TPv3 tunnel is closed when the current device switches back the standby or backup mode. |
| vrrp-master <1-255> | Establishes a L2TPv3 tunnel from the current device to the NOC controller, only when the current device becomes the VRRP master  
  - `<1-255>` — Specify the VRRP group number from 1 - 255.  
  **Note:** The L2TPv3 tunnel is closed when the current device switches back the standby or backup mode. |

Examples

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#establishment-criteria cluster-master
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1
  establishment-criteria cluster-master
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

Related Commands

- `no` Resets to default (always)
22.2.2 hostname

**l2tpv3-tunnel-commands**

Configures the tunnel’s local hostname

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
hostname <WORD>
```

**Parameters**

- `hostname <WORD>`

<table>
<thead>
<tr>
<th>hostname &lt;WORD&gt;</th>
<th>Configures the tunnel’s local hostname</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>Specify the tunnel’s local hostname.</td>
</tr>
</tbody>
</table>

**Examples**

```
rf7000-37FABE(config-profile default-rf7000-l2tpv3-tunnel-Tunnell)#hostname TunnelHost1
rf7000-37FABE(config-profile default-rf7000-l2tpv3-tunnel-Tunnell)#show context l2tpv3 tunnel Tunnell
hostname TunnelHost1
rf7000-37FABE(config-profile default-rf7000-l2tpv3-tunnel-Tunnell)#
```

**Related Commands**

| **no** | Removes the tunnel’s local hostname |
22.2.3 local-ip-address

Configures the tunnel’s source IP address. If no IP address is specified, the tunnel’s source IP address is automatically configured based on the tunnel’s peer IP address.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
local-ip-address <IP>
```

**Parameters**
- **local-ip-address <IP>**

  **local-ip-address <IP>**
  
  Configures the L2TPv3 tunnel’s source IP address
  
  • `<IP>` – Specify the tunnel’s IP address. Ensure the IP address is available (or will become available - virtual IP) on an interface. Modifying a tunnel’s local IP address re-establishes the tunnel.

**Examples**

```plaintext
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#local-ip-address 172.16.10.2
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1
  local-ip-address 172.16.10.2
  hostname TunnelHost1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

### 22.2.4 mtu

**l2tpv3-tunnel-commands**

Configures the *Maximum Transmission Unit* (MTU) size for this tunnel. This value determines the packet size transmitted over this tunnel.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`mtu <128-1460>`

**Parameters**

- `mtu <128-1460>`

  | `mtu <128-1460>`  | Configures the MTU size for this tunnel. Specify a value from 128 - 1460 bytes (default is 1460 bytes). |

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#mtu 1280
```

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1
  local-ip-address 172.16.10.2
  mtu 1280
  hostname TunnelHost1
```

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

**Related Commands**

- `no` Resets the MTU size for this tunnel to default (1460 bytes)
22.2.5 no

Negates or reverts a L2TPv3 tunnel settings to default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [establishment-criteria|hostname|local-ip-address|mtu|peer|router-id|session|use]

Parameters

- no <PARAMETERS>

Examples

The tunnel settings before the 'no' command is executed:

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1
  local-ip-address 172.16.10.2
  mtu 1280
  hostname TunnelHost1
  establishment-criteria cluster-master
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

The tunnel settings after the 'no' command is executed:

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#no local-ip-address
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#no mtu
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#no hostname
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1
  establishment-criteria cluster-master
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```
### 22.2.6 peer

> l2tpv3-tunnel-commands

Configures the L2TPv3 tunnel’s peers. At least one peer must be specified.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
peer <1-2> {hostname|ip-address|ipsec-secure|router-id|udp}
peer <1-2> {hostname [<HOSTNAME>|any]} {ipsec-secure|router-id|udp}
peer <1-2> {ip-address <IP>} {hostname|ipsec-secure|router-id|udp}
peer <1-2> {ipsec-secure} {gw [<IP>|<WORD>]}
peer <1-2> {router-id [<IP>|<WORD>|any]} {ipsec-secure|udp}
peer <1-2> {udp} {ipsec-secure|port <1-65535>}
```

#### Parameters

- **hostname**
  - **[<HOSTNAME>|any]**
    - Optional. Configures the peers’ hostname. The hostname options are:
      - `<HOSTNAME>` – Specifies the hostname as *Fully Qualified Domain Name* (FQDN) or partial DNS or any other name
      - `any` – Peer name is not specified. If the hostname is `any` this tunnel is considered as responder only and will allow incoming connection from any host.

- **ipsec-secure**
  - `{gw [<IP>|<WORD>]}`
    - After specifying the peer hostname, optionally specify the IPSec settings:
      - `ipsec-secure` – Optional. Enables auto IPSec
      - `gw` – Optional. Configures IPSec gateway IP address or hostname
        - `<IP>` – Configures IPSec gateway’s IP address
        - `<WORD>` – Configures IPSec gateway’s hostname

- **router-id**
  - `[<IP>|<WORD>|any]`
    - After specifying the peer hostname, optionally specify router ID settings:
      - `router-id` – Optional. Configures the peer’s router ID in one of the following formats:
        - `<IP>` – Peer router ID in the IP address (A.B.C.D) format
        - `<WORD>` – Peer router ID range (for example, 100-120)
        - `any` – Peer router ID is not specified. This allows incoming connection from any router ID.

- **udp**
  - `{ipsec-secure gw|port <1-65535>}
    - After specifying the peer hostname, optionally specify UDP settings:
      - The UDP option configures the encapsulation mode for this tunnel.
      - `UDP` – Optional. Configures UDP encapsulation (default encapsulation is IP)
        - `ipsec-secure gw` – Optional. Enables auto IPSec
        - `port <1-65535>` – Optional. Configures the peer’s UDP port running the L2TPv3 service from 1 - 65535. After specifying the peer UDP port, optionally configure the IPSec settings.
• **peer** <1-2> {ip-address <IP>} {hostname|ipsec-secure|router-id|udp}

  **peer** <1-2>
  
  Configures the tunnel’s peer ID from 1 - 2. At any time the tunnel is established with only one peer.

  **ip-address <IP>**
  
  Optional. Configures the peer’s IP address in the A.B.C.D format.

  **hostname [<FQDN>|any]**
  
  After specifying the peer IP address, optionally specify the peer’s hostname:
  
  Optional. Configures the peers’ hostname. The hostname options are:

  • <FQDN> – Specifies the hostname as FQDN or partial DN
  • any – Peer name is not specified. If the hostname is ‘any’ this tunnel is considered as responder only and will allow incoming connection from any host.

  **ipsec-secure {gw [<IP>|<WORD>]}**
  
  After specifying the peer IP address, optionally specify the IPSec settings:

  • ipsec-secure – Optional. Enables auto IPSec
  • gw – Optional. Configures IPSec gateway IP address or hostname
    
    • <IP> – Configures IPSec gateway’s IP address
    • <WORD> – Configures IPSec gateway’s hostname

  **router-id [<A.B.C.D>|<WORD>|any]**
  
  After specifying the peer IP address, optionally specify the router ID using one of the following options:

  • router-id – Optional. Configures the peer’s router-id in one of the following formats:
    
    • <A.B.C.D> – Peer router ID in the IP address (A.B.C.D) format
    • <WORD> – Peer router ID range (for example, 100-120)
    • any – Peer router ID is not specified. This allows incoming connection from any router ID.

  **udp {ipsec-secure gw|port <1-65535>|ipsec-secure}**
  
  After specifying the peer IP address, optionally specify the peer’s UDP port settings:

  The UDP option configures the encapsulation mode for this tunnel.

  • UDP – Optional. Configures UDP encapsulation (default encapsulation is IP)
  • ipsec-secure gw – Optional. Enables auto IPSec
  • port <1-65535> – Optional. Configures the peer’s UDP port running the L2TPv3 service from 1 - 65535. After specifying the peer UDP port, optionally configure the IPSec settings.

• **peer** <1-2> {ipsec-secure} {gw [<IP>|<WORD>]}

  **peer** <1-2>
  
  Configures the tunnel’s peer ID from 1 - 2. At any time the tunnel is established with only one peer.

  **ipsec-secure {gw [<IP>|<WORD>]}**
  
  Optional. Enables auto IPSec for this peer

  • gw – Optional. Configures IPSec gateway IP address or hostname
    
    • <IP> – Configures IPSec gateway’s IP address
    • <WORD> – Configures IPSec gateway’s hostname

• **peer** <1-2> {router-id [<IP>|<WORD>|any]} {ipsec-secure|udp}

  **peer** <1-2>
  
  Configures the tunnel peer ID from 1 - 2. At any time the tunnel is established with only one peer.

  **router-id [<A.B.C.D>|<WORD>|any]**
  
  Optional. Configures the peer’s router-id in one of the following formats:

  • <A.B.C.D> – Peer router ID in the IP address (A.B.C.D) format
  • <WORD> – Peer router ID range (for example, 100-120)
  • any – Peer router ID is not specified. This allows incoming connection from any router ID.
### Examples

```bash
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#peer 2
hostname tunnel1peer1 udp port 100

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  peer 2 hostname tunnel1peer1 udp port 100
  establishment-criteria cluster-master
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

22.2.7 router-id

- **l2tpv3-tunnel-commands**

  Configures the tunnel’s local router ID

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

  **Syntax**
  router-id [<1-4294967295>|<IP>]

  **Parameters**
  - router-id [<1-4294967295>|<IP>]

  | router-id [<1-4294967295>|<IP>] | Configures the tunnel’s local router ID in one of the following formats: |
  |---------------------------------|---------------------------------------------------------------------|
  |                                 | • <1-4294967295> – Router ID in the number format (from 1-4294967295) |
  |                                 | • <IP> – Router ID in IP address format (A.B.C.D)                    |

  **Examples**
  rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#router-id 2000

  rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1
  peer 2 hostname tunnell1peer1 udp port 100
  router-id 2000
  establishment-criteria cluster-master
  rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#

  **Related Commands**

  | no | Removes the tunnel’s router ID |
22.2.8 session

**l2tpv3-tunnel-commands**

Configures a session’s pseudowire ID, which describes the session’s purpose. The session established message sends this pseudowire ID to the L2TPv3 peer.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
session <L2TPV3-SESSION-NAME> [pseudowire-id|rate-limit]
session <L2TPV3-SESSION-NAME> pseudowire-id <1-4294967295> traffic-source vlan <VLAN-ID-RANGE> {native-vlan <1-4094>}
session <L2TPV3-SESSION-NAME> rate-limit [egress|ingress] rate <50-1000000> max-burst-size <2-1024>
```

**Parameters**

- **session <L2TPV3-SESSION-NAME> pseudowire-id <1-4294967295> traffic-source vlan <VLAN-ID-RANGE> {native-vlan <1-4094>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session &lt;L2TPV3-SESSION-NAME&gt;</td>
<td>Configures this session’s name</td>
</tr>
<tr>
<td>&lt;L2TPV3-SESSION-NAME&gt;</td>
<td>Specify the L2TPv3 session name (should not exceed 31 characters in length). A tunnel is usable only if it has one or more session(s) (having specific session names) configured. The L2TPv3 tunnel has no idle timeout, it closes when the last tunnel session is closed.</td>
</tr>
<tr>
<td>pseudowire-id &lt;1-4294967295&gt;</td>
<td>Configures the pseudowire ID for this session from 1- 4204067295</td>
</tr>
<tr>
<td>traffic-source vlan &lt;VLAN-ID-RANGE&gt;</td>
<td>Configures VLAN as the traffic source for this tunnel</td>
</tr>
<tr>
<td>native-vlan &lt;1-4094&gt;</td>
<td>Optional – Configures the native VLAN ID for this session, which is not tagged</td>
</tr>
<tr>
<td>rate-limit [egress</td>
<td>ingress] rate &lt;50-1000000&gt; max-burst-size &lt;2-1024&gt;</td>
</tr>
</tbody>
</table>

A pseudowire is an emulation of a layer 2 point-to-point connection over a *packet-switching network* (PSN). A pseudowire is needed to encapsulate and tunnel layer 2 protocols across a layer 3 network.
The working status of a pseudowire is reflected by the state of the L2TPv3 session. If the corresponding session is L2TPv3 down, the pseudowire associated with it must be shut down.

**Examples**

```bash
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#session tunnel1peer1session1 pseudowire-id 5000 traffic-source vlan 10-20 native-vlan 1
```

```bash
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1  
  peer 2 hostname tunnel1peer1 udp port 100  
  session tunnel1peer1session1 pseudowire-id 5000 traffic-source vlan 10-20 native-vlan 1  
  router-id 2000  
  establishment-criteria cluster-master
```

**Related Commands**

- **no**
  
  Removes a session
22.2.9 **use**

- **l2tpv3-tunnel-commands**

Configures a tunnel to use a specified L2TPv3 tunnel policy and specified critical resources

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

use [critical-resource|l2tpv3-policy]
use critical-resource <CRM-NAME1> {<CRM-NAME2>} {<CRM-NAME3>} {<CRM-NAME4>}
use l2tpv3-policy <L2TPV3-POLICY-NAME>

**Parameters**

- **use critical-resource <CRM-NAME1> {<CRM-NAME2>} {<CRM-NAME3>} {<CRM-NAME4>}**
  
  Specifies the critical resource(s) to use with this tunnel
  
  - <CRM1-NAME> — Specify the first critical resource name
  
  Maximum of four critical resources can be monitored.

  **Note:** In case of tunnel initiator, L2TPv3 tunnel is established only if the critical resources identified by the <CRM-NAME1>.......... <CRM-NAME4> arguments are available at the time of tunnel establishment.

  **Note:** In case of L2TPv3 tunnel termination, all incoming tunnel establishment requests are rejected if the critical resources specified by the <CRM-NAME1>.......... <CRM-NAME4> arguments are not available.

- **use l2tpv3-policy <L2TPV3-POLICY-NAME>**

  Associates a specified L2TPv3 policy with this tunnel

  - <L2TPV3-POLICY-NAME> — Specify the policy name.

**Examples**

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1) #use l2tpv3-policy L2TPV3Policy1

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1) #show context l2tpv3 tunnel Tunnel1
  peer 2 hostname tunnel1peer1 udp port 100
  use l2tpv3-policy L2TPV3Policy1
  session tunnel1peer1session1 pseudowire-id 5000 traffic-source vlan 10-20 native-vlan 1
  router-id 2000
  establishment-criteria cluster-master

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1) #

**Related Commands**

- **no**

  Removes the L2TPv3 policy configured with a tunnel and reverts to the default tunnel policy
22.3 l2tpv3-manual-session-commands

After a successful tunnel connection and establishment, individual sessions can be created. Each session is a single data stream. After successful session establishment, data corresponding to that session (pseudowire) can be transferred. If a session is down, the pseudowire associated with it is shut down as well.

Use the (profile-context) instance to manually configure a L2TPv3 session. To navigate to the L2TPv3 manual session configuration mode, use the following command in the profile context:

```
<DEVICE>(config-profile-default-rfs7000)#l2tpv3 manual-session <SESSION-NAME>
```

```
rfs7000-37FABE(config-profile-default-rfs7000)#l2tpv3 manual-session test
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

L2tpv3 Manual Session Mode commands:

- **local-cookie**: The local cookie for the session
- **local-ip-address**: Configure the IP address for tunnel. If not specified, tunnel source IP address would be chosen automatically based on the tunnel peer IP address
- **local-session-id**: Local session id for the session
- **mtu**: Configure the MTU size for the manual session tunnel
- **no**: Negate a command or set its defaults
- **peer**: Configure L2TPv3 manual session peer
- **remote-cookie**: The remote cookie for the session
- **remote-session-id**: Remote session id for the session
- **traffic-source**: Traffic that is tunneled
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

### 22.3.1 local-cookie

**l2tpv3-manual-session-commands**

Configures the local cookie field size for the manual session

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
```
local-cookie size [4|8] <1-4294967295> {<1-4294967295>}
```

**Parameters**
- `local-cookie size [4|8] <1-4294967295> {<1-4294967295>}`

| local-cookie size [4|8] | Configures the local cookie field size for this manual session. The options are: |
|-------------------------|-----------------------------------------------------------------------------------|
|                         | 4 – 4 byte local cookie field                                                     |
|                         | 8 – 8 byte local cookie field                                                     |
| <1-4294967295>          | Configures the local cookie value first word. Applies to both the 4 byte and 8 byte local cookies |
| <1-4294967295>          | Optional – Configures the local cookie value second word. Applicable to only 8 byte cookies. This parameter is ignored for 4 byte cookies. |

**Examples**
```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#local-cookie size 8 200 300
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
local-cookie size 8 200 300
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

**Related Commands**
- `no` Removes the local cookie size configured for a manual session
22.3.2 **local-ip-address**

- **l2tpv3-manual-session-commands**

Configures the manual session’s source IP address. If no IP address is specified, the tunnel’s source IP address is automatically configured based on the tunnel peer IP address. This parameter is applicable when establishing the session and responding to incoming requests.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`local-ip-address <IP>`

**Parameters**

- `local-ip-address <IP>`

**Examples**

```
# Configure the local-ip-address
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#local-ip-address 1.2.3.4

# Show context and configuration details
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context
local-cookie size 8 200 300
local-ip-address 1.2.3.4
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

**Related Commands**

- `no` Resets the manual session’s local source IP address. This re-establishes the session.
22.3.3 **local-session-id**

> **l2tpv3-manual-session-commands**

Configures the manual session’s local session ID

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

`local-session-id <1-63>`

**Parameters**

- `local-session-id <1-63>`

| local-session-id <1-63> | Configures this manual session’s local session ID from 1 - 63. This is the pseudowire ID for the session. This pseudowire ID is sent in a session establishment message to the L2TP peer. |

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#local-session-id 1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context 12tpv3 manual-session test
  local-cookie size 8 200 300
  local-ip-address 1.2.3.4
  local-session-id 1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

**Related Commands**

- `no` | Removes the manual session’s local session ID
22.3.4 mtu

Configures the Maximum Transmission Unit (MTU) size for the manual session tunnel. The MTU is the size (in bytes) of the largest protocol data unit the layer can pass between tunnel peers in this session. A larger MTU means processing fewer packets for the same amount of data.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

mtu <128-1460>

Parameters

- mtu <128-1460>

Examples

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#mtu 200

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
local-cookie size 8 200 300
local-ip-address 1.2.3.4
mtu 200
local-session-id 1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#

Related Commands

- no
  Resets the MTU size for this manual session to default (1460 bytes)
22.3.5 no

Negates or reverts L2TPv3 manual session settings to default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [local-cookie|local-ip-address|local-session-id|mtu|peer|remote-cookie|
remote-session-id|traffic-source]

Parameters

- no <PARAMETERS>

Examples

The following example shows the manual session 'test' settings before the 'no' commands are executed:

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context
l2tpv3 manual-session test
local-ip-address 1.2.3.4
peer ip-address 5.6.7.8 udp port 150
traffic-source vlan 50-60 native-vlan 2
local-session-id 1
remote-session-id 200
remote-cookie size 8 400 700
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#no local-ip-address
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#no local-session-id
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#no remote-session-id
The following example shows the manual session ‘test’ settings after the ‘no’ commands are executed:

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
peer ip-address 5.6.7.8 udp port 150
traffic-source vlan 50-60 native-vlan 2
remote-cookie size 8 400 700
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
### 22.3.6 peer

#### l2tpv3-manual-session-commands

Configures peer(s) allowed to establish the manual session tunnel. The peers are identified by their IP addresses.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

`peer ip-address <IP> {udp {port <1-65535>}}`

#### Parameters

- **peer ip-address <IP> {udp {port <1-65535>}}**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peer ip-address &lt;IP&gt;</td>
<td>Configures the tunnel's peer IP address in the A.B.C.D format</td>
</tr>
<tr>
<td>udp {port &lt;1-65535&gt;}</td>
<td>Optional. Configures the UDP encapsulation mode for this tunnel (default encapsulation is IP)</td>
</tr>
</tbody>
</table>

- **port <1-65535>** — Optional. Configures the peer's UDP port running the L2TPv3 service. Specify a value from 1 - 65535.

#### Examples

```text
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#peer ip-address 5.6.7.8 udp port 150
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
    local-cookie size 8 200 300
    local-ip-address 1.2.3.4
    peer ip-address 5.6.7.8 udp port 150
    mtu 200
    local-session-id 1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

#### Related Commands

### no

Removes the manual session's peer
22.3.7 remote-cookie

Configures the manual session’s remote cookie field size

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

remote-cookie size [4|8] <1-4294967295> {<1-4294967295>}

Parameters

- remote-cookie size [4|8] <1-4294967295> {<1-4294967295>}

remote-cookie size [4|8] | Configures the remote cookie field size for this manual session. The options are:
- 4 – 4 byte remote cookie field
- 8 – 8 byte remote cookie field

<1-4294967295> | Configures the remote cookie value first word. Applies to both the 4 byte and 8 byte local cookies

<1-4294967295> | Optional – Configures the remote cookie value second word. Applicable to only 8 byte cookies. This parameter is ignored for 4 byte cookies.

Examples

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#remote-cookie size 8 400 700

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
  local-ip-address 1.2.3.4
  peer ip-address 5.6.7.8 udp port 150
  mtu 200
  local-session-id 1
  remote-cookie size 8 400 700
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#

Related Commands

- **no** | Removes the manual session’s remote cookie field size
22.3.8 remote-session-id

`l2tpv3-manual-session-commands`

Configures the manual session’s remote ID. This ID is passed in the establishment of the tunnel session.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

remote-session-id <1-4294967295>

**Parameters**

- remote-session-id <1-4294967295>

| remote-session-id <1-4294967295> | Configures this manual session’s remote ID. Specify a value from 1 - 4294967295. |

**Examples**

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#remote-session-id 200

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
  local-ip-address 1.2.3.4
  peer ip-address 5.6.7.8 udp port 150
  local-session-id 1
  remote-session-id 200
  remote-cookie size 8 400 700
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#

**Related Commands**

- `no` Removes the manual session’s remote ID
22.3.9 traffic-source

Configures the traffic source tunneled by this session

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

traffic-source vlan <VLAN-ID-RANGE> {native-vlan <1-4094>}

Parameters

- traffic-source vlan <VLAN-ID-RANGE> {native-vlan <1-4094>}

<table>
<thead>
<tr>
<th>traffic-source vlan &lt;VLAN-ID-RANGE&gt;</th>
<th>Configures VLAN as the traffic source for this tunnel</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;VLAN-ID-RANGE&gt;</td>
<td>- &lt;VLAN-ID-RANGE&gt; – Configures VLAN range list of traffic source. Specify the VLAN IDs as a range (for example, 10-20, 25, 30-35)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>native-vlan &lt;1-4094&gt;</th>
<th>Optional – Configures the native VLAN ID for this session, which is not tagged</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-4094&gt;</td>
<td>- &lt;1-4094&gt; – Specify the native VLAN ID from 1-4094.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#traffic-source vlan 50-60 native-vlan 2

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
local-ip-address 1.2.3.4
peer ip-address 5.6.7.8 udp port 150
traffic-source vlan 50-60 native-vlan 2
local-session-id 1
remote-session-id 200
remote-cookie size 8 400 700
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#

Removes the traffic source configured for a tunnel
This chapter summarizes Open Shortest Path First (OSPF) router mode commands in the CLI command structure. All router-mode commands are available on both device and profile modes.

OSPF is an interior gateway protocol (IGP) used within large autonomous systems to distribute routing information. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer, which makes routing decisions based solely on the destination IP address found in IP packets.

OSPF detects changes in the topology, like a link failure, and plots a new loop-free routing structure. It computes the shortest path for each route using a shortest path first algorithm. Link state data is maintained on each router and is periodically updated on all OSPF member routers. This enables routers to synchronize routing tables.

OSPF uses a route table managed by the link cost (external metrics) defined for each routing interface. The cost could be the distance of a router (round-trip time), link throughput or link availability.

Use the (config) instance to configure router commands. To navigate to the (config-router-mode) instance, use the following command:

```
<DEVICE> (config-profile-<PROFILE-NAME>)#router ospf
<DEVICE> (config-profile <PROFILE-NAME>-router-ospf)#
```

```
rfs7000-37FABE(config-profile-default-rfs7000)#router ospf
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#?
```

Router OSPF Mode commands:

- **area** OSPF area
- **auto-cost** OSPF auto-cost
- **default-information** Distribution of default information
- **ip** Internet Protocol (IP)
- **network** OSPF network
- **no** Negate a command or set its defaults
- **ospf** OSPF
- **passive** Make OSPF Interface as passive
- **redistribute** Route types redistributed by OSPF
- **route-limit** Limit for number of routes handled OSPF process
- **router-id** Router ID
- **clrscr** Clears the display screen
- **commit** Commit all changes made in this session
- **do** Run commands from Exec mode
- **end** End current mode and change to EXEC mode
- **exit** End current mode and down to previous mode

</tr>
</tbody>
</table>
23.1.1.1 area

area

Configures OSPF network areas (OSPF enables interfaces)

An OSPF network can be subdivided into routing areas to simplify administration and optimize traffic utilization. Areas are logical groupings of hosts and networks, including routers having interfaces connected to an included network. Each area maintains a separate link state database whose information may be summarized towards the rest of the network by the connecting router. Areas are identified by 32-bit IDs, expressed either in decimal, or octet-based dot-decimal notation. Areas can defined as: stub area, totally-stub, non-stub, nssa, totally nssa. Each of these area types have been discussed further in the area-type section of this chapter.

At least one default area, bearing number ‘0’, should be configured for every OSPF network. In case of multiple areas, the default area 0 forms the backbone of the network. The default area 0 is used as a link to the other areas. Each area has its own link-state database.

A router running OSPF sends hello packets to discover neighbors and elect a designated router. The hello packet includes link state information and list of neighbors. OSPF is savvy with layer 2 topologies. If on a point-to-point link, OSPF knows it is sufficient, and the link stays up. If on a broadcast link, the router waits for election before determining if the link is functional.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

area [<0-4294967295>|<IP>]

Parameters

- <0-4294967295> Defines an OSPF area in the form of a 32 bit integer. Specify the value from 0 - 4294967295.
- <IP> Defines an OSPF area in the form of an IP address. Specify the IP address.

Examples

rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#area 4 ?
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.4)#?
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.4)#show context area 0.0.0.4
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.4)#

</tr>
</tbody>
</table>
23.1.1.2.1 area-type

This section describes the area-type command, which is used to configure OSPF areas as STUB, Totally STUB, NSSA or Totally NSSA.

Areas can be defined as:

- **stub area**: An area that does not receive route advertisements external to the autonomous system (AS), and routing from within the area is based entirely on a default route.
- **totally-stub**: An area that does not allow summary routes and external routes. A default route is the only way to route traffic outside of the area. When there is only one route out of the area, fewer routing decisions are needed, lowering system resource utilization.
- **non-stub**: An area that imports autonomous system external routes and forwards to other areas. However, it still cannot receive external routes from other areas.
- **nssa**: A Not-So-Stubby Area (NSSA) is an extension of a stub that allows the injection of limited external routes into a stub area. If selecting NSSA, no external routes, except a default route, enter the area.
- **totally-nssa**: A NSSA using 3 and 4 summary routes are not flooded into this type of area. It is also possible to declare an area both totally stubby and not-so-stubby, which means that the area will receive only the default route from area 0.0.0.0, but can also contain an Autonomous System Boundary Router (ASBR) that accepts external routing information and injects it into the local area, and from the local area into area 0.0.0.0.

Supported in the following platforms:

- **Access Points**: AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers**: RFS4000, RFS6000, RFS7000

**Syntax**

```
area-type [nssa|stub]

area-type nssa {default-cost|no-summary|translate-always|translate-candidate|translate-never}

area-type nssa {default-cost <0-16777215> |no-summary| default-cost <0-16777215> |no-summary}

area-type nssa translate-always|translate-candidate|translate-never

area-type stub {default-cost <0-16777215> |no-summary| default-cost <0-16777215> |no-summary}

area-type stub translate-always|translate-candidate|translate-never
```

**Parameters**

- **area-type [nssa|stub]**
  - **default-cost <0-16777215>**
  - **no-summary**
  - **translate-always**
  - **translate-candidate**
  - **translate-never**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nssa</td>
<td>Configures the OSPF area as NSSA</td>
</tr>
<tr>
<td>stub</td>
<td>Configures the OSPF area as <strong>Stub Area (STUB)</strong></td>
</tr>
<tr>
<td>default-cost</td>
<td>Specifies the default summary cost that will be advertised, if the OSPF area is a STUB or NSSA</td>
</tr>
<tr>
<td>&lt;0-16777215&gt;</td>
<td>- Specify the default summary cost value from 0 - 16777215.</td>
</tr>
<tr>
<td>no-summary</td>
<td>Configures the OSPF area as totally STUB if the area-type is STUB or totally NSSA if the area-type is NSSA</td>
</tr>
<tr>
<td>translate-always</td>
<td>Always translates type-7 <strong>Link State Advertisements (LSAs)</strong> into type-5 LSAs</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>translate-candidate</td>
<td>Defines it as default behavior</td>
</tr>
<tr>
<td>translate-never</td>
<td>Never translates type-7 LSAs into type-5 LSAs</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#area-type stub default-cost 1
```

```plaintext
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show context area 0.0.0.1
  area-type stub default-cost 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#
```

</tbody>
</table>
23.1.2.2 authentication

**OSPF-area-mode**

Specifies an authentication scheme used for an OSPF area used with the OSPF dynamic route.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

```
authentication [message-digest|simple-password]
```

**Parameters**

- `authentication [message-digest|simple-password]`

**Usage Guidelines**

OSPF packet authentication enables routers to use predefined passwords and participate within a routing domain. The two authentication modes are:

- **MD-5** — MD-5 authentication is a cryptographic authentication mode, where every router has a key (password) and key-id configured on it. This key and key-id together form the message digest that is appended to the OSPF packet.
- **Simple Password** — Simple password authentication allows a password (key) to be configured per area. Routers in the same area and participating in the routing domain have to be configured with the same key.

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#authentication simple-password
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show context area 0.0.0.1 authentication simple-password
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#area-type stub default-cost 1
```

**Related Commands**

- `no` Removes the authentication scheme
23.1.1.2.3 range

Specify a range of addresses for routes matching address/mask for OSPF summarization

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax
range <IP/M>

Parameters
- range <IP/M>

<table>
<thead>
<tr>
<th>&lt;IP/M&gt;</th>
<th>Specifies the routes matching address/mask for summarization.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note:</td>
<td>This command is applicable for a Area Border Router (ABR) only.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#range 172.16.10.0/24
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show context area 0.0.0.1
  authentication simple-password
  range 172.16.10.0/24
  area-type stub default-cost 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#

Related Commands
- no
  Removes the configured network IP range
23.1.2.4 no

**OSPF-area-mode**

Negates a command or set its defaults

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

no [area-type|authentication|range]

**Parameters**

- no <PARAMETERS>

**Usage Guidelines**

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

The following example shows the OSPF router settings before the `no` commands are executed:

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show context
area 0.0.0.1
    authentication simple-password
    range 172.16.10.0/24
    area-type stub default-cost 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#no authentication
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#no range 172.16.10.0/24
```

The following example shows the OSPF router settings after the `no` commands are executed:

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show context
area 0.0.0.1
    area-type stub default-cost 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#
```
23.1.2 auto-cost

`router-mode`

Configures the reference bandwidth in terms of megabits per second. Specifying the reference bandwidth allows you to control the default metrics for an interface, which is calculated by OSPF.

The formula used to calculate default metrics is: \( \text{ref-bw} \) divided by the \( \text{bandwidth} \).

Use the 'no auto-cost reference-bandwidth' to configure default metrics calculation based on interface type.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

```
auto-cost reference-bandwidth <1-4294967>
```

**Parameters**

- `auto-cost reference-bandwidth <1-4294967>`

  | reference-bandwidth <1-4294967> | Defines the reference bandwidth in Mbps

  - `<1-4294967>` – Specify the reference bandwidth value from 1 - 4294967.

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#auto-cost reference-bandwidth 1

Please make sure that auto-cost reference-bandwidth is configured uniformly on all routers
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf) #
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context router ospf
area 0.0.0.4
  auto-cost reference-bandwidth 1
```

**Related Commands**

| `no` | Removes auto-cost reference bandwidth settings |
23.1.3 default-information

**router-mode**

Controls the distribution of default route information. Use the `default-information > originate` command to advertise a default route in the routing table.

This option is disabled by default. When enabled, the default route becomes a distributed route.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

```
default-information originate {always|metric <0-16777214>|metric-type [1|2]}
```

**Parameters**

- `default-information originate {always|metric <0-16777214>|metric-type [1|2]}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>originate</td>
<td>Originates default route information. Enabling this feature makes the default route a distributed route. This option is disabled by default.</td>
</tr>
<tr>
<td>always</td>
<td>Optional. Always distributes default route information (will continue to advertise default route information even if that information has been removed from the routing table for some reason). This option is disabled by default.</td>
</tr>
<tr>
<td>metric &lt;0-16777214&gt;</td>
<td>This is a recursive parameter and can be optionally configured along with the metric-type option.</td>
</tr>
<tr>
<td>metric-type [1</td>
<td>2]</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#default-information originate metric-type 2 metric 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context router ospf
  area 0.0.0.4
    auto-cost reference-bandwidth 1
    default-information originate metric 1 metric-type 2
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

**Related Commands**

- `no` Disables advertising of default route information available in the routing table.
23.1.4 ip

*router-mode*

Configures IP default gateway priority

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

```
ip default-gateway priority <1-8000>
```

**Parameters**

- `ip default-gateway priority <1-8000>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-gateway</td>
<td>Configures the default gateway</td>
</tr>
<tr>
<td>priority &lt;1-8000&gt;</td>
<td>Sets the priority for the default gateway acquired via OSPF. Specify an integer from 1 - 8000. The default is 7000. Note: Lower the value, higher is the priority.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context router ospf
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

**Related Commands**

- `no` Removes default gateway priority settings
23.1.5 `network`

Assigns networks to specified areas (defines the OSPF interfaces and their associated area IDs)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

`network <IP/M> area [<0-4294967295>|<IP>]`

**Parameters**

- `network <IP/M> area [<0-4294967295>|<IP>]`

| `<IP/M>` | Specifies an OSPF network address/mask value. Defines networks (IP addresses and mask) participating in OSPF. |
| area `[<0-4294967295>|<IP>]` | Specifies an OSPF area, associated with the OSPF address range, in one of the following formats:  
  - `<0-4294967295>` – Specifies a 32 bit OSPF area ID from 0 - 4294967295  
  - `<IP>` – Defines an OSPF area ID in the form of an IPv4 address |

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#network 1.2.3.0/24 area 4.5.6.7
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context router ospf
   network 1.2.3.0/24 area 4.5.6.7
   area 0.0.0.4
   auto-cost reference-bandwidth 1
   default-information originate metric 1 metric-type 2
   ip default-gateway priority 1
```

**Related Commands**

| `no` | Removes the OSPF network to area ID association |
### 23.1.6 ospf

- **router-mode**

  Enables OSPF routing on a profile or device

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000

#### Syntax

`ospf enable`

#### Parameters

- `ospf enable`

#### Examples

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#ospf enable

rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
  router ospf
    ospf enable
    network 1.2.3.0/24 area 4.5.6.7
    area 0.0.0.4
    auto-cost reference-bandwidth 1
    default-information originate metric 1 metric-type 2
    ip default-gateway priority 1

rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

#### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>no</strong></td>
<td>Disables OSPF routing on a profile or device</td>
</tr>
</tbody>
</table>
### 23.1.7 passive

#### router-mode

Configures specified OSPF interface as passive. This option is disabled by default.

A passive interface receives routing updates, but does not transmit them.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

#### Syntax

```bash
passive [WORD]|all|vlan <1-4094>
```

#### Parameters

- `passive [WORD]|all|vlan <1-4094>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>WORD</code></td>
<td>Enables the OSPF passive mode on the interface specified by the <code>WORD</code> parameter</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Enables the OSPF passive mode on all the L3 interfaces</td>
</tr>
<tr>
<td><code>vlan &lt;1-4094&gt;</code></td>
<td>Enables the OSPF passive mode on the specified VLAN interface</td>
</tr>
<tr>
<td></td>
<td><code>&lt;1-4094&gt;</code> – Specify the VLAN interface ID from 1 - 4094.</td>
</tr>
</tbody>
</table>

#### Examples

```bash
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#passive vlan 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
   ospf enable
   network 1.2.3.0/24 area 4.5.6.7
   area 0.0.0.4
   auto-cost reference-bandwidth 1
   default-information originate metric 1 metric-type 2
   passive vlan1
   ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

#### Related Commands

- `no` 
  Disables the OSPF passive mode on a specified interface
### 23.1.8 redistribute

**router-mode**

Specifies the route types redistributed by OSPF

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

```
redistribute [bgp|connected|kernel|static] {metric <0-16777214>|metric-type [1|2]}
```

**Parameters**

- **bgp**
  - Redistributes all BGP routes by OSPF
- **connected**
  - Redistributes all connected interface routes by OSPF
- **kernel**
  - Redistributes all routes that are neither connected, static, dynamic, nor bgp
- **static**
  - Redistributes static routes by OSPF
- **metric <0-16777214>**
  - The following keywords are common to the ‘bgp’, ‘connected’, ‘kernel’, and ‘static’ parameters:
    - **metric <0-16777214>** – Optional. Specifies the OSPF metric value for redistributed routes.
    - `<0-16777214>` – Specify a value from 0 - 16777214.
- **metric-type [1|2]**
  - The following keywords are common to the ‘connected’, ‘kernel’, and ‘static’ parameters:
    - **metric-type [1|2]** – Optional. Sets the OSPF exterior metric type for redistributed routes
    - **1** – Sets the OSPF external type 1 metrics
    - **2** – Sets the OSPF external type 2 metrics

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#redistribute static metric-type 1
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
  ospf enable
  network 1.2.3.0/24 area 4.5.6.7
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  redistribute static metric-type 1
  passive vlan1
  ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

**Related Commands**

- **no**
  - Removes the OSPF redistribution of various route types
### 23.1.9 route-limit

**router-mode**

Limits the number of routes managed by OSPF. The maximum limit supported by the platform is the default configuration defined under the router-ospf context.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

```
route-limit [num-routes|reset-time|retry-count|retry-timeout]
```

```
route-limit [num-routes <DYNAMIC-ROUTE-LIMIT>|reset-time <1-86400>|retry-count <1-32>|retry-timeout <1-3600>]
```

**Parameters**

- **num-routes**
  - `<DYNAMIC-ROUTE-LIMIT>`
  - Specifies the maximum number of non self-generated LSAs this process can receive. 
  - `<DYNAMIC-ROUTE-LIMIT>` – Specify the dynamic route limit.

- **reset-time**
  - `<1-86400>`
  - Specifies the time, in seconds, after which the retry-count is reset to zero. Specify a value from 1 - 86400 seconds. The default is 360 seconds.

- **retry-count**
  - `<1-32>`
  - Specifies the maximum number of times adjacencies can be suppressed. Each time OSPF gets into an ignore state, a counter increments. If the counter exceeds the timeout configured by the retry-count parameter, OSPF stays in the same ignore state. Manual intervention is required to get OSPF out of the ignore state. The default is 5.

- **retry-timeout**
  - `<1-3600>`
  - Specifies the retry time in seconds. During this time, OSPF remains in ignore state and all adjacencies are suppressed. Specify a value from 1 - 3600 seconds. The default is 60 seconds.

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#route-limit num-routes 10 retry-count 5 retry-timeout 60 reset-time 10
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context router ospf
  ospf enable
  network 1.2.3.0/24 area 4.5.6.7
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  redistribute static metric-type 1
  passive vlan1
  route-limit num-routes 10 retry-count 5 retry-timeout 60 reset-time 10
  ip default-gateway priority 1
```

**Related Commands**

- **no**
  - Removes the limit on the number of routes managed by OSPF
### 23.1.10 router-id

**router-mode**

Specifies the OSPF router ID

This ID must be established in every OSPF instance. If not explicitly configured, the highest logical IP address is duplicated as the router identifier. However, since the router identifier is not an IP address, it does not have to be a part of any routable subnet in the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

```
router-id <IP>
```

**Parameters**

- `router-id <IP>`

<table>
<thead>
<tr>
<th><code>&lt;IP&gt;</code></th>
<th>Identifies the OSPF router by its IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IP&gt;</code></td>
<td>- Specify the router ID in the IP &lt;A.B.C.D&gt; format</td>
</tr>
</tbody>
</table>

**Examples**

```bash
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#router-id 172.16.10.8
```

Reload, or execute "clear ip ospf process" command, for this to take effect

```bash
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

**Related Commands**

- `no` Removes the configured OSPF router ID
23.1.11 no

Negates a command or reverts settings to their default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

no [area|auto-cost|default-information|ip|network|ospf|passive|redistribute|route-limit|router-id]

Parameters

- no <PARAMETERS>

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

The following example shows the OSPF router interface settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
    network 1.2.3.0/24 area 4.5.6.7
    area 0.0.0.4
    auto-cost reference-bandwidth 1
default-information originate metric 1 metric-type 2
redistribute static metric-type 1
passive vlan1
route-limit num-routes 10 reset-time 10
ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#no area 4
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#no auto-cost reference-bandwidth
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#no network 1.2.3.0/24 area 4.5.6.7
```

The following example shows the OSPF router interface settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
default-information originate metric 1 metric-type 2
redistribute static metric-type 1
passive vlan1
route-limit num-routes 10 reset-time 10
ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```
CHAPTER 24
ROUTING-POLICY

This chapter summarizes routing-policy commands in the CLI command structure.

Routing policies enable network administrators to control data packet routing and forwarding. Policy-based routing (PBR) always overrides protocol-based routing. Network administrators can define routing policies based on parameters, such as access lists, packet size etc. For example, a routing policy can be configured to route packets along user-defined routes.

In addition to the above, PBR policies facilitate the provisioning of preferential service to specific traffic. PBR minimally provides the following:

- A means to use source address, protocol, application, and traffic class as traffic routing criteria
- A means to load balance multiple WAN uplinks
- A means to selectively mark traffic for Quality of Service (QoS) optimization

Use the (config) instance to configure router-policy commands. To navigate to the (config-routing-policy mode) instance, use the following commands:

```
<DEVICE>(config)#routing-policy <ROUTING-POLICY-NAME>
rfs7000-37FABE(config)#routing-policy testpolicy
rfs7000-37FABE(config)#
```

```
rfs7000-37FABE(config-routing-policy-testpolicy)#?
```

Routing Policy Mode commands:

- **apply-to-local-packets**: Use Policy Based Routing for packets generated by the device
- **logging**: Enable logging for this Route Map
- **no**: Negate a command or set its defaults
- **route-map**: Create a Route Map
- **use**: Set setting to use
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-routing-policy-testpolicy)#
```

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
24.1.1 apply-to-local-packets

Enables/disables PBR for locally generated packets (packets generated by the device). When enabled, this option implements the match and action clauses defined within route maps. This option is enabled by default.

To disable PBR, use the `no apply-to-local-packets` command.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
apply-to-local-packets
```

Parameters

None

Examples

```
rfs7000-37FABE(config-routing-policy-testpolicy)#apply-to-local-packets
rfs7000-37FABE(config-routing-policy-testpolicy)#
```

24.1.2 logging

routing-policy-commands

Enables/disables logging for a specified route map. When enabled, this option logs events generated by the enforcement of route-maps. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
/logging

Parameters

None

Examples

rfs7000-37FABE(config-routing-policy-testpolicy)#logging
rfs7000-37FABE(config-routing-policy-testpolicy)#show context routing-policy testpolicy logging
rfs7000-37FABE(config-routing-policy-testpolicy)#

24.1.3  route-map

- routing-policy-commands

Creates a route map entry and enters the route map configuration mode

In policy-based routing (PBR), route maps control the flow of traffic within the network. They override route tables and direct traffic along a specific path.

Route-maps contain a set of filters that select traffic (match clauses) and associated actions (mark clauses) for routing. Every route-map entry has a precedence value. Lower the precedence, higher is the route-map's priority. All incoming packets are matched against these route-maps entries. The route-map entry with highest precedence (lowest numerical value) is applied first. In case of a match, action is taken based on the mark clause specified in the route-map. In case of no match, the route-map entry with the next highest precedence is applied. If the incoming packet does not match any of the route-map entries, it is subjected to typical destination-based routing. Each route-map entry can optionally enable/disable logging.

The following criteria can optionally be used as traffic selection segregation criteria:

- **IP Access List** - A typical IP ACL can be used for routing traffic. The mark and log actions in ACL rules however are neglected. Route-map entries have separate logging. Only one ACL can be configured per route map entry.
  
  ACL rules configured under route map entries merge to create a single ACL. Route map precedence values determine the prioritization of the rules in this merged ACL. An IP DSCP value is also added to the ACL rules.

- **IP DSCP** - Packet filtering can be performed by traffic class, as determined from the IP Differentiated Services Code Point (DSCP) field. One DSCP value can be configured per route map entry. If IP ACLs on a WLAN, ports or SVI mark packets, the new/marked DSCP value is used for matching.

- **Incoming WLAN** - Packets can be filtered on the basis of the incoming WLAN. Depending on whether the receiving device has an onboard radio or not, the following two scenarios are possible:
  
  - Device with an onboard radio: If a device having an onboard radio and capable of PBR receives a packet on a local WLAN, this WLAN is used for selection.
  
  - Device without an onboard radio: If a device, without an onboard radio, capable of PBR receives a packet from an extended VLAN, it passes the WLAN information in the MiNT packet to the PBR router. The PBR router uses this information as match criteria.

- **Client role** - The client role can be used as match criteria, similar to a WLAN. Each device has to agree on a unique identifier for role definition and pass the same MINT tunneled packets.

- **Incoming SVI** - A source IP address qualifier in an ACL typically satisfies filter requirements. But if the source host (where the packet originates) is multiple hops away, the incoming SVI can be used as match criteria. In this context the SVI refers to the device interface performing PBR, and not to the source device.

Mark (or action) clauses determine the routing function when a packet satisfies match criteria. If no mark clauses are defined, the default is to fallback to destination-based routing for packets satisfying the match criteria. If no mark clause is configured and fallback to destination-based routing is disabled, then the packet is dropped. The mark clause defines one of following actions:

- **Next hop** - The IP address of the next hop or the outgoing interface through which the packet should be routed. Up to two next hops can be specified. The outgoing interface should be a PPP, a tunnel interface or a SVI which has DHCP client configured. The first reachable hop should be used. But if all next hops are unreachable, typical destination-based route lookup is performed.

- **Default next hop** - If a packet subjected to PBR does not have an explicit route to the destination, the configured default next hop is used. This can be either the IP address of the next hop or the outgoing interface. Only one default next hop can be defined. The difference between the next hop and the default next-hop is: in case of the former, PBR occurs first, then destination-based routing. In case of the latter, the order is reversed. In both cases:
  
  a. If a defined next hop is reachable, it is used. If fallback is configured refer to (b).
b. Perform normal destination-based route lookup. If a next hop is found, it is used, if not refer to (c).

c. If default next hop is configured and reachable, it is used, if not, packet is dropped.

- **Fallback** - Enables fallback to destination-based routing if none of the configured next hops are reachable (or not configured). This is enabled by default.

- **Mark IP DSCP** - Configures IP DSCP bits for QoS using an ACL. The mark action of the route maps takes precedence over the mark action of an ACL.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX

- **Wireless Controllers** — RFS4000, RFS6000, RFS7000

- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

```plaintext
Syntax
route-map <1-100>

Parameters

- route-map <1-100>

  route-map <1-100> Creates a route map entry and enters the route map configuration mode. Specify a precedence value from 1-100.

  **Note:** Lower the sequence number, higher is the precedence.

Examples

rfs7000-37FABE(config-routing-policy-testpolicy)#route-map 1

rfs7000-37FABE(config-routing-policy-testpolicy)#show context
rfs7000-37FABE(config-routing-policy-testpolicy)
logging
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#

rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#

Route Map Mode commands:

- **default-next-hop** Default next-hop configuration (aka gateway-of-last-resort)
- **fallback** Fallback to destination based routing if no next-hop is configured or all are unreachable
- **mark** Mark action for route map
- **match** Match clause configuration for Route Map
- **next-hop** Next-hop configuration
- **no** Negate a command or set its defaults

  clrscr Clears the display screen
  commit Commit all changes made in this session
  do Run commands from Exec mode
  end End current mode and change to EXEC mode
  exit End current mode and down to previous mode
  help Description of the interactive help system
  revert Revert changes
  service Service Commands
  show Show running system information
  write Write running configuration to memory or terminal

rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#

</tbody>
</table>
24.1.4.1 default-next-hop

Sets the default next hop for packets satisfying match criteria

If a packet, subjected to PBR, does not have an explicit route to the destination, the configured default next hop is used. This value is set as either the IP address of the next hop or the outgoing interface. Only one default next hop can be defined. The difference between the next hop and the default next-hop is: in case of the former, PBR occurs first, then destination-based routing. In case of the latter, the order is reverse. Use this command to set either the default next hop IP address or define either a WWAN1, PPPoE1, or VLAN interface.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

default-next-hop [IP|<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID>|vlan <1-4094>|wwan1]

Parameters

- default-next-hop [IP|<ROUTER-IF-NAME>|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID>|pppoe1|vlan <1-4094>|wwan1]

<table>
<thead>
<tr>

Examples

rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#default-next-hop wwan1
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context route-map 1 default-next-hop wwan1
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#

Related Commands

- no | Removes default next hop router settings |
24.1.4.2 fallback

Enables fallback to destination-based routing. This option is enabled by default. To disable fallback, use the `no fallback` command.

The action taken for packets satisfying the match criteria is determined by the mark (action) clauses. If no action is defined, the default is to fallback to destination-based routing.

```
NOTE: If no mark clause is configured and fallback to destination-based routing is disabled, then the packet is dropped.
```

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
fallback
```

Parameters

None

Examples

```
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#fallback
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```

Related Commands

```
no
```
Disables fallback to destination-based routing, if no next hop is configured or are unreachable
24.1.4.3 mark

route-map-mode

Enables the marking of the DSCP field in the IP header

Use this command to set the IP DSCP bits for QoS using an ACL. The mark action of the route maps takes precedence over the mark action of an ACL.

The DSCP field in an IP header enables packet classification. Packet filtering can be done based on traffic class, determined from the IP DSCP field. One DSCP value can be configured per route map entry.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

mark ip dscp <0-63>

Parameters

- mark ip dscp <0-63>

| ip dscp <0-63> | Marks the DSCP field in the IP header. Specify a DSCP value from 0 - 63. |

Examples

rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context route-map 1
default-next-hop wwan1
    mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#

Related Commands

- no | Disables marking of IP packets |
24.1.4.4 match

Sets the match clauses

Each route map entry has a set of match clauses used to segregate and filter packets. Packets can be segregated using any one of the following criteria:

- **IP Access List** - A typical IP ACL can be used for routing traffic. The mark and log actions in ACL rules however are neglected. Route-map entries have separate logging. Only one ACL can be configured per route map entry.
  
  ACL rules configured under route map entries merge to create a single ACL. Route map precedence values determine the prioritization of the rules in this merged ACL. An IP DSCP value is also added to the ACL rules.

- **IP DSCP** - Packet filtering can be performed by traffic class, as determined from the IP Differentiated Services Code Point (DSCP) field. One DSCP value can be configured per route map entry. If IP ACLs on a WLAN, ports or SVI mark packets, the new/marked DSCP value is used for matching.

- **Incoming WLAN** - Packets can be filtered on the basis of the incoming WLAN. Depending on whether the receiving device has an onboard radio or not, the following two scenarios are possible:
  
  - Device with an onboard radio: If a device having an onboard radio and capable of PBR receives a packet on a local WLAN, this WLAN is used for selection.
  
  - Device without an onboard radio: If a device, without an onboard radio, capable of PBR receives a packet from an extended VLAN, it passes the WLAN information in the MiNT packet to the PBR router. The PBR router uses this information as match criteria.

- **Client role** - The client role can be used as match criteria, similar to a WLAN. Each device has to agree on a unique identifier for role definition and pass the same MiNT tunneled packets.

- **Incoming SVI** - A source IP address qualifier in an ACL typically satisfies filter requirements. But if the source host (where the packet originates) is multiple hops away, the incoming SVI can be used as match criteria. In this context the SVI refers to the device interface performing PBR, and not to the source device.

The action taken for filtered packets is determined by the mark (action) clauses. If no action is defined, the default is to fallback to destination-based routing for packets satisfying the match criteria. For more information on configuring mark clauses, see mark. And for more information on fallback action, see fallback.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

match [incoming-interface|ip|ip-access-list|wireless-client-role|wlan]

match incoming-interface [<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID>|vlan <1-4094>|wwan1]
match ip dscp <0-63>
match ip-access-list <IP-ACCESS-LIST-NAME>
match wireless-client-role <ROLE-POLICY-NAME> <ROLE-NAME>
match wlan <WLAN-NAME>
**Parameters**

- **match incoming-interface** `<ROUTERS-IF-NAME>|pppoe1|serial<SLID> <PORT-ID> <CHANNEL-GROUP-ID>|vlan <1-4094>|wwan1`
  
<table>
<thead>
<tr>

</tr>
</tbody>
</table>

- **match ip dscp <0-63>**
  
  | ip dscp <0-63> | Sets the DSCP match clause. Specify a value from 0 - 63. The defined DSCP value is used as a matching clause for this route map. |

- **match ip-access-list** `<IP-ACCESS-LIST-NAME>`
  
  | ip-access-list `<IP-ACCESS-LIST-NAME>` | Sets the match clause using a pre-configured IP access list. Specify a pre-configured IP access list name. |

- **match wireless-client-role** `<ROLE-POLICY-NAME> <ROLE-NAME>`
  
  | wireless-client-role `<ROLE-POLICY-NAME> <ROLE-NAME>` | Sets the wireless client role match clause. Specify a pre-configured role policy and a pre-configured role within it. |

- **match wlan** `<WLAN-NAME>`
  
  | wlan `<WLAN-NAME>` | Sets the incoming WLAN match clause. Specify a WLAN name. |

**Examples**

rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#match incoming-interface pppoe1

rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context route-map 1
  match incoming-interface pppoe1
  default-next-hop wwan1
  mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#

**Related Commands**

- **no** | Disables match clause settings for this route map |
24.1.4.5 next-hop

Sets the next hop for packets satisfying match criteria

This command allows you to configure the primary and secondary hop priority requests.

Define the primary and secondary hop settings. When defined, the primary hop resource is used with no additional considerations when ever it is available.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
next-hop [<IP>|<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID>|vlan <1-4094>|wwlan1] {<IP>|<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID>|vlan <1-4094>|wwlan1}
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>Specifies the primary and secondary next hop router’s IP address</td>
</tr>
<tr>
<td>&lt;WORD&gt;</td>
<td>Specifies the layer 3 Interface name (router interface)</td>
</tr>
<tr>
<td>pppoe1</td>
<td>Specifies the PPP over Ethernet interface</td>
</tr>
<tr>
<td>serial &lt;SLOT-ID&gt; &lt;PORT-ID&gt; &lt;CHANNEL-GROUP-ID&gt;</td>
<td>Specifies the serial interface’s slot, port, and channel group IDs.</td>
</tr>
<tr>
<td>vlan &lt;1-4094&gt;</td>
<td>Specifies the VLAN interface. Specify a VLAN ID from 1 - 4094. The VLAN interface should be a DHCP client.</td>
</tr>
<tr>
<td>wwan1</td>
<td>Specifies the WAN interface</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#next-hop vlan 1
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context route-map 1
    match incoming-interface pppoe1
    next-hop vlan1
    default-next-hop wwan1
    mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```

Related Commands

- **no** Disables the next hop router settings
24.1.4.6 no

Negates a command or sets its defaults

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
no [default-next-hop|fallback|mark|match|next-hop]

Parameters
- no <PARAMETERS>

Usage Guidelines
The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples
The following example shows the route-map ‘1’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context
route-map 1
    match incoming-interface pppoe1
    next-hop vlan1
    default-next-hop wwan1
    mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```

```
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#no default-next-hop
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#no next-hop
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#no next-hop
```

The following example shows the route-map ‘1’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context
route-map 1
    match incoming-interface pppoe1
    mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```
24.1.5 use

routing-policy-commands

Uses Critical Resource Management (CRM) to monitor link status.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

use critical-resource-monitoring

Parameters

- use critical-resource-monitoring

| use critical-resource-monitoring | Uses CRM to monitor the status of a link. Selecting this option determines the disposition of the route-map next hop via monitored critical resources. Link monitoring is the function used to determine a potential fail over to the secondary next hop. This option is enabled by default. |

Examples

rfs7000-37FABE(config-routing-policy-testpolicy)#use critical-resource-monitoring
rfs7000-37FABE(config-routing-policy-testpolicy)#

Related Commands

no | Disables CRM link status monitoring |
24.1.6 no

Negates a command or sets its defaults

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [apply-to-local-packets|logging|route-map|use]

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Negates a command or set its defaults |

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

The following example shows the routing policy ‘testpolicy’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-routing-policy-testpolicy)#show context
routing-policy testpolicy
  logging
  route-map 1
    match incoming-interface pppoe1
    default-next-hop wwan1  mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy)#
```

```
rfs7000-37FABE(config-routing-policy-testpolicy)#no logging
rfs7000-37FABE(config-routing-policy-testpolicy)#no route-map 1
rfs7000-37FABE(config-routing-policy-testpolicy)#no apply-to-local-packets
```

The following example shows the routing policy ‘testpolicy’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-routing-policy-testpolicy)#show context
routing-policy testpolicy
  no apply-to-local-packets
rfs7000-37FABE(config-routing-policy-testpolicy)#
```
This chapter summarizes the accounting, authentication, and authorization (AAA) Terminal Access Control Access-Control System (TACACS) policy commands in the CLI command structure.

TACACS is a network security application that provides additional network security by providing a centralized authentication, authorization, and accounting platform. TACACS implementation requires configuration of the TACACS authentication server and database.

Use the (config) instance to configure AAA-TACACS policy commands. To navigate to the config-aaa-tacacs-policy instance, use the following commands:

```
<DEVICE>(config)#aaa-tacacs-policy <POLICY-NAME>
rfs7000-37FABE(config)#aaa-tacacs-policy test
rfs7000-37FABE(config-aaa-tacacs-policy-test)#?
```

AAA TACACS Policy Mode commands:

- **accounting**: Configure accounting parameters
- **authentication**: Configure authentication parameters
- **authorization**: Configure authorization parameters
- **no**: Negate a command or set its defaults
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-aaa-tacacs-policy-test)#
```
25.1 aaa-tacacs-policy

The following table summarizes AAA-TACACS policy configuration commands:

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
## 25.1.1 accounting

> **aaa-tacacspolicy**

Configures the server type and interval at which interim accounting updates are sent to the server. Up to 2 accounting servers can be configured.

This feature tracks user activities on the network, and provides information such as, resources used and usage time. This information can be used for audit and billing purposes.

TACACS accounting tracks user activity and is useful for security audit purposes.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

```
accounting [access-method|auth-fail|commands|server|session]
accounting access-method [all|console|ssh|telnet] {console|ssh|telnet)
accounting [auth-fail|commands|session]
accounting server [<1-2>|preference]
accounting server preference [authenticated-server-host|authenticated-server-number|
authorized-server-host|authorized-server-number|none]
accounting server <1-2> [host|retry-timeout-factor <50-200>|timeout]
accounting server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]}
port <1-65535>
accounting server <1-2> timeout <3-5> {attempts <1-3>}
```

### Parameters

- **access-method**
  - Configures TACACS accounting access mode. The options are: console, SSH, Telnet, and all
  - **all**
    - Configures TACACS accounting for all access modes
  - **console**
    - Configures TACACS accounting for console access only
  - **ssh**
    - Configures TACACS accounting for SSH access only
  - **telnet**
    - Configures TACACS accounting for Telnet access only

- **auth-fail**
  - Enables accounting for authentication fail details. This option is disabled by default.

- **commands**
  - Enables accounting of commands executed. This option is disabled by default.

- **session**
  - Enables accounting for session start and stop details. This option is disabled by default.

- **accounting server preference**
  - Configures a TACACS accounting server

<p>| server | Configures a TACACS accounting server |</p>
<table>
<thead>
<tr>
<th>preference</th>
<th>Configures the accounting server preference (specifies the method of selecting a server, from the pool, to send the request)</th>
</tr>
</thead>
<tbody>
<tr>
<td>authenticated-server-host</td>
<td>Sets the authentication server as the accounting server. This is the default setting. This parameter indicates the same server is used for authentication and accounting. The server is referred to by its hostname.</td>

### 25.1.2 authentication

**aaa-tacacs-policy**

Configures user authentication parameters. Users are allowed or denied access to the network based on the authentication parameters set.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
authentication [access-method|directed-request|server|service]
```

```
authentication access-method [all|console|ssh|telnet|web] { (console|ssh|telnet|web) }
```

```
authentication directed-request
```

```
authentication server <1-2> [host|retry-timeout-factor|timeout] 
authentication server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET> | 2 <SECRET> | <SECRET>] } { port <1-65535> } 
authentication server <1-2> retry-timeout-factor <50-200> 
authentication server <1-2> timeout <3-60> { attempts <1-10> } 
```

```
authentication service <SERVICE-NAME> { protocol <AUTHENTICATION-PROTO-NAME> }
```

**Parameters**

- **access-method**
  - all: Authenticates users using all access modes (console, SSH, and Telnet)
  - console: Authenticates users using console access only
  - ssh: Authenticates users using SSH access only
  - telnet: Authenticates users using Telnet access only
  - web: Authenticates users using Web interface only

- **directed-request**
  - Enables user to specify TACACS server to use with `@server'. This option is disabled by default.
  - Note: The specified server should be present in the configured servers list.

</tbody>
</table>

- **authentication server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET> | 2 <SECRET> | <SECRET>] } { port <1-65535> }

- **server <1-2>**
  - Configures a TACACS authentication server. Up to 2 TACACS servers can be configured
  - `<1-2>` — Specify the TACACS server index from 1 - 2.

- **host <IP/HOSTNAME>**
  - Sets the TACACS server’s IP address or hostname
| secret [0 <SECRET>] 2 <SECRET> | Configures the secret key used to authenticate with the TACACS server  
| 2 <SECRET> | • 0 <SECRET> – Configures a clear text secret  
| 2 <SECRET> | • 2 <SECRET> – Configures an encrypted secret  
| <SECRET> | • <SECRET> – Specify the secret key. The shared key should not exceed 127 characters. |
| port <1-65535> | Optional. Specifies the port used to connect to the TACACS server  
| <1-65535> | • <1-65535> – Specify a value for the TCP authentication port from 1-65535. The default port is 49. |
| server <1-2> | Configures a TACACS authentication server. Up to 2 TACACS servers can be configured  
| <1-2> | • <1-2> – Specify the TACACS server index from 1-2. |
| retry-timeout-factor <50-200> | Configures timeout scaling between two consecutive TACACS authentication retries  
| <50-200> | • <50-200> – Specify the scaling factor from 50-200. The default is 100.  
| &nbsp; &nbsp; &nbsp; &nbsp; | A value of 100 indicates the interval between consecutive retries remains the same irrespective of the number of retries.  
| &nbsp; &nbsp; &nbsp; &nbsp; | A value lesser than 100 indicates the interval between consecutive retries reduces with each successive retry.  
| &nbsp; &nbsp; &nbsp; &nbsp; | A value greater than 100 indicates the interval between consecutive retries increases with each successive retry. |
| server <1-2> | Configures a TACACS authentication server. Up to 2 TACACS servers can be configured  
| <1-2> | • <1-2> – Specify the TACACS server index from 1-2. |
| timeout <3-60> | Configures the timeout, in seconds, for each request sent to the TACACS server. This is the time allowed to elapse before another request is sent to the TACACS server. If a response is received from the TACACS server within this time, no retry is attempted.  
| <3-60> | • <3-60> – Specify a value from 3-60 seconds. The default is 3 seconds. |
| attempts <1-10> | Optional. Indicates the number of retry attempts to make before giving up  
| <1-10> | • <1-10> – Specify a value from 1-10. The default is 3. |
| service <SERVICE-NAME> | Configures the TACACS authentication service name |
| protocol <AUTHENTICATION-PROTO-NAME> | Optional. Specify the authentication protocol used with this TACACS policy.  
| &nbsp; | Note: A maximum of five entries is allowed. |
Examples

rfs7000-37FABE(config-aaa-tacacs-policy-test)#authentication directed-request

25.1.3 **authorization**

- **aaa-tacacs-policy**

  Configures authorization parameters

  This feature allows network administrators to limit user accessibility and configure varying levels of accessibility for different users.

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX6500, NX7500, NX7510, NX7520, NX7530, NX6524, NX9000, NX9500, NX9510

**Syntax**

authorization [access-method|allow-privileged-commands|server]

authorization access-method [all|console|telnet|ssh] {(console|ssh|telnet)}

authorization server <1-2>|preference]

authorization server <1-2> [host|retry-timeout-factor|timeout]

authorizationserver <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]}

{port <1-65535>]

authorization server <1-2> retry-timeout-factor <50-200>

authorization server <1-2> timeout <3-5> {attempts <1-3>}

authorization server preference [authenticated-server-host|authenticated-server-number|none]

**Parameters**

- **authorization access-method [all|console|telnet|ssh] {console|ssh|telnet}**

<table>
<thead>
<tr>
<th>access-method</th>
<th>Configure the access method for command authorization</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Authorizes commands from all access methods</td>
</tr>
<tr>
<td>console</td>
<td>Authorizes commands from the console only</td>
</tr>
<tr>
<td>telnet</td>
<td>Authorizes commands from Telnet only</td>
</tr>
<tr>
<td>ssh</td>
<td>Authorizes commands from SSH only</td>
</tr>
<tr>
<td>{console</td>
<td>ssh</td>
</tr>
</tbody>
</table>

- **authorization allow-privileged-commands**

| allow-privileged-commands | Allows privileged commands execution without command authorization. This option is disabled by default. |

- **authorization server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]}

<table>
<thead>
<tr>
<th>server &lt;1-2&gt;</th>
<th>Configures a TACACS authorization server. Up to 2 TACACS servers can be configured</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-2&gt;</td>
<td>Specify the TACACS server index from 1 - 2.</td>

</tbody>
</table>

<p>| host &lt;IP/HOSTNAME&gt; | Sets the TACACS server’s IP address or hostname |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| secret [0 <SECRET> 2 <SECRET>] | Optional. Configures the secret used to authorize with the TACACS server  
  - 0 <SECRET> – Configures a clear text secret  
  - 2 <SECRET> – Configures an encrypted secret  
  - <SECRET> – Specify the secret key. The shared key should not exceed 127 characters. |
| port <1-65535>            | Optional. Specifies the port used to connect to the TACACS server  
  - <1-65535> – Specify a value for the TCP authorization port from 1 - 65535. The default port is 49. |
| authorization server <1-2> retry-timeout-factor <50-200> | Configures the scaling of timeouts between consecutive TACACS authorization retries  
  - <50-200> – Specify the scaling factor from 50 - 200. The default is 100.  
  - A value of 100 indicates the interval between consecutive retries remains the same irrespective of the number of retries.  
  - A value lesser than 100 indicates the interval between consecutive retries reduces with each successive retry.  
  - A value greater than 100 indicates the interval between consecutive retries increases with each successive retry. |
| server <1-2>              | Configures a TACACS authorization server. Up to 2 TACACS servers can be configured  
  - <1-2> – Specify the TACACS server index from 1 - 2. |
| retry-timeout-factor <50-200> | Configures the scaling of timeouts between consecutive TACACS authorization retries  
  - <50-200> – Specify the scaling factor from 50 - 200. The default is 100.  
  - A value of 100 indicates the interval between consecutive retries remains the same irrespective of the number of retries.  
  - A value lesser than 100 indicates the interval between consecutive retries reduces with each successive retry.  
  - A value greater than 100 indicates the interval between consecutive retries increases with each successive retry. |
| timeout <3-5>             | Configures the timeout, in seconds, for each request sent to the TACACS server. This is the time allowed to elapse before another request is sent to the TACACS server. If a response is received from the TACACS server within this time, no retry is attempted.  
  - <3-5> – Specify a value from 3 - 5 seconds. The default is 3 seconds. |
| attempts <1-3>            | Optional. Indicates the number of retry attempts to make before giving up  
  - <1-3> – Specify a value from 1 - 3. The default is 3. |
| preference [authenticated-server-host|authenticated-server-number|none] | Configures the authorization server preference  
  - authenticated-server-host – Sets the authentication server as the authorization server. This parameter indicates the same server is used for authentication and authorization. The server is referred to by its hostname.  
  - authenticated-server-number – Sets the authentication server as the authorization server. This parameter indicates the same server is used for authentication and authorization. The server is referred to by its index or number.  
  - none – Indicates the authorization server is independent of the authentication. |
AAA-TACACS-POLICY 25 - 11

Examples

rfs7000-37FABE(config-aaa-tacacs-policy-test)#authorization allow-privileged-commands

rfs7000-37FABE(config-aaa-tacacs-policy-test)#show context
aaa-tacacs-policy test
  authentication directed-request
  accounting server preference authorized-server-number
  authorization allow-privileged-commands
  accounting auth-fail
  accounting commands

rfs7000-37FABE(config-aaa-tacacs-policy-test)#

Related Commands

| no | Resets values or disables commands |
25.1.4 no

Negates a AAA TACACS policy command or sets its default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [accounting|authentication|authorization]

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Provide the parameters needed to reset or disable the desired AAA-TACACS policy setting. |

Examples

The following example shows the AAA-TACACS policy ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-aaa-tacacs-policy-test)#show context
aaa-tacacs-policy test
    authentication directed-request
    accounting server preference authorized-server-number
    authorization allow-privileged-commands
    accounting auth-fail
    accounting commands
rfs7000-37FABE(config-aaa-tacacs-policy-test)#
```

```
rfs7000-37FABE(config-aaa-tacacs-policy-test)#no authentication directed-request
rfs7000-37FABE(config-aaa-tacacs-policy-test)#no accounting auth-fail
rfs7000-37FABE(config-aaa-tacacs-policy-test)#no authorization allow-privileged-commands
```

The following example shows the AAA-TACACS policy ‘test’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-aaa-tacacs-policy-test)#show context
aaa-tacacs-policy test
    accounting server preference authorized-server-number
    accounting commands
rfs7000-37FABE(config-aaa-tacacs-policy-test)#
```

CHAPTER 26
MESHPOINT

This chapter summarizes the Meshpoint commands in the CLI command structure.

Meshpoints are detector radios that monitor their coverage areas for potential failed peers or coverage area holes requiring transmission adjustments for coverage compensation.

This chapter is organized as follows:

- meshpoint-config-instance
- meshpoint-qos-policy-config-instance
- meshpoint-device-config-instance
26.1 meshpoint-config-instance

MeshConnex (MCX) is a mesh networking technology that is comparable to the 802.11s mesh networking specification. MCX meshing uses a hybrid proactive/on-demand path selection protocol, similar to Ad hoc On Demand Distance Vector (AODV) routing protocols. This allows it to form efficient paths using multiple attachment points to a distribution WAN, or form purely ad-hoc peer-to-peer mesh networks in the absence of a WAN. Each device in the MCX mesh proactively manages its own path to the distribution WAN, but can also form peer-to-peer paths on demand to improve forwarding efficiency.

MCX is not compatible with MiNT Based meshing, though the two technologies can be enabled simultaneously in certain circumstances.

MCX is designed for large-scale, high-mobility outdoor mesh deployments. MCX continually gathers data from beacons and transmission attempts to estimate the efficiency and throughput of each MP-to-MP link. MCX uses this data to dynamically form and continually maintain paths for forwarding network frames.

In MCX systems, a meshpoint (MP) is a virtual mesh networking instance on a device, similar to a WLAN AP. On each device, up to 4 MPs can be created and 2 can be created per radio. MPs can be configured to use one or both radios in the device. If the MP is configured to use both radios, the path selection protocols will continually select the best radio to reach each destination. Each MP participates in a single Mesh Network, defined by the MeshID. The MeshID is typically a descriptive network name, similar to the SSID of a WLAN. All MPs configured to use the same MeshID attempt to form a mesh and interoperate. The MeshID allows overlapping mesh networks to discriminate and disregard MPs belonging to different networks.

Use the (config) instance to configure a meshpoint. To navigate to the meshpoint configuration instance, use the following command:

```plaintext
<DEVICE>(config)#meshpoint <MESHPOINT-NAME>
```

```plaintext
rfs7000-37FABE(config)#meshpoint test
rfs7000-37FABE(config-meshpoint-test)#
```

Mesh Point Mode commands:
- allowed-vlans: Set the allowed VLANs
- beacon-format: The beacon format of this meshpoint
- control-vlan: VLAN for meshpoint control traffic
- data-rates: Specify the 802.11 rates to be supported on this meshpoint
- description: Configure a description of the usage of this meshpoint
- meshid: Configure the Service Set Identifier for this meshpoint
- neighbor: Configure neighbor specific parameters
- no: Negate a command or set its defaults
- root: Set this meshpoint as root
- security-mode: The security mode of this meshpoint
- shutdown: Shutdown this meshpoint
- use: Set setting to use
- wpa2: Modify ccmp wpa2 related parameters

```plaintext
clrscr: Clears the display screen
commit: Commit all changes made in this session
do: Run commands from Exec mode
end: End current mode and change to EXEC mode
exit: End current mode and down to previous mode
help: Description of the interactive help system
revert: Revert changes
service: Service Commands
show: Show running system information
write: Write running configuration to memory or terminal
```

```plaintext
rfs7000-37FABE(config-meshpoint-test)#
```
The following table summarizes meshpoint configuration commands:

</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
26.1.1 allowed-vlans

Defines VLANs allowed on the mesh network. A VLAN must be added to the allowed VLANs list for data to be allowed across the mesh network. Use this command to remove VLANs from the list of allowed VLANs.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

allowed-vlans [<VLAN-ID>|add <VLAN-ID>|remove <VLAN-ID>]

Parameters

- allowed-vlans [<VLAN-ID>|add <VLAN-ID>|remove <VLAN-ID>]

<table>
<thead>
<tr>
<th>allowed-vlans</th>
<th>Defines VLANs allowed access on the mesh network</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;VLAN-ID&gt;</td>
<td>The VLAN ID or the range of IDs to be managed.</td>
</tr>
<tr>
<td></td>
<td>A single VLAN or multiple VLANs can be added to the list of allowed VLANs. When adding multiple VLANs, specify the range (for example, 10-20, 25, 30-35). Use this command to create a VLAN list on a new meshpoint.</td>
</tr>
<tr>
<td>add &lt;VLAN-ID&gt;</td>
<td>Adds a single VLAN or a range of VLANs to the list of allowed VLANs. To specify a range of VLANs, specify the first and last VLAN ID in the range separated by a hyphen (for example, 1-10).</td>
</tr>
<tr>
<td>remove &lt;VLAN-ID&gt;</td>
<td>Removes a single VLAN or a range of VLANs from the list of allowed VLANs.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-meshpoint-test)#allowed-vlans 1
rfs7000-37FABE(config-meshpoint-test)#allowed-vlans add 10-23
rfs7000-37FABE(config-meshpoint-test)#allowed-vlans remove 17
rfs7000-37FABE(config-meshpoint-test)#show context
meshpoint test
meshid test
beacon-format mesh-point
control-vlan 1
  allowed-vlans 1,10-16,18-23
security-mode none
no root
```

Related Commands

- **no** Clears the list of VLANs allowed access to the mesh network
26.1.2 beacon-format

Configures the beacon transmission format for this meshpoint. Beacons are transmitted periodically to advertise that a wireless network is available. It contains all the required information for a device to connect to the network.

The beacon format advertises how a mesh capable AP71XX acts. APs can act either as an access point or a meshpoint.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
beacon-format [access-point|mesh-point]

Parameters
- beacon-format [access-point|mesh-point]

| beacon-format | Configures how a mesh capable AP71XX acts in a mesh network |
| access-point | Uses access point style beacons |
| mesh-point | Uses meshpoint style beacons (this is the default setting) |

Examples
rfs7000-37FABE(config-meshpoint-test)#beacon-format mesh-point
rfs7000-37FABE(config-meshpoint-test)#show context
meshpoint test
meshid test beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
security-mode none
no root
rfs7000-37FABE(config-meshpoint-test)#

Related Commands
no Resets the beacon format for this meshpoint to its default (mesh-point)
26.1.3 control-vlan

- meshpoint-config-instance

Configures a VLAN as the dedicated control VLAN

Mesh management traffic can be sent over a dedicated VLAN. This dedicated VLAN is known as a control VLAN, and should be configured in the backhaul port of all the access points configured as meshpoint roots. Once configured, the control VLAN enables communication between meshpoint’s root APs.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
control-vlan <1-4094>
```

Parameters

- `control-vlan <1-4094>`

Examples

```
rfs7000-37FABE(config-meshpoint-test)#control-vlan 1
rfs7000-37FABE(config-meshpoint-test)#show context
    meshpoint test
    meshid test
    beacon-format mesh-point
    control-vlan 1
    allowed-vlans 1,10-16,18-23
    security-mode none
    no root
rfs7000-37FABE(config-meshpoint-test)#
```

Related Commands

```
no
```

Resets the control VLAN for this meshpoint to its default of 1
### 26.1.4 data-rates

Configures individual data rates for the 2.4 GHz and 5.0 GHz frequency bands

---

**NOTE:** Ensure that the basic data rates configured on a meshpoint’s root and non-root access points is the same.

---

Supported in the following platforms:
- Access Points — AP6522, AP6531, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

data-rates [2.4GHz|5GHz]

data-rates 2.4GHz [b-only|bg|bgn|default|g-only|gn]

data-rates 2.4GHz custom (1|11|12|18|2|24|36|48|5.5|54|6|9|basic-1|basic-11|basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|basic-9|mcs0-15|mcs0-7|mcs8-15|basic-mcs0-7)

data-rates 5GHz [a-only|an|default]

26.1.5 description

meshpoint-config-instance

Configures a brief description for this meshpoint. Use this command to describe this meshpoint and its features.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

rfs7000-37FABE(config-meshpoint-test)#

Related Commands

no

Removes the human friendly description provided for this meshpoint
26.1.6 meshid

meshpoint-config-instance

Configures a unique Service Set Identifier (SSID) for this meshpoint. This ID is used to uniquely identify this meshpoint.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS8000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

meshid <MESH-SSID>

Parameters

- meshid <MESH-SSID>

<table>
<thead>
<tr>
<th>meshid</th>
<th>Configures a unique SSID for the meshpoint</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;MESH-SSID&gt;</td>
<td>The unique SSID configured for this meshpoint</td>
</tr>
</tbody>
</table>

Note: The mesh SSID is case sensitive and should not exceed 32 characters.

Examples

rfs7000-37FABE(config-meshpoint-test)#meshid TestingMeshPoint

rfs7000-37FABE(config-meshpoint-test)#show context

26.1.7 **neighbor**

This command configures the inactivity timeout value for neighboring devices. If a frame is not received from the neighbor device for the configured time, then client resources are removed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
neighbor inactivity-timeout <60-86400>
```

**Parameters**

- `neighbor inactivity-timeout <60-86400>`

<table>
<thead>
<tr>
<th>neighbor inactivity-timeout &lt;60-86400&gt;</th>
<th>Configures the neighbor inactivity timeout in seconds. This represents the allowed interval between frames received from a neighbor before their client privileges are revoked.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;60-86400&gt;</code> – Specify a value from 60 - 86400 seconds. The default is 120 seconds.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-meshpoint-test)#neighbor inactivity-timeout 300
rfs7000-37FABE(config-meshpoint-test)# show context
meshpoint test
description "This is an example of a meshpoint description"
meshid TestingMeshPoint
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
neighbor inactivity-timeout 300

26.1.9 root

meshpoint-config-instance

Configures this meshpoint as the root meshpoint. Root meshpoints are generally tied to an Ethernet backhaul for wired connectivity. By default this option is disabled.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

root

Parameters

None

Examples

There are two ways of configuring root access points within a meshpoint.

1. First method:
   - Configure two meshpoints, having the **same meshid**, one with the **root** option enabled and the other configured as **no root**.
   - Apply the **root** meshpoint to the **root access point** and the **no-root** meshpoint to the **non-root access points**.

The following examples show the configuration of a meshpoint for the **root** access point:

```
rfs7000-37FABE(config)#meshpoint root
rfs7000-37FABE(config-meshpoint-root)#

rfs7000-37FABE(config-meshpoint-root)#meshid test
rfs7000-37FABE(config-meshpoint-root)#root
rfs7000-37FABE(config-meshpoint-root)#security-mode eap
rfs7000-37FABE(config-meshpoint-root)#commit

rfs7000-37FABE(config-meshpoint-root)#show context
meshpoint test-root
  meshid test
  beacon-format mesh-point
  control-vlan 1
  security-mode eap
  root

rfs7000-37FABE(config-meshpoint-root)#
```

The following examples show the configuration of a meshpoint for **non-root** access points:

```
rfs7000-37FABE(config)#meshpoint no-root
rfs7000-37FABE(config-meshpoint-no-root)#

rfs7000-37FABE(config-meshpoint-no-root)#meshid test
rfs7000-37FABE(config-meshpoint-no-root)#security-mode eap

rfs7000-37FABE(config-meshpoint-no-root)#show context
meshpoint no-root
  meshid test
  beacon-format mesh-point
  control-vlan 1
  security-mode eap
  no root

rfs7000-37FABE(config-meshpoint-no-root)#
```
2. Second method:

- Configure a **no-root** meshpoint and apply to all access points in the meshpoint.
- Log into the **meshpoint-device > no-root** configuration mode of the **root access point** and **enable root**.

```
rfs7000-37FABE(config-meshpoint-no-root)#show context
meshpoint no-root
meshid test
beacon-format mesh-point
control-vlan 1
security-mode eap
no root
rfs7000-37FABE(config-meshpoint-no-root)#
```

```
rfs7000-37FABE(config)#ap81xx B4-C7-99-71-17-28
rfs7000-37FABE(config-device-B4-C7-99-71-17-28)#meshpoint-device no-root
rfs7000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#
```

```
rfs7000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#show context
meshpoint no-root
meshid test
beacon-format mesh-point
control-vlan 1
security-mode eap
no root
rfs7000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#
```

```

rfs7000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#show context
meshpoint no-root
meshid test
beacon-format mesh-point
control-vlan 1
security-mode eap
root
rfs7000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#
```

**Related Commands**

| **no** | Removes the configuration of this meshpoint as a root meshpoint |
26.1.10 security-mode

Configures the security mode for this meshpoint

Supported in the following platforms:
- Access Points (as root APs only) — AP650, AP622
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Wireless Controllers — RFS8000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
security-mode [eap|none|psk]

Parameters
- security-mode [eap|none|psk]

<table>
<thead>
<tr>
<th>security-mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eap</td>
<td>Uses 802.1X/EAP as the security mode. When using this option, use the wpa2 command to specify the EAP authentication type and related parameters.</td>
</tr>
<tr>
<td>none</td>
<td>No security is configured for this meshpoint</td>
</tr>
<tr>
<td>psk</td>
<td>Uses Pre Shared Key (PSK) as the security mode. When using this option, use the wpa2 command to enter a 64 character HEX or an 8-63 ASCII character passphrase used for authentication on the mesh point.</td>
</tr>
</tbody>
</table>

Examples
The following example shows root meshpoint configuration with PSK authentication enabled:

```
rfs7000-37FABE(config-meshpoint-test)#security-mode psk
rfs7000-37FABE(config-meshpoint-test)#show context
meshpoint test
description "This is an example of a meshpoint description"
meshid TestingMeshPoint
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
neighbor inactivity-timeout 300
data-rates 2.4GHz bgn
data-rates 5GHz an
security-mode psk
root
rfs7000-37FABE(config-meshpoint-test)#
```

The following example shows root meshpoint configuration with EAP authentication enabled:

```
rfs7000-37FABE(config-meshpoint-root)#show context
meshpoint test
meshid test
beacon-format mesh-point
control-vlan 101
allowed-vlans 101,103
use aaa-policy test
security-mode eap
root
rfs7000-37FABE(config-meshpoint-test)#
```

26.1.11 service

Use this command to allow only those neighbors who are capable of 802.11n data rates to associate with this meshpoint.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
service [allow-ht-only|show cli]

Parameters
- service [allow-ht-only|show cli]

Examples
rfs7000-37FABE(config-meshpoint-test)#service allow-ht-only
rfs7000-37FABE(config-meshpoint-test)#show context

rfs7000-37FABE(config-meshpoint-test)#shutdown
rfs7000-37FABE(config)

Related Commands

| no | Enables an AP as a meshpoint |
26.1.13 use

meshpoint-config-instance

Uses a Quality of Service (QoS) policy defined specifically for meshpoints. To use this QoS policy, it must be defined. To define a meshpoint QoS policy, see meshpoint-qos-policy-config-instance.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

use [aaa-policy <AAA-POLICY-NAME>|meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>]

Parameters

- use [aaa-policy <AAA-POLICY-NAME>|meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>]

| use meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME> | Configures this meshpoint to use a predefined meshpoint QoS policy
|-------------------------------------------------------|-------------------------------------------------
| • <MESHPOINT-QOS-POLICY-NAME> – Specify the meshpoint QoS policy name (should be existing and configured). |

| use aaa-policy <AAA-POLICY-NAME> | Configures this meshpoint to use a predefined aaa-policy
|---------------------------------|-------------------------------------------------
| • <AAA-POLICY-NAME> – Specify the aaa-policy name (should be existing and configured). |

Examples

| meshpoint-qos-policy-config-instance | Creates and configures a meshpoint QoS policy |
26.1.14 wpa2

Use this command to configure the parameters of authentication mode specified using the ‘security-mode’ keyword. This command also allows you to set a unicast and broadcast key rotation interval.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
wpa2 [eap|psk|key-rotation]

wpa2 key-rotation [broadcast|unicast] <30-86400>

wpa2 psk [0 <SECRET>|2 <SECRET>|<SECRET>]

wpa2 eap [auth-type|identity|peap-mschapv2|tls]

wpa2 eap [auth-type [peap-mschapv2|tls]|identity <WORD>]

wpa2 eap peap-mschapv2 user <USER-NAME> password [0 <WORD>|2 <WORD>|<WORD>]
{trustpoint <TRUSTPOINT-NAME>}

wpa2 eap tls trustpoint <TRUSTPOINT-NAME>
```

Parameters
- **wpa2 key-rotation [broadcast|unicast] <30-86400>**
  - Enables periodic rotation of encryption keys used for broadcast and unicast traffic
  - **broadcast** Configures key rotation interval for broadcast and multicast traffic. This option is disabled by default.
    - When enabled, the key indices used for encrypting/decrypting broadcast traffic is alternatively rotated based on the defined interval. Key rotation enhances the broadcast traffic security on the WLAN.
  - **unicast** Configures key rotation interval for unicast traffic. This option is disabled by default.
  - **<30-86400>** Configures key rotation interval from 30 - 86400 seconds for unicast or broadcast transmission

- **wpa2 psk [0 <SECRET>|2 <SECRET>|<SECRET>]**
  - Configures the shared key for authentication mode PSK. If the security mode is set as ‘psk’ using the ‘security-mode’ keyword, use this command to configure the pre-shared key.

- **secret [0 <SECRET>|2 <SECRET>|<SECRET>]**
  - Configures the PSK used to authenticate this meshpoint with other meshpoints in the network
  - 0 <SECRET> – Configures a clear text secret
  - 2 <SECRET> – Configures an encrypted secret
  - <SECRET> – Specify the secret key. The pre-shared key can be in ASCII (8 to 63 characters in length) or Hexadecimal (not exceeding 64 characters in length) formats.
### `wpa2 eap [auth-type [peap-mschapv2|tls]|identity <WORD>]`

**wpa2 eap**

Configures the 802.1X/EAP based authentication type for this meshpoint. If the security mode is set as `eap` using the `security-mode` keyword, use this command to specify the EAP type. The options are: `peap-mschapv2` and `tls`.

**auth-type [peap-mschapv2|tls]**

Specifies the EAP authentication type. The options are:

- `peap-mschapv2` – Configures EAP authentication type as *Protected Extensible Authentication Protocol* (PEAP) with default auth type MSCHAPv2. This is the default setting.
  
  If using auth-type as `peap-mschapv2`, use the `peap-mschapv2` keyword to configure user credentials and trustpoint details.

- `tls` – Configures EAP authentication type as *Transport Layer Security* (TLS)
  
  If using auth-type as `tls`, use the `tls` keyword to configure trustpoint details.

**Note:** The certificate should be issued from an Enterprise or public certificate authority to allow 802.1X clients to validate the identity of the authentication server prior to forwarding credentials.

**identity <WORD>**

Configures identity to be used during phase1 authentication

- `<WORD>` – Enter a string up to 256 characters in length (this should not be actual identity of user but some anonymous/bogus username)

### `wpa2 eap peap-mschapv2 user <USER-NAME> password [0 <WORD>|2 <WORD>|<WORD>] {trustpoint <TRUSTPOINT-NAME>}`

**wpa2 eap peap-mschapv2**

Configures PEAP-related user credentials and trustpoint details

**user <USER-NAME>**

Specify the user credentials used for authentication

- `<USER-NAME>` – Specify the user name.

**password [0 <WORD>|2 <WORD>|<WORD>]**

- `<WORD>` – Specify the password associated with the specified user.

**trustpoint <TRUSTPOINT-NAME>**

Optional. Associates a trustpoint used for installing CA certificate and verifying server certificate

- `<TRUSTPOINT-NAME>` – Specify the trustpoint name (should be existing and configured).

### `wpa2 eap tls trustpoint <TRUSTPOINT-NAME>`

**wpa2 eap tls**

Configures TLS client related parameters

**trustpoint <TRUSTPOINT-NAME>**

Configures trustpoint details

- `<TRUSTPOINT-NAME>` – Assigns a trustpoint to be used for installing TLS client certificate, client private key, and CA certificate

- `<TRUSTPOINT-NAME>` – Specify the trustpoint name (should be existing and configured)

26.2 meshpoint-qos-policy-config-instance

Mesh Quality of Service (QoS) provides a data traffic prioritization scheme. QoS reduces congestion from excessive traffic. If there is enough bandwidth for all users and applications (unlikely because excessive bandwidth comes at a very high cost), then applying QoS has very little value. QoS provides policy enforcement for mission-critical applications and/or users that have critical bandwidth requirements when bandwidth is shared by different users and applications.

Mesh QoS helps ensure each mesh point on the mesh network receives a fair share of the overall bandwidth, either equally or as per the proportion configured. Packets directed towards clients are classified into categories such as video, voice and data. Packets within each category are processed based on the weights defined for each mesh point.

To create a meshpoint, see meshpoint-config-instance. A meshpoint QoS policy is created from the (config) instance. To create a meshpoint QoS policy use the following command:

```
<DEVICE>(config)#meshpoint-qos-policy <POLICYNAME>
```

```
rfs7000-37FABE(config)#meshpoint-qos-policy test
rfs7000-37FABE(config-meshpoint-qos-test)#
```

Mesh Point QoS Mode commands:
```
accelerated-multicast Configure accelerated multicast streams address and forwarding QoS classification
no Negate a command or set its defaults
rate-limit Configure traffic rate-limiting parameters on a per-meshpoint/per-neighbor basis
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal
```

```
rfs7000-37FABE(config-meshpoint-qos-test)#
```

The following table summarizes the mespoint-qos-policy configuration commands:

</tbody>
</table>
26.2.1 accelerated-multicast

meshpoint-qos-policy-config-instance

Configures the accelerated multicast stream's address and forwarding QoS classification

**NOTE:** For accelerated multicast feature to work, IGMP querier must be enabled.

When a user joins a multicast stream, an entry is created in the device’s (AP or wireless controller) snoop table and the entry is set to expire after a set time period. Multicast packets are forwarded to the appropriate wireless LAN or mesh until this entry is available in the snoop table.

Snoop querier keeps the snoop table current by updating entries that are set to expire. It also keeps an entry for each multicast stream till there are users registered for the stream.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```shell
accelerated-multicast [<MULTICAST-IP>|autodetect] {classification [background|best-effort|trust|video|voice]}
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

26.2.2 no

meshpoint-qos-policy-config-instance

Negates the commands for meshpoint QoS policy or resets their values to their default.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
no [accelerated-multicast|rate-limit]

no accelerated-multicast [MULTICAST-IP|autodetect]
no rate-limit [meshpoint|neighbor] [from-air|to-air] {max-burst-size|rate}
no rate-limit [meshpoint|neighbor] [from-air|to-air] {red-threshold [background|best-effort|video|voice]}

Parameters
- no <PARAMETERS>

| no <PARAMETERS> | Removes or reverts this meshpoint QoS policy settings to default based on the parameters passed |

Examples

rfs7000-37FABE(config-meshpoint-qos-test)#
26.2.3 rate-limit

- meshpoint-qos-policy-config-instance

Configures the rate limiting of traffic on a per meshpoint or per neighbor basis.

Excessive traffic can cause performance issues or bring down the network entirely. Excessive traffic, bombardments and interference are caused by numerous sources, such as network loops, faulty devices, or malicious software (such as a worm or virus) that has infected one or more branch-level devices. Rate limiting limits the maximum rate sent to or received from the wireless network (and meshpoint) per neighbor. It prevents any single user from overwhelming the wireless network. It also provides differential service for service providers. An administrator can set separate QoS rate limit configurations for data transmitted from the network and data transmitted from a mesh point’s neighbor.

Before defining rate limit thresholds for meshpoint transmit and receive traffic, it is recommended that you define the normal number of ARP, broadcast, multicast, and unknown unicast packets that typically transmit and receive from each supported WMM access category. If thresholds are defined too low, normal network traffic (required by end-user devices) is dropped, resulting in intermittent outages and performance problems.

A connected neighbor can also have QoS rate limit settings defined in both the transmit and receive direction.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

rate-limit [meshpoint|neighbor]
rate-limit [meshpoint|neighbor] [from-air|to-air] {max-burst-size <2-1024>|
  rate <50-1000000>}
rate-limit [meshpoint|neighbor] [from-air|to-air] {red-threshold [background <0-100>|
  best-effort <0-100>|video <0-100>|voice <0-100>]} Parameters

- rate-limit [meshpoint|neighbor] [from-air|to-air] {max-burst-size <2-1024>|
  rate <50-1000000>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>meshpoint</td>
<td>Configures rate limit parameters for all data received from any meshpoint in the mesh network. This option is disabled by default.</td>
</tr>
<tr>
<td>neighbor</td>
<td>Configures rate limit parameters for neighboring meshpoint devices. Enables rate limiting for data transmitted from the client to its associated access point radio and connected controller. This option is disabled by default.</td>
</tr>
<tr>
<td>from-air</td>
<td>Configures rate limits for traffic from the wireless neighbor to the network.</td>
</tr>
<tr>
<td>to-air</td>
<td>Configures rate limits for traffic from the network to the wireless neighbor.</td>
</tr>
<tr>
<td>max-burst-size &lt;2-1024&gt;</td>
<td>Optional. Configures the maximum burst size in kilobytes. Set a value from 2 - 1024 kbytes. For a meshpoint: The smaller the burst, the less likely that the transmit packet transmission results in congestion for the meshpoint’s client destinations. By trending the typical number of ARP, broadcast, multicast and unknown unicast packets over a period of time, the average rate for each access category can be obtained. Once a baseline is obtained, administrators should then add a 10% margin (minimally) to allow for traffic bursts at the site. The default burst size is 320 kbytes. For a neighbor: The smaller the burst, the less likely the transmit packet transmission will result in congestion for the wireless client. The default burst size is 64 kbytes.</td>
</tr>
<tr>
<td>rate &lt;50-1000000&gt;</td>
<td>Optional. Defines a receive or transmit rate limit in kilobytes per second. Set a value from 50 - 1000000 kbps. For a meshpoint: This limit constitutes a threshold for the maximum the number of packets transmitted or received over the meshpoint (from all access categories). Traffic that exceeds the defined rate is dropped and a log message is generated. The default setting is 5000 kbps. For a neighbor: This limit constitutes a threshold for the maximum the number of packets transmitted or received (from all access categories). Traffic that exceeds the defined rate is dropped by the client and a log message is generated. The default rate is 1,000 kbps.</td>
</tr>
</tbody>
</table>

- \[ \text{rate-limit} \ [\text{meshpoint}|\text{neighbor}] \ [\text{from-air}|\text{to-air}] \ \{\text{red-threshold} \ [\text{background} <0-100>|\text{best-effort} <0-100>|\text{video} <0-100>|\text{voice} <0-100>]\} \]

| meshpoint | Configures rate limit parameters for a meshpoint |
| neighbor | Configures rate limit parameters for neighboring meshpoint devices |
| from-air | Configures rate limits for traffic from the wireless neighbor to the network |
| to-air | Configures rate limit value for traffic from the network to the wireless neighbor |
| red-threshold | Optional. Configures random early detection threshold (RED threshold) for traffic class |
| background <0-100> | The following keyword is applicable to the ‘from-air’ and ‘to-air’ traffics. Configures the threshold for low priority (background) traffic For a meshpoint: This is a percentage of the maximum burst size for low priority traffic. Background traffic exceeding the defined threshold is dropped and a log message is generated. Background traffic consumes the least bandwidth of any access category, so this value can be set to a lower value once a general transmit rate is known by the network administrator (using a time trend analysis). The default threshold is 50%. For a neighbor: This is a percentage of the maximum burst size for low priority traffic. Background traffic exceeding the defined threshold is dropped by the client and a log message is generated. The default threshold is 50%. |
best-effort <0-100>
The following keyword is applicable to the ‘from-air’ and ‘to-air’ traffics.
Configures the threshold for best effort traffic
For a meshpoint: This is a percentage of the maximum burst size for normal priority traffic.
Best effort traffic exceeding the defined threshold is dropped and a log message is generated. Best effort traffic consumes little bandwidth, so this value can be set to a lower value once a general transmit rate is known by the network administrator (using a time trend analysis). The default threshold is 50%.
For a neighbor: This is a percentage of the maximum burst size for normal traffic. Best effort traffic exceeding the defined threshold is dropped by the client and a log message is generated. The default threshold is 50%.

video <0-100>
The following keyword is applicable to the ‘from-air’ and ‘to-air’ traffics.
Configures the threshold for video traffic
For a meshpoint: This is a percentage of the maximum burst size for video traffic. Video traffic exceeding the defined threshold is dropped and a log message is generated. Video traffic consumes significant bandwidth, so this value can be set to a higher value once a general transmit rate is known by the network administrator (using a time trend analysis). The default threshold is 25%.
For a neighbor: This is a percentage of the maximum burst size for video traffic. Video traffic exceeding the defined threshold is dropped by the client and a log message is generated. The default threshold is 25%.

voice <0-100>
The following keyword is applicable to the ‘from-air’ and ‘to-air’ traffics.
Configures the threshold for voice traffic
For a meshpoint: This is a percentage of the maximum burst size for voice traffic. Voice traffic exceeding the defined threshold is dropped and a log message is generated. Voice applications consume significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis). The default threshold is 0%.
For a neighbor: This is a percentage of the maximum burst size for voice traffic. Voice traffic exceeding the defined threshold is dropped by the client and a log message is generated. The default threshold is 0% and implies no early random drops will occur.

Examples
rfs7000-37FABE(config-meshpoint-qos-test)#rate-limit meshpoint from-air max-burst-size 800

26.3.1 meshpoint-device

This command configures an access point to use a defined meshpoint. This command is available only under the AP622, AP650, AP6522, AP6532, AP71XX, AP81XX, AP82XX device or profile context. To configure this feature use one of the following options:

- navigate to the device profile config context (used when configuring access point profile on a controller)
- navigate to the device’s config context using the self command (used when configuring a logged on access point)

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax

```
meshpoint-device <MESHPOINT-NAME>
```

Parameters

- meshpoint-device <MESHPOINT-NAME>

Examples

```
rfs7000-37FABE(config)#profile ap71xx AP71XXTestProfile
rfs7000-37FABE(config-profile-AP71XXTestProfile)#meshpoint-device test
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#
```

Mesh Point Device Mode commands:

- `acs` Configure auto channel selection parameters
- `exclude` Exclude neighboring Mesh Devices
- `hysteresis` Configure path selection SNR hysteresis values
- `monitor` Event Monitoring
- `no` Negate a command or set its defaults
- `path-method` Path selection method used to find a root node
- `preferred` Configure preferred path parameters
- `root` Set this meshpoint as root
- `root-select` Root selection method parameters
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#
```
Mesh Point Device Mode commands:

26.3.2.1 acs

meshpoint-device-commands

Enables Automatic Channel Selection (ACS) on this meshpoint device (access point). When enabled, this feature automatically selects the best channel for a meshpoint-device radio based on the device configuration, channel conditions, and network layout.

In a wireless network deployment, it is advantageous for network devices to have the ability to operate in multiple channels and not be limited to only a single channel. Multiple channels increase the bandwidth and throughput of the wireless network. In such a scenario, each network device must have a mechanism to dynamically select a suitable channel of operation. ACS provides the required mechanism for a MCX enabled device.

Use this command to configure the ACS settings and override the default meshpoint configurations.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax

acs [channel-hold-time|channel-switch-delta|channel-width|ocs-duration|ocs-frequency|

acs tolerance-period [2.4GHz|5GHz] <10-600>

Parameters
- acs channel-hold-time [2.4GHz|5GHz] <0-86400>

<table>
<thead>
<tr>
<th>acs</th>
<th>Configures ACS settings and overrides on the selected meshpoint-device</th>
</tr>
</thead>
</table>
channel-hold-time [2.4GHz|5GHz] <0-86400>

Configures the minimum time, in seconds, before a periodic scan, to assess channel conditions for a meshpoint root, is triggered.

- 2.4GHz – Configures the channel hold interval for the 2.4GHz radio band
- 5.0GHz – Configures the channel hold interval for the 5.0GHz radio band

The following keyword is common to the ‘2.4GHz’ and ‘5.0GHz’ bands:

- <0-86400> – Specify a value from 0 - 86400 seconds. The default is 1800 seconds.

Note: A value of ‘0’ disables periodic channel assessment.

- **acs channel-switch-delta [2.4GHz|5GHz] <5-35>**

channel-switch-delta [2.4GHz|5GHz] <5-35>

Configures the difference in interference between the current and best channel needed to trigger a channel change. Once the difference in the current channel and the best channel interference equals the configured value, a channel change is triggered.

- 2.4GHz – Configures the channel switch delta for the 2.4GHz radio band
- 5.0GHz – Configures the channel switch delta for the 5.0GHz radio band

The following keyword is common to the ‘2.4GHz’ and ‘5.0GHz’ bands:

- <5-35> – Specify a value from 5 - 35 dBm. The default is 10 dBm.

- **acs channel-width [2.4GHz|5GHz] [20MHz|40MHz|auto]**

channel-width [2.4GHz|5GHz] [20MHz|40MHz|auto]

Configures the channel width that meshpoint auto channel selection assigns to the radio

- 2.4 GHz – Configures the operating channel width for the 2.4 GHz radio band
- 5.0 GHz – Configures the operating channel width for the 5.0 GHz radio band

The following keywords are common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:

- 20 MHz – Assigns the 20 MHz channel width to the radio
- 40 MHz – Assigns the 40 MHz channel width to the radio
- auto – Selects and assigns the best possible channel from the 20/40 MHz width. This is the default setting.

- **acs ocs-duration [2.4GHz|5GHz] <20-250>**

ocs-duration [2.4GHz|5GHz] <20-250>

Configures the duration, in milliseconds, of off-channel scans (OCSs)

- 2.4 GHz – Configures the ocs-duration for the 2.4 GHz radio band
- 5.0 GHz – Configures the ocs-duration for the 5.0 GHz radio band

The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:

- <20-250> – Specify a value from 20 - 250 milliseconds. The default value is 50 milliseconds.

- **acs ocs-frequency [2.4GHz|5GHz] <1-60>**
ocs-frequency [2.4GHz|5GHz]  
<1-60>  
Configures the interval, in seconds, at which off-channel scan is performed. An ocs-frequency of 10 seconds means that an off-channel scan will be performed once every 10 seconds.  
- 2.4 GHz – Configures the ocs-frequency for the 2.4 GHz radio band  
- 5.0 GHz – Configures the ocs-frequency for the 5.0 GHz radio band  
The following keyword is common to the ’2.4 GHz’ and ’5.0 GHz’ bands:  
- <1-60> – Specify a value from 1 - 60 seconds. The default is 6 seconds.

acs path-min [2.4GHz|5GHz]  
<100-20000>  
Configures the minimum root path metric needed for auto channel selection. This is the acceptance root path metric value to consider a root as a possible candidate mesh node.  
- 2.4 GHz – Configures the minimum root path metric for the 2.4 GHz radio band  
- 5.0 GHz – Configures the minimum root path metric for the 5.0 GHz radio band  
The following keyword is common to the ’2.4 GHz’ and ’5.0 GHz’ bands:  
- <100-20000> – Specify a value from 100 - 20000. The default is 1000.

acs path-threshold [2.4GHz|5GHz]  
<800-65535>  
Configures the root path metric threshold for auto channel selection. This is the acceptance root path metric threshold beyond which the root bound to is considered as bad.  
- 2.4 GHz – Configures the root path metric threshold for the 2.4 GHz radio band  
- 5.0 GHz – Configures the root path metric threshold for the 5.0 GHz radio band  
The following keyword is common to the ’2.4 GHz’ and ’5.0 GHz’ bands:  
- <800-65535> – Specify a value from 800 - 65535. The default is 1500.

acs preferred-interface-tolerance-period [2.4GHz|5GHz]  
<10-600>  
Configures the maximum tolerance period, in seconds, for low root metrics on the preferred interface. This is the duration to wait before triggering an automatic channel selection for the next mesh-hop on the preferred interface.  
- 2.4 GHz – Configures the maximum tolerance period for the 2.4 GHz radio band  
- 5.0 GHz – Configures the maximum tolerance period for the 5.0 GHz radio band  
The following keyword is common to the ’2.4 GHz’ and ’5.0 GHz’ bands:  
- <800-65535> – Specify a value from 10 - 600 seconds.

acs preferred-radio-interface [2.4GHz|5GHz]  
<0-2>  
Configures ACS settings and overrides on the selected meshpoint-device
| preferred-radio-interface [2.4GHz|5GHz] <0-2> | Configures the preferred radio interface on dual band APs  
| • 2.4 GHz – Configures the preferred radio interface for the 2.4 GHz radio band  
| • 5.0 GHz – Configures the preferred radio interface for the 5.0 GHz radio band  
| The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:  
| • <0-2> – Specify a value form 0 - 2. A value of 0 (zero) indicates no preferred radio. |
| acs priority-meshpoint [2.4GHz|5GHz] <MESHPOINT-NAME> | Configures ACS settings and overrides on the selected meshpoint-device  
| • 2.4 GHz – Configures the priority meshpoint for the 2.4 GHz radio band  
| • 5.0 GHz – Configures the priority meshpoint for the 5.0 GHz radio band  
| The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:  
| • <MESHPOINT-NAME> – Specify the meshpoint name for the selected radio band. |
| acs sample-count [2.4GHz|5GHz] <1-10> | Configures ACS settings and overrides on the selected meshpoint-device  
| • 2.4 GHz – Configures the sample count for the 2.4 GHz radio band  
| • 5.0 GHz – Configures the sample count for the 5.0 GHz radio band  
| The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:  
| • <1-10> – Specify a value from 1 -10. The default is 5 samples. |
| acs snr-delta [2.4GHz|5GHz] <1-100> | Configures ACS settings and overrides on the selected meshpoint-device  
| • 2.4 GHz – Configures the snr-delta for the 2.4 GHz radio band  
| • 5.0 GHz – Configures the snr-delta for the 5.0 GHz radio band  
| The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:  
| • <1-100> – Specify a value from 1 - 100 dB. The default is 5 dB. |
| acs signal-threshold [2.4GHz|5GHz] <-100-0> | Configures ACS settings and overrides on the selected meshpoint-device  
| • 2.4 GHz – Configures the signal-threshold for the 2.4 GHz radio band  
| • 5.0 GHz – Configures the signal-threshold for the 5.0 GHz radio band  
| The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:  
| • <-100-0> – Specify a value from -100 - 0 dB. The default is -65 dB. |
- `acs tolerance-period [2.4GHz|5GHz] <10-600>`

rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#
```

**Related Commands**

- `no` | Reverts the configured ACS settings to default
26.3.2.2 exclude

* meshpoint-device-commands

Enables wired-peer (that are wired MiNT level-1 neighbors) exclusion

Supported in the following platforms:
  - Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
  - Access Points (as root APs only) — AP650, AP622

**Syntax**

```plaintext
exclude wired-peer mint-level-1
```

**Parameters**

- `exclude wired-peer mint-level-1`

**Examples**

```plaintext
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#exclude wired-peer mint-level-1
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#show context
    meshpoint-device test
    exclude wired-peer mint-level-1
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#
```

**Related Commands**

- `no` Disables wired-peer exclusion on this meshpoint
26.3.2.3 hysteresis

`meshpoint-device-commands`

Configures path selection SNR hysteresis values on this meshpoint-device (access point). These are settings that facilitate dynamic path selection. Configuring hysteresis prevents frequent re-ranking of the shortest path cost.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622

**Syntax**

```
hysteresis [min-threshold|period|root-sel-snr-delta|snr-delta]
```

```
hysteresis [min-threshold <-100-0>|period <0-600>|root-sel-snr-delta <1-100>|snr-delta <1-100>]
```

**Parameters**

- **hysteresis [min-threshold <-100-0>|period <0-600>|root-sel-snr-delta <1-100>|snr-delta <1-100>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>min-threshold &lt;-100-0&gt;</td>
<td>Configures the minimum signal strength that a device should have to be considered a likely candidate in the mesh route (to the mesh root node) selection process.</td>
</tr>
<tr>
<td>period &lt;0-600&gt;</td>
<td>Configures the interval, in seconds, for which a likely candidate’s path method hysteresis is sustained. In other words a device capable of sustaining the signal strength for the specified period of time is a likely candidate in the mesh route (to the mesh root node) selection process.</td>
</tr>
<tr>
<td>root-sel-snr-delta &lt;1-100&gt;</td>
<td>Configures the signal strength, in dB, that a device has to sustain, within the delta range, to be considered a likely candidate in the mesh route (to the mesh root node) selection process.</td>
</tr>
<tr>
<td>snr-delta &lt;1-100&gt;</td>
<td>Configures the SNR delta. The device with must have a SNR of a greater delta than its current neighbor to be considered a likely candidate in the mesh route (to the mesh root) selection process.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#hysteresis period 15
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#hysteresis root-sel-snr-delta 12
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#hysteresis snr-delta 3
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#hysteresis min-threshold -65
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#show context
meshpoint-device_test
    hysteresis period 15
    hysteresis snr-delta 3
    hysteresis min-threshold -65
    hysteresis root-sel-snr-delta 12
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#
```

**Related Commands**

```
no
```

Removes the configured path selection SNR hysteresis values
26.3.2.4 monitor

meshpoint-device-commands

Enables monitoring of critical resource and primary port links. It also configures the action taken in case a critical resource goes down or a primary port link is lost.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax

```
monitor [critical-resource|primary-port-link-loss]
monitor [critical-resource|primary-port-link-loss] action no-root
```

Parameters

- `monitor [critical-resource|primary-port-link-loss] action no-root`

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>critical-resource</td>
<td>Enables critical resource down event monitoring</td>
</tr>
<tr>
<td>primary-port-link-loss</td>
<td>Enables primary port link loss event monitoring</td>
</tr>
<tr>
<td>action no-root</td>
<td>The following are common to all of the above:</td>
</tr>
<tr>
<td></td>
<td>- action – Sets the action taken if a critical resource goes down or if a primary port link is lost</td>
</tr>
<tr>
<td></td>
<td>- no-root – Changes the meshpoint to be non root (this is the action taken in case any of the above mentioned two events occur)</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#monitor critical-resource action no-root
```

```
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context
meshpoint-device test
  name test
  monitor critical-resource action no-root
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#
```

Related Commands

- `no` Disables monitoring of critical resource and primary port links.
26.3.2.5 path-method

*meshpoint-device-commands*

Configures the path selection method used on a meshpoint device. This is the method used to select the route to the root node within a mesh network.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622

**Syntax**

```
path-method [bound-pair|mobile-snr-leaf|snr-leaf|uniform]
```

**Parameters**

- **path-method [bound-pair|mobile-snr-leaf|snr-leaf|uniform]**

<table>
<thead>
<tr>
<th>path-method</th>
<th>Sets the method used to select the path to the root node in a mesh network</th>
</tr>
</thead>
<tbody>
<tr>
<td>bound-pair</td>
<td>Enables a meshpoint to form an exclusive path with only one other meshpoint. Select this option to bind one mesh point connection at a time. Once established, other mesh point connection requests are denied.</td>
</tr>
<tr>
<td>mobile-snr-leaf</td>
<td>Configures the path selection method as mobile-snr-leaf. When selected, the path to the root node is selected based on the Signal-to-Noise Ratio (SNR) to a neighboring device. This option allows meshpoint devices to select a neighbor with the strongest SNR. Meshpoint devices using the mobile-snr-leaf method are non-forwarding nodes in the meshpoint traffic. <strong>Note:</strong> Select this option for Vehicular Mounted Modem (VMM) access points or other mobile devices.</td>
</tr>
<tr>
<td>snr-leaf</td>
<td>This option allows meshpoints to select a neighbor with the strongest SNR. It is similar to the mobile-snr-leaf option, but is not applicable to mobile devices, such as VMMs.</td>
</tr>
<tr>
<td>uniform</td>
<td>Indicates the path selection method is uniform. When selected, two paths will be considered equivalent if the average goodput is the same for both paths. This is the default setting. <strong>Note:</strong> Select this option for infrastructure devices.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#path-method mobile-snr-leaf
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context meshpoint-device TEST
    name TEST
    path-method mobile-snr-leaf
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#
```

**Related Commands**

- **no** Resets the path selection method on a meshpoint device
26.3.2.6 preferred

meshpoint-device-commands

Configures the preferred path parameters for this meshpoint device

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax

preferred [neighbor <MAC>|root <MAC>|interface [2.4GHz|4.9GHz|5GHz]]

Parameters

- preferred [neighbor <MAC>|root <MAC>|interface [2.4GHz|4.9GHz|5GHz]]
  - preferred Configures the preferred path parameters
  - neighbor <MAC> Adds the MAC address of a neighbor meshpoint as a preferred neighbor
  - root <MAC> Adds the MAC address of a root meshpoint as a preferred root
  - interface [2.4GHz|4.9GHz|5GHz] Sets the preferred interface

Examples

rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#preferred neighbor 11-22-33-44-55-66
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#preferred root 22-33-44-55-66-77
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#preferred interface 5GHz
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context
  meshpoint-device test
  name test
  preferred root 22-33-44-55-66-77
  preferred neighbor 11-22-33-44-55-66
  preferred interface 5GHz
  monitor critical-resource action no-root
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#

Related Commands

no Removes the configuration of preferred paths for this meshpoint device
26.3.2.7 root

meshpoint-device-commands

Configures this meshpoint device as the root meshpoint.

You can optionally use the select-method option to enable dynamic mesh selection. When enabled, this option overrides root or no-root configuration and uses the selection method.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax

root {select-method [auto-mint|auto-proximity]}

Parameters
- root {select-method [auto-mint|auto-proximity]}

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>select-method auto-mint</td>
<td>Optional. Enables or disables dynamic mesh selection. When enabled, this option overrides root or no-root configuration and chooses the selection method.</td>
</tr>
<tr>
<td></td>
<td>• auto-mint – Enables dynamic root selection using Auto-MiNT (based on path cost)</td>
</tr>
</tbody>
</table>

Note: The Auto-Mint or Cost Method dynamically determines the root/non-root configuration of a meshpoint by:
- Monitoring and ranking the signal strength and path cost of neighboring mesh points.
- Setting the configuration to:
  - non-root: If the link with the shortest path to the cost-root mesh device is a MCX meshpoint link
  - root: If the link with the shortest path to the cost-root mesh device is a non MCX meshpoint link (wired link).
- This requires that the meshpoint device, in the brain car, be configured as the ‘cost root’ and the ‘cost root’ meshpoint-device be the L2 gateway to the controller. Use the root-select > cost-root command to configure a meshpoint-device as ‘cost-root’.
- Using signal strength of neighboring meshpoint as the sole metric to determine the next mesh hop to the root.
- Loop detection with both meshpoints in a car select non-root and form a mesh link with the same root.
- auto-proximity – Enables dynamic root selection using meshpoint proximity. When auto-proximity is selected, root selection is based on signal strength of candidate roots.

Examples

rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#root
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context

26.3.2.8  root-select

Configures this meshpoint device as the cost root

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax
root-select cost-root

Parameters
- root-select cost-root

| root-select cost-root | Configures this meshpoint device as the cost root. This is necessary for dynamic root selection process. Select this option to set the meshpoint as the cost root for meshpoint root selection. This setting is disabled by default. |

Examples
ap7131-11B6C4(config-device-00-23-68-11-E6-C4-meshpoint-test)#root-select cost-root

There has been an exponential increase in the number and types of Wi-Fi mobile devices being used globally, resulting in a phenomenal growth in the data traffic volume. Consequently, the demand for secure, quick, and unlicensed access to public Wi-Fi hotspots, capable of handling this sudden influx of mobile data traffic, has been increasing. However, public hotspots have certain intrinsic usability issues, such as network discovery and selection, traffic prioritization, roaming capabilities, user authentication etc. The IEEE 802.11u standards (includes Hotspot 2.0 protocol extensions) were introduced to address these issues.

Hotspot 2.0 is a Wi-Fi Alliance standard that enables interoperability between clients, infrastructure, and operators. It makes a portion of the IEEE 802.11u standard mandatory and adds Hotspot 2.0 extensions that allow clients to query a network before actually attempting to join it. For example, you are using a laptop at an airport and have a list of SSIDs to select from. You will have to first identify the SSID you have the credentials for and then connect to the network. This can be time consuming. In such a scenario, a Hotspot 2.0 enabled device would present only those SSIDs for which you possess credentials. In short, Hotspot 2.0 allows devices to query a network for configuration details, such as WAN metrics, network type, hotspot service provider details, and domain names without actually connecting to the network.

Hotspot 2.0 enabled clients can identify a Hotspot 2.0 capable access point (AP) from the new elements present in the APs beacon/probe messages. Having ascertained that an AP is Hotspot 2.0 capable, the client uses action frames to send an Access Network Query Protocol (ANQP) query inside a Generic Advertisement Service (GAS) request. The AP responds with an action frame containing an ANQP response within a GAS response. Based on this response the mobile device determines the type of credentials needed to log on to the AP.

The WiNG Wi-Fi Alliance implementation defines a passpoint policy that allows a single or a set of Hotspot 2.0 configuration to be global and referenced by the devices that use it. This policy is applied to APs to make them Hotspot 2.0 Wi-Fi Alliance compliant. The passpoint policy is mapped to a WLAN. However, only primary WLANs on a BSSID will have their passpoint policy configuration used. For more information, see Chapter 4, GLOBAL CONFIGURATION COMMANDS.
To migrate to the passpoint policy configuration mode, use the following command:

```
<DEVICE>(config)#passpoint-policy <POLICY-NAME>
```

```
rfs4000-229D58(config)#passpoint-policy test
rfs4000-229D58(config-passpoint-policy-test)#
```

```
rfs4000-229D58(config-passpoint-policy-test)#?
```

Passpoint Policy Mode commands:

- `3gpp` Configure a 3gpp plmn (public land mobile network) id
- `access-network-type` Set the access network type for the hotspot
- `connection-capability` Configure the connection capability for the hotspot
- `domain-name` Add a domain-name for the hotspot
- `hessid` Set a homogeneous ESSID value for the hotspot
- `internet` Advertise the hotspot having internet access
- `ip-address-type` Configure the advertised ip-address-type
- `nai-realm` Configure a NAI realm for the hotspot
- `net-auth-type` Add a network authentication type to the hotspot
- `no` Negate a command or set its defaults
- `operator` Add configuration related to the operator of the hotspot
- `osu` Online signup
- `roam-consortium` Add a roam consortium for the hotspot
- `venue` Set the venue parameters of the hotspot
- `wan-metrics` Set the wan-metrics of the hotspot

## 27.1 passpoint-policy

The following table summarizes passpoint policy configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>3gpp</td>
<td>Configures a 3rd Generation Partnership Project (3gpp) Public Land Mobile Network (PLMN) ID</td>
<td>page 27-4</td>
</tr>
<tr>
<td>access-network-type</td>
<td>Configures the access network type element in this hotspot</td>
<td>page 27-5</td>
</tr>
<tr>
<td>connection-capability</td>
<td>Configures the connection capability element in this passpoint policy</td>
<td>page 27-6</td>
</tr>
<tr>
<td>domain-name</td>
<td>Configures the RF Domains to which this hotspot is applicable</td>
<td>page 27-8</td>
</tr>
<tr>
<td>hessid</td>
<td>Configures the Homogeneous Extended Service Set Identifier (HESSID) for a specified hotspot zone</td>
<td>page 27-9</td>
</tr>
<tr>
<td>internet</td>
<td>Advertises the availability of Internet access in this hotspot</td>
<td>page 27-10</td>
</tr>
<tr>
<td>ip-address-type</td>
<td>Advertises the IP address type used in this hotspot.</td>
<td>page 27-11</td>
</tr>
<tr>
<td>nai-realm</td>
<td>Configures a Network Access Identifier (NAI) realm name and enters its configuration mode</td>
<td>page 27-13</td>
</tr>
<tr>
<td>net-auth-type</td>
<td>Configures the network authentication type used in this hotspot</td>
<td>page 27-19</td>
</tr>
<tr>
<td>no</td>
<td>Removes or reverts passpoint policy configuration</td>
<td>page 27-20</td>
</tr>
<tr>
<td>operator</td>
<td>Configures the operator friendly name for this hotspot</td>
<td>page 27-21</td>
</tr>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
27.1.1 3gpp

`passpoint-policy`

Configures a 3rd Generation Partnership Project (3GPP) Public Land Mobile Network (PLMN) information. The 3GPP PLMN information is a combination of the Mobile Country Code (MCC) and Mobile Network Code (MNC). This MCC and MNC combination uniquely identifies a cellular operator. For example, Telstar Corporation Ltd. in Australia is identified by MCC 505 and MNC 001.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**

```
3gpp mcc <MOBILE-COUNTRY-CODE> mnc <MOBILE-NETWORK-CODE> {description <LINE>}
```

**Parameters**

- `3gpp mcc <MOBILE-COUNTRY-CODE> mnc <MOBILE-NETWORK-CODE> {description <LINE>}`

**Examples**

```
rfs4000-229D58(config-passpoint-policy-test)#3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#3gpp mcc 310 mnc 970
rfs4000-229D58(config-passpoint-policy-test)#show context hotspot2-policy test
3gpp mcc 310 mnc 970
3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#
```

**Related Commands**

- `no` Removes the specified 3gpp PLMN information and its corresponding MCC/MNC settings
27.1.2 access-network-type

Configures the access network type for this hotspot. The beacons and probe responses communicate the type of hotspot (public, private, guest-use, emergency etc.) to clients seeking access.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

Syntax

```
access-network-type [chargeable-public|emergency-services|experimental|free-public|
personal-device|private|private-guest|wildcard]
```

Parameters

- `access-network-type [chargeable-public|emergency-services|experimental|free-public|
personal-device|private|private-guest|wildcard]`

**access-network-type** | Select the access network type for this hotspot. The options are:
- chargeable-public – The network type is a chargeable public network
- emergency-services – The network is used to provide emergency services only
- experimental – The network is used for test or experimental purposes only
- free-public – The network type is a free public
- personal-device – The network is used for personal devices only
- private – The network is a private network
- private-guest – The network is a private network with guest access (default setting)
- wildcard – Includes all access network types

**Note:** If the network type is set to chargeable-public, probe responses advertise this hotspot as a chargeable-public hotspot.

Examples

```
rfs4000-229D58(config-passpoint-policy-test)#access-network-type chargeable-public
rfs4000-229D58(config-passpoint-policy-test)#show context hotspot2-policy_test
access-network-type chargeable-public
3gpp mcc 310 mnc 970
3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#
```

Related Commands

- **no** | Reverts to the default access network type setting (private)
27.1.3 connection-capability

`passpoint-policy`

Configures the connection capability element in this passpoint policy. When configured, it communicates which ports are open or closed on the Hotspot, in response to an ANQP query.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**

```
connection-capability [ftp|http|icmp|ip-protocol|ipsec-vpn|pptp-vpn|sip|ssh|tls-vpn]
connection-capability [ftp|http|icmp|ip-protocol|ipsec-vpn|pptp-vpn|sip|ssh|tls-vpn]
    [closed|open|unknown]
connection-capability ip-protocol <0-255> port <0-65535> [closed|open|unknown]
```

**Parameters**

- `connection-capability [ftp|http|icmp|ip-protocol|ipsec-vpn|pptp-vpn|sip|ssh|tls-vpn]`
  - `closed` — Specifies that the port(s) is/are closed
  - `open` — Specifies that the port(s) is/are open
  - `unknown` — Specifies that the port(s) status is not known

**Note:** When the connection capability element is not configured, the hotspot does not return the element in an ANQP capability request and ignores any ANQP query for the element.
### port `<0-65535>`
[closed|open|unknown]

After specifying the IP protocol type, specify the port number.
- port `<0-65535>` – Select a port for the IP protocol identified.

After specifying the port number, specify the port status.
- closed – Specifies that the port(s) is/are closed
- open – Specifies that the port(s) is/are open
- unknown – Specifies that the port(s) status is not known

**Note:** When the connection capability element is not configured, the hotspot does not return the element in an ANQP capability request and ignores any ANQP query for the element.

### Examples

```plaintext
rfs4000-229D58(config-passpoint-policy-test)#connection-capability 1 ip-protocol 2 port 10 closed
rfs4000-229D58(config-passpoint-policy-test)#show context
hotspot2-policy test
  access-network-type chargeable-public
  connection-capability ip-protocol 2 port 10 closed
  3gpp mcc 310 mnc 970
  3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#
```

27.1.4 domain-name

*passpoint-policy*

Configures the RF Domain(s) that are returned in response to an ANQP query.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**
domain-name <DOMAIN-NAME>

**Parameters**
- domain-name <DOMAIN-NAME>

**Examples**
rfs4000-229D58(config-passpoint-policy-test)#domain-name TechPubs
rfs4000-229D58(config-passpoint-policy-test)#show context hotspot2-policy test
  access-network-type chargeable-public
  connection-capability ip-protocol 2 port 10 closed
  domain-name TechPubs
  3gpp mcc 310 mnc 970
  3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#

**Related Commands**

<table>
<thead>
<tr>
<th><strong>no</strong></th>
<th>Removes the RF Domain mapped to this passpoint policy</th>
</tr>
</thead>
</table>

*Note: An hotspot can be applied across multiple RF Domains.*
27.1.5 **hessid**

*passpoint-policy*

Configures the *Homogeneous Extended Service Set Identifier* (HESSID) for the hotspot. The HESSID uniquely identifies a hotspot provider within a zone. This is essential in zones (such as an airport or shopping mall) having multiple hotspot service providers with overlapping coverage.

An HESSID is a 6 (six) byte identifier that uniquely identifies a set of APs belonging to the same network and exhibiting same network behaviour. It is the BSSID (MAC address) of one of the devices (AP) in the zone. When not configured, the radio’s BSSID is used as the HESSID.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**

```
hessid <MAC>
```

**Parameters**

- `hessid <MAC>`

**Examples**

```
rfs4000-229D58 (config-passpoint-policy-test)#hessid 00-23-68-88-0D-A7
```

```
rfs4000-229D58 (config-passpoint-policy-test)#show context
hotspot2-policy test
access-network-type chargeable-public
connection-capability ip-protocol 2 port 10 closed
domain-name TechPubs
hessid 00-23-68-88-0D-A7
3gpp mcc 310 mnc 970
3gpp mcc 505 mnc 14
rfs4000-229D58 (config-passpoint-policy-test)#
```

**Related Commands**

```
no
```

Removes the HESSID configured with this passpoint policy and reverts back to using the radio’s BSSID.
27.1.6 internet

Advertises the availability of Internet access on this hotspot. The Internet bit in the hotspot’s beacon and probe responses indicates if Internet access is available or not. By default this feature is enabled.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

Syntax
internet

Parameters
None

Examples
rfs4000-229D58(config-passpoint-policy-test)#internet
rfs4000-229D58(config-passpoint-policy-test)#

27.1.7 ip-address-type

Advertises the IP address type used in this hotspot. This information is returned in response to ANQP queries.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

**Parameters**
- **ip-address-type ipv4** [double-nat|not-available|port-restricted|port-restricted-double-nat|port-restricted-single-nat|public|single-nat|unknown]
- **ip-address-type ipv6** [available|not-available|unknown]

<td>nai-realm-config-mode</td>
<td>Invokes the NAI realm configuration mode commands</td>
<td>page 27-16</td>
</tr>
</tbody>
</table>
27.1.8.1 nai-realm

nai-realm

Configures a NAI realm name and enters its configuration mode. The NAI realm name identifies the accessible hotspot service providers. You can configure a list of NAI realm names of service providers operating within a specific hotspot zone. This NAI realm name list is presented in ANQP response to a NAI realm and NAI home realm query.

The configured NAI realm name list is presented in ANQP response to a NAI realm and NAI home realm query.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

Syntax
nai-realm <HOTSPOT2-NAI-REALM-NAME>

Parameters
- nai-realm <HOTSPOT2-NAI-REALM-NAME>

Examples

<tr>
<td></td>
<td>passpoint policy</td>
<td></td>
</tr>
</tbody>
</table>
27.1.8.2.1 eap-method

Specifies the EAP authentication mechanisms supported by each of the service providers associated with this passpoint policy.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

Syntax
```
eap-method <1-10> [<1-255>|fast|gtc|identity|ikev2|ms-auth|mschapv2|otp|peap|psk|rsa-public-key|sim|tls|ttls] auth-param [credential|expanded-eap|expanded-inner-eap|inner-eap|non-eap-inner|tunn-eap-credential|vendor] [cert|hw-token|nfc-secure-elem|none|sim|soft-token|username-password|usim|vendor]
```

Parameters
- **eap-method <1-10>**
- **<1-255>**
- **fast**
- **gtc**
- **identity**
- **ikev2**
- **ms-auth**
- **mschapv2**
- **opt**
- **peap**
- **psk**
- **rsa-public-key**
- **sim**
- **tls**
- **ttls**
- **vendor**
- **cert**
- **hw-token**
- **nfc-secure-elem**
- **none**
- **sim**
- **soft-token**
- **username-password**
- **usim**

**eap-method <1-10>**
- Creates an EAP authentication method and assigns it an index number
- **<1-10>** – Specify a identifier for this EAP method from 1 - 10.

**Note:** A maximum of 10 (ten) authentication methods can be specified for every NAI realm. After creating the EAP authentication method, specify the associated authentication mechanisms (method types).

**<1-255>**
- Identifies the EAP authentication method type from the corresponding *Internet Assigned Numbers Authority* (IANA) number

**Note:** **<1-255>** – Specify the IANA identity number for the authentication protocol from 1 -255.

**fast**
- Specifies the EAP authentication method type as *Flexible Authentication via Secure Tunneling* (FAST)

**gtc**
- Specifies the EAP authentication method type as *Generic Token Card* (GTC)

**identity**
- Specifies the EAP authentication method type as Identification

**ikev2**
- Specifies the EAP authentication method type as *Internet Key Exchange Protocol version 2* (IKEv2)

**ms-auth**
- Specifies the EAP authentication method type as *Microsoft Authentication* (MS-Auth)

**mschapv2**
- Specifies the EAP authentication method type as *Microsoft Challenge Handshake Authentication Protocol version 2* (MSCHAPv2)

**opt**
- Specifies the EAP authentication method type as *One Time Password* (OTP)

**peap**
- Specifies the EAP authentication method type as *Protected Extensible Authentication Protocol* (PEAP)

**psk**
- Specifies the EAP authentication method type as *Pre-shared Key* (PSK)

**rsa-public-key**
- Specifies the EAP authentication method type as RSA public key protocol

**sim**
- Specifies the EAP authentication method type as GSM *Subscriber Identity Module* (SIM)
### Examples

The following examples show four EAP authentication methods associated with the NAI realm `mail.example.com`. Each method supports a different EAP authentication mechanism:

```plaintext
rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#eap-method 1
ttls auth-param vendor hex 00121F

rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#eap-method 2
rsa-public-key auth-param credential cert

rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#eap-method 3
otp auth-param credential username-password

rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#show context
nai-realm mail.example.com
  eap-method 1 ttls auth-param vendor hex 00121F
  eap-method 2 rsa-public-key auth-param credential cert
  eap-method 3 otp auth-param credential username-password
  eap-method 4 peap auth-param credential cert
rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)##
```

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>tls</strong></td>
<td>Specifies the EAP authentication method type as <em>Transport Layer Security</em> (TLS)</td>
</tr>
<tr>
<td><strong>ttls</strong></td>
<td>Specifies the EAP authentication method type as <em>Tunneled Transport Layer Security</em> (TTLS)</td>
</tr>
<tr>
<td><strong>auth-param</strong></td>
<td>After specifying the EAP authentication method type, specify the authentication parameters. These parameters depend on the EAP authentication mechanism selected.</td>
</tr>
</tbody>
</table>
| [cert|hw-token|nfc-secure-elem|none|sim|soft-token|username-password|usim|vendor] | The following parameters are common to all the above authentication parameters:  
  • cert – Certificate  
  • hw-token – Hardware token  
  • nfc-secure-elem – NFC secure element  
  • none – No credential  
  • sim – Subscriber identity module  
  • soft-token – Soft token  
  • username-password – Username and password  
  • usim – Universal subscriber identity module  
  • vendor – Vendor specific credential |
27.1.9 **net-auth-type**

驾校配置此热点的网络认证类型。配置的详细信息将返回到对ANQP的查询。

支持以下平台：
- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**

```
net-auth-type [accept-terms|dns-redirect|http-redirect|online-enroll] {url <URL>}
```

**Parameters**

- **net-auth-type [accept-terms|dns-redirect|http-redirect|online-enroll] {url <URL>}**
- **accept-terms** Enables user acceptance of terms and conditions
- **dns-redirect** Enables DNS redirection of user
- **http-redirect** Enables HTTP redirection of user
- **online-enroll** Enables online user enrolment
- **url <URL>** Optional. Specify the location for each of above network authentication types.

**Examples**

```
rfs4000-229D58(config-passpoint-policy-test)#net-auth-type accept-terms url "www.test.com"
rfs4000-229D58(config-passpoint-policy-test)#

Removes the network authentication type configured with this passpoint policy.
27.1.10 no

Removes or reverts the passpoint policy settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

Syntax

no [3gpp|access-network-type|connection-capability|domain-name|hessid|internet|ip-address-type|nai-realm|net-auth-type|operator|osu|roam-consortium|venue|wan-metrics]

Parameters

- no

Examples

The following example shows the passpoint policy 'test' settings before the 'no' commands are executed:

rfs4000-229D58(config-passpoint-policy-test)#show context

rfs4000-229D58(config-passpoint-policy-test)#
27.1.11 operator

Configures the operator friendly name for this hotspot. The name can be configured in English or in any language other than English. When the name is specified in English, the system allows an ASCII input. If you are using a language other than English, first specify the ISO-639 language code, and then specify the name as an hexadecimal code.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

Syntax

operator name [\{<OPERATOR-NAME>|iso-lang <ISO-LANG-CODE>\}]

operator name <OPERATOR-NAME>

operator name iso-lang <ISO-LANG-CODE> <OPERATOR-NAME>

Parameters

- operator name <OPERATOR-NAME>
- iso-lang <ISO-LANG-CODE> <OPERATOR-NAME>

Examples

rfs4000-229D58(config-passpoint-policy-test)#operator name emergencyservices

rfs4000-229D58(config-passpoint-policy-test)#show context

thotspot2-policy test

</tr>
</tbody>
</table>
27.1.12.1 osu

Add an online sign up (OSU) SSID (WLAN)/OSU provider and enters its configuration mode

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

Syntax

```
osu [provider <PASSPOINT-OSU-PROVIDER>|ssid <SSID>]
```

Parameters

- osu [provider <PASSPOINT-OSU-PROVIDER>|ssid <SSID>]

Examples

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#?
```

Passpoint OSU Provider Mode commands:
```
description Configure the english description of the online signup provider
icon Add an icon for the online signup provider
method Specify the online signup method supported by provider
nai Configure the NAI for the online signup provider
name Configure the english name of the online signup provider
no Negate a command or set its defaults
server-url Configure the signup url for the online signup provider
```

```
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
drop End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal
```

```

27.12.2.1 description

- **osu-config-mode commands**

Configures the OSU SSID/provider’s description. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532,-
  AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**

description [<DESCRIPTION>|iso-lang <ISO-LANG-CODE>]

**Parameters**

- description [<DESCRIPTION>|iso-lang <ISO-LANG-CODE>]

<table>
<thead>
<tr>
<th>&lt;DESCRIPTION&gt;</th>
<th>Provides a description for the OSU provider. It should not exceed 253 characters in length.</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;DESCRIPTION&gt;</td>
<td>Specify the description in one or more languages. By default the system configures the name in English.</td>
</tr>
</tbody>
</table>

| iso-lang <ISO-LANG-CODE> | Identifies the language by its ISO 639 language code (for example, ‘chi-chinese’ or ‘spa-spanish’). By default the language is set to English. If specifying the description in any language other than English, specify the ISO language code. |

**Examples**

```
pxx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#description "Provides free service for testing purposes"
```

```
pxx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context
osu provider WiFi
  description "Provides free service for testing purposes"
```

```
pxx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#
```

**Related Commands**

- **no** Removes this OSU provider’s description
27.1.12.2.2 icon

* osu-config-mode commands

Adds the OSU provider's icon. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**

```
icon iso-lang <ISO-LANG-CODE> width <0-65535> height <0-65535> mime-type <FILE-MIME-TYPE> file [<IMAGE-FILE-NAME/PATH>|<FILE-NAME>]
```

**Parameters**

- **icon iso-lang <ISO-LANG-CODE> width <0-65535> height <0-65535> mime-type <FILE-MIME-TYPE> file [<IMAGE-FILE-NAME/PATH>|<FILE-NAME>]**
  - `icon iso-lang <ISO-LANG-CODE>` — Configures an icon representing the OSU provider
  - `<ISO-LANG-CODE>` — Identifies the language by its ISO 639 language code (for example, 'chi-chinese' or 'spa-spanish'). By default the language is set to English. If specifying the image file name and path in any language other than English, specify the ISO language code.

- **width <0-65535>**
  - Configures the icon's width in pixels
  - `<0-65535>` — Specify a value from 0 - 65535 pixels.

- **height <0-65535>**
  - Configures the icon's height in pixels
  - `<0-65535>` — Specify a value from 0 - 65535 pixels.

- **mime-type <FILE-MIME-TYPE>**
  - Configures a string describing the icon's standard mime type. For example, image/png
  - `<FILE-MIME-TYPE>` — Specify the icon's mime type.

- **file [<IMAGE-FILE-NAME/PATH>|<FILE-NAME>]**
  - Configures the location and name of the image file
  - `<IMAGE-FILE-NAME/PATH>` — Specify the path and filename. For example, flash:/icon.png
  - `<FILE-NAME>` — Use this option to specify the filename in the flash:/ directory

**Examples**

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
```

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context osu provider WiFi
description "Provides free service for testing purposes"
icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
```

**Related Commands**

- `no` Removes this OSU provider’s icon
27.1.12.2.3 method

This command configures the open sign up methods available on this OSU provider. This value is returned, in the specified order of precedence, in the ANQP OSU providers list.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

Syntax

```
method [oma-dm|soap-xml-spp] priority <1-2>
```

Parameters

- **method [oma-dm|soap-xml-spp] priority <1-2>**

  - **oma-dm** — Configures the OSU method used as Open Mobile Alliance (OMA) device management
  - **soap-xml-spp** — Configures the OSU method used as Soap-xml subscription provisioning protocol
  - **priority <1-2>** — Sets the priority of the specified method. Select a value from 1 - 2. The default is one (1).

Examples

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#method soap-xml-spp priority 1

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context
   osu provider WiFi
   description "Provides free service for testing purposes"
   icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
   method soap-xml-spp priority 1

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#
```

Related Commands

- **no** — Removes the online sign up methods configured on this OSU provider
27.1.12.2.4 nai

* osu-config-mode commands

Configures the OSU provider’s NAI. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532,- AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**

```
nai <WORD>
```

**Parameters**

- **nai <WORD>**

<table>
<thead>
<tr>
<th>nai &lt;WORD&gt;</th>
<th>Configures the OSU provider’s NAI</th>
</tr>
</thead>
<tbody>
<tr>
<td>- &lt;WORD&gt;</td>
<td>– Specify the NAI.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#nai wifi.org
```

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context
osu provider WiFi
description "Provides free service for testing purposes"
icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
method soap-xml-spp priority 1
```

```

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#
27.12.2.7 server-url

`osu-config-mode commands`

Configures the OSU provider server’s URL. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**

```
server-url <URL>
```

**Parameters**
- `server-url <URL>`

<table>
<thead>
<tr>
<th>server-url &lt;URL&gt;</th>
<th>Configures the OSU provider server’s URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;URL&gt;</code> — Specify the server’s url.</td>

```

**Related Commands**

```
no
```

`no` Removes this OSU provider’s server’s URL
27.1.13 roam-consortium

**passpoint-policy**

Configures a list of Roaming Consortium (RC) Organization Identifiers (OIs) supported on this hotspot. The beacons and probe responses communicate this Roaming Consortium list to devices. This information enables a device to identify the networks available through this AP.

Each OI identifies a either a group of Subscription Service Providers (SSPs) or a single SSP.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**

roam-consortium hex <WORD>

**Parameters**

- roam-consortium hex <WORD>

  Adds a Roaming Consortium OI to this hotspot in hexadecimal format
  - <WORD> — Specify the Roaming Consortium OI in hexadecimal format (should not exceed 128 characters)

- hex <WORD>

  Configures a hexadecimal input
  - <WORD> — Specify the Roaming Consortium OI in hexadecimal format (should not exceed 128 characters)

**Examples**

rfs4000-229D58(config-passpoint-policy-test)#roam-consortium hex 223344
rfs4000-229D58(config-passpoint-policy-test)#

  roam-consortium hex 223344
  3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#

**Related Commands**

- **no** — Removes the Roaming Consortium OIs supported on this passpoint policy
27.1.14 venue

Configures the venue where this hotspot is located. The hotspot venue configuration informs prospective clients about the hotspot’s nature of activity, such as educational, institutional, residential etc.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

Syntax

```plaintext
venue [group|name]

venue group [assembly|business|educational|industrial|institutional|mercantile|outdoor|residential|storage|unspecified|utility-and-misc|vehicular] type

venue name [<VENUE-NAME>|iso-lang]
venue name <VENUE-NAME>
venue name iso-lang <ISO-LANG-CODE> <VENUE-NAME>
```

Parameters

- **venue group** [assembly|business|educational|industrial|institutional|mercantile|outdoor|residential|storage|unspecified|utility-and-misc|vehicular] type
  - Configures the venue group associated with this hotspot
  - **assembly type** Configures the venue group as assembly (1). This hotspot type is applicable to public assembly venues.
    - **type** — Specifies the venue type for this group. The options are:
      - `<0-255>` — Specifies an unlisted venue type number from 0 - 255
      - amphitheater — Specifies the venue type as amphitheater (4)
      - amusement-park — Specifies the venue type as amusement park (5)
      - arena — Specifies the venue type as arena (1)
      - bar — Specifies the venue type as bar (12)
      - coffee-shop — Specifies the venue type as a coffee shop (13)
      - convention-centre — Specifies the venue type as a convention center (7)
      - emergency-coordination-center — Specifies the venue type as an emergency coordination center (15)
      - library — Specifies the venue type as a library (8)
      - museum — Specifies the venue type as a museum (9)
      - passenger-terminal — Specifies the venue type as a passenger terminal (3)
      - place-of-worship — Specifies the venue type as a place of worship (6)
      - restaurant — Specifies the venue type as a restaurant (10)
      - stadium — Specifies the venue type as a stadium (2)
      - theater — Specifies the venue type as a theater (11)
      - unspecified — Specifies the venue type as not specified (0)

27.1.15 **wan-metrics**

> passpoint-policy

Configures the WAN performance metrics for this hotspot. This command configures the upstream and downstream speeds associated with this hotspot. The upstream and downstream speed values (in Kbps) are estimates of the bandwidth available on the WAN. This information is returned in response to client ANQP query, and is useful for clients having a minimum and/or large bandwidth requirement.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**

```
wan-metrics down-speed <0-4294967295> up-speed <0-4294967295>
```

**Parameters**

- **wan-metrics down-speed <0-4294967295> up-speed <0-4294967295>**

This chapter summarizes the *Border Gateway Protocol* (BGP) related configuration commands in the CLI command structure. BGP is a routing protocol, which establishes routing between ISPs. ISPs use BGP to exchange routing information between *Autonomous Systems* (ASs) on the Internet. The routing information shared includes details, such as ASs traversed to a particular destination, reachable ASs, best paths available, network policies and rules applied on a route etc. These details appear as BGP attributes carried in routing update packets. BGP uses this information to make routing decisions. Therefore, the primary role of a BGP system is to exchange routing information with other BGP peers.

BGP uses TCP as its transport protocol. This eliminates the need to implement explicit update fragmentation, retransmission, acknowledgement, and sequencing. BGP listens on TCP port 179. The error notification mechanism used in BGP assumes that TCP supports a *graceful* close (all outstanding data is delivered before the connection is closed). Routing information exchanged through BGP supports only destination-based forwarding (it assumes a router forwards packets based on the destination address carried in the IP header of the packet).

An AS is a set of routers under the same administration that use *Interior Gateway Protocol* (IGP) and common metrics to define how to route packets within the AS. There are two types of BGP systems: *external BGP* (eBGP) and *internal BGP* (iBGP). iBGP represents the exchange of routing information between BGP peers within an AS. Whereas, when two BGP peers, belonging to different ASs, are connected you have an eBGP setup.

BGP peers (also referred to as neighbors) are BGP enabled devices that are directly connected through an established TCP connection. When two BGP enabled peers establish a TCP connection the first time, they exchange their BGP routing tables. All subsequent route table modifications are exchanged as route updates. BGP tracks these route updates by maintaining route table version numbers. With every update the version number changes. At any given point in time, all BGP peers should have the same route table version. The peer-to-peer TCP connections are kept alive through keepalive packets exchanged at specified intervals. Errors and special events are communicated between peers as notification packets.

This chapter is organized as follows:

- `bgp-ip-prefix-list-config commands`
- `bgp-ip-access-list-config commands`
- `bgp-as-path-list-config commands`
- `bgp-community-list-config commands`
- `bgp-extcommunity-list-config commands`
- `bgp-route-map-config commands`
- `bgp-router-config commands`
bgp-neighbor-config commands
28.1 bgp-ip-prefix-list-config commands

IP prefix lists are a convenient way to filter prefixes (contained in route update packets) transmitted to (or received from) other BGP supported routers. IP prefix lists are similar to access lists. They contain ordered entries (deny or permit prefix rules), identified by their sequence numbers. Each rule specifies match criteria (network and subnet prefixes and prefix masks) to match. When a prefix (received or transmitted) matches the prefix specified in one of the rules, it is filtered and an action is applied depending on where the IP prefix list is used. For example, when used in the BGP neighbor context, the prefixes received from the neighbor are filtered and the filtered prefixes are either rejected or accepted depending on the rule type (deny or permit).

IP prefix lists are also used in the BGP route map context to filter prefixes. The action applied, on filtered prefixes is set within the route map. Another use case for IP prefix lists is to filter prefixes before redistribution of local OSPF routes to eBGP enabled ASs.

Like in access lists, these deny and permit prefix rules are processed sequentially, in ascending order of their sequence number. Once a match is made, the BGP enabled router stops processing all subsequent rules in the ip-prefix-list.

IP prefix lists are used as match criteria in the following contexts:

- BGP neighbor. For more information, see use.
- BGP route-map context. For more information, see match.

To navigate to the ip-prefix-list configuration instance, use the following command:

<DEVICE>(config)#bgp ip-prefix-list <IP-PREFIX-LIST-NAME>

<DEVICE>(config-bgp-ip-prefix-list-test)#?

<td>page 28-6</td>
</tr>
</tbody>
</table>
28.1.1 deny

Creating and configures a deny prefix-list rule. The deny rule specifies match criteria based on which prefixes received from (or transmitted to) a BGP neighbor are filtered. A deny action is applied on these filtered prefixes. For example, in the BGP router neighbor context a filter is applied using an IP prefix list. The list contains a deny rule with a prefix to match as 192.168.13.0/24. All prefixes received from the neighbor matching this prefix are denied.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

deny prefix-list <1-4294967295> [PREFIX-TO-MATCH/MASK]|any]
deny prefix-list <1-4294967295> [PREFIX-TO-MATCH/MASK] {ge <0-32>|le <0-32}>|any]

Parameters
- deny prefix-list <1-4294967295> [PREFIX-TO-MATCH/MASK] {ge <0-32>|le <0-32}>|any]

Examples

```bash
nx9500-6c8809(config-bgp-ip-prefix-list-test)#deny prefix-list 1 168.192.13.0/24
```

```bash
nx9500-6c8809(config-bgp-ip-prefix-list-test)#show context bgp ip-prefix-list test
deny prefix-list 1 168.192.13.0/24
```

```bash
nx9500-6c8809(config-bgp-ip-prefix-list-test)#
```

Related Commands

no

Removes a deny prefix-list rule from this IP prefix list
28.1.2 permit

* bgp-ip-prefix-list-config commands

Creates and configures a permit prefix-list rule. The permit rule specifies match criteria based on which prefixes received from (or transmitted to) a BGP neighbor are filtered. A permit action is applied on these filtered prefixes. For example, in the BGP router neighbor context a filter is applied using a IP prefix list. The list contains a permit rule with a prefix to match as 172.168.10.0/24. All prefixes received from the neighbor matching this prefix are permitted.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

```
permit prefix-list <1-4294967295> [ prefix-to-match/mask | any ]
```

Parameters

- `permit prefix-list <1-4294967295> [ prefix-to-match/mask | any ]`

Examples

```
nx9500-6C8809(config-bgp-ip-prefix-list-test)#permit prefix-list 2 172.122.10.0/24
```

Related Commands

```
no
```

Removes a permit prefix rule from this IP prefix list
28.1.3 no

- bgp-ip-prefix-list-config commands

Removes the specified deny or permit prefix-list rule from this IP prefix list

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

no [deny|permit]

no [deny|permit] prefix-list <1-4294967295> {<PREFIX-TO-MATCH/MASK>/any}

Parameters

- no <PARAMETERS>

Removing a deny or permit rule from this IP prefix list:

Examples

The following example shows the IP prefix list ‘test’ settings before the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-ip-prefix-list-test)#show context
bgp ip-prefix-list test
  deny prefix-list 1 168.192.13.0/24
  permit prefix-list 2 172.122.10.0/24
nx9500-6C8809(config-bgp-ip-prefix-list-test)#
```

The following example shows the IP prefix list ‘test’ settings after the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-ip-prefix-list-test)#no deny prefix-list 1 168.192.13.0/24

nx9500-6C8809(config-bgp-ip-prefix-list-test)#show context
bgp ip-prefix-list test
  permit prefix-list 2 172.122.10.0/24
nx9500-6C8809(config-bgp-ip-prefix-list-test)#
```
28.2 bgp-ip-access-list-config commands

**BORDER GATEWAY PROTOCOL**

BGP peers and route maps can reference a single IP based access control list (ACL). Apply IP ACLs to both inbound and outbound route updates. When applied to a BGP enabled router, every route update is passed through the ACL. Each ACL contains deny and permit entries that are applied sequentially, in the order they appear within the list. When a route matches an entry, the decision to permit or deny the route is applied. Once a match is made the remaining entries in the ACL are not processed.

BGP IP ACLs are used as match criteria in the following contexts:

- BGP neighbor. For more information, see *use*.
- BGP route-map context. For more information, see *match*.

To navigate to the BGP IP ACL configuration instance, use the following command:

```
<DEVICE>(config)#bgp ip-access-list <IP-ACL-NAME>
```

```
<DEVICE>(config-bgp-ip-access-list-<IP-ACL-NAME>)#?
```

BGP IP Access List Mode commands:

- **deny**: Specify packets to reject
- **no**: Negate a command or set its defaults
- **permit**: Specify packets to forward
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

```
<DEVICE>(config-bgp-ip-access-list-<IP-ACL-NAME>)#
```

## 28.2.1 deny

*bgp-ip-access-list-config commands*

Creates and configures a deny entry for this BGP IP ACL

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

deny access-list [<PREFIX-TO-MATCH/MASK> {exact-match}|any]

**Parameters**

- deny access-list [<PREFIX-TO-MATCH/MASK> {exact-match}|any]

| 
| deny access-list \[<PREFIX-TO-MATCH/MASK> {exact-match}|any]\ |
| Creates and configures a deny entry for this BGP IP ACL |
| - <PREFIX-TO-MATCH/MASK> – Specify the prefix to match. |
| - exact-match – Optional. Enables an exact match of the prefix provided in the previous step. |
| - any – Specifies the prefix to match as ‘any’. |

**Examples**

```bash
nx9500-6C8809(config-bgp-ip-access-list-test)#deny access-list 192.168.13.0/24 exact-match

nx9500-6C8809(config-bgp-ip-access-list-test)#show context bgp ip-access-list test
deny access-list 192.168.13.0/24 exact-match
nx9500-6C8809(config-bgp-ip-access-list-test)#
```

**Related Commands**

- no
  - Removes the specified the deny entry in this IP BGP ACL
28.2.2 permit

bogp-ip-access-list-config commands

Creates and configures a permit entry for this BGP IP ACL

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

permit access-list [<PREFIX-TO-MATCH/MASK>|any]

Parameters

- permit access-list [<PREFIX-TO-MATCH/MASK> {exact-match}|any]

| permit access-list [<PREFIX-TO-MATCH/MASK> {exact-match}|any] | Creates and configures a permit entry for this BGP IP ACL |
|-------------------------------------------------------------|------------------------------------------------------|
| • <PREFIX-TO-MATCH/MASK> — Specify the prefix to match.  |
| • exact-match — Optional. Enables an exact match of the prefix provided in the previous step. |
| When configured, the route is permitted only in case of an exact match. |
| • any — Specifies the prefix to match as ‘any’. |

Examples

nx9500-6C8809(config-bgp-ip-access-list-test)#permit access-list 172.168.10.0/24

nx9500-6C8809(config-bgp-ip-access-list-test)#show context bgp ip-access-list test

permit access-list 172.168.10.0/24
deny access-list 192.168.13.0/24 exact-match

nx9500-6C8809(config-bgp-ip-access-list-test)#

Related Commands

no

Removes the specified the permit entry in this IP BGP ACL
28.2.3 no

*bgp-ip-access-list-config commands*

Removes a deny or permit entry from this BGP IP ACL

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

no [deny|permit]

no [deny|permit] access-list [<PREFIX-TO-MATCH/MASK>|any]

**Parameters**

- no <PARAMETERS>

| no <PARAMETERS> | Removes a deny or permit entry from this BGP IP ACL |

**Examples**

The following example shows the BGP IP ACL ‘test’ settings before the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-ip-access-list-test)#show context
bgp ip-access-list test
    permit access-list 172.168.10.0/24
    deny access-list 192.168.13.0/24 exact-match
```

```
nx9500-6C8809(config-bgp-ip-access-list-test)#no permit access-list 172.168.10.0/24
```

The following example shows the BGP IP ACL ‘test’ settings after the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-ip-access-list-test)#show context
bgp ip-access-list test
    deny access-list 192.168.13.0/24 exact-match
```

```
nx9500-6C8809(config-bgp-ip-access-list-test)"
28.3 bgp-as-path-list-config commands

BGP enabled devices use routing updates to exchange network routing information with each other. This information includes route details, such as the network number, path specific attributes, and the list of ASNs that a route traverses to reach a destination. This list is contained in the AS path.

An AS path access control list (ACL) filters AS paths (routes) included in routing updates. Each AS path access list consists of deny and/or permit rules that define regular expressions (match criteria). When configured and applied on inbound and outbound routing updates, the BGP AS path attributes are matched against the regular expressions specified in the AS path ACL. In case of a match, the route is filtered and an action (deny or permit) is applied. Once a match is made subsequent rules in the AS path access list are not processed.

AS path access lists also help prevent looping within an AS. Routing loops are prevented by rejecting routing updates containing local ASNs. Since local ASNs indicate that the route has already traveled through that autonomous system, by rejecting them looping is avoided.

AS path access lists are used as match criteria in the following contexts:

- BGP neighbor. For more information, see use.
- BGP route map context. For more information, see match.

To navigate to the AS path configuration instance, use the following command:

```bash
<DEVICE>(config)#bgp as-path <AS-PATH-LIST-NAME>
```

BGP AS Path List Mode commands:

- `deny` Specify packets to reject
- `no` Negate a command or set its defaults
- `permit` Specify packets to forward
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

The following table summarizes the BGP AS path list configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Creates and configures a deny as-path-list rule</td>
<td>page 28-12</td>

</tr>
</tbody>
</table>
28.3.1 deny

**bgp-as-path-list-config commands**

Creates and configures a deny as-path-list rule. The deny rule specifies a regular expression to match. This regular expression, a string against the BGP AS paths contained in routing updates. AS paths matching the provided string are filtered and a deny action is applied.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**
deny as-path <REG-EXP>

**Parameters**
- deny as-path <REG-EXP>

**Usage Guidelines**
The following table lists some of the characters used in forming regular expressions:

<table>
<thead>
<tr>
<th>Character to use</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Indicates the start of a string</td>
</tr>
<tr>
<td>$</td>
<td>Indicates the end of a string</td>
</tr>
<tr>
<td>_ (underscore)</td>
<td>Indicates a comma, left brace, right brace, start and end of an input string, or a space. For example, “_ _”</td>
</tr>
</tbody>
</table>

**Examples**
nx9500-6C8809(config-bgp-as-path-list-test)#deny as-path ^100$
nx9500-6C8809(config-bgp-as-path-list-test)#show context bgp as-path-list test
deny as-path ^100$
nx9500-6C8809(config-bgp-as-path-list-test)#

**Related Commands**
- no
  - Removes the specified deny as-path ACL rule
28.3.2 permit

This command configures a permit as-path-list rule. The permit rule specifies a regular expression to match. This regular expression is matched against the BGP AS paths contained in routing updates. AS paths matching the provided string are filtered and a permit action is applied.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
permit as-path <REG-EXP>

Parameters
- permit as-path <REG-EXP>

Usage Guidelines
The following table lists some of the characters used in forming regular expressions:

<table>
<thead>
<tr>
<th>Character to use</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Indicates the start of a string</td>
</tr>
<tr>
<td>$</td>
<td>Indicates the end of a string</td>
</tr>
<tr>
<td>_ (underscore)</td>
<td>Indicates a comma, left brace, right brace, start and end of an input string, or a space. For example, &quot;_ _&quot;.</td>
</tr>
</tbody>
</table>

Examples
nx9500-6C8809(config-bgp-as-path-list-test)#permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#permit as-path _323_

nx9500-6C8809(config-bgp-as-path-list-test)#show context
bgp as-path-list test
deny as-path ^100$
permit as-path _323_
permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#

Related Commands
- no | Removes the specified permit as-path ACL rule
28.3.3 no

- bgp-as-path-list-config commands

Removes a deny or permit rule from this AS path ACL

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

no as-path-list [deny|permit] <REG-EXP>

Parameters

- no <PARAMETERS>

Examples

nx9500-6C8809(config-bgp-as-path-list-test)#show context
bgp as-path-list test
  deny as-path ^100$
  permit as-path __323_
  permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#

nx9500-6C8809(config-bgp-as-path-list-test)#no permit as-path _323_

nx9500-6C8809(config-bgp-as-path-list-test)#show context

  deny as-path ^100$
  permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#
28.4 bgp-community-list-config commands

BORDER GATEWAY PROTOCOL

Creates and configures a named community list

IP BGP routes have a set of attributes, mandatory and optional. The community and extended community attributes are optional. Optional attributes are specified by network administrators to mark (color) routes received in updates containing these attributes. These marked routes are filtered and special actions applied (accepted, preferred, distributed, or advertised). For example, the NO_EXPORT community, indicates that routes attached to it are local and not to be advertised to external ASs. Similarly, a set of routes using a common routing policy can be tagged to a community, and the policy applied to the community.

A BGP community is a group of routes sharing common attributes. Route updates contain community information in the form of path attributes. These attributes help identify community members.

A BGP community list is a list of deny or permit entries. It is either assigned a name (regular expressions, predefined community names) or a number. Assigning names to communities increases the number of configurable community lists. All rules applicable to numbered communities apply to named communities too. The only difference being in the number of attributes configurable for a named community list.

Since the community attribute is optional, it is shared only between devices that understand communities and are configured to handle communities. By default the community attribute is not sent to neighbors unless the send-community command option is enabled in the BGP neighbor context. For more information see, send-community.

Some of the predefined, globally used communities are:

- no-export – Routes tagged to this community are not advertised to external BGP peers
- no-advertise – Routes tagged to this community are not advertised to any BGP peers
- local-as – Routes tagged to this community are not advertised outside the local AS
- internet – Routes tagged to this community are advertised to the internet community. By default all BGP enabled devices belong to this community.

BGP community lists are used in the following context as match clauses:

- BGP route map context. For more information, see match.

To navigate to the BGP community configuration instance, use the following command:

DEVICE>(config)#bgp community-list <COMMUNITY-LIST-NAME>

DEVICE>(config-bgp-community-list-<COMMUNITY-LIST-NAME>)#?

BGP Community List Mode commands:

deny Add a BGP Community List deny rule to Specify community to reject
no Negate a command or set its defaults
permit Add a BGP Community List permit rule to Specify community to accept
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

DEVICE>(config-bgp-community-list-<COMMUNITY-LIST-NAME>)#
The following table summarizes the BGP community list configuration commands:

<table>
<thead>
<tr>

</tbody>
</table>
28.4.1  **deny**

* bgp-community-list-config commands

Creates and configures a deny community (expanded or standard) rule.

Standard community lists specify known communities and community numbers. Expanded community lists filter communities using a regular expression that specifies patterns to match the attributes of different communities.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

deny community [expanded|standard]
deny community expanded <LINE>
deny community standard [AA:NN|internet|local-AS|no-advertise|no-export]

**Parameters**

- deny community expanded <LINE>

<table>
<thead>
<tr>
<th>deny community expanded &lt;LINE&gt;</th>
<th>Configures a deny expanded community list entry and associates it with a regular expression to match. The regular expression represents the patterns to match in the community attributes.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;LINE&gt; – Provide the regular expression.</td>
<td></td>
</tr>
</tbody>
</table>

- deny community standard [AA:NN|internet|local-AS|no-advertise|no-export]

| deny community standard [AA:NN|internet|local-AS|no-advertise|no-export] | Configures a deny standard community list entry and associates it with a predefined, globally used, known community or community number. The options are: |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------|
| aa:nn - Configures the community number. The first part (aa) represents the AS number. The second part (nn) represents a 2-byte number. |
| internet – Advertises this route to the internet community |
| local-AS – Prevents transmission of this route outside the local AS |
| no-advertise – Prevents advertisement of this route to any peer (internal or external |
| no-export – Prevents advertisement of this route to external BGP peers (keeping this route within an AS) |

**Examples**

nx9500-6C8809(config-bgp-community-list-test)#deny community expanded 100

```plaintext	nx9500-6C8809(config-bgp-community-list-test)#show context

**Related Commands**

| **no** | Removes the specified deny community rule from this community list |
### 28.4.2 permit

- **bgp-community-list-config commands**

  Creates and configures a permit community (expanded or standard) rule

  Standard community lists specify known communities and community numbers. Expanded community lists filter communities using a regular expression that specifies patterns to match the attributes of different communities.

  Supported in the following platforms:
  - Wireless Controllers — RFS4000, RFS6000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
permit community [expanded|standard]
permit community expanded <LINE>
permit community standard [AA:NN|internet|local-AS|no-advertise|no-export]
```

**Parameters**

- **permit community expanded <LINE>**

  Configures a permit expanded community list entry and associates it with a regular expression to match. The regular expression represents the patterns to match in the community attributes.
  - `<LINE>` – Provide the regular expression.

- **permit community standard [AA:NN|internet|local-AS|no-advertise|no-export]**

  Configures a permit standard community list entry and associates it with a predefined, globally used, known community or community number. The options are:
  - `aa:nn` – Configures the community number. The first part (aa) represents the AS number. The second part (nn) represents a 2-byte number.
  - `internet` – Advertises this route to the internet community
  - `local-AS` – Prevents transmission of this route outside the local AS
  - `no-advertise` – Prevents advertisement of this route to any peer (internal or external)
  - `no-export` – Prevents advertisement of this route to external BGP peers (keeping this route within an AS)

**Examples**

```
nx9500-6C8809(config-bgp-community-list-test)#permit community expanded 300

  permit community expanded 300
nx9500-6C8809(config-bgp-community-list-test)#
28.5 bgp-extcommunity-list-config commands

**BORDER GATEWAY PROTOCOL**

 Creates an configures a named extended community list

 A BGP extended community is a group of routes sharing a common attribute, regardless of their network or physical boundary. By using a BGP extended community attribute, routing policies can implement inbound or outbound route filters based on the extended community tag, rather than a long list of individual permit or deny rules. A BGP extended community list is used to create groups of communities to use in a match clause of a route map. An extended community list is used to control which routes are accepted, preferred, distributed, or advertised.

 The BGP extended community and standard community attributes are identical in function and structure, except that the former is an eight octet and the latter is a four octet attribute.

 BGP extended community lists are used as match clauses in the following context:

- BGP route map context. For more information, see *match*.

 To navigate to the extended community configuration instance, use the following command:

```
<DEVICE>(config)#bgp extcommunity-list <EXTCOMMUNITY-LIST-NAME>
<DEVICE>(config-bgp-extcommunity-list-<EXTCOMMUNITY-LIST-NAME>)#?
```

**BGP Extcommunity List Mode commands:**

**bgp-extcommunity-list-config commands**

Creates and configures a deny extended community (expanded or standard) rule

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

deny extcommunity [expanded|standard]
deny extcommunity expanded <LINE>
deny extcommunity standard [rt|soo] <COMMUNITY-NUMBER>

**Parameters**

- **deny extcommunity expanded <LINE>**
  - Configures a deny expanded named extended community list entry and associates it with a regular expression to match. The regular expression represents the patterns to match in the extended community attributes.
  - `<LINE>` — Provide the regular expression.

- **deny extcommunity standard [rt|soo] <COMMUNITY-NUMBER>**
  - Configures a deny standard named extended community list entry, and associates it with the target or origin community attributes.
  - `rt` — Configures the route target (RT) extended community attribute
  - `soo` — Configures the site-of-origin (SOO) extended community attribute
  - `<COMMUNITY-NUMBER>` — Specify the community number in one of the following formats: AA:NN or A.B.C.D:NN

**Examples**

nx9500-6C8809(config-bgp-extcommunity-list-test)#deny extcommunity standard rt 200:12

28.6 bgp-route-map-config commands

**BORDER GATEWAY PROTOCOL**

BGP route maps are used to control and modify routing information. A BGP route map is a collection of deny and/or permit route rules that define and control redistribution of routes between routers and routing processes. Each rule consists of match criteria and set lines. If a route matches a criteria, the corresponding set line is applied, and the route is passed to the BGP table or to the neighbor, depending on whether the route map is set for incoming or outgoing route updates.

Use the (config) instance to configure BGP route map related parameters.

To navigate to this instance, use the following command:

```
<DEVICE>(config)#route-map <ROUTE-MAP-NAME>
```

To configure a deny or permit route map rule, use the following commands:

```
<DEVICE>(config)#deny route-map <1-65535>
<DEVICE>(config)#permit route-map <1-65535>
```

For example:

```
<DEVICE>(config)#deny route-map 1
<DEVICE>(config)#permit route-map 2
```

Use the `show context` command to review the configured route map:

```
<DEVICE>(config)#show context
route-map test
  deny route-map 1
  permit route-map 2
```

The route map configuration can be saved using the `write` command:

```
<DEVICE>(config)#write
```
The following table summarizes BGP deny/permit route map rules configuration mode commands:

**Table 28.6** BGP-Route-Map-Config-Mode Commands

28.6.1 **description**

- **bgp-route-map-config commands**

Configures a description for this route map rule (deny or permit) that uniquely distinguishes it from others with similar access permissions.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

description <LINE>

**Parameters**

- description <LINE>

<table>
<thead>
<tr>
<th>description &lt;LINE&gt;</th>
<th>Provide a description for the route map rule (should not exceed 64 characters in length)</th>
</tr>
</thead>
</table>

**Examples**

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#description "This is a deny route map rule"

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context
deny route-map 1
description "This is a deny route map rule"
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#

**Related Commands**

| no                  | Removes this deny/permit route-map rule’s description                                  |
28.6.2 match

**bgp-route-map-config commands**

Configures the match criteria associated with this deny or permit BGP route map

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
match [as-path | community | extcommunity | ip-address | ip-next-hop | ip-route-source | metric | origin | tag]
match [as-path <AS-PATH-LIST-NAME> | community <COMMUNITY-LIST-NAME> {exact-match}] | extcommunity <EXTCOMMUNITY-LIST-NAME>]
match [ip-address | ip-next-hop | ip-route-source] [BGP-IP-ACCESS-LIST <BGP-ACL-NAME> | prefix-list <PREFIX-LIST-NAME>]
match metric <0-4294967295>
match origin [egp | igp | incomplete]
match tag <0-65535>
```

**Parameters**

- **match [as-path <AS-PATH-LIST-NAME> | community <COMMUNITY-LIST-NAME> {exact-match}] | extcommunity <EXTCOMMUNITY-LIST-NAME>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| as-path <AS-PATH-LIST-NAME> | Configures a BGP AS path list to match
- An AS path is a list of ASs a packet traverses to reach its destination
- `<AS-PATH-LIST-NAME>` – Specify the AS path list name (should be existing and configured)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| community <COMMUNITY-LIST-NAME> {exact-match} | Configures the AS community list string to match
- `<COMMUNITY-LIST-NAME>` – Specify the AS community list name (should be existing and configured)
- exact-match – Optional. Does an exact match when matching the specified AS community string. This option is disabled by default.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| extcommunity <EXTCOMMUNITY-LIST-NAME> | Configures the external community list string to match
- `<EXTCOMMUNITY-LIST-NAME>` – Specify the external community list name (should be existing and configured)

- **match [ip-address | ip-next-hop | ip-route-source] [BGP-IP-ACCESS-LIST <BGP-ACL-NAME> | prefix-list <PREFIX-LIST-NAME>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| ip-address [BGP-IP-ACCESS-LIST <BGP-ACL-NAME> | prefix-list <PREFIX-LIST-NAME>] | Configures a string of IP addresses, in the route, to match
- The IP Address is a list of IP addresses in the route used to filter the route. Use one of the following options to provide a list of IP addresses:
  - `BGP-IP-ACCESS-LIST <BGP-ACL-NAME>` – Associates an existing BGP ACL with this BGP route map. Specify the BGP ACL name (should be existing and configured).
  - `prefix-list <PREFIX-LIST-NAME>` – Associates an existing IP address prefix list with this BGP route map. The IP Address Prefix List is a list of prefixes in the route used to filter route. Specify the prefix list name (should be existing and configured).
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **ip-next-hop**<br>[BGP-IP-ACCESS-LIST <BGP-ACL-NAME>]<br>[prefix-list <PREFIX-LIST-NAME>] | Configures the next-hop's IP address to match. The IP Next Hop is a list of IP addresses used to filter routes based on the IP address of the next-hop in the route. Use one of the following options to provide next-hop's IP addresses:  
- **BGP-IP-ACCESS-LIST <BGP-ACL-NAME>** – Associates an existing BGP ACL with this BGP route map. Specify the BGP ACL name (should be existing and configured).  
- **prefix-list <PREFIX-LIST-NAME>** – Associates an existing IP next-hop prefix list with this BGP route map. The IP Next Hop Prefix List is a list of prefixes for the route's next-hop determining how the route is filtered. Specify the prefix list name (should be existing and configured). |
| **ip-route-source**<br>[BGP-IP-ACCESS-LIST <BGP-ACL-NAME>]<br>[prefix-list <PREFIX-LIST-NAME>] | Configures the advertised route source IP address to match. The IP Route Source is a list of IP addresses used to filter routes based on the advertised IP address of the source. Use one of the following options to provide route-source IP addresses:  
- **BGP-IP-ACCESS-LIST <BGP-ACL-NAME>** – Associates an existing BGP ACL with this BGP route map. Specify the BGP ACL name (should be existing and configured).  
- **prefix-list <PREFIX-LIST-NAME>** – Associates an existing IP route source prefix list with this BGP route map. The IP Route Source Prefix List is a list of prefixes used to filter routes based on the prefix list used for the source. Specify the prefix list name (should be existing and configured). |
| **match metric <0-4294967295>** | Defines the exterior metric, used for route map distribution, to match. BGP uses a route table managed by the external metric defined. Setting a metric provides a dynamic way to load balance between routes of equal cost.  
- <0-4294967295> – Specify the external metric value from 0 - 4294967295. |
| **match origin [egp|igp|incomplete]** | Configures the source of the BGP route to match. Options include:  
- **egp** – Matches if the origin of the route is from the **exterior gateway protocol** (eBGP). eBGP exchanges routing table information between hosts outside an autonomous system.  
- **igp** – Matches if the origin of the route is from the **interior gateway protocol** (iBGP). iBGP exchanges routing table information between routers within an autonomous system.  
- **incomplete** – Matches if the origin of the route is not identifiable. |
| **match tag <0-65535>** | Configures the BGP route tag to match. The Tag is a way to preserve a route's AS path information for routers in iBGP. This option is disabled by default.  
- <0-65535> – Specify the iBGP route's tag from 0 - 65535. |
Examples
The following examples show the configuration of match criteria for the deny route-map rule 1:

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#match as-path FilterList_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#match ip-route-source prefix-list PrefixList_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context
deny route-map 1
  description "This is a deny route map rule"
  match as-path FilterList_01
  match ip-route-source prefix-list PrefixList_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#
```

A permit route-map rule 2 is added to the BGP route-map “test”.

```
nx9500-6C8809(config-dr-route-map-test)#permit route-map 2
```

A match criteria is added for the permit route-map rule 2.

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-2)#match ip-next-hop DL_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-2)#show context
  permit route-map 2
  match ip-next-hop DL_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-2)#
```

The following example displays the BGP route-map “test” settings:

```
nx9500-6C8809(config-dr-route-map-test)#show context
  route-map test
deny route-map 1
  description "This is a deny route map rule"
  match as-path FilterList_01
  match ip-route-source prefix-list PrefixList_01
permit route-map 2
  match ip-next-hop DL_01
nx9500-6C8809(config-dr-route-map-test)#
```

28.6.3 no

bgp-route-map-config commands

Removes or reverts the settings defined for a deny or permit route-map rule

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

no [description|match <PARAMETERS>|set <PARAMETERS>]

Parameters

- no <PARAMETERS>

Examples

The following example shows the 'deny route-map rule-1' settings before the 'no' commands are executed:

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context
deny route-map 1
  description "This is a deny route map rule"
  match as-path FilterList_01
  match ip-route-source prefix-list PrefixList_01
  set aggregator-as 1 192.168.13.7
  set as-path exclude 20
  set ip next-hop peer-address
  set metric 300
  set local-preference 30
  set community internet
```

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#no match as-path
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#no set aggregator-as
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#no set metric

The following example shows the 'deny route-map rule-1' settings after the 'no' commands are executed:

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context
deny route-map 1
  description "This is a deny route map rule"
  match ip-route-source prefix-list PrefixList_01
  set as-path exclude 20
  set ip next-hop peer-address
  set local-preference 30
  set community internet
```

The following example shows the route-map 'test' settings:

```
nx9500-6C8809(config-dr-route-map-test)#show context
route-map test
  deny route-map 1
    description "This is a deny route map rule"
    match ip-route-source prefix-list PrefixList_01
    set as-path exclude 20
    set ip next-hop peer-address
    set local-preference 30
    set community internet
  permit route-map 2
    match ip-next-hop DL_01
```

nx9500-6C8809(config-dr-route-map-test)#
28.6.4 set

*bgp-route-map-config commands*

Configures the values attributed to a route matching the match criteria specified in the BGP deny or permit route-map rules. These attributes are applied before the route is sent out.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
set [aggregator-as|as-path|atomic-aggregate|comm-list|community|extcommunity|ip|
    local-preference|metric|origin|originator-id|source-ip|tag|weight]

set aggregator-as <1-4294967295> <IP>
set as-path [exclude|prepend] <1-4294967295> {<1-4294967295>}
set atomic-aggregate
set comm-list delete <COMMUNITY-LIST-NAME>
set community [<COMMUNITY-NUMBER>|none]
set extcommunity [rt|soo] <EXTCOMMUNITY-NUMBER>
set ip next-hop [<IP>|peer-address]
set local-preference <0-4294967295>
set metric <0-4294967295>
set origin [egp|igp|incomplete]
set originatorid <IP>
set source-ip <IP>
set tag <0-65535>
set weight <0-4294967295>
```

**Parameters**
- **set aggregator-as <1-4294967295> <IP>**

  Configures the BGP aggregator’s ASN and IP address. Aggregates minimize the size of routing tables. Aggregation combines the characteristics of multiple routes and advertises them as a single route. The configured BGP aggregator settings are applied to filtered routes.
  - `<1-4294967295>` — Specify the route aggregator’s ASN from 1- 4294967295. This option is disabled by default.
  - `<IP>` — Specify the route aggregator’s IP address. BGP allows the aggregation of specific routes into one route using an aggregate IP address.
**set as-path [exclude|prepend] <1-4294967295> {<1-4294967295>}**

Configures the BGP transform AS path attribute to be applied to filtered routes
- **exclude** – Configures a single AS, or a list of ASs, excluded from the AS path
- **prepend** – Configures a single AS, or a list of ASs, prepended to the AS path
  - `<1-4294967295>` – This keyword is common to the ‘exclude’ and ‘prepend’ parameters. Use it to specify the AS number. The ASs identified here are excluded or prepended depending on the option selected.

*Note*: You can configure multiple ASNs.

**set atomic-aggregate**

Enables BGP atomic aggregate attributes

When a BGP enabled wireless controller or service platform receives a set of overlapping routes from a peer, or if the set of routes selects a less specific route, then the local device must set this value when propagating the route to its neighbors. This option is disabled by default.

**set comm-list delete <COMMUNITY-LIST-NAME>**

Deletes specified BGP communities. All communities matching the community list name string are deleted from the route.

A BGP community is a group of routes sharing a common attribute.
- `<COMMUNITY-LIST-NAME>` – Specify the community list name.

**set community [<COMMUNITY-NUMBER>|none]**

Configures a community attribute for this route
- `<COMMUNITY-NUMBER>` – Specify a community attribute. Use one of the following formats:
  - `internet` - Advertises this route to the Internet. This is a global community.
  - `local-AS` - Prevents the transmit of packets outside the local AS
  - `no-advertise` - Prevents advertisement of this route to any peer, either internal or external
  - `no-export` - Prevents advertisement of this route to BGP peers, keeping this route within an AS.
  - `aa:nn` - Configures the first part (aa) representing the AS number. The second part (nn) represents a 2-byte number.
- `none` – Specifies community attribute as `none`

**set extcommunity [rt|soo] <EXTCOMMUNITY-NUMBER>**

Configures a extended community attribute for this route
- **rt** – Identifies the *route target* (rt) extended community
- **soo** – Identifies the *site-of-origin* (soo) community. This is the origin community associated with the route reflector.
  - `<EXTCOMMUNITY-NUMBER>` – This keyword is common to the ‘rt’ and ‘soo’ parameters. Use it to specify the extended community number.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| set ip next-hop [<IP>|peer-address] | Configures the next hop for this route. Use one of the following options to identify the next hop:  
  - `<IP>` – Specify the next hop's IP address  
  - `peer-address` – Enables the identification of the next-hop address for peer devices. This option is disabled by default |
| set local-preference <0-4294967295> | Configures the BGP local preference path attribute for this route map. When configured, enables the communication of preferred routes out of the AS between peers. This option is disabled by default  
  - `<0-4294967295>` – Specify the preference value from 0 - 4294967295. |
| set metric <0-4294967295> | Configures a metric for the route  
  BGP uses a route table managed by the external metric defined. Setting a metric provides a dynamic way to load balance between routes of equal cost.  
  - `<0-4294967295>` – Specify the metric from 0 - 4294967295. |
| set origin [egp|igp|incomplete] | Configures the origin code for this BGP route map  
  - `egp` - Sets the origin of the route to eBGP  
  - `igp` - Sets the origin of the route to iBGP  
  - `incomplete` - Sets the origin of the route as not identifiable. Use this option if the route is from a source other than eBGP or iBGP. |
| set originatorid <IP> | Configures this route map's originator IP address |
| set source-ip <IP> | Configures this route map's source IP address  
  - `<IP>` – Specify the IP address in the A.B.C.D format. |
| set tag <0-65535> | Configures this route map's tag value  
  The Tag is a way to preserve a route’s AS path information for routers in iBGP.  
  - `<0-65535>` – Specify a tag value from 1 - 65535. |
| set weight <0-4294967295> | Enables assignment of a weighted priority to the aggregate route  
  - `<0-4294967295>` – Specify a value from 0 - 4294967295. |
Examples

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#set aggregator-as 1 192.168.13.7

28.7 bgp-router-config commands

Use the (device-config) or (profile-config) instance to configure BGP router related parameters.

To navigate to the BGP router configuration instance, in the device-config mode, use the following commands:

<DEVICE>(config)#self
<DEVICE>(config-device-<MAC>)#router bgp
<DEVICE>(config-device <MAC>-router-bgp)#

<DEVICE>(config-device <MAC>-router-bgp)#?

Router BGP Mode commands:
- aggregate-address  Configure aggregate address
- asn                Configure local Autonomous System Number
- bgp                Border Gateway Protocol
- bgp-route-limit    Limit for number of routes handled by BGP process
- distance           Configure administrative distance
- ip                 Internet Protocol (IP)
- network            Configure a local network
- no                 Negate a command or set its defaults
- route-redistribute Redistribute information from another routing protocol
- timers             Adjust routing timers
- clrscr             Clears the display screen
- commit             Commit all changes made in this session
- do                 Run commands from Exec mode
- end                End current mode and change to EXEC mode
- exit               End current mode and down to previous mode
- help               Description of the interactive help system
- revert             Revert changes
- service            Service Commands
- show               Show running system information
- write              Write running configuration to memory or terminal

<DEVICE>(config-device <MAC>-router-bgp)#

When configured as a profile, the router settings are applied to all devices using the profile.

To navigate to the BGP router configuration instance, in the profile-config mode, use the following commands:

<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile <PROFILE-NAME>)#router bgp
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#

<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#?

Router BGP Mode commands:
- aggregate-address  Configure aggregate address
- asn                Configure local Autonomous System Number
- bgp                Border Gateway Protocol
- bgp-route-limit    Limit for number of routes handled by BGP process
- distance           Configure administrative distance
- ip                 Internet Protocol (IP)
- network            Configure a local network
- no                 Negate a command or set its defaults
- route-redistribute Redistribute information from another routing protocol
- timers             Adjust routing timers
- clrscr             Clears the display screen
- commit             Commit all changes made in this session
- do                 Run commands from Exec mode
- end                End current mode and change to EXEC mode
- exit               End current mode and down to previous mode
- help               Description of the interactive help system
- revert             Revert changes
- service            Service Commands
- show               Show running system information
- write              Write running configuration to memory or terminal

### 28.7.1 aggregate-address

**bgp-router-config commands**

Creates and configures an aggregate address entry in the BGP database

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
aggregate-address <IP/M> {as-set {summary-only}|summary-only}
```

**Parameters**
- `aggregate-address <IP/M> {as-set {summary-only}|summary-only}`

<table>
<thead>
<tr>
<th>aggregate-address</th>
<th>Specify the aggregate IP address and mask</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/M&gt;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>as-set {summary-only}</th>
<th>Optional. Summarizes the AS_PATH attributes of the individual routes aggregated</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary-only</td>
<td>Optional. Filters more specific routes from updates</td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#aggregate-address 192.168.13.10/32 as-set summary-only

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#show context
router bgp
   bgp enable
   asn 1

**Related Commands**

| `no` | Removes the aggregate address entry |
28.7.2 `asn`  

- **bgp-router-config commands**

Configures the ASN. The ASN represents a group of routers under the same administration and using IGP and common metrics to define how to route packets. In short the ASN represents all routers within an AS.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

`asn <1-4294967295>`

**Parameters**

- `asn <1-4294967295>`

| `asn <1-4294967295>` | Specify the ASN from 1 - 4294967295. |

**Examples**

```
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#asn 1

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context router bgp
  asn 1

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#
```
28.7.3 bgp

- **bgp-router-config commands**

  Configures BGP router parameters

  Supported in the following platforms:

  - Wireless Controllers — RFS4000, RFS6000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
bgp [always-compare-med|bestpath|client-to-client|cluster-id|confederation|
    dampening|default|deterministic-med|enable|enforce-first-as|fast-external-failover|
    graceful-restart|log-neighbor-changes|neighbor|network|router-id|scan-time]
```

```
bgp [always-compare-med|deterministic-med|enable|enforce-first-as|
    fast-external-failover|log-neighbor-changes]
```

```
bgp best-path [as-path [confed|ignore]|compare-router-id|
    med {confed {missing-as-worst}|missing-as-worst}]
```

```
bgp client-to-client reflection
```

```
bgp cluster <IP>
```

```
bgp confederation [identifier|peers] <1-4294967295>
```

```
bgp dampening {<1-45>} {<1-20000>} <1-20000> <1-255>
```

```
bgp default [ipv4-unicast|local-preference <0-4294967295>]
```

```
bgp graceful-restart {stalepath-time <1-3600}]
```

```
bgp neighbor <IP>
```

```
bgp network import-check
```

```
bgp router-id <IP>
```

```
bgp scan-time <5-60>
```

**Parameters**

- **always-compare-med** Enables comparison of *Multi-exit Discriminators* (MEDs) received from neighbors. This option is disabled by default.

  MED is a value used by BGP peers to select the best route among multiple routes. When enabled, the MED value encoded in the route is always compared when selecting the best route to the host network. A route with a lower MED value is preferred over a route with a higher MED value. BGP does not discriminate between iBGP and eBGP when using MED for route selection. This option is mutually exclusive to the **deterministic-med** option.

- **deterministic-med** Enables selection of the best MED path from amongst all paths advertised by neighboring ASs. This option is disabled by default.

  MED is used by BGP peers to select the best route among multiple routes. When enabled, MED route values (from the same AS) are compared to select the best route. This best route is then compared with other routes in the BGP route table to select the best overall route. This option is mutually exclusive to the **always-compare-med** option.

- **enable** Starts the BGP daemon on the device (wireless controller or service platform). BGP is disabled by default.

- **enforce-first-as** Enforces the first AS for all BGP routes. This option is disabled by default.

  When enforced, devices deny updates received from an external neighbor that does not have the neighbor’s configured AS at the beginning of the received AS path parameter. This enhances security by not allowing traffic from an unauthorized AS.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fast-external-failover</td>
<td>Enables/disables immediate resetting of BGP session on the interface once the BGP connection goes down. This option is enabled by default. When enabled, a session is reset as soon as the direct link to an external peer goes down. Normally, when a BGP connection goes down, the device waits for the expiry of the duration specified in holdtime parameter before bringing down the interface. <strong>Note:</strong> To configure the ‘holdtime’, use the <code>timers bgp &lt;keepalive-time&gt; &lt;holdtime&gt;</code> command in this (BGP router) configuration mode.</td>
</tr>
<tr>
<td>log-neighbor-changes</td>
<td>Enables/disables logging of a BGP neighbor's status change (active or not active) events. It also enables or disables the logging of the reason for such change in status.</td>
</tr>
<tr>
<td>`bgp best-path [as-path [confed</td>
<td>ignore]</td>
</tr>
<tr>
<td>as-path [confed</td>
<td>ignore]</td>
</tr>
<tr>
<td></td>
<td>- confed – Enables comparison of path lengths (including confederation sets and sequences) when selecting a route (EXPERIMENTAL). This option is disabled by default.</td>
</tr>
<tr>
<td></td>
<td>- ignores – Disables an AS path length from being considered as a criteria for selecting a preferred route. When, disabled the AS path length is ignored. This option is disabled by default.</td>
</tr>
<tr>
<td>compare-router-id</td>
<td>Enables/disables the use of router ID as a selection criteria when selecting the preferred route. When enabled, the router ID is used to select the best path between two identical BGP routes. The route with the lower router ID is selected over a route with a higher router ID. This option is disabled by default.</td>
</tr>
<tr>
<td>med</td>
<td>Enables/disables comparison of AS path MED value when selecting the preferred route</td>
</tr>
<tr>
<td>{confed {missing-as-worst}</td>
<td>missing-as-worst]</td>
</tr>
<tr>
<td></td>
<td>- confed – Optional. Enables /disables comparison of MED value among confederation paths (EXPERIMENTAL). When enabled, you can optionally enable the treatment of AS paths without the MED value as the least preferable route. This option is disabled by default.</td>
</tr>
<tr>
<td></td>
<td>- missing-as-worst – Optional. Enables the treatment of AS paths without the MED value as the least preferable route. This option is disabled by default.</td>
</tr>
<tr>
<td><code>bgp client-to-client reflection</code></td>
<td>Enables/disables client-to-client route reflection (EXPERIMENTAL) Route reflectors are used when all iBGP speakers are not fully meshed. If the clients are fully meshed, the route-reflectors are not required. This option is enabled by default.</td>
</tr>
<tr>
<td>cluster &lt;IP&gt;</td>
<td>Enables and sets a cluster ID, in case the BGP cluster has more than one route-reflector A cluster generally consists of a single route-reflector and its clients. The cluster is usually identified by the router ID of this single route-reflector. Sometimes, to increase redundancy, a cluster might have more than one route-reflector configured. In this case, all route-reflectors in the cluster are identified by the cluster ID (configured in the IP format).</td>
</tr>
</tbody>
</table>
### bgp confederation [identifier|peers] <1-4294967295>

- **identifier** – Enables and sets a BGP confederation identifier to allow an AS to be divided into several ASs. In other words an AS is divided into multiple ASs, and together they form a confederation. This confederation is visible to external routers as a single AS. The ASN is usually the confederation ID. Specify a value from 1 - 4294967295.

**Note:** Forming AS confederation reduces iBGP mesh inside an AS.

- **peers** – Configures the maximum number of the ASs constituting this BGP confederation. Specify the AS number from 1 - 4294967295. Multiple ASs can be added to the list of confederation members.

### bgp dampening {<1-45>} {<1-20000>} <1-20000> <1-255>

- Enables dampening and configures dampening parameters. This option is disabled by default.

Dampening minimizes the instability caused by route flapping. A penalty is added for every flap in the flapping route. As soon as the total penalty reaches the specified **Route Suppress Limit** value, the advertisement of this route is suppressed. This penalty is delayed when the time specified in **Half Lifetime** occurs. Once the penalty becomes lower than the value specified in **Start Route Reuse**, the advertisement of the route is un-suppressed.

- **<1-45>** – Optional. Configures the half lifetime (in minutes). A penalty is imposed on a route that flaps. This is the time for the penalty to decrease to half its current value. Specify a value from 1 - 45 minutes. The default is 1 minute.

- **<1-20000>** – Optional. Configures the route reuse value. When the penalty for a suppressed route decays below the value specified here, the route is un-suppressed (reused). Specify a value from 1 - 20000.

- **<1-20000>** – Configures the route suppress value. When a route flaps, a penalty is added to the route. When the penalty reaches or exceeds the value specified as the `maximum duration to suppress a stable route`. Specify a value from 1 - 20000.

**Note:** The maximum duration to suppress a stable route, is the next set of value configured in this command from 1 - 255.

- **<1-255>** – Configures the maximum duration, in minutes, a suppressed route is suppressed. This is the maximum duration for which a route remains suppressed before it is reused. Specify a value from 1 - 255 minutes.

### bgp default [ipv4-unicast|local-preference <0-4294967295>]

- **default** – Configures the following defaults for BGP neighbor-related parameters: IPv4 unicast and local preference.

- **ipv4-unicast** – Enable/disables IPv4 unicast traffic for neighbors. This option is enabled by default.

- **local-preference <0-4294967295>** – Configures a local preference for the neighbor. Higher the value higher is the preference.
  - **<0-4294967295>** – Specify a value from 1 - 4294967295.
- `bgp graceful-restart {stalepath-time <1-3600>}`  
  Enables/disables graceful restart on this BGP router. This option is disabled by default.  
  - `stalepath-time <1-3600>` – Optional. Configures the maximum time, in seconds, to retain stale paths from restarting neighbor. This is the time the paths from a restarting neighbor are preserved. All stale paths, unless reinstated by the neighbor after re-establishment, are deleted at the expiry of the time specified here.  
  - `<1-3600>` – Specify a value from 1 - 3600 seconds.

- `bgp neighbor <IP>`  
  Configures the BGP neighbor’s IP address and enters its configuration mode. Use this command to configure a BGP neighbor’s parameters.  
  - `<IP>` – Specify the IP address in the A.B.C.D format.  
  **Note:** For BGP neighbor configuration parameters, see `bgp-neighbor-config commands`.

- `bgp network import-check`  
  Enables checking of the existence of BGP network route in IGP before importing

- `bgp router-id <IP>`  
  Enables the device (BGP supported wireless controller or service platform) identified by the `<IP>` parameter as a router. The router’s IP address is configured as its ID, and uniquely identifies it. When not specified, the IP address of the interface is configured as the router ID. This option is disabled by default.

- `bgp scan-time <5-60>`  
  Configures the scanning interval, in seconds, for updating BGP routes. This is the interval between two consecutive scans the BGP device performs in order to validate routes in its routing table. To disable scanning, set the value to Zero (0).  
  - `<5-60>` – Specify a value from 5 - 60 seconds. The default is 60 seconds.

**Examples**

```plaintext
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#bgp router-id 192.168.13.13
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#aggregate-address 116.117.118.0/24 as-set summary-only
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#bgp neighbor 192.168.13.99
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context router bgp
  aggregate-address 116.117.118.0/24 as-set summary-only
  bgp router-id 192.168.13.13
  bgp neighbor 192.168.13.99
  remote-as 199
  maximum-prefix 9999 80 restart 50

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#
```

**Related Commands**

- `no`  
  Removes the BGP router parameters. The `no > bgp > enable` command disabled BGP.
28.7.4 bgp-route-limit

**bgp-router-config commands**

Configures the BGP route limit parameters

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
bgp-route-limit [num-routes <VALUE>|reset-time <1-86400>|retry-count <1-32>|retry-timeout <1-3600>]
```

**Parameters**

- **num-routes <VALUE>**
  - Configures the number of routes that can be stored on this BGP router. Set this value based on the available memory on this BGP router (wireless controller or service platform).
  - `<VALUE>` — Specify a value from 1 - 4,294,967,295. The default is 9216 routes.

- **reset-time <1-86400>**
  - Configures the reset time in seconds. This is the time after which the retry count value is set to Zero (0).
  - `<1-86400>` — Specify a value from 1- 86,400 seconds. The default is 360 seconds.

- **retry-count <1-32>**
  - Configures the maximum number of times the BGP process is reset before being permanently shut down. Once shut down, the BGP process has to be started manually. The BGP process is reset if it is flooded with route entries that exceed the maximum number of routes configured for this device.
  - `<1-32>` — Specify a value from 1 - 32. The default is 5 routes.

- **retry-timeout <1-3600>**
  - Configures the duration, in seconds, the BGP process is temporarily shut down, before a reset of the process is attempted.
  - `<1-3600>` — Specify a value from 1 - 3600 seconds. The default is 60 seconds.

**Examples**

```
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#bgp-route-limit num-routes 10
```

```
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context
router bgp
  bgp enable
  as 1
  aggregate-address 116.117.118.0/24 as-set summary-only
  bgp neighbor 192.168.13.99 remote-as 199
  maximum-prefix 9999 80 restart 50
  bgp-route-limit num-routes 10
```

**Related Commands**

- **no**
  - Removes BGP route limitations configured. Use the no command to revert back to default.
28.7.5 distance

- `bgp-router-config commands`

Configures administrative distance parameters. The distance parameter is a rating of the trustworthiness of a route. The higher the distance, lower is the trust rating. The distance can be set for each type of route indicating its trust rating.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

distance [<IP/M> <1-255> <BGP-ACL-NAME> | bgp <1-255> <1-255> <1-255>]

**Parameters**
- distance [<IP/M> <1-255> <BGP-ACL-NAME> | bgp <1-255> <1-255> <1-255>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>distance</td>
<td>Configures the default administrative distance, specified by the &lt;1-255&gt; parameter, when the route's source IP address matches the specified IP prefix.</td>
</tr>
<tr>
<td>&lt;IP/M&gt;</td>
<td>Specify the IP source prefix and prefix length.</td>
</tr>
<tr>
<td>&lt;1-255&gt;</td>
<td>Specify the distance from 1 - 255.</td>
</tr>
<tr>
<td>&lt;BGP-ACL-NAME&gt;</td>
<td>Optional. Specify the BGP access list name.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>bgp &lt;1-255&gt; &lt;1-255&gt;</th>
<th>Configures the default administrative distance for different route types</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-255&gt;</td>
<td>Configures the default administrative distance for routes external to this AS. Specify a value from 1 - 255.</td>
</tr>
<tr>
<td>&lt;1-255&gt;</td>
<td>Configures the default administrative distance for routes internal to this AS. Specify a value from 1 - 255.</td>
</tr>
<tr>
<td>&lt;1-255&gt;</td>
<td>Configures the default administrative distance for local routes. Specify a value from 1 - 255.</td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#distance bgp 200 100 200

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context router bgp
bgp enable
asn 1
aggregate-address 116.117.118.0/24 as-set summary-only
distance bgp 200 100 200
bgp neighbor 192.168.13.99
remote-as 199
maximum-prefix 9999 80 restart 50
bgp-route-limit num-routes 10

28.7.6 ip

* bgp-router-config commands

Configures the BGP default gateway’s priority

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

ip default-gateway priority <1-8000>

**Parameters**

- ip default-gateway priority <1-8000>

| default-gateway priority <1-8000> | Configures the default gateway’s (acquired through BGP) priority
|------------------------------------|------------------------------------------------------------------|

- <1-8000> – Specify a value from 1 - 8000. The default is 7500.

**Note:** Lower the value, higher is the priority.

**Examples**

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#ip default-gateway priority 1

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context

  router bgp
  bgp enable
  asn 1
  ip default-gateway priority 1
  bgp-route-limit num-routes 10

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#

**Related Commands**

- **no** Removes the BGP default gateway configuration
28.7.7 network

**bgp-router-config commands**

Configures the local network IP addresses and masks. These network addresses are broadcasted to neighboring BGP peers. You can configure a single IP address or a range of IP addresses in the A.B.C.D/M notation.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
network <IP/M> {backdoor|pathlimit|route-map}
```

```
network <IP/M> {backdoor pathlimit <1-255>}
network <IP/M> {pathlimit <1-255>}
network <IP/M> {route-map <ROUTE-MAP-NAME>}
```

**Parameters**

- `network <IP/M> {backdoor|pathlimit|route-map}`
  - `<IP/M>` — Specify the network address.
  - `backdoor` — Optional. Configures a BGP backdoor route. After configuring the backdoor route, you can optionally configure the as-path hop count limit attribute for this backdoor route.
    - `pathlimit <1-255>` — Specify the hop count limit from 1 - 255.
  - `pathlimit` — Optional. Configures the maximum path limit for this AS
    - `<1-255>` — Specify the hop count limit from 1 - 255.
  - `route-map` — Optional. Associates a BGP route map with this local network. When applied, the route-map values take precedence

**Examples**

```
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#network 192.168.13.0/24 backdoor pathlimit 200
```

```
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context router bgp
  bgp enable
  asn 1
  aggregate-address 116.117.118.0/24 as-set summary-only
distance bgp 200 100 200
bgp neighbor 192.168.13.99
  remote-as 199
  maximum-prefix 9999 80 restart 50
network 1.2.3.0/24
  network 192.168.13.0/24 backdoor pathlimit 200
  bgp-route-limit num-routes 10
```

**Related Commands**

- `no` — Removes the list of local networks configured
28.7.8 no

* bgp-router-config commands

Removes the BGP router settings

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
no [aggregate-address|bgp|bgp-route-limit|distance|ip|network|route-redistribute|timers]
```

**Parameters**

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes the BGP router settings</th>
</tr>
</thead>
</table>

**Examples**

The following example shows the BGP router settings before the ‘no’ commands have been executed:

```plaintext
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#show context
router bgp
  bgp enable
  as 1
  aggregate-address 116.117.118.0/24 as-set summary-only
  bgp neighbor 192.168.13.199
    remote-as 1
    use route-map UnSupMap_01 in
  bgp neighbor 192.168.13.99
    remote-as 199
    maximum-prefix 9999 80 restart 50
  bgp-route-limit num-routes 10 reset-time 360
```

```plaintext
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#
```

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#no bgp neighbor 192.168.13.99

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#no aggregate-address 116.117.118.0/24

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#no bgp-route-limit

The following example shows the BGP router settings after the ‘no’ commands have been executed:

```plaintext
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#show context
router bgp
  bgp enable
  as 1
  bgp neighbor 192.168.13.199
    remote-as 1
    use route-map UnSupMap_01 in
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#
```
28.7.9 route-redistribute

Enables redistribution of routes learnt from other routing protocols into BGP.

Large ISP networks using multiple routing protocols, need to enable redistribution of routes across routing protocols. Routing protocols differ in their basic characteristics, such as metrics, administrative distance, classful and classless capabilities etc. When enabling redistribution, these differences have to be taken into consideration.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

```
route-redistribution [connected|kernel|ospf|static] {metric <0-4294967295>|
   route-map <ROUTE-MAP-NAME>}
```

Parameters

- `route-redistribution [connected|kernel|ospf|static] {metric <0-4294967295>|
  route-map <ROUTE-MAP-NAME>}`

28.7.10 timers

- bgp-router-config commands

Enables adjustment of keepalive and holdtime intervals

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

```
timers bgp <0-65535> <0-65535>
```

Parameters
- timers bgp <0-65535> <0-65535>

<table>
<thead>
<tr>
<th>timers bgp &lt;0-65535&gt;</th>
<th>Configures the keepalive and holdtime interval in seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;0-65535&gt;</td>
<td>- Specify a keepalive interval from 0 - 65535 seconds. It is the interval, in seconds, between two successive keepalive packets exchanged with this router and its neighbor to keep the TCP connection alive.</td>
</tr>
<tr>
<td>&lt;0-65535&gt;</td>
<td>- Specify a holdtime value from 0 - 65535 seconds. This is the time this router will wait without receiving a keepalive packet from its neighbor before declaring it dead. If the time since the last keepalive packet received (from its neighbor) exceeds the value set here, the neighbor is declared dead.</td>
</tr>
</tbody>
</table>

Reverts BGP timers to default
28.8 bgp-neighbor-config commands

BGP enabled devices connected through an established TCP connection are referred to as BGP peers or neighbors. To establish a TCP connection, BGP routers exchange open messages containing the following information: AS number, BGP version running, BGP router ID, and timer values (keepalive and holdtime). Once these values are accepted by both devices, the connection is established and the routers become neighbors. With the TCP connection established the BGP neighbors begin sharing routing information and updates. A failure in the establishment of the TCP connection indicates that the routers are not neighbors and cannot exchange routing information.

Use the (profile/device-config) instance to configure BGP neighbors.

To navigate to the BGP neighbor configuration instance, use the following commands:

```plaintext
<DEVICE>(config)#profile <PROFILE-NAME>
<DEVICE>(config-profile <PROFILE-NAME>)#router bgp
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#?
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#bgp neighbor ?
A.B.C.D  IP address of the bgp neighbor
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#bgp neighbor <IP>
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp-neighbor-<IP>)#?
```

<td>Enables a strict capability match before allowing a neighbor BGP peer to open a connection (EXPERIMENTAL)</td>
<td>page 28-84</td>
</tr>
<tr>
<td>timers</td>
<td>Configures this BGP neighbor’s keepalive and holdtime durations</td>
<td>page 28-85</td>
</tr>
<tr>
<td>unsuppress-map</td>
<td>Uses a route-map that selectively un suppresses routes that have been suppressed using the aggregate-address command</td>
<td>page 28-87</td>
</tr>
<tr>
<td>update-source</td>
<td>Allows BGP sessions to use any operational interface to establish the TCP connection with this neighbor</td>
<td>page 28-88</td>
</tr>
<tr>
<td>use</td>
<td>Configures filters for this neighbor. These filters are BGP IP ACL, IP prefix list, AS path list, and route map. Based on the filters used, updates received from this neighbor are filtered.</td>
<td>page 28-89</td>
</tr>
<tr>
<td>weight</td>
<td>Configures a weight for all routes learned from this BGP neighbor</td>
<td>page 28-90</td>
</tr>
</tbody>
</table>
28.8.1 activate

Enables an address family for this neighbor. This option is enabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
activate

Parameters
None

Examples
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#activate
28.8.2 advertisement-interval

- bgp-neighbor-config commands

Configures the minimum interval, in seconds, between two consecutive BGP router updates

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
advertisement-interval <0-600>

Parameters
- advertisement-interval <0-600>

| advertisement-interval <0-600> | Configures the minimum interval, in seconds, between two consecutive BGP router updates. Sending too many router updates creates flapping of routes leading to possible disruptions. Specify a minimum interval so that the BGP routing updates are sent after the set interval.
| &lt;0-600&gt; | &lt;0-600&gt; — Specify a value from 0 - 600 seconds. The default is 5 seconds.

Examples

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
advertisement-interval 100

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
bgp neighbor 192.168.13.99
advertisement-interval 100
```

Related Commands

- no
  Reverts the advertisement interval to default (5 seconds)
28.8.3 allowas-in

*bgp-neighbor-config commands*

Enables re-advertisement of all prefixes containing duplicate ASNs. Use this command to configure the maximum number of times an ASN is advertised. This option is disabled by default.

When enabled, Provider Edge (PE) routers can re-advertise all prefixes containing duplicate ASNs. This creates a pair of VPN Routing/Forwarding (VRF) instances on each PE router to receive and re-advertise prefixes. The PE router receives prefixes with ASNs from all PE routers and advertises to its neighbor PE routers on one VRF. The other VRF receives prefixes with ASNs from the Customer Edge (CE) routers and re-advertises them to all PE routers in the configuration.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

`allowas-in <1-10>`

**Parameters**

- `allowas-in <1-10>`

**Examples**

```bash
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
allowas-in 10
```

```bash
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
  bgp neighbor 192.168.13.99
    advertisement-interval 100
    allowas-in 10
```

**Related Commands**

| `no` | Disables re-advertisement of all prefixes containing duplicate ASNs |

---
### 28.8.4 attribute-unchanged

**bgp-neighbor-config commands**

Enables propagation of BGP attribute values unchanged to this neighbor BGP device. The BGP attributes are: as-path, med, and next-hop.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
attribute-unchanged {as-path|med|next-hop}
```

**Parameters**

- **attribute-unchanged {as-path|med|next-hop}**

<table>
<thead>
<tr>
<th>attribute-unchanged</th>
<th>Enables the propagation of the following BGP attribute values unchanged:</th>
</tr>
</thead>
<tbody>
<tr>
<td>as-path — Optional.</td>
<td>Enables propagation of AS path BGP attribute unchanged to this neighbor BGP device. This option is disabled by default.</td>
</tr>
<tr>
<td>med — Optional.</td>
<td>Enables propagation of MED BGP attribute unchanged to this neighbor BGP device. This option is disabled by default.</td>
</tr>
<tr>
<td>next-hop — Optional.</td>
<td>Enables propagation of the next-hop BGP attribute value unchanged to this neighbor BGP device. This option is disabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
attribute-unchanged as-path
```

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
```

**Related Commands**

- **no** Disables propagation of BGP attribute values unchanged to this neighbor BGP device
### 28.8.5 capability

- **bkg-neighbor-config commands**

Enables the advertisement of capability (dynamic and ORF) to BGP peers.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
capability [dynamic|orf]
capability dynamic
capability orf prefix-list [both|receive|send]
```

**Parameters**

- **capability dynamic**
  - Enables/disables the advertisement of dynamic capability.
  - Enable this option to show a neighbor device's capability to advertise or withdraw and address capability to other peers in a non-disruptive manner. This option is disabled by default.

- **capability orf prefix-list [both|receive|send]**
  - Enables/disables the advertisement of Outbound Router Filtering (ORF) capability. This option is disabled by default.
  - Enable this option to enable ORF, and advertise this capability to peer devices. ORFs send and receive capabilities to lessen the number of updates exchanged between BGP peers. By filtering updates, ORF minimizes update generation and exchange overhead.
  - The local BGP device advertises ORF in the `send` mode. The peer BGP device receives the ORF capability in the `receive` mode. The two devices exchange updates to maintain the ORF for each router. Only a peer group or an individual BGP router can be configured to be in `receive` or `send` mode. A peer group member cannot be configured.
  - **both** — Advertises the capability to send and receive the ORF to/from this neighbor
  - **receive** — Advertises the capability to receive the ORF from this neighbor
  - **send** — Advertises the capability to send the ORF to this neighbor

**Examples**

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
capability orf prefix-list both
```

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
```

**Related Commands**

- **no** Disables advertisement of capability (dynamic and ORF) to BGP peers
### 28.8.6 default-originate

**bgp-neighbor-config commands**

Enables the sending of the default route to BGP neighbors. It also allows the configuration of the default route. When enabled and configured, local BGP routers send the default route 0.0.0.0 (or a route map specified route) to its neighbor for use as the default route.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

default-originate {route-map <BGP-ROUTE-MAP-NAME>}

**Parameters**
- default-originate {route-map <BGP-ROUTE-MAP-NAME>}

<table>
<thead>
<tr>
<th>default-originate {route-map &lt;BGP-ROUTE-MAP-NAME&gt;}</th>
<th>Enables default originate on this BGP neighbor. This option is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>- route-map &lt;BGP-ROUTE-MAP&gt; — Optional. Use this keyword to specify a route map to use as the default originate route</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> If no route-map is specified, the default route 0.0.0.0 is sent.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#default-originate

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
    bgp neighbor 192.168.13.99
    advertisement-interval 100
    allowas-in 10
    attribute-unchanged as-path
    capability orf prefix-list both
    default-originate

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
```

**Related Commands**

| no | Disables the sending of the default route to BGP neighbors |
28.8.7 description

- bgp-neighbor-config commands

Configures a description for this BGP neighbor device

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

description neighbor <LINE>

Parameters
- description neighbor <LINE>

| neighbor <LINE> | Specify a description for this BGP neighbor device (should not exceed 80 characters). |

Examples

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#description neighbor "This neighbor is an external AS neighbor"

default-originate
description neighbor "This neighbor is an external AS neighbor"

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

Related Commands

- no
  Removes this BGP neighbor’s description
28.8.8 disable-connected-check

- bgp-neighbor-config commands

Enables one-hop away eBGP peer using loop back address. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
disable-connected-check

Parameters
None

Examples
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#disable-connected-check

   advertisement-interval 100
   allowas-in 10
   attribute-unchanged as-path
   capability orf prefix-list both
   default-originate
   description neighbor "This neighbor is an external AS neighbor"
   disable-connected-check

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

Related Commands

| no | Disables one-hop away eBGP peer using loop back address |
28.8.9 `dont-capability-negotiate`

`bpg-neighbor-config commands`

Disables capability negotiation with BGP neighbors. This is to allow compatibility with older BGP versions that have no capability parameters used in the `open` messages between peers. Capability negotiation is enabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

dont-capability-negotiate

Parameters
None

Examples

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
dont-capability-negotiate
```

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
bgp neighbor 192.168.13.99
advertisement-interval 100
allowas-in 10
attribute-unchanged as-path
capability orf prefix-list both
default-originate
description neighbor "This neighbor is an external AS neighbor"
disable-connected-check
dont-capability-negotiate
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
```

</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Enables capability negotiation with BGP neighbors</td>
</tr>
</tbody>
</table>
28.8.10 **ebgp-multihop**

▲ bgp-neighbor-config commands

Enables eBGP Multihop on this BGP neighbor. When enabled, allows neighbor connection to be established between two eBGP neighbors that are not directly connected to each other. Use this command to configure the maximum number of hops possible between two such eBGP neighbors. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
ebgp-multihop <1-255>
```

**Parameters**

- **ebgp-multihop <1-255>**

<table>
<thead>
<tr>
<th>ebgp-multihop &lt;1-255&gt;</th>
<th>Configures the maximum number of hops that can be between eBGP neighbors not directly connected to each other.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-255&gt;</td>
<td>• &lt;1-255&gt; — Specify a value from 1 - 255. The default is 255.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#ebgp-multihop 20

  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
  default-originate
description neighbor "This neighbor is an external AS neighbor"
disable-connected-check
dont-capability-negotiate
  ebgp-multihop 20

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
```

**Related Commands**

- **no** Disables eBGP Multihop on this BGP neighbor
28.8.11 enforce-multihop

Forces eBGP neighbors to perform multi-hop checks

A multihop route is a route to external peers on indirectly connected networks. When enforced, eBGP neighbors perform multi-hop check. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
enforce-multihop

Parameters
None

Examples
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#enforce-multihop

  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
  default-originate
  description neighbor "This neighbor is an external AS neighbor"
  disable-connected-check
  dont-capability-negotiate
ebgp-multihop 20
  enforce-multihop

28.8.12 local-as

Bgp-neighbor-config commands

Configures this neighbor’s local AS number

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

local-as <1-4294967295> {no-prepend}

Parameters

- local-as <1-4294967295> {no-prepend}

| local-as <1-4294967295> {no-prepend} | Configures the local AS number
|----------------------------------------|---------------------------------------------------|
|                                       | • `<1-4292967295>` – Specify a value from 1 - 4294967295.
|                                       | • no-prepend – Optional. Select to enable. When enabled, the local AS number is not
|                                       | prepended to route updates from eBGP peers. AS numbers are prepended to route updates by
|                                       | default.

Examples

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#local-as 20
no-prepend

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
bgp neighbor 192.168.13.99
advertisement-interval 100
allowas-in 10
attribute-unchanged as-path
capability orf prefix-list both
default-originate
description neighbor "This neighbor is an external AS neighbor"
disable-connected-check
dont-capability-negotiate
ebgp-multihop 20
enforce-multihop
local-as 20 no-prepend
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

Related Commands

- no

Removes the local AS number. And also reverts prepending of AS numbers to default (allows prepending).
28.8.13 maximum-prefix

- `bgp-neighbor-config commands`

Configures the maximum number of prefixes that can be received from a BGP neighbor. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

```
maximum-prefix <1-4294967295> {(<1-100>|restart <1-65535>|warning-only)}
```

Parameters

- `maximum-prefix <1-4294967295>`
- `(<1-100>)` — Optional. Sets the threshold limit for generating a log message. This value represents a percentage of the maximum-prefix configured in the preceding step. When this value is reached, a log entry is generated. For example if the maximum-prefix is set to 100 and threshold limit is set to 65, then after receiving 65 prefixes, a log entry is generated. This option is disabled by default.
- `restart <1-65535>` — Optional. Restarts BGP peer connection once the maximum-prefix limit specified is exceeded. For example, If the value specified is 10, then after receiving 10 prefixes from the neighbor, the system restarts the connection with that neighbor. Specify a value from 1 - 65535. This option is disabled by default.
- `warning-only` — Configure to enable. When the maximum-prefix limit is exceeded, the connection is restarted. However, when this option is enabled, the connection is not restarted and an event is generated instead. This option is disabled by default.

Examples

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#maximum-prefix 400 50 warning-only
```

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show con
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
  default-originate
description neighbor "This neighbor is an external AS neighbor"
disable-connected-check
dont-capability-negotiate
ebgp-multihop 20
nenforce-multihop
local-as 20 no-prepend
  maximum-prefix 400 50 warning-only
```

Related Commands

- `no` — Removes the maximum prefix settings configured for this neighbor
28.8.14 next-hop-self

- bgp-neighbor-config commands

Enables next-hop calculation for this neighbor. This option is disabled by default.

When enabled, this device (or devices using this profile) are configured as the next hop for the BGP speaking neighbor or peer group. This allows the BGP device to change the next hop information that is sent to iBGP peers. The next hop address is set to the IP address of the interface used to communicate with the eBGP neighbor.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
next-hop-self

Parameters
None

Examples
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
next-hop-self

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context

Disables this BGP neighbor device (or devices using this profile) as passive
28.8.18 password

- bgp-neighbor-config commands

Sets a password for this BGP neighbor device (or devices using this profile). When configured, this password is used for Message Digest 5 (MD5) authentication between two BGP peers connected over TCP. To enable MD5 authentication between two BGP peers, configure both with the same password.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
password neighbor <LINE>

Parameters
- password neighbor <LINE>

Examples
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#password neighbor eBGPneighbor@300

Related Commands
| no | Removes the password configured for this neighbor |
28.8.19 peer-group

Sets the peer group for this BGP neighbor device (or devices using this profile). Peer groups are a set of BGP neighbors with the same update policies. This facilitates the updates of various policies, such as, distribute lists and filter lists.

The peer group can be configured as a single entity. Any changes made to the peer group is propagated to all members.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

peer-group <PEER-GROUP-NAME>

Parameters

- peer-group <PEER-GROUP-NAME>

Examples

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#peer-group eBGPPeerGrp1

advertisement-interval 100
peer-group eBGPPeerGrp1

password neighbor eBGPneighbor@300

Related Commands

no

Removes the peer group configuration. This neighbor peer group setting is removed.
28.8.20 port

- bgp-neighbor-config commands

Configures a non-standard BGP port for this BGP neighbor

By default BGP uses port 179. Use this command to set a non standard port for this BGP neighbor.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

port <0-65535>

Parameters

- port <0-65535>

| port <0-65535> | Specify a value from 0 - 65535. |

Examples

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#port 21

Related Commands

no

Removes the non standard port configured for this neighbor
28.8.21 remote-as

> bgp-neighbor-config commands

Configures the ASN for this neighbor BGP device (or devices using this profile). ASN is a set of routers under the same administration that use Interior Gateway Protocol (IGP) and common metrics to define how to route packets within the AS.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
remote-as <1-4294967295>

Parameters
- remote-as <1-4294967295>

Examples
```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#remote-as 100

28.8.22 remove-private-as

`bgp-neighbor-config commands`

Removes the private ASN from outbound updates. By default private ASNs are included in outbound updates.

Private AS numbers are not advertised to the Internet. This option is used with external BGP (eBGP) peers only. The router removes the AS numbers only if the update includes private AS numbers. If the update includes both private and public AS numbers, the system treats it as an error.

This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

Related Commands

- no
  Disables this BGP neighbor device (or devices using this profile) to act as a route server client
28.8.24 send-community

> bgp-neighbor-config commands

Enables sending of the community attribute to the BGP neighbor. The community attribute groups destinations in a certain community and applies routing decisions based on the community. On receiving community attribute, the BGP router announces it to the neighbor.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

```
send-community [both|extended|standard]
```

Parameters

- **send-community [both|extended|standard]**

| send-community [both|extended|standard] | Enables sending of the community attributes to the BGP neighbor |
|-----------------------------------------|---------------------------------------------------------------|
|                                        | • both – Sends extended and standard community attributes    |
|                                        | • extended – Sends extended community attributes only         |
|                                        | • standard – Sends standard community attributes only         |

```
28.8.25 shutdown

- bgp-neighbor-config commands

Shuts down this BGP neighbor device (or devices using this profile). When configured, this neighbor is administratively shut down. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
shutdown

Parameters
None

Examples
nx9500-6C8809(config-profile testNX500-router-bgp-neighbor-192.168.13.99)#shutdown

  remove-private-as
  route-server-client
  shutdown

**28.8.26 soft-reconfiguration**

- *bgp-neighbor-config commands*

  Enables storing of updates for inbound soft reconfiguration. This option is disabled by default.

  Soft-reconfiguration can be used in lieu of BGP route refresh capability. Enabling this option enables local storage of all received routes and their attributes. This requires additional memory on the BGP device.

  When a soft reset (inbound) is performed on the neighbor device, the locally stored routes are reprocessed according to the inbound policy. The BGP neighbor connection is not affected.

  Supported in the following platforms:
  - Wireless Controllers — RFS4000, RFS6000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

`soft-reconfiguration inbound`

**Parameters**

- `soft-reconfiguration inbound`

**Examples**

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
soft-reconfiguration inbound
```

**Related Commands**

- `no` Disables soft reconfiguration
28.8.27 strict-capability-match

- bgp-neighbor-config commands

Enforces a strict capability match before allowing a TCP connection with this neighbor. In case capabilities do not match, the BGP connection is not established. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

strict-capability-match

Parameters

None

Examples

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#strict-capability-match

Related Commands

| no | Disables a strict capability match before allowing a connection with this neighbor |
28.8.28 timers

`bgp-neighbor-config commands`

Configures this BGP neighbor’s keepalive and holdtime durations

**NOTE:** The keepalive and holdtime settings configured at the neighbor level override those configured on the BGP router.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**
```
timers [<0-65535> <0-65535> | connect <0-65535>]
```

**Parameters**
- `timers [<0-65535> <0-65535> | connect <0-65535>]`

<table>
<thead>
<tr>
<th><code>timers &lt;0-65535&gt; &lt;0-65535&gt;</code></th>

### 28.8.29 unsuppress-map

#### bgp-neighbor-config commands

Unsuppresses map to selectively advertise routes that have been suppressed using the `aggregate-address` command.

The aggregate-address command creates a route map with an IP/mask address that consolidates subnets under it. This reduces the number of route maps on the BGP device to one consolidated entry. Use unsuppress-map to selectively allow/deny a subnet or a set of subnets from this consolidated entry.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

#### Syntax

```
unsuppress-map <ROUTE-MAP-NAME>
```

#### Parameters

- `unsuppress-map <ROUTE-MAP-NAME>`

#### Examples

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99)#
unsuppress-map test
```

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99)#show context
bgp neighbor 192.168.13.99
  remote-as 199
  maximum-prefix 9999 80 restart 50
unsuppress-map test
```

#### Related Commands

- `no` Removes the unsuppress flag applied on the specified route map.
**28.8.30 update-source**

**bgp-neighbor-config commands**

Allows BGP sessions to use any operational interface to establish the TCP connection with this neighbor

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

update-source <IPv4>

**Parameters**

- **update-source** <IPv4>

| update-source <IPv4> | Specify the BGP enabled neighbor’s IPv4 address. |

**Examples**

remote-as 100
advertisement-interval 100
peer-group eBGPpeerGrp1
port 21
strict-capability-match
timers connect 20
timers 20 40
allows-in 10

**Related Commands**

| **no** | Removes the source of routing updates |
**28.8.31 use**

*bgp-neighbor-config commands*

Configures filters for this neighbor. These filters are BGP IP ACL, IP prefix list, AS path list, and route map. Based on the filters used, updates received from this neighbor are filtered.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
use [distribute-list <BGP-IP-ACL-NAME>|filter-list <AS-PATH-LIST-NAME>|prefix-list <IP-PREFIX-LIST-NAME>|route-map <BGP-ROUTE-MAP-NAME>]
```

**Parameters**

- `use [distribute-list <BGP-IP-ACL-NAME>|filter-list <AS-PATH-LIST-NAME>|prefix-list <IP-PREFIX-LIST-NAME>|route-map <BGP-ROUTE-MAP-NAME>]`

  - `distribute-list <BGP-IP-ACL-NAME>` — Uses a BGP IP ACL. Specify the BGP IP ACL name.
  - `filter-list <AS-PATH-LIST-NAME>` — Uses an AS path list. Specify the AS path list name.
  - `prefix-list <IP-PREFIX-LIST-NAME>` — Uses a IP prefix list. Specify the IP prefix list name.
  - `route-map <BGP-ROUTE-MAP-NAME>` — Uses a route map. Specify the route map name.

**Examples**

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99)#
use filter-list FilterList_01 in

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99)#
use route-map testBGPRouteMap out

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99)#
show context
  bgp neighbor 192.168.13.99
  remote-as 199
  use filter-list FilterList_01 in
  maximum-prefix 9999 80 reStart 50
  use route-map testBGPRouteMap out
  unsuppress-map test

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99)#
```

**Related Commands**

- `no` — Removes the filters used to filter updates received from this neighbor
### 28.8.32 weight

* bgp-neighbor-config commands

Configures a weight for all routes learned from this BGP neighbor. Weight is used to decide the preferred route when the same route is learned from multiple neighbors. The highest weight is always chosen.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
weight <0-65535>
```

**Parameters**

- weight <0-65535>

**Examples**

```bash
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)# weight 10

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
    bgp neighbor 192.168.13.99
    remote-as 100
    advertisement-interval 100
    peer-group eBGPPeerGrp1
    port 21
    strict-capability-match
    timers connect 20
    timers 20 40
    allowas-in 10
    attribute-unchanged as-path
    capability orf prefix-list both
    default-originate
    description neighbor "This neighbor is an external AS neighbor"
    disable-connected-check
    dont-capability-negotiate
    ebgp-multihop 20
    enforce-multihop
    local-as 20 no-prepend
    maximum-prefix 400 50 warning-only
    next-hop-self
    override-capability
    passive
    password neighbor eBGPneighbor@300
    remove-private-as
    route-server-client
    send-community both
    update-source 192.168.13.1
    weight 10

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
```

**Related Commands**

- `no` Reverts to default value
This chapter summarizes the crypto certificate management protocol (CMP) policy commands in the CLI command structure. CMP is an Internet protocol designed to enable devices (access point, wireless controller, or service platform) to obtain and manage digital certificates in a Public Key Infrastructure (PKI) network. A Certificate Authority (CA) issues the certificates using the defined CMP.

WiNG CMP implementation allows you to configure a crypto CMP policy that enables auto installation and auto management of device certificates. When configured and implemented on a device, the crypto CMP policy allows the device to automatically trigger a certification request to a configured, CMP supported certificate authority (CA) server. Once the certificate is validated and confirmed from the CA server it is saved on the device and becomes part of the trustpoint. During the creation of the CMP policy the trustpoint is assigned a name and client information. You can use a manually created trustpoint for one service (like HTTPS) and use the CMP generated trustpoint for RADIUS EAP certificate based authentication.

Use the (config) instance to configure a crypto CMP policy. To navigate to the crypto CMP policy configuration instance, use the following commands:

```
<DEVICE>(config)#crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>
ap6522-D8273A(config)#crypto-cmp-policy CMP
ap6522-D8273A(config-cmp-policy-CMP)#
ap6522-D8273A(config-cmp-policy-CMP)#?
```

**CMP Policy Mode commands:**

- `ca-server` CMP CA Server configuration commands
- `cert-renewal-timeout` Trigger a cert renewal request on timeout
- `cert-update` Enable cert renewal of certificate when about to expire
- `no` Negate a command or set its defaults
- `subjectAltName` Configure subjectAltName value
- `trustpoint` Trustpoint for CMP
- `use` Set setting to use
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
ap6522-D8273A(config-cmp-policy-CMP)#
```
This chapter is organized as follows:

- `crypto-cmp-policy-instance`
- `other-cmp-related-commands`
### 29.1 crypto-cmp-policy-instance

The following table summarizes crypto CMP policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>ca-server</td>
<td>Configures the CA server details</td>
<td>page 29-4</td>
</tr>
<tr>
<td>cert-renewal-timeout</td>
<td>Configures a certificate renewal timeout in days</td>
<td>page 29-5</td>
</tr>
<tr>
<td>cert-update</td>
<td>Enables/disables certificate renewal on a device whose certificate is about to expire</td>
<td>page 29-6</td>
</tr>
<tr>
<td>subjectAltName</td>
<td>Configures an alternate subject name for this CMP policy</td>
<td>page 29-7</td>
</tr>
<tr>
<td>trustpoint</td>
<td>Configures a trustpoint and its associated information, such as the subject name, the sender’s (device requesting certification) details, and the recipient’s (CA) details</td>
<td>page 29-8</td>
</tr>
<tr>
<td>use</td>
<td>Associates a device’s autogen-uniqueid with this crypto CMP policy</td>
<td>page 29-10</td>
</tr>
<tr>
<td>no</td>
<td>Removes the crypto CMP policy settings</td>
<td>page 29-11</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, **COMMON COMMANDS**.
29.1.1 ca-server

Configures the primary and secondary CA server details.

A CA is a network authority that generates and issues digital certificates in response to requests received from network devices.

The CA is an external, trusted third-party server. Use this command to configure the primary and secondary CA server details, such as name of the device hosting the CA server, the port used to access the CA server, and the path where the certificate is stored. Once defined, devices using this CMP policy automatically send requests to the specified primary CA server, and retrieve the certificate from the specified location. If the primary CA server is not reachable, the requests are sent to the secondary CA server.

Supported in the following platforms:
- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
ca-server [primary|secondary] host <IP/HOSTNAME> port <PORT-NUMBER> path <PATH>

Parameters
- ca-server [primary|secondary] host <IP/HOSTNAME> port <PORT-NUMBER> path <PATH>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ca-server</td>
<td>Configures the primary and secondary CA server details (IP address, port, and path)</td>
</tr>
<tr>
<td>[primary</td>
<td>secondary]</td>
</tr>
<tr>
<td></td>
<td>• secondary – Configures the secondary CA server’s details</td>
</tr>
<tr>
<td>host &lt;IP/HOSTNAME&gt;</td>
<td>Configures IP address or hostname of the device hosting the primary/secondary CA server</td>
</tr>
<tr>
<td></td>
<td>• &lt;IP/HOSTNAME&gt; – Specify the IP address or hostname.</td>
</tr>
<tr>
<td>port &lt;PORT-NUMBER&gt;</td>
<td>Configures the port on which the primary/secondary CA server can be reached</td>
</tr>
<tr>
<td></td>
<td>• &lt;PORT-NUMBER&gt; – Specify the port number.</td>
</tr>
<tr>
<td>path &lt;PATH&gt;</td>
<td>Configures the path or filename of the primary/secondary CA certificate.</td>
</tr>
<tr>
<td></td>
<td>• &lt;PATH&gt; – Specify the path. Once specified, the certificate is downloaded from this location and installed on the device.</td>
</tr>
</tbody>
</table>

Examples
ap6522-D8273A(config-cmp-policy-CMP)#ca-server primary host 192.168.8.74 port 8 path cmp
ap6522-D8273A(config-cmp-policy-CMP)#show context crypto-cmp-policy CMP
crypto-cmp-policy CMP
ca-server primary host 192.168.8.74 port 80 path cmp
ap6522-D8273A(config-cmp-policy-CMP)#

Related Commands
no

Removes the configured primary/secondary CA server details
29.1.2 cert-renewal-timeout

`crypto-cmp-policy-instance`

Configures a certificate renewal timeout in days. This is the number of days, before the expiration of the device's certificate, that a certificate renewal is triggered.

The expiration of device's certificate is checked once a day. When a certificate is about to expire a certificate renewal is initiated with the dedicated CMP CA server resource through an existing IPSec tunnel. If the tunnel is not established, the CMP renewal request is not sent. If a renewal succeeds the newly obtained certificate overwrites an existing certificate. If the renewal fails, an error is logged.

Supported in the following platforms:
- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

`cert-renewal-timeout <DAYS>`

Parameters

- `cert-renewal-timeout <DAYS>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cert-renewal-timeout &lt;DAYS&gt;</code></td>
<td>Configures the certificate renewal timeout in days. This is the number of days, before the expiration of the device's certificate, that a certificate renewal is triggered. Once the configured time is completed, the device triggers a certificate renewal request.</td>
</tr>
<tr>
<td>- <code>&lt;DAYS&gt;</code></td>
<td>Specify a value from 1 - 60 days. The default is fourteen (14) days. Therefore, by default a device triggers certificate renewal request 14 days before its certificate expires.</td>
</tr>
</tbody>
</table>

Examples

```
ap6522-D8273A(config-cmp-policy-CMP)#cert-renewal-timeout 60
```

```
ap6522-D8273A(config-cmp-policy-CMP)#show context crypto-cmp-policy_CMP
    cert-renewal-timeout 60
    ca-server primary host 192.168.8.74 port 8 path cmp
```  
ap6522-D8273A(config-cmp-policy-CMP)#

Related Commands

```
no
```

Reverts the certificate renewal timeout to default (14 days)
29.1.3 *cert-update*

Enables/disables certificate renewal on a device whose certificate is about to expire. This option is enabled by default. Supported in the following platforms:

- **Access Points** — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, WiMod
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**
cert-update

**Parameters**
None

**Examples**
ap6522-D8273A(config-cmp-policy-CMP)#cert-update

ap6522-D8273A(config-cmp-policy-CMP)#show context crypto-cmp-policy CMP
cert-update ca-server primary host 192.168.8.74 port 8 path cmp
cert-renewal-timeout 60
ap6522-D8273A(config-cmp-policy-CMP)#

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>no</em></td>
<td>Disables certificate renewal</td>
</tr>
</tbody>
</table>
29.1.4 subjectAltName

**crypto-cmp-policy-instance**

Configures the subjectAltName identity for this CMP policy

Supported in the following platforms:

- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
subjectAltName [address <IP>|dn <DISTINGUISHED-NAME>|email <EMAIL-ID>|fqdn <FQDN>|string <USER-DEFINED-STRING>]
```

**Parameters**

- `subjectAltName [address <IP>|dn <DISTINGUISHED-NAME>|email <EMAIL-ID>|fqdn <FQDN>|string <USER-DEFINED-STRING>]`

**Examples**

```
ap6522-D8273A(config-cmp-policy-CMP)#subjectAltName dn TechPubsCA
```

```
ap6522-D8273A(config-cmp-policy-CMP)#show context crypto-cmp-policy CMP
cert-update
cert-renewal-timeout 60
cacserver primary host 192.168.8.74 port 8 path cmp
subjectAltName dn TechPubsCA
```

**Related Commands**

- `no`
  
  Removes the subjectAltName identity configured with this CMP policy
29.1.5 trustpoint

- **crypto-cmp-policy-instance**

Configures a trustpoint and its associated information, such as the subject name, the sender’s (device requesting certification) details, and the recipient’s (CA) details. This information is needed to obtain the certificate from the CA server using CMP.

Each certificate is digitally signed by a trustpoint and contains device-specific information, such as device name, IP address, serial number. It helps to uniquely identify a device.

Supported in the following platforms:
- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
trustpoint <TRUSTPOINT-NAME> subject-name <WORD> secret [0 <WORD>|2 <WORD>] reference-id <WORD> sender-name <WORD> [recipient-name <WORD>|ca-psk <CERT-PATH>]
```

**Parameters**

- **trustpoint <TRUSTPOINT-NAME>**
  - Configures a trustpoint name (should not exceed 32 characters)
    - `<TRUSTPOINT-NAME>` – Specify the trustpoint's name.

- **subject-name <WORD>**
  - Configures a subject name for this trustpoint. The subject name should uniquely identify the certificate and should not exceed 512 characters in length.

- **secret [0 <WORD>|2 <WORD>]**
  - Configures the secret used to encrypt the trustpoint. The secret should not exceed 128 characters in length.
    - 0 <WORD> – Configures a clear text password
    - 2 <WORD> – Configures an encrypted password

- **reference-id <WORD>**
  - Configures the reference ID. The CA server uses this information to identify the shared secret key used.
    - `<WORD>` – Specify the reference ID.

- **sender-name <WORD>**
  - Configures the sender’s name. The CA server uses this information to identify the shared secret key used. The sender’s name should not exceed 512 characters in length.
    - `<WORD>` – Specify the sender name.

- **recipient-name**
  - Configures the recipient’s name. The CA server uses this information to validate the request. The recipient’s name should not exceed 256 characters in length.

- **ca-psk <CERT-PATH>**
  - Configures the certificate path for the server certificate
    - `<CERT-PATH>` – Specify the certificate path.

**29.1.6 use**

`crypto-cmp-policy-instance`

Associates a device’s autogen-uniqueid with this crypto CMP policy

A device’s autogen-uniqueid is a combination of a user-defined string (prefix or suffix) and a substitution token. The WiNG software implementation provides two built-in substitution tokens: `$SN` and `$MiNT-ID` that represent the device’s serial number and MiNT ID respectively. These substitution tokens are internally retrieved and combined with the user-defined string to auto generate a unique identity for a device.

To auto generate the device’s unique ID, in the device configuration mode execute the following command:

```
autogen-uniqueid <WORD>
```

For more information on the autogen-uniqueid command, see `autogen-uniqueid`.

Supported in the following platforms:

- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
use autogen-uniqueid
```

**Parameters**

- `use autogen-uniqueid`

**Examples**

```
ap6522-D8273A(config-cmp-policy-CMP)#use autogen-uniqueid

ap6522-D8273A(config-cmp-policy-CMP)#show context crypto-cmp-policy CMP

### 29.2 other-cmp-related-commands

*CRYPTO-CMP-POLICY*

The following table summarizes other commands associated with the implementation of the crypto CMP policy:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>use</td>
<td>Associates a crypto CMP policy with a device</td>
<td>page 29-13</td>
</tr>
<tr>
<td>show</td>
<td>Displays current status of CMP requests in progress. This command also displays trustpoint details (CMP and non-CMP trustpoints).</td>
<td>page 29-14</td>
</tr>
</tbody>
</table>
29.2.1 use

other-cmp-related-commands

Applies a crypto CMP policy to a device. Once CMP enabled, the device automatically requests for a certificate from the CA server and installs it. After applying the CMP policy, commit and write the change to memory. This is needed to apply this configuration across reboots.

To apply a CMP policy on a device, navigate to the device’s config-device mode and execute the `use > crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>` command.

Supported in the following platforms:
- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

use crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>

Parameters

- use crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>

Examples

ap6522-D8273A(config-device-00-11-3F-D8-27-3A)#use crypto-cmp-policy CMP
ap6522-D8273A(config-device-00-11-3F-D8-27-3A)#commit
29.2.2 show

▶ other-cmp-related-commands

Displays current status of CMP requests in progress. This command also displays trustpoint details (CMP and non-CMP trustpoints).

Supported in the following platforms:
- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show crypto [cmp|pki]

show crypto cmp request status
show crypto pki trustpoints

Parameters
- show crypto cmp request status

<table>
<thead>
<tr>
<th>show crypto cmp request</th>
<th>Displays the current status of all on-going CMP requests</th>
</tr>
</thead>
</table>

- show crypto pki trustpoints

<table>
<thead>
<tr>
<th>show pki trustpoints</th>
<th>Displays all trustpoints including CMP generated trustpoints</th>
</tr>
</thead>
</table>

Examples

ap6522-D8273A#show crypto pki trustpoints

<table>
<thead>
<tr>
<th>TRUSTPOINT</th>
<th>KEY NAME</th>
<th>VALID UNTIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmp-test</td>

CMP Request Status: cmp-complete

ap6522-D8273A#
This chapter summarizes the Roaming Assist policy commands in the CLI command structure.

By constantly monitoring a client’s packets and the received signal strength indicator (RSSI) of a given client by a group of access points, decision can be made on the optimal access point to which the client needs to roam. Then forcefully direct the client to the optimal access point.

The threshold intervals are configurable and can be adjusted based on the client load.

Use the (config) instance to configure a Roaming Assist policy. To navigate to the Roaming Assist policy configuration instance, use the following commands:

```
<DEVICE> (config) roaming-assist-policy <ROAMING-ASSIST-POLICY-NAME>
rfs6000-81742D(config)roaming-assist-policy test
nx9500-6C8809(config)roaming-assist-policy test
```

```
nx9500-6C8809(config-roaming-assist-policy-test)#?
Roaming Assist Mode commands:
  action                Configure action - action is deauth / log / assisted-roam
  aggressiveness        Configure the roaming aggressiveness for a wireless client
  detection-threshold  Configure the detection threshold - when exceeded, client monitoring starts
  handoff-count        Configure the handoff count - number of times client can exceed handoff threshold
  handoff-threshold    Configure the handoff threshold - when exceeds an action is taken.
  monitoring-interval  Configure the monitoring interval - interval at which client monitoring occurs
  no                   Negate a command or set its defaults
  sampling-interval    Configure the sampling interval - interval at which client rssi values are checked
  clrscr               Clears the display screen
  commit               Commit all changes made in this session
  end                  End current mode and change to EXEC mode
  exit                 End current mode and down to previous mode
  help                 Description of the interactive help system
  revert               Revert changes
  service              Service Commands
  show                 Show running system information
  write                Write running configuration to memory or terminal
```

```
nx9500-6C8809(config-roaming-assist-policy-test)#
```
30.1 roaming-assist-policy-instance

The following table summarizes roaming assist policy configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>

<td>page 30-10</td>
</tr>
</tbody>
</table>

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
30.1.1 action

Specifies the action invoked on the client once it reaches a specified threshold value. The threshold values are configured based on the client load.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

action [assisted-roam|deauth|log]

Parameters

- action [assisted-roam|deauth|log]

| action [assisted-roam|deauth|log] | Configures the action invoked on the client once it reaches the specified threshold value. The options are:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>assisted-roam</td>
<td>Provides 802.11v assisted roaming facility to the client</td>
</tr>
<tr>
<td>deauth</td>
<td>De-authenticates the client</td>
</tr>
<tr>
<td>log</td>
<td>Generates a log</td>
</tr>
</tbody>
</table>

In all three cases an event is generated. However, the message generated differs and is based on the action specified.

Examples

rfs6000-81742D(config-roaming-assist-policy-test)#action log
rfs6000-81742D(config-roaming-assist-policy-test)#

Related Commands

no Remoes the configured action details
### 30.1.2 aggressiveness

Configures a roaming aggressiveness value for wireless clients. Configuring this value increases the client's roaming capabilities in scenarios where the client's location is likely to change drastically and suddenly. For example, when a client hops on to a train that speeds up quickly. In such a scenario, the access point receives a maximum of 2 (two) messages, from the client, having relatively low RSSI value. This results in a decaying-average, which is above the specified handover-threshold value. Consequently, the client is unable to roam.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```plaintext
aggressiveness [highest|lowest|medium|medium-high|medium-low]
```

**Parameters**

- `aggressiveness [highest|lowest|medium|medium-high|medium-low]`

  Configures a roaming aggressiveness value for wireless clients. The options are:
  - `highest` — De-authenticates client in case of any degradation in the client's link quality. When selected, the access point considers only the RSSI value of the last message received from the client.
  - `lowest` — De-authenticates client only in case of significant degradation in the client's link quality. When selected, the access point uses a weighted average [80% of decaying average + 20% of last seen RSSI] as the final reported RSSI value. This is the default setting.
  - `medium` — This is an intermediate setting between not roaming and performance
  - `medium-high` — Allows roaming even if performance goes down. When selected, the access point calculates the client's signal strength based on average received signal as well as last received signal level, weighted towards the last received value.
  - `medium-low` — Allows roaming even if performance goes average. When selected, the access point calculates the client's signal strength based on average received signal as well as last received signal level, weighted towards the average value.

**Examples**

```plaintext
nx9500-6C8809(config-roaming-assist-policy-test)#aggressiveness medium

nx9500-6C8809(config-roaming-assist-policy-test)#show context roaming-assist-policy test
  aggressiveness medium

nx9500-6C8809(config-roaming-assist-policy-test)#
```

**Related Commands**

- `no` Reverts the aggressiveness value to default (lowest)
### 30.1.3 detection-threshold

**roaming-assist-policy-instance**

Specifies the detection-threshold determining when a client is monitored.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

detection-threshold <-100--40>

**Parameters**

- detection-threshold <-100--40>

<table>
<thead>
<tr>
<th>detection-threshold &lt;-100--40&gt;</th>
<th>Configures the detection threshold value determining when a client is monitored. The clients with bad RSSI values are monitored more frequently.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;-100--40&gt; – Specify the RSSI value from -100 dBm - -40 dBm</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs6000-81742D(config-roaming-assist-policy-test)#detection-threshold -90
rfs6000-81742D(config-roaming-assist-policy-test)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>no</th>
<th>Removes the configured detection threshold details</th>
</tr>
</thead>
</table>
30.1.4 handoff-count

roaming-assist-policy-instance

Specifies the number of times a client can exceed the specified handoff-threshold value before an action is invoked.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
handoff-count <1-10>

Parameters
- handoff-count <1-10>

<table>
<thead>
<tr>
<th>handoff-count &lt;1-10&gt;</th>
<th>Specifies the number of times a client can exceed the specified handoff-threshold value before an action is invoked</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;1-10&gt; – Specify a value from 1 - 10. If the client’s RSSI increases beyond the set handoff-threshold, it is removed from the queue for monitoring and action invocation.</td>
</tr>
</tbody>
</table>

Examples
rfs6000-81742D(config-roaming-assist-policy-test)#handoff-count 1
rfs6000-81742D(config-roaming-assist-policy-test)#

Related Commands
- no
  Removes the configured handoff-count details
30.1.5 handoff-threshold

Configures the handoff-threshold, which specifies client status for handoff-action. Once exceeded an action is invoked.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
handoff-threshold <-100--40>

Parameters

- handoff-threshold <-100--40>

<table>
<thead>
<tr>
<th>handoff-threshold &lt;-100--40&gt;</th>
<th>Configures the handoff-threshold, which specifies client status for handoff-action. Once exceeded an action is invoked.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;-100--40&gt; — Specify the RSSI value from -100 dBm - -40 dBm. If the client’s RSSI increases beyond the set handoff-threshold, it is removed from the queue for monitoring and action invocation.</td>
</tr>
</tbody>
</table>

Examples

rfs6000-81742D(config-roaming-assist-policy-test)#handoff-threshold -78
rfs6000-81742D(config-roaming-assist-policy-test)#

Related Commands

*no* Removes the configured handoff-threshold details
30.1.6 monitoring-interval

Configures the interval, in seconds, at which clients are monitored to determine if their RSSI value is below the specified handoff-threshold value.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
monitoring-interval <1-60>
```

Parameters

- `monitoring-interval <1-60>`

<table>
<thead>
<tr>
<th>monitoring interval &lt;1-60&gt;</th>
<th>Specifies the interval, in seconds, at which clients are monitored to determine if their RSSI is below the specified handoff-threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-60&gt;</td>
<td>&lt;1-60&gt; – Specify the duration from 1 - 60 seconds. The default is 5 seconds.</td>
</tr>
</tbody>
</table>

Examples

```
rfs6000-81742D(config-roaming-assist-policy-test)#monitoring-interval 10
rfs6000-81742D(config-roaming-assist-policy-test)#
```

Related Commands

- `no` Removes the configured monitoring interval details
30.1.7 **sampling-interval**

*roaming-assist-policy-instance*

Configures the interval, in seconds, at which clients are sampled to determine their RSSI value.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
sampling-interval <5-60>
```

**Parameters**

- `sampling-interval <5-60>`

**Examples**

```
rfs6000-81742D(config-roaming-assist-policy-test)#sampling-interval 20
rfs6000-81742D(config-roaming-assist-policy-test)#
```

**Related Commands**

- `no` Removes the configured sampling interval details
30.1.8 no

roaming-assist-policy-instance

Removes or reverts this roaming assist policy settings based on the parameters passed

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [action|aggressiveness|detection-threshold|handoff-count |handoff-threshold|monitoring-interval|sampling-interval]

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes or reverts this roaming assist policy settings to default based on the parameters passed |

Examples

rfs6000-81742D(config-roaming-assist-policy-test)#no action

rfs6000-81742D(config-roaming-assist-policy-test)#no detection-threshold

rfs6000-81742D(config-roaming-assist-policy-test)#no handoff-threshold

rfs6000-81742D(config-roaming-assist-policy-test)#show context roaming-assist-policy test
  sampling-interval 20
  monitoring-interval 10
rfs6000-81742D(config-roaming-assist-policy-test)#
APPENDIX A
CONTROLLER MANAGED WLAN USE CASE

This section describes the activities required to configure a WLAN. Instructions are provided using the wireless controller CLI.

- Creating a First Controller Managed WLAN
- Assumptions
- Design
- Using the Command Line Interface to Configure the WLAN
A.1 Creating a First Controller Managed WLAN

CONTROLLER MANAGED WLAN USE CASE

This section describes the process of creating managed WLAN on an RFS4000 wireless controller. Upon completion, you will have created a WLAN on a RFS4000 model wireless controller using a DHCP server to allocate IP addresses to associated wireless clients.

A.1.1 Assumptions

Verify the following conditions have been satisfied before attempting the WLAN configuration activities described in this section:

- It is assumed the RFS4000 wireless controller has the latest firmware version available.
- It is assumed the AP650 and AP71XX access points also have the latest firmware version available.
- It is assumed there are no previous configurations on the wireless controller or access point and default factory configurations are running on the devices.
- It is assumed you have administrative access to the wireless controller and access point CLI.
- It is assumed the individual administrating the network is a professional network installer.

A.1.2 Design

This section defines the network design being implemented.

![Network Design Diagram](image)

This is a simple deployment scenario, with the access points connected directly to the wireless controller. One wireless controller port is connected to an external network.

On the RFS4000 wireless controller, the GE1 interface is connected to an external network. Interfaces GE3 and GE4 are used by the access points.

On the external network, the wireless controller is assigned an IP address of 192.168.10.188. The wireless controller acts as a DHCP server for the wireless clients connecting to it, and assigns IP addresses in the range of 172.16.11.11 to 172.16.11.200. The rest of IPs in the range are reserved for devices requiring static IP addresses.
A.1.3 Using the Command Line Interface to Configure the WLAN

Creating a First Controller Managed WLAN

These instructions are for configuring your first WLAN using the wireless controller CLI.

Use a serial console cable when connecting to the wireless controller for the first time. Set the following configuration when using the serial connection:

- **Bits per second:** 19200
- **Data Bit:** 8
- **Parity:** None
- **Stop Bit:** 1
- **Flow Control:** None

The steps involved in creating a WLAN on a wireless controller are:

1. **Logging Into the Controller for the First Time**
2. **Creating a RF Domain**
3. **Creating a Wireless Controller Profile**
4. **Creating an AP Profile**
5. **Creating a DHCP Server Policy**
6. **Completing and Testing the Configuration**

A.1.3.1 Logging Into the Controller for the First Time

When powering on the wireless controller for the first time, you are prompted to replace the existing administrative password. The credentials for logging into the wireless controller for the first time are:

- **User Name:** admin
- **Password:** admin123

Ensure the new password created is strong enough to provide adequate security for the wireless controller managed network.

A.1.3.2 Creating a RF Domain

A RF Domain is a collection of configuration settings specific to devices located at the same physical deployment, such as a building or a floor. Create a RF Domain and assign the country code where the devices are deployed. This is a mandatory step, and the devices will not function as intended if this step is omitted.

The instructions in this section must be performed from the Global Configuration mode of the wireless controller. To navigate to this mode:

```
rfs4000>enable
rfs4000#
rfs4000#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs4000(config)#
```
Create the RF Domain using the following commands:

```
rfs4000(config)#rf-domain RFDOMAIN_UseCase1
rfs4000(config-rf-domain-RFDOMAIN_UseCase1)#
```
This command creates a profile with the name `RFDOMAIN_UseCase1`.

Set the country code for the RF Domain.

```
rfs4000(config-rf-domain-RFDOMAIN_UseCase1)#country-code us
```
This sets the country code for this RF Domain. Save this change and exit the RF Domain profile context.

```
rfs4000(config-rf-domain-RFDOMAIN_UseCase1)#commit write
rfs4000(config-rf-domain-RFDOMAIN_UseCase1)#exit
rfs4000(config)#
```
To define the wireless controller's physical location, use the same RF Domain configuration.

```
rfs4000(config)#self
rfs4000(config-device-03-14-28-57-14-28)#
rfs4000(config-device-03-14-28-57-14-28)#use rf-domain RFDOMAIN_UseCase1
```
Commit the changes and write to the running configuration. Exit this context.

```
rfs4000(config-device-03-14-28-57-14-28)#commit write
rfs4000(config-device-03-14-28-57-14-28)#exit
rfs4000(config)#
```

### A.1.3.3 Creating a Wireless Controller Profile

#### Using the Command Line Interface to Configure the WLAN

The first step in creating a WLAN is to configure a profile defining the parameters applied to a wireless controller.

To create a profile:

```
rfs4000(config)#profile rfs4000 RFS4000_UseCase1
rfs4000(config-profile-RFS4000_UseCase1)#
```
This creates a profile with the name `RFS4000_UseCase1` and moves the cursor into its context. Any configuration made under this profile is available when it is applied to a device.

#### Configure a VLAN

Create the VLAN to use with the WLAN configuration. This can be done using the following commands:

```
rfs4000(config-profile-RFS4000_UseCase1)#interface vlan 2
rfs4000(config-profile-RFS4000_UseCase1-if-vlan2)#ip address 172.16.11.1/24
```
The above command assigns the IP address 172.16.11.1 with the mask of 255.255.255.0 to VLAN 2. Exit the VLAN 2 context.

```
rfs4000(config-profile-RFS4000_UseCase1-if-vlan2)#exit
rfs4000(config-profile-RFS4000_UseCase1)#
```
The next step is to assign this newly created VLAN to a physical interface. In this case, VLAN 2 is mapped to GE3 and GE4 to support two access points, an AP650 and an AP71XX. The AP650 is connected to the gigabit interface GE3 and the AP71XX to the GE4 interface.

```
rfs4000(config-profile-RFS4000_UseCase1)#interface ge 3
rfs4000(config-profile-RFS4000_UseCase1-if-ge3)#
```
Map VLAN 2 to this interface. This assigns the IP address to the selected physical interface.

```
rfs4000(config-profile-RFS4000_UseCase1-if-ge3)#switchport access vlan 2
rfs4000(config-profile-RFS4000_UseCase1-if-ge3)#exit
rfs4000(config-profile-RFS4000_UseCase1)#
```
Similarly, map the defined VLAN 2 to the GE4 interface.

```
rfs4000(config-profile-RFS4000_UseCase1)#interface ge 4
rfs4000(config-profile-RFS4000_UseCase1-if-ge4)#switchport access vlan 2
rfs4000(config-profile-RFS4000_UseCase1-if-ge4)#exit
rfs4000(config-profile-RFS4000_UseCase1)#
```
Exit the profile and save it.

```
rfs4000(config-profile-RFS4000_UseCase1)#exit
rfs4000(config)#commit write
```

**Configure the Wireless Controller to use the Profile**

Before the wireless controller can be further configured, the profile must be applied to the wireless controller.

```
rfs4000(config)#self
rfs4000(config-device-03-14-28-57-14-28)#
rfs4000(config-device-03-14-28-57-14-28)#use profile RFS4000_UseCase1
rfs4000(config-device-03-14-28-57-14-28)#exit
rfs4000(config)#commit write
```

**Create a WLAN**

Use the following commands to create a WLAN:

```
rfs4000(config)#wlan 1
rfs4000(config-wlan-1)#
```

Configure the SSID for the WLAN. This is the value that identifies and helps differentiate this WLAN.

```
rfs4000(config-wlan-1)#ssid WLAN_USECASE_01
```

Enable the SSID to be broadcast so wireless clients can find it and associate.

```
rfs4000(config-wlan-1)#broadcast-ssid
```

Associate VLAN 2 to the WLAN and exit.

```
rfs4000(config-wlan-1)#vlan 2
rfs4000(config-wlan-1)#exit
```

**Commit the Changes**

Once these changes have been made, they have to be committed before proceeding.

```
rfs4000(config)#commit write
```

## A.1.3.4 Creating an AP Profile

### Using the Command Line Interface to Configure the WLAN

An AP profile provides a method of applying common settings to access points of the same model. The profile significantly reduces the time required to configure access points within a large deployment. For more information, see:

- Creating an AP650 Profile
- Creating an AP71XX Profile

### A.1.3.4.1 Creating an AP650 Profile

**Creating an AP Profile**

An AP650's firmware is updated directly by its associated wireless controller. The process is automatic, and no intervention is required. To create a profile for use with an AP650:

```
rfs4000(config)#profile ap650 AP650_UseCase1
rfs4000(config-profile-AP650_UseCase1)#
```

Assign the access point to be a member of the same VLAN defined in Creating an AP Profile on page A-5. In this section, the VLAN was defined as VLAN 2. Configure the access point to be a member of VLAN 2.

```
rfs4000(config-profile-AP650_UseCase1)#interface vlan 2
rfs4000(config-profile-AP650_UseCase1-if-vlan2)#
```

Configure this VLAN to use DHCP, so any device that is associated using this access point is automatically assigned a unique IP address. Once completed, exit this context.

```
rfs4000(config-profile-AP650_UseCase1-if-vlan2)#ip address dhcp
rfs4000(config-profile-AP650_UseCase1-if-vlan2)#exit
```
The VLAN has to be mapped to a physical interface on the access point. Since the only available physical interface on the AP650 is GE1, this VLAN is mapped to it.

```
rfs4000(config-profile-AP650_UseCase1)#interface ge 1
rfs4000(config-profile-AP650_UseCase1-if-ge1)#switchport access vlan 2
rfs4000(config-profile-AP650_UseCase1-if-ge1)#exit
```

Before a WLAN can be implemented, it has to be mapped to a radio on the access point. An AP650 has 2 radios, in this scenario, both radios are utilized.

```
rfs4000(config-profile-AP650_UseCase1)#interface radio 1
rfs4000(config-profile-AP650_UseCase1-if-radio1)#wlan 1
rfs4000(config-profile-AP650_UseCase1-if-radio1)#exit
rfs4000(config-profile-AP650_UseCase1)#interface radio 2
rfs4000(config-profile-AP650_UseCase1-if-radio2)#wlan 1
rfs4000(config-profile-AP650_UseCase1-if-radio2)#exit
rfs4000(config-profile-AP650_UseCase1)#
```

Commit the changes made to this profile and exit.

```
rfs4000(config-profile-AP650_UseCase1)#commit write
rfs4000(config-profile-AP650_UseCase1)#exit
```

Apply this Profile to the Discovered AP650

Access the discovered access point using the following command. The discovered device's MAC address is used to access its context.

```
rfs4000(config)#ap650 00-A0-F8-00-00-01
rfs4000(config-device-00-A0-F8-00-00-01)#
```

Assign the AP profile to this AP650 access point.

```
rfs4000(config-device-00-A0-F8-00-00-01)#use profile AP650_UseCase1
rfs4000(config-device-00-A0-F8-00-00-01)#commit write
```

Apply the RF Domain profile to the AP

Apply the previously created RF Domain to enable a country code to be assigned to the discovered access point. A discovered access point only works properly if its country code is the country code of its associated wireless controller.

```
rfs4000(config-device-00-A0-F8-00-00-01)#use rf-domain RFDOMAIN_UseCase1
rfs4000(config-device-00-A0-F8-00-00-01)#commit write
```

A.1.3.4.2 Creating an AP71XX Profile

Creating an AP Profile

To create a profile for use with an AP71XX:

```
rfs4000(config)#profile ap7131 AP7131_UseCase1
rfs4000(config-profile-AP7131_UseCase1)#
```

Set the access point to be a member of the same VLAN defined in Creating an AP Profile on page A-5. In this section, the VLAN was defined as VLAN 2. Configure the access point to be a member of the VLAN 2.

```
rfs4000(config-profile-AP7131_UseCase1)#interface vlan 2
rfs4000(config-profile-AP7131_UseCase1-if-vlan2)#
```

Configure this VLAN to use DHCP, so any device associated using this access point is automatically assigned a unique IP address. Once completed, exit this context.

```
rfs4000(config-profile-AP7131_UseCase1-if-vlan2)#ip address dhcp
rfs4000(config-profile-AP7131_UseCase1-if-vlan2)#exit
```
The configured VLAN has to be mapped to a physical interface on the access point. Map VLAN 2 to the GE1 and GE2 interfaces on the AP71XX. To configure the GE1 interface:

```
rfs4000(config-profile-AP7131_UseCase1)#interface ge 1
rfs4000(config-profile-AP7131_UseCase1-if-ge1)#switchport access vlan 2
rfs4000(config-profile-AP7131_UseCase1-if-ge1)#exit
```

Similarly configure the GE2 interface.

```
rfs4000(config-profile-AP7131_UseCase1)#interface ge 2
rfs4000(config-profile-AP7131_UseCase1-if-ge2)#switchport access vlan 2
rfs4000(config-profile-AP7131_UseCase1-if-ge2)#exit
```

Before the WLAN can be implemented, it has to be mapped to the physical radio on the access point. An AP71XX has 3 radios (on certain models), two of which can be configured for WLAN support. In this scenario, two radios are used.

```
rfs4000(config-profile-AP7131_UseCase1)#interface radio 1
rfs4000(config-profile-AP7131_UseCase1-if-radio1)#wlan 1
rfs4000(config-profile-AP7131_UseCase1-if-radio1)#exit
rfs4000(config-profile-AP7131_UseCase1)#interface radio 2
rfs4000(config-profile-AP7131_UseCase1-if-radio2)#wlan 1
rfs4000(config-profile-AP7131_UseCase1-if-radio2)#exit
rfs4000(config-profile-AP7131_UseCase1)#
```

Commit the changes made to the profile and exit this context.

```
rfs4000(config-profile-AP7131_UseCase1)#commit write
rfs4000(config-profile-AP7131_UseCase1)#exit
rfs4000(config)#
```

**Apply this Profile to the Discovered AP71XX**

Access the discovered access point using the following command. The discovered device’s MAC address is used to access its context.

```
rfs4000(config)#ap7131 00-23-68-16-C6-C4
```

Assign the AP profile to this access point.

```
rfs4000(config-device-00-23-68-16-C6-C4)#use profile AP7131_UseCase1
rfs4000(config-device-00-23-68-16-C6-C4)#commit write
```

**Apply the RF Domain profile to the AP**

Apply the previously created RF Domain to enable a country code to be assigned to the discovered access point. A discovered access point only works properly if its country code is the same as its associated wireless controller.

```
rfs4000(config-device-00-23-68-16-C6-C4)#use rf-domain RFDOMAIN_UseCase1
rfs4000(config-device-00-23-68-16-C6-C4)#commit write
rfs4000(config-device-00-23-68-16-C6-C4)#exit
```

**A.1.3.5 Creating a DHCP Server Policy**

*Using the Command Line Interface to Configure the WLAN*

The DHCP server policy defines the parameters required to run a DHCP server on the wireless controller and assign IP addresses automatically to devices that associate. Configuring DHCP enables the reuse of a limited set of IP addresses.

To create a DHCP server policy:

```
rfs4000-37FABE(config)#dhcp-server-policy DHCP_POLICY_UseCase1
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1)#
```
The following table displays how IP addresses are used.

<table>
<thead>
<tr>
<th>IP Range</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>172.16.11.1 till 172.16.11.10</td>
<td>Reserved for devices that require a static IP address</td>
</tr>
<tr>
<td>172.16.11.11 till 172.16.11.200</td>
<td>Range of IP addresses that can be assigned using the DHCP server.</td>
</tr>
<tr>
<td>172.16.11.201 till 172.16.11.254</td>
<td>Reserved for devices that require a static IP address</td>
</tr>
</tbody>
</table>

In the table, the IP address range of 172.16.11.11 to 172.16.11.200 is available using the DHCP server. To configure the DHCP server:

```bash
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1)#dhcp-pool DHCP_POOL_USECASE1_01
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-DHCP_POOL_USECASE1_01)#
```

Configure the address range as follows:

```bash
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-DHCP_POOL_USECASE1_01)#address range 172.16.11.11 172.16.11.200
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-DHCP_POOL_USECASE1_01)#
```

Configure the IP pool used with a network segment. This starts the DHCP server on the specified interface.

```bash
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-DHCP_POOL_USECASE1_01)#network 172.16.11.0/24
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-DHCP_POOL_USECASE1_01)#exit
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1)#exit
rfs4000-37FABE(config)#commit write
```

Configure the RFS4000 to use the DHCP Policy

For the DHCP to work properly, the new DHCP Server Policy must be applied to the wireless controller. To apply the DHCP Server Policy to the wireless controller:

```bash
rfs4000-37FABE(config)#self
rfs4000-37FABE(config-device-03-14-28-57-14-28)#use dhcp-server-policy DHCP_POLICY_UseCase1
rfs4000-37FABE(config-device-03-14-28-57-14-28)#commit write
rfs4000-37FABE(config-device-03-14-28-57-14-28)#exit
rfs4000-37FABE(config)#
```

### A.1.3.6 Completing and Testing the Configuration

**Using the Command Line Interface to Configure the WLAN**

A wireless client must be configured to associate with the wireless controller managed WLAN. The following information must be defined:

- **SSID**: WLAN_USECASE_01
- **Country**: Same as the country configured in *Creating a RF Domain on page A-3*. In this scenario, the country code is set to US.
- **Mode**: Infrastructure

With the WLAN set to beacon, use the wireless client's discovery client to discover the configured WLAN and associate.
APPENDIX B
PUBLICLY AVAILABLE SOFTWARE

B.1 General Information

This document contains information regarding licenses, acknowledgments and required copyright notices for open source packages used in the following products:

Access Points
- AP8232, AP8222, AP8163, AP8132, AP8122, AP7181, AP7161, AP7131, AP7502, AP7522, AP7532, AP6562, AP6532, AP6522, AP6521, AP6511, AP650, AP622, AP621

Wireless Switches

B.3 OSS Licenses

B.3.1 Apache License, Version 2.0

Apache License
Version 2.0, January 2004
http://www.apache.org/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

“License” shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

“Licensor” shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

“Legal Entity” shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, “control” means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

“You” (or “Your”) shall mean an individual or Legal Entity exercising permissions granted by this License.

“Source” form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

“Object” form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

“Work” shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

“Derivative Works” shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

“Contribution” shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, “submitted” means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as “Not a Contribution.”

“Contributor” shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination
of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
   a. You must give any other recipients of the Work or Derivative Works a copy of this License; and
   b. You must cause any modified files to carry prominent notices stating that You changed the files; and
   c. You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
   d. If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement You may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor
harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

B.3.2 The BSD License

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, and the entire permission notice in its entirety, including the disclaimer of warranties.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. The name of the author may not be used to endorse or promote products derived from this software without specific prior written permission.
4. Neither the name of the University nor the names of its contributors may be used to endorse or promote products derived from this software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE REGENTS AND CONTRIBUTORS "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ALL OF WHICH ARE HEREBY DISCLAIMED. IN NO EVENT SHALL THE AUTHOR BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF NOT ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

B.3.3 Creative Commons Attribution-ShareAlike License, version 3.0

Creative Commons Attribution-ShareAlike 3.0 Unported

CREATIVE COMMONS CORPORATION IS NOT A LAW FIRM AND DOES NOT PROVIDE LEGAL SERVICES. DISTRIBUTION OF THIS LICENSE DOES NOT CREATE AN ATTORNEY-CLIENT RELATIONSHIP. CREATIVE COMMONS PROVIDES THIS INFORMATION ON AN "AS-IS" BASIS. CREATIVE COMMONS DISCLAIMS LIABILITY FOR DAMAGES RESULTING FROM ITS USE

License

THE WORK (AS DEFINED BELOW) IS PROVIDED UNDER THE TERMS OF THIS CREATIVE COMMONS PUBLIC LICENSE ("CCPL" OR "LICENSE"). THE WORK IS PROTECTED BY COPYRIGHT AND/OR OTHER APPLICABLE LAW. ANY USE OF THE WORK OTHER THAN AS AUTHORIZED UNDER THIS LICENSE OR COPYRIGHT LAW IS PROHIBITED

BY EXERCISING ANY RIGHTS TO THE WORK PROVIDED HERE, YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS LICENSE. TO THE EXTENT THIS LICENSE MAY BE CONSIDERED TO BE A CONTRACT, THE LICENSOR GRANTS YOU THE RIGHTS CONTAINED HERE IN CONSIDERATION OF YOUR ACCEPTANCE OF SUCH TERMS AND CONDITIONS.

1. Definitions

1. "Adaptation" means a work based upon the Work, or upon the Work and other pre-existing works, such as a translation, adaptation, derivative work, arrangement of music or other alterations of a literary or artistic work, or phonogram or performance and includes cinematographic adaptations or any other form in which the Work may be recast, transformed, or adapted including in any form recognizably derived from the original, except that a work that constitutes a Collection will not be considered an Adaptation for the purpose of this License. For the avoidance of doubt, where the Work is a musical work,
performance or phonogram, the synchronization of the Work in timed-relation with a moving image ("synching") will be considered an Adaptation for the purpose of this License.

2. "Collection" means a collection of literary or artistic works, such as encyclopedias and anthologies, or performances, phonograms or broadcasts, or other works or subject matter other than works listed in Section 1(f) below, which, by reason of the selection and arrangement of their contents, constitute intellectual creations, in which the Work is included in its entirety in unmodified form along with one or more other contributions, each constituting separate and independent works in themselves, which together are assembled into a collective whole. A work that constitutes a Collection will not be considered an Adaptation (as defined below) for the purposes of this License.

3. "Creative Commons Compatible License" means a license that is listed at http://creativecommons.org/compatiblelicenses that has been approved by Creative Commons as being essentially equivalent to this License, including, at a minimum, because that license: (i) contains terms that have the same purpose, meaning and effect as the License Elements of this License; and, (ii) explicitly permits the relicensing of adaptations of works made available under that license under this License or a Creative Commons jurisdiction license with the same License Elements as this License.

4. "Distribute" means to make available to the public the original and copies of the Work or Adaptation, as appropriate, through sale or other transfer of ownership.

5. "License Elements" means the following high-level license attributes as selected by Licensor and indicated in the title of this License: Attribution, ShareAlike.

6. "Licensor" means the individual, individuals, entity or entities that offer(s) the Work under the terms of this License.

7. "Original Author" means, in the case of a literary or artistic work, the individual, individuals, entity or entities who created the Work or if no individual or entity can be identified, the publisher; and in addition (i) in the case of a performance the actors, singers, musicians, dancers, and other persons who act, sing, deliver, declaim, play in, interpret or otherwise perform literary or artistic works or expressions of folklore; (ii) in the case of a phonogram the producer being the person or legal entity who first fixes the sounds of a performance or other sounds; and, (iii) in the case of broadcasts, the organization that transmits the broadcast.

8. "Work" means the literary and/or artistic work offered under the terms of this License including without limitation any production in the literary, scientific and artistic domain, whatever may be the mode or form of its expression including digital form, such as a book, pamphlet and other writing; a lecture, address, sermon or other work of the same nature; a dramatic or dramatico-musical work; a choreographic work or entertainment in dumb show; a musical composition with or without words; a cinematographic work to which are assimilated works expressed by a process analogous to cinematography; a work of drawing, painting, architecture, sculpture, engraving or lithography; a photographic work to which are assimilated works expressed by a process analogous to photography; a work of applied art; an illustration, map, plan, sketch or three-dimensional work relative to geography, topography, architecture or science; a performance; a broadcast; a phonogram; a compilation of data to the extent it is protected as a copyrightable work; or a work performed by a variety or circus performer to the extent it is not otherwise considered a literary or artistic work.

9. "You" means an individual or entity exercising rights under this License who has not previously violated the terms of this License with respect to the Work, or who has received express permission from the Licensor to exercise rights under this License despite a previous violation.

10. "Publicly Perform" means to perform public recitations of the Work and to communicate to the public those public recitations, by any means or process, including by wire or wireless means or public digital performances; to make available to the public Works in such a way that members of the public may access these Works from a place and at a place individually chosen by them; to perform the Work to the public by any means or process and the communication to the public of the performances of the Work, including by public digital performance; to broadcast and rebroadcast the Work by any means including signs, sounds or images.

11. "Reproduce" means to make copies of the Work by any means including without limitation by sound or visual recordings and the right of fixation and reproducing fixations of the Work, including storage of a protected performance or phonogram in digital form or other electronic medium.
2. Fair Dealing Rights. Nothing in this License is intended to reduce, limit, or restrict any uses free from copyright or rights arising from limitations or exceptions that are provided for in connection with the copyright protection under copyright law or other applicable laws.

3. License Grant. Subject to the terms and conditions of this License, Licensor hereby grants You a worldwide, royalty-free, non-exclusive, perpetual (for the duration of the applicable copyright) license to exercise the rights in the Work as stated below:

   1. to Reproduce the Work, to incorporate the Work into one or more Collections, and to Reproduce the Work as incorporated in the Collections;

   2. to create and Reproduce Adaptations provided that any such Adaptation, including any translation in any medium, takes reasonable steps to clearly label, demarcate or otherwise identify that changes were made to the original Work. For example, a translation could be marked “The original work was translated from English to Spanish,” or a modification could indicate “The original work has been modified.”;

   3. to Distribute and Publicly Perform the Work including as incorporated in Collections; and,

   4. to Distribute and Publicly Perform Adaptations

For the avoidance of doubt:

1. Non-waivable Compulsory License Schemes. In those jurisdictions in which the right to collect royalties through any statutory or compulsory licensing scheme cannot be waived, the Licensor reserves the exclusive right to collect such royalties for any exercise by You of the rights granted under this License;

2. Waivable Compulsory License Schemes. In those jurisdictions in which the right to collect royalties through any statutory or compulsory licensing scheme can be waived, the Licensor waives the exclusive right to collect such royalties for any exercise by You of the rights granted under this License; and,

3. Voluntary License Schemes. The Licensor waives the right to collect royalties, whether individually or, in the event that the Licensor is a member of a collecting society that administers voluntary licensing schemes, via that society, from any exercise by You of the rights granted under this License.

The above rights may be exercised in all media and formats whether now known or hereafter devised. The above rights include the right to make such modifications as are technically necessary to exercise the rights granted in the Work. Subject to Section 8(f), all rights not expressly granted by Licensor are hereby reserved.

4. Restrictions. The license granted in Section 3 above is expressly made subject to and limited by the following restrictions:

   1. You may Distribute or Publicly Perform the Work only under the terms of this License. You must include a copy of, or the Uniform Resource Identifier (URI) for, this License with every copy of the Work You Distribute or Publicly Perform. You may not offer or impose any terms on the Work that restrict the terms of this License or the ability of the recipient of the Work to exercise the rights granted to that recipient under the terms of the License. You may not sublicense the Work. You must keep intact all notices that refer to this License and to the disclaimer of warranties with every copy of the Work You Distribute or Publicly Perform. When You Distribute or Publicly Perform the Work, You may not impose any effective technological measures on the Work that restrict the ability of a recipient of the Work from You to exercise the rights granted to that recipient under the terms of the License. This Section 4(a) applies to the Work as incorporated in a Collection, but this does not require the Collection apart from the Work itself to be made subject to the terms of this License. If You create a Collection, upon notice from any Licensor You must, to the extent practicable, remove from the Collection any credit as required by Section 4(c), as requested. If You create an Adaptation, upon notice from any Licensor You must, to the extent practicable, remove from the Adaptation any credit as required by Section 4(c), as requested.

   2. You may Distribute or Publicly Perform an Adaptation only under the terms of: (i) this License; (ii) a later version of this License with the same License Elements as this License; (iii) a Creative Commons jurisdiction license (either this or a later license version) that contains the same License Elements as this License (e.g., Attribution-ShareAlike 3.0 US); (iv) a Creative Commons Compatible License. If you license the Adaptation under one of the licenses mentioned in (iv), you must comply with the terms of that license. If you license the Adaptation under the terms of any of the licenses mentioned in (i), (ii) or (iii) (the “Applicable License”), you must comply with the terms of the Applicable License generally and the following provisions: (I) You must include a copy of, or the URI for, the Applicable License with every copy of each Adaptation You Distribute or Publicly
Perform; (II) You may not offer or impose any terms on the Adaptation that restrict the terms of the Applicable License or the ability of the recipient of the Adaptation to exercise the rights granted to that recipient under the terms of the Applicable License; (III) You must keep intact all notices that refer to the Applicable License and to the disclaimer of warranties with every copy of the work as included in the Adaptation You Distribute or Publicly Perform; (IV) when You Distribute or Publicly Perform the Adaptation, You may not impose any effective technological measures on the Adaptation that restrict the ability of a recipient of the Adaptation from You to exercise the rights granted to that recipient under the terms of the Applicable License. This Section 4(b) applies to the Adaptation as incorporated in a Collection, but this does not require the Collection apart from the Adaptation itself to be made subject to the terms of the Applicable License.

3. If You Distribute, or Publicly Perform the Work or any Adaptations or Collections, You must, unless a request has been made pursuant to Section 4(a), keep intact all copyright notices for the Work and provide, reasonable to the medium or means You are utilizing: (i) the name of the Original Author (or pseudonym, if applicable) if supplied, and/or if the Original Author and/or Licensor designate another party or parties (e.g., a sponsor institute, publishing entity, journal) for attribution (“Attribution Parties”) in Licensor’s copyright notice, terms of service or by other reasonable means, the name of such party or parties; (ii) the title of the Work if supplied; (iii) to the extent reasonably practicable, the URI, if any, that Licensor specifies to be associated with the Work, unless such URI does not refer to the copyright notice or licensing information for the Work; and (iv), consistent with Section 3(b), in the case of an Adaptation, a credit identifying the use of the Work in the Adaptation (e.g., “French translation of the Work by Original Author,” or “Screenplay based on original Work by Original Author”). The credit required by this Section 4(c) may be implemented in any reasonable manner; provided, however, that in the case of a Adaptation or Collection, at a minimum such credit will appear, if a credit for all contributing authors of the Adaptation or Collection appears, then as part of these credits and in a manner at least as prominent as the credits for the other contributing authors. For the avoidance of doubt, You may only use the credit required by this Section for the purpose of attribution in the manner set out above and, by exercising Your rights under this License, You may not implicitly or explicitly assert or imply any connection with, sponsorship or endorsement by the Original Author, Licensor and/or Attribution Parties, as appropriate, of You or Your use of the Work, without the separate, express prior written permission of the Original Author, Licensor and/or Attribution Parties.

4. Except as otherwise agreed in writing by the Licensor or as may be otherwise permitted by applicable law, if You Reproduce, Distribute or Publicly Perform the Work either by itself or as part of any Adaptations or Collections, You must not distort, mutilate, modify or take other derogatory action in relation to the Work which would be prejudicial to the Original Author’s honor or reputation. Licensor agrees that in those jurisdictions (e.g. Japan), in which any exercise of the right granted in Section 3(b) of this License (the right to make Adaptations) would be deemed to be a distortion, mutilation, modification or other derogatory action prejudicial to the Original Author’s honor and reputation, the Licensor will waive or not assert, as appropriate, this Section, to the fullest extent permitted by the applicable national law, to enable You to reasonably exercise Your right under Section 3(b) of this License (right to make Adaptations) but not otherwise.

5. Representations, Warranties and Disclaimer

UNLESS OTHERWISE MUTUALLY AGREED TO BY THE PARTIES IN WRITING, LICENSOR OFFERS THE WORK AS-IS AND MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND CONCERNING THE WORK, EXPRESS, IMPLIED, STATUTORY OR OTHERWISE, INCLUDING, WITHOUT LIMITATION, WARRANTIES OF TITLE, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NONINFRINGEMENT, OR THE ABSENCE OF LATENT OR OTHER DEFECTS, ACCURACY, OR THE PRESENCE OF ABSENCE OF ERRORS, WHETHER OR NOT DISCOVERABLE. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES, SO SUCH EXCLUSION MAY NOT APPLY TO YOU.

6. Limitation on Liability. EXCEPT TO THE EXTENT REQUIRED BY APPLICABLE LAW, IN NO EVENT WILL LICENSOR BE LIABLE TO YOU ON ANY LEGAL THEORY FOR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR EXEMPLARY DAMAGES ARISING OUT OF THIS LICENSE OR THE USE OF THE WORK, EVEN IF LICENSOR HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. Termination

1. This License and the rights granted hereunder will terminate automatically upon any breach by You of the terms of this License. Individuals or entities who have received Adaptations or Collections from You under this License, however, will not have their licenses terminated provided such individuals or entities remain in full compliance with those licenses. Sections 1, 2, 5, 6, 7, and 8 will survive any termination of this License.
2. Subject to the above terms and conditions, the license granted here is perpetual (for the duration of the applicable copyright in the Work). Notwithstanding the above, Licensor reserves the right to release the Work under different license terms or to stop distributing the Work at any time; provided, however that any such election will not serve to withdraw this License (or any other license that has been, or is required to be, granted under the terms of this License), and this License will continue in full force and effect unless terminated as stated above.

8. Miscellaneous

1. Each time You Distribute or Publicly Perform the Work or a Collection, the Licensor offers to the recipient a license to the Work on the same terms and conditions as the license granted to You under this License.

2. Each time You Distribute or Publicly Perform an Adaptation, Licensor offers to the recipient a license to the original Work on the same terms and conditions as the license granted to You under this License.

3. If any provision of this License is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the emainder of the terms of this License, and without further action by the parties to this agreement, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

4. No term or provision of this License shall be deemed waived and no breach consented to unless such waiver or consent shall be in writing and signed by the party to be charged with such waiver or consent.

5. This License constitutes the entire agreement between the parties with respect to the Work licensed here. There are no understandings, agreements or representations with respect to the Work not specified here. Licensor shall not be bound by any additional provisions that may appear in any communication from You. This License may not be modified without the mutual written agreement of he Licensor and You.

6. The rights granted under, and the subject matter referenced, in this License were drafted utilizing the terminology of the Berne Convention for the Protection of Literary and Artistic Works (as amended on September 28, 1979), the Rome Convention of 1961, the WIPO Copyright Treaty of 1996, the WIPO Performances and Phonograms Treaty of 1996 and the Universal Copyright Convention (as revised on July 24, 1971). These rights and subject matter take effect in the relevant jurisdiction in which the License terms are sought to be enforced according to the corresponding provisions of the implementation of those treaty provisions in the applicable national law. If the standard suite of rights granted under applicable copyright law includes additional rights not granted under this License, such additional rights are deemed to be included in the License; this License is not intended to restrict the license of any rights under applicable law.

Creative Commons Notice

Creative Commons is not a party to this License, and makes no warranty whatsoever in connection with the Work. Creative Commons will not be liable to You or any party on any legal theory for any damages whatsoever, including without limitation any general, special, incidental or consequential damages arising in connection to this license. Notwithstanding the foregoing two (2) sentences, if Creative Commons has expressly identified itself as the Licensor hereunder, it shall have all rights and obligations of Licensor.

Except for the limited purpose of indicating to the public that the Work is licensed under the CCPL, Creative Commons does not authorize the use by either party of the trademark "Creative Commons" or any related trademark or logo of Creative Commons without the prior written consent of Creative Commons. Any permitted use will be in compliance with Creative Commons’ then-current trademark usage guidelines, as may be published on its website or otherwise made available upon request from time to time. For the avoidance of doubt, this trademark restriction does not form part of the License.

Creative Commons may be contacted at http://creativecommons.org/.
B.3.4 DropBear License

Dropbear contains a number of components from different sources, hence there are a few licenses and authors involved. All licenses are fairly non-restrictive.

The majority of code is written by Matt Johnston, under the license below.

Portions of the client-mode work are (c) 2004 Mihnea Stoenescu, under the same license:

-------------------------------------------------------------------------------

B.3.5 GNU General Public License, version 2

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION
This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- The modified work must itself be a software library.
- You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
- You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.
- If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source
code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user’s computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.
It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

Each time you redistribute the Library (or any work based on the library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version
published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

B.3.6 GNU Lesser General Public License 2.1

GNU LESSER GENERAL PUBLIC LICENSE

Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.

51 Franklin Street, Fifth Floor, Boston, MA  02110-1301  USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL.  It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.
For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that
we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you
must provide complete object files to the recipients, so that they can relink them with the library after making changes to the
library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you
legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is
modified by someone else and passed on, the recipients should know that what they have is not the original version, so that
the original author’s reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company
cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we
insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in
this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU
Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public
License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally
speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such
linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria
for linking other code with the library.

We call this license the “Lesser” General Public License because it does Less to protect the user’s freedom than the ordinary
General Public License. It also provides other free software developers Less of an advantage over competing non-free
programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the
Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that
it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case
is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free
library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large
body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to
use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users’ freedom, it does ensure that the user of a program
that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference
between a "work based on the library" and a "work that uses the library". The former contains code derived from the library,
whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder
or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called “this
License”). Each licensee is addressed as “you”.

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application
programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based
on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library

or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term “modification”.)

“Source code” for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library’s complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

2. You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

3. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   a. The modified work must itself be a software library.

   b. You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

   c. You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

   d. If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

      (For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

4. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General
Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

5. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

6. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

7. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer’s own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a. Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b. Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user’s computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.
c. Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d. If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e. Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

8. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

- Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.
- Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

9. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

10. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

11. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

12. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of
software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice. This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

13. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

14. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

15. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

16. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.
B.3.7 GNU General Public License, version 3

GNU GENERAL PUBLIC LICENSE

Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers’ and authors’ protection, the GPL clearly explains that there is no warranty for this free software. For both users’ and authors’ sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users’ freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.
TERMS AND CONDITIONS

0. Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

"The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.
2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the
stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output
from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This
License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license
otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications
exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this
License in conveying all material for which you do not control copyright. Those thus making or running the covered works for
you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies
of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing i not allowed;
section 10 makes it unnecessary.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations
under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting
circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the
extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim
any intention to limit operation or modification of the work as a means of enforcing, against the work’s users, your or third
parties’ legal rights to forbid circumvention of echnological measures.

You may convey verbatim copies of the Program’s source code as you receive it, in any medium, provided that you
conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this
License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence
of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a
fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source
code under the terms of section 4, provided that you also meet all of these conditions:

a) The work must carry prominent notices stating that you modified it, and giving a relevant date.

b) The work must carry prominent notices stating that it is released under this License and any conditions added under
section

7. This requirement modifies the requirement in section 4 to “keep intact all notices”.

c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This
License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts,
regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not
invalidate such permission if you have separately received it.

d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has
interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.
A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an “aggregate” if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation’s users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install.
modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

“Additional permissions” are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or

b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or

c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or

d) Limiting the use for publicity purposes of names of licensors or authors of the material; or

e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or

f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered “further restrictions” within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).
However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party’s predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A “contributor” is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor’s “contributor version”.

A contributor’s “essential patent claims” are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, “control” includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor’s essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a “patent license” is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To “grant” such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the
requirements of this License, to extend the patent license to downstream recipients. "Knowingly relying" means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is "discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

15. Disclaimer of Warranty.
THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS

B.3.8 ISC License

Permission to use, copy, modify, and/or distribute this software for any purpose with or without fee is hereby granted, provided that the above copyright notice and this permission notice appear in all copies.

THE SOFTWARE IS PROVIDED "AS IS" AND THE AUTHOR DISCLAIMS ALL WARRANTIES WITH REGARD TO THIS SOFTWARE INCLUDING ALL IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS. IN NO EVENT SHALL THE AUTHOR BE LIABLE FOR ANY SPECIAL, DIRECT, INDIRECT, OR CONSEQUENTIAL DAMAGES OR ANY DAMAGES WHATSOEVER RESULTING FROM LOSS OF USE, DATA OR PROFITS, WHETHER IN AN ACTION OF CONTRACT, NEGLIGENCE OR OTHER TORTIOUS ACTION, ARISING OUT OF OR IN CONNECTION WITH THE USE OR PERFORMANCE OF THIS SOFTWARE.

B.3.9 GNU Lesser General Public License, version 3.0

GNU LESSER GENERAL PUBLIC LICENSE

Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc.

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This version of the GNU Lesser General Public License incorporates the terms and conditions of version 3 of the GNU General Public License, supplemented by the additional permissions listed below.

0. Additional Definitions.

As used herein, "this License" refers to version 3 of the GNU Lesser General Public License, and the "GNU GPL" refers to version 3 of the GNU General Public License.

“The Library” refers to a covered work governed by this License, other than an Application or a Combined Work as defined below.

An "Application" is any work that makes use of an interface provided by the Library, but which is not otherwise based on the Library. Defining a subclass of a class defined by the Library is deemed a mode of using an interface provided by the Library.

A "Combined Work" is a work produced by combining or linking an Application with the Library. The particular version of the Library with which the Combined Work was made is also called the "Linked Version".
The "Minimal Corresponding Source" for a Combined Work means the Corresponding Source for the Combined Work, excluding any source code for portions of the Combined Work that, considered in isolation, are based on the Application, and not on the Linked Version.

The "Corresponding Application Code" for a Combined Work means the object code and/or source code for the Application, including any data and utility programs needed for reproducing the Combined Work from the Application, but excluding the System Libraries of the Combined Work.

1. Exception to Section 3 of the GNU GPL.
You may convey a covered work under sections 3 and 4 of this License without being bound by section 3 of the GNU GPL.

2. Conveying Modified Versions.
If you modify a copy of the Library, and, in your modifications, a facility refers to a function or data to be supplied by an Application that uses the facility (other than as an argument passed when the facility is invoked), then you may convey a copy of the modified version:

a) under this License, provided that you make a good faith effort to ensure that, in the event an Application does not supply the function or data, the facility still operates, and performs whatever part of its purpose remains meaningful, or

b) under the GNU GPL, with none of the additional permissions of this License applicable to that copy.

The object code form of an Application may incorporate material from a header file that is part of the Library. You may convey such object code under terms of your choice, provided that, if the incorporated material is not limited to numerical parameters, data structure layouts and accessors, or small macros, inline functions and templates (ten or fewer lines in length), you do both of the following:

a) Give prominent notice with each copy of the object code that the Library is used in it and that the Library and its use are covered by this License.

b) Accompany the object code with a copy of the GNU GPL and this license document.

You may convey a Combined Work under terms of your choice that, taken together, effectively do not restrict modification of the portions of the Library contained in the Combined Work and reverse engineering for debugging such modifications, if you also do each of the following:

a) Give prominent notice with each copy of the Combined Work that the Library is used in it and that the Library and its use are covered by this License.

b) Accompany the Combined Work with a copy of the GNU GPL and this license document.

c) For a Combined Work that displays copyright notices during execution, include the copyright notice for the Library among these notices, as well as a reference directing the user to the copies of the GNU GPL and this license document.

d) Do one of the following:

0) Convey the Minimal Corresponding Source under the terms of this License, and the Corresponding Application Code in a form suitable for, and under terms that permit, the user to recombine or relink the Application with a modified version of the Linked Version to produce a modified Combined Work, in the manner specified by section 6 of the GNU GPL for conveying Corresponding Source.

1) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (a) uses at run time a copy of the Library already present on the user’s computer system, and (b) will operate properly with a modified version of the Library that is interface-compatible with the Linked Version.

e) Provide Installation Information, but only if you would otherwise be required to provide such information under section 6 of the GNU GPL, and only to the extent that such information is necessary to install and execute a modified version of the Combined Work produced by recombining or relinking the Application with a modified version of the Linked Version. (If you use
option 4d0, the Installation Information must accompany the Minimal Corresponding Source and Corresponding Application
Code. If you use option 4d1, you must provide the Installation Information in the manner specified by section 6 of the GNU GPL
for conveying Corresponding Source.)

You may place library facilities that are a work based on the Library side by side in a single library together with other library
facilities that are not Applications and are not covered by this License, and convey such a combined library under terms of your
choice, if you do both of the following:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library
facilities, conveyed under the terms of this License.

b) Give prominent notice with the combined library that part of it is a work based on the Library, and explaining where to
find the accompanying uncombined form of the same work.

6. Revised Versions of the GNU Lesser General Public License.

The Free Software Foundation may publish revised and/or new versions of the GNU Lesser General Public License from
time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems
or concerns.

Each version is given a distinguishing version number. If the Library as you received it specifies that a certain numbered
version of the GNU Lesser General Public License “or any later version” applies to it, you have the option of following the terms
and conditions either of that published version or of any later version published by the Free Software Foundation. If the Library
as you received it does not specify a version number of the GNU Lesser General Public License, you may choose any version of
the GNU Lesser General Public License ever published by the Free Software Foundation.

If the Library as you received it specifies that a proxy can decide whether future versions of the GNU Lesser General Public
License shall apply, that proxy’s public statement of acceptance of any version is permanent authorization for you to choose
that version for the Library.

B.3.10 GNU General Public License 2.0

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA
02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General
Public License is intended to guarantee your freedom to share and change free software— to make sure the software is free for
all its users.

This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and
to any other libraries whose authors decide to use it. You can use it for your libraries, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make
sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive
source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that
you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the
rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.
For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author’s protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors’ reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, thus in effect making the program proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone’s free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don’t assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better. However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

TERM AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called “this License”). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.
Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the

   You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   a. The modified work must itself be a software library.

   b. You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

   c. You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

   d. If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

      (For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

   These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

   Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

   In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

   Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

   This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-
readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer’s own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a. Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b. Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

c. If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

d. Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.
It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:
   a. Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.
   b. Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.
The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and “any later version”, you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

B.3.11 GNU Lesser General Public License, version 2.0

GNU LIBRARY GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1991 Free Software Foundation, Inc. 51 Franklin St, Fifth Floor, Boston, MA 02110-1301, USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed. [This is the first released version of the library GPL. It is numbered 2 because it goes with version 2 of the ordinary GPL.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and to any other libraries whose authors decide to use it. You can use it for your libraries, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive
source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library, or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link a program with the library, you must provide complete object files to the recipients so that they can relink them with the library, after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

Our method of protecting your rights has two steps: (1) copyright the library, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the library.

Also, for each distributor’s protection, we want to make certain that everyone understands that there is no warranty for this free library. If the library is modified by someone else and passed on, we want its recipients to know that what they have is not the original version, so that any problems introduced by others will not reflect on the original authors’ reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that companies distributing free software will individually obtain patent licenses, thus in effect transforming the program into proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone’s free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which wa designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don’t assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library
or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, 
translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source 
code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used 
to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act 
of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute 
a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what 
the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided 
that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep 
intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along 
with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in 
exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy 
and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these 
conditions:

   * a) The modified work must itself be a software library.
   * b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any 
      change.
   * c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.
   * d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that 
      uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure 
      that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part 
      of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the 
application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be 
optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, 
and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply 
to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole 
which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for 
other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest you rights to work written entirely by you; rather, the intent is 
to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) 
on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the 
Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public 
License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has 
appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to 
all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.
4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called

   a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also compile or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

   * a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

   * b) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

   * c) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

   * d) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.
It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

   * a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

   * b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Library General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.
Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

B.3.12 GNU Lesser General Public License, version 2.1

GNU LESSER GENERAL PUBLIC LICENSE

Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA  02110-1301  USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.
To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author’s reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the “Lesser” General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users’ freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

**GNU LESSER GENERAL PUBLIC LICENSE**

**TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION**

This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".
A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification").

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

   You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   a. The modified work must itself be a software library.

   b. You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

   c. You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

   d. If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

      (For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

   These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

   Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

   In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.
3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices. Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer’s own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a. Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b. Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user’s computer system, rather than copying library functions into the
executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c. Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d. If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e. Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a. Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b. Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of
software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice. This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

**NO WARRANTY**

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

### B.3.13 MIT License

Permission is hereby granted, without written agreement and without license or royalty fees, to use, copy, modify, and distribute this software and its documentation for any purpose, provided that the above copyright notice and the following two paragraphs appear in all copies of this software.

IN NO EVENT SHALL THE COPYRIGHT HOLDER BE LIABLE TO ANY PARTY FOR DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OF THIS SOFTWARE AND ITS DOCUMENTATION, EVEN IF THE COPYRIGHT HOLDER HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

THE COPYRIGHT HOLDER SPECIFICALLY DISCLAIMS ANY WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE SOFTWARE PROVIDED HEREUNDER IS ON AN “AS IS” BASIS, AND THE COPYRIGHT HOLDER HAS NO OBLIGATION TO PROVIDE MAINTENANCE, SUPPORT, UPDATES, ENHANCEMENTS, OR MODIFICATIONS.
B.3.14 Mozilla Public License, version 2

Version 2.0

1. Definitions

1.1. Contributor means each individual or legal entity that creates, contributes to the creation of, or owns Covered Software.

1.2. Contributor Version means the combination of the Contributions of others (if any) used by a Contributor and that particular Contribution.

1.3. Contribution means Covered Software of a particular Contributor.

1.4. Covered Software means Source Code Form to which the initial Contributor has attached the notice in Exhibit A, the Executable Form of such Source Code Form, and Modifications of such Source Code Form, in each case including portions thereof.

1.5. Incompatible With Secondary Licenses means

1. that the initial Contributor has attached the notice described in Exhibit B to the Covered Software; or
2. that the Covered Software was made available under the terms of version 1.1 or earlier of the License, but not also under the terms of a Secondary License.

1.6. Executable Form means any form of the work other than Source Code Form.

1.7. Larger Work means a work that combines Covered Software with other material, in a separate file or files, that is not Covered Software.

1.8. License means this document.

1.9. Licensable means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently, any and all of the rights conveyed by this License.

1.10. Modifications means any of the following:

1. any file in Source Code Form that results from an addition to, deletion from, or modification of the contents of Covered Software; or
2. any new file in Source Code Form that contains any Covered Software.

1.11. Patent Claims of a Contributor means any patent claim(s), including without limitation, method, process, and apparatus claims, in any patent Licensable by such Contributor that would be infringed, but for the grant of the License, by the making, using, selling, offering for sale, having made, import, or transfer of either its Contributions or its Contributor Version.

1.12. Secondary License means either the GNU General Public License, Version 2.0, the GNU Lesser General Public License, Version 2.1, the GNU Affero General Public License, Version 3.0, or any later versions of those licenses.

1.13. Source Code Form means the form of the work preferred for making modifications.

1.14. You (orYour) means an individual or a legal entity exercising rights under this License. For legal entities, You includes any entity that controls, is controlled by, or is under common control with You. For purposes of this definition, control means (a) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (b) ownership of more than fifty percent (50%) of the outstanding shares or beneficial ownership of such entity.

2. License Grants and Conditions

2.1. Grants

Each Contributor hereby grants You a world-wide, royalty-free, non-exclusive license:

1. under intellectual property rights (other than patent or trademark) Licensable by such Contributor to use, reproduce, make available, modify, display, perform, distribute, and otherwise exploit its Contributions, either on an unmodified basis, with Modifications, or as part of a Larger Work; and
2. under Patent Claims of such Contributor to make, use, sell, offer for sale, have made, import, and otherwise transfer
either its Contributions or its Contributor Version.

2.2. Effective Date

The licenses granted in Section 2.1 with respect to any Contribution become effective for each Contribution on the date the
Contributor first distributes such Contribution.

2.3. Limitations on Grant Scope

The licenses granted in this Section 2 are the only rights granted under this License. No additional rights or licenses will be
implied from the distribution or licensing of Covered Software under this License. Notwithstanding Section 2.1(b) above, no
patent license is granted by a Contributor:

1. for any code that a Contributor has removed from Covered Software; or
2. for infringements caused by: (i) Your and any other third party's modifications of Covered Software, or (ii) the
   combination of its Contributions with other software (except as part of its Contributor Version); or
3. under Patent Claims infringed by Covered Software in the absence of its Contributions.

This License does not grant any rights in the trademarks, service marks, or logos of any Contributor (except as may be necessary
to comply with the notice requirements in Section 3.4).

2.4. Subsequent Licenses

No Contributor makes additional grants as a result of Your choice to distribute the Covered Software under a subsequent
version of this License (see Section 10.2) or under the terms of a Secondary License (if permitted under the terms of Section 3.3).

2.5. Representation

Each Contributor represents that the Contributor believes its Contributions are its original creation(s) or it has sufficient rights
to grant the rights to its Contributions conveyed by this License.

2.6. Fair Use

This License is not intended to limit any rights You have under applicable copyright doctrines of fair use, fair dealing, or other
equivalents.

2.7. Conditions

Sections 3.1, 3.2, 3.3, and 3.4 are conditions of the licenses granted in Section 2.1.

3. Responsibilities

3.1. Distribution of Source Form

All distribution of Covered Software in Source Code Form, including any Modifications that You create or to which You
contribute, must be under the terms of this License. You must inform recipients that the Source Code Form of the Covered
Software is governed by the terms of this License, and how they can obtain a copy of this License. You may not attempt to alter
or restrict the recipients' rights in the Source Code Form under this License.

3.2. Distribution of Executable Form

If You distribute Covered Software in Executable Form then:

1. such Covered Software must also be made available in Source Code Form, as described in Section 3.1, and You must
   inform recipients of the Executable Form how they can obtain a copy of such Source Code Form by reasonable means in a timely
   manner, at a charge no more than the cost of distribution to the recipient; and
2. You may distribute such Executable Form under the terms of this License, or sublicense it under different terms, provided
   that the license for the Executable Form does not attempt to limit or alter the recipients' rights in the Source Code Form
   under this License.

3.3. Distribution of a Larger Work
You may create and distribute a Larger Work under terms of Your choice, provided that You also comply with the requirements of this License for the Covered Software. If the Larger Work is a combination of Covered Software with a work governed by one or more Secondary Licenses, and the Covered Software is not Incompatible With Secondary Licenses, this License permits You to additionally distribute such Covered Software under the terms of such Secondary License(s), so that the recipient of the Larger Work may, at their option, further distribute the Covered Software under the terms of either this License or such Secondary License(s).

3.4. Notices
You may not remove or alter the substance of any license notices (including copyright notices, patent notices, disclaimers of warranty, or limitations of liability) contained within the Source Code Form of the Covered Software, except that You may alter any license notices to the extent required to remedy known factual inaccuracies.

3.5. Application of Additional Terms
You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Software. However, You may do so only on Your own behalf, and not on behalf of any Contributor. You must make it absolutely clear that any such warranty, support, indemnity, or liability obligation is offered by You alone, and You hereby agree to indemnify every Contributor for any liability incurred by such Contributor as a result of warranty, support, indemnity or liability terms You offer. You may include additional disclaimers of warranty and limitations of liability specific to any jurisdiction.

4. Inability to Comply Due to Statute or Regulation
If it is impossible for You to comply with any of the terms of this License with respect to some or all of the Covered Software due to statute, judicial order, or regulation then You must: (a) comply with the terms of this License to the maximum extent possible; and (b) describe the limitations and the code they affect. Such description must be placed in a text file included with all distributions of the Covered Software under this License. Except to the extent prohibited by statute or regulation, such description must be sufficiently detailed for a recipient of ordinary skill to be able to understand it.

5. Termination
5.1. The rights granted under this License will terminate automatically if You fail to comply with any of its terms. However, if You become compliant, then the rights granted under this License from a particular Contributor are reinstated (a) provisionally, unless and until such Contributor explicitly and finally terminates Your grants, and (b) on an ongoing basis, if such Contributor fails to notify You of the non-compliance by some reasonable means prior to 60 days after You have come back into compliance. Moreover, Your grants from a particular Contributor are reinstated on an ongoing basis if such Contributor notifies You of the non-compliance by some reasonable means, this is the first time You have received notice of non-compliance with this License from such Contributor, and You become compliant prior to 30 days after Your receipt of the notice.

5.2. If You initiate litigation against any entity by asserting a patent infringement claim (excluding declaratory judgment actions, counter-claims, and cross-claims) alleging that a Contributor Version directly or indirectly infringes any patent, then the rights granted to You by any and all Contributors for the Covered Software under Section 2.1 of this License shall terminate.

5.3. In the event of termination under Sections 5.1 or 5.2 above, all end user license agreements (excluding distributors and resellers) which have been validly granted by You or Your distributors under this License prior to termination shall survive termination.

6. Disclaimer of Warranty
Covered Software is provided under this License on an "as is" basis, without warranty of any kind, either expressed, implied, or statutory, including, without limitation, warranties that the Covered Software is free of defects, merchantable, fit for a particular purpose or non-infringing. The entire risk as to the quality and performance of the Covered Software is with You. Should any Covered Software prove defective in any respect, You (not any Contributor) assume the cost of any necessary servicing, repair, or correction. This disclaimer of warranty constitutes an essential part of this License. No use of any Covered Software is authorized under this License except under this disclaimer.

7. Limitation of Liability
Under no circumstances and under no legal theory, whether tort (including negligence), contract, or otherwise, shall any Contributor, or anyone who distributes Covered Software as permitted above, be liable to You for any direct, indirect, special, incidental, or consequential damages of any character including, without limitation, damages for lost profits, loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses, even if such party shall have been informed of the possibility of such damages. This limitation of liability shall not apply to liability for death or personal injury resulting from such partyâ€™s negligence to the extent applicable law prohibits such limitation. Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so this exclusion and limitation may not apply to You.

8. Litigation

Any litigation relating to this License may be brought only in the courts of a jurisdiction where the defendant maintains its principal place of business and such litigation shall be governed by laws of that jurisdiction, without reference to its conflict-of-law provisions. Nothing in this Section shall prevent a partyâ€™s ability to bring cross-claims or counter-claims.

9. Miscellaneous

This License represents the complete agreement concerning the subject matter hereof. If any provision of this License is held to be unenforceable, such provision shall be reformed only to the extent necessary to make it enforceable. Any law or regulation which provides that the language of a contract shall be construed against the drafter shall not be used to construe this License against a Contributor.

10. Versions of the License

10.1. New Versions

Mozilla Foundation is the license steward. Except as provided in Section 10.3, no one other than the license steward has the right to modify or publish new versions of this License. Each version will be given a distinguishing version number.

10.2. Effect of New Versions

You may distribute the Covered Software under the terms of the version of the License under which You originally received the Covered Software, or under the terms of any subsequent version published by the license steward.

10.3. Modified Versions

If you create software not governed by this License, and you want to create a new license for such software, you may create and use a modified version of this License if you rename the license and remove any references to the name of the license steward (except to note that such modified license differs from this License).

10.4. Distributing Source Code Form that is Incompatible With Secondary Licenses

If You choose to distribute Source Code Form that is Incompatible With Secondary Licenses under the terms of this version of the License, the notice described in Exhibit B of this License must be attached.

Exhibit A - Source Code Form License Notice

This Source Code Form is subject to the terms of the Mozilla Public License, v. 2.0. If a copy of the MPL was not distributed with this file, You can obtain one at http://mozilla.org/MPL/2.0/. You may add additional accurate notices of copyright ownership.

Exhibit B - Incompatible With Secondary Licenses Notice

This Source Code Form is Incompatible With Secondary Licenses, as defined by the Mozilla Public License, v. 2.0.

B.3.15 The Open LDAP Public License

The OpenLDAP Public License

Version 2.8, 17 August 2003

Redistribution and use of this software and associated documentation ("Software"), with or without modification, are permitted provided that the following conditions are met:
1. Redistributions in source form must retain copyright statements and notices,

2. Redistributions in binary form must reproduce applicable copyright statements and notices, this list of conditions, and the following disclaimer in the documentation and/or other materials provided with the distribution, and

3. Redistributions must contain a verbatim copy of this document.

The OpenLDAP Foundation may revise this license from time to time. Each revision is distinguished by a version number. You may use this Software under terms of this license revision or under the terms of any subsequent revision of the license.

POSSIBILITY OF SUCH DAMAGE. This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com).

B.3.17 WU-FTPD Software License

WU-FTPD SOFTWARE LICENSE

Use, modification, or redistribution (including distribution of any modified or derived work) in any form, or on any medium, is permitted only if all the following conditions are met:

1. Redistributions qualify as "freeware" or "Open Source Software" under the following terms:
   a. Redistributions are made at no charge beyond the reasonable cost of materials and delivery. Where redistribution of this software is as part of a larger package or combined work, this restriction applies only to the costs of materials and delivery of this software, not to any other costs associated with the larger package or combined work.
   b. Redistributions are accompanied by a copy of the Source Code or by an irrevocable offer to provide a copy of the Source Code for up to three years at the cost of materials and delivery. Such redistributions must allow further use, modification, and redistribution of the Source Code under substantially the same terms as this license. For the purposes of redistribution "Source Code" means all files included in the original distribution, including all modifications or additions, on a medium and in a form allowing fully working executable programs to be produced.

2. Redistributions of Source Code must retain the copyright notices as they appear in each Source Code file and the COPYRIGHT file, these license terms, and the disclaimer/liability of liability set forth as paragraph 6 below.

3. Redistributions in binary form must reproduce the Copyright Notice, these license terms, and the disclaimer/liability of liability set forth as paragraph 6 below, in the documentation and/or other materials provided with the distribution. For the purposes of binary distribution the "Copyright Notice" refers to the following language:

   Copyright (c) 1999,2000,2001 WU-FTPD Development Group.

   All rights reserved.

   The Regents of the University of California.

   Portions Copyright (c) 1993, 1994 Washington University in Saint Louis.

   Portions Copyright (c) 1996, 1998 Berkeley Software Design, Inc.

   Portions Copyright (c) 1996, 1998 Sendmail, Inc.

   Portions Copyright (c) 1989 Massachusetts Institute of Technology.

   Portions Copyright (c) 1997 Stan Barber.

   Portions Copyright (c) 1997 Kent Landfield.

   Use and distribution of this software and its source code are governed by the terms and conditions of the WU-FTPD Software License ("LICENSE").

   If you did not receive a copy of the license, it may be obtained online at http://www.wu-ftpd.org/license.html

4. All advertising materials mentioning features or use of this software must display the following acknowledgement: "This product includes software developed by the WU-FTPD Development Group, the Washington University at Saint Louis, Berkeley Software Design, Inc., and their contributors."
5. Neither the name of the WU-FTPD Development Group, nor the names of any copyright holders, nor the names of any contributors may be used to endorse or promote products derived from this software without specific prior written permission. The names "wuftpd" and "wu-ftpd" are trademarks of the WU-FTPD Development Group and the Washington University at Saint Louis.

6. Disclaimer/Limitation of Liability:

   THIS SOFTWARE IS PROVIDED BY THE WU-FTPD DEVELOPMENT GROUP, THE COPYRIGHT HOLDERS, AND CONTRIBUTORS, \"AS IS\" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE WU-FTPD DEVELOPMENT GROUP, THE COPYRIGHT HOLDERS, OR CONTRIBUTORS, BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. USE, MODIFICATION, OR REDISTRIBUTION, OF THIS SOFTWARE IMPLIES
   ACCEPTANCE OF ALL TERMS AND CONDITIONS OF THIS LICENSE.

**B.3.18 zlib License**

If you have a problem with your equipment, contact Support for your region. Support and issue resolution is provided for products under warranty or that are covered by a services agreement. Contact information and Web self-service is available by visiting www.zebra.com/support.

When contacting Support, please provide the following information:

- MAC ID of the unit
- Model number or product name
- Software type and version number

Support responds to calls by email or telephone within the time limits set forth in support agreements. If you purchased your product from a business partner, contact that business partner for support.

**Customer Support Web Site**

The support site, located at www.zebra.com/support provides information and online assistance including developer tools, software downloads, product manuals, support contact information and online repair requests.

**Manuals**

To see manuals, go to www.zebra.com/support.
