ABOUT THIS GUIDE

Chapter 1, INTRODUCTION
  1.3.1 Basic Conventions ........................................................................................................ .............................1-10
  1.4.1 Moving the Cursor on the Command Line .................................................................................... .............1-10
  1.4.2 Completing a Partial Command Name ........... ...........................................................................................1-11
  1.4.3 Command Output Pagination ................................................................................................ ....................1-12
  1.5.1 Creating Profiles ........................................................................................................ ................................1-12
  1.5.2 Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface ...............1-13
  1.5.3 Enabling Remote Administration ...................................................................................................... 1-13

Chapter 2, USER EXEC MODE COMMANDS
  2.1.1 captive-portal-page-upload ............................................................................................... ...........................2-5
  2.1.2 change-passwd ............................................................................................................ ...............................2-8
  2.1.3 clear .................................................................................................................... .........................................2-9
  2.1.4 clock .................................................................................................................... ......................................2-20
  2.1.5 cluster .................................................................................................................. ......................................2-21
  2.1.6 connect .................................................................................................................. ....................................2-22
  2.1.7 create-cluster ........................................................................................................... ..................................2-23
  2.1.8 crypto ................................................................................................................... ......................................2-25
  2.1.9 crypto-cmp-cert-update ................................................................................................... ..........................2-34
  2.1.10 database ................................................................................................................ ..................................2-35
  2.1.11 database-backup ........................................................................................................ .............................2-36
  2.1.12 database-restore ........................................................................................................ .............................2-37
  2.1.13 device-upgrade ........................................................................................................ ..............................2-38
  2.1.14 disable ................................................................................................................. ....................................2-48
  2.1.15 enable .................................................................................................................. ....................................2-49
  2.1.16 file-sync ............................................................................................................... ....................................2-50
  2.1.17 join-cluster ............................................................................................................ ...................................2-52
  2.1.18 l2tpv3 .................................................................................................................. .....................................2-54
  2.1.19 logging ................................................................................................................. ....................................2-56
  2.1.20 mint .................................................................................................................... ......................................2-58
  2.1.21 no ...................................................................................................................... .......................................2-60
  2.1.22 on ...................................................................................................................... .......................................2-62

Appendix C, CUSTOMER SUPPORT
This manual supports the following wireless controllers, service platforms, and access points:

- **Wireless Controllers** – RFS4000, RFS6000, RFS7000
- **Service Platforms** – NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
- **Access Points** – AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP7131, AP7161, AP7181, AP7502, AP7522, AP7532, AP7562, AP8122, AP8132, AP8163, AP8222, AP8232

---

**NOTE:** ES6510 is an *Ethernet Switch* managed by a wireless controller or service platform, such as RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, and NX9600. ES6510 does not have radios and does not provide WLAN support.

---

**NOTE:** In this guide,

- AP7131, AP7161, and AP7181 are collectively represented as AP71XX.
- AP8122, AP8132, and AP8163 are collectively represented as AP81XX. AP8163 is an outdoor mesh supporting access point.
- AP8222 and AP8232 are collectively represented as AP82XX.
- NX4500 and NX4524 are collectively represented as NX45XX.
- NX6500 and NX6524 are collectively represented as NX65XX.
- NX7510, NX7520, and NX7530 are collectively represented as NX7500 series.
- NX9000, NX9500, and NX9510 are collectively represented as NX9000 series.

---

A simplified version of the WiNG operating system *user interface* (UI) is available on the following access point and service platform models with the E-SKU:

- AP6511, AP6521, AP6522, AP6562, AP7502, AP7522, AP7532, and AP7562
- NX7510

This new UI, referred to as the WiNG *Express* (WE) UI, simplifies configuration and monitoring of small access point deployments by limiting monitoring, analytics, and configuration capabilities. The WE UI is designed for single-site access point deployments not exceeding more than 24 access points of the same model.
CAUTION: If using the WiNG Express (WE) UI, to configure a WE access point, use the WE UI exclusively. Do not use the command line interface (CLI) along with it. Similarly, when using the CLI to configure the WE access point, do not use the WE UI along with it.

This section is organized into the following topics:

- Document Conventions
- Notational Conventions
- End-User Software License Agreement
Document Conventions

The following conventions are used in this document to draw your attention to important information:

**NOTE:** Indicates tips or special requirements.

---

**CAUTION:** Indicates conditions that can cause equipment damage or data loss.

---

**WARNING!** Indicates a condition or procedure that could result in personal injury or equipment damage.

---

**Switch Note:** Indicates caveats unique to a RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, or NX9600 model controller.
Notational Conventions

The following notational conventions are used in this document:

- Italics are used to highlight specific items in the general text, and to identify chapters and sections in this and related documents
- Bullets (∗) indicate:
  - lists of alternatives
  - lists of required steps that are not necessarily sequential
  - action items
- Sequential lists (those describing step-by-step procedures) appear as numbered lists

Understanding Command Syntax

| <variable> | Variables are described with a short description enclosed within a '<' and a '>' pair.  
For example, the command,  
```
show interface ge 1
```

where:  
- show – is the command – displays information  
- interface – is the keyword – represents the interface type  
- <1-4> – is the variable – represents the ge interface index value |

|  | The pipe symbol. This is used to separate the variables/keywords in a list.  
For example, the command,  
```
rfs7000-37FABE>show adoption|bonjour|boot
```

where:
- show – is the command – displays information  
- [adoption|bonjour|......] – indicates the different keywords that can be combined with the show command. However, only one of the above option can be used at a time.
Of the different keywords and variables listed inside a `[]` pair, only one can be used. Each choice in the list is separated with a `|` (pipe) symbol. For example, the command,

```
rfs7000-37FABE#clear ...
```

is documented as:

```
clear [arp-cache|bonjour|cdp|counters|crypto|
  event-history|firewall|gre|ip|ipv6|
  l2tpv3-stats|license|lldp|logging|
  mac-address-table|mint|role|rtls|
  spanning-tree|traffic-shape|vrrp]
```

where:
- `clear` – is the command
- `[arp-cache|cdp|counters|crypto|event-history|firewall|gre|ip|ipv6|
  l2tpv3-stats|license|lldp|logging|
  mac-address-table|mint|role|rtls|
  spanning-tree|traffic-shape|vrrp]` – indicates that these keywords are available for this command. However, only one can be used at a time.

Any command/keywordvariable or a combination of them inside a `{ }` pair is optional. All optional commands follow the same conventions as listed above. However, they are displayed italicized.

For example, the command,

```
rfs7000-37FABE> show adoption ....
```

is documented as:

```
show adoption info {on <DEVICE-NAME>}
```

here:
- `show adoption info` – is the command. This command can also be used as:
  ```
  show adoption info
  ```

The command can also be extended as:

```
show adoption info {on <DEVICE-NAME>}
```

here:
- `{on <DEVICE-NAME>}` – is the keyword, which is optional.

The first word is always a command. Keywords are words that must be entered as is. Commands and keywords are mandatory.

For example, the command,

```
rfs7000-37FABE> show wireless
```

is documented as:

```
show wireless
```

where:
- `show` – is the command
- `wireless` – is the keyword
Any command/keyword-variable or a combination of them inside a '()' pair are recursive. All recursive commands can be listed in any order and can be used once along with the rest of the commands.

For example, the command,

```plaintext
crypto pki export request generate-rsa-key
test autogen-subject-name ...
```

is documented as:

```plaintext
rfs7000-37FABE#crypto pki export request
generate-rsa-key test autogen-subject-name
(<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>)
```

here:

- crypto pki export request generate-rsa-key <RSA-KEYPAIR-NAME> auto-gen-subject-name – is the command
- <RSA-KEYPAIR-NAME> – is the RSA keypair name (in this example, the keypair name is ‘test’), and is a variable
- (<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>) – is the set of recursive parameters (separated by commas) that can be used in any order.
End-User Software License Agreement

BY INSTALLING AND/OR USING THIS PRODUCT, YOU ACKNOWLEDGE THAT YOU HAVE READ THIS AGREEMENT, UNDERSTAND IT AND AGREE TO BE BOUND ITS TERMS. IF YOU DO NOT AGREE TO THE TERMS OF THIS AGREEMENT, ZEBRA IS NOT WILLING TO LICENSE THE PRODUCT TO YOU, AND YOU MUST NOT INSTALL OR USE THIS PRODUCT.

GRANT OF LICENSE. Zebra Technologies Corporation ("Zebra") grants you ("Licensee" or "you") a personal, nonexclusive, nontransferable, revocable, nonassignable, limited license to use the software and documentation ("Product(s)") subject to the terms and conditions of this Agreement. You shall use the Products only for your internal business purposes, exclusively to support Zebra devices. Any use of the Products outside of the conditions set forth herein is strictly prohibited and will be deemed a breach of this Agreement resulting in immediate termination of your License. In the event of a breach of this Agreement, Zebra will be entitled to all available remedies at law or in equity (including immediate immediate termination of the license without notice, immediate injunctive relief and repossess of all Products unless Licensee is a Federal agency of the United States Government).

You shall not distribute, sublicense, rent, loan, lease, export, re-export, resell, ship or divert or cause to be exported, re-exported, resold, shipped or diverted, directly or indirectly, the Products under this Agreement. You shall not, and shall not permit others to: (i) modify, translate, decompile, bootleg, reverse engineer, disassemble, or the inner workings of the Products, (ii) copy the look-and-feel or functionality of the Products; (iii) remove any proprietary notices, marks, labels, or logos from the Products; (iv) rent or transfer all or some of the Products to any other party without Zebra’s prior written consent; or (v) utilize any computer software or hardware which is designed to defeat any copy protection device, should the Products be equipped with such a protection device.

Title to all copies of Products will not pass to Licensee at any time and remains vested exclusively in Zebra. All intellectual property developed, originated, or prepared by Zebra in connection with the Products remain vested exclusively in Zebra, and this Agreement does not grant to Licensee any intellectual property rights.

Portions of the Products are protected by United States patent and copyright laws, international treaty provisions, and other applicable laws. Therefore, you must treat the Products like any other copyrighted material (e.g., a book or musical recording) except that you may make one copy of the Product solely for back-up purposes. Unauthorized duplication of the Products constitutes copyright infringement, and in the United States is punishable in federal court by fine and imprisonment.

LIMITED WARRANTY. Zebra warrants for a period of ninety (90) days from your receipt of the Products to you that the Software, under normal use, will perform substantially in accordance with Zebra’s published specifications for that release level of the Software. The written materials are provided “AS IS” and without warranty of any kind. Zebra’s entire liability and your sole and exclusive remedy for any breach of the foregoing limited warranty will be, at Zebra’s option, the provision of a downloadable patch or replacement code, or a refund of the unused portion of your bargained for contractual benefit up to the amount paid for the Products.

DISCLAIMER. THIS LIMITED WARRANTY IS THE ONLY WARRANTY PROVIDED BY ZEBRA, AND ZEBRA MAKES, AND YOU RECEIVE, NO OTHER WARRANTIES OF ANY KIND, WHETHER EXPRESS, IMPLIED, STATUTORY, OR IN ANY COMMUNICATION WITH YOU. ZEBRA SPECIFICALLY DISCLAIMS ANY WARRANTY INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY, NONINFRINGEMENT, OR FITNESS FOR A PARTICULAR PURPOSE. ZEBRA DOES NOT WARRANT THAT THE PRODUCTS WILL MEET YOUR REQUIREMENTS, OR THAT THE OPERATION OF THE PRODUCTS WILL BE UNINTERRUPTED OR ERROR FREE, OR THAT DEFECTS IN THE PRODUCTS WILL BE CORRECTED. ZEBRA MAKES NO WARRANTY WITH RESPECT TO THE CORRECTNESS, ACCURACY, OR RELIABILITY OF THE PRODUCTS. Some jurisdictions do not allow the exclusion of implied warranties, so the above exclusion may not apply to you.

LIMITATION OF LIABILITY. THE TOTAL LIABILITY OF ZEBRA UNDER THIS AGREEMENT FOR DAMAGES SHALL NOT EXCEED THE FAIR MARKET VALUE OF THE PRODUCTS LICENSED UNDER THIS AGREEMENT. IN NO EVENT WILL ZEBRA BE LIABLE IN ANY WAY FOR INCIDENTAL, CONSEQUENTIAL, INDIRECT, SPECIAL OR PUNITIVE DAMAGES OF ANY NATURE, INCLUDING WITHOUT LIMITATION, LOST BUSINESS PROFITS, OR LIABILITY OR INJURY TO THIRD PERSONS, WHETHER FORESEEABLE OR NOT, REGARDLESS OF WHETHER ZEBRA HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. Some jurisdictions do not permit limitations of liability for incidental or consequential damages, so the above exclusions may not apply to you. This Limitation of Liability provision survives the termination of this Agreement.
and applies notwithstanding any contrary provision in this Agreement. Licensee must bring any action under this Agreement within one (1) year after the cause of action arises.

MAINTENANCE. Unless provided for in a separate agreement, Zebra shall not be responsible for maintenance or field service of the Products.

HIGH RISK ACTIVITIES. The Products are not fault-tolerant and are not designed, manufactured or intended for use or resale as on-line control software in hazardous environments requiring fail-safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life support machines, or weapons systems, in which the failure of the Products could lead directly to death, personal injury, or severe physical or environmental damage (“High Risk Activities”).

Zebra and its suppliers specifically disclaim any express or implied warranty of fitness for High Risk Activities, and if you elect to use the Products in any High Risk Activities, you agree to indemnify, defend, and hold Zebra harmless from and against any and all costs, damages, and losses related to that use.

U.S. GOVERNMENT. If you are acquiring the Products on behalf of any unit or agency of the U.S. Government, the following shall apply. Use, duplication, or disclosure of the Products is subject to the restrictions set forth in subparagraphs (c) (1) and (2) of the Commercial Computer Software - Restricted Rights clause at FAR 52.227-19 (JUNE 1987), if applicable, unless being provided to the Department of Defense. If being provided to the Department of Defense, use, duplication, or disclosure of the Products is subject to the restricted rights set forth in subparagraph (c) (1) (ii) of the Rights in Technical Data and Computer Software clause at DFARS 252.227-7013 (OCT 1988), if applicable. Products may or may not include a Restricted Rights notice, or other notice referring specifically to the terms and conditions of this Agreement. The terms and conditions of this Agreement shall each continue to apply, but only to the extent that such terms and conditions are not inconsistent with the rights provided to you under the aforementioned provisions of the FAR and DFARS, as applicable to the particular procuring agency and procurement transaction.

ASSIGNMENT. Except as otherwise provided in this section, neither party may assign this Agreement, or any of its rights or obligations under this Agreement, without the prior written approval of the other party, which will not be unreasonably withheld. Any attempted assignment, delegation, or transfer without the necessary approval will be void. Notwithstanding the foregoing, for any Zebra acquisition, merger, consolidation, reorganization, or similar transaction, or any spin-off, divestiture, or other separation of a Zebra business, Zebra may, without the prior written consent of the other party: (i) assign its rights and obligations under this Agreement, in whole or in part, or (ii) split and assign its rights and obligations under this Agreement so as to retain the benefits of this Agreement for both Zebra and the assignee entity(ies) (and their respective Affiliates) following the split.

GOVERNING LAW. This Agreement shall be governed by the laws of the United States of America to the extent that they apply and otherwise by the laws of the State of New York without regard to its conflict of laws provisions or by the internal substantive laws of the country to which the Products is shipped if end-user customer is a sovereign governmental entity. The terms of the U.N. Convention on Contracts for the International Sale of Goods do not apply. In the event that the Uniform Computer information Transaction Act, any version of this Act, or a substantially similar law (collectively “UCITA”) becomes applicable to a Party’s performance under this Agreement, UCITA does not govern any aspect of this End User License Agreement or any license granted under this End-User License Agreement, or any of the parties’ rights or obligations under this End User License Agreement. The governing law will be that in effect prior to the applicability of UCITA.

COMPLIANCE WITH LAWS. Licensee will comply with all applicable laws and regulations, including export laws and regulations of the United States. Licensee will not, without the prior authorization of Zebra and the appropriate governmental authority of the United States, in any form export or re-export, sell or resell, ship or reship, or divert, through direct or indirect means, any item or technical data or direct or indirect products sold or otherwise furnished to any person within any territory for which the United States Government or any of its agencies at the time of the action, requires an export license or other governmental approval. Violation of this provision will be a material breach of this Agreement, permitting immediate termination by Zebra.

THIRD PARTY SOFTWARE. The Products may contain one or more items of Third-Party Software. The terms of this Agreement govern your use of any Third-Party Software UNLESS A SEPARATE THIRD-PARTY SOFTWARE LICENSE IS INCLUDED, IN WHICH CASE YOUR USE OF THE THIRD-PARTY SOFTWARE WILL THEN BE GOVERNED BY THE SEPARATE THIRD-PARTY LICENSE.
OPEN SOURCE SOFTWARE. The Products may contain one or more items of Open Source Software. Open Source Software is software covered by a publicly available license governed solely under Copyright law, whereas the complete terms and obligations of such license attach to a licensee solely through the act of copying, using and/or distribution of the licensed software, such obligations often include one or more of attribution obligations, distribution obligations, copyleft obligations, and intellectual property encumbrances. The use of any Open Source Software is subject to the terms and conditions of this Agreement as well as the terms and conditions of the corresponding license of each Open Source Software package. If there is a conflict between the terms and conditions of this Agreement and the terms and conditions of the Open Source Software license, the applicable Open Source Software license will take precedence. Copies of the licenses for the included Open Source Software, if any, as well as their attributions, acknowledgements, and software information details, are provided in the electronic copy of this Agreement, which is available in the Legal Notices or README file associated with the Product. Zebra is required to reproduce the software licenses, acknowledgments and copyright notices as provided by the authors and owners, thus, all such information is provided in its native language form, without modification or translation. Depending on the license terms of the specific Open Source Software, source code may not be provided. Please reference and review the entire Open Source Software information to identify which Open Source Software packages have source code provided or available. For instructions on how to obtain a copy of any source code made publicly available by Zebra related to Open Source Software distributed by Zebra, you may send your request (including the Zebra Product name and version, along with the Open Source Software specifics) in writing to: Zebra Technologies Corporation, Open Source Software Director, Legal Department, 3 Overlook Point, Lincolnshire, IL 60069 USA.

This chapter describes the commands available within a device’s Command Line Interface (CLI) structure. CLI is available for wireless controllers, access points (APs), and service platforms.

Access the CLI by using:
- A terminal emulation program running on a computer connected to the serial port on the device (access point, wireless controller, and service platform).
- A Telnet session through Secure Shell (SSH) over a network.

**Configuration for connecting to a Controller using a terminal emulator**

If connecting through the serial port, use the following settings to configure your terminal emulator:

<table>
<thead>
<tr>
<th>Bits Per Second</th>
<th>19200</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Bits</td>
<td>8</td>
</tr>
<tr>
<td>Parity</td>
<td>None</td>
</tr>
<tr>
<td>Stop Bit</td>
<td>1</td>
</tr>
<tr>
<td>Flow Control</td>
<td>None</td>
</tr>
</tbody>
</table>

When a CLI session is established, complete the following (user input is in **bold**):

login as: **<username>**
administrator’s login password: **<password>**

**User Credentials**

Use the following credentials when logging into a device for the first time:

<table>
<thead>
<tr>
<th>User Name</th>
<th>admin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>admin123</td>
</tr>
</tbody>
</table>

When logging into the CLI for the first time, you are prompted to change the password.
Examples in this reference guide
Examples used in this reference guide are generic to each supported wireless controller, service platform, and AP model. Commands that are not common, are identified using the notation “Supported in the following platforms:” For an example, see below:

Supported in the following platforms:
• Wireless Controller – RFS6000

The above example indicates the command is only available for a RFS6000 model wireless controller.

This chapter is organized into the following sections:
• CLI Overview
• Getting Context Sensitive Help
• Using the No Command
• Using CLI Editing Features and Shortcuts
• Using CLI to Create Profiles and Enable Remote Administration

1.1 CLI Overview

INTRODUCTION

The CLI is used for configuring, monitoring, and maintaining the network. The user interface allows you to execute commands on supported wireless controllers, service platforms, and APs, using either a serial console or a remote access method.

This chapter describes basic CLI features. Topics covered include an introduction to command modes, navigation and editing features, help features and command history.

The CLI is segregated into different command modes. Each mode has its own set of commands for configuration, maintenance, and monitoring. The commands available at any given time depend on the mode you are in, and to a lesser extent, the particular model used. Enter a question mark (?) at the system prompt to view a list of commands available for each command mode/instance.

Use specific commands to navigate from one command mode to another. The standard order is: USER EXEC mode, PRIV EXEC mode and GLOBAL CONFIG mode.

![Hierarchy of User Modes](image-url)
Command Modes

A session generally begins in the USER EXEC mode (one of the two access levels of the EXEC mode). For security, only a limited subset of EXEC commands are available in the USER EXEC mode. This level is reserved for tasks that do not change the device’s (wireless controller, service platform, or AP) configuration.

```
rfs7000-37FABE>
```

The system prompt signifies the device name and the last three bytes of the device MAC address.

To access commands, enter the PRIV EXEC mode (the second access level for the EXEC mode). Once in the PRIV EXEC mode, enter any EXEC command. The PRIV EXEC mode is a superset of the USER EXEC mode.

```
rfs7000-37FABE>enable
rfs7000-37FABE#
```

Most of the USER EXEC mode commands are one-time commands and are not saved across device reboots. Save the command by executing `commit` command. For example, the show command displays the current configuration and the clear command clears the interface.

Access the GLOBAL CONFIG mode from the PRIV EXEC mode. In the GLOBAL CONFIG mode, enter commands that set general system characteristics. Configuration modes, allow you to change the running configuration. If you save the configuration later, these commands are stored across device reboots.

Access a variety of protocol specific (or feature-specific) modes from the global configuration mode. The CLI hierarchy requires you to access specific configuration modes only through the global configuration mode.

```
rfs7000-37FABE#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config)#
```

You can also access sub-modes from the global configuration mode. Configuration sub-modes define specific features within the context of a configuration mode.

```
rfs7000-37FABE(config)#aaa-policy test
rfs7000-37FABE(config-aaa-policy-test)#
```

The following table summarizes available CLI commands:

<table>
<thead>
<tr>
<th>User Exec Mode</th>
<th>Priv Exec Mode</th>
<th>Global Configuration Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal-page-upload</td>

1.2 Getting Context Sensitive Help

INTRODUCTION

Enter a question mark (?) at the system prompt to display a list of commands available for each mode. Obtain a list of arguments and keywords for any command using the CLI context-sensitive help.

Use the following commands to obtain help specific to a command mode, command name, keyword or argument:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(prompt)#help</td>
<td>Displays a brief description of the help system</td>
</tr>
<tr>
<td>(prompt)#abbreviated-command-entry?</td>
<td>Lists commands in the current mode that begin with a particular character string</td>
</tr>
<tr>
<td>(prompt)#abbreviated-command-entry[TAB]</td>
<td>Completes a partial command name</td>
</tr>
<tr>
<td>(prompt)#?</td>
<td>Lists all commands available in the command mode</td>
</tr>
<tr>
<td>(prompt)#command ?</td>
<td>Lists the available syntax options (arguments and keywords) for the command</td>
</tr>
<tr>
<td>(prompt)#command keyword ?</td>
<td>Lists the next available syntax option for the command</td>
</tr>
</tbody>
</table>

NOTE: The system prompt varies depending on the configuration mode.

NOTE: Enter Ctrl + V to use ? as a regular character and not as a character used for displaying context sensitive help. This is required when the user has to enter a URL that ends with a ?

NOTE: The escape character used throughout the CLI is \"\". To enter a "\" use "\\" instead.

When using context-sensitive help, the space (or lack of a space) before the question mark (?) is significant. To obtain a list of commands that begin with a particular sequence, enter the characters followed by a question mark (?). Do not include a space. This form of help is called word help, because it completes a word.

rfs7000-37FABE#service?
service Service Commands
rfs7000-37FABE#service
Enter a question mark (?) (in place of a keyword or argument) to list keywords or arguments. Include a space before the “?” . This form of help is called command syntax help. It shows the keywords or arguments available based on the command/keyword and argument already entered.

```
rfs7000-37FABE#service ?
    block-adopter-config-update       Block configuration updates from the adopter
    clear                             Clear adoption history
    cli-tables-skin                   Choose a formatting layout/skin for CLI tabular outputs
    cluster                           Cluster Protocol
    copy                               Copy from one file to another
    delete                            Delete sessions
    delete-offline-aps                Delete Access Points that are configured but offline
    force-send-config                 Resend configuration to the device
    force-update-vm-stats             Force VM statistics to be pushed up to the NOC
    load-balancing                    Wireless load-balancing service commands
    locator                           Enable leds flashing on the device
    mint                              MiNT protocol
    pktcap                            Start packet capture
    pm                                Process Monitor
    radio                             Radio parameters
    radius                            Radius test
    request-full-config-from-adopter  Request full configuration from the adopter
    set                               Set validation mode
    show                              Show running system information
    signal                            Send a signal to a process
    smart-rf                          Smart-RF Management Commands
    snmp                              Snmp
    ssm                               Command related to ssm
    start-shell                       Provide shell access
    syslog                            Test the syslog server configuration
    trace                             Trace a process for system calls and signals
    wireless                          Command related to wireless
```

It is possible to abbreviate commands and keywords to allow a unique abbreviation. For example, "configure terminal" can be abbreviated as config t. Since the abbreviated command is unique, the controller accepts the abbreviation and executes the command.

Enter the help command (available in any command mode) to provide the following description:

```
rfs7000-37FABE#help
```

When using the CLI, help is provided at the command line when typing ' ?'.

If no help is available, the help content will be empty. Backup until entering a '?' shows the help content.

There are two styles of help provided:

1. Full help. Available when entering a command argument (e.g. 'show ?'). This will describe each possible argument.

2. Partial help. Available when an abbreviated argument is entered. This will display which arguments match the input (e.g. 'show ve?').

```
rfs7000-37FABE>
```
1.3 Using the No Command

INTRODUCTION
Almost every command has a no form. Use no to disable a feature or function or return it to its default. Use the command without the no keyword to re-enable a disabled feature.

1.3.1 Basic Conventions
Keep the following conventions in mind while working within the CLI structure:
• Use ? at the end of a command to display available sub-modes. Type the first few characters of the sub-mode and press the tab key to add the sub-mode. Continue using ? until you reach the last sub-mode.
• Pre-defined CLI commands and keywords are case-insensitive: cfg = Cfg = CFG. However (for clarity), CLI commands and keywords are displayed (in this guide) using mixed case. For example, apPolicy, trapHosts, channelInfo.
• Enter commands in uppercase, lowercase, or mixed case. Only passwords are case sensitive.

1.4 Using CLI Editing Features and Shortcuts

INTRODUCTION
A variety of shortcuts and edit features are available. The following sections describe these features:
• Moving the Cursor on the Command Line
• Completing a Partial Command Name
• Command Output Pagination

1.4.1 Moving the Cursor on the Command Line

Using CLI Editing Features and Shortcuts
The following table shows the key combinations or sequences to move the command line cursor. Ctrl defines the control key, which must be pressed simultaneously with its associated letter key. Esc means the escape key (which must be pressed first), followed by its associated letter key. Keys are not case sensitive. Specific letters are used to provide an easy way of remembering their functions.

Table 1.2 Keystrokes Details

<table>
<thead>
<tr>
<th>Keystrokes</th>
<th>Function Summary</th>
<th>Function Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left Arrow</td>
<td>Back character</td>
<td>Moves the cursor one character to the left</td>
</tr>
<tr>
<td>or Ctrl-B</td>
<td></td>
<td>When entering a command that extends beyond a single line, press the Left Arrow or Ctrl-B keys repeatedly to move back to the system prompt.</td>
</tr>
<tr>
<td>Right Arrow or Ctrl-F</td>
<td>Forward character</td>
<td>Moves the cursor one character to the right</td>
</tr>
<tr>
<td>Esc- B</td>
<td>Back word</td>
<td>Moves the cursor back one word</td>
</tr>
<tr>
<td>Esc- F</td>
<td>Forward word</td>
<td>Moves the cursor forward one word</td>
</tr>
<tr>
<td>Ctrl-A</td>
<td>Beginning of line</td>
<td>Moves the cursor to the beginning of the command line</td>
</tr>
<tr>
<td>Ctrl-E</td>
<td>End of line</td>
<td>Moves the cursor to the end of the command line</td>
</tr>
<tr>
<td>Ctrl-D</td>
<td></td>
<td>Deletes the current character</td>
</tr>
<tr>
<td>Ctrl-U</td>
<td></td>
<td>Deletes text up to cursor</td>
</tr>
</tbody>
</table>
1.4.2 Completing a Partial Command Name

Using CLI Editing Features and Shortcuts

If you cannot remember a command name (or if you want to reduce the amount of typing you have to perform), enter the first few letters of a command, then press the Tab key. The command line parser completes the command if the string entered is unique to the command mode. If your keyboard does not have a Tab key, press Ctrl-L.

The CLI recognizes a command once you have entered enough characters to make the command unique. If you enter "conf" within the privileged EXEC mode, the CLI associates the entry with the configure command, since only the configure command begins with conf.

In the following example, the CLI recognizes a unique string in the privileged EXEC mode when the Tab key is pressed:

```
rfs7000-37FABE#conf[TAB]
rfs7000-37FABE#configure
```

When using the command completion feature, the CLI displays the full command name. The command is not executed until the Return or Enter key is pressed. Modify the command if the full command was not what you intended in the abbreviation. If entering a set of characters (indicating more than one command), the system lists all commands beginning with that set of characters.

Enter a question mark (?) to obtain a list of commands beginning with that set of characters. Do not leave a space between the last letter and the question mark (?).

For example, entering U lists all commands available in the current command mode:

```
rfs7000-37FABE#cc?
commit     Commit all changes made in this session
configure  Enter configuration mode
connect    Open a console connection to a remote device
copy       Copy from one file to another
```

faithful: The characters entered before the question mark are reprinted to the screen to complete the command entry.
1.4.3 Command Output Pagination

Using CLI Editing Features and Shortcuts

Output often extends beyond the visible screen length. For cases where output continues beyond the screen, the output is paused and a `--More--` prompt displays at the bottom of the screen. To resume the output, press the Enter key to scroll down one line or press the Spacebar to display the next full screen of output.

1.5 Using CLI to Create Profiles and Enable Remote Administration

INTRODUCTION

The following sections describe the following essential procedures:

- Creating Profiles
- Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface
- Enabling Remote Administration

1.5.1 Creating Profiles

Using CLI to Create Profiles and Enable Remote Administration

Profiles are sort of a ‘template’ representation of configuration. The system has:

- a default profile for each of the following devices:
  - RFS4000, RFS6000, RFS7000
- a default profile for each of the following service platforms:
  - NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
- a default profile for each of the following access points:
  - AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX

To modify the default profile to assign an IP address to the management port:

```
rfs7000-37FABE(config)#profile rfs7000 default-rfs7000
rfs7000-37FABE(config-profile-default-rfs7000)#interface me1
rfs7000-37FABE(config-profile-default-rfs7000-if-me1)#ip address 172.16.10.2/24
rfs7000-37FABE(config-profile-default-rfs7000-if-me1)#commit
rfs7000-37FABE(config-profile-default-rfs7000)#exit
```

The following command displays a default AP71XX profile:

```
rfs7000-37FABE(config)#profile ap71xx default-ap71xx
rfs7000-37FABE(config-profile-default-ap71xx)#
rfs7000-37FABE(config-profile-default-ap71xx)#show context
profile ap71xx default-ap71xx
autoinstall configuration
autoinstall firmware
device-upgrade persist-images
crypto ikev1 policy ikev1-default
    isakmp-proposal default encryption aes-256 group 2 hash sha
crypto ikev2 policy ikev2-default
    isakmp-proposal default encryption aes-256 group 2 hash sha
crypto ipsec transform-set default esp-aes-256 esp-sha-hmac
crypto ikev1 remote-vpn
crypto ikev2 remote-vpn
crypto auto-ipsec-secure
crypto remote-vpn-client
interface radio1
```
interface radio2
interface radio3
interface ge1
ip dhcp trust
qos trust dscp
qos trust 802.1p
interface ge2
ip dhcp trust
qos trust dscp

--More--

1.5.2 Changing the default profile by creating vlan 150 and mapping to ge3

Physical interface

Using CLI to Create Profiles and Enable Remote Administration

Logon to the controller in config mode and follow the procedure below:

rfs7000-37FABE(config-profile-default-rfs7000)#interface vlan 150
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan150)#ip address 192.168.150.20/24
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan150)#exit
rfs7000-37FABE(config-profile-default-rfs7000)#interface ge 3
rfs7000-37FABE(config-profile-default-rfs7000-if-ge3)#switchport access vlan 150
rfs7000-37FABE(config-profile-default-rfs7000-if-ge3)#commit write
[OK]
rfs7000-37FABE(config-profile-default-rfs7000-if-ge3)#show interface vlan 150

Interface vlan150 is UP
Hardware-type: vlan, Mode: Layer 3, Address: 00-15-70-37-FA-BE
Index: 8, Metric: 1, MTU: 1500
IP-Address: 192.168.150.20/24
input packets 43, bytes 12828, dropped 0, multicast packets 0
input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
output packets 0, bytes 0, dropped 0
output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
collisions 0

1.5.2.1 Viewing Configured APs

To view previously configured APs, enter the following command:

rfs7000-6DCD4B#show wireless ap configured

<table>
<thead>
<tr>
<th>IDX</th>
<th>NAME</th>
<th>MAC</th>
<th>PROFILE</th>
<th>RF-DOMAIN</th>
<th>ADOPTED-BY</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ap7131-11E6C4</td>
<td>00-23-68-11-B6-C4</td>
<td>default-ap71xx</td>
<td>default</td>
<td>un-adopted</td>
</tr>
<tr>
<td>2</td>
<td>ap8132-711728</td>
<td>B4-C7-99-71-17-28</td>
<td>default-ap81xx</td>
<td>00-15-70-81-74-2D</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>ap81xx-74B45C</td>
<td>B4-C7-99-74-B4-5C</td>
<td>default-ap81xx</td>
<td>default</td>
<td>un-adopted</td>
</tr>
</tbody>
</table>

rfs7000-6DCD4B#

1.5.3 Enabling Remote Administration

Using CLI to Create Profiles and Enable Remote Administration

A terminal server may function in remote administration mode if either the terminal services role is not installed on
the machine or the client used to invoke the session has enabled the admin controller.

• A terminal emulation program running on a computer connected to the serial port on the controller. The serial
port is located on the front of the controller.

• A Telnet session through a Secure Shell (SSH) over a network. The Telnet session may or may not use SSH
depending on how the controller is configured. It is recommended you use SSH for remote administration tasks.

This section is organized into the following sub sections:

• Configuring Telnet for Management Access
• Configuring SSH
1.5.3.1 Configuring Telnet for Management Access

**Enabling Remote Administration**

Login through the serial console. Perform the following:

1. A session generally begins in the USER EXEC mode (one of the two access levels of the EXEC mode).

2. Access the GLOBAL CONFIG mode from the PRIV EXEC mode.

   ```
   rfs7000-37FABE>en
   rfs7000-37FABE#configure terminal
   Enter configuration commands, one per line. End with CNTL/Z.
   ```

3. Go to ‘default-management-policy’ mode.

   ```
   rfs7000-37FABE(config)#management-policy ?
   rfs7000-37FABE(config)#management-policy default
   rfs7000-37FABE(config-management-policy-default)#
   ```

4. Enter Telnet and the port number at the command prompt. The port number is optional. The default port is 23. Commit the changes after every command. Telnet is enabled.

   ```
   rfs7000-37FABE(config-management-policy-default)#telnet
   rfs7000-37FABE(config-management-policy-default)#commit write
   ```

5. Connect to the controller through Telnet using its configured IP address. Use the following credentials when logging on to the device for the first time:

<table>
<thead>
<tr>
<th>User Name</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin</td>
<td>admin123</td>
</tr>
</tbody>
</table>

   When logging into the controller for the first time, you are prompted to change the password.

   To change user credentials:

1. Enter the username, password, role and access details.

   ```
   rfs7000-37FABE(config-management-policy-default)#user testuser password test@123
   role helpdesk access all
   rfs7000-37FABE(config-management-policy-default)#commit
   rfs7000-37FABE(config-management-policy-default)#show context
   management-policy default
   telnet
   http server
   https server
   ssh
   user admin password 1
   ba7da2bf2f7945af1d3ae1b8b762b541bd5bac1f80a54c4d4488f38ed44b91ecd role superuser
   access all
   user operator password 1
   0be97e9e30d29d8c4733e7c05f74a7be54570c2450e855cea1a696b0558a40401 role monitor access all
   user testuser password 1
   bca381b5b93cdddb0c209e1da8a9d837fa09bfae14cc987438a4d144cb516ffcb role helpdesk access all
   snmp-server community public ro
   snmp-server community private rw
   snmp-server user snmptrap v3 encrypted des auth md5 0 test@123
   snmp-server user snmpoperator v3 encrypted des auth md5 0 operator
   snmp-server user snmpmanager v3 encrypted des auth md5 0 test@123
   rfs7000-37FABE(config-management-policy-default)#
   ```

2. Logon to the Telnet console and provide the user details configured in the previous step to access the controller.

   ```
   rfs7000 release 5.8.1.0-007D
   rfs7000-37FABE login: testuser
   Password:
   Welcome to CLI
   Starting CLI...
   rfs7000-37FABE>
   ```
1.5.3.2 Configuring SSH

*Enabling Remote Administration*

By default, SSH is enabled from the factory settings on the controller. The controller requires an IP address and login credentials.

To enable SSH access in the default profile, login through the serial console. Perform the following:

1. Access the GLOBAL CONFIG mode from the PRIV EXEC mode.

   ```
   rfs7000-37FABE>en
   rfs7000-37FABE#configure
   Enter configuration commands, one per line. End with CNTL/Z.
   ```

2. Go to 'config-management-policy-default' mode.

   ```
   rfs7000-37FABE(config)#management-policy default
   rfs7000-37FABE(config-management-policy-default)#
   ```

3. Enter SSH at the command prompt.

   ```
   rfs7000-37FABE(config-management-policy-default)#ssh
   ```

4. Log into the controller through SSH using appropriate credentials.

5. Use the following credentials when logging on to the device for the first time:

<table>
<thead>
<tr>
<th>User Name</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin</td>
<td>admin123</td>
</tr>
</tbody>
</table>

When logging into the controller for the first time, you are prompted to change the password.

To change the user credentials:

```
rfs7000 release 5.8.1.0-007D
rfs7000-37FABE login: testuser
Password:
Welcome to CLI
Starting CLI...
rfs7000-37FABE>
```
CHAPTER 2
USER EXEC MODE COMMANDS

Logging in to the wireless controller places you within the USER EXEC command mode. Typically, a login requires a user name and password. You have three login attempts before the connection attempt is refused. USER EXEC commands (available at the user level) are a subset of the commands available at the privileged level. In general, USER EXEC commands allow you to connect to remote devices, perform basic tests, and list system information.

To list available USER EXEC commands, use ? at the command prompt. The USER EXEC prompt consists of the device host name followed by an angle bracket (>).

<DEVICE>>?
Command commands:
  captive-portal-page-upload  Captive portal advanced page upload
  change-passwd               Change password
  clear                       Clear
  clock                       Configure software system clock
  cluster                     Cluster commands
  commit                      Commit all changes made in this session
  connect                     Open a console connection to a remote device
  create-cluster              Create a cluster
  crypto                      Encryption related commands
  crypto-cmp-cert-update      Update the cmp certs
  database                    Database
  database-backup             Backup database
  database-restore            Restore database
  debug                       Debugging functions
  device-upgrade              Device firmware upgrade
  disable                     Turn off privileged mode command
  enable                      Turn on privileged mode command
  file-sync                   File sync between controller and adoptees
  help                        Description of the interactive help system
  join-cluster                Join the cluster
  l2tpv3                      L2tpv3 protocol
  logging                     Modify message logging facilities
  mint                        MiNT protocol
  no                          Negate a command or set its defaults
  on                          On RF-Domain
  opendns                     Opendns username/password configuration
  page                        Toggle paging
  ping                        Send ICMP echo messages
  ping6                       Send ICMPv6 echo messages
  revert                      Revert changes
  service                     Service Commands
  show                        Show running system information
  smart-cache                 Content Cache Operation
  ssh                         Open an ssh connection
  telnet                      Open a telnet connection
  terminal                   Set terminal line parameters
<table>
<thead>
<tr>

### 2.1 User Exec Commands

The following table summarizes the User Exec Mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal-page-upload</td>
<td>Uploads captive portal advanced pages</td>
<td>page 2-5</td>
</tr>
<tr>
<td>change-passwd</td>
<td>Changes the password of a logged user</td>
<td>page 2-8</td>
</tr>
<tr>
<td>clear</td>
<td>Resets the last saved command</td>
<td>page 2-9</td>
</tr>
<tr>
<td>clock</td>
<td>Configures the system clock</td>
<td>page 2-20</td>
</tr>
<tr>
<td>cluster</td>
<td>Accesses the cluster context</td>
<td>page 2-21</td>
</tr>
<tr>
<td>connect</td>
<td>Establishes a console connection to a remote device</td>
<td>page 2-22</td>
</tr>
<tr>
<td>create-cluster</td>
<td>Creates a new cluster on a specified device</td>
<td>page 2-23</td>
</tr>
<tr>
<td>crypto</td>
<td>Enables encryption</td>
<td>page 2-25</td>
</tr>
<tr>
<td>crypto-cmp-cert-update</td>
<td>Triggers a CMP certificate update on a specified device or devices</td>
<td>page 2-34</td>
</tr>
<tr>
<td>database</td>
<td>Enables automatic repairing (vacuuming) and dropping of databases</td>
<td>page 2-35</td>
</tr>
<tr>
<td>database-backup</td>
<td>Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server</td>
<td>page 2-36</td>
</tr>
<tr>
<td>database-restore</td>
<td>Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored to the original database.</td>
<td>page 2-37</td>
</tr>
<tr>
<td>device-upgrade</td>
<td>Configures device firmware upgrade settings</td>
<td>page 2-38</td>
</tr>
<tr>
<td>disable</td>
<td>Turns off (disables) the privileged mode command set</td>
<td>page 2-48</td>
</tr>
<tr>
<td>enable</td>
<td>Turns on (enables) the privileged mode command set</td>
<td>page 2-49</td>
</tr>
<tr>
<td>file-sync</td>
<td>Configures parameters enabling syncing of PKCS#12 certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points</td>
<td>page 2-50</td>
</tr>
<tr>
<td>join-cluster</td>
<td>Adds a device (access point, wireless controller, or service platform) to an existing cluster of devices</td>
<td>page 2-52</td>
</tr>
<tr>
<td>l2tpv3</td>
<td>Establishes or brings down Layer 2 Tunneling Protocol Version 3 (L2TPV3) tunnels</td>
<td>page 2-54</td>
</tr>
<tr>
<td>logging</td>
<td>Modifies message logging facilities</td>
<td>page 2-56</td>
</tr>
<tr>
<td>mint</td>
<td>Configures MiNT protocol</td>
<td>page 2-58</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or sets its default</td>
<td>page 2-60</td>
</tr>
<tr>
<td>on</td>
<td>Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, show</td>
<td>page 2-62</td>
</tr>
</tbody>
</table>
### Table 2.1 User Exec Mode Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>opendns</strong></td>
<td>Connects to the OpenDNS site using OpenDNS registered credentials (username, password) to obtain the device-id. This command is a part of the process integrating access points and controllers with the OpenDNS service.</td>
<td>page 2-63</td>
</tr>
<tr>
<td><strong>page</strong></td>
<td>Toggles a device’s (access point, wireless controller, or service platform) paging function</td>
<td>page 2-65</td>
</tr>
<tr>
<td><strong>ping</strong></td>
<td>Sends ICMP echo messages to a user-specified location</td>
<td>page 2-66</td>
</tr>
<tr>
<td><strong>ping6</strong></td>
<td>Sends ICMPv6 echo messages to a user-specified IPv6 address</td>
<td>page 2-68</td>
</tr>
<tr>
<td><strong>ssh</strong></td>
<td>Opens an SSH connection between two network devices</td>
<td>page 2-69</td>
</tr>
<tr>
<td><strong>telnet</strong></td>
<td>Opens a Telnet session</td>
<td>page 2-70</td>
</tr>
<tr>
<td><strong>terminal</strong></td>
<td>Sets the length and width of the terminal window</td>
<td>page 2-71</td>
</tr>
<tr>
<td><strong>time-it</strong></td>
<td>Verifies the time taken by a particular command between request and response</td>
<td>page 2-72</td>
</tr>
<tr>
<td><strong>traceroute</strong></td>
<td>Traces the route to its defined destination</td>
<td>page 2-73</td>
</tr>
<tr>
<td><strong>traceroute6</strong></td>
<td>Traces the route to a specified IPv6 destination</td>
<td>page 2-74</td>
</tr>
<tr>
<td><strong>watch</strong></td>
<td>Repeats a specific CLI command at a periodic interval</td>
<td>page 2-75</td>
</tr>
<tr>
<td><strong>smart-cache</strong></td>
<td>Pre-fetches content cache from the specified list of URLs. This command is specific to the NX45XX, NX65XX, NX9XXX series service platforms.</td>
<td>page 2-77</td>
</tr>
<tr>
<td><strong>virtual-machine</strong></td>
<td>Installs, configures, and monitors the status of virtual machines (VMs). This command is specific to the NX45XX, NX65XX, NX9XXX series service platforms.</td>
<td>page 2-78</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.

**NOTE:** The input parameter <_HOSTNAME>, if used in syntaxes across this chapter, cannot include an underscore (_) character.
2.1.1 captive-portal-page-upload

**User Exec Commands**

Uploads captive portal advanced pages to connected access points. Use this command to provide connected access points with specific captive portal configurations so that they can successfully provision login, welcome, and condition pages to requesting clients attempting to access the wireless network using the captive portal.

---

**NOTE:** Ensure that the captive portal pages uploaded are *.tar files.

---

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

captive-portal-page-upload  [<CAPTIVE-PORTAL-NAME>|cancel-upload|delete-file|load-file]
captive-portal-page-upload  <CAPTIVE-PORTAL-NAME>  [<MAC/HOSTNAME]|all|rf-domain]
captive-portal-page-upload  <CAPTIVE-PORTAL-NAME>  [<MAC/HOSTNAME]|all]
{upload-time  <TIME>}
captive-portal-page-upload  <CAPTIVE-PORTAL-NAME>  rf-domain  [<DOMAIN-NAME]|all]
{from-controller}  {(upload-time  <TIME>))}
captive-portal-page-upload cancel-upload  [<MAC/HOSTNAME]|all|on rf-domain
{[<DOMAIN-NAME]|all]}]
captive-portal-page-upload delete-file  <CAPTIVE-PORTAL-NAME>  <FILE-NAME>
captive-portal-page-upload load-file  <CAPTIVE-PORTAL-NAME>  <URL>

**Parameters**
- captive-portal-page-upload  <CAPTIVE-PORTAL-NAME>  [<MAC/HOSTNAME]|all]
{upload-time  <TIME>)}

<table>
<thead>
<tr>
<th>captive-portal-page-upload  &lt;CAPTIVE-PORTAL-NAME&gt;</th>
<th>Uploads advanced pages of the captive-portal identified by the &lt;CAPTIVE-PORTAL-NAME&gt; parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;MAC/HOSTNAME&gt;</td>
<td>Uploads to a specified AP</td>
</tr>
<tr>
<td>all</td>
<td>Uploads to all APs</td>
</tr>
<tr>
<td>upload-time &lt;TIME&gt;</td>
<td>Optional. Configures an AP upload time</td>
</tr>
</tbody>
</table>

- <CAPTIVE-PORTAL-NAME> — Specify the captive portal’s name (should be existing and configured).
- <MAC/HOSTNAME> — Specify AP’s MAC address or hostname.
- <TIME> — Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format.
**captive-portal-page-upload** `<CAPTIVE-PORTAL-NAME>` **rf-domain** `[<DOMAIN-NAME>|all]`

- **from-controller** `{(upload-time <TIME>)}`

  Uploads advanced pages of the captive portal identified by the `<CAPTIVE-PORTAL-NAME>` parameter
  - `<CAPTIVE-PORTAL-NAME>` – Specify captive portal’s name (should be existing and configured).

<table>
<thead>
<tr>
<th>captive-portal-page-upload</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;CAPTIVE-PORTAL-NAME&gt;</code></td>
</tr>
</tbody>
</table>

- **rf-domain** `[<DOMAIN-NAME>|all]` Uploads to all APs within a specified RF Domain or all RF Domains
  - `<DOMAIN-NAME>` – Uploads to APs within a specified RF Domain. Specify the RF Domain name.
  - `all` – Uploads to APs across all RF Domains

<table>
<thead>
<tr>
<th>rf-domain</th>
</tr>
</thead>
<tbody>
<tr>
<td>`[&lt;DOMAIN-NAME&gt;</td>
</tr>
</tbody>
</table>

- **from-controller** Optional. Uploads to APs from the adopted device

<table>
<thead>
<tr>
<th>from-controller</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional. Uploads to APs from the adopted device</td>
</tr>
</tbody>
</table>

- **upload-time** `<TIME>` Optional. Configures an AP upload time
  - `<TIME>` – Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format.

<table>
<thead>
<tr>
<th>upload-time</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;TIME&gt;</code></td>
</tr>
</tbody>
</table>

**captive-portal-page-upload cancel-upload** `[<MAC/ HOSTNAME>|all|on rf-domain `[<DOMAIN-NAME]|all]]`

- Select one of the following options:
  - `<MAC/ HOSTNAME>` – Cancels scheduled upload to a specified AP. Specify the AP’s MAC address or hostname.
  - `all` – Cancels all scheduled AP uploads
  - `on rf-domain` – Cancels all scheduled uploads within a specified RF Domain or all RF Domains
    - `<DOMAIN-NAME>` – Cancels scheduled uploads within a specified RF Domain. Specify RF Domain name.
    - `all` – Cancels scheduled uploads across all RF Domains

<table>
<thead>
<tr>
<th>cancel-upload</th>
</tr>
</thead>
<tbody>
<tr>
<td>`[&lt;MAC/ HOSTNAME&gt;</td>
</tr>
</tbody>
</table>

**captive-portal-page-upload delete-file** `<CAPTIVE-PORTAL-NAME>` `<FILE-NAME>`

- Deletes a captive portal’s, identified by the `<CAPTIVE-PORTAL-NAME>` keyword, uploaded internal page files
  - `<CAPTIVE-PORTAL-NAME>` – Specify the captive portal’s name.
  - `<FILE-NAME>` – Specify the file name. The specified internal captive portal page is deleted.

<table>
<thead>
<tr>
<th>captive-portal-page-upload delete-file</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> <code>&lt;FILE-NAME&gt;</code></td>
</tr>
</tbody>
</table>

**captive-portal-page-upload load-file** `<CAPTIVE-PORTAL-NAME>` `<URL>`

- Loads captive-portal advanced pages
  - Specify the captive portal’s name and location. The captive portal should be existing and configured.
  - `<URL>` – Specifies location of the captive-portal’s advanced pages. Use one of the following formats to specify the location:

<table>
<thead>
<tr>
<th>captive-portal-page-upload load-file</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> <code>&lt;URL&gt;</code></td>
</tr>
</tbody>
</table>
IPv4 URLs:
  - tftp://<hostname|IP>[:port]/path/file
  - ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
  - sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
  - http://<hostname|IP>[:port]/path/file
  - cf:/path/file
  - usb<n>:/path/file

IPv6 URLs:
  - tftp://<hostname>[IPv6]>[:port]/path/file
  - ftp://<user>:<passwd>@<hostname>[IPv6]>[:port]/path/file
  - sftp://<user>:<passwd>@<hostname>[IPv6]>[:port]/path/file

**Note:** The captive portal pages are downloaded to the controller from the location specified here. After downloading use the `captive-portal-page-upload > <CAPTIVE-PORTAL-NAME> > <DEVICE-OR-DOMAIN-NAME>` command to upload these pages to APs.

**Examples**

```
ap6562-B1A214>captive-portal-page-upload load-file captive_portal_test tftp://89.89.89.17/pages_new_only.tar
```

```
ap6562-B1A214>show captive-portal-page-upload load-image-status

2.1.2 change-passwd

User Exec Commands

Changes the password of a logged user. When this command is executed without any parameters, the password can be changed interactively.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
change-passwd \{<OLD-PASSWORD>\} <NEW-PASSWORD>

Parameters
- change-passwd \{<OLD-PASSWORD>\} <NEW-PASSWORD>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;OLD-PASSWORD&gt;</td>
<td>Optional. Specify the password to be changed.</td>
</tr>
<tr>
<td>&lt;NEW-PASSWORD&gt;</td>
<td>Specify the new password.</td>
</tr>
</tbody>
</table>

Note: The password can also be changed interactively. To do so, press [Enter] after the command.

Usage Guidelines

A password must be from 1 - 64 characters.

Examples
rfs7000-37FABE>change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory\{write memory\} to be persistent.
rfs7000-37FABE#write memory
OK
rfs7000-37FABE>
2.1.3 clear

**User Exec Commands**

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared, using this command, depends on the mode where the clear command is executed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

clear [arp-cache|bonjour|cdp|counters|crypto|event-history|gre|ip|ipv6|lldp|mac-address-table|mint|role|rtls|smart-cache|spanning-tree|traffic-shape|vrrp]
clear arp-cache {on <DEVICE-NAME>}
clear bonjour cache {on <DEVICE-NAME>}
clear [cdp|lldp] neighbors {on <DEVICE-NAME>}
clear counters [ap|radio|wireless-client]
clear counters [ap {<MAC>}|radio {<MAC>/DEVICE-NAME>} {<1-X>]|wireless-client {<MAC>}]
{on <DEVICE-OR-DOMAIN-NAME>}
clear crypto [ike|ipsec] sa
clear crypto ike sa [{<IP>}|all] {on <DEVICE-NAME>}
clear crypto ipsec sa {on <DEVICE-NAME>}
clear event-history
clear gre stats {on <DEVICE-NAME>}
clear ip [bgp|dhcp|ospf]
clear ip bgp [{<IP>}|all external|process]
clear ip bgp [{<IP>}|all external] {in|on|out|soft}
clear ip bgp [{<IP>}|all external] {in prefix-filter} {on <DEVICE-NAME>}
clear ip bgp [{<IP>}|all external] {out} {on <DEVICE-NAME>}
clear ip bgp [{<IP>}|all external] {soft {in|out}} {on <DEVICE-NAME>}
clear ip bgp process {on <DEVICE-NAME>}
clear ip dhcp bindings [{<IP>}|all] {on <DEVICE-NAME>}
clear ip ospf process {on <DEVICE-NAME>}
clear ipv6 neighbor-cache {on <DEVICE-NAME>}
clear mac-address-table {address|interface|vlan} {on <DEVICE-NAME>}
clear mac-address-table {address <MAC>|vlan <1-4094>} {on <DEVICE-NAME>}
clear mac-address-table {interface [<IF-NAME>|ge <1-X]|port-channel <1-X>|t1e1 <1-4>|<1-1>|up <1-X>|vmif <1-X>|xge <1-4>} {on <DEVICE-NAME>}
clear mint mlcp history {on <DEVICE-NAME>}
clear role ldap-stats {on <DEVICE-NAME>}

**NOTE:** When using the `clear` command, refer to the interface details provided in Chapter 7, `interface`.
clear rtls [aeroscout|ekahau] 
{<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>}}

clear spanning-tree detected-protocols {interface|on} 
{on <DEVICE-NAME>}

clear spanning-tree detected-protocols {interface [{INTERFACE-NAME}|ge <1-X>|me1|port-channel <1-X>|pppoe1|up|vian <1-4094>|wwan1|vmif <1-X}> {on <DEVICE-NAME>}

clear traffic-shape statistics class <1-4> {on <DEVICE-NAME>}

clear vrrp [error-stats|stats] {on <DEVICE-NAME>}

The following clear command is specific to the NX45XX, NX65XX, and NX9XXX series service platforms:
clear smart-cache storage [all|url-regex <WORD>] {on <DEVICE-NAME>}

Parameters

<table>
<thead>
<tr>
<th>clear arp-cache {on &lt;DEVICE-NAME&gt;}</th>
</tr>
</thead>
<tbody>
<tr>
<td>arp-cache</td>
</tr>
<tr>
<td>Clears Address Resolution Protocol (ARP) cache entries on a device. This protocol matches layer 3 IP addresses to layer 2 MAC addresses.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt; Optional. Clears ARP cache entries on a specified device</td>
</tr>
<tr>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>clear bonjour cache {on &lt;DEVICE-NAME&gt;}</th>
</tr>
</thead>
<tbody>
<tr>
<td>bonjour cache</td>
</tr>
<tr>
<td>Clears all Bonjour cached statistics. Once cleared the system has to re-discover available Bonjour services.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt; Optional. Clears all Bonjour cached statistics on a specified device</td>
</tr>
<tr>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

| clear [cdp|lldp] neighbors {on <DEVICE-NAME>} |
|-----------------------------------------------|
| cdp                                            |
| Clears Cisco Discovery Protocol (CDP) table entries |
| lldp                                           |
| Clears Link Layer Discovery Protocol (LLDP) table entries |
| neighbors                                      |
| Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step |
| on <DEVICE-NAME> Optional. Clears CDP or LLDP neighbor table entries on a specified device |
| • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

| clear counters [ap {<MAC>}|radio {<MAC/DEVICE-NAME>} {<1-X>}|wireless-client {<MAC>}] {on <DEVICE-OR-DOMAIN-NAME>} |
|--------------------------------------------------------|
| counters                                               |
| Clears counters based on the parameters passed. The options are: AP, radio, and wireless clients. |
| ap <MAC>                                               |
| Clears counters for all APs or a specified AP         |
| • <MAC> – Optional. Specify the AP’s MAC address.     |

Note: If no MAC address is specified, all AP counters are cleared.
### USER EXEC MODE COMMANDS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear crypto ike sa</code> [IP]</td>
<td>Clears encryption module database for IKE security associations (SAs) for the peer identified by the IP keyword.</td>
</tr>
<tr>
<td><code>&lt;MAC/DEVICE-NAME&gt;</code></td>
<td>Clears radio interface counters on a specified device or on all devices.</td>
</tr>
<tr>
<td><code>&lt;1-X&gt;</code></td>
<td>Specifies the radio interface by its index.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>Clears IKE SA entries on a specified device.</td>
</tr>
<tr>
<td><code>clear crypto ipsec sa</code> [IP]</td>
<td>Clears encryption module database for IPSec SAs.</td>
</tr>
<tr>
<td><code>&lt;MAC&gt;</code></td>
<td>Clears counters for all wireless clients or a specified wireless client.</td>
</tr>
<tr>
<td><code>wireless-client</code></td>
<td>Specifies the wireless client's MAC address.</td>
</tr>
<tr>
<td><code>&lt;MAC&gt;</code></td>
<td>Clears GRE tunnel statistics on a specified device.</td>
</tr>
<tr>
<td><code>gre stats</code></td>
<td>ClearsGRE tunnel statistics.</td>
</tr>
<tr>
<td><code>&lt;DEVICE-NAME&gt;</code></td>
<td>Clears event history cache entries.</td>
</tr>
<tr>
<td><code>event-history</code></td>
<td>Specifies the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Note:** If no device name or MAC address is specified, all radio interface counters are cleared.

**Example:**
```
clear crypto ike sa [IP] all {on <DEVICE-NAME>}
```

**Note:** If no MAC address is specified, all wireless client counters are cleared.

**Example:**
```
clear crypto ipsec sa {on <DEVICE-NAME>}
```

**Note:** If no MAC address is specified, all GRE tunnel statistics are cleared.

**Example:**
```
clear gre stats {on <DEVICE-NAME>}
```

**Note:** If no device name is specified, all event history cache entries are cleared.

**Example:**
```
clear event-history
```
- clear ip bgp [<IP>|all|external] {in prefix-filter} {on <DEVICE-NAME>}

```
ip bgp [<IP>|all|external] Clears on-going BGP sessions based on the option selected
  • <IP> – Clears BGP session with the peer identified by the <IP> keyword. Specify the BGP peer’s IP address.
  • all – Clears all BGP peer sessions
  • external – Clears external BGP (eBGP) peer sessions
This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, NX9000, NX9600 platforms.
Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy etc.) take effect only after on-going BGP sessions are cleared.
The clear > ip > bgp command clears BGP sessions. To reduce lose of route updates during the process, use the ‘soft’ option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.
in prefix-filter Optional. Clears inbound route updates
  • prefix-filter – Optional. Clears the existing Outbound Route Filtering (ORF) prefix-list
on <DEVICE-NAME> Optional. Clears route updates on a specified device
  • <DEVICE-NAME> – Specify the name of the AP or service platform.
```

- clear ip bgp [<IP>|all|external] {out} {on <DEVICE-NAME>}

```
out Optional. Clears outbound route updates. Optionally specify the device on which to execute this command.
on <DEVICE-NAME> The following keyword is recursive and optional.
  • on <DEVICE-NAME> – Optional. Clears BGP sessions on a specified device
  • <DEVICE-NAME> – Specify the name of the AP or service platform.
```

- clear ip bgp [<IP>|all|external] {soft {in|out}} {on <DEVICE-NAME>}

```
ip bgp [ <IP>|all|external] Clears on-going BGP sessions based on the option selected
  • <IP> – Clears the BGP peer session with the peer identified by the <IP> keyword. Specify the BGP peer’s IP address.
  • all – Clears all BGP peer sessions
  • Contd..
<table>
<thead>
<tr>
<th>USER EXEC MODE COMMANDS 2-13</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>clear ip bgp process</strong> {on &lt;DEVICE-NAME&gt;}</td>
</tr>
<tr>
<td><strong>ip bgp process</strong> clears all BGP processes running. This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, NX9000, and NX9600 platforms.</td>
</tr>
<tr>
<td><strong>on &lt;DEVICE-NAME&gt;</strong> Optional. Clears all BGP processes on a specified device</td>
</tr>
<tr>
<td><strong>&lt;DEVICE-NAME&gt;</strong> – Specify the name of the AP or service platform.</td>
</tr>
<tr>
<td><strong>clear ip dhcp bindings</strong> [&lt;IP&gt;</td>
</tr>
<tr>
<td><strong>ip dhcp bindings</strong> clears DHCP connections and server bindings.</td>
</tr>
<tr>
<td><strong>&lt;IP&gt;</strong> clears specific address binding entries. Specify the IP address to clear binding entries.</td>
</tr>
<tr>
<td><strong>all</strong> clears all address binding entries.</td>
</tr>
<tr>
<td><strong>on &lt;DEVICE-NAME&gt;</strong> Optional. Clears a specified address binding or all address bindings on a specified device</td>
</tr>
<tr>
<td><strong>&lt;DEVICE-NAME&gt;</strong> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
<tr>
<td><strong>clear ip ospf process</strong> {on &lt;DEVICE-NAME&gt;}</td>
</tr>
<tr>
<td><strong>ip ospf process</strong> clears already enabled Open Shortest Path First (OSPF) process and restarts the process.</td>
</tr>
<tr>
<td><strong>on &lt;DEVICE-NAME&gt;</strong> Optional. Clears OSPF process on a specified device</td>
</tr>
<tr>
<td>OSPF is a link-state interior gateway protocol (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighboring routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer, which makes routing decisions based solely on the destination IP address found in IP packets.</td>
</tr>
<tr>
<td><strong>&lt;DEVICE-NAME&gt;</strong> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>
- **clear ipv6 neighbor-cache {on <DEVICE-NAME>}**
  
  clears IPv6 neighbor cache entries

- **clear ipv6 neighbor-cache {on <DEVICE-NAME>}**
  
  Optional. Clears IPv6 neighbor cache entries on a specified device
  
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- **clear mac-address-table {address <MAC>|vlan <1-4094>} {on <DEVICE-NAME>}**
  
  clears the MAC address forwarding table

  • address <MAC> Optional. Clears a specified MAC address from the MAC address table.
    
    • <MAC> – Specify the MAC address in one of the following formats: AA-BB-CC-DD-EE-FF or AA:BB:CC:DD:EE:FF or AABB.CCDD.EEFF

  • vlan <1-4094> Optional. Clears all MAC addresses for a specified VLAN
    
    • <1-4094> – Specify the VLAN ID from 1 - 4094.

  • on <DEVICE-NAME> Optional. Clears a single MAC entry or all MAC entries, for the specified VLAN on a specified device
    
    • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

    On the NX45XX and NX65XX series service platform, this command clears the MAC address forwarding table on the device's hardware and not the dataplane.

- **clear mac-address-table interface [{<IF-NAME>|ge <1-X>|port-channel <1-X>|t1e1 <1-4> <1-1>|up <1-2>|vmif <1-X>|xge <1-4>} {on <DEVICE-NAME>}**
  
  clears the MAC address forwarding table

  • interface Clears all MAC addresses for the selected interface. Use the options available to specify the interface.

  • <IF-NAME> Clears MAC address forwarding table for the specified layer 2 interface (Ethernet port)
    
    • <IF-NAME> – Specify the layer 2 interface name.

  • ge <1-X> Clears MAC address forwarding table for the specified GigabitEthernet interface
    
    • <1-X> – Specify the GigabitEthernet interface index from 1 - X.
    
    The number of Ethernet interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 24 GE interfaces. Where as, RFS4000 supports 5 GE interfaces.

  • port-channel <1-X> Clears MAC address forwarding table for the specified port-channel interface
    
    • <1-X> – Specify the port-channel interface index from 1 - X.
    
    The number of port-channel interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 13 port-channels. Where as, RFS4000 supports 3 port-channels.

  • t1e1 <1-4> <1-1> Clears MAC address forwarding table for the specified T1E1L interface
    
    • <1-4> – Specify the T1E1 interface index from 1 - 4. A maximum of 4 slots are available. Select the slot to clear the MAC address forwarding table.
    
    • <1-1> – Specify the T1E1 port ID from 1 - 1.
    
    The T1E1 interfaces are supported only on the NX45XX and NX65XX series service platforms.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **up <1-X>**  | Clears MAC address forwarding table for the WAN Ethernet interface  
The number of WAN Ethernet interfaces supported varies for different devices. The RFS4000 and RFS6000 devices support 1 WAN Ethernet interface. The NX45XX supports 2 WAN Ethernet interfaces. |
| **vmif <1-X>**| Clears MAC address forwarding table for the VM interface  
• `<1-X>` – Specify the VM interface index from 1 - X.  
The VMIF interfaces are supported only on the NX45XX, NX65XX, NX9500, and NX9510 series service platforms. The number of supported VMIFs varies for different device types. |
| **xge <1-4>` | Clears MAC address forwarding table for the specified TenGigabitEthernet interface  
• `<1-4>` – Specify the GigabitEthernet interface index from 1 - 4.  
This interface is supported only on the NX9000 series service platforms. |
| **on <DEVICE-NAME>** | Optional. Clears the MAC address forwarding table, for the selected interface, on a specified device  
• `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |

- clear mint mlcp history `{on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>mint</strong></td>
<td>Clears MiNT related information</td>
</tr>
<tr>
<td><strong>mlcp history</strong></td>
<td>Clears <em>MiNT Link Creation Protocol</em> (MLCP) client history</td>
</tr>
</tbody>
</table>
| **on <DEVICE-NAME>** | Optional. Clears MLCP client history on a specified device  
• `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |

- clear role ldap-stats `{on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>role ldap-stats</strong></td>
<td>Clears <em>Lightweight Directory Access Protocol</em> (LDAP) server statistics</td>
</tr>
</tbody>
</table>
| **on <DEVICE-NAME>** | Optional. Clears LDAP server statistics on a specified device  
• `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |

- clear rtls [aeroscout|ekahau] `{<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>}}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>rtls</strong></td>
<td>Clears <em>Real Time Location Service</em> (RTLS) statistics</td>
</tr>
<tr>
<td><strong>aeroscout</strong></td>
<td>Clears RTLS Aeroscout statistics</td>
</tr>
<tr>
<td><strong>ekahau</strong></td>
<td>Clears RTLS Ekahau statistics</td>
</tr>
</tbody>
</table>
| `<MAC/DEVICE-NAME>` | This keyword is common to the ‘aeroscout’ and ‘ekahau’ parameters.  
• `<MAC/DEVICE-NAME>` – Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified AP, wireless controller, or service platform. Specify the AP’s MAC address or hostname. |
| **on <DEVICE-OR-DOMAIN-NAME>** | This keyword is common to the ‘aeroscout’, ‘ekahau’, and <MAC/DEVICE-NAME> parameters.  
| on <DEVICE-OR-DOMAIN-NAME> – Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified device  
| <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain  |

| **clear spanning-tree detected-protocols {on <DEVICE-NAME>}** |

| **spanning-tree** | Clears spanning tree entries on an interface, and restarts protocol migration  |
| **detected-protocols** | Restarts protocol migration  |
| **on <DEVICE-NAME>** | Optional. Clears spanning tree entries on a specified device  
| <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.  |

| **clear spanning-tree detected-protocols {interface [<INTERFACE-NAME>|ge <1-X>|me1|port-channel <1-X>|pppoe1|up1|vlan <1-4094>|wwan1|vmif <1-X>]} {on <DEVICE-NAME>}** |

| **spanning-tree** | Clears spanning tree entries on an interface and restarts protocol migration  |
| **detected-protocols** | Restarts protocol migration  |
| **interface** | Optional. Clears spanning tree entries on different interfaces  
| [<INTERFACE-NAME>]  
| ge <1-X>|me1|port-channel <1-X>|pppoe1|up1|vlan <1-4094>|wwan1|vmif <1-X>]  
| **on <DEVICE-NAME>** | Optional. Clears spanning tree entries on a specified device  
| <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.  |

**spanning-tree** Clears spanning tree entries on an interface, and restarts protocol migration  
**detected-protocols** Restarts protocol migration  
**interface** Optional. Clears spanning tree entries on different interfaces  
<INTERFACE-NAME> – Clears detected spanning tree entries on a specified interface. Specify the interface name.  
ge <1-X> – Clears detected spanning tree entries for the selected GigabitEthernet interface. Select the GigabitEthernet interface index from 1 - X.  
The number of Ethernet interfaces supported varies for different device types. For example the NX45XX and NX65XX support 24 GE interfaces. Where as, RFS4000 supports 5 GE interfaces.  
me1 – Clears FastEthernet interface spanning tree entries  
port-channel <1-X> – Clears detected spanning tree entries for the selected port channel interface. Select the port channel index from 1 - X.  
The number of port-channel interfaces supported varies for different device types. For example the NX45XX and NX65XX support 13 port-channels. Where as, RFS4000 supports 3 port-channels.  
pppoe1 – Clears detected spanning tree entries for Point-to-Point Protocol over Ethernet (PPPoE) interface  
up1 – Clears detected spanning tree entries for the WAN Ethernet interface  
vlan <1-4094> – Clears detected spanning tree entries for the selected VLAN interface. Select a Switch Virtual Interface (SVI) VLAN ID from 1- 4094.  
wwan1 – Clears detected spanning tree entries for wireless WAN interface.  
vmif <1-X> – Clears detected spanning tree entries for VM interfaces  
The VMIF interfaces are supported only on the NX45XX, NX65XX, NX9500, and NX9510 series service platforms. The number of supported VMIFs varies for different device types.  
on <DEVICE-NAME> Optional. Clears spanning tree entries on a specified device  
<DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
### clear traffic-shape statistics class <1-4> {on <DEVICE-NAME>}

rfs4000-229D58>
2.1.4 clock

User Exec Commands

Sets a device’s system clock. By default all WiNG devices are shipped with the time zone and time format set to UTC and 24-hour clock respectively. If a device’s clock is set without resetting the time zone, the time is displayed relative to the *Universal Time Coordinated* (UTC) – Greenwich Time. For example, San Jose is approximately 7 or 8 hours (depending on the time of the year) behind the UTC time. If the time at Greenwich, UK is 15:00:00 UTC, at San Jose it will display as 8:00:00 or 7:00:00 UTC. To display time in the local time zone format, in the device’s configuration mode, use the timezone command to reset the time zone. You can also reset the time zone at the RF Domain level. When configured as RF Domain setting, it applies to all devices within the domain. Configuring the local time zone prior to setting the clock is recommended. For more information on configuring RF Domain time zone, see `timezone`.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}

Parameters

- `<HH:MM:SS>` Sets the current time (in military format hours, minutes, and seconds)
  
  *Note:* By default, the WiNG software displays time in the 24-hour clock format. This setting cannot be changed.

- `<1-31>` Sets the numerical day of the month

- `<MONTH>` Sets the month of the year (Jan to Dec)

- `<1993-2035>` Sets a valid four digit year from 1993 - 2035

- `on <DEVICE-NAME>` Optional. Sets the clock on a specified device
  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

Examples

The following commands set the time zone and clock for the logged device:

```
nx4500-5CFA8E(config-device-B4-C7-99-5C-FA-8E)#timezone America/Los_Angeles
```

```
nx4500-5CFA8E>clock set 10:13:00 24 Mar 2015
```

```
nx4500-5CFA8E>show clock
2015-03-24 10:13:07 PDT
```

Note, if the clock is set without resetting the time zone, the time displays as UTC time, as shown in the following example:

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show clock
2015-09-07 08:55:23 UTC
```

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```
2.1.5 cluster

User Exec Commands

Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member.

Commands executed under this context are executed on all members of the cluster.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

cluster start-election

Parameters

- cluster start-election

| start-election | Starts a new cluster master election |

Examples

rfs7000-37FABE>cluster start-election
rfs7000-37FABE>

Related Commands

### 2.1.7 create-cluster

*User Exec Commands*

Creates a new device cluster with the specified name and assigns it an IP address and routing level.

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member's failure.

A cluster's load is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

**Parameters**

- `create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}`

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
</table>
| name      | Configures the cluster name
| <CLUSTER-NAME> | - Specify a cluster name. Define a name for the cluster name unique to its configuration or profile support requirements. The name cannot exceed 64 characters. |
| ip         | Specifies the device's IP address used for cluster creation
| <IP>      | - Specify the device's IP address in the A.B.C.D format. |
| level [1|2]  | Optional. Configures the cluster’s routing level
| 1         | - Configures level 1 (local) routing |
| 2         | - Configures level 2 (inter-site) routing |

**Examples**

```plaintext
rfs4000-229D58>create-cluster name TechPubs ip 192.168.13.13 level 1

</tbody>
</table>
2.1.8 crypto

User Exec Commands

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate Certificate Signing Request (CSR).

This command also enables trustpoint configuration. Trustpoints contain the CA's identity and configuration parameters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

crypto [key|pki]
crypto key [export|generate|import|zeroize]
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|on|passphrase}
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL>
{background|on|passphrase}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}
crypto pki [authenticate|export|generate|import|zeroize]
crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background}
{(on <DEVICE-NAME>)}
crypto pki export [request|trustpoint]
crypto pki export request [generate-rsa-key|short|use-rsa-key] <RSA-KEYPAIR-NAME>
{autogen-subject-name|subject-name}
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>
autogen-subject-name <EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>, ip-address <IP>
crypto pki export request [generate-rsa-key|short |generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
<ORGANIZATION> <ORGANIZATION-UNIT> <EXPORT-TO-URL>,email <SEND-TO-EMAIL>, fqdn <FQDN>,ip-address <IP>
crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> autogen-subject-name <EMAIL >>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
<ORI7ANIZATION> <ORGANIZATION-UNIT> {(email <SEND-TO-EMAIL>,fqdn <FQDN>, ip-address <IP>,on <DEVICE-NAME>)}
crypto pki import [certificate|crl|trustpoint]
    crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
        {background} {(on <DEVICE-NAME>)}
    crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
        {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
    crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}

**Parameters**

- **crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL>**
  {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

</tbody>
</table>
| **import rsa** <RSA-KEYPAIR-NAME> | Imports a RSA Keypair from a specified source  
  - `<RSA-KEYPAIR-NAME>` – Specify the RSA Keypair name. |
| `<IMPORT-FROM-URL>` | Specify the RSA Keypair source address. Both IPv4 and IPv6 address formats are supported.  
  After specifying the source address (where the RSA Keypair is imported from), configure one of the following parameters: background or passphrase. |
| **background** | Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on. |
| **passphrase** <KEY-PASSPHRASE> background | Optional. Decrypts the RSA Keypair after importing  
  - `<KEY-PASSPHRASE>` – Specify the passphrase to decrypt the RSA Keypair.  
  - **background** – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point, controller, or service platform) to perform the import on. |
| **on <DEVICE-NAME>** | The following parameter is recursive and common to the ‘background’ and ‘passphrase’ keywords:  
  - **on <DEVICE-NAME>** – Optional. Performs import operation on a specific device  
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| **crypto key zeroize rsa** <RSA-KEYPAIR-NAME> `{force} {on <DEVICE-NAME>}` | Deletes a specified RSA Keypair  
  - `<RSA-KEYPAIR-NAME>` – Specify the RSA Keypair name.  
  **Note:** All device certificates associated with this key will also be deleted. |
| **force** | Optional. Forces deletion of all certificates associated with the specified RSA Keypair. Optionally specify a device on which to force certificate deletion. |
| **on <DEVICE-NAME>** | The following parameter is recursive and optional:  
  - **on <DEVICE-NAME>** – Optional. Deletes all certificates associated with the RSA Keypair on a specified device  
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| **crypto pki authenticate** <TRUSTPOINT-NAME> <URL> `{background} {on <DEVICE-NAME>}` | Enables Private Key Infrastructure (PKI) management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated Certificate Authority (CA) certificates.  
  - **authenticate** <TRUSTPOINT-NAME> | Authenticates a trustpoint and imports the corresponding CA certificate  
    - `<TRUSTPOINT-NAME>` – Specify the trustpoint name.  
  - `<URL>` | Specify CA's location. Both IPv4 and IPv6 address formats are supported.  
    - **Note:** The CA certificate is imported from the specified location. |
| **background** | Optional. Performs authentication in the background. If selecting this option, you can optionally specify the device (access point, controller, or service platform) to perform the export on. |
| **on <DEVICE-NAME>** | The following parameter is recursive and optional:  
  - on <DEVICE-NAME> – Optional. Performs authentication on a specified device  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

**crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>**  
**autogen-subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)**  
**pki** Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.  
**export request** Exports CSR to the CA for digital identity certificate. The CSR contains applicant’s details and RSA Keypair’s public key.  
**[generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>** Generates a new RSA Keypair or uses an existing RSA Keypair  
  - generate-rsa-key – Generates a new RSA Keypair for digital authentication  
  - use-rsa-key – Uses an existing RSA Keypair for digital authentication  
  - <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.  
**autogen-subject-name** Auto generates subject name from configuration parameters. The subject name identifies the certificate.  
**<EXPORT-TO-URL>** Specify the CA’s location. Both IPv4 and IPv6 address formats are supported.  
**email <SEND-TO-EMAIL>** Exports CSR to a specified e-mail address  
**fqdn <FQDN>** Exports CSR to a specified Fully Qualified Domain Name (FQDN)  
**ip-address <IP>** Exports CSR to a specified device or system  

**crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)**  
**pki** Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.  
**export request** Exports CSR to the CA for a digital identity certificate. The CSR contains applicant’s details and RSA Keypair’s public key.  
**[generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-key] <RSA-KEYPAIR-NAME>** Generates a new RSA Keypair or uses an existing RSA Keypair  
  - generate-rsa-key – Generates a new RSA Keypair for digital authentication  
  - short [generate-rsa-key|use-rsa-key] – Generates and exports a shorter version of the CSR  
  - use-rsa-key – Generates a new RSA Keypair for digital authentication. If generating a new RSA Keypair, specify a name for it.  
Contd..
- **use-rsa-key** – Uses an existing RSA Keypair for digital authentication. If using an existing RSA Keypair, specify its name.
- **use-rsa-key** – Uses an existing RSA Keypair for digital authentication
  - `<RSA-KEYPAIR-NAME>` – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.

**subject-name**

| `<COMMON-NAME>` | Configures a subject name, defined by the `<COMMON-NAME>` keyword, to identify the certificate
| | • `<COMMON-NAME>` – Specify the common name used with the CA certificate. The name should enable you to identify the certificate easily (2 to 64 characters in length).

**<COUNTRY>**

Sets the deployment country code (2 character ISO code)

**<STATE>**

Sets the state name (2 to 64 characters in length)

**<CITY>**

Sets the city name (2 to 64 characters in length)

**<ORGANIZATION>**

Sets the organization name (2 to 64 characters in length)

**<ORGANIZATION-UNIT>**

Sets the organization unit (2 to 64 characters in length)

**<EXPORT-TO-URL>**

Specify the CA's location. Both IPv4 and IPv6 address formats are supported.
- The CSR is exported to the specified location.

**email**

| `<SEND-TO-EMAIL>` | Exports CSR to a specified e-mail address
| | • `<SEND-TO-EMAIL>` – Specify the CA's e-mail address.

**fqdn <FQDN>**

Exports CSR to a specified FQDN
- `<FQDN>` – Specify the CA's FQDN.

**ip-address <IP>**

Exports CSR to a specified device or system
- `<IP>` – Specify the CA's IP address.

- **crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}**

**pki**

Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

**export trustpoint**

| `<TRUSTPOINT-NAME>` | Exports a trustpoint along with CA certificate, Certificate Revocation List (CRL), server certificate, and private key
| | • `<TRUSTPOINT-NAME>` – Specify the trustpoint name (should be authenticated).

**<EXPORT-TO-URL>**

Specify the destination address. Both IPv4 and IPv6 address formats are supported. The trustpoint is exported to the address specified here.

**background**

Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on

**passphrase**

| `<KEY-PASSPHRASE>` | Optional. Encrypts the key with a passphrase before exporting
| | • `<KEY-PASSPHRASE>` – Specify the passphrase to encrypt the trustpoint.
| | • background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.

| | • <FQDN> – Specify the FQDN. |
| ip-address <IP> | Optional. Exports the self-signed certificate to a specified device or system  
| | • <IP> – Specify the device’s IP address. |

**crypto pki import** [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} {on <DEVICE-NAME>}

| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| import | Imports certificates, Certificate Revocation List (CRL), or a trustpoint to the selected device |
| [certificate|crl] <TRUSTPOINT-NAME> | Imports a signed server certificate or CRL  
| | • certificate – Imports signed server certificate  
| | • crl – Imports CRL  
| | • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated). |
| <IMPORT-FROM-URL> | Specify the signed server certificate or CRL source address. Both IPv4 and IPv6 address formats are supported. The server certificate or the CRL (based on the parameter passed in the preceding step) is imported from the location specified here. |
| background | Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional:  
| | • on <DEVICE-NAME> – Optional. Performs import operation on a specified device  
| | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

**crypto pki import trustpoint** <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}

| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
import
Imports certificates, CRL, or a trustpoint to the selected device

trustpoint
<TRUSTPOINT-NAME>
Imports a trustpoint and its associated CA certificate, server certificate, and private key
• <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).

<IMPORT-FROM-URL>
Specify the trustpoint source address. Both IPv4 and IPv6 address formats are supported.

background
Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.

passphrase
<KEY-PASSPHRASE>
Optional. Decrypts trustpoint with a passphrase after importing
• <KEY-PASSPHRASE> – Specify the passphrase. After specifying the passphrase, optionally specify the device to perform import on.
• background – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on.

on <DEVICE-NAME>
The following parameter is recursive and optional:
• on <DEVICE-NAME> – Optional. Performs import operation on a specified device
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

• crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {on <DEVICE-NAME>}

pki
Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

zeroize trustpoint
<TRUSTPOINT-NAME>
Deletes a trustpoint and its associated CA certificate, server certificate, and private key
• <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).

del-key
Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on.

on <DEVICE-NAME>
The following parameter is recursive and optional:
• on <DEVICE-NAME> – Optional. Deletes the trustpoint on a specified device
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Usage Guidelines
The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:
• IPv4 URLs:
  tftp://<hostname|IP>[:port]/path/file
  ftp://<user>:@<hostname|IP>[:port]/path/file
  sftp://<user>:@<hostname|IP>[:port]/path/file
  http://<hostname|IP>[:port]/path/file
  cf:/path/file
  usb<n>:/path/file
• IPv6 URLs:
  tftp://<hostname|[IPv6]>[:port]/path/file
  ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file
  sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file

Examples
rfs7000-37FABE>crypto key generate rsa key 1025
RSA Keypair successfully generated
rfs7000-37FABE>
rfs7000-37FABE>crypto key import rsa test123 url passphrase word background
RSA key import operation is started in background
rfs7000-37FABE>
rfs7000-37FABE>crypto pki generate self-signed word generate-rsa-key word autogen-
subject-name fqdn word
Successfully generated self-signed certificate
rfs7000-37FABE>
rfs7000-37FABE>crypto pki zeroize trustpoint word del-key
Successfully removed the trustpoint and associated certificates
%Warning: Applications associated with the trustpoint will start using default-trustpoint
rfs7000-37FABE>
rfs7000-37FABE>crypto pki authenticate word url background
Import of CA certificate started in background
rfs7000-37FABE>
rfs7000-37FABE>crypto pki import trustpoint word url passphrase word
Import operation started in background
rfs7000-37FABE>

Related Commands

| no | Removes server certificates, trustpoints and their associated certificates |
2.1.9 *crypto-cmp-cert-update*

### User Exec Commands

Triggers a Certificate Management Protocol (CMP) certificate update on a specified device or devices.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

### Parameters

- **crypto-cmp-cert-update** <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

  *Triggers a CMP certificate update on a specified device or devices*

  - **<TRUSTPOINT-NAME>** — Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the crypto-cmp-policy context mode to configure the trustpoint.
  - **on <DEVICE-NAME>** — Optional. Initiates a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list.
  - **<DEVICE-NAME>** — Specify the name of the AP, wireless controller, or service platform.

### Examples

```
rfs4000-229D58>crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
rfs4000-229D58>
```
### 2.1.10 database

**User Exec Commands**

Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight). Vacuuming a database refers to the process of finding and reclaiming space left over from previous DELETE statements.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
database [drop|repair]
database drop [all|captive-portal|nsight]
database repair {on <DEVICE-NAME>}
```

#### Parameters

- **database drop [all|captive-portal|nsight]**
  - Drops (deletes) all or a specified database
  - `all` — Drops all databases, captive portal and NSight.
  - `captive-portal` — Drops captive-portal database only
  - `nsight` — Drops NSight database only

- **database repair {on <DEVICE-NAME>]**
  - Enables automatic repairing of all databases
  - `on <DEVICE-NAME>` — Optional. Specifies the name of the device hosting the database. When specified, databases on the specified device are periodically checked through to identify and remove obsolete data documents.
  - `<DEVICE-NAME>` — Specify the name of the access point, wireless controller, or service platform.

**Note:** If no device is specified, the system repairs all databases.

#### Examples

```plaintext
nx9500-6C8809>database repair on nx9500-6C8809
```

### 2.1.11 database-backup

**User Exec Commands**

Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

```
database-backup database [captive-portal|nsight] <URL>
```

**Parameters**

- `database-backup database [captive-portal|nsight] <URL>`

| **database-backup database [captive-portal|nsight]** | Backs up captive portal and/or NSight database to a specified location and file. Select the database to backup:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>captive-portal</strong></td>
<td>Backs up captive portal database</td>
</tr>
<tr>
<td><strong>nsight</strong></td>
<td>Backs up NSight database</td>
</tr>
</tbody>
</table>

After specifying the database type, configure the destination location and file name. The database is backed up at the specified location. Specify the location URL in one of the following formats:

- `ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz`
- `sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz`

**Examples**

```
nx9500-6C8809>database-backup database nsight ftp://anonymous:anonymous@192.168.13.10/backup/backup.tar.gz
```

**Related Commands**

<tbody>
<tr>
<td><strong>database-restore</strong></td>
<td>Restores a previously exported (backed up) database [captive-portal and/or NSight]</td>
</tr>
</tbody>
</table>
2.1.12 **database-restore**

*User Exec Commands*

Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored from the backed-up location to the original database.

Supported in the following platforms:

- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

database-restore database [captive-portal|nsight] <URL>

**Parameters**

- database-restore database [captive-portal|nsight] <URL>

| database-restore database [captive-portal|nsight] | Restores previously exported (backed up) captive-portal and/or NSight database. Specify the database type:
| <URL> | Configures the destination location. The database is restored from the specified location. Specify the location URL in one of the following formats:

ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz
sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz

**Examples**

```
nx9500-6C8809>database-restore database nsight
ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

**Related Commands**

<td>database-backup</td>
<td>Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server</td>
</tr>
</tbody>
</table>
2.1.13 **device-upgrade**

*User Exec Commands*

Enables firmware upgrade on an adopted device or a set of adopted devices (access points, wireless controllers, and service platforms). In an *hierarchically managed* (HM) network, this command enables centralized device upgradation across the network.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single *Network Operations Center* (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

All adopted devices (access points and second-level controllers) are referred to as the 'adoptee'. The adopting devices are the 'adopters'. A controller cannot be configured as an adoptee and an adopter simultaneously. In other words, a controller can either be an adopter (adopts another controller) or an adoptee (is adopted by another controller).

Network administrators can use the device-upgrade command to schedule firmware upgrades across adopted devices within the network. Devices are upgraded based on their device names, MAC addresses, or RF Domain. The firmware image used for the upgrade can either be user-defined or built-in.

The user-defined image is pulled from the defined location and applied to the device(s). Use the `device-upgrade > load-image` command to provide the image file name and location. User-defined images always get precedence over built-in images.

NOC and site controllers possess built-in firmware images for the various device types. If the administrator has not specified an image file name and location, the image on the controller is used to upgrade the device. The following example describes the various scenarios possible in the absence of a user-defined image.

A site controller has been scheduled to upgrade all adopted AP6562s. Before executing the upgrade, the site controller compares the image it possesses with the image on the NOC controller. In case of an image version mismatch, the site controller does the following:

1. If the site controller is a cluster member, it pulls the image:
   - From a cluster peer, provided the AP6562 image version on the peer and the NOC controller matches.
   - From the NOC controller, if the AP6562 image version on the peer and the NOC controller are mismatched.
   - From the NOC controller, if none of the cluster members possess a AP6562 image.
2. If the site controller is not a cluster member, it pulls the image from the NOC controller.

When upgrading devices in a RF Domain, the process is controlled and driven by the NOC controller. For example, in case of a scheduled upgrading of all AP6562s within an *RF Domain*, the NOC controller:

1. Adopts all controllers, in the RF Domain, to the NOC cluster and gets the status of each controller.
2. Upgrades all controllers, in the cluster, without rebooting them.

Once the upgrade is complete, the following two scenarios are possible:

**Scenario 1:** *If the upgrade/reboot options ARE NOT specified by the network administrator, the NOC controller:*

- Pushes the AP6562 image on to the RF Domain manager.
- Reboots the active controller within the RF Domain.
- Reboots standby controllers after the active controller has successfully rebooted.

If the controllers are auto upgrade enabled, all AP6562s are upgraded after the controllers have rebooted and the APs have been re-adopted.

**Scenario 2:** *If the upgrade/reboot options ARE specified by the network administrator, the NOC controller:*

NOTE: Hierarchical management allows the NOC controller to upgrade controllers and access points that are directly or indirectly adopted to it. However, ensure that the NOC controller is loaded with the correct firmware version.
a. Reboots the active controller followed by the standby controllers.
b. Pushes the AP6562 image file on to the RF Domain manager.
c. Initiates upgrades on all AP6562 within the RF Domain.

Ensure the RF Domain controllers are auto upgrade enabled.

NOTE: If the *persist-images* option is selected, the RF Domain manager retains the old firmware image, or else deletes it. For more information on enabling device upgrade on profiles and devices (including the ‘persist-images’ option), see `device-upgrade`.

NOTE: A NOC controller’s capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller — RFS7000, NX9000, NX95XX (NX9500 and NX9510), NX9600
- Site controller — RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX9000, or NX95XX

Within a HM network, the devices deployed as site controllers depends on the NOC controller device type. For more information on the adoption capabilities of various NOC controller devices, see Usage Guidelines *(NOC controller adoption matrix)*.

NOTE: Standalone devices have to be manually upgraded.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```bash
device-upgrade [<MAC/HOSTNAME>|all|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap9000|ap9500|ap9600|ap9900|rf-domain]
```

```bash
device-upgrade <MAC/HOSTNAME> {no-reboot|reboot-time <TIME>|upgrade-time <TIME>}
```

```bash
device-upgrade all {force|no-reboot/reboot-time <TIME>|upgrade-time <TIME> {no-reboot/reboot-time <TIME>}} {(staggered-reboot)}
```

```bash

</table>
```

- all

  Upgrades firmware on all devices

  ```plaintext
  all \{force|no-reboot|reboot-time <TIME>|upgrade-time <TIME>\} \{no-reboot|reboot-time <TIME>\}\{(staggered-reboot)\}
  ```
**device-upgrade** **<DEVICE-TYPE>** all

Upgrades firmware on all devices of a specific type. Select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000.

After selecting the device type, schedule an automatic upgrade and/or an automatic reboot.

**force**

Optional. Select this option to force upgrade on the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.

**no-reboot**

Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)

**reboot-time** **<TIME>**

Optional. Schedules an automatic reboot after a successful upgrade

• **<TIME>** – Optional. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

**upgrade-time** **<TIME>**

Optional. Schedules an automatic firmware upgrade on all devices, of the specified type, on a specified day and time

• **<TIME>** – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format.

The following actions can be performed after a scheduled upgrade:

• no-reboot – Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)

• reboot-time **<TIME>** – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

• staggered-reboot

This keyword is recursive and common to all of the above.

• Optional. Enables staggered device reboot (one at a time) without network impact

**cancel-upgrade**

Cancels a scheduled firmware upgrade based on the parameters passed. This command provides the following options to cancel scheduled firmware upgrades:

• Cancels upgrade on specific device(s). The devices are identified by their MAC addresses or hostnames.

• Cancels upgrade on all devices within the network

• Cancels upgrade on all devices of a specific type. Specify the device type.

• Cancels upgrade on specific device(s) or all device(s) within a specific RF Domain or all RF Domains. Specify the RF Domain name.

• cancels a scheduled firmware upgrade on a specified device or on all devices

• `<MAC/HOSTNAME>` – Cancels a scheduled upgrade on the device identified by the `<MAC/HOSTNAME>` keyword. Specify the device’s MAC address or hostname.

• all – Cancels scheduled upgrade on all devices
<table>

</tr>
</tbody>
</table>
| cancel-upgrade on rf-domain [<RF-DOMAIN-NAME>|all] | Cancels scheduled firmware upgrade on all devices in a specified RF Domain or all RF Domains  
  - <RF-DOMAIN-NAME> – Cancels scheduled device upgrade on all devices in a specified RF Domain. Specify the RF Domain name.  
  - all – Cancels scheduled device upgrade on all devices across all RF Domains  

- **device-upgrade load-image** [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx500|nx65xx|nx9000|nx9600|vx9000] {<IMAGE-URL>|on <DEVICE-OR-DOMAIN-NAME>}

| load-image <DEVICE-TYPE> | Loads device firmware image from a specified location. Use this command to specify the device type and the location of the corresponding image file.  
  - <DEVICE-TYPE> – Specify the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000.  
  After specifying the device type, provide the location of the required device firmware image.  
  - <IMAGE-URL> Specify the device’s firmware image location in one of the following formats:  
    IPv4 URLs:  
    - tftp://<hostname|IP>[:port]/path/file  
    - ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file  
    - sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file  
    - http://<hostname|IP>[:port]/path/file  
    - cf:/path/file  
    - usb<n>:/path/file  
    IPv6 URLs:  
    - tftp://<hostname|[IPv6]>[:port]/path/file  
    - ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file  
    - sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file  

| on <DEVICE-OR-DOMAIN-NAME> | Specify the name of the device or RF Domain. The image, of the specified device type is loaded from the device specified here. In case of an RF Domain, the image available on the RF Domain manager is loaded.  
  - <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.  

- **device-upgrade rf-domain**
  - `<RF-DOMAIN-NAME>`: Upgrades devices in the RF Domain identified by the `<RF-DOMAIN-NAME>` keyword.
  - `all`: Upgrades devices across all RF Domains
  - `containing <WORD>`: Filters RF Domains by their names. RF Domains with names containing the sub-string identified by the `<WORD>` keyword are filtered. Devices on the filtered RF Domains are upgraded.
  - `filter location <WORD>`: Filters devices by their location. All devices with location matching the `<WORD>` keyword are upgraded.

- **<DEVICE-TYPE>**
  - After specifying the RF Domain, select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000.

- **<MAC/HOSTNAME>**
  - Optional. Use this option to identify specific devices for upgradation. Specify the device’s MAC address or hostname. The device should be within the specified RF Domain and of the specified device type. After identifying the devices to upgrade, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller.
  - Note: If no MAC address or hostname is specified, all devices of the type selected are upgraded.

- **force**
  - Optional. Select this option to force upgrade for the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.

- **from-controller**
  - Optional. Upgrades a device through the adopted device. If initiating an upgrade through the adopting controller, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.

- **no-reboot**
  - Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)

- **reboot-time <TIME>**
  - Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

- **staggered-reboot**
  - This keyword is common to all of the above.
  - Optional. Enables staggered reboot (one at a time) without network impact.
Usage Guidelines (NOC controller adoption matrix)

The following examples show the upgradation of devices in a HM network.

**The HM setup is as follows:**

```
rfs7000-6DCD4B (NOC) > l3-adoption > rfs6000-81701D (SITE-CONTROLLER) > l2-adoption > ap8132-711728 (access point)
```

**Step 1: Load AP81XX firmware on the NOC (rfs7000-6DCD4B):**

```
rfs7000-6DCD4B>device-upgrade load-image ap81XX
ftp://anonymous:anonymous@192.168.13.10/LatestBuilds/W58/AP81XX-012D.img
```

<table>
<thead>
<tr>
<th>CONTROLLER</th>
<th>STATUS</th>
<th>MESSAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>rfs7000-6DCD4B</td>
<td>Success</td>
<td>Successfully initiated load image</td>
</tr>
</tbody>
</table>

```
rfs7000-6DCD4B>
```

```
rfs7000-6DCD4B>show device-upgrade load-image-status
Download of ap81xx firmware file is complete
rfs7000-6DCD4B>
```

```
Step 2: Execute the upgrade command on the NOC. This pushes the AP81XX image through the Site Controller on to the adopted AP81XX (ap8132-711728).

```
rfs7000-6DCD4B>device-upgrade ap8132-711728

2.1.14 disable

This command can be executed in the Priv Exec Mode only. This command turns off (disables) the privileged mode command set and returns to the User Executable Mode. The prompt changes from `rfs7000-37FABE#` to `rfs7000-37FABE>`.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

disable

Parameters

None

Examples

rfs7000-37FABE#disable
rfs7000-37FABE>
2.1.15 enable

**User Exec Commands**

Turns on (enables) the privileged mode command set. The prompt changes from rfs7000-37FABE> to rfs7000-37FABE#. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
enable
```

**Parameters**

None

**Examples**

```plaintext
rfs7000-37FABE>enable
rfs7000-37FABE#
```
2.1.16 file-sync

User Exec Commands

Syncs EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points. Use this command to configure parameters that enable syncing of PKCS#12 certificate.

When enabling file syncing, consider the following points:

- The X.509 certificate needs synchronization only if the access point’s radio2, the client-bridge radio, is configured to use EAP-TLS authentication
- Execute the command on the controller adopting the access point
- Ensure that the X.509 certificate file is installed on the controller
- If the adopting device is a site controller with layer 3 adoption to the NOC, ensure that the X.509 certificate is synced across the hierarchically managed setup – between the NOC, site-controller (the staging-controller), and the client-bridge access points.

Syncing of wireless client-bridge certificate can be automated. To automate file syncing, in the controller’s device/profile configuration mode, execute the following command: `file-sync [auto|count <1-20>]`. For more information, see `file-sync`.

For more information on configuring a AP client-bridge, see `bridge`.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
file-sync [cancel|load-file|wireless-bridge]
file-sync cancel wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]
file-sync load-file wireless-bridge <URL>
file-sync wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]
    {from-controller} {reset-radio|upload-time <TIME>}
```

Parameters

- `file-sync cancel wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]` Cancels scheduled wireless client-bridge certificate synchronization on a specified AP, or all APs, or APs within an RF Domain
  - `<DEVICE-NAME>` – Cancels scheduled certificate synchronization on the AP identified by the `<DEVICE-NAME>` parameter. Specify the AP’s hostname or MAC address.
  - all – Cancels scheduled certificate synchronization on all APs
  - rf-domain [<DOMAIN-NAME>|all] – Cancels scheduled certificate synchronization on all APs in a specified RF Domain or in all RF Domains
  - `<DOMAIN-NAME>` – Cancels scheduled certificate synchronization on all APs within the RF Domain identified by the `<DOMAIN-NAME>` parameter. Specify the RF Domain’s name.
  - all – Cancels scheduled certificate synchronization on all RF Domains
• **file-sync load-file wireless-bridge <URL>**

    **file-sync load-file wireless-bridge <URL>**

    Loads the client-bridge certificate to the staging controller. Use this command to load the certificate to the controller before scheduling or initiating a certificate synchronization.
    • <URL> – Provide the certificate location using one of the following formats:
      - tftp://<hostname|IP>[:port]/path/file
      - ftp://<username>:<password>@<hostname|IP>[:port]/path/file
      - sftp://<username>:<password>@<hostname|IP>[:port]/path/file
      - http://<hostname|IP>[:port]/path/file
      - cf:/path/file
      - usb<n>:/path/file
    
    **Note:** Both IPv4 and IPv6 address types are supported.

• **file-sync wireless-bridge [DEVICE-NAME]|all|rf-domain [DOMAIN-NAME]|all} {from-controller}**

    **file-sync wireless-bridge [DEVICE-NAME]|all|rf-domain [DOMAIN-NAME]|all} {from-controller}**

    Configures the following file-sync parameters:
    • post certificate synchronization action
    • upload time
    
    These file-sync options can be applied to a specified AP, all APs, or all APs within a specified RF Domain or on all RF Domains.
    • <DEVICE-NAME> – Applies these parameters to the AP identified by the <DEVICE-NAME> parameter. Specify the AP’s hostname or MAC address.
    • all – Applies these parameters to all APs
    • rf-domain [DOMAIN-NAME]|all – Applies these parameters to all APs in a specified RF Domain or in all RF Domains
      • <DOMAIN-NAME> – Select to apply to APs within the RF Domain identified by the <DOMAIN-NAME> parameter. Specify the RF Domain’s name.
      • all – Select to apply these parameters to all RF Domains
    • from-controller – Optional. Loads certificate to the APs from the adopting controller and not the RF Domain manager
    
    After specify the access points to load certificate, specify the following options: reset-radio and upload-time.

**reset-radio**

This keyword is recursive and applicable to all of the above parameters.
Optional. Resets the radio after file synchronization. Reset the radio in case the certificate is renewed along with no changes made to the ‘bridge EAP username’ and ‘bridge EAP password’.

**upload-time <TIME>**

This keyword is recursive and applicable to all of the above parameters.
Optional. Schedules certificate upload at a specified time
• <TIME> – Specify the time in the MM/DD/YYYY-HH:MM or HH:MM format. If no time is configured, the process is initiated as soon as the command is executed.

**Examples**

rfs7000-6DCD4B>file-sync wireless-bridge ap7131-11E6C4 upload-time 12/12/2015-12:30

<table>
<thead>
<tr>
<th>CONTROLLER</th>

<tr>
<td>B4-C7-99-6D-CD-4B</td>
<td>Success</td>
<td>Queued 1 APs to upload</td>
</tr>
</tbody>
</table>

rfs7000-6DCD4B>

The following uploads certificate to all access points:

rfs6000-6DB5D4>file-sync wireless-bridge all upload-time 06/05/2015-23:42
### 2.1.17 join-cluster

#### User Exec Commands

Adds a device (access point, wireless controller, or service platform), as a member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
join-cluster <IP> user <USERNAME> password <WORD> {level|mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}
```

**Parameters**

- `join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>Specify the cluster member's IP address.</td>
</tr>
<tr>
<td>user &lt;USERNAME&gt;</td>
<td>Specify a user account with super user privileges on the new cluster member</td>
</tr>
<tr>
<td>password &lt;WORD&gt;</td>
<td>Specify password for the account specified in the user parameter</td>
</tr>
<tr>
<td>level [1</td>
<td>2]</td>
</tr>
<tr>
<td>mode [active</td>
<td>standby]</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To add a device to an existing cluster:
- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding the device to a cluster, execute the “write memory” command to ensure the configuration persists across reboots.

**Examples**

```
rfs7000-37FABE>join-cluster 192.168.13.15 user admin password superuser level 1 mode standby
... connecting to 192.168.13.15
... applying cluster configuration
... committing the changes
... saving the changes
[OK]
rfs7000-37FABE>
```
rfs7000-37FABE>show context

### 2.1.18 l2tpv3

#### User Exec Commands

Establishes or brings down an *Layer 2 Tunnel Protocol Version 3* (L2TPV3) tunnel

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

- `l2tpv3 tunnel [<TUNNEL-NAME>|all]`
- `l2tpv3 tunnel <TUNNEL-NAME> [down|session|up]`
- `l2tpv3 tunnel <TUNNEL-NAME> down|up [on <DEVICE-NAME>]`
- `l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] [on <DEVICE-NAME>]`
- `l2tpv3 tunnel all [down|up] [on <DEVICE-NAME>]`

#### Parameters

- **l2tpv3 tunnel <TUNNEL-NAME> [down|up] [on <DEVICE-NAME>]**
  - Establishes or brings down L2TPv3 tunnels
  - `<TUNNEL-NAME>` Specifies the tunnel name to establish or bring down
    - `down` – Brings down the specified tunnel
    - `up` – Establishes the specified tunnel
  - `on <DEVICE-NAME>` Optional. Establishes or brings down a tunnel on a specified device
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- **l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] [on <DEVICE-NAME>]**
  - Establishes or brings down a specified session inside an L2TPv3 tunnel
  - `<TUNNEL-NAME>` – Specify the tunnel name.
    - `session` – Identifies a specific session
    - `<SESSION-NAME>` – Specify the session name.
    - `down` – Brings down the session identified by the `<SESSION-NAME>` keyword
    - `up` – Establishes the session identified by the `<SESSION-NAME>` keyword
  - `on <DEVICE-NAME>` Optional. Establishes or brings down a tunnel session on a specified device
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- **l2tpv3 tunnel all [down|up] [on <DEVICE-NAME>]**
  - Establishes or brings down all L2TPv3 tunnels
  - `down` – Brings down all tunnels
  - `up` – Establishes all tunnels
<table>
<thead>
<tr>
<th>Optional. Establishes or brings down all tunnels on a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE>l2tpv3 tunnel Tunnell session TunnellSession1 up on rfs7000-37FABE
```

---

**NOTE:** For more information on the L2TPv3 tunnel configuration mode and commands, see *Chapter 22, L2TPV3-POLICY.*
## 2.1.19 logging

**User Exec Commands**

Modifies message logging settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}
```

**Parameters**

- `logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}`

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>monitor</code></td>
<td>Sets the terminal lines logging levels. The logging severity levels can be set from 0-7. The system configures default settings, if no logging severity level is specified.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;0-7&gt;</code> – Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows:</td>
</tr>
<tr>
<td></td>
<td>• alerts – Optional. Immediate action needed (severity=1)</td>
</tr>
<tr>
<td></td>
<td>• critical – Optional. Critical conditions (severity=2)</td>
</tr>
<tr>
<td></td>
<td>• debugging – Optional. Debugging messages (severity=7)</td>
</tr>
<tr>
<td></td>
<td>• emergencies – Optional. System is unusable (severity=0)</td>
</tr>
<tr>
<td></td>
<td>• errors – Optional. Error conditions (severity=3)</td>
</tr>
<tr>
<td></td>
<td>• informational – Optional. Informational messages (severity=6)</td>
</tr>
<tr>
<td></td>
<td>• notifications – Optional. Normal but significant conditions (severity=5)</td>
</tr>
<tr>
<td></td>
<td>• warnings – Optional. Warning conditions (severity=4)</td>
</tr>
</tbody>
</table>

**Note:** Before configuring the message logging level, ensure logging module is enabled. To enable message logging, in the device’s configuration mode, execute the `logging > on` command. Message logging can also be enabled on a profile. All devices using the profile will have message logging enabled.

### Examples

```text
rfs7000-6DCD4B(config-device-B4-C7-99-6D-CD-4B)#logging on
rfs7000-6DCD4B>logging monitor debugging
rfs7000-6DCD4B>show logging

Logging module: enabled
Aggregation time: disabled
Console logging: level debugging
Monitor logging: disabled
Buffered logging: level warnings
Syslog logging: level warnings
Facility: local7

Log Buffer (103 bytes):

May 17 22:03:53 2015: rfs7000-6DCD4B : %SYSTEM-3-LOGIN_FAIL: Log-in failed for user 'admin' from 'ssh'
```

</table>
## 2.1.20 mint

### User Exec Commands

Uses MiNT protocol to perform a ping and traceroute to a remote device

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```plaintext
mint ping <MINT-ID> {(count <1-10000>|size <1-64000>|timeout <1-10>)}
mint traceroute <MINT-ID> {(destination-port <1-65535>|max-hops <1-255>|source-port <1-65535>|timeout <1-255>)}
```

### Parameters

- **ping <MINT-ID>***
  - Sends a MiNT echo message to a specified destination
  - `<MINT-ID>` – Specify the destination device’s MiNT ID.
  - **count <1-10000>***
    - Optional. Sets the pings to the MiNT destination
    - `<1- 10000>` – Specify a value from 1 - 10000. The default is 3.
  - **size <1-64000>***
    - Optional. Sets the MiNT payload size in bytes
    - `<1-64000>` – Specify a value from 1 - 64000 bytes. The default is 64 bytes.
  - **timeout <1-10>***
    - Optional. Sets a response time in seconds
    - `<1-10>` – Specify a value from 1 sec - 10 sec. The default is 1 second.

- **traceroute <MINT-ID>***
  - Prints the route packets trace to a device
  - `<MINT-ID>` – Specify the destination device’s MiNT ID.
  - **destination-port <1-65535>***
    - Optional. Sets the Equal-cost Multi-path (ECMP) routing destination port
    - `<1- 65535>` – Specify a value from 1 - 65535. The default port is 45.
  - **max-hops <1-255>***
    - Optional. Sets the maximum number of hops a traceroute packet traverses in the forward direction
    - `<1- 255>` – Specify a value from 1 - 255. The default is 30.
  - **source-port <1-65535>***
    - Optional. Sets the ECMP source port
    - `<1- 65535>` – Specify a value from 1 - 65535. The default port is 45.
  - **timeout <1-255>***
    - Optional. Sets the minimum response time period in seconds
    - `<1- 255>` – Specify a value from 1 sec - 255 sec. The default is 30 seconds.
Examples

rfs7000-37FABE>mint ping 68.22.9D.58 count 5 size 120
MiNT ping 68.22.9D.58 with 120 bytes of data.
  Response from 68.22.9D.58: id=1 time=0.341 ms
  Response from 68.22.9D.58: id=2 time=0.313 ms
  Response from 68.22.9D.58: id=3 time=0.314 ms
  Response from 68.22.9D.58: id=4 time=0.333 ms
  Response from 68.22.9D.58: id=5 time=0.291 ms

--- 68.22.9D.58 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.291/0.318/0.341 ms
rfs7000-37FABE>
2.1.21 no

User Exec Commands

Use the no command to revert a command or to set parameters to their default. This command turns off an enabled feature or reverts settings to default.

NOTE: The commands have their own set of parameters that can be reset.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [adoption|captive-portal|crypto|debug|logging|page|service|terminal|virtual-machine|wireless]

no adoption {on <DEVICE-OR-DOMAIN-NAME>}

NOTE: The no > adoption command resets the adoption state of a specified device (and all devices adopted to it) or devices within a specified RF Domain. When executed without specifying the device or RF Domain, the command resets the adoption state of the logged device and all devices, if any, adopted to it.

no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>] {on <DEVICE-OR-DOMAIN-NAME>}

no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>|on <DEVICE-NAME>}}

no logging monitor

no page

no service [block-adopter-config-update|locator|snmp|ssm|wireless]

no service smtp sysoid wing5

no service block-adopter-config-update

no service ssm trace pattern {<WORD>} {on <DEVICE-NAME>}

no service wireless [trace pattern {<WORD>} {on <DEVICE-NAME>}]|unsanctioned ap air-terminate <BSSID> {on <DOMAIN-NAME>}

no service locator {on <DEVICE-NAME>}

no terminal [length|width]

no virtual-machine assign-usb-ports {on <DEVICE-NAME>}

no wireless client [all|<MAC>]

no wireless client all {filter|on}
no wireless client all {filter [wlan <WLAN-NAME>]}

no wireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]}

no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}

**Parameters**

- no <PARAMETERS>

| no <PARAMETERS> | Resets or reverts settings based on the parameters passed |

**Usage Guidelines**

The *no* command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

rfs7000-37FABE>no adoption

rfs7000-37FABE>no page
2.1.22 on

User Exec Commands

Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

on rf-domain [<RF-DOMAIN-NAME>|all]

Parameters

- on rf-domain [<RF-DOMAIN-NAME>|all]

| on rf-domain [<RF-DOMAIN-NAME>|all] | Enters the RF Domain context based on the parameter specified |
|--------------------------------------|----------------------------------------------------------|
| • <RF-DOMAIN-NAME> | Specify the RF Domain name. Enters the specified RF Domain context. |
| • all | Specifies all RF Domains. |

Examples

nx9500-6C8809(rf-domain-all)>?
nx9500-6C8809(rf-domain-all)>on RF-Domain Mode commands:

clearscl | Clears the display screen
| do | Run commands from Exec mode
| end | End current mode and change to EXEC mode
| exit | End current mode and down to previous mode
| help | Description of the interactive help system
| service | Service Commands
| show | Show running system information

nx9500-6C8809(rf-domain-all)>
### 2.1.23 opendns

**User Exec Commands**

Retrieves the OpenDNS device-id from the OpenDNS site

This command integrates access points and controllers with OpenDNS. It obtains the device-id (16 character hex-string) from OpenDNS. This device-id is configured under all WLANs that are to be OpenDNS enabled. When configured and enabled on a WLAN, DNS queries from all wireless clients on the WLAN are redirected to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers. These OpenDNS resolvers act as proxy DNS servers, and also provide additional features, such as Web filtering, performance improvements etc.

**NOTE:** OpenDNS is a free, alternative DNS service that is faster and more reliable than other DNS services available. OpenDNS enables swift navigation of the Web without the outages that are frequent in other ISP provided DNS services. It also blocks inappropriate Web sites, phishing sites, and prevents virus and malware attacks.

**NOTE:** The 'username' and 'password' values passed in this command should be pre-registered with the OpenDNS site. The 'label' can be any value. Only with a combination of a valid 'username', 'password', and any 'label' the OpenDNS server returns a device-id.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

**Parameters**

- **opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>**
  - **username <USERNAME>** — Configures the OpenDNS user name (should be valid username registered with OpenDNS)
    - `<USERNAME>` – Provide the OpenDNS user name.
  - **password <OPENDNS-PSWD>** — Configures the password associated with the user configured in the previous step
    - `<OPENDNS-PSWD>` – Provide the OpenDNS password for the user.
  - **label <LABEL>** — Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal.
    - `<LABEL>` – Specify your OpenDNS server label.
    - **Note:** For every unique set of username, password, and label only one device-id is returned. Apply this device-id in WLANs that are to be OpenDNS enabled. For information on configuring the device-id in the WLAN context, see `opendns`. 

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Configures the OpenDNS user name (should be valid username registered with OpenDNS)</td>
</tr>
<tr>
<td>password</td>
<td>Configures the password associated with the user configured in the previous step</td>
</tr>
<tr>
<td>label</td>
<td>Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal.</td>
</tr>
</tbody>
</table>
Usage Guidelines

Use your OpenDNS credentials to logon to the opendns.org site and use the *labels*, *edit settings*, and *customize content filtering* options to configure Web filtering settings.

Examples

```
ap7131-E6D512>opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7131-E6D512>
```
2.1.24 page

User Exec Commands

Toggles a device’s paging function. Enabling this command displays the CLI command output page by page, instead of running the entire output at once.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

2.1.25 ping

User Exec Commands

Sends Internet Controller Message Protocol (ICMP) echo messages to a user-specified location

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|source [<IP>|pppoe|vlan <1-4094>|wwan]}
```

Parameters

- `<IP/HOSTNAME>` Specify the destination IP address or hostname. When entered without any parameters, this command prompts for an IP address or a hostname.
- `count <1-10000>` Optional. Sets the pings to the specified destination
  - `<1-10000>` – Specify a value from 1 - 10000. The default is 5.
- `dont-fragment {count|size}` Optional. Sets the don’t fragment bit in the ping packet. Packets with the dont-fragment bit specified are not fragmented. When a packet, with the dont-fragment bit specified, exceeds the specified maximum transmission unit (MTU) value, an error message is sent from the device trying to fragment it.
  - `count <1-10000>` – Optional. Sets the pings to the specified destination from 1 - 10000. The default is 5.
  - `size <1-64000>` – Optional. Sets the ping payload size from 1 - 64000 bytes. The default is 100 bytes.
- `size <1-64000>` Optional. Sets the ping payload size in bytes
  - `<1-64000>` – Specify the ping payload size from 1 - 64000. The default is 100 bytes.
- `source [<IP>|pppoe|vlan <1-4094>|wwan]` Optional. Sets the source address or interface name. This is the source of the ICMP packet to the specified destination.
  - `<IP>` – Specifies the source IP address
  - `pppoe` – Selects the PPP over Ethernet interface
  - `vlan <1-4094>` – Selects the VLAN interface from 1 - 4094
  - `wwan` – Selects the wireless WAN interface
Examples

rfs7000-37FABE>ping 172.16.10.4 count 6
PING 172.16.10.4 (172.16.10.4): 100 data bytes

rfs7000-6DCD4B>
2.1.26 ping6

User Exec Commands

Sends ICMPv6 echo messages to a user-specified IPv6 address

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ping6 <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}

Parameters

- ping <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IPv6/HOSTNAME&gt;</td>
<td>Specify the destination IPv6 address or hostname.</td>
</tr>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Specify the interface name for link local/broadcast address</td>
</tr>
<tr>
<td>count &lt;1-10000&gt;</td>
<td>Optional. Sets the pings to the specified IPv6 destination</td>
</tr>
<tr>
<td>size &lt;1-64000&gt;</td>
<td>Optional. Sets the IPv6 ping payload size in bytes</td>
</tr>
</tbody>
</table>

Usage Guidelines

To configure a device’s IPv6 address, in the VLAN interface configuration mode, use the `ipv6 > address <IPv6-ADDRESS>` command. After configuring the IPv6 address, use the `ipv6 > enable` command to enable IPv6. For more information see, `ipv6`.

Examples

```
rfs4000-1B3596(config-device-00-23-68-1B-35-96-if-ge4)#show ipv6 interface brief

rfs4000-229D58>
```
2.1.27 ssh

User Exec Commands

Opens a Secure Shell (SSH) connection between two network devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}

Parameters

- ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Specify the remote system's IP address or hostname.</td>
</tr>
<tr>
<td>&lt;USERNAME&gt;</td>
<td>Specify the name of the user requesting SSH connection with the remote system.</td>
</tr>
<tr>
<td>&lt;INF-NAME/LINK-LOCAL-ADD&gt;</td>
<td>Optional. Specify the interface's name or link local address.</td>
</tr>
</tbody>
</table>

Examples

nx9500-6C8809>ssh 192.168.13.15 admin
admin@192.168.13.15's password:
rfs7000-37FABE>
2.1.28 telnet

User Exec Commands

Opens a Telnet session between two network devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

Parameters

- telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Configures the destination remote system’s IP (IPv4 or IPv6) address or hostname. The Telnet session is established between the connecting system and the remote system.</td>
</tr>
<tr>
<td></td>
<td>- &lt;IP/HOSTNAME&gt; – Specify the system’s IPv4 or IPv6 address or hostname.</td>
</tr>
<tr>
<td>&lt;TCP-PORT&gt;</td>
<td>Optional. Specify the Transmission Control Protocol (TCP) port number.</td>
</tr>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Optional. Specify the interface name for the link local address.</td>
</tr>
</tbody>
</table>

Examples

nx4500-5CFA8E>telnet 192.168.13.13
Entering character mode
Escape character is '^]'.

Password:
nx9500-6C8809>
2.1.29 terminal

User Exec Commands

Sets the length and width of the CLI display window on a terminal

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
terminal [length|width] <0-512>

Parameters
- terminal [length|width] <0-512>

<table>
<thead>
<tr>
<th>length &lt;0-512&gt;</th>
<th>Sets the number of lines displayed on the terminal window</th>
</tr>
</thead>
<tbody>
<tr>
<td>width &lt;0-512&gt;</td>
<td>Sets the width (the number of characters displayed in one line) of the terminal window</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE>terminal length 150
rfs7000-37FABE>terminal width 215
rfs7000-37FABE>show terminal
Terminal Type: xterm
Length: 150 Width: 215
rfs7000-37FABE>

Related Commands
- no
  Resets the width or length of the terminal window
2.1.30 time-it

User Exec Commands

Verifies the time taken by a particular command between request and response

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

time-it <COMMAND>

Parameters

- time-it <COMMAND>

<table>
<thead>
<tr>
<th>time-it &lt;COMMAND&gt;</th>
<th>Verifies the time taken by a particular command to execute and provide a result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;COMMAND&gt;</td>
<td>– Specify the command.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE>time-it enable
That took 0.00 seconds..
rfs7000-37FABE#
2.1.31 traceroute

User Exec Commands

Traces the route to a defined destination

Use ‘--help’ or ‘-h’ to display a complete list of parameters for the traceroute command

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

traceroute <LINE>

Parameters

- traceroute <LINE>

tracerrute <LINE> Traces the route to a destination IP address or hostname

• <LINE> – Specify the destination IPv6 address or hostname.

Examples

rfs7000-37FABE>traceroute --help
BusyBox v1.14.1 () multi-call binary

Trace the route to HOST

Options:
- F Set the don't fragment bit
- I Use ICMP ECHO instead of UDP datagrams
- l Display the ttl value of the returned packet
- d Set SO_DEBUG options to socket
- n Print hop addresses numerically rather than symbolically
- r Bypass the normal routing tables and send directly to a host
- v Verbose
- m max_ttl Max time-to-live (max number of hops)
- p port# Base UDP port number used in probes (default is 33434)
- q nqueries Number of probes per 'ttl' (default 3)
- s src_addr IP address to use as the source address
- t tos Type-of-service in probe packets (default 0)
- w wait Time in seconds to wait for a response (default 3 sec)
- g Loose source route gateway (0 max)

rfs7000-37FABE>

rfs7000-6DCD4B>traceroute 192.168.13.16
traceroute to 192.168.13.16 (192.168.13.16), 30 hops max, 38 byte packets
1 192.168.13.16 (192.168.13.16) 5.071 ms 0.294 ms 0.283 ms
rfs7000-6DCD4B>
2.1.32 traceroute6

User Exec Commands

Traces the route to a specified IPv6 destination

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

t traceroute6 <LINE>

Parameters

• traceroute6 <LINE>

| traceroute6 <LINE> | Traces the route to a destination IPv6 address or hostname
|--------------------|---------------------------------------------------|
| <LINE>             | <LINE> – Specify the destination IPv6 address or hostname.

Examples

```
rfs4000-229D58>traceroute6 2001:10:10:10:10:10:10:1
rfs4000-229D58>
```
### 2.1.33 watch

#### User Exec Commands

Repeats the specified CLI command at periodic intervals

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
watch <1-3600> <LINE>
```

#### Parameters

- `watch <1-3600> <LINE>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-3600&gt;</td>
<td>Select an interval from 1 - 3600 sec. Pressing CTRL-Z halts execution of the command.</td>
</tr>
<tr>
<td>&lt;LINE&gt;</td>
<td>Specify the CLI command.</td>
</tr>
</tbody>
</table>

#### Examples

```plaintext
rfs7000-6DCD4B>watch 40 ping 192.168.13.16
PING 192.168.13.16 (192.168.13.16) 100(128) bytes of data.
108 bytes from 192.168.13.16: icmp_seq=1 ttl=64 time=0.565 ms
108 bytes from 192.168.13.16: icmp_seq=2 ttl=64 time=0.393 ms
108 bytes from 192.168.13.16: icmp_seq=3 ttl=64 time=0.344 ms
108 bytes from 192.168.13.16: icmp_seq=4 ttl=64 time=0.433 ms
108 bytes from 192.168.13.16: icmp_seq=5 ttl=64 time=0.352 ms
--- 192.168.13.16 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3997ms
rtt min/avg/max/mdev = 0.344/0.417/0.565/0.082 ms

rfs7000-6DCD4B>
```
2.1.34 exit

**User Exec Commands**

Ends the current CLI session and closes the session window

For more information, see `exit`.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

exit

**Parameters**

None

**Examples**

rfs7000-37FABE>exit
2.1.35 smart-cache

User Exec Commands

Pre-fetches cached content from the specified list of URLs

Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see smart-cache-policy.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

smart-cache pre-fetch-immediate <URL-LIST-NAME>

Parameters

- smart-cache pre-fetch-immediate <URL-LIST-NAME>

<table>
<thead>
<tr>
<th>smart-cache</th>
<th>Pre-fetches content from the specified list of URLs</th>
</tr>
</thead>
<tbody>
<tr>
<td>pre-fetch-immediate</td>
<td>Provide the URL list names (should be existing and configured). For more information on configuring URL lists, see url-list.</td>
</tr>
</tbody>
</table>

Examples

nx4500-5CFA2B>smart-cache pre-fetch-immediate ?
   URL-LIST  URL List to be Pre Fetched

nx4500-5CFA2B>
## 2.1.36 virtual-machine

### User Exec Commands

Installs, configures, and monitors the status of third-party virtual machines (VMs)

In addition to the WiNG VMs, the NX45XX, NX65XX, NX9500, and NX9510 series service platforms support the installation and administration of third-party VMs. However, the third-party VMs supported by these devices varies.

The third-party VMs supported on NX45XX and NX65XX are:

- TEAM-URC
- TEAM-RLS
- TEAM-VoWLAN

The VM supported on NX9500 and NX9510 is:

- ADSP

Use the virtual-machine command to install the third-party VMs, and configure parameters, such as install media type and location, number of Virtual Central Processing Units (VCPUS), VM memory, VM disk, number of Virtual Network Interfaces (VIFs), and Virtual Networking Computing (VNC) port.

Installing third-party VMs saves on hardware cost and provides a unified VM management interface.

This section is organized into the following sub-sections:

- Syntax **NX45XX, NX65XX**
- Syntax **NX9500 and NX9510**

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax NX45XX, NX65XX**

```plaintext
virtual-machine [assign-usb-ports|console|export|install|restart|set|start|stop|uninstall]

virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}

virtual-machine console [{<VM-NAME>|team-urc|team-rls|team-vowlan}

virtual-machine export <VM-NAME> [{<FILE>|<URL>}{on <DEVICE-NAME>}

virtual-machine install [{<VM-NAME>|team-urc|team-rls|team-vowlan}

virtual-machine install <VM-NAME> type [disk|iso disk-size <SIZE>|vm-archive]
install-media [{<FILE>|<URL>|<USB>}{autostart|memory|on|vcpus|vif-count|vnc}
virtual-machine install [team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine restart [{<VM-NAME>|hard|team-urc|team-rls|team-vowlan}
virtual-machine restart [{<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine restart hard [{<VM-NAME>|team-urc|team-rls|team-vowlan}
virtual-machine set [autostart|memory|vcpus|vif-count|vif-mac|vif-to-vmif|vnc]
virtual-machine set [autostart|ignore|start] memory <512-8192> vcpus <1-4>
vif-count <0-2>vif-mac <VIF-INDEX>{<MAC-INDEX>|<MAC>}
vif-to-vmif <VIF-INDEX>vnc [disable|enable] [{<VM-NAME>|team-urc|team-rls|team-vowlan}
{on <DEVICE-NAME>}

virtual-machine start [{<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine stop [{<VM-NAME>|hard|team-urc|team-rls|team-vowlan]
virtual-machine stop [{<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```
### virtual-machine uninstall

```
virtual-machine uninstall [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

**Parameters** NX45XX, NX65XX

- assign-usb-ports team-vowlan {on <DEVICE-NAME>}

Assigns USB ports to TEAM-VoWLAN

- team-vowlan – Assigns USB ports to TEAM-VoWLAN on a specified device
  - on <DEVICE-NAME> – Optional. Specify the device name.

Use the `no > virtual-machine > assign-usb-ports` command to reassign the port to WING.

**Note:** TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.

### virtual-machine console

```
virtual-machine console [<VM-NAME>|team-urc|team-rls|team-vowlan]
```

Connects to the VM’s console, based on the parameters passed. Select one of the following console options:

- `<VM-NAME>` – Connects to the console of the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- team-urc – Connects to the VM TEAM Unified Retail Communication’s (URC) (IP-PBX) console
- team-rls – Connects to the VM TEAM Radio Link Service (RLS) server’s console
- team-vowlan – Connects to the VM TEAM-VoWLAN’s (Voice over WLAN) console

### virtual-machine export

```
virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}
```

Exports an existing VM image and settings. Use this command to export the VM to another NX45XX or NX65XX device in the same domain.

- `<VM-NAME>` – Specify the VM name.
- `<FILE>` – Specify the location and name of the source file (VM image). The VM image is retrieved and exported from the specified location.
- `<URL>` – Specify the destination location. This is the location to which the VM image is copied. Use one of the following formats to provide the destination path:
  - `tftp://<hostname|IP>[:port]/path/file`
  - `ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
  - `sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
  - `http://<hostname|IP>[:port]/path/file`
- on `<DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

The VM should be in a stop state during the export process.

If the destination is a device, the image is copied to a predefined location (VM archive).

### virtual-machine install

```
virtual-machine install <VM-NAME> type [disk|iso disk-size <SIZE>|vm-archive] install-media [<FILE>|<URL>|<USB>] {autostart|memory|on|vcpus|vif-count|vnc}
```

Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process.

- `<VM-NAME>` – Specify the VM name.
  - type – Specify the install-media (image) type. The options are:
    - disk – Specifies the install media type as pre-installed OS disk image (located in the flash memory) Contd..
- iso disk-size \(<\text{SIZE}>\) – Specifies the install media type as ISO file. This is a single file, which contains the OS bootable install media.
- disk-size \(<\text{SIZE}>\) – If the install media type is ISO, specify the disk size in GB.
- vm-archive – Specifies the install media type as VM archive. The VM archive file is a tar.gz file consisting of a pre-installed OS disk image and an associated configuration file. The configuration is a standard libvirt VM template consisting of VM specific information.

**Note:** After specifying the install media type, specify the location of the image. The image can be located in any of the following supported locations: FLASH, USB, or a remote location, such as http, ftp, sftp, tftp.

<table>
<thead>
<tr>
<th>install-media</th>
<th>Specifies the install media location</th>
</tr>
</thead>
</table>
| \(<\text{FILE}>|\<\text{URL}>|\<\text{USB}>>\) \{autostart|memory|on|vcpus|vif-count|vnc\} | \(<\text{FILE}>\) – Specifies the install-media file is located on flash, for example flash:/cache\n\(<\text{URL}>\) – Specifies the install-media file is located on a remote URL. Provide the URL using one of the following formats:
- tftp://\<hostname>|\<IP>[:\port]/\<path>|\<file>
- ftp://\<user>:\<passwd>@\<hostname>|\<IP>[:\port]/\<path>|\<file>
- sftp://\<user>:\<passwd>@\<hostname>|\<IP>[:\port]/\<path>|\<file>
- http://\<hostname>|\<IP>[:\port]/\<path>|\<file>
\(<\text{USB}>\) – Specifies the install-media file is located on a USB. Provide the USB path and file name using the following format:
- usb<n>:/\<path>|\<file>

After specifying the image location, you may provide the following information:
- autostart – Optional. Specifies whether to autostart the VM on system reboot
- ignore – Enables autostart on each system boot/reboot
- start – Disables autostart (default setting)
- memory – Optional. Defines the VM memory size
- \(<512-8192>\) – Specify the VM memory from 512 - 8192 MB. The default is 2048 MB.
- on – Optional. Executes the command on a specified device
- \(<\text{DEVICE-NAME}>\) – Specify the service platform name.
- vcpus – Optional. Specifies the number of VCPUS for this VM
- \(<1-4>\) – Specify the number of VCPUS from 1 - 4. The default setting is 4.
- vif-count – Optional. Configures or resets the VIF number for this VM
- \(<0-2>\) – Specify the VIF number from 0 - 2. The default setting is 1. If assigning a virtual network interface for the VM, optionally specify the following parameters:
- vif-mac – Sets the MAC index for the virtual interfaces 1 & 2.
- vif-to-vmif – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8. VMIFs are layer 2 interfaces on the WiNG bridge. Each custom VM can have up to a maximum of 2 virtual Ethernet interfaces. By default, these interfaces are internally connected to the Dataplane bridge through VMIF1, which is an untagged port with access VLAN 1.
- vnc – Enables VNC on the virtual interfaces 1 & 2
- vnc – Optional. Disables/enables VNC port. When enabled, provides remote access to VGA through the noVNC client.
- disable – Disables VNC
- enable – Enables VNC (default setting)
### virtual-machine install [team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process. Select one of the following options:

- **team-urc** – Installs the VM TEAM-URC image
- **team-rls** – Installs the VM TEAM-RLS image
- **team-vowlan** – Installs the VM TEAM-VoWLAN image

The following keywords are common to all of the above parameters:

- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

### virtual-machine restart [<VM-NAME>|hard|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

Restarts the VM

- **<VM-NAME>** – Restarts the VM identified by the `<VM-NAME>` keyword
- **team-urc** – Restarts the VM TEAM-URC
- **team-rls** – Restarts the VM TEAM-RLS
- **team-vowlan** – Restarts the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

The option 'hard' forces the specified VM to restart.

Configures the VM settings

- **autostart** – Specifies whether to autostart the VM on system reboot
  - **ignore** – Enables autostart on each system reboot
  - **start** – Disables autostart
- **memory** – Defines the VM memory size
  - **<512-8192>** – Specify the VM memory from 512 - 8192 MB. The default is 1024 MB.
- **vcpus** – Specifies the number of VCPUS for this VM
  - **<1-4>** – Specify the number of VCPUS from 1 - 4.
- **vif-count** – Configures or resets the VM's VIFs
  - **<0-2>** – Specify the Virtual Interface (VIF) number from 0 - 2.
- **vif-mac** – Configures the MAC address of the selected virtual network interface
  - **<VMIF-INDEX>** – Select the VIF Index from 1 - 2.
  - **<MAC-INDEX>** – Specify the MAC index for the selected VIF from 1 - 8.
  - **<MAC>** – Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format.

Contd..
Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the 'set' keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the dataplane (referred to as VMIF). These VMIFs are standard l2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM’s interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the `vif-to-vmif` command to map a VIF to a VMIF on the DP bridge.

- `vif-to-vmif` – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8.
  - `<VIF-INDEX>` – Selects the VIF index from 1 - 2.
  - `<VMIF-INDEX>` – Specify the VMIF index from 1 - 8.

WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two VM interfaces. Each VM interface can be mapped to one of the eight VMIF ports for NX4500 and NX6500 service platforms and twelve ports for NX9500 on the dataplane bridge. This mapping determines the destination for service platform routing.

By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1, by default, is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.

- `vnc` – Disables/enables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client.
  - `disable` – Disables VNC port
  - `enable` – Enables VNC port

After configuring the VM settings, identify the VM to apply the settings.

- `<VM-NAME>` – Applies these settings to the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Applies these settings to the VM TEAM-URC
- `team-rls` – Applies these settings to the VM TEAM-RLS
- `team-vowlan` – Applies these settings to the VM TEAM-VoWLAN
  - `on <DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

<table>
<thead>
<tr>
<th>virtual-machine start [ <code>&lt;VM-NAME&gt;</code></th>
<th>team-urc</th>
<th>team-rls</th>
<th>team-vowlan ] { on <code>&lt;DEVICE-NAME&gt;</code> }</th>
</tr>
</thead>
<tbody>
<tr>
<td>virtual-machine start</td>
<td>Starts the VM, based on the parameters passed. Select one of the following options:</td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>&lt;VM-NAME&gt;</code></td>
<td>• <code>&lt;VM-NAME&gt;</code> – Starts the VM identified by the <code>&lt;VM-NAME&gt;</code> keyword. Specify the VM name.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>team-urc</td>
<td>• <code>team-urc</code> – Starts the VM TEAM-URC</td>
<td></td>

<td></td>
<td></td>
</tr>
<tr>
<td>on <code>&lt;DEVICE-NAME&gt;</code></td>
<td>Contd..</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The following keywords are common to all of the above parameters:
- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**virtual-machine stop** [ <VM-NAME> | hard | team-urc | team-rls | team-vowlan ] { on <DEVICE-NAME> }

Stops the VM, based on the parameters passed. Select one of the following options:
- <VM-NAME> – Stops the VM identified by the <VM-NAME> keyword. Specify the VM name.
- team-urc – Stops the VM TEAM-URC
- team-rls – Stops the VM TEAM-RLS
- team-vowlan – Stops the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:
- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

The option ‘hard’ forces the selected VM to shutdown.

**virtual-machine uninstall** [ <VM-NAME> | team-urc | team-rls | team-vowlan ] { on <DEVICE-NAME> }

Uninstalls the specified VM
- <VM-NAME> – Uninstalls the VM identified by the <VM-NAME> keyword. Specify the VM name.
- team-urc – Uninstalls the VM TEAM-URC
- team-rls – Uninstalls the VM TEAM-RLS
- team-vowlan – Uninstalls the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:
- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Note:** This command releases the VM’s resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.

**Syntax NX9500 and NX9510**

```
virtual-machine console adsp
virtual-machine install [adsp] { on <DEVICE-NAME> }
virtual-machine restart [adsp] { on <DEVICE-NAME> }
virtual-machine set disk-size <100-500> adsp { on <DEVICE-NAME> }
virtual-machine set memory <512-8192> adsp { on <DEVICE-NAME> }
virtual-machine set wing-memory <12288-32739>
virtual-machine [start|stop] adsp { on <DEVICE-NAME> }
virtual-machine uninstall adsp { on <DEVICE-NAME> }
```

**NOTE:** On an NX95XX, you can use the install, start, stop, restart, and set commands to manage a third-party VM running on a NX45XX and NX65XX. You can also configure a third-party VM’s settings through a NX95XX series service platform.
### Parameters NX9500 and NX9510

- **virtual-machine console adsp**

  Connects to the *Air-Defense Services Platform* (ADSP) VM’s management console. When ADSP is running on the NX9500 and NX9510 model service platforms, WiNG communicates with ADSP using a *single sign-on* (SSO) authentication mechanism. Once the user is logged in, WiNG gains access to ADSP without being prompted to login again at ADSP. However, the WiNG and ADSP databases are not synchronized. ADSP has its own user database, stored locally within its VM, which is accessed whenever a user logs directly into ADSP.

  WiNG and ADSP must be consistent in the manner events are reported up through a network hierarchy to ensure optimal interoperability and event reporting. To provide such consistency, WiNG has added support for an ADSP-like hierarchal tree. The tree resides within WiNG, and ADSP reads it from WiNG and displays the network hierarchy in its own ADSP interface. The hierarchal tree can also be used to launch ADSP modules (like Spectrum Analyzer) directly from WiNG. For more information on configuring WiNG tree-node structure, see *tree-node*.

- **virtual-machine install adsp {on <DEVICE-NAME>]**

  Installs the ADSPVM
  - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

  Before installing the ADSP VM, execute the upgrade command, giving the path and file name of the ADSP firmware image. This extracts the image on to the device (NX9500 or NX9510) on which the command has been executed. On successful completion of this process, execute the reload command to reboot the device. Once the device has been successfully rebooted, execute the `virtual-machine > install > adsp` command.

  For example:

  ```
  #upgrade tftp://20.1.1.60/adsp-9.1.1
  May 29 15:12:41 2015: %DAEMON-6-INFO: lighttpd[2405]: 127.0.0.1 127.0.0.1:443 - "POST /mapi.fcgi HTTP/1.1" 200 192 "-" "-
  03-5.8.1.0-008D.img
  May 29 15:12:51 2014: nx9500-6C874D : %DIAG-6-NEW_LED_STATE: LED state message FIRMWARE_UPGRADE_STARTED from module led_msg
  Running from partition /dev/sda8
  Validating image file header
  Extracting files (this may take some time).....May 29 15:12:53 2014: %DAEMON-6-INFO: lighttpd[2405]: 127.0.0.1 127.0.0.1:443 - "POST /mapi.fcgi HTTP/1.1" 200 923 "-" "-
  ...........
  ```

- **virtual-machine restart adsp {on <DEVICE-NAME>]**

  Restarts the ADSP VM
  - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.
### virtual-machine set disk-size \(<100-500>\) adsp \{on \(<\text{DEVICE-NAME}\>)\}

Sets the ADSP VM's disk size (in GB).
- \(<100-500>\) – Specify a value from 100 - 500 GB.
- adsp – Sets the VM as ADSP
  - on \(<\text{DEVICE-NAME}\>) – Optional. Executes the command on a specified device or devices
  - \(<\text{DEVICE-NAME}\>) – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Stop the ADSP VM before executing this command.

### virtual-machine set memory \(<512-8192>\) adsp \{on \(<\text{DEVICE-NAME}\>)\}

Modifies the ADSP VM's memory
- \(<512-8192>\) – Specify a value from 512 - 8192 MB.
- adsp – Sets the VM as ADSP
  - on \(<\text{DEVICE-NAME}\>) – Optional. Executes the command on a specified device or devices
  - \(<\text{DEVICE-NAME}\>) – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

### virtual-machine set wing-memory \(<12288-32739>\)

Specifies the WiNG memory size in MB
This command is applicable only to the NX9500 and NX9510 service platforms. Use the `show > virtual-machine-configuration` command to view the configured memory allocation. Use the `show > virtual-machine-statistics` to view the current allocated memory allocation.
- \(<12288-32739>\) – Specify a value from 12288 - 32739 MB. The default is 18432 MB.

The new memory setting takes effect only after the next boot.

### virtual-machine \([\text{start|stop}]\) adsp \{on \(<\text{DEVICE-NAME}\>)\}

Starts/stops the ADSP VM
- start – Starts the ADSP VM. Use this command to boot a shut down VM (in a stop state).
- stop – Stops a running ADSP VM. Use this command to shut down a running VM.
  - on \(<\text{DEVICE-NAME}\>) – Optional. Executes the start/stop command on a specified device or devices
  - \(<\text{DEVICE-NAME}\>) – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

### virtual-machine uninstall adsp \{on \(<\text{DEVICE-NAME}\>)\}

Uninstalls the ADSP VM
- adsp – Sets the VM as ADSP
  - on \(<\text{DEVICE-NAME}\>) – Optional. Executes the command on a specified device or devices
  - \(<\text{DEVICE-NAME}\>) – Specify the service platform name. In case of multiple devices, list the device names separated by commas.
Examples
The following examples show the VM installation process:

Installation media: USB

<DEVICE>>virtual-machine install <VM-NAME> type iso disk-size 8 install-media usb1://vms/win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable

Installation media: pre-installed disk image

<DEVICE>>virtual-machine install <VM-NAME> type disk install-media flash:/vms/win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on <DEVICE-NAME>

In the preceding example, the command is executed on the device identified by the <DEVICE-NAME> keyword. In such a scenario, the disk-size is ignored if specified. The VM has the install media as first boot device.

Installation media: VM archive

<DEVICE>>virtual-machine install type vm-archive install-media flash:/vms/<VM-NAME> vcpus 3

In the preceding example, the default configuration attached with the VM archive overrides any parameters specified.

Exporting an installed VM:

<DEVICE>>virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>

In the preceding example, the command copies the VM archive on to the URL (VM should be in stop state).

nx4500-5CFA2B>virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.
nx4500-5CFA2B>

NOTE: Use the show > virtual-machine > [configuration|debugging|export|statistics] command to view installed VM details.

</table>
Most PRIV EXEC commands set operating parameters. Privileged-level access should be password protected to prevent unauthorized use. The PRIV EXEC command set includes commands contained within the USER EXEC mode. The PRIV EXEC mode also provides access to configuration modes, and includes advanced testing commands.

The PRIV EXEC mode prompt consists of the hostname of the device followed by a pound sign (#).

To access the PRIV EXEC mode, enter the following at the prompt:

<DEVICE>>enable
<DEVICE>#

The PRIV EXEC mode is often referred to as the enable mode, because the enable command is used to enter the mode.

There is no provision to configure a password to get direct access to PRIV EXEC (enable) mode.

<DEVICE>##?

Privileged command commands:

- **archive**: Manage archive files
- **boot**: Boot commands
- **captive-portal-page-upload**: Captive portal advanced page upload
- **cd**: Change current directory
- **change-passwd**: Change password
- **clear**: Clear
- **clock**: Configure software system clock
- **cluster**: Cluster commands
- **commit**: Commit all changes made in this session
- **configure**: Enter configuration mode
- **connect**: Open a console connection to a remote device
- **copy**: Copy contents of one dir to another
- **cpe**: T5 CPE configuration
- **create-cluster**: Create a cluster
- **crypto**: Encryption related commands
- **crypto-cmp-cert-update**: Update the cmp certs
- **database**: Database
- **database-backup**: Backup database
- **database-restore**: Restore database
- **debug**: Debugging functions
- **delete**: Deletes specified file from the system
- **device-upgrade**: Device firmware upgrade
- **diff**: Display differences between two files
- **dir**: List files on a filesystem
- **disable**: Turn off privileged mode command
- **edit**: Edit a text file
- **enable**: Turn on privileged mode command
- **erase**: Erase a filesystem
ex3500                      EX3500 commands
factory-reset               Factory reset configuration and reload
file-sync                   File sync between controller and adoptees

telnet                      Open a telnet connection
terminal                    Set terminal line parameters
time-it                     Check how long a particular command took between request and completion of response
traceroute                  Trace route to destination
traceroute6                 Trace route to destination(IPv6)
upgrade                     Upgrade software image
upgrade-abort               Abort an ongoing upgrade
virtual-machine             Virtual Machine
watch                       Repeat the specific CLI command at a periodic interval
write                       Write running configuration to memory or terminal
clrscr                      Clears the display screen
exit                        Exit from the CLI

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character.
## 3.1 Privileged Exec Mode Commands

The following table summarizes the PRIV EXEC Mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>archive</td>
<td>Manages file archive operations</td>
<td>page 3-6</td>
</tr>
<tr>
<td>boot</td>
<td>Specifies the image used after reboot</td>
<td>page 3-8</td>
</tr>
<tr>
<td>captive-portal-page-upload</td>
<td>Uploads captive portal advanced pages</td>
<td>page 3-9</td>
</tr>
<tr>
<td>cd</td>
<td>Changes the current directory</td>
<td>page 3-12</td>
</tr>
<tr>
<td>change-passwd</td>
<td>Changes the password of a logged user</td>
<td>page 3-13</td>
</tr>
<tr>
<td>clear</td>
<td>Clears parameters, cache entries, table entries, and other similar entries</td>
<td>page 3-14</td>
</tr>
<tr>
<td>clock</td>
<td>Configures the system clock</td>
<td>page 3-27</td>
</tr>
<tr>
<td>cluster</td>
<td>Initiates a cluster context</td>
<td>page 3-28</td>
</tr>
<tr>
<td>configure</td>
<td>Enters the global configuration mode</td>

<tr>
<td>mint</td>
<td>Configures MiNT protocols</td>
<td>page 3-85</td>
</tr>
<tr>
<td>mkdir</td>
<td>Creates a new directory in the file system</td>
<td>page 3-87</td>
</tr>
<tr>
<td>more</td>
<td>Displays the contents of a file</td>
<td>page 3-88</td>
</tr>
<tr>
<td>no</td>
<td>Reverts a command or sets values to their default</td>
<td>page 3-89</td>
</tr>
<tr>
<td>on</td>
<td>Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, show</td>
<td>page 3-91</td>
</tr>
<tr>
<td>opendns</td>
<td>Connects to the OpenDNS site using OpenDNS registered credentials (username, password) to obtain the device-id. This command is a part of the process integrating access points and controllers with the OpenDNS service.</td>
<td>page 3-92</td>
</tr>
<tr>
<td>page</td>
<td>Toggles a device’s (access point, wireless controller, or service platform) paging function</td>
<td>page 3-94</td>
</tr>
<tr>
<td>ping</td>
<td>Sends ICMP echo messages to a user-specified location</td>
<td>page 3-95</td>
</tr>
<tr>
<td>ping6</td>
<td>Sends ICMPv6 echo messages to a user-specified location</td>
<td>page 3-97</td>
</tr>
<tr>
<td>pwd</td>
<td>Displays the current directory</td>
<td>page 3-98</td>
</tr>
<tr>
<td>re-elect</td>
<td>Re-elects the tunnel controller (wireless controller, service platform, or access point)</td>
<td>page 3-99</td>
</tr>
<tr>
<td>reload</td>
<td>Halts a device (wireless controller, service platform, or access point) and performs a warm reboot</td>
<td>page 3-100</td>
</tr>
</tbody>
</table>
### Table 3.1 Privileged Exec Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rename</code></td>
<td>Renames a file in the existing file system</td>
<td>page 3-105</td>

<td>series service platforms.</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.

**NOTE:** The input parameter `<HOSTNAME>`, if used in syntaxes across this chapter, cannot include an underscore (_) character.
### 3.1.1 archive

#### Privileged Exec Mode Commands

Manages file archive operations

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>archive tar /table [&lt;FILE&gt;</td>
<td>&lt;URL&gt;]</td>
</tr>
<tr>
<td>archive tar /create [&lt;FILE&gt;</td>
<td>&lt;URL&gt;] &lt;FILE&gt;</td>
</tr>
<tr>
<td>archive tar /xtract [&lt;FILE&gt;</td>
<td>&lt;URL&gt;] &lt;DIR&gt;</td>
</tr>
</tbody>
</table>

#### Parameters

- **archive tar /table [<FILE>|<URL>]**
  - `<FILE>` Defines a tar filename
  - `<URL>` Sets the tar file URL

- **archive tar /create [<FILE>|<URL>] <FILE>**
  - `<FILE>` Defines tar filename
  - `<URL>` Sets the tar file URL

- **archive tar /xtract [<FILE>|<URL>] <DIR>**
  - `<DIR>` Specify a directory name. When used with /create, dir is the source directory for the tar file. When used with /xtract, dir is the destination file where contents of the tar file are extracted.
Examples

Following examples show how to zip the folder flash:/log/?

nx9500-6C8809#
3.1.2 boot

Privileged Exec Mode Commands

Specifies the image used after reboot

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`boot system [primary|secondary] {on <DEVICE-NAME>}`

Parameters

- `boot system [primary|secondary] {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>system [primary</td>
<td>secondary]</td>

nx9500-6C8809# 
```
3.1.3 captive-portal-page-upload

Privileged Exec Mode Commands

Uploads captive portal advanced pages to connected access points. Use this command to provide connected access points with specific captive portal configurations so they can successfully provision login, welcome, and condition pages to requesting clients attempting to access the wireless network using the captive portal.

NOTE: Ensure that the captive portal pages to be uploaded are *.tar files.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
captive-portal-page-upload [<CAPTIVE-PORTAL-NAME>|cancel-upload|delete-file|load-file]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all|rf-domain]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all]
    {upload-time <TIME>}
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME]|all]
    {from-controller} {(upload-time <TIME>)}
captive-portal-page-upload cancel-upload [<MAC/HOSTNAME]|all|on rf-domain
    [<DOMAIN-NAME]|all]]
captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>
```

Parameters

- captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all]
  {upload-time <TIME>}

  captive-portal-page-upload <CAPTIVE-PORTAL-NAME>
  Uploads advanced pages specified by the <CAPTIVE-PORTAL-NAME> parameter
  • <CAPTIVE-PORTAL-NAME> – Specify captive portal name (should be existing and configured).

  <MAC/HOSTNAME>
  Uploads to a specified AP
  • <MAC/HOSTNAME> – Specify the AP’s MAC address or hostname.

  all
  Uploads to all APs

  upload-time <TIME>
  Optional. Schedules an upload time
  • <TIME> – Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal-page-upload</td>
<td>Uploads advanced pages specified by the <code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> parameter</td>
</tr>
<tr>
<td><code>&lt;CAPTIVE-PORTAL-NAME&gt;</code></td>
<td>• <code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> – Specify captive portal name (should be existing and configured).</td>
</tr>
<tr>
<td>rf-domain</td>
<td>Uploads to all APs within a specified RF Domain or all RF Domains</td>
</tr>
<tr>
<td>`[&lt;DOMAIN-NAME&gt;</td>
<td>all]`</td>
</tr>
<tr>
<td>from-controller</td>
<td>Optional. Uploads to APs from the adopted device</td>
</tr>
<tr>
<td>upload-time <code>&lt;TIME&gt;</code></td>
<td>Optional. Schedules an AP upload</td>
</tr>
<tr>
<td>cancel-upload</td>
<td>Cancels a scheduled AP upload</td>
</tr>
<tr>
<td>`[&lt;MAC/HOSTNAME&gt;</td>
<td>all</td>
</tr>
<tr>
<td>delete-file</td>
<td>Deletes a captive portal's uploaded captive-portal internal page files</td>
</tr>
<tr>
<td><code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> <code>&lt;FILE-NAME&gt;</code></td>
<td>• <code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> – Specify the captive portal’s name.</td>
</tr>
<tr>
<td>load-file</td>
<td>Loads captive-portal advanced pages</td>
</tr>
<tr>
<td><code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> <code>&lt;URL&gt;</code></td>
<td></td>
</tr>
</tbody>
</table>
<CAPTIVE-PORTAL-NAME> <URL>

Specify captive portal name (should be existing and configured) and location.

- <URL> – Specifies location of the captive-portal's advanced pages. Use one of the following formats:

IPv4 URLs:
- `tftp://<hostname|IP>[:port]/path/file`
- `ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
- `sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
- `http://<hostname|IP>[:port]/path/file`
- `cf:/path/file`
- `usb<n>:/path/file`

IPv6 URLs:
- `tftp://<hostname|IPv6>[:port]/path/file`
- `ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file`
- `sftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file`
- `http://<hostname|IPv6>[:port]/path/file`

**Note:** The captive portal pages are downloaded to the controller from the location specified here. After downloading use the `captive-portal-page-upload` <CAPTIVE-PORTAL-NAME> > <DEVICE-OR-DOMAIN-NAME> command to upload these pages to APs.

**Examples**

```
ap6562-B1A214#captive-portal-page-upload load-file captive_portal_test tftp://89.89.89.17/pages_new_only.tar
ap6562-B1A214#
ap6562-B1A214#show captive-portal-page-upload load-image-status
Download of captive_portal_test advanced page file is complete
ap6562-B1A214#
ap6562-B1A214#captive-portal-page-upload captive_portal_test all
```

```
3.1.4 cd

Privileged Exec Mode Commands

Changes the current directory

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
cd {<DIR>}
```

Parameters

- `cd {<DIR>}`

<table>
<thead>
<tr>
<th><code>&lt;DIR&gt;</code></th>
<th>Optional. Changes the current directory to the directory identified by the <code>&lt;DIR&gt;</code> keyword. If a directory name is not provided, the system displays the current directory.</th>
</tr>
</thead>
</table>

Examples

```
rfs7000-37FABE#cd flash:/log/
rfs7000-37FABE#pwd
flash:/log/
rfs7000-37FABE#```
3.1.5 change-passwd

Privileged Exec Mode Commands

Changes the password of a logged user. When this command is executed without any parameters, the password can be changed interactively.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
change-passwd \{<OLD-PASSWORD>\} <NEW-PASSWORD>
```

Parameters

- `change-passwd \{<OLD-PASSWORD>\} <NEW-PASSWORD>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;OLD-PASSWORD&gt;</code></td>
<td>Optional. Specify the password to be changed.</td>
</tr>
<tr>
<td><code>&lt;NEW-PASSWORD&gt;</code></td>
<td>Specify the new password. Note: The password can also be changed interactively. To do so, press [Enter] after the command.</td>
</tr>
</tbody>
</table>

Usage Guidelines

A password must be from 1 - 64 characters.

Examples

```
rfs7000-37FABE#change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory{write memory} to be persistent.
rfs7000-37FABE#write memory
OK
rfs7000-37FABE#
```
### 3.1.6 clear

**Privileged Exec Mode Commands**

Clears parameters, cache entries, table entries, and other entries. The clear command is available for specific commands only. The information cleared using this command varies depending on the mode where the clear command is executed.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

---

**NOTE:** When using the `clear` command, refer to the interface details provided in **Chapter 7, PROFILES, section interface.**

#### Syntax

```plaintext
clear [arp-cache|bonjour|cdp|counters|crypto|event-history|firewall|gre|ip|ipv6|l2tpv3-stats|license|lldp|logging|mac-address-table|mint|role|rtls|smart-cache|spanning-tree|traffic-shape|vrrp]

  {on <DEVICE-NAME>}

clear traffic-shape statistics {class <1-4>} {(on <DEVICE-NAME>)}

clear vrrp [error-stats|stats] {on <DEVICE-NAME>}

The following clear command is specific to the NX45XX, NX65XX, and NX9XXX series service platforms:
clear smart-cache storage [all|url-regex <WORD>] {on <DEVICE-NAME>}

clear logging analytics {on <DEVICE-NAME>}

Parameters
  • clear arp-cache {on <DEVICE-NAME>}

  **arp-cache**
  Clears Address Resolution Protocol (ARP) cache entries on a device. This protocol
  matches layer 3 IP addresses to layer 2 MAC addresses.

  on <DEVICE-NAME>
  Optional. Clears ARP cache entries on a specified device
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service
    platform.

  • clear bonjour cache {on <DEVICE-NAME>}

  **bonjour cache**
  Clears all Bonjour cached statistics. Once cleared, the system has to re-discover
  available Bonjour services.

  on <DEVICE-NAME>
  Optional. Clears all Bonjour cached statistics on a specified device
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service
    platform.

  • clear [cdp|lldp] neighbors {on <DEVICE-NAME>}

  **cdp**
  Clears Cisco Discovery Protocol (CDP) table entries

  **lldp**
  Clears Link Layer Discovery Protocol (LLDP) neighbor table entries
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>neighbors</td>
<td>Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step</td>
</tr>
</tbody>
</table>
| on `<DEVICE-NAME>` | Optional. Clears CDP or LLDP neighbor table entries on a specified device  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |

- **clear counters [all|bridge|router|thread]**
  
  **counters [all|bridge|router|thread]** | Clears counters on a system  
  - all – Clears all counters irrespective of the interface type  
  - bridge – Clears bridge counters  
  - router – Clears router counters  
  - thread – Clears per-thread counters |

- **clear counters [ap|wireless-client] `{<MAC}>` `{on <DEVICE-OR-DOMAIN-NAME>}`**
  
  `<MAC>` | The following keyword is common to the ‘ap’ and ‘wireless-client’ parameters:  
  - `<MAC>` – Optional. Clears counters of the AP/wireless client identified by the `<MAC>` keyword. Specify the MAC address of the AP or wireless client.  
  **Note:** The system clears all AP or wireless client counters, if no MAC address is specified. |

- **clear counters interface [INTERFACE-NAME]|all|ge <1-X>|me1|port-channel <1-X>|pppoel|vlan <1-4094>|wwan1|vmif <1-X>|xge <1-4>**
  
  `INTERFACE-NAME` | Clears interface counters for a specified interface  
  - `INTERFACE-NAME` – Clears a specified interface counters. Specify the interface name.  
  - all – Clears all interface counters  
  - `ge <1-X>` – Clears GigabitEthernet interface counters. Specify the GigabitEthernet interface index from 1 - X.  
  **Note:** The number of Ethernet interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 24 GE interfaces. Where as, RFS4000 supports 5 GE interfaces.  
  - `me1` – Clears FastEthernet interface counters  
  - `port-channel <1-X>` – Clears port-channel interface counters. Specify the port channel interface index from 1 - X.  
  **Note:** The number of port-channel interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 13 port-channels. Where as, RFS4000 supports 3 port-channels.  
  Contd..
### clear counters radio

- **clear counters radio** `{<MAC/HOSTNAME> <1-X>} {(on <DEVICE-OR-DOMAIN-NAME>)}`

  **counters radio**
  - Clears wireless radio counters

  **<MAC/HOSTNAME> <1-X>**
  - Clears counters of a radio identified by the `<MAC/HOSTNAME>` keyword.
    - `<MAC/HOSTNAME>` – Optional. Specify the hostname or MAC address.
      Optionally, append the interface number to form radio ID in the form of AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX
    - `<1-X>` – Optional. Specify the radio index (if not specified as part of the radio ID).
      The maximum number of radio antennas supported varies with the access point type.
      **Note:** If no MAC address or radio index is specified, the system clears all radio counters.

  **on <DEVICE-OR-DOMAIN-NAME>**
  - The following keyword is recursive and is applicable to the `<MAC>` parameter:
    - `<DEVICE-OR-DOMAIN-NAME>` – Optional. Clears AP/wireless-client counters on a specified device or RF Domain
      - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.
      **Note:** If no MAC address is specified, the system clears all AP or wireless client counters on the specified AP, wireless controller, service platform, or RF Domain.

### clear crypto ike sa

- **clear crypto ike sa** `[<IP>|all] {on <DEVICE-NAME>}`

  **crypto**
  - Clears encryption module database

  **ike sa** `[<IP>|all]`
  - Clears *Internet Key Exchange* (IKE) *security associations* (SAs)
    - `<IP>` – Clears IKE SAs for a certain peer
    - `all` – Clears IKE SAs for all peers

  **on <DEVICE-NAME>**
  - Optional. Clears IKE SA entries, for a specified peer or all peers, on a specified device
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

### clear crypto ipsec sa

- **clear crypto ipsec sa** `{on <DEVICE-NAME>}`

  **crypto**
  - Clears encryption module database

  **ipsec sa** `{on <DEVICE-NAME>}`
  - Clears *Internet Protocol Security* (IPSec) database SAs
    - `<DEVICE-NAME>` – Optional. Clears IPSec SA entries on a specified device
      - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.
### clear event-history

<table>
<thead>
<tr>
<th>event-history</th>
<th>Clears event history cache entries</th>
</tr>
</thead>
</table>

### clear firewall [dhcp snoop-table|dos stats|flows [ipv4|ipv6]|neighbors snoop-table] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>firewall</th>
<th>Clears firewall event entries</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp snoop-table</td>
<td>Clears DHCP snoop table entries</td>
</tr>
<tr>
<td>dos stats</td>
<td>Clears denial of service statistics</td>
</tr>
<tr>
<td>flows [ipv4</td>
<td>ipv6]</td>
</tr>
<tr>
<td>neighbors snoop-table</td>
<td>Clears IPv6 neighbors snoop-table entries</td>
</tr>
</tbody>
</table>
| on <DEVICE-NAME>                 | The following keywords are common to the DHCP, DOS, and flows parameters:  
  - on <DEVICE-NAME> – Optional. Clears DHCP snoop table entries, denial of service statistics, or the established firewall sessions on a specified device  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

### clear gre stats {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>gre stats</th>
<th>Clears GRE tunnel statistics</th>
</tr>
</thead>
</table>
| on <DEVICE-NAME>                 | Optional. GRE tunnel statistics on a specified device  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

### clear ip bgp [<IP>|all|external] {in prefix-filter} {on <DEVICE-NAME>}

| ip bgp [<IP>|all|external]         | Clears BGP routing table information based on the option selected  
  - <IP> – Clears the BGP peer identified by the <IP> keyword. Specify the BGP peer’s IP address.  
  - all – Clears Route Updates Received From All BGP Peers  
  - external – Clears route updates received from external BGP peers  
  Note: This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, NX9000, and NX9600 series service platforms.  
  Note: In case of a change in routing policy it is necessary to clear BGP routing table entries in order for the new policy to take effect. |
| in prefix-filter                  | Optional. Clears soft-reconfiguration inbound route updates  
  - prefix-filter – Optional. Clears the existing Outbound Route Filtering (ORF) prefix-list. |
| on <DEVICE-NAME>                 | Optional. Clears soft-reconfiguration inbound route updates on a specified device  
  - <DEVICE-NAME> – Specify the name of the AP or service platform. |
### clear ip bgp `<IP>|all|external` `{out}` `{on <DEVICE-NAME>}`

**ip bgp`<IP>|all|external>`: Clears BGP routing table information based on the option selected
- `<IP>` – Clears the BGP peer identified by the `<IP>` keyword. Specify the BGP peer’s IP address.
- all – Clears route updates received from all BGP peers
- external – Clears route updates received from external BGP peers

**Note:** This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 series service platforms.

**Note:** In case of a change in routing policy it is necessary to clear BGP routing table entries in order for the new policy to take effect.

**out** Optional. Clears soft-reconfiguration outbound route updates. Optionally specify the device on which to execute this command.

**on `<DEVICE-NAME>`**

The following keyword is recursive and optional.
- on `<DEVICE-NAME>` – Optional. Clears BGP sessions on a specified device
- `<DEVICE-NAME>` – Specify the name of the AP or service platform.

### clear ip bgp `<IP>|all|external` `{soft in|out}` `{on <DEVICE-NAME>}`

**ip bgp `<IP>|all|external>`: Clears BGP routing table information based on the option selected
- `<IP>` – Clears the BGP peer identified by the `<IP>` keyword. Specify the BGP peer’s IP address.
- all – Clears route updates received from all BGP peers
- external – Clears route updates received from external BGP peers

**Note:** This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 series service platforms.

**Note:** In case of a change in routing policy it is necessary to clear BGP routing table entries in order for the new policy to take effect.

**soft `{in|out}`** Optional. Enables soft-reconfiguration of route updates for the specified IP address. This option allows routing tables to be reconfigured without clearing BGP sessions.
- in – Optional. Enables soft reconfiguration of inbound route updates
- out – Optional. Enables soft reconfiguration of outbound route updates

**Note:** Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy etc.) take effect only after on-going BGP sessions are cleared. The `clear > ip > bgp` command clears BGP sessions. To reduce loss of route updates during the process, use the ‘soft’ option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.

**on `<DEVICE-NAME>`** Optional. Clears soft-reconfiguration inbound/outbound route updates on a specified device
- `<DEVICE-NAME>` – Specify the name of the AP or service platform.

### clear ip bgp process `{on `<DEVICE-NAME>`}`

**ip bgp process** Clears all BGP processes running

**Note:** This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, NX9000, NX9600 platforms.

**on `<DEVICE-NAME>`** Optional. Clears all BGP processes on a specified device
- `<DEVICE-NAME>` – Specify the name of the AP or service platform.
• clear ip dhcp bindings [<IP>|all] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>Clears a Dynamic Host Configuration Protocol (DHCP) server’s IP address bindings entries</td>
</tr>
<tr>
<td>dhcp bindings</td>
<td>Clears DHCP server’s connections and address binding entries</td>
</tr>
<tr>
<td>&lt;IP&gt;</td>
<td>Clears specific address binding entries. Specify the IP address to clear binding entries.</td>
</tr>
<tr>
<td>all</td>
<td>Clears all address binding entries</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears a specified address binding or all address bindings on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

• clear ip ospf process {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip ospf process</td>
<td>Clears already enabled open shortest path first (OSPF) process and restarts the process</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears OSPF process on a specified device</td>
</tr>
<tr>
<td></td>
<td>OSPF is a link-state interior gateway protocol (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet layer which makes routing decisions based solely on the destination IP address found in IP packets.</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

• clear ipv6 neighbor-cache {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ipv6 neighbor-cache</td>
<td>Clears IPv6 neighbor cache entries</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears IPv6 neighbor cache entries on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

• clear l2tpv3-stats tunnel <L2TPV3-TUNNEL-NAME> {session <SESSION-NAME>} {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2tpv3-stats</td>
<td>Clears L2TPv3 tunnel session statistics</td>
</tr>
<tr>
<td>tunnel</td>
<td>Clears all sessions associated with a specified L2TPv3 tunnel</td>
</tr>
<tr>
<td>&lt;L2TPV3-TUNNEL-NAME&gt;</td>
<td>• &lt;L2TPV3-TUNNEL-NAME&gt; – Specify the L2TPv3 tunnel name.</td>
</tr>
<tr>
<td>session</td>
<td>Optional. Clears a specified L2TPv3 tunnel session, identified by the &lt;SESSION-NAME&gt; keyword</td>
</tr>
<tr>
<td>&lt;SESSION-NAME&gt;</td>
<td>• &lt;SESSION-NAME&gt; – Specify the session name.</td>
</tr>
</tbody>
</table>
### clear license borrowed

The following parameter is recursive and optional:
- **on <DEVICE-NAME>** – Optional. Specifies the device running the L2TPv3 tunnel session.
- **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

**Note:** If no optional parameters are specified, the system clears all L2TPv3 tunnel session statistics.

```
• clear license borrowed {on <DEVICE-NAME>}
```

### license borrowed

Releases or revokes all licenses borrowed by a site controller.

- **on <DEVICE-NAME>** – Optional. Specifies the borrowing controller’s name.

**Note:** If no device name is specified, the system clears all borrowed licenses on the logged device.

```
license borrowed {on <DEVICE-NAME>}
```

### clear license lent

NOC controller releases or revokes all licenses loaned to a site controller.

- **on <DEVICE-NAME>** – Optional. Specifies the controller’s name.

**Note:** If no device name is specified, the system clears all loaned licenses on the logged device.

```
license lent to <DEVICE-NAME> {on <DEVICE-NAME>}
```

### clear mac-address-table

Clears the MAC address forwarding table.

- **address <MAC>** – Specify the MAC address in one of the following formats: AA-BB-CC-DD-EE-FF or AA:BB:CC:DD:EE:FF or AABB.CCDD.EEFF
- **vlan <1-4094>** – Specify the VLAN ID from 1 - 4094

```
• clear mac-address-table {address <MAC>|vlan <1-4094>} {on <DEVICE-NAME>}
```

### interface

Clears all MAC addresses for the selected interface. Use the options available to specify the interface.

```
• clear mac-address-table interface [<IF-NAME>|ge <1-X>|port-channel <1-X>|t1e1 <1-4> <1-1>|up <1-X>|vmif <1-X>|xge <1-4>] {on <DEVICE-NAME>}
```

- **<IF-NAME>** – Specify the layer 2 interface name.
<table>
<thead>
<tr>

<tr>
<td>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>

### smart-cache

Clears the smart-cache storage

Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see smart-cache-policy.
### PRIVILEGED EXEC MODE COMMANDS

| storage [all|regex <WORD>] | Clears stored content based on the parameters passed  
|---------------------------|-----------------------------------------------------|
|                           | - all – Clears all cached content  
|                           | - regex <WORD> – Clears only those URLs matching the specified expression  
|                           |  - <WORD> – Provide the URL in the following format: e.g. \\.xxx\/\+.\.(flv|mp4)  

| on <DEVICE-NAME> | Optional. Clears stored content on a specified device  
|-------------------|-----------------------------------------------------|
|                   | - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform

nx4500-5CFA2B#
3.1.7 clock

Sets a device’s system clock. By default all WiNG devices are shipped with the time zone and time format set to UTC and 24-hour clock respectively. If a device’s clock is set without resetting the time zone, the time is displayed relative to the Universal Time Coordinated (UTC) – Greenwich Time. For example, San Jose is approximately 7 or 8 hours (depending on the time of the year) behind the UTC time. If the time at Greenwich, UK is 15:00:00 UTC, at San Jose it will display as 8:00:00 or 7:00:00 UTC. To display time in the local time zone format, in the device’s configuration mode, use the timezone command to reset the time zone. You can also reset the time zone at the RF Domain level. When configured as RF Domain setting, it applies to all devices within the domain. Configuring the local time zone prior to setting the clock is recommended. For more information on configuring RF Domain time zone, see timezone.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}

Parameters

- clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}

| clock set | Sets a device’s system clock |
| <HH:MM:SS> | Sets the current time (in military format hours, minutes and seconds)  
**Note:** By default the WiNG software displays time in the 24-hour clock format. This setting cannot be changed. |
| <1-31> | Sets the numerical day of the month |
| <MONTH> | Sets the month of the year from Jan - Dec |
| <1993-2035> | Sets a valid four digit year from 1993 - 2035 |

on <DEVICE-NAME> Optional. Sets the clock on a specified device

- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

The following commands set the time zone and clock for the logged device:

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#timezone America/Los_Angeles
```

```
nx9500-6C8809#clock set 10:13:00 24 Mar 2015
```

```
nx9500-6C8809#show clock
2015-03-24 10:13:07 PDT
```

Note, if the clock is set without resetting the time zone, the time displays as UTC time as shown in the following example:

```
nx4500-5CFA2B#show clock
2015-09-08 06:19:34 UTC
```

```
nx4500-5CFA2B#```
### 3.1.8 cluster

- **Privileged Exec Mode Commands**

  Initiates the cluster context. The cluster context provides centralized management to configure all cluster members from any one member.

  Commands executed under this context are executed on all members of the cluster.

  Supported in the following platforms:
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
cluster start-election
```

**Parameters**

- `cluster start-election`

**Examples**

```
rfs7000-37FABE#cluster start-election
rfs7000-37FABE#
```

**Related Commands**

<table>
<thead>
<tr>

3.1.9 configure

Privileged Exec Mode Commands

Enters the configuration mode. Use this command to enter the current device’s configuration mode, or enable configuration from the terminal.

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
configure {self|terminal}

Parameters
• configure {self|terminal}

<table>
<thead>
<tr>
<th>self</th>
<th>Optional. Enables the current device’s configuration mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>terminal</td>
<td>Optional. Enables configuration from the terminal</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE#configure self
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#

rfs7000-37FABE#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config)#
3.1.10 connect

Privileged Exec Mode Commands

Begins a console connection to a remote device using the remote device’s MiNT ID or name

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]

Parameters
- connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]

Examples
rfs7000-6DCD4B#show mint lsp-db
6 LSPs in LSP-db of 19.6D.CD.4B:
LSP 19.58.72.58 at level 1, hostname "ap5142-587258", 5 adjacencies, seqnum 748149

Password:
nx9500-6C8809>
3.11 copy

Privileged Exec Mode Commands

Copies a file (config, log, txt... etc) from any location to the access point, wireless controller, or service platform and vice-versa.

**NOTE:** Copying a new config file to an existing running-config file merges it with the existing running-config file on the wireless controller. Both the existing running-config and the new config file are applied as the current running-config.

Copying a new config file to a start-up config file replaces the existing start-up config file with the parameters of the new file. It is better to erase the existing start-up config file and then copy the new config file to the startup config.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
copy [<SOURCE-FILE>|<SOURCE-URL>] [<DESTINATION-FILE>|<DESTINATION-URL>]
```

**Parameters**

- `<SOURCE-FILE>` Specify the source file to copy.
- `<SOURCE-URL>` Specify the source file’s location (URL).
- `<DESTINATION-FILE>` Specify the destination file to copy to.
- `<DESTINATION-URL>` Specify the destination file’s location (URL).

**Examples**

Transferring file snmpd.log to remote TFTP server.
```
rfs7000-37FABE#copy flash:/log/snmpd.log tftp://157.235.208.105:/snmpd.log
```

Accessing running-config file from remote TFTP server into switch running-config.
```
rfs7000-37FABE#copy tftp://157.235.208.105:/running-config running-config
```
3.1.12 cpe

Privileged Exec Mode Commands

Enables a WiNG controller to perform certain operations on Customer Premises Equipment (CPEs) through an adopted T5 controller.

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a Digital Subscriber Line (DSL) as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

cpe [boot|led|reload|upgrade]

cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}

cpe [led|reload|upgrade <IMAGE-LOCATION>] cpe [<1-24>|all] {on <T5-DEVICE-NAME>}

Parameters

- cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}

<table>
<thead>
<tr>
<th>cpe boot system</th>
<th>Changes the image used by a CPE to boot. When reloading, the CPE uses the specified image.</th>
</tr>
</thead>
<tbody>
<tr>
<td>cpe [&lt;1-24&gt;</td>
<td>all]</td>
</tr>
<tr>
<td>[primary</td>
<td>secondary]</td>
</tr>
<tr>
<td>on &lt;T5-DEVICE-NAME&gt;</td>
<td>Optional. Performs this operation on a specified T5 device</td>
</tr>
</tbody>
</table>

| cpe [led|reload|upgrade <IMAGE-LOCATION>] | Performs the following operations on CPEs |
|------------------------------------------|-----------------------------------------|
| led – Enables flashing of LEDs |
| reload – Reloads the device |
| upgrade <IMAGE-LOCATION> – Upgrades the device |
| <IMAGE-LOCATION> – Specify the location of the firmware image. Both IPv4 and IPv6 addresses are supported. |

Contd..
Use one of the following options to provide the location:
IPv4 URLs: tftp://<hostname/IP>[:port]/path/file
ftp://<user>:@<hostname/IP>[:port]/path/file
sftp://<user>:@<hostname/IP>[:port]/path/file
http://<hostname/IP>[:port]/path/file
cf:/path/file
usb<n>:/path/file
IPv6 URLs: tftp://<hostname/[IPv6]>[:port]/path/file
ftp://<user>:@<hostname/[IPv6]>[:port]/path/file
sftp://<user>:@<hostname/[IPv6]>[:port]/path/file

**Note:** After specifying the operation to perform, identify the device(s).

| cpe [<1-24>|all] | Identifies the CPE(s) on which the operation is performed |
|------------------|----------------------------------------------------------|
| • <1-24> – Configures the CPE’s ID from 1 - 24 |
| • all – Configures all CPEs |

<table>
<thead>
<tr>
<th>on &lt;T5-DEVICE-NAME&gt;</th>
<th>Optional. Performs this operation on a specified T5 device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;T5-DEVICE-NAME&gt; – Specify the T5 device’s hostname.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**
rfs7000-37FABE#cpe led cpe all on t5-ED5C2C
Updated T5 CPE led state
rfs7000-37FABE#
### 3.1.13 create-cluster

 privileget Exec Mode Commands

Creates a new device cluster, with the specified name, and assigns it an IP address and routing level.

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member's failure.

A cluster's load is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```bash
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

#### Parameters

- `create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name &lt;CLUSTER-NAME&gt;</td>
<td>Configures the cluster name</td>
</tr>
<tr>
<td>ip &lt;IP&gt;</td>
<td>Specifies the device’s IP address used for cluster creation</td>
</tr>
<tr>
<td>level [1</td>
<td>2]</td>
</tr>
</tbody>
</table>

#### Examples

```bash
rfs4000-229D58# create-cluster name TechPubsLAN ip 192.168.13.8 level 2
... creating cluster

3.14 crypto

Privileged Exec Mode Commands

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate Certificate Signing Request (CSR).

This command also enables trustpoint configuration. Trustpoints contain the CA's identity and configuration parameters.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

crypto [key|pki]

crypto key [export|generate|import|zeroize]

crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|on|passphrase}
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> 
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|on|passphrase}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> 
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}

crypto pki [authenticate|export|generate|import|zeroize]

crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background}
{(on <DEVICE-NAME>)}
crypto pki export [request|trustpoint]

crypto pki export request [generate-rsa-key|short|use-rsa-key] <RSA-KEYPAIR-NAME> 
[autogen-subject-name|subject-name]
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> 
autogen-subject-name <(EXPORT-TO-URL),email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>}
crypto pki export request [generate-rsa-key|short |generate-rsa-key|use-rsa-key] | 
use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> <(EXPORT-TO-URL),email <SEND-TO-EMAIL>, 
fqdn <FQDN>,ip-address <IP>}
crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> 
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key| 
use-rsa-key] <RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key| 
use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name <(email <SEND-TO-EMAIL>, 
fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)}
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] 
<RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> <(email <SEND-TO-EMAIL>,fqdn <FQDN>, 
ip-address <IP>,on <DEVICE-NAME>)}
### crypto pki import [certificate|crl|trustpoint]
### crypto pki import [certificate | crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> 
{background} {on <DEVICE-NAME>}
### crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL> 
{background | passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}
### crypto pki zeroize trustpoint <TRUSTPOINT-NAME> 
{del-key} {on <DEVICE-NAME>}

#### Parameters
- **crypto key export rsa** <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> 
  {background | passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}
- **crypto key generate rsa** <RSA-KEYPAIR-NAME> [2048|4096] 
  {on <DEVICE-NAME>}
- **crypto key import rsa** <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> 
  {background | passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>key</th>
<th>Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.</th>
</tr>
</thead>
</table>
| export rsa <RSA-KEYPAIR-NAME> | Exports an existing RSA Keypair to a specified destination  
  • <RSA-KEYPAIR-NAME> – Specify the RSA Keypair name.  
  <EXPORT-TO-URL> Specify the RSA Keypair destination address. Both IPv4 and IPv6 address formats are supported.  
  After specifying the destination address (where the RSA keypair is exported), configure one of the following parameters: background or passphrase. |
| background | Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on. |
| passphrase <KEY-PASSPHRASE> background | Optional. Encrypts RSA Keypair before exporting  
  • <KEY-PASSPHRASE> – Specify a passphrase to encrypt the RSA keypair.  
  • background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on. |
| on <DEVICE-NAME> | The following parameter is recursive and common to all of the above parameters:  
  • on <DEVICE-NAME> – Optional. Performs export operation on a specified device  
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **crypto key generate rsa** <RSA-KEYPAIR-NAME> [2048|4096] 
  {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>key</th>
<th>Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.</th>
</tr>
</thead>
</table>
| generate rsa <RSA-KEYPAIR-NAME> [2048|4096] | Generates a new RSA Keypair  
  • <RSA-KEYPAIR-NAME> – Specify the RSA Keypair name.  
  • [2048|4096] – Sets the size of the RSA key in bits. The options are 2048 bits and 4096 bits. The default size is 2048 bits.  
  After specifying the key size, optionally specify the device (access point or controller) to generate the key on. |
| on <DEVICE-NAME> | Optional. Generates the new RSA Keypair on a specified device  
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **crypto key import rsa** <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> 
  {background | passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}

<table>

</tbody>
</table>
| on <DEVICE-NAME> | The following parameter is recursive and optional:  
  • on <DEVICE-NAME> – Optional. Performs authentication on a specified device  
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)

| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| export request | Exports CSR to the CA for digital identity certificate. The CSR contains applicant’s details and RSA Keypair’s public key. |
| [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> | Generates a new RSA Keypair or uses an existing RSA Keypair  
  • generate-rsa-key – Generates a new RSA Keypair for digital authentication  
  • use-rsa-key – Uses an existing RSA Keypair for digital authentication  
  • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |

- autogen-subject-name | Auto generates subject name from configuration parameters. The subject name identifies the certificate. |
| <EXPORT-TO-URL> | Specify the CA's location. Both IPv4 and IPv6 address formats are supported.  
  Note: The CSR is exported to the specified location. |
| email <SEND-TO-EMAIL> | Exports CSR to a specified e-mail address  
  • <SEND-TO-EMAIL> – Specify the CA’s e-mail address. |
| fqdn <FQDN> | Exports CSR to a specified Fully Qualified Domain Name (FQDN)  
  • <FQDN> – Specify the CA’s FQDN. |
| ip-address <IP> | Exports CSR to a specified device or system  
  • <IP> – Specify the CA’s IP address. |

- crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)

<p>| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| export request | Exports CSR to the CA for a digital identity certificate. The CSR contains applicant’s details and RSA Keypair’s public key. |</p>

### Trustpoint Export Command

```plaintext
[generate-rsa-key] short [generate-rsa-key|use-rsa-key]] use-rsa-key] <RSA-KEYPAIR-NAME>
```

Generates a new RSA Keypair or uses an existing RSA Keypair
- `generate-rsa-key` – Generates a new RSA Keypair for digital authentication
- `short generate-rsa-key|use-rsa-key` – Generates and exports a shorter version of the CSR
- `generate-rsa-key` – Generates a new RSA Keypair for digital authentication. If generating a new RSA Keypair, specify a name for it.
- `use-rsa-key` – Uses an existing RSA Keypair for digital authentication. If using an existing RSA Keypair, specify its name.
- `use-rsa-key` – Uses an existing RSA Keypair for digital authentication
- `<RSA-KEYPAIR-NAME>` – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.

### Subject Name Configuration

```plaintext
subject-name <COMMON-NAME>
```

Configures a subject name, defined by the `<COMMON-NAME>` keyword, to identify the certificate
- `<COMMON-NAME>` – Specify the common name used with the CA certificate. The name should enable you to identify the certificate easily (2 to 64 characters in length).

### Country Configuration

```plaintext
<COUNTRY>
```

Sets the deployment country code (2 character ISO code)

### State Configuration

```plaintext
<STATE>
```

Sets the state name (2 to 64 characters in length)

### City Configuration

```plaintext
<CITY>
```

Sets the city name (2 to 64 characters in length)

### Organization Configuration

```plaintext
<ORGANIZATION>
```

Sets the organization name (2 to 64 characters in length)

### Organization Unit Configuration

```plaintext
<ORGANIZATION-UNIT>
```

Sets the organization unit (2 to 64 characters in length)

### Export-to-URL Configuration

```plaintext
<EXPORT-TO-URL>
```

Specify the CA's location. Both IPv4 and IPv6 address formats are supported. The CSR is exported to the specified location.

### Email Configuration

```plaintext
del fcredit email <SEND-TO-EMAIL>
```

Exports CSR to a specified e-mail address
- `<SEND-TO-EMAIL>` – Specify the CA’s e-mail address.

### FQDN Configuration

```plaintext
fqdn <FQDN>
```

Exports CSR to a specified FQDN
- `<FQDN>` – Specify the CA’s FQDN.

### IP Address Configuration

```plaintext
ip-address <IP>
```

Exports CSR to a specified device or system
- `<IP>` – Specify the CA’s IP address.

---

```
• crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}
```

---

### Other Commands

- `pki` Enables PKI management.
- `export trustpoint` Exports a trustpoint along with CA certificate, Certificate Revocation List (CRL), server certificate, and private key.
- `<EXPORT-TO-URL>` Specify the destination address. Both IPv4 and IPv6 address formats are supported. The trustpoint is exported to the address specified here.
| passphrase | Optional. Encrypts the key with a passphrase before exporting  
| <KEY-PASSPHRASE> | • <KEY-PASSPHRASE> – Specify the passphrase to encrypt the trustpoint.  
| background | • background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.  
| on <DEVICE-NAME> | The following parameter is recursive and common to the ‘background’ and ‘passphrase’ keywords:  
| <DEVICE-NAME> | • on <DEVICE-NAME> – Optional. Performs export operation on a specified device  
| <DEVICE-NAME> | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.  

**crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name {<email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>}}**

| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates.  
| generate | Generates a certificate and a trustpoint  
| self-signed | Generates a self-signed certificate and a trustpoint  
| <TRUSTPOINT-NAME> | • <TRUSTPOINT-NAME> – Specify a name for the certificate and its trustpoint.  
| [generate-rsa-key|use-rsa-key] | Generates a new RSA Keypair, or uses an existing RSA Keypair  
| <RSA-KEYPAIR-NAME> | • generate-rsa-key – Generates a new RSA Keypair for digital authentication  
| | • use-rsa-key – Uses an existing RSA Keypair for digital authentication  
| | • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.  
| autogen-subject-name | Auto generates the subject name from the configuration parameters. The subject name helps to identify the certificate.  
| email <SEND-TO-EMAIL> | Optional. Exports the self-signed certificate to a specified e-mail address  
| <SEND-TO-EMAIL> | • <SEND-TO-EMAIL> – Specify the e-mail address.  
| fqdn <FQDN> | Optional. Exports the self-signed certificate to a specified FQDN  
| <FQDN> | • <FQDN> – Specify the FQDN.  
| ip-address <IP> | Optional. Exports the self-signed certificate to a specified device or system  
| <IP> | • <IP> – Specify the device’s IP address.  
| on <DEVICE-NAME> | Optional. Exports the self-signed certificate on a specified device  
| <DEVICE-NAME> | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.  

**crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> {<email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>}}**

| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates.  
| generate self-signed | Generates a self-signed certificate and a trustpoint  
| <TRUSTPOINT-NAME> | • <TRUSTPOINT-NAME> – Specify a name for the certificate and its trustpoint.  

---

**pki**

Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates.

**generate self-signed**

Generates a self-signed certificate and a trustpoint

**<TRUSTPOINT-NAME>**

• <TRUSTPOINT-NAME> – Specify a name for the certificate and its trustpoint.

</tr>
</tbody>
</table>

**Usage Guidelines**

The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

- IPv4 URLs:
  - tftp://<hostname|IP>[:port]/path/file
  - ftp://<user>:@<hostname|IP>[:port]/path/file
  - sftp://<user>:@<hostname|IP>[:port]/path/file
  - http://<hostname|IP>[:port]/path/file
  - cf:/path/file
usb<n>:/path/file

- IPv6 URLs:
  - tftp://<hostname|[IPv6]>[:port]/path/file
  - ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file
  - sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file

**Examples**

```
rfs7000-37FABE#crypto key generate rsa key 1025
RSA Keypair successfully generated
rfs7000-37FABE#
```

```
rfs7000-37FABE#crypto key import rsa test123 url passphrase word background
RSA key import operation is started in background
rfs7000-37FABE#
```

```
rfs7000-37FABE#crypto pki generate self-signed word generate-rsa-key word autogen-
subject-name fqdn word
Successfully generated self-signed certificate
rfs7000-37FABE#
```

```
rfs7000-37FABE#crypto pki zeroize trustpoint word del-key
Successfully removed the trustpoint and associated certificates
%Warning: Applications associated with the trustpoint will start using default-trustpoint
rfs7000-37FABE#
```

```
rfs7000-37FABE#crypto pki authenticate word url background
Import of CA certificate started in background
rfs7000-37FABE#
```

```
rfs7000-37FABE#crypto pki import trustpoint word url passphrase word
Import operation started in background
rfs7000-37FABE#
```

### 3.1.15 crypto-cmp-cert-update

**Privileged Exec Mode Commands**

Triggers a Certificate Management Protocol (CMP) certificate update on a specified device or devices.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
crypto-cmp-cert-update <TRUSTPOINT-NAME>{on <DEVICE-NAME>}
```

**Parameters**

- `crypto-cmp-cert-update <TRUSTPOINT-NAME>{on <DEVICE-NAME>}`  
  - Triggers a CMP certificate update on a specified device or devices:  
    - `<TRUSTPOINT-NAME>` – Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the crypto-cmp-policy context to configure the trustpoint.  
    - `<DEVICE-NAME>` – Optional. Triggers a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list.

**Examples**

```
rfs4000-229D58#crypto-cmp-cert-update test on B4-C7-99-71-17-28  
CMP Cert update success  
rfs4000-229D58#
```
3.1.16 database

▶ Privileged Exec Mode Commands

Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight). Vacuuming a database refers to the process of finding and reclaiming space left over from previous DELETE statements. Supported in the following platforms:
  • Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

database [drop|repair]
database drop [all|captive-portal|nsight]
database repair {on <DEVICE-NAME>}

Parameters
  • database drop [all|captive-portal|nsight]
  • database repair {on <DEVICE-NAME>}

| database drop [all|captive-portal|nsight] | Drops (deletes) all or a specified database
|------------------------------------------|---------------------------------|
|                                          | • all – Drops all databases, captive portal and NSight.
|                                          | • captive-portal – Drops captive-portal database only
|                                          | • nsight – Drops NSight database only

| database repair {on <DEVICE-NAME>} | Enables automatic repairing of all databases
|------------------------------------|--------------------------------------------------------|
|                                    | • on <DEVICE-NAME> – Optional. Specifies the name of the access point, wireless controller, or service platform hosting the database. When specified, databases on the specified device are periodically checked through to identify and remove obsolete data documents.
|                                    | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
|                                    | If no device is specified, the system repairs all databases.

Examples

nx9500-6C8809#database repair on nx9500-6C8809
nx9500-6C8809#

Related Commands

</tr>
</tbody>
</table>
### 3.1.17 database-backup

- **Privileged Exec Mode Commands**

  Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server.

  Supported in the following platforms:
  - Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

```
database-backup database [captive-portal|nsight] <URL>
```

**Parameters**

- `database-backup database [captive-portal|nsight] <URL>`

| database-backup database [captive-portal|nsight] | Backs up captive portal and/or NSight database to a specified location and file. Select the database to backup:
| | - captive-portal – Backs up captive portal database
| | - nsight – Backs up NSight database
| <URL> | Configures the destination location. The database is backed up at the specified location. Specify the location URL in one of the following formats:
| | - ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz
| | - sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz

**Examples**

```
nx9500-6C8809#database-backup database nsight ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

**Related Commands**

<table>
<thead>
<tr>
<th><strong>database</strong></th>
<th>Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight)</th>

</thead>
<tbody>
<tr>
<td><strong>database-restore</strong></td>
<td>Restores a previously exported (backed up) database [captive-portal and/or NSight]</td>
</tr>
</tbody>
</table>
3.1.18 database-restore

Privileged Exec Mode Commands

Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored from the backed-up location to the original database.

Supported in the following platforms:
  • Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

database-restore database [captive-portal|nsight] <URL>

Parameters

- database-restore database [captive-portal|nsight] <URL>

| database-restore database [captive-portal|nsight] | Restores previously exported (backed up) captive-portal and/or NSight database. Specify the database type:
| | • captive-portal – Restores captive portal database
| | • nsight – Restores NSight database
| | After specifying the database type, configure the destination location and file name from where the files are restored.

| <URL> | Configures the destination location. The database is restored from the specified location. Specify the location URL in one of the following formats:
| | ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz
| | sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz

Examples

nx9500-6C8809#database-restore database nsight
ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz

Related Commands

- database  Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight)
- database-backup  Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server
3.1.19 delete

Privileged Exec Mode Commands

Deletes a specified file from the device's file system

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

del [force <FILE> | recursive <FILE> | <FILE>]

Parameters

- force [force <FILE> | recursive <FILE> | <FILE>]
- recursive <FILE> Performs a recursive delete
- <FILE> Specifies the file name
  * Deletes the file specified by the <FILE> parameter

Examples

rfs7000-37FABE#delete flash:/out.tar flash:/out.tar.gz
Delete flash:/out.tar [y/n]? y
Delete flash:/out.tar.gz [y/n]? y

rfs7000-37FABE#delete /force flash:/tmp.txt
rfs7000-37FABE#

rfs7000-37FABE#delete /recursive flash:/backup/
Delete flash:/backup//fileMgmt_350_180B.core
[y/n]? y
Delete
flash:/backup//fileMgmt_350_18212X.core_bk
[y/n]? n
Delete flash:/backup//imish_1087_18381X.core.gz
[y/n]? n
rfs7000-37FABE#
3.1.20 device-upgrade

Privileged Exec Mode Commands

Enables firmware upgrade on an adopted device or a set of adopted devices (access points, wireless controllers, and service platforms)

This command simplifies device upgradation within a hierarchically managed (HM) network. For more information on HM networks, see device-upgrade.

NOTE: A NOC controller’s capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller – RFS7000, NX9000, NX95XX (NX9500 and NX9510), NX9600
- Site controller – RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, or NX95XX

Within a HM network, the devices deployed as site controllers depends on the NOC controller device type. For more information on the adoption capabilities of various NOC controller devices, see Usage Guidelines (NOC controller adoption matrix).

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

device-upgrade [<MAC/HOSTNAME>|all|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap82xx|rf34000|rf56000|rf67000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|vx9000|cancel-upgrade|load-image|rf-domain]

    from-controller|reboot-time <TIME>}/staggered-reboot|upgrade-time <TIME>}

### Privileged Exec Mode Commands

#### Parameters

- **device-upgrade** `<MAC/HOSTNAME>` \{`no-reboot`|`reboot-time` `<TIME>`|`upgrade-time` `<TIME>`\} \{`no-reboot`|`reboot-time` `<TIME>`\}

  - Upgrades firmware on the device identified by the `<MAC/HOSTNAME>` keyword.
  - `<MAC/HOSTNAME>` – Specify the device’s MAC address or hostname.

- **device-upgrade** `all` \{`force`|`no-reboot`|`reboot-time` `<TIME>`|`upgrade-time` `<TIME>`\} \{`no-reboot`|`reboot-time` `<TIME>`\}

  - Upgrades firmware on all devices.

</tbody>
</table>

#### Staggered Reboot

- Optional. Enables staggered device reboot (one at a time), without network impact.
device-upgrade <DEVICE-TYPE> all

Upgrades firmware on all devices of a specific type. Select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000.

After selecting the device type, schedule an automatic upgrade and/or an automatic reboot.

force

Optional. Select this option to force upgrade on selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.

no-reboot

Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted).

reboot-time <TIME>

Optional. Schedules an automatic reboot after a successful upgrade:

- <TIME> – Optional. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

upgrade-time <TIME> {no-reboot|reboot-time <TIME>}

Optional. Schedules an automatic firmware upgrade on all devices of the specified type, on a specified day and time:

- <TIME> – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. The following actions can be performed after a scheduled upgrade:
  - no-reboot – Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
  - reboot-time <TIME> – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

staggered-reboot

This keyword is recursive and common to all of the above:

- Optional. Enables staggered device reboot (one at a time), without network impact.

cancel-upgrade [<MAC/HOSTNAME>|all|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|vx9000 on rf-domain [<RF-DOMAIN-NAME>|all]]

Cancels a scheduled firmware upgrade based on the parameters passed. This command provides the following options to cancel scheduled firmware upgrades:

- Cancels upgrade on specific device(s). The devices are identified by their MAC addresses or hostnames.
- Cancels upgrade on all devices within the network.
- Cancels upgrade on all devices of a specific type. Specify the device type.
- Cancels upgrade on specific device or all device(s) within a specific RF Domain or all RF Domains. Specify the RF Domain name.

cancel-upgrade [<MAC/HOSTNAME>|all]

Cancels a scheduled firmware upgrade on a specified device or on all devices

- <MAC/HOSTNAME> – Cancels a scheduled upgrade on the device identified by the <MAC/HOSTNAME> keyword. Specify the device’s MAC address or hostname.
- all – Cancels scheduled upgrade on all devices
<table>

</tr>
</tbody>
</table>
| cancel-upgrade on rf-domain   | Cancels scheduled firmware upgrade on all devices in a specified RF Domain or all RF Domains  
• `<RF-DOMAIN-NAME>` – Cancels scheduled device upgrade on all devices in a specified RF Domain. Specify the RF Domain name.  
• `all` – Cancels scheduled device upgrade on all devices across all RF Domains |
| load-image                   | Loads device firmware image from a specified location. Select the device type and provide the location of the required device firmware image.  
• `<DEVICE-TYPE>` – Specify the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000. After specifying the device type, provide the location of the required device firmware image. |
| `<IMAGE-URL>`                | Specify the device’s firmware image location in one of the following formats:  
IPv4 URLs:  
- `tftp://<hostname/IP>[:port]/path/file`  
- `ftp://<user>:<passwd>@<hostname/IP>[:port]/path/file`  
- `sftp://<user>:<passwd>@<hostname/IP>[:port]/path/file`  
- `http://<hostname/IP>[:port]/path/file`  
- `cf:/path/file`  
- `usb<n>:/path/file`  
IPv6 URLs:  
- `tftp://<hostname[IPv6]>[:port]/path/file`  
- `ftp://<user>:<passwd>@<hostname[IPv6]>[:port]/path/file`  
- `sftp://<user>:<passwd>@<hostname[IPv6]>[:port]/path/file`  
- `cf:/path/file`  
- `usb<n>:/path/file`  
| on `<DEVICE-OR-DOMAIN-NAME>` | Optional. Specifies the name of a device or RF Domain. The image, of the specified device type is loaded from the device specified here. In case of an RF Domain, the image available on the RF Domain manager is loaded.  
• `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain. |
device-upgrade rf-domain [<RF-DOMAIN-NAME>|all|containing <WORD>|filter location <WORD>] [all|ap621|ap622|ap650|ap651|ap652|ap6522|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45XX|nx5500|nx55XX|nx75xx|nx9000|nx9600|vx9000] {(<MAC/HOSTNAME>|force|from-controller|no-reboot|reboot-time <TIME>|staggered-reboot|upgrade-time <TIME>)}

| rf-domain [<RF-DOMAIN-NAME>|all|containing <WORD>|filter location <WORD>]| Upgrades firmware on devices in a specified RF Domain or all RF Domains. Devices within a RF Domain are upgraded through the RF Domain manager.  
  • <RF-DOMAIN-NAME> – Upgrades devices in the RF Domain identified by the <RF-DOMAIN-NAME> keyword.  
  • <RF-DOMAIN-NAME> – Specify the RF Domain name.  
  • all – Upgrades devices across all RF Domains  
  • containing <WORD> – Filters RF Domains by their names. RF Domains with names containing the sub-string identified by the <WORD> keyword are filtered. Devices on the filtered RF Domains are upgraded.  
  • filter location <WORD> – Filters devices by their location. All devices with location matching the <WORD> keyword are upgraded.

| <DEVICE-TYPE> | After specifying the RF Domain, select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX55XX, NX75XX, NX9000, NX9600, VX9000. After specifying the RF Domain and the device type, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller.

| <MAC/HOSTNAME> | Optional. Use this option to identify specific devices for upgradation. Specify the device's MAC address or hostname. The device should be within the specified RF Domain and of the specified device type. After identifying the devices to upgrade, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller.  
  **Note:** If no MAC address or hostname is specified, all devices of the type selected are upgraded.

| force | Optional. Select this option to force upgrade for the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.

| from-controller | Optional. Upgrades a device through the adopting device. If initiating an upgrade through the adopting controller, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.

| no-reboot {staggered-reboot} | Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)

| reboot-time <TIME> {staggered-reboot} | Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

| staggered-reboot | This keyword is common to all of the above.  
  Optional. Enables staggered reboot (one at a time), without network impact.
upgrade-time <TIME> {no-reboot|reboot-time <TIME>}

Optional. Schedules an automatic firmware upgrade
• <TIME> – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format.
  After a scheduled upgrade, the following actions can be performed:
  • no-reboot – Optional. Disables automatic reboot after a successful upgrade
    (the device must be manually restarted)
  • reboot-time <TIME> – Optional. Schedules an automatic reboot after a successful
    upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

Usage Guidelines (NOC controller adoption matrix)

rfs7000-6DCD4B#
3.1.21 diff

Privileged Exec Mode Commands

Displays the differences between two files on a device’s file system or a particular URL.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

diff [FILE] [URL]

Parameters
- diff [FILE] [URL]
- <FILE> The first <FILE> is the source file for the diff command. The second <FILE> is used for comparison.
- <URL> The first <URL> is the source file’s URL. The second <URL> is the second file’s URL.

Privileged Exec Mode Commands

Turns on (enables) the privileged mode command set. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

enable

Parameters

None

Examples

rfs7000-37FABE#enable
rfs7000-37FABE#
## 3.1.26 erase

### Privileged Exec Mode Commands

Erases a device's (wireless controller, access point, and service platform) file system. Erases the content of the specified storage device. Also erases the startup configuration to restore the device to its default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>erase startup-config</code></td>
<td>Erases the startup configuration file.</td>
</tr>
<tr>
<td><code>erase startup-config</code></td>
<td>Parameters</td>
</tr>
<tr>
<td><code>&lt;HOSTNAME/MAC&gt;</code></td>
<td>Optional. Erases the startup configuration file on the device</td>
</tr>
<tr>
<td><code>&lt;DOMAIN-NAME&gt;</code></td>
<td>identified by the <code>&lt;HOSTNAME/MAC&gt;</code> keyword. Specify the device</td>
</tr>
<tr>
<td><code>&lt;SUB-STRING&gt;</code></td>
<td>device's hostname or MAC address.</td>
</tr>
</tbody>
</table>

### Parameters

- **flash:** Erases everything in the device's flash: file
- **nvram:** Erases everything in the device's nvram: file
- **startup-config:** Erases the device's startup configuration file. The startup configuration file is used to configure the device when it reboots.
- **usb1:** Erases everything in the device's usb1: file
  - **Note:** The number of USB ports displayed varies for different device types. For example, an NX95XX has two USB ports, while an NX45XX has four USB ports.
- **usb2:** Erases everything in the device's usb2: file
- **usb3:** Erases everything in the device's usb3: file
- **usb4:** Erases everything in the device's usb4: file
- **<HOSTNAME/MAC>/on <DOMAIN-NAME>** {containing `<SUB-STRING>`/exclude-controllers|exclude-rf-domain-manager|filter `<DEVICE-TYPE>`}
Examples

nx4500-5CFA2B#erase ?
  flash:          Erase everything in flash:
  nvram:          Erase everything in nvram:
  startup-config Reset configuration to factory default
  usb1:           Erase everything in usb1:
  usb2:           Erase everything in usb2:
  usb3:           Erase everything in usb3:
  usb4:           Erase everything in usb4:

nx4500-5CFA2B#

In the following example shows the startup configuration file being erased on a device having hostname ‘rfs6000-81701D’:

rfs7000-6DCD4B#erase startup-config rfs6000-81701D

<td>Success</td>
<td>None</td>
</tr>
</tbody>
</table>

rfs7000-6DCD4B#
Privileged Exec Mode Commands

Enables EX3500 switch firmware management. Use this command to perform the following operations: boot, copy, delete, and IP-related configurations.

The copy keyword provides multiple copy options. It allows you to upload or download code images or configuration files between the switch's flash memory and an FTP/TFTP server. When you save the system code or configuration settings to a file on an FTP/TFTP server, that file can later be downloaded to the switch to restore system operation. The success of the file transfer depends on the accessibility of the FTP/TFTP server and the quality of the network connection.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

ex3500 [adopted|boot|copy|delete|ip]

ex3500 adopted upgrade <URL> on <EX3500-DEVICE-NAME>

ex3500 boot system <1-1> (config|opcode) <FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy [file|ftp|running-config|tftp|unit]

ex3500 copy [file file <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME]

ex3500 copy [ftp|tftp] [add-to-running-config|file|https-certificate|public-key|running-config|startup-config]

ex3500 copy [ftp|tftp] [running-config|startup-config] <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy unit file <1-1> [1|2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 delete [file|public-key]

ex3500 delete file [name <FILE-NAME>|unit <1-1> name <FILE-NAME>]

ex3500 delete public-key <USER-NAME> [dsa|rsa] on <EX3500-DEVICE-NAME>

ex3500 ip ssh [crypto|save]

ex3500 ip ssh crypto host-key generates [dsa|rsa] on <EX3500-DEVICE-NAME>
### PRIVILEGED EXEC MODE COMMANDS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ex3500 ip ssh crypto zeroize [dsa</td>
<td>rsa] on &lt;EX3500-DEVICE-NAME&gt;</td>

</tr>
<tr>
<td>- <code>ex3500 copy file &lt;SOURCE-FILE-NAME&gt; &lt;DEST-FILE-NAME&gt; on &lt;EX3500-DEVICE-NAME&gt;</code></td>
<td>Copies the file to a specified EX3500 switch. <strong>Note:</strong> As of now only one (1) EX3500 unit can be managed through a NOC controller.</td>
</tr>
</tbody>
</table>
**ex3500 copy [ftp|tftp] add-to-running-config** `<FTP/TFTP-SERVER-IP> <USER-NAME> <PASS-WORD> <SOURCE-FILE-NAME>` on `<EX3500-DEVICE-NAME>`

Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key etc. This command also allows you to add a remote system's running configuration to the current system configuration.

**add-to-running-config**

Adds a remote system’s running configuration to the current system.

- `<FTP/TFTP-SERVER-IP>` – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- `<USER-NAME>` – If using a FTP server, specify the FTP server’s user name (should be an authorized user)
- `<PASS-WORD>` – Specify the password applicable for the above specified FTP server user name.

- `<SOURCE-FILE-NAME>` – Specify the source file's name

Copies the file to a specified EX3500 switch

- `<EX3500-DEVICE-NAME>` – Specify the EX3500 switch’s hostname. The specified source file is copied to specified destination file on the EX3500 identified here.

Copies to a specified file system

- `<FTP/TFTP-SERVER-IP>` – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- `<USER-NAME>` – If using a FTP server, specify the FTP server’s user name (should be an authorized user)
- `<PASS-WORD>` – Specify the password applicable for the above specified FTP server user name.

- `[1|2]` – Select the file type from 1 - 2.
  - 1 – Copies the EX3500 configuration file.
  - 2 – Copies the opcode, which is the runtime code. The opcode is like an operating system that enables the WiNG software to communicate with the EX3500 device.
- `<SOURCE-FILE-NAME>` – Specify the source file’s name.
- `<DEST-FILE-NAME>` – Specify the destination file’s name.
<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>**ex3500 copy [ftp</td>
<td>tftp] [running-config</td>
</tr>
<tr>
<td>**ex3500 copy ftp</td>
<td>tftp**</td>
</tr>
</tbody>
</table>
| **[running-config|startup-config]** | Copies the running or startup configuration file to one of the following destinations: file system, FTP server, or TFTP server
The running configuration file can be copied to the startup configuration file and vice versa. |
| **<FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD>** | If copying to a FTP/TFTP server, configure the following parameters:
- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user)
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name. |
| **<DEST-FILE-NAME>** | Configures the destination file name. The running or startup configuration file is copied to the specified destination file.
- **<DEST-FILE-NAME>** – Specify the destination file name. You can also copy the running configuration file to the startup configuration file and vice versa. |
| **on <EX3500-DEVICE-NAME>** | Copies the running or startup configuration file on to a specified EX3500 device
- **<EX3500-DEVICE-NAME>** – Specify the EX3500 device’s hostname. |
| **ex3500 copy unit file <1-1> [1|2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>** | Copies from a EX3500 switch
- **<1-1> [1|2]** – Specify the unit number from 1 - 1.
- **<SOURCE-FILE-NAME>** – Specify the source file name. You can copy the running configuration file to the startup configuration file and vice versa. |

**[1|2] <SOURCE-PUB-KEY-FILE-NAME> <USER-NAME>**

After identifying the FTP or TFTP server, specify the following:
- **[1|2]** – Configures the SSH public key type as RS or DSA
  - **1** – Configures the public key type as RSA
  - **2** – Configures the public key type as DSA
- **<SOURCE-PUB-KEY-FILE-NAME>** – Specifies the source public key file name
- **<USER-NAME>** – Specifies the public key’s user name.

**on <EX3500-DEVICE-NAME>**

Copies the public key to a specified EX3500 device
- **<EX3500-DEVICE-NAME>** – Specify the EX3500 device’s hostname.

**<SOURCE-PUB-KEY-FILE-NAME> <USER-NAME> <PASSWORD>**

If copying to a FTP/TFTP server, configure the following parameters:
- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user)
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

**<DEST-FILE-NAME>**

Configures the destination file name. The running or startup configuration file is copied to the specified destination file.
- **<DEST-FILE-NAME>** – Specify the destination file name. You can also copy the running configuration file to the startup configuration file and vice versa.
<table>

<tr>
<td><code>ex3500 ip ssh crypto host-key generates</code></td>
<td>Generates the host-key pair (public and private). This host key is used by the SSH server to negotiate a session key and encryption method with the client trying to connect to it.</td>
<td><code>&lt;EX3500-DEVICE-NAME&gt;</code> - Specify the EX3500 device’s hostname.</td>
</tr>
<tr>
<td><code>ex3500 ip ssh zeroize</code></td>
<td>Removes the host-key (DSA and RSA) from the volatile memory (i.e. RAM)</td>
<td><code>&lt;EX3500-DEVICE-NAME&gt;</code> - Specify the EX3500 device’s hostname.</td>
</tr>
</tbody>
</table>
on <EX3500-DEVICE-NAME> Executes the command on a specified EX3500 device
  • <EX3500-DEVICE-NAME> – Specify the EX3500 device’s hostname.

• ex3500 ip ssh save host-key on <EX3500-DEVICE-NAME>

ex3500 ip ssh save host-key Saves the host-key (DSA and RSA) to the flash memory

on <EX3500-DEVICE-NAME> Executes the command on a specified EX3500 device
  • <EX3500-DEVICE-NAME> – Specify the EX3500 device’s hostname.

Usage Guidelines
When using the ex3500 command and its parameters, keep in mind the following:

• Destination file names should not:
  • Contain slashes (\ or /).
  • Exceed 32 characters for files on the switch, or 127 characters for files on the server
  • The FTP server’s default user name is set as “anonymous”.
  • The Boot ROM and Loader cannot be uploaded or downloaded from the FTP/TFTP server. Follow instructions provided in the release notes for new firmware, or contact your distributor for help.
  • The “Factory_Default_Config.cfg” can be used as the source to copy from, but cannot be used as the destination.
  • Although the switch supports only two operation code files, the maximum number of user-defined configuration files supported is 16.

Examples
nx9500-6C8809#adopted upgrade tftp://192.168.0.99/ex3500-adopted-5.8.1.0.img on ex3524-ED5EAC

### 3.1.28 factory-reset

#### Privileged Exec Mode Commands

Erases startup configuration on a specified device or all devices within a specified RF Domain

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

- `factory-reset <HOSTNAME/MAC>`
- `factory-reset on <RF-DOMAIN-NAME>`
- `factory-reset [config-all|config-device-only] on <RF-DOMAIN-NAME>`

#### Parameters

- **factory-reset <HOSTNAME/MAC>**
  - Erases startup configuration and reloads device(s) based on the parameters passed
  - For more information on the actions performed by this command, see *Actions performed by the factory-reset command.*

- **<HOSTNAME/MAC>**
  - Erases startup configuration and reloads the device identified by the `<HOSTNAME/MAC>` keyword. Specify the device’s hostname or MAC address.
  - **<HOSTNAME/MAC>** – Optional. You can optionally specify multiple space-separated devices.

- **factory-reset on <RF-DOMAIN-NAME>**
  - Erases startup configuration and reloads all devices or specified device(s) within a specified RF Domain identified by the `<RF-DOMAIN-NAME>` keyword
  - For more information on the actions performed by this command, see *Actions performed by the factory-reset command.*

- **on <RF-DOMAIN-NAME>**
  - Erases startup configuration and reloads all devices or specified device(s) within a specified RF Domain identified by the `<RF-DOMAIN-NAME>` keyword
  - **<RF-DOMAIN-NAME>** – Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, the command is executed on all devices within the RF Domain. These filters are:
    - **containing <SUB-STRING>** – Optional. Executes the command on all devices containing a specified sub-string in their hostname
    - **<SUB-STRING>** – Specify the sub-string to match.
    - **exclude-controllers** – Optional. Executes the command on all devices excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller.
    - **exlude-rf-domain-manager** – Optional. Executes the command on all devices excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller.
    - **filter <DEVICE-TYPE>**

Contd..
### factory-reset

Erases startup configuration and reloads device(s) based on the parameters passed.

For more information on the actions performed by this command, see **Actions performed by the factory-reset command.**

Usage Guidelines

Actions performed by the `factory-reset` command.

The action taken by this command depends on the parameters passed.

- For the `factory-reset [DEVICE-NAME]|on <RF-DOMAIN-NAME>` options, the command:
  - Erases startup configuration on the target device (or) all devices in the target RF Domain.
  - Erases the device configuration entries from the controller’s configuration for the target device (or) for all the devices in the target RF Domain.
  - Reloads the target device (or) all devices in the target RF Domain.

- For the `factory-reset config-all [DEVICE-NAME]|on <RF-DOMAIN-NAME>` options, the command:
  - Erases startup configuration on the target device (or) all devices in the target RF Domain.
  - Erases the device configuration entries from the controller’s configuration for the target device (or) for all the devices in the target RF Domain.

- For the `factory-reset config-device-only [DEVICE-NAME]|on <RF-DOMAIN-NAME>` options, the command:
  - Erases startup configuration on the target device (or) all devices in the target RF Domain.

Examples

```bash
nx7500-7F3609# factory-reset config-all ap6522-5A873C
In progress ....
Erased startup-config - success 1 fail 0
Successful device deletion - total 1
nx7500-7F3609#
```

```bash
rfs6000-18072B# factory-reset ap650-72DBC4 ap650-72E53C
In progress ....
Erased startup-config and initiated reload - success 2 fail 0
Successful device deletion - total 2
rfs6000-18072B#
```

```bash
rfs6000-18072B# factory-reset B4-C7-99-5A-87-3C
In progress ....
Erased startup-config and initiated reload - success 1 fail 0
Successful device deletion - total 1
rfs6000-18072B#
```

The following example displays the access points in the RF Domain 'rfd1':

```bash
nx7500-7F3609# show wireless ap on rfd1
```

```

ap650-A6566C: OK, Reload scheduled in 60 seconds...
ap4532-34505C: OK, Reload scheduled in 60 seconds...
ap650-345000: OK, Reload scheduled in 60 seconds...

Successful device deletion - total 3
nx7500-7F3609#```
3.1.29 file-sync

Privileged Exec Mode Commands

Syncs EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points. Use this command to configure parameters that enable syncing of PKCS#12 certificate.

When enabling file syncing, consider the following points:

• The X.509 certificate needs synchronization only if the access point’s radio2, the client-bridge radio, is configured to use EAP-TLS authentication
• Execute the command on the controller adopting the access point
• Ensure that the X.509 certificate file is installed on the controller
• If the adopting device is a site controller with layer 3 adoption to the NOC, ensure that the X.509 certificate is synced across the hierarchically managed setup – between the NOC, site-controller (the staging-controller), and the client-bridge access points.

Syncing of wireless client-bridge certificate can be automated. To automate the file syncing process, in the controller’s device/profile configuration mode, execute the following command: file-sync [auto|count <1-20>]. For more information, see file-sync.

For more information on configuring an AP client-bridge, see bridge.

Supported in the following platforms:

• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

file-sync [cancel|load-file|wireless-bridge]

file-sync cancel wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]

file-sync load-file wireless-bridge <URL>

file-sync wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all] {from-controller] {reset-radio|upload-time <TIME>}

Parameters

• file-sync cancel wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]

| file-sync cancel wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]] | Cancels scheduled wireless client-bridge certificate synchronization on a specified AP, or all APs, or APs within an RF Domain |
|-----------------------------------------------|-------------------------------------------------------------|
| • <DEVICE-NAME> – Cancels scheduled certificate synchronization on the AP identified by the <DEVICE-NAME> parameter. Specify the AP’s hostname or MAC address. |
| • all – Cancels scheduled certificate synchronization on all APs |
| • rf-domain [<DOMAIN-NAME>|all] – Cancels scheduled certificate synchronization on all APs in a specified RF Domain or in all RF Domains |
| • <DOMAIN-NAME> – Cancels scheduled certificate synchronization on all APs within the RF Domain identified by the <DOMAIN-NAME> parameter. Specify the RF Domain’s name. |
| • all – Cancels scheduled certificate synchronization on all RF Domains |
• **file-sync load-file wireless-bridge <URL>**

**file-sync load-file wireless-bridge <URL>**

Loads the wireless client-bridge certificate to the staging controller. Use this command to load the certificate to the controller before scheduling or initiating a certificate synchronization.

- `<URL>` – Provide the certificate location using one of the following formats:
  - tftp://<hostname/IP>[:port]/path/file
  - ftp://<user>:<passwd>@<hostname/IP>[:port]/path/file
  - sftp://<user>:<passwd>@<hostname/IP>[:port]/path/file
  - http://<hostname/IP>[:port]/path/file
  - cf:/path/file
  - usb<n>:/path/file

**Note:** Both IPv4 and IPv6 address types are supported.

• **file-sync wireless-bridge [ DEVICE-NAME ] [ all ] rf-domain [ DOMAIN-NAME ] [ all ] from-controller [ ] { reset-radio | upload-time <TIME> }**

**file-sync wireless-bridge [ DEVICE-NAME ] [ all ] rf-domain [ DOMAIN-NAME ] [ all ] from-controller [ ] { reset-radio | upload-time <TIME> }**

Configures the following file-sync parameters:

- post certificate synchronization action
- upload time

These file-sync options can be applied to a specified AP, all APs, or all APs within a specified RF Domain or on all RF Domains.

- `<DEVICE-NAME>` – Applies these parameters to the AP identified by the `<DEVICE-NAME>` parameter. Specify the AP’s hostname or MAC address.
- `all` – Applies these parameters to all APs
- `rf-domain [ DOMAIN-NAME ] [ all ]` – Applies these parameters to all APs in a specified RF Domain or in all RF Domains
  - `<DOMAIN-NAME>` – Select to apply to APs within the RF Domain identified by the `<DOMAIN-NAME>` parameter. Specify the RF Domain’s name.
  - `all` – Select to apply these parameters to APs in all RF Domains
  - `from-controller` – Optional. Loads certificate to the APs from the adopting controller and not the RF Domain manager

After specifying the access points to load certificate, specify the following options: reset-radio and upload-time.

**reset-radio**

This keyword is recursive and applicable to all of the above parameters.

Optional. Resets the radio after file synchronization

**upload-time <TIME>**

This keyword is recursive and applicable to all of the above parameters.

Optional. Schedules file upload at a specified time

- `<TIME>` – Specify the time in the MM/DD/YYYY-HH:MM or HH:MM format. If no time is configured, the process is initiated as soon as the command is executed.

**Examples**

rfs7000-6DCD4B# file-sync wireless-bridge ap7131-11E6C4 upload-time 12/12/2015-12:30

rfs7000-6DCD4B#
3.1.30 **format**

*Privileged Exec Mode Commands*

Formats a device’s compact flash file system

Supported in the following platforms:

- Wireless Controllers — RFS7000

**Syntax**

`format cf:`

**Parameters**

- `format cf:`

| cf: | Formats the compact flash file system |

**Examples**

`rfs7000-37FABE#format cf:`

Warning: This will destroy the contents of compact flash.
Do you want to continue [y/n]? n

`rfs7000-37FABE`
### 3.1.31 halt

**Privileged Exec Mode Commands**

Stops (halts) a device (access point, wireless controller, or service platform). Once halted, the system must be restarted manually.

This command stops the device immediately. No indications or notifications are provided while the device shuts down.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
halt {force} {(on <DEVICE-NAME>)}
```

**Parameters**

- **halt** {force} {(on <DEVICE-NAME>)}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>halt</td>
<td>Halts a device</td>
</tr>
<tr>
<td>force</td>
<td>Optional. Forces a device to halt ignoring in-progress operations, such as firmware upgrades, downloads, unsaved configuration changes, etc.</td>
</tr>
</tbody>
</table>
| on <DEVICE-NAME> | The following keywords are recursive and applicable to the ‘force’ parameter:  
  - on <DEVICE-NAME> – Optional. Specifies the name of the device to be halted  
  - <DEVICE-NAME> – Enter the name of the AP, wireless controller, or service platform.  
  **Note:** If the device name is not specified, the logged device is halted. |

**Examples**

```
rfs7000-37FABE#halt on rfs7000-37FABE
rfs7000-37FABE#
```
### 3.1.32 join-cluster

#### Privileged Exec Mode Commands

Adds a device (access point, wireless controller, or service platform), as cluster member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
join-cluster <IP> user <USERNAME> password <WORD> {level|mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>Specify the cluster member's IP address.</td>
</tr>
<tr>
<td>user &lt;USERNAME&gt;</td>
<td>Specify a user account with super user privileges on the new cluster member.</td>
</tr>
<tr>
<td>password &lt;WORD&gt;</td>
<td>Specify password for the account specified in the user parameter.</td>
</tr>
<tr>
<td>level [1</td>
<td>2]</td>
</tr>
<tr>
<td>mode [active</td>
<td>standby]</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

To add a device to an existing cluster:
- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding the device to a cluster, execute the “write memory” command to ensure the configuration persists across reboots.

#### Examples

```
rfs6000-6DB5D4#join-cluster 192.168.13.16 user admin password superuser level 1
  mode standby
  ... connecting to 192.168.13.16
  ... applying cluster configuration
  ... committing the changes
  ... saving the changes
  [OK]
rfs6000-6DB5D4#
```

```
rfs6000-6DB5D4#show context
  !
  ! Configuration of RFS6000 version 5.8.1.0-021D
  !
  ! version 2.3
  !
```
interface ge1
   switchport mode access
   switchport access vlan 1
interface vlan1
   ip address 192.168.13.16/24
   ip dhcp client request options all
   no ipv6 enable
   no ipv6 request-dhcpv6-options
cluster name TechPubs
cluster mode standby
cluster member ip 192.168.13.16 level 1
logging on
logging console warnings
logging buffered warnings
!
!
end
rfs6000-6DB5D4#

### 3.1.33 l2tpv3

**Privileged Exec Mode Commands**

Establishes or brings down an L2TPv3 tunnel

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
12tpv3 tunnel [<TUNNEL-NAME>|all]
12tpv3 tunnel <TUNNEL-NAME> [down|session|up] {on <DEVICE-NAME>}
12tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}
12tpv3 tunnel all [down|up] {on <DEVICE-NAME>}
```

**Parameters**

- **l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}
  - Establishes or brings down an L2TPv3 tunnel
  - `<TUNNEL-NAME>` – Specify the tunnel name.
  - `down` – Brings down the specified tunnel
  - `up` – Establishes the specified tunnel
  - `on <DEVICE-NAME>` Optional. Establishes or brings down a tunnel on a specified device

- **l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}
  - Establishes or brings down a session in the specified tunnel
  - `<TUNNEL-NAME>` – Specify the tunnel name.
  - `<SESSION-NAME>` – Specify the session name.
  - `down` – Brings down the specified tunnel session
  - `up` – Establishes the specified tunnel session
  - `on <DEVICE-NAME>` Optional. Establishes or brings down a tunnel session on a specified device

- **l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}
  - Establishes or brings down all L2TPv3 tunnels
  - `down` – Brings down all tunnels
  - `up` – Establishes all tunnels
  - `on <DEVICE-NAME>` Optional. Establishes or brings down all tunnels on a specified device

---

```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>12tpv3 tunnel &lt;TUNNEL-NAME&gt; [down</td>
<td>up] {on &lt;DEVICE-NAME&gt;}</td>
</tr>
<tr>
<td>12tpv3 tunnel &lt;TUNNEL-NAME&gt; session &lt;SESSION-NAME&gt; [down</td>
<td>up] {on &lt;DEVICE-NAME&gt;}</td>
</tr>
<tr>
<td>12tpv3 tunnel all [down</td>
<td>up] {on &lt;DEVICE-NAME&gt;}</td>
</tr>
</tbody>
</table>
```
Examples

rfs7000-37FABE#l2tpv3 tunnel Tunnel1 session Tunnel1Session1 up on rfs7000-37FABE

NOTE: For more information on the L2TPv3 tunnel configuration mode and commands, see Chapter 22, L2TPV3-POLICY.
3.1.34 logging

Privileged Exec Mode Commands

Modifies message logging settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

logging monitor \{<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings\}

Parameters

- logging monitor \{<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings\}

monitor

Sets terminal lines logging levels. The logging severity levels can be set from 0 - 7. The system configures default settings, if no logging severity level is specified.

- \(<0-7>\) – Optional. Enter the logging severity level from 0 - 7. The various levels and their implications are:
  - alerts – Optional. Immediate action needed (severity=1)
  - critical – Optional. Critical conditions (severity=2)
  - debugging – Optional. Debugging messages (severity=7)
  - emergencies – Optional. System is unusable (severity=0)
  - errors – Optional. Error conditions (severity=3)
  - informational – Optional. Informational messages (severity=6)
  - notifications – Optional. Normal but significant conditions (severity=5)
  - warnings – Optional. Warning conditions (severity=4)

Note: Ensure that the logging module is enabled, before configuring the message logging level. To enable message logging, in the device’s configuration mode, execute the logging > on command. Message logging can also be enabled on a profile.

Examples

rfs4000-229D58(config-device-00-23-68-22-9D-58)#logging on

rfs4000-229D58#logging monitor debugging

rfs4000-229D58#show logging

Logging module: enabled
Aggregation time: disabled
Console logging: level debugging
Monitor logging: level debugging
Buffer logging: level warnings
Syslog logging: level warnings
Facility: local7

Log Buffer (804 bytes):

May 30 11:23:13 2015: rfs4000-229D58 : %NSM-4-IFUP: Interface ge4 is up
May 30 11:23:11 2015: rfs4000-229D58 : %NSM-4-IFUP: Interface ge4 is up

### 3.1.35 mint

**Privileged Exec Mode Commands**

Uses MiNT protocol to perform a ping and traceroute to a remote device

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

- mint [ping|traceroute]
- mint ping <MINT-ID> {count <1-10000>|size <1-64000>|timeout <1-10>}
- mint traceroute <MINT-ID> {destination-port <1-65535>|max-hops <1-255>|source-port <1-65535>|timeout <1-255>}

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ping &lt;MINT-ID&gt;</td>
<td>Sends a MiNT echo message to a specified destination</td>
</tr>
<tr>
<td>count &lt;1-10000&gt;</td>
<td>Optional. Sets the pings to the MiNT destination</td>
</tr>
<tr>
<td>size &lt;1-64000&gt;</td>
<td>Optional. Sets the MiNT payload size in bytes</td>
</tr>
<tr>
<td>timeout &lt;1-10&gt;</td>
<td>Optional. Sets a response time in seconds</td>
</tr>
<tr>
<td>traceoute &lt;MINT-ID&gt;</td>
<td>Prints the route packets trace to a device</td>
</tr>
<tr>
<td>destination-port &lt;1-65535&gt;</td>
<td>Optional. Sets the Equal-cost Multi-path (ECMP) routing destination port</td>
</tr>
<tr>
<td>max-hops &lt;1-255&gt;</td>
<td>Optional. Sets the maximum number of hops a traceroute packet traverses</td>
</tr>
<tr>
<td>source-port &lt;1-65535&gt;</td>
<td>Optional. Sets the ECMP source port</td>
</tr>
<tr>
<td>timeout &lt;1-255&gt;</td>
<td>Optional. Sets the minimum response time period</td>
</tr>
</tbody>
</table>
Examples

rfs4000-229D58#mint ping 68.88.0D.A7
MiNT ping 68.88.0D.A7 with 64 bytes of data.
   Response from 68.88.0D.A7: id=1 time=0.364 ms
   Response from 68.88.0D.A7: id=2 time=0.333 ms
   Response from 68.88.0D.A7: id=3 time=0.368 ms

--- 68.88.0D.A7 ping statistics ---
 3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 0.333/0.355/0.368 ms
rfs4000-229D58#
3.1.36 mkdir

Privileged Exec Mode Commands

Creates a new directory in the file system

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
mkdir <DIR>

Parameters
- mkdir <DIR>

Examples

rfs4000-229D58#dir

rfs4000-229D58#
Privileged Exec Mode Commands

Displays files on the device’s file system. This command navigates and displays specific files in the device’s file system. Provide the complete path to the file more <file>.

The more command also displays the startup configuration file.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

more <FILE>

Parameters

- more <FILE>

Examples

rfs4000-229D58#more flash:/archived_logs/startup.1.log

--More--
rfs4000-229D58#
Privileged Exec Mode Commands

Use the no command to revert a command or a set of parameters to their default. This command is useful to turn off an enabled feature or to revert to default settings.

The no commands have their own set of parameters that can be reset. These parameters depend on the context in which the command is being used.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
no [adoption|captive-portal|cpe|crypto|debug|logging|page|raid|service|
    terminal|upgrade|virtual-machine|wireless]
no adoption {on <DEVICE-OR-DOMAIN-NAME>}
no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>] {on <DEVICE-OR-DOMAIN-NAME>}
no crypto pki [server|trustpoint] {del-key {on <DEVICE-NAME>} | on <DEVICE-NAME>}
no logging monitor
no page
no service [block-adopter-config-update|locator|snmp|ssm|wireless]
no service block-adopter-config-update
no service locator {on <DEVICE-NAME>}
no service snmp sysoid wing5
no service ssm trace pattern {<WORD>} {(on <DEVICE-NAME>)}
no service wireless [trace pattern {<WORD>} {(on <DEVICE-NAME>)}| unsanctioned ap air-terminate <BSSID> {on <DOMAIN-NAME>}]
no terminal [length|width]
no upgrade <PATCH-NAME> {on <DEVICE-NAME>}
no wireless client [all|<MAC>] {filter|on}
no wireless client all {filter [wlan <WLAN-NAME>]}
no wireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]}
no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
```

The following command is available only on the RFS4000, RFS7000, NX45XX, NX65XX, and NX9000 series service platforms:

```
no cpe led cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
```
The following command is available only on the NX45XX, NX65XX, and NX9000 series service platforms:

```
no virtual-machine assign-usb-ports {on <DEVICE-NAME>}
```

The following commands are available only on the NX9000 series service platforms:

```
no raid locate
```

**Parameters**

- no <PARAMETERS>

| no <PARAMETERS> | Resets or reverts settings based on the parameters passed |

**Usage Guidelines**

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

```
rfs7000-37FABE# no adoption
rfs7000-37FABE#
```

```
rfs7000-37FABE# no page
rfs7000-37FABE#
```
3.1.39 on

Privileged Exec Mode Commands

Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

on rf-domain [<RF-DOMAIN-NAME>|all]

Parameters

- on rf-domain [<RF-DOMAIN-NAME>|all]

| on rf-domain [<RF-DOMAIN-NAME>|all] | Enter the RF Domain context based on the parameter specified |
|--------------------------------------|-----------------------------------------------------------|
|                                    | • <RF-DOMAIN-NAME> – Specify the RF Domain name. Enters the specified RF Domain context. |
|                                    | • all – Specifies all RF Domains. |

**3.1.40 opendns**

> Privileged Exec Mode Commands

Retrieves the OpenDNS device-id from the OpenDNS site

This command integrates access points and controllers with OpenDNS. It obtains the device-id (16 character hex-string) from OpenDNS. This device-id is configured under all WLANs that are to be OpenDNS enabled. When configured and enabled on a WLAN, DNS queries from all wireless clients on the WLAN are redirected to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers. These OpenDNS resolvers act as proxy DNS servers, and also provide additional features, such as Web filtering, performance improvements etc.

**NOTE:** OpenDNS is a free, alternative DNS service that is faster and more reliable than other DNS services available. OpenDNS enables swift navigation of the Web without the outages that are frequent in other ISP provided DNS services. It also blocks inappropriate Web sites, phishing sites, and prevents virus and malware attacks.

**NOTE:** The 'username' and 'password' values passed in this command should be pre-registered with the OpenDNS site. The 'label' can be any value. Only with a combination of a valid 'username', 'password', and any 'label' the OpenDNS server returns a device-id.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>

**Parameters**

- opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opendns</td>
<td>Obtains the OpenDNS device-id from the OpenDNS site</td>
</tr>
<tr>
<td>username</td>
<td>Configures the OpenDNS user name (should be valid username registered with OpenDNS)</td>
</tr>
<tr>
<td>&lt;USERNAME&gt;</td>
<td>• &lt;USERNAME&gt; – Provide the OpenDNS user name.</td>
</tr>
<tr>
<td>password</td>
<td>Configures the password associated with the user configured in the previous step</td>
</tr>
<tr>
<td>&lt;OPENDNS-PSWD&gt;</td>
<td>• &lt;OPENDNS-PSWD&gt; – Provide the OpenDNS password for the user.</td>
</tr>
<tr>
<td>label</td>
<td>Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal.</td>
</tr>
<tr>
<td>&lt;LABEL&gt;</td>
<td>• &lt;LABEL&gt; – Specify your network label.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For every unique set of username, password, and label only one device-id is returned. Apply this device-id in WLANs that are to be OpenDNS enabled. For information on configuring the device-id in the WLAN context, see <strong>opendns</strong>.</td>
</tr>
</tbody>
</table>
Usage Guidelines

Use your OpenDNS credentials to logon to the opendns.org site and use the labels, edit settings, and customize content filtering options to configure Web filtering settings.

Examples

3.1.41 page

Privileged Exec Mode Commands

Toggles controller paging. Enabling this command displays the CLI command output page by page, instead of running the entire output at once.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

page

Parameters

None

Examples

rfs7000-37FABE:#page
rfs7000-37FABE#

3.1.42 ping

Privileged Exec Mode Commands

Sends Internet Controller Message Protocol (ICMP) echo messages to a user-specified location.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|source [<IP]|pppoe|vlan <1-4094>|wwan}]
```

Parameters

- `<IP/HOSTNAME>` Specify the destination IP address or hostname to ping. When entered without any parameters, this command prompts for an IP address or a hostname.
- `count <1-10000>` Optional. Sets the pings to the specified destination.
  - `<1-10000>` – Specify a value from 1 - 10000. The default is 5.

- `dont-fragment {count|size}` Optional. Sets the dont-fragment bit in the ping packet. Packets with the dont-fragment bit specified, are not fragmented. When a packet, with the dont-fragment bit specified, exceeds the specified Maximum Transmission Unit (MTU) value, an error message is sent from the device trying to fragment it.
  - `count <1-10000>` – Sets the pings to the specified destination from 1 - 10000. The default is 5.
  - `size <1-64000>` – Sets the size of ping payload size from 1 - 64000 bytes. The default is 100 bytes.

- `size <1-64000>` Optional. Sets the ping packet’s size in bytes.
  - `<1-64000>` – Specify the ping payload size from 1 - 64000 bytes. The default is 100 bytes.

- `source [<IP]|pppoe|vlan <1-4094>|wwan]` Optional. Sets the source address or interface name. This is the source of the ICMP packet to the specified destination.
  - `<IP>` – Specifies the source IP address
  - `pppoe` – Selects the PPP over Ethernet interface
  - `vlan <1-4094>` – Selects the VLAN interface from 1 - 4094
  - `wwan` – Selects the wireless WAN interface
Examples

rfs7000-37FABE#ping 172.16.10.4 count 6
PING 172.16.10.4 (172.16.10.4) 100(128) bytes of data.
108 bytes from 172.16.10.4: icmp_seq=1 ttl=64 time=3.93 ms

--- 10.2.0.99 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3998ms
rtt min/avg/max/mdev = 0.648/0.774/1.168/0.202 ms
rfs7000-6DCD4B#
3.1.43 ping6

Privileged Exec Mode Commands

Sends ICMPv6 echo messages to a user-specified IPv6 address

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
ping6 <IPv6/HOSTNAME> {<INTF-NAME>|count <1-10000>|size <1-64000>}
```

Parameters

- ping <IPv6/HOSTNAME> {<INTF-NAME>|count <1-10000>|size <1-64000>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IPv6/HOSTNAME&gt;</td>
<td>Specify the destination IPv6 address or hostname.</td>
</tr>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Optional. Specify the interface name for link local/broadcast address</td>
</tr>
<tr>
<td>count &lt;1-10000&gt;</td>
<td>Optional. Sets the pings to the specified IPv6 destination</td>
</tr>
<tr>
<td>size &lt;1-64000&gt;</td>
<td>Optional. Sets the IPv6 ping payload size in bytes</td>
</tr>
</tbody>
</table>

Usage Guidelines

To configure a device’s IPv6 address, in the VLAN interface configuration mode, use the `ipv6 > address <IPv6-ADDRESS> command`. After configuring the IPv6 address, use the `ipv6 > enable` command to enable IPv6. For more information see, `ipv6`.

Examples

```
rfs4000-1B3596#ping6 2001:10:10:10:10:10:10:2 count 6 size 200
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=1 ttl=64 time=0.509 ms  
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=2 ttl=64 time=0.323 ms  
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=3 ttl=64 time=0.318 ms  
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=4 ttl=64 time=0.317 ms  
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=5 ttl=64 time=0.314 ms  
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=6 ttl=64 time=0.318 ms  
6 packets transmitted, 6 received, 0% packet loss, time 4999ms
rtt min/avg/max/mdev = 0.314/0.349/0.509/0.075 ms
rfs4000-1B3596# ```
3.1.44 pwd

Privileged Exec Mode Commands

Displays the full path of the present working directory, similar to the UNIX pwd command

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

pwd

Parameters

None

Examples

rfs4000-229D58#pwd
flash:/
rfs4000-229D58#

rfs4000-229D58#dir
Directory of flash:/.

### 3.1.45 re-elect

**Privileged Exec Mode Commands**

Re-elects the tunnel controller (wireless controller or service platform)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>}|on <DEVICE-NAME>}
```

**Parameters**
- `re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>}|on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>re-elect tunnel-controller</th>
<th>Re-elects the tunnel controller</th>
</tr>
</thead>
</table>
| `<WORD>` {on <DEVICE-NAME>}` | Optional. Re-elects the tunnel controller on all devices whose preferred tunnel controller name matches `<WORD>`
  - `{on <DEVICE-NAME>}` – Optional. Re-elects the tunnel controller on a specified device
  - `{on <DEVICE-NAME>}` – Specify the name of the AP, wireless controller, or service platform.

**Examples**

```plaintext
rfs7000-37FABE#re-elect tunnel-controller
OK
rfs7000-37FABE#
```
3.1.46 reload

Privileged Exec Mode Commands

Halts a device or devices and performs a warm reboot

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
reload {<DEVICE-MAC-OR-HOSTNAME>|at|cancel|force|in|on|staggered}
reload {((<DEVICE-MAC-OR-HOSTNAME>)}
reload {at <TIME> <1-31> <MONTH> <1993-2035> {on <DEVICE-OR-DOMAIN-NAME>}}
reload {cancel} {on <DEVICE-OR-DOMAIN-NAME>}
reload {force} {((<DEVICE-MAC-OR-HOSTNAME>)|on <DOMAIN-NAME>|staggered})
reload {force} {on <DOMAIN-NAME> {staggered}|staggered {<DEVICE-MAC-OR-HOSTNAME>}|filter <DEVICE-TYPE>}
reload {in <1-999>} {list|on}
reload {in <1-999>} {list {<LINE>|all}|on <DEVICE-OR-DOMAIN-NAME>}
reload {in <1-999>} {on <DEVICE-OR-DOMAIN-NAME>}
reload {on <DOMAIN-NAME>} {containing <WORD>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}
reload {staggered} {((<DEVICE-MAC-OR-HOSTNAME>)|on <DOMAIN-NAME>) {containing <WORD>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}

Parameters
- reload {((<DEVICE-MAC-OR-HOSTNAME>)
- reload <DEVICE-MAC-OR-HOSTNAME> Initiates device(s) reloads and configures associated parameters
  The following keyword is recursive and allows you to specify multiple devices:
  - <DEVICE-MAC-OR-HOSTNAME> – Optional. Reloads a specified device(s), identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device's hostname or MAC address.
  Note: If no device is specified, the system reloads the logged device.
- reload {at <TIME> <1-31> <MONTH> <1993-2035> {on <DEVICE-OR-DOMAIN-NAME>}}
- reload at Initiates device(s) reloads and configures associated parameters
  - at – Optional. Schedules a reload at a specified time and day. Use the following keywords to specify the time and day: <TIME>, <1-31>, <MONTH>, and <1993-2035>.
  - <TIME> Specifies the time in the HH:MM:SS format
  - <1-31> Specifies the day of the month from 1 - 31
  - <MONTH> Specifies the month from Jan - Dec
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;1993-2035&gt;</code></td>
<td>Specifies the year from 1993 - 2035. It should be a valid 4 digit year.</td>
</tr>
</tbody>
</table>
| `on <DEVICE-OR-DOMAIN-NAME>` | Optional. Performs reload at the scheduled time, on a specified device or all devices within a specified RF Domain. 
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain. When a RF Domain name is provided, all devices within the specified RF Domain are reloaded at the scheduled time. 
Note: If no device is specified, the reload is scheduled on the logged device. |
| `reload {cancel} {on <DEVICE-OR-DOMAIN-NAME>}` | Cancels pending/scheduled reloads of device(s). 
  - `cancel` – Optional. Cancels all pending reloads. 
  - `on <DEVICE-OR-DOMAIN-NAME>` – Optional. Cancels reloads pending on a specified device or all devices within a specified RF Domain. 
Note: If no device is specified, the system cancels reloads pending on the logged device. |
| `reload force` | Initiates device(s) reloads and configures associated parameters. 
  - `force` – Optional. Forces device(s) to reload, while ignoring conditions like upgrade in progress, unsaved changes etc. Use the options provided to force a reload on a specified device or all devices in a RF Domain. |
| `<DEVICE-MAC-OR-HOSTNAME>` | This keyword is recursive and allows you to specify multiple devices. 
  - `<DEVICE-MAC-OR-HOSTNAME>` – Optional. Forces a reload on a specified device identified by the `<DEVICE-MAC-OR-HOSTNAME>` keyword. Specify the device’s hostname or MAC address. When executed, the specified device(s) are forced to halt and a warm reboot is performed. 
Note: If no device is specified, the system forcefully reloaded the logged device. |
| `on <DOMAIN-NAME>` {staggered}|staggered {<DEVICE-MAC-OR-HOSTNAME>}|{containing <WORD>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}` | Initiates device(s) reloads and configures associated parameters. 
  - `force` – Optional. Forces device(s) to reload, while ignoring conditions like upgrade in progress, unsaved changes etc. Use the options provided to force a reload on a specified device or all devices in a RF Domain. 
  - `<DOMAIN-NAME>` – Optional. Specifies the name of the RF Domain. When executed, all devices within the specified RF Domain are forced to halt and a warm reboot is performed. 
  - `staggered` – Optional. Enables staggered reload of devices (one at a time) without network impact. Use this option when rebooting multiple devices within an RF Domain. When executed, all devices within the specified RF Domain are forced to halt and reboot in a staggered manner. |
### Staggered Reload

devices specified by the `<DEVICE-MAC-OR-HOSTNAME>` keyword. Specify the device’s hostname or MAC address. This is a recursive keyword that allows you to specify multiple devices. When executed, the specified device(s) are forced to halt and a warm reboot is performed.

- `<DEVICE-MAC-OR-HOSTNAME>` – Optional. Forces a reload on specified device(s) identified by the `<DEVICE-MAC-OR-HOSTNAME>` keyword. Specify the device’s hostname or MAC address. This is a recursive keyword that allows you to specify multiple devices. When executed, the specified device(s) are forced to halt and a warm reboot is performed.

### Optional Reload

- `<DOMAIN-NAME>` – Optional. Forces a reload on all devices in a RF Domain. Specify the name of the RF Domain. When executed, all devices within the specified RF Domain are forced to halt and a warm reboot is performed.

**Note:** If no device or RF Domain is specified, the system forcefully reloads the logged device.

### Reload Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>reload</code></td>
<td>Initiates device(s) reloads and configures associated parameters</td>
</tr>
<tr>
<td><code>{in &lt;1-999&gt;}</code></td>
<td>Performs a reload after a specified time period</td>
</tr>
<tr>
<td>`{list {&lt;LINE&gt;</td>
<td>all}</td>
</tr>
<tr>
<td><code>&lt;LINE&gt;</code></td>
<td>Reloads listed devices. List all devices (to be reloaded) separated by a space.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Reloads all devices adopted by this controller</td>
</tr>
<tr>
<td><code>&lt;DEVICE-OR-DOMAIN-NAME&gt;</code></td>
<td>Reloads a specified device or all devices within a specified RF Domain</td>
</tr>
<tr>
<td><code>&lt;DEVICE-OR-DOMAIN-NAME&gt;</code></td>
<td>Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

**Note:** If no RF Domain is specified, the system reloads the logged device.

Examples

rfs7000-6DCD4B#reload at 12:30:00 31 Mar 2015 on rfs6000-81742D
Reload scheduled at 2015-03-31 12:30:00 UTC ...
rfs7000-6DCD4B#

rfs7000-6DCD4B#reload cancel on rfs6000-81742D
Scheduled reload cancelled.
rfs7000-6DCD4B#

The following example schedules a reload on all non-controller devices in the RF Domain ‘default’:

rfs7000-6DCD4B#reload on default exclude-controllers
ap8132-711728: OK

rfs7000-6DCD4B#
3.1.47 rename

Privileged Exec Mode Commands

Renames a file in the devices' file system

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
rename <OLD-FILE-NAME> <NEW-FILE-NAME>

Parameters

- rename <OLD-FILE-NAME> <NEW-FILE-NAME>

Examples

rfs4000-229D58#dir
Directory of flash:/.

rfs4000-229D58#
### 3.1.48 rmdir

**Privileged Exec Mode Commands**

Deletes an existing directory from the file system (only empty directories can be removed)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext```
rmdir <DIR>
```

**Parameters**

- `rmdir <DIR>`

<table>
<thead>
<tr>
<th>rmdir &lt;DIR&gt;</th>
<th>Specifies the directory name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note:</strong> The directory, specified by the &lt;DIR&gt; parameter, is removed from the file system.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58#dir
Directory of flash:/.

  drwx        Wed Jan 30  02:45:10 2014   log
  drwx        Sat Jan  1  00:00:09 2000   configs
  drwx        Fri Feb 15  14:50:49 2014   Final
  drwx        Sat Jan  1  00:00:08 2000   cache
  drwx        Wed Jan 16  22:26:53 2014   crashinfo
  drwx        Sat Jan  1  00:00:08 2000   upgrade
  drwx        Sat Jan  1  00:00:09 2000   hotspot
  drwx        Sat Jan  1  00:00:09 2000   floorplans
  drwx        Sat Jan  1  00:00:09 2000   startuplog
  -rw-       176128    Fri Feb 15  14:32:51 2014   out.tar

rfs4000-229D58#
```

```
rfs4000-229D58#rmdir Final
rfs4000-229D58#
```

```
rfs4000-229D58#dir
Directory of flash:/.

  drwx        Wed Jan 30  02:45:10 2014   log
  drwx        Sat Jan  1  00:00:09 2000   configs

rfs4000-229D58#
```
3.1.49 **self**

Privileged Exec Mode Commands

Enters the logged device’s configuration context

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
self
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE#self
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#
```
3.1.50 ssh

Privileged Exec Mode Commands

Opens a Secure Shell (SSH) connection between two network devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ssh <IP/HOSTNAME> <USERNAME> {<INF-NAME/LINK-LOCAL-ADD>}

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Specify the remote system’s IP address or hostname.</td>
</tr>
<tr>
<td>&lt;USERNAME&gt;</td>
<td>Specify the name of the user requesting the SSH connection.</td>
</tr>
<tr>
<td>&lt;INF-NAME/\LINK-LOCAL-ADD&gt;</td>
<td>Optional. Specify the interface’s name or link local address.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To exit the other device’s context, use the command that is relevant to that device.

Examples

nx9500-6C8809#ssh 192.168.13.16 admin
admin@192.168.13.16's password:
rfs6000-6DB5D4>

nx9500-6C8809#ssh 192.168.13.14 admin
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '192.168.13.14' (RSA) to the list of known hosts. admin@192.168.13.14's password:
nx4500-5CFA8E>
Privileged Exec Mode Commands

Executes following operations on a T5 device through the WiNG controller:

- copy, rename, and delete files on the T5 device's file system
- write running configuration to the T5 device's memory

The T5 switch is a means of providing cost-effective, high-speed, wall-to-wall coverage across a building. The T5 switch leverages the in-building telephone lines to extend Ethernet and Wireless LAN networks without additional expenditure on re-wiring. This setup is ideally suited for hotels, providing high-speed Wi-Fi coverage to guest rooms.

The entire setup consists of the DSL T5 switch, TW-510 Ethernet wallplates, and TW-511 wireless wallplate access points. Replace the phone jack plate in a room with the TW-511 delivers 802.11 a/b/g/n and extend wireless connectivity in that room and the neighboring rooms. These TW-511 wallplates (also referred to as the CPEs) are connected to the T5 switch over the DSL interface using a phone block.

The T5 switch is adopted and managed through a WiNG controller. The connection between the T5 and WiNG switches is over a WebSocket.

### Syntax

```
t5 [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME>|delete <FILE-NAME>|rename <SOURCE-FILE-NAME> <DEST-FILE-NAME>|write memory] {on <T5-DEVICE-NAME>}
```

### Parameters

- **t5** [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME>|delete <FILE-NAME>|rename <SOURCE-FILE-NAME> <DEST-FILE-NAME>|write memory] {on <T5-DEVICE-NAME>}

<table>
<thead>
<tr>
<th><strong>copy</strong>&lt;br&gt;<strong>&lt;SOURCE-FILE-NAME&gt;</strong>&lt;br&gt;<strong>&lt;DEST-FILE-NAME&gt;</strong></th>
<th>Copies file to an external server</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;SOURCE-FILE-NAME&gt;</code> – Specify the source file name.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;DEST-FILE-NAME&gt;</code> – Specify the destination file name.</td>
</tr>
<tr>
<td><strong>Note:</strong> The content from the source file is copied to the destination file.</td>
<td></td>
</tr>
<tr>
<td>The source or destination files can be local or remote FTP or TFTP files. The source file also can be a pre-defined keyword. At least one of the files should be a local file. Use this command to copy the startup and/or running configurations to an external server.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>delete</strong>&lt;br&gt;<strong>&lt;FILE-NAME&gt;</strong></th>
<th>Deletes files on the T5 device’s file system</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;FILE-NAME&gt;</code> – Specify the file name. The specified file is deleted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>rename</strong>&lt;br&gt;<strong>&lt;SOURCE-FILE-NAME&gt;</strong>&lt;br&gt;<strong>&lt;DEST-FILE-NAME&gt;</strong></th>
<th>Renames a file on the T5 device’s file system</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;SOURCE-FILE-NAME&gt;</code> – Specify the source file name</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;DEST-FILE-NAME&gt;</code> – Specify the new file name. The source file is renamed to the input provided here.</td>
</tr>
</tbody>
</table>

---

**NOTE:** For more information on other T5 CPE related commands, see cpe.
### write memory

Writes running configuration to an adopted T5 device's memory

- memory – Writes running configuration to the T5 device's *non-volatile* (NV) memory.

### on <T5-DEVICE-NAME>

Optional. Executes these operation on a specified T5 device

- `<T5-DEVICE-NAME>` – Specify the T5 device's hostname.

### Examples

```
rfa7000-37FABE#t5 write memory on t5-ED5C2C
Success
rfa7000-37FABE#
```
### 3.1.52 telnet

*Privileged Exec Mode Commands*

Opens a Telnet session between two network devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

**Parameters**

- telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Configures the remote system's IP (IPv4 or IPv6) address or hostname. The Telnet session will be established between the connecting system and the remote system.</td>
</tr>
<tr>
<td></td>
<td>• &lt;IP&gt; – Specify the remote system's IPv4 or IPv6 address or hostname.</td>
</tr>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Optional. Specify the interface name for the link local address.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To exit the other device’s context, use the command relevant to that device.

**Examples**

nx9500-6C8809#telnet 192.168.13.22

Entering character mode
Escape character is ‘[^]’.

AP7131 release 5.8.1.0-023D
ap7131-11B6C4 login: admin
Password: ap7131-11B6C4>
3.1.53 **terminal**

*Privileged Exec Mode Commands*

Sets the number of characters per line, and the number of lines displayed within the terminal window.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
terminal [length|width] <0-512>
```

**Parameters**

- `terminal [length|width] <0-512>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>length</td>
<td>Sets the number of lines displayed on the terminal window</td>
</tr>
<tr>
<td>width</td>
<td>Sets the width or number of characters displayed on the terminal window</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rfs7000-37FABE#terminal length 150</td>
<td></td>
</tr>
<tr>
<td>rfs7000-37FABE#terminal width 215</td>
<td></td>
</tr>
<tr>
<td>rfs7000-37FABE#show terminal</td>
<td>Terminal Type: xterm</td>
</tr>
<tr>
<td></td>
<td>Length: 150 Width: 215</td>
</tr>
</tbody>
</table>

**Related Commands**

```
no
```

Resets the width of the terminal window or the number of lines displayed on a terminal window.
3.1.54 **time-it**

> Privileged Exec Mode Commands

Verifies the time taken by a particular command between request and response

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

time-it <COMMAND>

**Parameters**

- time-it <COMMAND>

<table>
<thead>
<tr>
<th>time-it &lt;COMMAND&gt;</th>
<th>Verifies the time taken by a particular command to execute and provide a result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;COMMAND&gt;</td>
<td>— Specify the command name.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE#time-it config terminal
Enter configuration commands, one per line. End with CNTL/Z.
That took 0.00 seconds..
rfs7000-37FABE(config)#
3.1.55 traceroute

> Privileged Exec Mode Commands

Traces the route to a defined destination

Use ‘--help’ or ‘-h’ to display a complete list of parameters for the traceroute command

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

traceroute <WORD>

Parameters

- traceroute <WORD>

<table>
<thead>
<tr>
<th>&lt;WORD&gt;</th>
<th>Traces the route to a IP address or hostname</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;WORD&gt; – Specify the IPv4 address or hostname.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

nx9500-6C8809#traceroute 192.168.13.16
traceroute to 192.168.13.16 (192.168.13.16), 30 hops max, 46 byte packets
  1 192.168.13.16 (192.168.13.16) 0.479 ms 0.207 ms 0.199 ms
nx9500-6C8809#
3.1.56 traceroute6

Traces the route to a specified IPv6 destination

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
traceroute6 <WORD>

Parameters
- traceroute6 <WORD>

<table>
<thead>
<tr>
<th>traceroute6 &lt;WORD&gt;</th>
<th>Traces the route to a IPv6 address or hostname</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>– Specify the IPv6 address or hostname.</td>
</tr>
</tbody>
</table>

Examples
rfs4000-1B3596# traceroute6 2001:10:10:10:10:10:10:2
  1  2001:10:10:10:10:10:10:2 (2001:10:10:10:10:10:10:2) 0.622 ms 0.497 ms 0.531 ms
rfs4000-1B3596#
3.1.57 upgrade

Privileged Exec Mode Commands
Upgrades a device’s software image
Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
upgrade [<FILE>|<URL>|dhcp-vendor-options]
upgrade [<FILE>|<URL>]{background|on <DEVICE-NAME>}
upgrade dhcp-vendor-options {<DEVICE-NAME>|on <RF-DOMAIN-NAME>}
upgrade dhcp-vendor-options {<DEVICE-NAME>}{<DEVICE-NAME>}
upgrade dhcp-vendor-options {on <RF-DOMAIN-NAME>}{containing <SUB-STRING>|exclude-controllers|exclude-rf-domain-managers|filter <DEVICE-TYPE>}

Parameters
- upgrade [<FILE>|<URL>]{background|on <DEVICE-NAME>}

| <FILE> | Specify the target firmware image location in the following format:
|        | cf:/path/file
|        | usb1:/path/file
|        | usb2:/path/file
|        | usb<n>:/path/file
| <URL>  | Specify the target firmware image location. Use one of the following formats:
|        | IPv4 URLs:
|        | tftp://<hostname|IP>[:port]/path/file
|        | ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
|        | sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
|        | http://<hostname|IP>[:port]/path/file
|        | cf:/path/file
|        | usb<n>:/path/file
|        | IPv6 URLs:
|        | tftp://<hostname|IPv6>[:port]/path/file
|        | ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file
|        | sftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file
|        | http://<hostname|IPv6>[:port]/path/file

- background Optional. Performs upgrade in the background
- on <DEVICE-NAME> Optional. Upgrades the software image on a specified remote device
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
PRIVILEGED EXEC MODE COMMANDS 3-117

- upgrade dhcp-vendor-options {<DEVICE-NAME>} {<DEVICE-NAME>}

<table>
<thead>
<tr>
<th>dhcp-vendor-options</th>
<th>Uses DHCP vendor options to upgrade device(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>{&lt;DEVICE-NAME&gt;} {&lt;DEVICE-NAME&gt;}</td>
<td>Optional. Uses DHCP vendor options to upgrade a specified device. Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
<tr>
<td>• &lt;DEVICE-NAME&gt; – Optional. You can optionally specify multiple comma-separated device names/MAC addresses to upgrade.</td>
<td></td>
</tr>
</tbody>
</table>

- upgrade dhcp-vendor-options {on <RF-DOMAIN-NAME>} {containing <SUB-STRING>| exclude-controllers|exclude-rf-domain-managers|filter <DEVICE-TYPE>}

<table>
<thead>
<tr>
<th>dhcp-vendor-options</th>
<th>Uses DHCP vendor options to upgrade device(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;RF-DOMAIN-NAME&gt;</td>
<td>Optional. Uses DHCP vendor options to upgrade all devices or specified device(s) within the RF Domain identified by the &lt;RF-DOMAIN-NAME&gt; keyword</td>
</tr>
<tr>
<td>• &lt;RF-DOMAIN-NAME&gt; – Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, all devices within the RF Domain are upgraded. These filters are:</td>
<td></td>
</tr>
<tr>
<td>• containing &lt;SUB-STRING&gt; – Optional. Upgrades all devices, within the specified RF Domain, containing a specified sub-string in their hostname</td>
<td></td>
</tr>
<tr>
<td>• &lt;SUB-STRING&gt; – Specify the sub-string to match.</td>
<td></td>
</tr>
<tr>
<td>• exclude-controllers – Optional. Upgrades all devices, within the specified RF Domain, excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller.</td>
<td></td>
</tr>
<tr>
<td>• exclude-rf-domain-manager – Optional. Upgrades all devices, within the specified RF Domain, excluding RF Domain managers. Use this option when executing the command on the NOC, Site controller, or RF Domain manager.</td>
<td></td>
</tr>
<tr>
<td>• filter &lt;DEVICE-TYPE&gt; – Optional. Executes the command on all devices, within the specified RF Domain, of a specified type</td>
<td></td>
</tr>
<tr>
<td>• &lt;DEVICE-TYPE&gt; – Specify the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000. Upgrades all devices of the type specified here. For example, if AP6521 is the device-type specified, all AP6521s within the specified RF Domain are upgraded.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

3.1.58 **upgrade-abort**

- *Privileged Exec Mode Commands*

Aborts an ongoing software image upgrade

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
upgrade-abort {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

- `upgrade-abort {on <DEVICE-OR-DOMAIN-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

Making file system
Extracting files (this may take some time).................

*Update error: Aborted*
```

rfs4000-229D58#
3.1.59 watch

Privileged Exec Mode Commands
Repeats a specified CLI command at periodic intervals
Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
watch <1-3600> <LINE>

Parameters
- watch <1-3600> <LINE>

<table>
<thead>
<tr>
<th>watch &lt;1-3600&gt;</th>
<th>Repeats a CLI command at a specified interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-3600&gt;</td>
<td>Select an interval from 1 - 3600 seconds. Pressing CTRL-Z halts execution of the command.</td>
</tr>
<tr>
<td>&lt;LINE&gt;</td>
<td>Specify the CLI command name.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE#watch 1 show clock
rfs7000-37FABE#
3.1.60 **exit**

*Privileged Exec Mode Commands*

Ends the current CLI session and closes the session window

For more information, see `exit`.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9000, NX9500, NX9510, NX9600

**Syntax**

`exit`

**Parameters**

None

**Examples**

```
exit
```
3.1.61 smart-cache

Privileged Exec Mode Commands

Pre-fetches cached content from the specified list of URLs

Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see smart-cache-policy.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

smart-cache pre-fetch-immediate <URL-LIST-NAME>

Parameters

- smart-cache pre-fetch-immediate <URL-LIST-NAME>

<table>
<thead>
<tr>
<th>smart-cache</th>
<th>Pre-fetches content from the specified list of URLs</th>
</tr>
</thead>
<tbody>
<tr>
<td>pre-fetch-immediate &lt;URL-LIST-NAME&gt;</td>
<td>Provide the URL list names (should be existing and configured). For more information on configuring URL lists, see url-list.</td>
</tr>
</tbody>
</table>

Examples

nx4500-5CFA2B#smart-cache pre-fetch-immediate ?
  URL-LIST  URL List to be Pre Fetched

nx4500-5CFA2B#
3.1.62 virtual-machine

Privileged Exec Mode Commands

Installs, configures, and monitors the status of third-party virtual machines (VMs)

In addition to the WiNG VMs, the NX45XX, NX65XX, NX9500, and NX9510 series service platforms support the installation and administration of third-party VMs. However, the third-party VMs supported by these devices varies.

The third-party VMs supported on NX45XX and NX65XX are:

• TEAM-URC
• TEAM-RLS
• TEAM-VoWLAN

The VM supported on NX9500 and NX9510 is:

• ADSP

Use the virtual-machine command to install the third-party VMs, and configure parameters, such as install media type and location, number of Virtual Central Processing Units (VCPUS), VM memory, VM disk, number of Virtual Network Interfaces (VIFs), and Virtual Networking Computing (VNC) port.

Installing third-party VMs saves on hardware cost and provides a unified VM management interface.

This section is organized into the following sub-sections:

• Syntax NX45XX, NX65XX
• Syntax NX9500 and NX9510

Supported in the following platforms:

• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524,
  • NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax NX45XX, NX65XX

virtual-machine [assign-usb-ports|console|export|install|restart|set|start|stop|uninstall]

virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}

virtual-machine console [<VM-NAME>|team-urc|team-rls|team-vowlan]

virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}

virtual-machine install [<VM-NAME]|team-urc|team-rls|team-vowlan]

virtual-machine install <VM-NAME> type disk|iso disk-size <SIZE>|vm-archive
  install-media [<FILE>|<URL>|<USB>] {autostart|memory|on|vcpus|vif-count|vnc}

virtual-machine install [team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine restart [<VM-NAME]|hard|team-urc|team-rls|team-vowlan]

virtual-machine restart [on <DEVICE-NAME>]

virtual-machine restart hard [on <DEVICE-NAME>]

virtual-machine set [autostart|memory|vcpus|vif-count|vif-mac|vif-to-vmif|vnc]

virtual-machine set [on <DEVICE-NAME>]

virtual-machine start [auto-start ignore|start] [memory <512-8192>] [vcpus <1-4]|
  vif-count <0-2> [vif-mac <VIF-INDEX>] [vnc <DISABLE|ENABLE>] {on <DEVICE-NAME>}

virtual-machine start [on <DEVICE-NAME>]

virtual-machine stop [hard|team-urc|team-rls|team-vowlan]

virtual-machine stop [on <DEVICE-NAME>]

virtual-machine stop [on <DEVICE-NAME>]
virtual-machine stop hard [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine uninstall [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

Parameters NX45XX, NX65XX

• virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}

Assigns USB ports to TEAM-VoWLAN

• team-vowlan – Assigns USB ports to TEAM-VoWLAN on a specified device

• on <DEVICE-NAME> – Optional. Specify the device name.

Use the no > virtual-machine > assign-usb-ports command to reassign the port to WING.

Note: TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.

• virtual-machine console [<VM-NAME>|team-urc|team-rls|team-vowlan]

Connects to the VM’s console, based on the parameters passed. Select one of the following console options:

• <VM-NAME> – Connects to the console of the VM identified by the <VM-NAME> keyword. Specify the VM name.

• team-urc – Connects to the VM TEAM Unified Retail Communication’s (URC) (IP-PBX) console

• team-rls – Connects to the VM TEAM Radio Link Service (RLS) server’s console

• team-vowlan – Connects to the VM TEAM-VoWLAN’s (Voice over WLAN) console

• virtual-machine export <VM-NAME> [<FILE>|<URL>] {on <DEVICE-NAME>}

Exports an existing VM image and settings. Use this command to export the VM to another NX45XX or NX65XX device in the same domain.

• <VM-NAME> – Specify the VM name.

• <FILE> – Specify the location and name of the source file (VM image). The VM image is retrieved and exported from the specified location.

• <URL> – Specify the destination location. This is the location to which the VM image is copied. Use one of the following formats to provide the destination path:

  tftp://<hostname|IP>[:port]/path/file

  ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file

  sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file

  http://<hostname|IP>[:port]/path/file

• on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices.

• <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

The VM should be in a stop state during the export process.

If the destination is a device, the image is copied to a predefined location (VM archive).

• virtual-machine install <VM-NAME> type [disk|iso disk-size <SIZE>|vm-archive] install-media [<FILE>|<URL>|<USB>] {autostart|memory|on|vcpus|vif-count|vnc}

Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process.

• <VM-NAME> – Specify the VM name.

• type – Specify the install-media (image) type. The options are:

  • disk – Specifies the install media type as pre-installed OS disk image (located in the flash memory) Contd..
• iso disk-size <SIZE> – Specifies the install media type as ISO file. This is a single file, which contains the OS bootable install media.
  • disk-size <SIZE> – If the install media type is ISO, specify the disk size in GB.
  • vm-archive – Specifies the install media type as VM archive. The VM archive file is a tar.gz file consisting of a pre-installed OS disk image and an associated configuration file. The configuration is a standard libvirt VM template consisting of VM specific information.

Note: After specifying the install media type, specify the location of the image. The image can be located in any of the following supported locations: FLASH, USB, or a remote location, such as http, ftp, sftp, tftp.

install-media
[<FILE>|<URL>|<USB>]
{autostart|memory|on|vcpus|vif-count|vnc}

Specifies the install media location
• <FILE> – Specifies the install-media file is located on flash, for example flash:/cache
• <URL> – Specifies the install-media file is located on a remote URL. Provide the URL using one of the following formats:
  tftp://<hostname|IP>[:<port>]/path/file
  ftp://<user>:<passwd>@<hostname|IP>[:<port>]/path/file
  sftp://<user>:<passwd>@<hostname|IP>[:<port>]/path/file
  http://<hostname|IP>[:<port>]/path/file
• <USB> – Specifies the install-media file is located on a USB. Provide the USB path and file name using the following format:
  usb<n>:/path/file

After specifying the image location, you may provide the following information:
• autostart – Optional. Specifies whether to autostart the VM on system reboot
  • ignore – Enables autostart on each system boot/reboot
  • start – Disables autostart (default setting)
• memory – Optional. Defines the VM memory size
  • <512-8192> – Specify the VM memory from 512 - 8192 MB. The default is 2048 MB.
• on – Optional. Executes the command on a specified device
  • <DEVICE-NAME> – Specify the service platform name.
• vcpus – Optional. Specifies the number of VCPUS for this VM
  • <1-4> – Specify the number of VCPUS from 1- 4. The default setting is 4.
• vif-count – Optional. Configures or resets the VIF number for this VM
  • <0-2> – Specify the VIF number from 0 - 2. the default setting is 1. If assigning a virtual network interface for the VM, optionally specify the following parameters:
    • vif-mac – Sets the MAC index for the virtual interfaces 1 & 2.
    • vif-to-vmif – Maps the virtual interface (1 or 2) to the selected VMIF interface.
      Specify the VMIF interface index from 1 - 8. VMIFs are layer 2 interfaces on the WiNG bridge. Each custom VM can have up to a maximum of 2 virtual Ethernet interfaces. By default, these interfaces are internally connected to the Dataplane bridge through VMIF1, which is an untagged port with access VLAN 1.
    • vnc – Enables VNC on the virtual interfaces 1 & 2
  • vnc – Optional. Disables/enables VNC port. When enabled, provides remote access to VGA through the noVNC client.
  • disable – Disables VNC
  • enable – Enables VNC (default setting)
• virtual-machine install [team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine install [team-urc|team-rls|team-vowlan]
on <DEVICE-NAME>
Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process. Select one of the following options:
• team-urc – Installs the VM TEAM-URC image
• team-rls – Installs the VM TEAM-RLS image
• team-vowlan – Installs the VM TEAM-VoWLAN image
The following keywords are common to all of the above parameters:
• on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
• <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

• virtual-machine restart [<VM-NAME>|hard|team-urc|team-rls|team-vowlan]
{on <DEVICE-NAME>}

virtual-machine restart [<VM-NAME>|hard|team-urc|team-rls|team-vowlan]
Restarts the VM
• <VM-NAME> – Restarts the VM identified by the <VM-NAME> keyword
• team-urc – Restarts the VM TEAM-URC
• team-rls – Restarts the VM TEAM-RLS
• team-vowlan – Restarts the VM TEAM-VoWLAN
The following keywords are common to all of the above parameters:
• on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
• <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.
The option 'hard' forces the specified VM to restart.

• virtual-machine set [autostart [ignore|start]|memory <512-8192>|vcpus <1-4>
vif-count <0-2>|vif-mac <VIF-INDEX> [MAC-INDEX]|MAC|vif-to-vmif <VIF-INDEX> <VMIF-INDEX>|vnc [disable|enable]] [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine set autostart [ignore|start]
memory <512-8192>vcpus <1-4>vif-count <0-2>vif-mac <VIF-INDEX> [MAC-INDEX]|MAC|vif-to-vmif <VIF-INDEX> <VMIF-INDEX>vnc [disable|enable]
[<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
Configures the VM settings
• autostart – Specifies whether to autostart the VM on system reboot
  • ignore – Enables autostart on each system reboot
  • start – Disables autostart
• memory – Defines the VM memory size
  • <512-8192> – Specify the VM memory from 512 - 8192 MB. The default is 1024 MB.
• vcpus – Specifies the number of VCPUS for this VM
  • <1-4> – Specify the number of VCPUS from 1- 4.
• vif-count – Configures or resets the VM’s VIFs
  • <0-2> – Specify the Virtual Interface (VIF) number from 0 - 2.
• vif-mac – Configures the MAC address of the selected virtual network interface
  • <VIF-INDEX> – Select the VIF Index from 1 - 2.
  • <MAC-INDEX> – Specify the MAC index for the selected VIF from 1 - 8.
  • <MAC> – Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format.

Contd..
Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the ‘set’ keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the dataplane (referred to as VMIF). These VMIFs are standard l2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM’s interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the `vif-to-vmif` command to map a VIF to a VMIF on the DP bridge.

- `vif-to-vmif` – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8.
  - `<VIF-INDEX>` – Selects the VIF index from 1 - 2.
  - `<VMIF-INDEX>` – Specify the VMIF index from 1 - 8.

WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two VM interfaces. Each VM interface can be mapped to one of the eight VMIF ports for NX4500 and NX6500 service platforms and twelve ports for NX9500 on the dataplane bridge. This mapping determines the destination for service platform routing.

By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1, by default, is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.

- `vnc` – Disables/enables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client.
  - `disable` – Disables VNC port
  - `enable` – Enables VNC port

After configuring the VM settings, identify the VM to apply the settings.

- `<VM-NAME>` – Applies these settings to the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Applies these settings to the VM TEAM-URC
- `team-rls` – Applies these settings to the VM TEAM-RLS
- `team-vowlan` – Applies these settings to the VM TEAM-VoWLAN
  - on `<DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

- **virtual-machine start** `[<VM-NAME>][team-urc|team-rls|team-vowlan] [on `<DEVICE-NAME>`]`
The following keywords are common to all of the above parameters:
- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**virtual-machine stop**

```
virtual-machine stop [<VM-NAME>|hard|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

Stops the VM, based on the parameters passed. Select one of the following options:
- **<VM-NAME>** – Stops the VM identified by the **<VM-NAME>** keyword. Specify the VM name.
- **team-urc** – Stops the VM TEAM-URC
- **team-rls** – Stops the VM TEAM-RLS
- **team-vowlan** – Stops the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:
- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

The option 'hard' forces the selected VM to shutdown.

**virtual-machine uninstall**

```
virtual-machine uninstall [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

Uninstalls the specified VM
- **<VM-NAME>** – Uninstalls the VM identified by the **<VM-NAME>** keyword. Specify the VM name.
- **team-urc** – Uninstalls the VM TEAM-URC
- **team-rls** – Uninstalls the VM TEAM-RLS
- **team-vowlan** – Uninstalls the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:
- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Note:** This command releases the VM’s resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.

**Syntax NX9500 and NX9510**

```
virtual-machine

virtual-machine console adsp
virtual-machine install [adsp] {on <DEVICE-NAME>}
virtual-machine restart [adsp] {on <DEVICE-NAME>}
virtual-machine set disk-size <100-500> adsp {on <DEVICE-NAME>}
virtual-machine set memory <512-8192> adsp {on <DEVICE-NAME>}
virtual-machine set wing-memory <12288-32739>
virtual-machine [start|stop] adsp {on <DEVICE-NAME>}
virtual-machine uninstall adsp {on <DEVICE-NAME>}
```

**NOTE:** On an NX95XX, you can use the install, start, stop, restart, and set commands to manage a third-party VM running on a NX45XX and NX65XX. You can also configure a third-party VM’s settings through a NX95XX series service platform.
### Parameters NX9500 and NX9510

- **virtual-machine console adsp**

  Connects to the *Air-Defense Services Platform* (ADSP) VM's management console. When ADSP is running on the NX9500 and NX9510 model service platforms, WiNG communicates with ADSP using a *single sign-on* (SSO) authentication mechanism. Once the user is logged in, WiNG gains access to ADSP without being prompted to login again at ADSP. However, the WiNG and ADSP databases are not synchronized. ADSP has its own user database, stored locally within its VM, which is accessed whenever a user logs directly into ADSP.

  WiNG and ADSP must be consistent in the manner events are reported up through a network hierarchy to ensure optimal interoperability and event reporting. To provide such consistency, WiNG has added support for an ADSP-like hierarchal tree. The tree resides within WiNG, and ADSP reads it from WiNG and displays the network hierarchy in its own ADSP interface. The hierarchal tree can also be used to launch ADSP modules (like Spectrum Analyzer) directly from WiNG. For more information on configuring WiNG tree-node structure, see [tree-node](#).

- **virtual-machine install adsp {on <DEVICE-NAME>]**

  Installs the ADSP VM
  - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

  Before installing the ADSP VM, execute the upgrade command, giving the path and file name of the ADSP firmware image. This extracts the image on to the device (NX9500 or NX9510) on which the command has been executed. On successful completion of this process, execute the reload command to reboot the device. Once the device has been successfully rebooted, execute the `virtual-machine > install > adsp` command.

  For example:

  ```plaintext
  #upgrade tftp://20.1.1.60/adsp-9.1.1May 29 15:12:41 2015: %DAEMON-6-INFO: lighttpd[2405]: 127.0.0.1 127.0.0.1:443 - "POST /mapi.fcgi HTTP/1.1" 200 192 "-" "-
  03-5.8.1.0-008D.img
  May 29 15:12:51 2014: nx9500-6C874D : %DIAG-6-
  NEW_LED_STATE: LED state message FIRMWARE_UPGRADE_STARTED
  from module led_msg
  Running from partition /dev/sda8
  Validating image file header
  Extracting files (this may take some time).....May 29 15:12:53 2014: %DAEMON-6-INFO: lighttpd[2405]: 127.0.0.1 127.0.0.1:443 - "POST /mapi.fcgi HTTP/1.1" 200 923 "-" "-
  ...........
  ```

- **virtual-machine restart adsp {on <DEVICE-NAME>]**

  Restarts the ADSP VM
  - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| virtual-machine set disk-size <100-500> adsp {on <DEVICE-NAME>} | Sets the ADSP VM's disk size (in GB)  
  - <100-500> – Specify a value from 100 - 500 GB.  
  - adsp – Sets the VM as ADSP  
    - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices  
    - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.  
  Stop the ADSP VM before executing this command. |
| virtual-machine set memory <512-8192> adsp {on <DEVICE-NAME>} | Modifies the ADSP VM's memory  
  - <512-8192> – Specify a value from 512 - 8192 MB.  
  - adsp – Sets the VM as ADSP  
    - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices  
    - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas. |
| virtual-machine set wing-memory <12288-32739> | Specifies the WiNG memory size in MB  
  This command is applicable only to the NX9500 and NX9510 service platforms. Use the `show > virtual-machine-configuration` command to view the configured memory allocation. Use the `show > virtual-machine-statistics` to view the current allocated memory allocation.  
  - <12288-32739> – Specify a value from 12288 - 32739 MB. The default is 18432 MB.  
  The new memory setting takes effect only after the next boot. |
| virtual-machine [start|stop] adsp {on <DEVICE-NAME>} | Starts/stops the ADSP VM  
  - start – Starts the ADSP VM. Use this command to boot a shut down VM (in a stop state).  
  - stop – Stops a running ADSP VM. Use this command to shut down a running VM.  
    - on <DEVICE-NAME> – Optional. Executes the start/stop command on a specified device or devices  
    - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas. |
| virtual-machine uninstall adsp {on <DEVICE-NAME>} | Uninstalls the ADSP VM  
  - adsp – Sets the VM as ADSP  
    - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices  
    - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas. |
Examples
The following examples show the VM installation process:

Installation media: USB

<DEVICE>#virtual-machine install <VM-NAME> type iso disk-size 8 install-media usb1://vms/win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable

Installation media: pre-installed disk image

<DEVICE>##virtual-machine install <VM-NAME> type disk install-media flash:/vms/win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on <DEVICE-NAME>

In the preceding example, the command is executed on the device identified by the <DEVICE-NAME> keyword. In such a scenario, the disk-size is ignored if specified. The VM has the install media as first boot device.

Installation media: VM archive

<DEVICE>#virtual-machine install type vm-archive install-media flash:/vms/<VM-NAME> vcpus 3

In the preceding example, the default configuration attached with the VM archive overrides any parameters specified.

Exporting an installed VM:

<DEVICE>#virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>

In the preceding example, the command copies the VM archive on to the URL (VM should be in stop state).

nx4500-5CFA2B#virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.
nx4500-5CFA2B#

**NOTE:** Use the `show > virtual-machine` command to view installed VM details.

3.1.63 raid

Privileged Exec Mode Commands

Enables Redundant Array of Independent Disks (RAID) management

RAID is a group of one or more independent, physical drives, referred to as an array or drive group. These physically independent drives are linked together and appear as a single storage unit or multiple virtual drives. Replacing a single, large drive system with an array, improves performance (input and output processes are faster) and increases fault tolerance within the data storage system.

In an array, the drives can be organized in different ways, resulting in different RAID types. Each RAID type is identified by a number, which determines the RAID level. The common RAID levels are 0, 00, 1, 5, 6, 50 and 60. The WiNG MegaRAID implementation supports RAID-1, which provides data mirroring, but does not support data parity. RAID-1 consists of a two-drive array, where the data is simultaneously written on both drives, ensuring total data redundancy. In case of a drive failure the information on the other drive is used to rebuild the failed drive.

An array is said to be degraded when one of its drives has failed. A degraded array continues to function and can be rebooted using the one remaining functional drive. When a drive fails, the chassis sounds an alarm (if enabled), and the CLI prompt changes to "RAID degraded". The failed drive is automatically replaced with a hot spare (provided a spare is installed). The spare is used to re-build the array.

Use this command to:

• Verify the current array status
• Start and monitor array consistency checks
• Retrieve date and time of the last consistency check
• Shut down drives before physically removing them
• Install new drives
• Assign drives as hot spares
• Identify a degraded drive
• Deactivate an alarm (triggered when a drive is removed from the array)

Supported in the following platforms:
• Service Platforms — NX7530, NX9500

Syntax
raid [check|install|locate|remove|silence|spare]
raid [check|silence]
raid [install|locate|remove|spare] drive <0-4>

Parameters
• raid [check|silence]

| check | Starts a consistency check on the RAID array. Use the show > raid command to view consistency check status. A consistency check verifies the data stored in the array. When regularly executed, it helps protect against data corruption, and ensures data redundancy. Consistency checks also warn of potential disk failures. |
### raid [install|locate|remove|spare] drive <0-4>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
</table>
| silence  | Deactivates an alarm | **Note:** When enabled, an audible alarm is triggered when a drive in the array fails. The *silence* command deactivates the alarm (sound). **Note:** To enable RAID alarm, in the device configuration mode, use the *raid > alarm > enable* command. A NX9500 profile can also have the RAID alarm feature activated. For more information on the enabling RAID alarm, see *raid*.

### Examples

```
nx9500-6C874D#raid install drive 0
Error: Input Error: Drive 0 is already member of array, can't be added
nx9500-6C874D#  
```
CHAPTER 4
GLOBAL CONFIGURATION COMMANDS

This chapter summarizes the global-configuration commands in the CLI command structure.

The term global indicates characteristics or features effecting the system as a whole. Use the Global Configuration Mode to configure the system globally, or enter specific configuration modes to configure specific elements (such as interfaces or protocols). Use the configure terminal command (under PRIV EXEC) to enter the global configuration mode.

The following example describes the process of entering the global configuration mode from the PRIV EXEC mode:

<DEVICE>#configure terminal
<DEVICE>(config)#

NOTE: The system prompt changes to indicate you are now in the global configuration mode. The prompt consists of the device host name followed by (config) and a pound sign (#).

Commands entered in the global configuration mode update the running configuration file as soon as they are entered. However, these changes are not saved in the startup configuration file until a commit write memory command is issued.

<DEVICE>(config)#?
Global configuration commands:
  aaa-policy
    Configure a authentication/accounting/authorization policy
  aaa-tacacs-policy
    Configure an authentication/accounting/authorization TACACS policy

ipv6-router-advertisement-policy   IPv6 Router Advertisement related configuration
l2tpv3                              L2tpv3 tunnel protocol
mac                                 MAC configuration
management-policy                   Configure a management policy
meshpoint                           Configure a meshpoint quality-of-service policy
mint-policy                         Configure the global mint policy
nac-list                            Configure a network access control list
no                                  Configure a Nsight policy
nx45xx                              NX45XX integrated services platform
nx5500                              NX5500 wireless controller
nx65xx                              NX65XX integrated services platform
nx75xx                              NX75XX wireless controller
nx9000                              NXX9000 wireless controller
passpoint-policy                    Configure a passpoint policy
password-encryption                 Encrypt passwords in configuration
profile                             Profile related commands - if no parameters are given, all profiles are selected
radio-qos-policy                    Configure a radio quality-of-service policy
radius-group                         Configure radius user group parameters

## 4.1 Global Configuration Commands

### GLOBAL CONFIGURATION COMMANDS

The following table summarizes Global Configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa-policy</td>
<td>Configures a AAA policy</td>
<td>page 4-9</td>
</tr>
<tr>
<td>aaa-tacacs-policy</td>
<td>Configures AAA-TACACS policy</td>
<td>page 4-17</td>
</tr>
<tr>
<td>alias</td>
<td>Configures network, VLAN, and service aliases</td>
<td>page 4-10</td>
</tr>
<tr>
<td>ap621</td>
<td>Adds an AP621 to the network</td>
<td>page 4-18</td>
</tr>
<tr>
<td>ap622</td>
<td>Adds an AP622 to the network</td>
<td>page 4-19</td>
</tr>
<tr>
<td>ap650</td>
<td>Adds an AP650 to the network</td>
<td>page 4-20</td>
</tr>
<tr>
<td>ap6511</td>
<td>Adds an AP6511 to the network</td>
<td>page 4-21</td>
</tr>
<tr>
<td>ap6521</td>
<td>Adds an AP6521 to the network</td>
<td>page 4-22</td>
</tr>
<tr>
<td>ap6522</td>
<td>Adds an AP6522 to the network</td>
<td>page 4-23</td>
</tr>
<tr>
<td>ap6532</td>
<td>Adds an AP6532 to the network</td>
<td>page 4-24</td>
</tr>
<tr>
<td>ap6562</td>
<td>Adds an AP6562 to the network</td>
<td>page 4-25</td>
</tr>
<tr>
<td>ap71xx</td>
<td>Adds an AP71XX to the network</td>
<td>page 4-26</td>
</tr>
<tr>
<td>ap7502</td>
<td>Adds an AP7502 to the network</td>
<td>page 4-27</td>
</tr>
<tr>
<td>ap7522</td>
<td>Adds an AP7522 to the network</td>
<td>page 4-28</td>
</tr>
<tr>
<td>ap7532</td>
<td>Adds an AP7532 to the network</td>
<td>page 4-29</td>
</tr>
<tr>
<td>ap7562</td>
<td>Adds an AP7562 to the network</td>
<td>page 4-30</td>
</tr>
<tr>
<td>ap81xx</td>
<td>Adds an AP81XX to the network</td>
<td>page 4-31</td>
</tr>
<tr>
<td>ap82xx</td>
<td>Adds an AP82XX to the network</td>
<td>page 4-32</td>
</tr>
<tr>
<td>application</td>
<td>Creates an application definition and enters its configuration mode.</td>
<td>page 4-33</td>
</tr>
<tr>
<td>application-policy</td>
<td>Creates an application policy and enters its configuration mode</td>
<td>page 4-42</td>
</tr>
<tr>
<td>association-acl-policy</td>
<td>Configures an association ACL policy</td>
<td>page 4-59</td>
</tr>
<tr>
<td>auto-provisioning-policy</td>
<td>Configures an auto provisioning policy, which defines the process by which an access point discovers controllers and associates with it.</td>
<td>page 4-60</td>
</tr>
<tr>
<td>bgp</td>
<td>Configures Border Gateway Protocol (BGP) settings</td>
<td>page 4-61</td>
</tr>
<tr>
<td>bonjour-gw-discovery-policy</td>
<td>Configures a Bonjour GW Discovery policy (RFS7000 and AP7131)</td>
<td>page 4-63</td>
</tr>
<tr>
<td>bonjour-gw-forwarding-policy</td>
<td>Configures a Bonjour GW Forwarding policy (RFS7000 and AP7131)</td>
<td>page 4-65</td>
</tr>
</tbody>
</table>
### Table 4.1 Global Config Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bonjour-gw-query-forwarding-policy</code></td>
<td>Configures a Bonjour GW Query Forwarding policy, which enables Bonjour query forwarding across multiple VLANs (RFS7000 and AP7131)</td>
<td>page 4-66</td>
</tr>
<tr>
<td><code>captive portal</code></td>
<td>Configures a captive portal</td>
<td>page 4-67</td>
</tr>
<tr>
<td><code>clear</code></td>
<td>Clears the event history</td>
<td>page 4-107</td>
</tr>
<tr>
<td><code>client-identity</code></td>
<td>Enables client identification through DHCP device fingerprinting</td>
<td>page 4-108</td>
</tr>
<tr>
<td><code>client-identity-group</code></td>
<td>Creates a new client identity group and enters its configuration mode</td>
<td>page 4-116</td>
</tr>
<tr>
<td><code>clone</code></td>
<td>Clones a specified configuration object</td>
<td>page 4-123</td>
</tr>
<tr>
<td><code>crypto-cmp-policy</code></td>
<td>Creates a crypto Certificate Management Protocol (CMP) policy and enters its configuration mode</td>
<td>page 4-124</td>
</tr>
<tr>
<td><code>customize</code></td>
<td>Customizes the CLI command summary output</td>
<td>page 4-125</td>
</tr>
<tr>
<td><code>device</code></td>
<td>Specifies configuration on multiple devices</td>
<td>page 4-136</td>
</tr>
<tr>
<td><code>device-categorization</code></td>
<td>Configures a device categorization object</td>
<td>page 4-138</td>
</tr>
<tr>
<td><code>dhcp-server-policy</code></td>
<td>Configures a DHCP server policy</td>
<td>page 4-143</td>
</tr>
<tr>
<td><code>dhcpv6-server-policy</code></td>
<td>Configures DHCPv6 server policy parameters, such as class, address range, and options</td>
<td>page 4-144</td>
</tr>
<tr>
<td><code>dns-whitelist</code></td>
<td>Configures a DNS whitelist</td>
<td>page 4-146</td>
</tr>
<tr>
<td><code>event-system-policy</code></td>
<td>Configures an event system policy</td>
<td>page 4-152</td>
</tr>
<tr>
<td><code>ex3500</code></td>
<td>Creates an EX3500 time range list and enters its configuration mode</td>
<td>page 4-168</td>
</tr>
<tr>
<td><code>ex3500-management-policy</code></td>
<td>Creates an EX3500 management policy and enters its configuration mode</td>
<td>page 4-174</td>
</tr>
<tr>
<td><code>ex3500-qos-class-map-policy</code></td>
<td>Creates an EX3500 QoS class map policy and enters its configuration mode</td>
<td>page 4-192</td>
</tr>
<tr>
<td><code>ex3500-qos-policy-map</code></td>
<td>Creates an EX3500 QoS policy map and enters its configuration mode</td>
<td>page 4-200</td>
</tr>
<tr>
<td><code>ex3524</code></td>
<td>Adds a EX3524 switch to the network</td>
<td>page 4-214</td>
</tr>
<tr>
<td><code>ex3548</code></td>
<td>Adds a EX3548 switch to the network</td>
<td>page 4-216</td>
</tr>
<tr>
<td><code>firewall-policy</code></td>
<td>Configures a firewall policy</td>
<td>page 4-217</td>
</tr>
<tr>
<td><code>global-association-list</code></td>
<td>Configures a global list of client MAC addresses</td>
<td>page 4-219</td>
</tr>
<tr>
<td><code>guest-management</code></td>
<td>Configures a guest management policy that redirects guest users to a registration portal, upon association to a captive portal Service Set Identifier (SSID)</td>
<td>page 4-222</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>-------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>------------</td>
</tr>
<tr>
<td>host</td>
<td>Sets the system's network name</td>
<td>page 4-232</td>
</tr>
<tr>
<td>inline-password-encryption</td>
<td>Stores the encryption key in the startup configuration file</td>
<td>page 4-233</td>
</tr>
<tr>
<td>ip</td>
<td>Creates a IP access control list (ACL) and/or a Simple Network Management Protocol (SNMP) ACL, and enters its configuration mode</td>
<td>page 4-234</td>
</tr>
<tr>
<td>ipv6</td>
<td>Creates a IPv6 ACL and enters its configuration mode</td>
<td>page 4-236</td>
</tr>
<tr>
<td>ipv6-router-advertisement-policy</td>
<td>Creates an IPv6 router advertisement (RA) policy and enters its configuration mode</td>
<td>page 4-237</td>
</tr>
<tr>
<td>l2tpv3</td>
<td>Configures Layer 2 Tunneling Protocol Version 3 (L2TPV3) tunnel policy</td>
<td>page 4-255</td>
</tr>
<tr>
<td>mac</td>
<td>Configures MAC access lists (goes to the MAC ACL mode)</td>
<td>page 4-257</td>
</tr>
<tr>
<td>management-policy</td>
<td>Configures a management policy</td>
<td>page 4-258</td>
</tr>
<tr>
<td>meshpoint</td>
<td>Configures meshpoint related configuration commands</td>
<td>page 4-260</td>
</tr>
<tr>
<td>meshpoint-qos-policy</td>
<td>Configures a set of parameters that defines the quality of service (QoS)</td>
<td>page 4-262</td>
</tr>
<tr>
<td>mint-policy</td>
<td>Configures a MiNT security policy</td>
<td>page 4-263</td>
</tr>
<tr>
<td>nac-list</td>
<td>Configures a network ACL</td>
<td>page 4-264</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or sets its default</td>
<td>page 4-270</td>
</tr>
<tr>
<td>nsight-policy</td>
<td>Creates an NSight policy and enters its configuration mode</td>
<td>page 4-274</td>
</tr>
<tr>
<td>passpoint-policy</td>
<td>Creates a new passpoint policy and enters its configuration mode</td>
<td>page 4-283</td>
</tr>
<tr>
<td>password-encryption</td>
<td>Enables password encryption</td>
<td>page 4-285</td>
</tr>
<tr>
<td>profile</td>
<td>Configures profile related commands</td>
<td>page 4-286</td>
</tr>
<tr>
<td>radio-qos-policy</td>
<td>Configures a radio qos policy</td>
<td>page 4-290</td>
</tr>
<tr>
<td>radius-group</td>
<td>Configures a RADIUS group</td>
<td>page 4-291</td>
</tr>
<tr>
<td>radius-server-policy</td>
<td>Configures a RADIUS server policy</td>
<td>page 4-292</td>
</tr>
<tr>
<td>radius-user-pool-policy</td>
<td>Configures a RADIUS user pool policy</td>
<td>page 4-293</td>
</tr>
<tr>
<td>rename</td>
<td>Renames and existing top-level object (TLO)</td>
<td>page 4-294</td>
</tr>
<tr>
<td>rf-domain</td>
<td>Creates an RF Domain</td>
<td>page 4-298</td>
</tr>
<tr>
<td>rfs4000</td>
<td>Adds an RFS4000 to the network</td>
<td>page 4-329</td>
</tr>
<tr>
<td>rfs6000</td>
<td>Adds an RFS6000 to the network</td>
<td>page 4-330</td>
</tr>
<tr>
<td>rfs7000</td>
<td>Adds an RFS7000 to the network</td>
<td>page 4-331</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>nx45xx</td>
<td>Adds an NX45XX to the network</td>
<td>page 4-332</td>
</tr>
<tr>
<td>nx5500</td>
<td>Adds an NX5500 to the network</td>
<td>page 4-333</td>
</tr>
<tr>
<td>nx65xx</td>
<td>Adds an NX65XX to the network</td>
<td>page 4-334</td>
</tr>
<tr>
<td>nx75xx</td>
<td>Adds an NX75XX to the network</td>
<td>page 4-335</td>
</tr>
<tr>
<td>nx9000</td>
<td>Adds a NX9000, NX9500, or NX9510 to the network</td>
<td>page 4-336</td>
</tr>
<tr>
<td>roaming-assist-policy</td>
<td>Configures a roaming assist policy that enables access points to assist wireless clients in making roaming decisions, such as which access point to connect etc.</td>
<td>page 4-337</td>
</tr>
<tr>
<td>role-policy</td>
<td>Configures a role policy</td>
<td>page 4-338</td>
</tr>
<tr>
<td>route-map</td>
<td>Creates a dynamic BGP route map and enters its configuration mode</td>
<td>page 4-339</td>
</tr>
<tr>
<td>routing-policy</td>
<td>Configures a routing policy</td>
<td>page 4-340</td>
</tr>
<tr>
<td>self</td>
<td>Displays a logged device’s configuration context</td>
<td>page 4-341</td>
</tr>
<tr>
<td>smart-rf-policy</td>
<td>Configures a Smart RF policy</td>
<td>page 4-342</td>
</tr>
<tr>
<td>t5</td>
<td>Configures a t5 wireless controller. This command is applicable only on the RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600 platforms.</td>
<td>page 4-343</td>
</tr>
<tr>
<td>web-filter-policy</td>
<td>Creates a Web Filtering policy and enters its configuration mode</td>
<td>page 4-345</td>
</tr>
<tr>
<td>wips-policy</td>
<td>Configures a WIPS policy</td>
<td>page 4-355</td>
</tr>
<tr>
<td>wlan</td>
<td>Configures a wireless WLAN</td>
<td>page 4-357</td>
</tr>
<tr>
<td>wlan-qos-policy</td>
<td>Configures a WLAN QoS policy</td>
<td>page 4-447</td>
</tr>
<tr>
<td>smart-cache-policy</td>
<td>Enables content caching to allow temporary storing of frequently accessed content on an intermediate network device. This command is specific to the NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, and NX9600 series service platforms.</td>
<td>page 4-449</td>
</tr>
<tr>
<td>url-filter</td>
<td>Creates a new URL filter and enters its configuration mode. URL filtering is a licensed feature.</td>
<td>page 4-467</td>
</tr>
<tr>
<td>url-list</td>
<td>Creates an URL list. This command is specific to the NX4500, NX4524, NX6500, and NX6524 series service platforms.</td>
<td>page 4-481</td>
</tr>
<tr>
<td>vx9000</td>
<td>Configures a Virtual WLAN Controller (V-WLC) in a virtual machine (VM) environment</td>
<td>page 4-486</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
NOTE: The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character.
4.1.1  aaa-policy

Configures an Authentication, Accounting, and Authorization (AAA) policy. This policy configures multiple servers for authentication and authorization. Up to six servers can be configured for providing AAA services.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
aaa-policy <AAA-POLICY-NAME>
```

Parameters

- `aaa-policy <AAA-POLICY-NAME>`

Examples

```
rfs7000-37FABE(config)#aaa-policy test
rfs7000-37FABE(config-aaa-policy-test)#?
AAA Policy Mode commands:
  accounting        Configure accounting parameters
  attribute         Configure RADIUS attributes in access and accounting requests
  authentication    Configure authentication parameters
  health-check      Configure server health-check parameters
  mac-address-format Configure the format in which the MAC address must be filled in the Radius-Request frames
  no                 Negate a command or set its defaults
  proxy-attribute   Configure radius attribute behavior when proxying through controller or rf-domain-manager
  server-pooling-mode Configure the method of selecting a server from the pool of configured AAA servers
  use                Set setting to use
  clrscr             Clears the display screen
  commit             Commit all changes made in this session
  do                  Run commands from Exec mode
  end                 End current mode and change to EXEC mode
  exit                End current mode and down to previous mode
  help                Description of the interactive help system
  revert             Revert changes
  service             Service Commands
  show                Show running system information
  write               Write running configuration to memory or terminal
```

Related Commands

- `no`  Removes an existing AAA policy

NOTE: For more information on the AAA policy commands, see Chapter 8, AAA-POLICY.
4.1.2 alias

4.1.2.1 Global Configuration Commands

Configures network, VLAN, host, string, and network-service aliases

Aliases are objects having a unique name and content that is determined by the alias type (network, VLAN, and network-service).

A typical large enterprise network consists of multiple sites (RF Domains) having similar configuration parameters with few elements that vary, such as networks or network ranges, hosts having different IP addresses, and VLAN IDs or URLs. These elements can be defined as aliases (object oriented wireless firewalls) and used across sites by applying overrides to the object definition. Using aliases results in a configuration that is easier to understand and maintain.

Multiple instances of an alias (same type and same name) can be defined at any of the following levels: global, RF Domain, profile, or device. An alias defined globally functions as a top-level-object (TLO). Global aliases are not mandatory, and can be defined at the domain-level, or profile, or device-level only. An alias defined on a device is applicable to that device only. An alias defined on a profile applies to every device using the profile. Similarly, aliases defined at the RF Domain level apply to all devices within that domain.

Aliases defined at any given level can be overridden at any of the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

Aliases can be classified as:

- address-range alias – Maps a name to a range of IP addresses. An address-range alias can be utilized at different deployments. For example, if an ACL defines a pool of network addresses as 192.168.10.10 through 192.168.10.100 for an entire network, and a remote location’s network range is 172.16.13.20 through 172.16.13.110, the remote location’s ACL can be overridden using an alias. At the remote location, the ACL works with the 172.16.13.20-110 address range. A new ACL need not be created specifically for the remote deployment location.

- host alias – Maps a name to a specific host (identified by its IP address. For example, 192.168.10.23). A host alias can be utilized at different deployments. For example, if a central network DNS server is set a static IP address, and a remote location’s local DNS server is defined, this host can be overridden at the remote location. At the remote location, the network is functional with a local DNS server, but uses the name set at the central network. A new host need not be created at the remote location. This simplifies creating and managing hosts and allows an administrator to better manage specific local requirements.

- network alias – Maps a name to a network. A network alias can be utilized at different deployments. For example, if a central network ACL defines a network as 192.168.10.0/24, and a remote location’s network range is 172.16.10.0/24, the ACL can be overridden at the remote location to suit their local (but remote) requirement. At the remote location, the ACL functions with the 172.16.10.0/24 network. A new ACL need not be created specifically for the remote deployment. This simplifies ACL definition and allows an administrator to better manage specific local requirements.

- network-group alias – Maps a name to a single or a range of addresses of devices, hosts, and network configurations. Network configurations are complete networks in the form 192.168.10.0/24 or IP address range in the form 192.168.10.10-192.168.10.20.

  A network-group alias can contain a maximum of eight (8) host entries, eight (8) network entries, and eight (8) IP address-range entries. A maximum of 32 network-group alias entries can be created.

  A network-group alias can be used in IP firewall rules to substitute hosts, subnets, and IP address ranges.

- network-service alias – Maps a name to service protocols and ports to match. Both source and destination ports are configurable. For each protocol, up to 2 source port ranges and up to 2 destination port ranges can be configured. A maximum of 4 protocol entries can be configured per network-service alias. When used with an ACL, the network-service alias defines the service-specific components of the ACL rule. Overrides can be applied to the service alias, at the device level, without modifying the ACL. Application of overrides to the service alias allows an ACL to be used across sites.
Use a network-service alias to associate more than one IP address to a network interface, providing multiple connections to a network from a single IP node.

NOTE: When used with ACLs, network, network-group, and network-service aliases act as enhanced firewalls.

- **number alias** – Maps a name to a number
- **vlan alias** – Maps a name to a VLAN ID. A VLAN alias can be used at different deployments. For example, if a named VLAN is defined as 10 for the central network, and the VLAN is set at 26 at a remote location, the VLAN can be overridden at the deployment location with an alias. At the remote deployment location, the network is functional with a VLAN ID of 26 but utilizes the name defined at the centrally managed network. A new VLAN need not be created specifically for the remote deployment.
- **string alias** – Maps a name to a specific string (for example, RF Domain name). A host alias can be utilized at different deployments. For example, if the main domain at a remote location is called `loc1.domain.com` and at another deployment location it is called `loc2.domain.com`, the alias can be overridden at the remote location to suit the local (but remote) requirement. At one remote location, the alias functions with the `loc1.domain.com` domain and at the other with the `loc2.domain.com` domain.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
alias [address-range|host|network|network-group|network-service|number|string|vlan]
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
alias host <HOST-ALIAS-NAME> <HOST-IP>
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP>] [host <HOST-IP>] [network <NETWORK-ADDRESS/MASK>]
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|ntp|nntp|pop3|proto|sip|smtp|sourceport|ssh|telnet|tftp|www)}
alias number <NUMBER-ALIAS-NAME> <0-4294967295>
alias string <STRING-ALIAS-NAME> <LINE>
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

**Parameters**

- alias address-range `<ADDRESS-RANGE-ALIAS-NAME>` `<STARTING-IP>` to `<ENDING-IP>`

| address-range `<ADDRESS-RANGE-ALIAS-NAME>` | Creates a address range alias, defining a range of IP addresses
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• <code>&lt;ADDRESS-RANGE-ALIAS-NAME&gt;</code> – Specify the address range alias name.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Alias name should begin with `$`.  

---

NOTE: When used with ACLs, network, network-group, and network-service aliases act as enhanced firewalls.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| alias host `<HOST-ALIAS-NAME>` `<HOST-IP>` | Associates the network host's IP address with this host alias. For example, 'alias host $HOST 1.1.1.100'. In this example, the host alias name is: $HOST and the host IP address it is mapped to is: 1.1.1.100.  
  - `<HOST-IP>` – Specify the network host's IP address. |
| alias network `<NETWORK-ALIAS-NAME>` `<NETWORK-ADDRESS/MASK>` | Associates a single network with this network alias. For example, 'alias network $NET 1.1.1.0/24'. In this example, the network alias name is: $NET and the network it is mapped to is: 1.1.1.0/24.  
  - `<NETWORK-ADDRESS/MASK>` – Specify the network's address and mask. |
| alias network-group `<NETWORK-GROUP-ALIAS-NAME>` [address-range `<STARTING-IP>` to `<ENDING-IP>` | Associates a range of IP addresses with this network-group alias  
  - `<STARTING-IP>` – Specify the first IP address in the range.  
  - to `<ENDING-IP>` – Specify the last IP address in the range.  
  - `<STARTING-IP>` to `<ENDING-IP>` – Optional. Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured. |
| network `<NETWORK-GROUP-ALIAS-NAME>` | Associates a single or multiple networks with this network-group alias  
  - `<NETWORK-ADDRESS/MASK>` – Specify the network's address and mask.  
  - `<NETWORK-ADDRESS/MASK>` – Optional. Specifies more than one network. A maximum of eight (8) networks can be configured. |
### GLOBAL CONFIGURATION COMMANDS 4-13

**alias network-service** `<NETWORK-SERVICE-ALIAS-NAME>` *proto [<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|ntp|ntp|pop3|proto|sip|smtp|sourceport (<1-65535>|<WORD>|ssh|telnet|tftp|www)>}

<table>
<thead>
<tr>
<th>alias network-service <code>&lt;NETWORK-SERVICE-ALIAS-NAME&gt;</code></th>
<th>Configures an alias that specifies available network services and the corresponding source and destination software ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <code>&lt;NETWORK-SERVICE-ALIAS-NAME&gt;</code> – Specify a network-service alias name.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> Alias name should begin with <code>$</code>.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> Network-service aliases are used in ACLs, to define the service-specific components. ACLs using aliases can be used across sites by re-defining the network-service alias elements at the device or profile level.</td>
<td></td>
</tr>
</tbody>
</table>

**proto [0-254]|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp]**

| proto [0-254]| <WORD>|eigrp|gre|igmp|igp|ospf|vrrp) | Use one of the following options to associate an Internet protocol with this network-service alias: |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| • `0-254` – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the Protocol field of the IPv4 header and the Next Header field of IPv6 header. For example, the User Datagram Protocol's (UDP) designated number is 17. |
| • `<WORD>` – Identifies the protocol by its name. Specify the protocol name. |
| • `gre` – Selects Generic Routing Encapsulation (GRE). The protocol number is 47. |
| • `igmp` – Selects Internet Group Management Protocol (IGMP). The protocol number is 2. |
| • `igp` – Selects Interior Gateway Protocol (IGP). The protocol number is 9. |
| • `ospf` – Selects Open Shortest Path First (OSPF). The protocol number is 89. |
| • `vrrp` – Selects Virtual Router Redundancy Protocol (VRRP). The protocol number is 112. |

{(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|ntp|ntp|pop3|proto|sip|smtp|sourceport (<1-65535>|<WORD>|ssh|telnet|tftp|www)}

| `<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|ntp|ntp|pop3|proto|sip|smtp|sourceport (<1-65535>|<WORD>|ssh|telnet|tftp|www)> | After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports. |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| • `1-65535` – Optional. Configures a destination port number from 1 - 65535 |
| • `<WORD>` – Optional. Identifies the destination port by the service name provided. For example, the secure shell (SSH) service uses TCP port 22. |
| • `bgp` – Optional. Configures the default Border Gateway Protocol (BGP) services port (179) |
| • `dns` – Optional. Configures the default Domain Name System (DNS) services port (53) |

Contd..
• **ftp** – Optional. Configures the default *File Transfer Protocol* (FTP) control services port (21)
• **ftp-data** – Optional. Configures the default FTP data services port (20)
• **gopher** – Optional. Configures the default gopher services port (70)
• **https** – Optional. Configures the default HTTPS services port (443)
• **ldap** – Optional. Configures the default *Lightweight Directory Access Protocol* (LDAP) services port (389)
• **nntp** – Optional. Configures the default *Newsgroup* (NNTP) services port (119)
• **ntp** – Optional. Configures the default *Network Time Protocol* (NTP) services port (123)
• **POP3** – Optional. Configures the default *Post Office Protocol* (POP3) services port (110)
• **proto** – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step.
• **sip** – Optional. Configures the default *Session Initiation Protocol* (SIP) services port (5060)
• **smtp** – Optional. Configures the default *Simple Mail Transfer Protocol* (SMTP) services port (25)
• **sourceport [<1-65535>|<WORD>]** – Optional. After specifying the destination port, you may specify a single or range of source ports.
  • **<1-65535>** – Specify the source port from 1 - 65535.
  • **<WORD>** – Specify the source port range, for example 1-10.
• **ssh** – Optional. Configures the default SSH services port (22)
• **telnet** – Optional. Configures the default Telnet services port (23)
• **tftp** – Optional. Configures the default *Trivial File Transfer Protocol* (TFTP) services port (69)
• **www** – Optional. Configures the default HTTP services port (80)

---

**alias number <NUMBER-ALIAS-NAME> <0-4294967295>**

| alias number <NUMBER-ALIAS-NAME> <0-4294967295> | Creates a number alias identified by the <NUMBER-ALIAS-NAME> keyword. Number aliases map a name to a numeric value. For example, ‘alias number $NUMBER 100’
| | • The number alias name is: $NUMBER
| | • The value assigned is: 100
| | The value referenced by alias $NUMBER, wherever used, is 100.
| | • <NUMBER-ALIAS-NAME> – Specify the number alias name.
| | • <0-4294967295> – Specify the number, from 0 - 4294967295, assigned to the number alias created.

**Note:** Alias name should begin with ‘$’.  

---
### Global Configuration Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| alias string <STRING-ALIAS-NAME> <LINE> | Creates a string alias identified by the `<STRING-ALIAS-NAME>` keyword.  
* `<STRING-ALIAS-NAME>` – Specify the string alias name.  
* `<LINE>` – Specify the string value.  
**Note:** String aliases map a name to an arbitrary string value. For example, 'alias string $DOMAIN test.example_company.com'.  
  - The string alias name is: `$DOMAIN`  
  - The value assigned is: test.example_company.com (a domain name)  
  - The value referenced by alias `$DOMAIN`, wherever used, is test.example_company.com.  
* **Note:** Alias name should begin with `$`. |
| alias vlan <VLAN-ALIAS-NAME> <1-4094> | Creates a VLAN alias identified by the `<VLAN-ALIAS-NAME>` keyword.  
* `<VLAN-ALIAS-NAME>` – Specify the VLAN alias name.  
**Note:** Alias name should begin with `$`.  
* `<1-4094>` – Specify the VLAN ID from 1 - 4094. |

### Examples

```bash
rfs4000-229D58(config)#alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
rfs4000-229D58(config)#alias network $TestNetworkAlias 192.168.13.0/24
rfs4000-229D58(config)#alias host $TestHostAlias 192.168.13.10
rfs4000-229D58(config)#alias vlan $TestVLANAlias 1
rfs4000-229D58(config)#alias network-group $TestNetGrpAlias address-range 192.168.13.7 to 192.168.13.16 192.168.13.20 to 192.168.13.25
rfs4000-229D58(config)#commit
rfs4000-229D58(config)#alias network-group $TestNetGrpAlias network 192.168.13.0/24 192.168.16.0/24
rfs4000-229D58(config)#commit
rfs4000-229D58(config)#alias network-service $NetworkServAlias proto 17
rfs4000-229D58(config)#commit
rfs4000-229D58(config)#show context
```

</tr>
</tbody>
</table>

---

### Note

**String aliases** map a name to an arbitrary string value. For example, 'alias string $DOMAIN test.example_company.com'.

- **String alias name**: `$DOMAIN`  
- **Value assigned**: test.example_company.com (a domain name)  
- **Value referenced by alias**: test.example_company.com

**Note:** Alias name should begin with `$`.
**Example 1:**
rfs4000-229D58(config)#alias network-group $test host 192.168.1.10 192.168.1.11
rfs4000-229D58(config)#alias network-group $test network 192.168.2.0/24 192.168.3.0/24
rfs4000-229D58(config)#alias network-group $test address-range 192.168.4.10 to 192.168.4.20

In the preceding example, the network-group alias '$test' includes hosts 192.168.1.10 and 192.168.1.11, networks 192.168.2.0/24 and 192.168.3.0/24 and address-range 192.168.4.10 to 192.168.4.20.

**Example 2:**
rfs4000-229D58(config)#alias network-service $kerberos proto tcp 749 750 80 proto tcp sourceport 20 proto udp 68 sourceport 67

rfs4000-229D58(config)#commit

In the preceding example, the network-service alias '$kerberos' is configured to allow following traffic:

- TCP traffic to destination ports 749, 750, and 80
- TCP traffic from source port 20
- UDP traffic to destination port 68 and from source port 67
4.1.3 aaa-tacacs-policy

Global Configuration Commands

Configures AAA Terminal Access Controller Access-Control System (TACACS) policy. This policy configures multiple servers for authentication and authorization. A TACACS Authentication server should be configured when the server preference is authenticated server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>

Parameters
- aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>

Examples
rfs7000-37FABE(config)#aaa-tacacs-policy testpolicy
rfs7000-37FABE(config-aaa-tacacs-policy-testpolicy)#?

AAA TACACS Policy Mode commands:
- accounting Configure accounting parameters
- authentication Configure authentication parameters
- authorization Configure authorization parameters
- no Negate a command or set its defaults
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-aaa-tacacs-policy-testpolicy)#

Related Commands

| no | Removes an existing AAA TACACS policy |

NOTE: For more information on the AAA-TACACS policy commands, see Chapter 25, AAA-TACACS-POLICY.
4.1.4 ap621

*Global Configuration Commands*

Adds an AP621 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`ap621 <MAC>`

**Parameters**

- `ap621 <MAC>`

**Examples**

```plaintext
rfs7000-37FABE(config)#ap621 5C-0E-8B-E3-C3-56
rfs7000-37FABE(config-device-5C-0E-8B-E3-C3-56)#show context
ap621 5C-0E-8B-E3-C3-56
use profile default-ap621
use rf-domain default
hostname ap621-E3C356
rfs7000-37FABE(config-device-5C-0E-8B-E3-C3-56)#

rfs7000-37FABE(config)#show wireless ap configured
---------------------------------------------------------------------------------------
IDX   NAME                MAC              PROFILE       RF-DOMAIN    ADOPTED-BY
---------------------------------------------------------------------------------------
1     ap621-E3C356        5C-0E-8B-E3-C3-56 default-ap621 default un-adopted
---------------------------------------------------------------------------------------
```

**Related Commands**

- `no` Removes an AP621 from the network
### 4.1.5 ap622

*Global Configuration Commands*

Adds an AP622 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`ap622 <MAC>`

**Parameters**

- `ap622 <MAC>`

  - `<MAC>` Specify the AP622’s MAC address.

**Examples**

```bash
rfs7000-37FABE(config)#ap622 B4-C7-99-43-C3-DC
rfs7000-37FABE(config-device-B4-C7-99-43-C3-DC)#show context
ap622 B4-C7-99-43-C3-DC
  use profile default-ap622
  use rf-domain default
  hostname ap622-43C3DC
rfs7000-37FABE(config-device-B4-C7-99-43-C3-DC)#
rfs7000-37FABE(config)#show wireless ap configured
```

**Related Commands**

`no` Removes an AP622 from the network
4.1.6 ap650

Global Configuration Commands

Adds an AP650 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
ap650 <MAC>

Parameters
- ap650 <MAC>

Examples
rfs7000-37FABE(config)#ap650 5C-0E-8B-34-81-BC
rfs7000-37FABE(config-device-5C-0E-8B-34-81-BC)#show context

### 4.1.19 application

The following table lists the commands that enable you to enter the Application definition configuration mode:

**Table 4.2 Application-Policy Config Command**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>application</td>
<td>Creates a new application definition and enters its configuration mode. This command allows you to create a customized application detection definition.</td>
<td>page 4-34</td>
</tr>
<tr>
<td>application-config-mode commands</td>
<td>Summarizes application definition configuration mode commands.</td>
<td>page 4-36</td>
</tr>
</tbody>
</table>
4.1.19.1 application

application

Creating a new application definition and enters its configuration mode. This command allows you to create a customized application recognition definition.

The WiNG software uses Protocol and Application Classification Engine (PACE), a third-party Deep Packet Inspection (DPI) engine from IPOQUE, to enable application recognition. When enabled, the PACE evaluation package inspects network traffic to determine the application/protocol type. It can detect common HTTP-based applications (for example, Youtube and Facebook), enterprise-based applications (for example, Lync and Webex), and peer-to-peer applications (for example Facetime and Bittorrent) in the network’s traffic. PACE uses a range of DPI technologies to identify approximately 700 built-in applications that are grouped into twenty two (22) application categories. You can use this command to add applications not included in the PACE package.

Application recognition can be used as a filter to classify packets based on their application/protocol type. Once classified, an action is applied, such as deny, allow, mark, or rate-limit on the packet. These actions are defined in an application policy. Therefore, an application policy, like an Access Control List (ACL), is a set of rules that control traffic within the managed network. The match criteria, used by the application policy, are the built-in PACE app-categories and/or the customized applications configured here.

NOTE: The PACE DPI engine has to be enabled to trigger application recognition. To enable DPI, in the device or profile configuration mode, execute the dpi command. To enable customized application detection, in the device/profile configuration mode execute the dpi > custom-app <APPLICATION-NAME> command. For more information, see dpi.

NOTE: To enable application recognition based traffic control, apply this application or PACE app-categories to an application policy, and use the policy with the RADIUS user authentication process, user role, WLAN, or bridge VLAN. For more information, see application-policy.

Supported in the following platforms:
- Access Points — AP7522, AP7532, AP7562
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

application <APPLICATION-NAME>

Parameters

- application <APPLICATION-NAME>

<table>
<thead>
<tr>
<th>application &lt;APPLICATION-NAME&gt;</th>
<th>Creates a new application definition and enters its configuration mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;APPLICATION-NAME&gt; – Specify a name of the new application definition. It is created if not already existing in the system.</td>
<td></td>
</tr>

<td>application-policy-mode commands</td>
<td>Summarizes the application policy configuration mode commands</td>
<td>page 4-45</td>
</tr>
</tbody>
</table>
4.1.20.1 application-policy

- **application-policy**

  Creates an application policy and enters its configuration mode

  An application policy defines actions to perform on a packet when it matches a specified set of pre-defined applications or application categories. These rules are numbered and are applied to each packet sequentially in increasing order of their precedence number. Once a match is made, the packet is either forwarded, dropped, marked, or rate limited depending on the action specified in that rule.

  Application recognition is the most important aspect of application-based traffic control and prioritization within a managed network. The WiNG software uses PACE, a third-party DPI engine from IPOQUE, to enable application recognition. When enabled, PACE uses various DPI technologies to identify a range of applications that include Web-based and other difficult-to-classify protocols utilizing dynamic TCP/UDP port assignments. When an application is recognized and classified, a pre-defined application policy invokes appropriate action for that specific application. PACE provides a default database of application definitions (approximately 700 canned application signatures). In addition, to these, there is a provision to add new customized application definitions. You can also customize the default, canned application definitions.

  To enable an application policy, apply it at one or all of the following levels within the network to enforce application assurance:

  - **RADIUS CoA usage** – In the device/profile configuration mode, use the `application-policy > radius > <APPLICATION-POLICY-NAME>` command to apply the policy to every user successfully authenticated by the RADIUS server.

  - **User role** – In the role-policy-user-role configuration mode, use the `use > application-policy <APPLICATION-POLICY-NAME>` command to apply the policy to all users assigned to the role.

  - **WLAN** – In the WLAN configuration mode, use the `use > application-policy <APPLICATION-POLICY-NAME>` command to apply the policy to all users accessing the WLAN.

  - **Bridge VLAN** – In the bridge VLAN configuration mode, use the `use > application-policy <APPLICATION-POLICY-NAME>` command to apply the policy for the traffic corresponding to the bridged VLAN.

  Supported in the following platforms:

  - Access Points — AP7522, AP7532
  - Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
application-policy <APPLICATION-POLICY-NAME>
```

**Parameters**

- **application-policy <APPLICATION-POLICY-NAME>**

| application-policy <APPLICATION-POLICY-NAME> | Specify the application policy name. If the policy does not exist, it is created. |
Examples

nx9500-6C8809(config)#application-policy TestApplicPolicy

</table>
### 4.1.20.2.1 allow

> application-policy-mode commands

Creates an allow rule and configures the match criteria based on which packets are filtered and the allow access action applied.

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
precedence <1-256>
```

**Parameters**

- **allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]**
  - `app-category` Uses application category as the match criteria
    - `<APP-CATEGORY-NAME>` – Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote\ control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system forwards the packet or else drops it.
    - `all` – The system forwards all packets irrespective of the application category.
  - `application` Uses application name as the match criteria
    - `<APPLICATION-NAME>` – Specify the application name. Each packet’s application is matched with the application name specified here. In case of a match, the system forwards the packet.

**Note:** The WiNG database provides approximately 381 canned applications. In addition to these, the database also includes custom-made applications. These are application definitions created using the `application` command.

- **precedence <1-256>**
  - Assigns a precedence value for this allow rule. The precedence value differentiates between rules applicable to applications and the application categories to which they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.

Let us consider application `youtube` belonging to app-category `streaming`. The action required is: Allow `youtube` packets and deny all other applications belonging to app-category `streaming`.

The rules can be defined as:

```
#allow application youtube precedence 1
#deny app-category streaming precedence 2
```

Contd..
The following configuration is incorrect:
```plaintext
#deny app-category streaming precedence 1
#allow application youtube precedence 2
```
Once the `deny` app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent `allow` rule.

Note: The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
</table>
| The following examples show two `allow` rules, allowing access to all packets belonging to the application category ‘business’ and the application ‘Bing’:
```
x9500-6C8809(config-app-policy-Bing)#allow application Bing [TAB]
Bing
BitTorrent                BitTorrent_encrypted
BitTorrent_plain          BitTorrent_uTP            BitTorrent_uTP_encrypted
nx9500-6C8809(config-app-policy-Bing)#
```

Note: Bing is not one of the WiNG built-in database applications. It is a customized application created using the `application` command.
```
x9500-6C8809(config-app-policy-Bing)#allow application Bing precedence 1
nx9500-6C8809(config-app-policy-Bing)#allow app-category business [TAB]
all    antivirus\ update    audio
business    conference    custom
database    filetransfer    gaming
generic    im    mail
mobile     network\ management    other
p2p     remote_control    social\ networking
standard    streaming    tunnel
video    voip    web
nx9500-6C8809(config-app-policy-Bing)#
```
```
x9500-6C8809(config-app-policy-Bing)#allow app-category business precedence 2
nx9500-6C8809(config-app-policy-Bing)#show context application-policy Bing
allow application Bing precedence 1
allow app-category business precedence 2
nx9500-6C8809(config-app-policy-Bing)#
```

Related Commands
```
no
Removes this allow rule from the application policy
```
### 4.1.20.2.2 deny

**application-policy-mode commands**

Creates a deny rule and configures the match criteria based on which packets are filtered and the deny access action applied.

**Syntax**

```
deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
    precedence <1-256>
```

**Parameters**

- `deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
  precedence <1-256>`

<table>
<thead>
<tr>
<th>deny</th>
<th>Creates a deny rule and configures the match criteria. The options are app-category and application.</th>
</tr>
</thead>
<tbody>
<tr>
<td>app-category [&lt;APP-CATEGORY-NAME&gt;</td>
<td>all]</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;APP-CATEGORY-NAME&gt;</code> – Specify the application category name. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote\ control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet’s app-category is matched with the value specified here. In case of a match, the system drops the packet.</td>
</tr>
<tr>
<td></td>
<td>• <code>all</code> – The system drops all packets irrespective of the application category.</td>
</tr>
<tr>
<td>application &lt;APPLICATION-NAME&gt;</td>
<td>Uses application name as the match criteria.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;APPLICATION-NAME&gt;</code> – Specify the application name. Each packet’s application is matched with the application name specified here. In case of a match, the system drops the packet.</td>
</tr>
<tr>
<td>precedence &lt;1-256&gt;</td>
<td>Assigns a precedence value for this deny rule. The precedence value differentiates between rules applicable to applications and the application categories to which they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule. Let us consider application <code>youtube</code> belonging to app-category <code>streaming</code>. The action required is: Allow <code>youtube</code> packets and deny all other applications belonging to app-category <code>streaming</code>. The rules can be defined as:</td>
</tr>
<tr>
<td></td>
<td>#allow application youtube precedence 1</td>
</tr>
<tr>
<td></td>
<td>#deny app-category streaming precedence 2</td>
</tr>
<tr>
<td></td>
<td>The following configuration is incorrect:</td>
</tr>
<tr>
<td></td>
<td>#deny app-category streaming precedence 1</td>
</tr>
<tr>
<td></td>
<td>#allow application youtube precedence 2</td>
</tr>
<tr>
<td></td>
<td>Once the <code>deny</code> app-category streaming precedence 1 rule is hit, all streaming packets, including <code>youtube</code>, are dropped. Consequently, there are no packets left to apply the subsequent <code>allow</code> rule.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.</td>
</tr>
</tbody>
</table>
Examples
The following example shows one deny rule, denying access to all packets belonging to the application category 'social networking':

```plaintext
nx9500-6C8809(config-app-policy-Bing)#deny app-category social networking precedence 3
```

```plaintext
nx9500-6C8809(config-app-policy-Bing)#show context application-policy Bing
  allow application Bing precedence 1
  allow app-category business precedence 2
  deny app-category "social networking" precedence 3
nx9500-6C8809(config-app-policy-Bing)#
```

Note, In the preceding example, none of the allow and deny rules apply to the same application or app-category.

<td></td>
<td>• end-time – Configures the end time. This is the time at which the application policy enforcement ends.</td>
</tr>
<tr>
<td></td>
<td>• <a href="">HH:MM</a> – Specify the start and end time in the HH:MM format.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-app-policy-Bing)#enforcement-time days weekdays start-time 10:30 end-time 20:00

nx9500-6C8809(config-app-policy-Bing)#show context application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 10:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
```

**Related Commands**

- `no` Removes this application policy’s enforcement period
4.1.20.2.5 logging

Enable logging of application recognition hits made by the PACE DPI engine. It also sets the logging level. Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

logging [level|on]

logging on

logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings]

**Parameters**

- logging on
  - Enables logging of application recognition hits made by the PACE DPI engine. This option is disabled by default.

- logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings]
  - Sets the logging level for application recognition hits made by the PACE DPI engine. This option is disabled by default.
    - <0-7> — Sets the message logging severity level on a scale of 0 - 7
    - emergencies – Severity level 0: System is unusable
    - alerts – Severity level 1: Requires immediate action
    - critical – Severity level 2: Critical conditions
    - errors – Severity level 3: Error conditions
    - warnings – Severity level 4: Warning conditions
    - notifications – Severity level 5: Normal but significant conditions (this is the default setting)
    - informational – Severity level 6: Informational messages
    - debugging – Severity level 7: Debugging messages

**Examples**

nx9500-6C8809(config-app-policy-Bing)#logging level critical

nx9500-6C8809(config-app-policy-Bing)# show context application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
logging level critical

nx9500-6C8809(config-app-policy-Bing)#

**Related Commands**

- `no` - Resets the logging level to default (notifications). And the `no > logging > on` command disables DPI logging.
4.1.20.2.6 mark

application-policy-mode commands

Creates a mark rule and configures the match criteria based on which packets are marked.

Marks packets, matching a specified set of application categories or applications/protocols, with 802.1p priority level or Differentiated Services Code Point (DSCP) type of service (ToS) code. Marking packets is a means of identifying them for specific actions, and is used to provide different levels of service to different traffic types.

Supported in the following platforms:
• Access Points — AP7522, AP7532
• Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX7500, NX9000, NX9500, NX9510, NX9600

Syntax
mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
[8021p <0-7>|dscp <0-63>] precedence <1-256>

Parameters
• mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
[8021p <0-7>|dscp <0-63>] precedence <1-256>

mark Creates a mark rule and configures the match criteria. When applied, the rule marks packets, matching the criteria configured here, with 802.1p priority value or DSCP code. The match criteria options are: app-category and application.

app-category [<APP-CATEGORY-NAME>|all] Uses application category as the match criteria
• <APP-CATEGORY-NAME> – Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet’s app-category is matched with the value specified here. In case of a match, the system marks the packet.
• all – The system marks all packets irrespective of the application category.

application <APPLICATION-NAME> Uses application name as the match criteria
• <APPLICATION-NAME> – Specify the application name. Each packet’s application is matched with the application name specified here. In case of a match, the system marks the packet.

Note: The WiNG database provides approximately 381 canned applications. In addition to these, the database includes custom-made applications. These are application definitions created using the application command.

8021p <0-7> Marks packets matching the specified criteria with 802.1p priority value
• <0-7> – Specify a value from 0 - 7.

Note: The IEEE 802.1p signaling standard enables marking of layer 2 network traffic. Layer 2 network devices (such as switches), using 802.1p standards, group traffic into classes based on their 802.1p priority value, which is appended to the packet’s MAC header. In case of traffic congestion, packets with higher priority get precedence over lower priority packets and are forwarded first.

dscp <0-63> Marks packets matching the specified criteria with DSCP ToS code
• <0-63> – Specify a value from 0 - 63.

Note: The DSCP protocol marks layer 3 network traffic. Layer 3 network devices (such as routers) using DSCP, mark each layer 3 packet with a six-bit DSCP code, which is appended to the packet’s IP header. Each DSCP code is assigned a corresponding level of service, enabling packet prioritization.
precedence <1-256> Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.

Let us consider application *youtube* belonging to app-category *streaming*.

The action required is: Allow *youtube* packets and deny all other applications belonging to app-category *streaming*.

The rules can be defined as:

```
#allow application youtube precedence 1
#deny app-category streaming precedence 2
```

The following configuration is incorrect:

```
#deny app-category streaming precedence 1
#allow application youtube precedence 2
```

Once the *deny* app-category streaming precedence 1 rule is hit, all streaming packets, including *youtube*, are dropped. Consequently, there are no packets left to apply the subsequent *allow* rule.

**Note:** The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.

Examples

nx9500-6C8809(config-app-policy-Bing)#mark app-category video dscp 9 precedence 4

nx9500-6C8809(config-app-policy-Bing)#mark application facetime dscp 10 precedence 5

nx9500-6C8809(config-app-policy-Bing)#show context

application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
logging level critical

nx9500-6C8809(config-app-policy-Bing)#

Related Commands

```
no
```
Removes this mark rule from the application policy
4.1.20.2.7 rate-limit

application-policy-mode commands

Creates a rate-limit rule and configures the match criteria

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

rate-limit [app-category <APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] ([egress|ingress]) rate <50-1000000> max-burst-size <2-1024> precedence <0-256>

Parameters

- rate-limit [app-category <APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] ([egress|ingress]) rate <50-1000000> max-burst-size <2-1024> precedence <0-256>

rate-limit Creates a rate-limit rule and configures the match criteria. When applied, the rule applies a rate-limit to packets that match the criteria configured here. These packets could be incoming, outgoing, or both. The match criteria options are: app-category and application.

app-category <APP-CATEGORY-NAME>|all]

Uses application category as the match criteria

- <APP-CATEGORY-NAME> – Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system rate-limits the packet.
- all – The system rate-limits all packets irrespective of the application category.

application <APPLICATION-NAME>

Uses application name as the match criteria

- <APPLICATION-NAME> – Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system rate-limits the packet.

[egress|ingress] The egress and ingress parameters are recursive and can be used to rate limit either incoming, outgoing, or both incoming and outgoing traffic.

- egress – Selects the traffic type as outgoing
- ingress – Selects the traffic type as outgoing

Note: After selecting the traffic type (incoming/outgoing) configure the rate and maximum burst size.

rate <50-1000000>

The following parameters are common to the ‘egress’ and ‘ingress’ keywords:

- rate – Configures the rate limit, in Kbps, for both incoming and outgoing packets
- <50-1000000> – Specify the rate limit from 50 - 1000000 Kbps.

max-burst-size

The following parameters are common to the ‘egress’ and ‘ingress’ keywords:

- max-burst-size – Configures the maximum burst size, in Kbytes, for both incoming and outgoing packets
- <2-1024> – Specify the maximum burst size from 2 - 1024 Kbytes.
precedence <1-256>

Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.

Let us consider application **youtube** belonging to app-category **streaming**.

The action required is: Allow **youtube** packets and deny all other applications belonging to app-category **streaming**.

The rules can be defined as:

```bash
#allow application youtube precedence 1
#deny app-category streaming precedence 2
```

The following configuration is incorrect:

```bash
#deny app-category streaming precedence 1
#allow application youtube precedence 2
```

Once the **deny** app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent **allow** rule.

**Note:** The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.

---

**Examples**

nx9500-6C8809(config-app-policy-Bing)#rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"

enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6
logging level critical

nx9500-6C8809(config-app-policy-Bing)#

**Related Commands**

The following example shows the application policy 'Bing' settings after the 'no' commands are executed:

```
 nx9500-6C8809(config-app-policy-Bing)#show context application-policy Bing
   description "This application policy allows Bing search engine packets"
   enforcement-time days weekdays start-time 12:30 end-time 20:00
   allow application Bing precedence 1
   mark app-category video dscp 9 precedence 4
   mark application facetime dscp 10 precedence 5
   rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6
   logging level critical
 nx9500-6C8809(config-app-policy-Bing)#
```
4.1.21 association-acl-policy

Global Configuration Commands

Configures an association ACL policy. This policy defines a list of devices allowed or denied access to the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>

Parameters
- association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>

Examples
rfs7000-37FABE(config)#association-acl-policy test
rfs7000-37FABE(config-assoc-acl-test)#?
Association ACL Mode commands:
  deny Specify MAC addresses to be denied
  no Negate a command or set its defaults
  permit Specify MAC addresses to be permitted
  clrscr Clears the display screen
  commit Commit all changes made in this session
  do Run commands from Exec mode
  end End current mode and change to EXEC mode
  exit End current mode and down to previous mode
  help Description of the interactive help system
  revert Revert changes
  service Service Commands
  show Show running system information
  write Write running configuration to memory or terminal

rfs7000-37FABE(config-assoc-acl-test)#

Related Commands
- no Resets values or disables commands

NOTE: For more information on the association-acl-policy, see Chapter 10, ASSOCIATION-ACL-POLICY.
4.1.22 auto-provisioning-policy

Global Configuration Commands

Configures an auto provisioning policy. This policy configures the automatic provisioning of device adoption. The policy configures how an AP is adopted based on its type.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>

Parameters

- auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>

Examples

rfs7000-37FABE(config)#auto-provisioning-policy test
rfs7000-37FABE(config-auto-provisioning-policy-test)#?

Auto-Provisioning Policy Mode commands:

- adopt Add rule for device adoption
- default-adoption Adopt devices even when no matching rules are found. Assign default profile and default rf-domain
- deny Add rule to deny device adoption
- evaluate-always Set the flag to evaluate the policy everytime, regardless of previous adoption status
- no Negate a command or set its defaults
- redirect Add rule to redirect device adoption
- upgrade Add rule for device upgrade
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-auto-provisioning-policy-test)#

Related Commands

- no Removes an existing Auto Provisioning policy

NOTE: For more information on the association-acl-policy, see Chapter 9, AUTO-PROVISIONING-POLICY.
4.1.23 bgp

Global Configuration Commands

Configures Border Gateway Protocol (BGP) settings

BGP is an inter-ISP routing protocol which establishes routing between Internet Service Providers (ISPs). ISPs use BGP to exchange routing and reachability information between Autonomous Systems (AS) on the Internet. BGP makes routing decisions based on paths, network policies and/or rules configured by network administrators. The primary role of a BGP system is to exchange network reachability information with other BGP peers. This information includes information on AS that the reachability information traverses. This information is sufficient to create a graph of AS connectivity from which routing decisions can be created and rules enforced.

An AS is a set of routers under the same administration that use Interior Gateway Protocol (IGP) and common metrics to define how to route packets within the AS. AS uses inter-AS routing to route packets to other ASs. For an external AS, an AS appears to have a single coherent interior routing plan and presents a consistent picture of the destinations reachable through it.

Routing information exchanged through BGP supports only destination based forwarding (it assumes a router forwards packets based on the destination address carried in the IP header of the packet).

BGP uses TCP as its transport protocol. This eliminates the need to implement explicit update fragmentation, retransmission, acknowledgment, and sequencing. BGP listens on TCP port 179. The error notification mechanism used in BGP assumes that TCP supports a graceful close (all outstanding data is delivered before the connection is closed).

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>
```

Parameters
- bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>

| as-path-list <LIST-NAME> | Creates an AS path list and enters its configuration mode  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;LIST-NAME&gt; – Provide the AS-PATH-LIST name.</td>
</tr>
</tbody>
</table>
| community-list <LIST-NAME> | Creates a community list and enters its configuration mode  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;LIST-NAME&gt; – Provide the COMMUNITY-LIST name.</td>
</tr>
</tbody>
</table>
| extcommunity-list <LIST-NAME> | Creates an extended community list and enters its configuration mode  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;LIST-NAME&gt; – Provide the EXTCOMMUNITY-LIST name.</td>
</tr>
</tbody>
</table>
| ip-access-list <LIST-NAME> | Creates a BGP IP access list and enters its configuration mode  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;LIST-NAME&gt; – Provide the BGP IP-ACCESS-LIST name.</td>
</tr>
</tbody>
</table>
| ip-prefix-list <LIST-NAME> | Creates a BGP IP prefix list and enters its configuration mode  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;LIST-NAME&gt; – Provide the BGP IP-PREFIX-LIST name.</td>
</tr>
</tbody>
</table>
Examples

```
nx4500-5CFA2B(config)#bgp ?
  as-path-list  BGP AS path list Configuration
  community-list Add a community list entry
  extcommunity-list Add a extended community list entry (EXPERIMENTAL)
  ip-access-list Add an access list entry
  ip-prefix-list Build a prefix list

nx4500-5CFA2B(config)#
```

```
nx4500-5CFA2B(config)#bgp as-path-list AS-TEST-PATH
nx4500-5CFA2B(config-bgp-as-path-list-AS-TEST-PATH)#?
```

BGP AS Path List Mode commands:
- `deny` Specify packets to reject
- `no` Negate a command or set its defaults
- `permit` Specify packets to forward
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
nx4500-5CFA2B(config-bgp-as-path-list-AS-TEST-PATH)#
```

Related Commands

| `no` | Modifies BGP settings, based on the parameters passed |

**NOTE:** For more information on configuring BGP Top-Level Objects (TLOs), see Chapter 28, BORDER GATEWAY PROTOCOL.
4.1.24 **bonjour-gw-discovery-policy**

Bonjour is Apple's zero-configuration networking (Zeroconf) implementation. Zeroconf is a group of technologies that include service discovery, address assignment and hostname resolution. Bonjour locates the devices (printers, computers etc.) and services these computers provide over a local network.

Bonjour provides a method to discover services on a local area network (LAN). Bonjour allows users to set up a network without any configuration. Services such as printers, scanners and file-sharing servers can be found using Bonjour. Bonjour only works within a single broadcast domain. However, with a special DNS configuration, it can be extended to find services across broadcast domains.

This command configures a Bonjour GW Discovery policy. The policy defines a list of services clients can discover across subnets. A maximum of 8 (eight) policies can be created on access points, wireless controllers, or service platforms.

When configured and applied, this feature enables discovery of Bonjour services on local and/or tunneled VLANs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
bonjour-gw-discovery-policy <POLICY-NAME>
```

**Parameters**

- `bonjour-gw-discovery-policy <POLICY-NAME>`

| <POLICY-NAME> | Specify the Bonjour GW Discovery policy name. If the policy does not exist, it is created. In the Bonjour GW Discovery policy configuration mode, use the allow-service keyword to configure the services that the Bonjour gateway is allowed to discover. A maximum of 16 (sixteen) service rules can be created. Optionally, you can restrict this facility for users on specific VLANs. To do so, specify the VLAN IDs. **Note:** Execute the `bonjour-gw-forwarding-policy` command to enable forwarding of Bonjour service responses across VLANs. **Note:** To associate a Bonjour GW Discovery policy with a WLAN, in the WLAN configure mode, execute the following command:

```
use > bonjour-gw-discovery-policy > <POLICY-NAME>
```

For more information see, `use`.

**Note:** To associate a Bonjour GW Discovery policy with a VLAN, in the interface VLAN configure mode, execute the following command:

```
use > bonjour-gw-discovery-policy > <POLICY-NAME>
```

For more information see, `use`.

**Note:** To associate a Bonjour GW Discovery policy with a user role, in the role-policy - user-role config mode, execute the following command:

```
use > bonjour-gw-discovery-policy > <POLICY-NAME>
```

For more information see, `use`.  

---
Examples
rfs7000-37FABE(config)#bonjour-gw-discovery-policy TestPolicy
rfs7000-37FABE(config-bonjour-gw-discovery-policy-TestPolicy)#?

commands:
allow-service  Allow Bonjour Service on local or tunneled vlan, Optionally
                VLAN IDs can be given so service will be discovered for those
                vlan only
no             Negate a command or set its defaults
clrscr         Clears the display screen
commit         Commit all changes made in this session
do             Run commands from Exec mode
derb End current mode and change to EXEC mode
help           Description of the interactive help system
revert         Revert changes
service        Service Commands
show           Show running system information
write          Write running configuration to memory or terminal

rfs7000-37FABE(config-bonjour-gw-discovery-policy-TestPolicy)#

Related Commands

| no          | Removes an existing Bonjour GW Discovery policy |
4.1.25 bonjour-gw-forwarding-policy

Configures a Bonjour GW Forwarding policy. When configured and applied on the controller, the policy defines the service VLANs (the VLANs on which Bonjour services are running) and client VLANs where clients are present. All Bonjour responses from service VLANs are forwarded to client VLANs. A maximum of 2 (two) policies can be created on a wireless controller or service platform. And only 1 (one) policy can be created on an access point.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
bonjour-gw-forwarding-policy <POLICY-NAME>
```

Parameters

- bonjour-gw-forwarding-policy <POLICY-NAME>

**Examples**

```
rfs7000-37FABE(config)#bonjour-gw-forwarding-policy TestPolicy
rfs7000-37FABE(config-bonjour-gw-forwarding-policy-TestPolicy)#?
commands:
  forward-bonjour-response   Forwards bonjour service response across vlans
  no                         Negate a command or set its defaults
  clrscr                     Clears the display screen
  commit                     Commit all changes made in this session
  do                         Run commands from Exec mode
  end                        End current mode and change to EXEC mode
  exit                       End current mode and down to previous mode
  help                       Description of the interactive help system
  revert                     Revert changes
  service                    Service Commands
  show                       Show running system information
  write                      Write running configuration to memory or terminal
```

```
rfs7000-37FABE(config-bonjour-gw-forwarding-policy-TestPolicy)#
```

**Related Commands**

| no | Removes an existing Bonjour GW Forwarding policy |
4.1.26 bonjour-gw-query-forwarding-policy

Global Configuration Commands

Configures a Bonjour GW Query Forwarding policy and enters its configuration mode. When created and applied, this policy enables forwarding of Bonjour queries across VLANs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
bonjour-gw-query-forwarding-policy <POLICY-NAME>

Parameters
- bonjour-gw-query-forwarding-policy <POLICY-NAME>

Examples
rfs7000-37FABE(config)#bonjour-gw-query-forwarding-policy TestPolicy
rfs7000-37FABE(config-bonjour-gw-query-forwarding-policy-test)#?
(config-bonjour-gw-query-forwarding-policy) commands:
  forward-bonjour-query  Forwards bonjour query across vlans
  no                     Negate a command or set its defaults
  clrscr                 Clears the display screen
  commit                 Commit all changes made in this session
  do                     Run commands from Exec mode
  end                    End current mode and change to EXEC mode
  exit                   End current mode and down to previous mode
  help                   Description of the interactive help system
  revert                 Revert changes
  service                Service Commands
  show                   Show running system information
  write                  Write running configuration to memory or terminal

rfs7000-37FABE(config-bonjour-gw-query-forwarding-policy-test)#

Related Commands
- no  Removes an existing Bonjour GW Query Forwarding policy

Note: In the Bonjour GW Query Forwarding policy configuration mode, specify the ‘from’ and ‘to’ VLAN(s). The from-vlans option configures the VLAN(s) that are the source of the Bonjour queries. The to-vlans option configures the destination VLAN(s) that can access the Bonjour queries.

Note: To associate a Bonjour GW Query Forwarding policy with a device or profile, in the profile/device configuration mode, execute the use > bonjour-gw-query-forwarding-policy > <POLICY-NAME> command. For more information see, use.
4.1.27 captive portal

Global Configuration Commands

A captive portal provides secure guest access and authentication services within the network. The following table lists the commands available to enter the captive portal configuration mode:

Table 4.6 Captive-Portal Config Commands

</tbody>
</table>
4.27.1 captive-portal

- captive portal

Configures a captive portal

A captive portal provides secure access using a standard Web browser. Captive portals provide authenticated access by capturing and re-directing a wireless user's Web browser session to a captive portal login page where the user must enter valid credentials to access to the wireless network. Once logged into the captive portal, additional Acknowledgment, Agreement, Welcome, No Service, and Fail pages provide the administrator options to customize the screen flow and user appearance.

Captive portals are recommended for providing guests or visitors authenticated access to network resources when 802.1X EAP is not a viable option. Captive portal authentication does not provide end-user data encryption, but it can be used with static WEP, WPA-PSK or WPA2-PSK encryption.

Authentication for captive portal access requests is performed using a username and password pair, authenticated by an integrated RADIUS server. Authentication for private network access is conducted either locally on the requesting wireless client, or centrally at a datacenter.

Captive portals use a Web provisioning tool to create guest user accounts directly on the controller, service platform, or access point. The connection medium defined for the Web connection is either HTTP or HTTPS. Both HTTP and HTTPS use a request and response procedure to disseminate information to and from requesting wireless clients.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
captive-portal <CAPTIVE-PORTAL-NAME>
```

Parameters

- captive-portal <CAPTIVE-PORTAL-NAME>

Examples

```
rfs7000-37FABE(config)#captive-portal test
rfs7000-37FABE(config-captive-portal-test)#?
```

Captive Portal Mode commands:

- `access-time` Allowed access time for the client. Used when there is no session time in radius response
- `access-type` Access type of this captive portal
- `accounting` Configure how accounting records are created for this captive portal policy
- `bypass` Bypass captive portal
- `connection-mode` Connection mode for this captive portal
- `custom-auth` Custom user information
- `data-limit` Enforce data limit for clients
- `inactivity-timeout` Inactivity timeout in seconds. If a frame is not received from client for this amount of time, then current session will be removed
- `localization` Configure the FQDN address to get the localization parameters for the client
- `ipv6` Internet Protocol version 6 (IPv6)
- `logout-fqdn` Configure the FQDN address to logout the session from client
- `no` Negate a command or set its defaults
- `oauth` OAuth 2.0 authentication configuration
GLOBAL CONFIGURATION COMMANDS 4-69

post-authentication-vlan  Configure post authentication vlan for captive portal users
radius-vlan-assignment    Enable radius vlan assignment for captive portal users
redirection               Configure connection redirection parameters
server                    Configure captive portal server parameters
simultaneous-users        Particular username can only be used by a certain number of MAC addresses at a time
terms-agreement           User needs to agree for terms and conditions
use                       Set setting to use
webpage                   Configure captive portal webpage parameters
webpage-auto-upload       Enable automatic upload of advanced webpages
webpage-location          The location of the webpages to be used for authentication. These pages can either be hosted on the system or on an external web server.
welcome-back             Welcome back page settings
clrscr                    Clears the display screen
commit                    Commit all changes made in this session
do                        Run commands from Exec mode
end                       End current mode and change to EXEC mode
exit                      End current mode and down to previous mode
help                      Description of the interactive help system
revert                    Revert changes
service                   Service Commands
show                      Show running system information
write                     Write running configuration to memory or terminal

4.1.27.2.1 access-time

* captive-portal-mode commands

Defines the permitted access time for a client. It is used when no session time is defined in the RADIUS response.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

access-time <10-10080>

Parameters

- access-time <10-10080>

<table>
<thead>
<tr>
<th>access-time &lt;10-10080&gt;</th>
<th>Defines the duration wireless clients are allowed access to the Internet using this captive portal policy</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;10-10080&gt; – Specify a value from 10 - 10080 minutes. The default is 1440 minutes.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-captive-portal-test)#access-time 35
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
access-time 35
rfs7000-37FABE(config-captive-portal-test)#

Related Commands

- no
  Reverts to the default permitted access time (1440 minutes)
4.1.27.2.2 **access-type**

* captive-portal-mode commands

Defines the captive portal's access type. The authentication scheme configured here is applied to wireless clients using this captive portal.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
access-type [custom-auth-radius|logging|no-auth|radius|registration]
```

**Parameters**

- **access-type [custom-auth-radius|logging|no-auth|radius|registration]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>custom-auth-radius</td>
<td>Specifies the custom user information used for authentication (RADIUS lookup of given information, such as name, e-mail address, telephone etc.). When configured, accessing clients are required to provide a 1-32 character lookup data string used to authenticate their credentials. <strong>Note:</strong> When selecting this option, use the custom-auth command to configure the required user information.</td>
</tr>
<tr>
<td>logging</td>
<td>Provides users access without authentication. The system logs access details of users allowed access.</td>
</tr>
<tr>
<td>no-auth</td>
<td>Defines no authentication required for a guest (guest is redirected to welcome message). Provides users access to the captive portal without authentication.</td>
</tr>
<tr>
<td>radius</td>
<td>Enables RADIUS authentication for wireless clients. Provides captive portal access to successfully authenticated users only. This is the default setting.</td>
</tr>
<tr>
<td>registration</td>
<td>Enables captive portal's clients to self register in the captive portal's database <strong>Note:</strong> If enabled, use the <code>webpage &gt; internal &gt; registration &gt; field</code> command to customize the registration page. If not customized, the default, built-in registration Web page is displayed.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#access-type logging
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
  access-type logging
  access-time 35
rfs7000-37FABE(config-captive-portal-test)#
```

**Related Commands**

```
no
```

Removes the captive portal access type or reverts to default (radius)
4.27.2.3 accounting

captive-portal-mode commands

Enables support for accounting messages for this captive portal

When enabled, accounting for clients entering and exiting the captive portal is initiated. Accounting is the method of collecting and sending security server information for billing, auditing, and reporting user data. This data includes information, such as start and stop times, executed commands (such as PPP), number of packets and number of bytes transmitted etc. Accounting enables tracking of captive portal services consumed by clients.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

accounting [radius|syslog]

accounting radius

accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}

Parameters

- accounting radius

  radius Enables support for RADIUS accounting messages. When enabled, this option uses an external RADIUS resource for AAA accounting. This option is disabled by default.

  • accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}

- syslog host <IP/HOSTNAME>

  Enables support for syslog accounting messages. When enabled, data relating to wireless client usage of remote access services is logged on the specified external syslog resource. This information assists in differentiating between local and remote users. Remote user information can be archived to an external location for periodic network and user administration. This option is disabled by default.

  - host <IP/HOSTNAME> — Specifies the destination where accounting messages are sent. Specify the destination’s IP address or hostname.

  port <1-65535> Optional. Specifies the syslog server’s listener port

  - <1-65535> – Specify the UDP port from 1-65535. The default is 514.

  proxy-mode [none|through-controller|through-rf-domain-manager] Optional. Specifies the mode of proxying the syslog server

  - none – Accounting messages are sent directly to the syslog server
  - through-controller – Accounting messages are sent through the controller configuring the device
  - through-rf-domain-manager – Accounting messages are sent through the local RF Domain manager
Examples
rfs7000-37FABE(config-captive-portal-test)#accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
   access-type logging
   access-time 35
   accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#

</tbody>
</table>
4.1.27.2.4 bypass

* captive-portal-mode commands

Enables bypassing of captive portal detection requests from wireless clients

Certain devices, such as Apple IOS devices send Captive Network Assistant (CNA) requests to detect existence of captive portals. When enabled, the bypass option does not allow CNA requests to be redirected to the captive portal pages.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

bypass captive-portal-detection

Parameters

- bypass captive-portal-detection

| bypass captive-portal-detection | Bypasses captive portal detection requests |

Examples

rfs4000-229D58(config-captive-portal-test)#bypass captive-portal-detection
rfs4000-229D58(config-captive-portal-test)#show context captive-portal test
  bypass captive-portal-detection
rfs4000-229D58(config-captive-portal-test)#

Related Commands

- no | Disables bypassing of captive portal detection requests |
4.1.27.2.5 connection-mode

**captive-portal-mode commands**

Configures a captive portal’s mode of connection to the Web server. HTTP uses plain unsecured connection for user requests. HTTPS uses an encrypted connection to support user requests.

Both HTTP and HTTPS use the same *Uniform Resource Identifier* (URI), so controller and client resources can be identified. However, the use of HTTPS is recommended, as it affords controller and client transmissions some measure of data protection HTTP cannot provide.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`connection-mode [http|https]`

**Parameters**

- `connection-mode [http|https]`

<table>
<thead>
<tr>
<th>http</th>
<th>Sets HTTP as the default connection mode. This is the default setting.</th>
</tr>
</thead>
<tbody>
<tr>
<td>https</td>
<td>Sets HTTPS as the default connection mode</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#connection-mode https
rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-type logging
  access-time 35
  connection-mode https
  accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#
```

**Related Commands**

- `no` Removes this captive portal’s connection mode
4.1.27.2.6 custom-auth

captive-portal-mode commands

Configures custom user information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

custom-auth info <LINE>

Parameters

- custom-auth info <LINE>

| info <LINE> | Configures information used for RADIUS lookup when custom-auth RADIUS access type is configured
|            | • <LINE> – Guest data needs to be provided. Specify the name, e-mail address, and telephone number of the user.

Examples

rfs7000-37FABE(config-captive-portal-test)#custom-auth info bob bob@examplecompany.com

rfs7000-37FABE(config-captive-portal-test)#show context
  captive-portal test
  access-type logging
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#

Related Commands

- no
  Removes custom user information configured with this captive portal
4.27.2.7 data-limit

> captive-portal-mode commands

Enforces data transfer limits on captive portal clients. This feature enables the tracking and logging of user usage. Users exceeding the allowed bandwidth are restricted from the captive portal.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

data-limit <1-102400> {action [log-and-disconnect|log-only]}

Parameters
- data-limit <1-102400> {action [log-and-disconnect|log-only]}

<table>
<thead>
<tr>
<th>data-limit &lt;1-102400&gt;</th>
<th>Sets a captive portal client’s data transfer limit in megabytes. This limit is applicable for both upstream and downstream data transfer.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-102400&gt; – Specify a value from 1 - 102400 MB.</td>
</tr>
</tbody>
</table>

| action [log-and-disconnect|log-only] | Optional. Specifies the action taken when a client exceeds the configured data limit. The options are: |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------|
|                                        | • log-and-disconnect – Logs a record and disconnects the client                                        |
|                                        | • log-only – Only a log is generated and the client remains connected to the captive portal. This is the default setting. |

Examples

rfs7000-37FABE(config-captive-portal-test)#data-limit 200 action log-and-disconnect

rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
data-limit 200 action log-and-disconnect
rfs7000-37FABE(config-captive-portal-test)#

Related Commands

| no | Removes data limit enforcement for captive portal clients |
4.27.2.8 inactivity-timeout

Defines an inactivity timeout in seconds. If a frame is not received from a client for the specified interval the current session is terminated.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
inactivity-timeout <60-86400>

Parameters
- inactivity-timeout <60-86400>

<table>
<thead>
<tr>
<th>&lt;60-86400&gt;</th>
<th>Defines the timeout interval after which a captive portal session is automatically terminated</th>
</tr>
</thead>
<tbody>
<tr>
<td>- &lt;60-86400&gt;</td>
<td>Specify a value from 60 - 86400 seconds. The default is 10 minutes or 600 seconds.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-captive-portal-test)#inactivity-timeout 750
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
access-type logging
access-time 35
custom-auth info bob bob@examplecompany.com
custom-auth info bob bob@examplecompany.com
connection-mode https
inactivity-timeout 750
accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#

Related Commands
- **no** Removes the client inactivity interval configured with this captive portal
4.1.27.2.9 ipv6

`captive-portal-mode commands`

Configures the internal captive portal server's (running on the centralized mode) IPv6 address. If using centralized server mode, use this option to define the controller, service platform, or access point resource's (hosting the captive portal) IPv6 address. For information on configuring the server mode, see `server`.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`ipv6 server host <IPv6>`

**Parameters**

- `ipv6 server host <IPv6>`

<table>
<thead>
<tr>
<th><code>ipv6 server host &lt;IPv6&gt;</code></th>
<th>Configures the IPv6 address of the internal captive portal server</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IPv6&gt;</code></td>
<td><code>&lt;IPv6&gt;</code> – Specify the captive portal server’s global IPv6 address.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-6DCD4B(config-captive-portal-test2)#show context captive-portal test2 access-type OAuth
rfs7000-6DCD4B(config-captive-portal-test2)#

**Related Commands**

`no` Removes the captive portal server’s IPv6 address
4.1.27.2.10 localization

* captive-portal-mode commands

Configures an FQDN address string that enables the client to receive localization parameters. Use this option to add a URL to trigger a one-time redirect on demand. The defined URL is triggered from a mobile application to derive location information from the wireless network so an application can be localized to a particular store or region.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
localization [fqdn <WORD>|response <WORD>]
```

**Parameters**

- **localization [fqdn <WORD>|response <WORD>]**

  - **fqdn <WORD>**: Configures the FQDN address string, which is used to obtain localization parameters for the captive portal's client.
    - `<WORD>` – Specify the FQDN address string. For example, local.guestaccess.com

  - **response <WORD>**: Configures a message, which is sent back to the client in response to the client’s localization HTTP requests.
    - `<WORD>` – Specify the response message (should not exceed 512 characters in length). The following built-in query tags can be included in the response message:
      - `WING_TAG_CLIENT_IP` - Captive portal client IPv4 address
      - `WING_TAG_CLIENT_MAC` - Captive portal client MAC address
      - `WING_TAG_WLAN_SSID` - Captive portal client WLAN ssid
      - `WING_TAG_AP_MAC` - Captive portal client AP MAC address
      - `WING_TAG_AP_NAME` - Captive portal client AP Name
      - `WING_TAG_RF_DOMAIN` - Captive portal client RF Domain
      - `WING_TAG_USERNAME` - Captive portal authentication username
      - `WING_TAG_USERTYPE` - Captive portal usertype
      - `(new/return/refresh)`
      - Example:-
        ```
        <local><site>WING_TAG_RF_DOMAIN</site><ap>WING_TAG_AP_NAME</ap></local>
        ```

**Examples**

```
nx4500-5CFA2B(config-captive-portal-test)#localization fqdn local.guestaccess.com

nx4500-5CFA2B(config-captive-portal-test)#localization response <local><site>SJZebra</site><ap>ap8132-74B45C</ap><user>Bob</user></local>

nx4500-5CFA2B(config-captive-portal-test)#show context include-factory | include localization
localization fqdn local.guestaccess.com
localization response <local><site>SJZebra</site><ap>ap8132-74B45C</ap><user>Bob</user></local>
```

nx4500-5CFA2B(config-captive-portal-test)#

4.1.27.2.11 logout-fqdn

Configure captive-portal-mode commands

Configure the Fully Qualified Domain Name (FQDN) address to logout of the session from the client.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

logout-fqdn <WORD>

Parameters

- logout-fqdn <WORD>

Examples

rfs7000-37FABE(config-captive-portal-test)#logout-fqdn logout.testuser.com

Related Commands

- no
  - Clears the logout FQDN address
4.1.27.2.12  no

**captive-portal-mode commands**

The `no` command reverts the selected captive portal’s settings or resets settings to default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```

```
Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes or resets this captive portal's settings, based on the parameters passed. |

Examples

The following example shows the captive portal 'test' settings before the 'no' commands are executed:

```
  rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-type logging
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  inactivity-timeout 750
  accounting syslog host 172.16.10.13 port 1
  rfs7000-37FABE(config-captive-portal-test)#
```

```
  rfs7000-37FABE(config-captive-portal-test)#no accounting syslog
  rfs7000-37FABE(config-captive-portal-test)#no access-type
```

The following example shows the captive portal 'test' settings after the 'no' commands are executed:

```
  rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  inactivity-timeout 750
  rfs7000-37FABE(config-captive-portal-test)#
```
4.27.2.13 oauth

Enables OAuth-based authentication support on this captive portal. When enabled, OAuth allows captive-portal users to sign in to guest WLANs using their Facebook or Google credentials.

OAuth is an open-source protocol that allows secure authorization from Web, mobile, and desktop applications. The OAuth 2.0 authorization framework enables a third-party application (which, in this scenario, is the WiNG software) to obtain limited access to an HTTP service. The WiNG software running on an access point or a controller provides the captive portal authentication service. Wireless clients accessing a guest WLAN using OAuth are asked for their Google or Facebook credentials, and are allowed network access only upon successful authentication.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

oauth {client-id [facebook|google] <WORD>}

Parameters

- oauth {client-id [facebook|google] <WORD>}

<table>
<thead>
<tr>
<th>oauth</th>
<th>Configures OAuth 2.0 settings required to provide OAuth access to clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-id [facebook</td>
<td>google] &lt;WORD&gt;</td>
</tr>
<tr>
<td>facebook – Configures the client's Facebook ID</td>
<td></td>
</tr>
<tr>
<td>google – Configures the client's Google ID</td>
<td></td>
</tr>
<tr>
<td>&lt;WORD&gt; – Provide the client's Facebook/Google ID (should be registered with the OAuth provider)</td>
<td></td>
</tr>
</tbody>
</table>

Examples

rfs7000-6DCD4B(config-captive-portal-test2)#OAuth client-id Google TechPubs.printer.google.com
rfs7000-6DCD4B(config-captive-portal-test2)#show context captive-portal test2  
OAuth client-id Google TechPubs.printer.google.com  
rfs7000-6DCD4B(config-captive-portal-test2)#

Related Commands

- no | Removes all OAuth client identities configured for this captive portal |
4.1.27.2.14 post-authentication-vlan

**captive-portal-mode commands**

Configures the VLAN that is assigned to this captive portal’s users upon successful authentication.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]`

**Parameters**

- `post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]`

| post-authentication-vlan [<1-4096>|<VLAN-ALIAS>] | Configures the post authentication VLAN. The VLAN specified here is assigned to this captive portal’s users after they have authenticated and logged on to the network. Provide the VLAN ID, or use an existing VLAN alias to identify the post authentication VLAN. |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
|                                               | • <1-4096> – Specify the VLAN’s number from 1 - 4096. |
|                                               | • <VLAN-ALIAS> – Specify the VLAN alias (should be existing and configured). |

**Note:** VLAN alias names begin with a ‘$’.

**Examples**

```
rfs4000-229D58(config-captive-portal-test)#post-authentication-vlan 1
rfs4000-229D58(config-captive-portal-test)#show context captive-portal test
post-authentication-vlan 1
rfs4000-229D58(config-captive-portal-test)#
```

</tbody>
</table>
4.1.27.2.15 radius-vlan-assignment

Enables assignment of a RADIUS VLAN for this captive portal

When enabled, if the RADIUS server as part of the authentication process returns a client's VLAN-ID in a RADIUS access-accept packet, then all client traffic is forwarded on the post authentication VLAN. If disabled, the RADIUS server's VLAN assignment is ignored and the VLAN configuration defined within the WLAN configuration is used instead. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

radius-vlan-assignment

Parameters

None

Examples

rfs4000-229D58(config-captive-portal-test)#radius-vlan-assignment
rfs4000-229D58(config-captive-portal-test)#show context captive-portal test
post-authentication-vlan 1

4.1.27.2.16 redirection

- captive-portal-mode commands

Configures a list of destination ports (separated by commas, or using a dash for a range) that are taken into consideration when redirecting client connections.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

redirection ports <LIST-OF-PORTS>

Parameters

- redirection ports <LIST-OF-PORTS>

<table>
<thead>
<tr>
<th>ports &lt;LIST-OF-PORTS&gt;</th>
<th>Configures destination ports considered for redirecting client connection</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> A maximum of 16 ports can be specified in a comma-separated list. Standard ports 80 and 443 are always considered for client connections regardless of what's entered by the administrator.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58(config-captive-portal-test)#redirection ports 1,2,3
rfs4000-229D58(config-captive-portal-test)#show context captive-portal test redirection ports 1-3
rfs4000-229D58(config-captive-portal-test)#

Related Commands

4.1.27.2.17 server

* captive-portal-mode commands

Configures captive portal server parameters, such as the hostname, IP address, and mode of operation. This is the server validating guest user permissions.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
server [host|mode]
server host <IP/HOSTNAME>
server mode [centralized|centralized-controller {hosting-vlan-interface <0-4096>}|self]
```

**Parameters**
- **host <IP/HOSTNAME>**
  
  Configures the internal captive portal authentication server (wireless controller, access point, service platform)

  - `<IP/HOSTNAME>` – Specify the IPv4 address or hostname of the captive portal server.

  **Note:** For centralized wireless controller mode, this should be a virtual hostname and not an IP address.

  **Note:** This option is available only when hosting the captive portal on an external (fixed) server resource.

- **server mode [centralized|centralized-controller {hosting-vlan-interface <0-4096>}|self]**

<table>
<thead>
<tr>
<th>mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>centralized</td>
<td>Considers the configured server’s hostname or IP address as the centralized captive portal server. Select this option if the captive portal is supported on an external server.</td>
</tr>
<tr>
<td>centralized-controller {hosting-vlan-interface &lt;0-4096&gt;}</td>
<td>Configures the numeric IP address (or DNS hostname) for the server validating guest user permissions for the captive portal policy. This option is available only for the centralized (external) AND centralized-controller captive portal server resources.</td>
</tr>
<tr>
<td></td>
<td>• hosting-vlan-interface – Optional. Configures the VLAN where the client can reach the wireless controller (server). This option is available only for the centralized-controller mode.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;0-4096&gt;</code> – Specify the VLAN number (0 implies the controller is available on the client’s VLAN).</td>
</tr>
<tr>
<td>self</td>
<td>Selects the captive portal server as the same device supporting the WLAN (the captive portal and the WLAN are configured on the same device). Select this option to maintain the captive portal configuration (Web pages) internally. This is the default setting.</td>
</tr>
</tbody>
</table>
Examples

rfs7000-37FABE(config-captive-portal-test)#server host 172.16.10.9

rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test

**Related Commands**

- **no** | Resets or disables captive portal commands
4.1.27.2.19 terms-agreement

➤ captive-portal-mode commands

Enforces the user to agree to terms and conditions (included in the login page) for captive portal access. This feature is disabled by default.

When enabled, the system enforces a previously registered user to re-confirm the terms of agreement, on successive log ins, only if the interval between the last log out and the current log in exceeds the agreement-refresh timeout configured in the WLAN context. For more information on configuring the agreement-refresh timeout value, see registration.

For example:

If the agreement-refresh timeout is set at 20 minutes, the following two possibilities can arise:

• The interval between logging out and re-logging exceeds 20 minutes - in which case the user is served the Terms of Agreement page on successful authentication.
• The interval between logging out and re-logging is less than 20 minutes - in which case the user is provided direct Internet access.

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

Syntax
terms-agreement

Parameters
None

Examples

4.27.2.20 use

> captive-portal-mode commands

Configures a AAA policy and DNS whitelist with this captive portal policy. AAA policies are used to configure authentication and accounting servers for this captive portal. DNS whitelists restrict users to a set of configurable domains on the Internet.

For more information on AAA policies, see Chapter 8, AAA-POLICY.

For more information on DNS whitelists, see Chapter 4, dns-whitelist.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

text

Parameters

- use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]

Examples

rfs7000-37FABE(config-captive-portal-test)# use aaa-policy test
rfs7000-37FABE(config-captive-portal-test)# use dns-whitelist test
rfs7000-37FABE(config-captive-portal-test)#show context

4.1.27.2.21 webpage

Use this command to define the appearance and flow of Web pages requesting clients encounter when accessing a controller, service platform, or access point managed captive portal. Define whether the Web pages are maintained locally or externally to the managing device as well as messages displayed requesting clients.

Configures Web pages displayed when interacting with a captive portal. These pages are:

- acknowledgment – This page displays details for the user to acknowledge
- agreement – This page displays "Terms and Conditions" that a user accepts before allowed access to the captive portal.
- fail – This page is displayed when the user is not authenticated.
- login – This page is displayed when the user connects to the captive portal. It fetches login credentials from the user.
- no-service – This page is displayed when a captive portal user is unable to access the captive portal due to unavailability of critical services.
- registration – This page is displayed when users are redirected to a Web page where they have to register in the captive portal's database.
- welcome – This page is displayed to welcome an authenticated user to the captive portal.

These Web pages, which interact with captive portal users, can be located either on the controller or an external location.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NXT9510, NX9600

Syntax

webpage [external|internal]

webpage external [acknowledgment|agreement|fail|login {post}|no-service|registration|welcome] <URL>

webpage internal [acknowledgment|agreement|fail|login|no-service|org-name|org-signature|registration|welcome]

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>webpage external</code> [acknowledgment</td>
<td>agreement</td>
</tr>
<tr>
<td><code>external</code></td>
<td>Indicates the page is displayed for user acknowledgment of details. Users are redirected to this page to acknowledge information provided.</td>
</tr>
<tr>
<td><code>acknowledgment</code></td>
<td>Indicates the page is displayed for “Terms &amp; Conditions” The agreement page provides conditions that must be agreed to before captive portal access is permitted.</td>
</tr>
<tr>
<td><code>agreement</code></td>
<td>Indicates the page is displayed for login failure The fail page asserts authentication attempt has failed, the user is not allowed to access the Internet (using this captive portal) and must provide the correct login information again to access the Internet.</td>
</tr>
<tr>
<td><code>fail</code></td>
<td>Indicates the page is displayed for getting user credentials. This page is displayed by default.</td>
</tr>
<tr>
<td><code>login {post}</code></td>
<td>Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The no-service page asserts the captive portal service is temporarily unavailable due to technical reasons. Once the services become available, the captive portal user is automatically connected back to the services available through the captive portal. The possible scenarios are:</td>
</tr>
<tr>
<td><code>no-service</code></td>
<td>To provide this service, enable the following:</td>
</tr>
<tr>
<td><code>registration</code></td>
<td>Indicates the page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register.</td>
</tr>
<tr>
<td><code>welcome</code></td>
<td>Indicates the page is displayed after a user has been successfully authenticated. The welcome page asserts a user has logged in successfully and can access the captive portal.</td>
</tr>
</tbody>
</table>
### <URL>

This parameter is common to all of the above mentioned Web pages, and specifies the Web page URL. The Web page is retrieved and served from the specified external location.

The URL can include following query tags:

- `WING_TAG_CLIENT_IP` - Captive portal client IPv4 address
- `WING_TAG_CLIENT_MAC` - Captive portal client MAC address
- `WING_TAG_WLAN_SSID` - Captive portal client WLAN ssid
- `WING_TAG_AP_MAC` - Captive portal client AP MAC address
- `WING_TAG_AP_NAME` - Captive portal client AP Name
- `WING_TAG_RF_DOMAIN` - Captive portal client RF Domain
- `WING_TAG_CP_SERVER` - Captive portal server address
- `WING_TAG_USERNAME` - Captive portal authentication username

Example:

```
http://cportal.com/policy/login.html?client_ip=WING_TAG_CLIENT_IP&ap_m
```

Use `&` or `?` character to separate field-value pair.

**Note:** Enter ‘ctrl-v’ followed by ‘?’ to configure query string.

### webpage internal [acknowledgment|agreement|fail|login|no-service|registration|welcome] [description|footer|header|title] <CONTENT>

<td>Indicates the Web page is displayed for users to acknowledge the information provided</td>
</tr>
<tr>
<td>Fail</td>
<td>Indicates the page is displayed for login failure</td>
</tr>
<tr>
<td>Login</td>
<td>Indicates the page is displayed for user credentials</td>
</tr>
</tbody>
</table>
| No-Service  | Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The possible scenarios are:  
  - The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated  
  - The external captive portal server is not reachable  
  - The connectivity between the adopted AP and controller is lost  
  - The external DHCP server is not reachable  
  
  To provide this service, enable the following:  
  - External captive portal server monitoring  
  - AAA server monitoring. This enables detection of RADIUS server failure.  
  - External DHCP server monitoring  
  - AP to controller connectivity monitoring  
  
  **Note:** For more information on enabling these critical resource monitoring, see wlan. |
| Registration | Indicates the page displayed is the registration page to which users are redirected in order to register in the captive portal’s database  
  
  Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register. |
<p>| Welcome     | Indicates the page is displayed after a user has been successfully authenticated |</p>

<tr>
<td>text</td>
<td>Configures the zip field as only alpha-numeric and special characters input field</td>
</tr>
</tbody>
</table>
After specifying the field, configure the field type. The options displayed depend on the field selected in the previous step. These options are: checkbox, date, dropdown-menu, e-address, number, radio-button, and text.

- checkbox – Configures the field as a check box
- date – Configures the field as only date-format input field
- dropdown-menu – Configures the field as a drop-down menu
- e-address – Configures the field as an e-mail address input field
- number – Configures the field as only-numeric characters input field
- radio-button – Configures the field as a radio button
- text – Configures the field as only alpha-numeric and special characters input field

**Note:** Some of the fields can have more than one field type options. For example, the field 'zip' can either be a numerical field or a text. Select the one best suited for your captive-portal.

Enables the field. When enabled, the field is displayed on the registration page. After enabling the field, optionally configure the following parameters:

- label <LINE> – Optional. Configures the field’s label
- mandatory – Optional. Makes the field mandatory
- title – Optional. Configures the comma-separated list of items to include in the drop-down menu.
- placeholder <LINE> – Optional. Configures a string, not exceeding 300 characters, that is displayed within the field. If not configured, the field remains blank.

Related Commands

| no | Resets or disables captive portal configurations |
4.1.27.2.22 webpage-auto-upload

Enables automatic upload of advanced Web pages to requesting clients on association. Enable this option if the webpage-location is selected as advanced. For more information see, webpage-location.

If this feature is enabled, access points shall request for Web pages from the controller during adoption. If the controller has a different set of Web pages, than the ones existing on the access points, the controller shall distribute the Web pages uploaded on it to the access points.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
webpage-auto-upload

Parameters
None

Examples
rfs7000-37FABE(config-captive-portal-test)#webpage-auto-upload
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test webpage-auto-upload logout-fqdn logout.testuser.com

4.1.27.2.24 welcome-back

► captive-portal-mode commands

Enables the provision of direct Internet access to once-registered, captive-portal guest users on subsequent log-ins. When enabled, a previously registered captive-portal guest user, on subsequent logins, is served the Acknowledgement page only if:

- The agreement-refresh option is enabled for device-based (device and device-OTP) registration, and
- The interval between logout and login is lesser than the agreement-refresh timeout configured in the WLAN context. If this interval exceeds the agreement-refresh timeout, the user is served the Agreement page. For more information on configuring the agreement-refresh timeout value, see registration.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
welcome-back pass-through

Parameters
- welcome-back pass-through

<table>
<thead>
<tr>
<th>welcome-back pass-through</th>
<th>Enables display of the Acknowledgement page to an already registered user on subsequent captive-portal log-ins, provided the interval between logout and login is lesser than the agreement-refresh timeout</th>
</tr>
</thead>
<tbody>
<tr>
<td>pass-through</td>
<td>pass-through – Provides user direct Internet access, from the Welcome-back page, without any user action</td>

4.1.29 client-identity

Global Configuration Commands

With an increase in Bring Your Own Device (BYOD) corporate networks, there is a parallel increase in the number of possible attack scenarios within the network. BYOD devices are inherently unsafe, as the organization’s security mechanisms do not extend to these personal devices deployed in the corporate wireless network. Organizations can protect their network by limiting how and what these BYODs can access on and through the corporate network.

Device fingerprinting assists administrators by controlling how BYOD devices access a corporate wireless domain. Device fingerprinting uses DHCP options sent by the client in request or discover packets to derive a unique signature specific to device class. For example, Apple devices have a different signature from Android devices. The signature is used to classify the devices and assign permissions and restrictions on each device class.

The following table summarizes the commands available for creating and configuring a set of new client identity parameters:

<table>
<thead>
<tr>
<th>Command</th>

4.1.29.1 client-identity

Creates a new client identity and enters its configuration mode. Client identity is a set of unique fingerprints used to identify a class of devices. This information is used to configure permissions and access rules for the identified class of devices in the network. The client-identity feature enables device fingerprinting.

Device fingerprinting is a technique of collecting, analyzing, and identifying traffic patterns originating from remote computing devices. When enabled, device fingerprinting helps to identify a wireless client’s device type. There are two methods of fingerprinting devices: Active and Passive.

Active fingerprinting is based on the fact that traffic patterns vary with varying device types. It involves the sending of requests (HTTP etc.) to devices (clients) and analyzing their response to determine the device type. For example, an invalid request is sent to a device, and its error response is analyzed to identify the device type. Since active device fingerprinting involves sending of packets, the probability of the network getting flooded is very high, especially when many devices are being fingerprinted simultaneously.

Passive fingerprinting involves monitoring of devices to check for known traffic patterns specific to devices based on the protocol, driver implementation etc. This method accurately classifies a client’s TCP/IP configuration, OS fingerprints, wireless settings etc. No packets are sent to the device. Some of the commonly used protocols for passive device fingerprinting are, TCP, DHCP, HTTP etc.

This feature implements DHCP device fingerprinting, which relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

client-identity <CLIENT-IDENTITY-NAME>

Parameters

- client-identity <CLIENT-IDENTITY-NAME>

<table>
<thead>
<tr>
<th>client-identity &lt;CLIENT-IDENTITY-NAME&gt;</th>
<th>Creates a new client identity policy and enters its configuration mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;CLIENT-IDENTITY-NAME&gt; – Specify a client identity policy name. If the client identity policy does not exist, it is created.</td>
<td></td>
</tr>
</tbody>
</table>

Usage Guidelines

The following points should be considered when configuring the client identity (device fingerprinting) feature:

1. Ensure that DHCP is enforced on the WLANs. For more information on enforcing DHCP on WLANs, see enforce-dhcp.

2. Successful identification of different device types depends on the uniqueness of the configured fingerprints. DHCP fingerprinting identifies clients based on the patterns (fingerprints) in the DHCP discover and request messages sent by clients. If different operating systems have the same fingerprints, it will be difficult to identify the device type.

3. When associating client identities with a role policy, ensure that the profile/device, under which the role policy is being used, also has an associated client identity group (containing all the client identities used by the role policy).
Examples

rfs4000-229D58(config)#client-identity test
rfs4000-229D58(config-client-identity-test)#?
Client Identity Mode commands:
  dhcp                     Add a DHCP option based match criteria
  dhcp-match-message-type  Specify DHCP message type to match
  no                       Negate a command or set its defaults
  clrscr                   Clears the display screen
  commit                   Commit all changes made in this session
  do                       Run commands from Exec mode
  end                      End current mode and change to EXEC mode
  exit                     End current mode and down to previous mode
  help                     Description of the interactive help system
  revert                   Revert changes
  service                  Service Commands
  show                     Show running system information
  write                    Write running configuration to memory or terminal
rfs4000-229D58(config-client-identity-test)#
4.1.29.2 client-identity-mode commands

The following table summarizes client identity configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>

</tr>
<tr>
<td>no</td>
<td>Removes the DHCP option (used for client identification) configurations</td>
<td>page 4-115</td>
</tr>
</tbody>
</table>
4.1.29.2.1 dhcp

client-identity-mode commands

Configures the DHCP option match criteria (signature) for the discover and request message types received from wireless clients.

When accessing a network, DHCP discover and request messages are passed between wireless clients and the DHCP server. These messages contain DHCP options and option values that differ from device to device and are based on the DHCP implementation in the device's operating system (OS). Options and option values contained in a client's messages are parsed and compared against the configured DHCP option values to identify the device. Once a device type is identified, the wireless client database is updated with the discovered device type.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dhcp <1-16> message-type [discover|request] [option|option-codes]
dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes] [contains|exact|starts-with] [ascii|hexstring] <WORD>

Parameters

- dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes] [contains|exact|starts-with] [ascii|hexstring] <WORD>

<table>
<thead>
<tr>
<th>dhcp &lt;1-16&gt;</th>
<th>Adds a DHCP option match criteria signature</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-16&gt;</td>
<td>Specify an index for this DHCP match criteria from 1 - 16.</td>
</tr>
<tr>
<td>Note:</td>
<td>A maximum of 16 match criteria can be configured.</td>
</tr>
</tbody>
</table>

message-type [discover|request] Specifies the message type to which this DHCP match criteria is applicable.

- discover – Applies this match criteria to DHCP discover messages only. Indicates that the fingerprint is only checked with any DHCP discover messages received from any device.
- request – Applies this match criteria to DHCP request messages only. Indicates that the fingerprint is only checked with any DHCP request messages received from any device.

Note: It is recommended to configure client-identity with request messages, because clients rarely send discover messages.

- If the message type is not specified, the fingerprint is checked with all message types (DHCP request and DHCP discover).

option <1-254> The following keywords are common to the 'discover' and 'request' message types:

- option – Configures a DHCP option value, which is used as the match criteria
- <1-254> – Configures a code for this DHCP option from 1 - 254 (except option 53)

option-codes The following keyword is common to the 'discover' and 'request' message types:

- option-codes – Matches criteria based on the DHCP option codes contained in the client's discover/request messages

Note: Devices pass options in their DHCP discover/request messages as option codes, option types, and option value sets. These option codes are extracted and matched against the configured DHCP option codes and a fingerprint is derived. This derived fingerprint is used to identify the device.
Usage Guidelines

The following DHCP options are useful for identifying different device types:

1. Option 55: Used by a DHCP client to request values for specific configuration parameters. It is a list of DHCP option codes and can be in the client's order of preference.

2. Client configured list of DHCP options (all options parsed into a hex string).

3. Option 60: Vendor class identifier. Used to identify the vendor and functionality of a DHCP client (some devices do not set the value of this field).

Though it is possible to use any option to configure a device fingerprint, the use of a combination of one or more of the preceding options to define a device is recommended.

Examples

```
rfs4000-229D58(config-client-identity-test)#dhcp 1 message-type request option 60 exact ascii MSFT\5.0
rfs4000-229D58(config-client-identity-test)#dhcp 2 message-type discover option 2 exact hexstring 012456c22c44

rfs4000-229D58(config-client-identity-test)#show context client-identity test
dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT\5.0
rfs4000-229D58(config-client-identity-test)#
```

Related Commands

```
no
```

Removes a DHCP option signature (match criteria)
4.1.29.2.2 dhcp-match-message-type

`client-identity-mode commands`

Configures the DHCP message type to match

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dhcp-match-message-type [all|any|discover|request]

Parameters
- dhcp-match-message-type [all|any|discover|request]

| dhcp-match-message-type [all|any|discover|request] | Specifies the DHCP message type to consider for matching |
|-----------------------------------------------------|--------------------------------------------------------|
| `all` — Matches all message types: discover and request. Indicates that the fingerprint is checked with both the DHCP request and the DHCP discover message. |
| `any` — Matches any message type: discover or request. Indicates that the fingerprint is checked with either the DHCP request or the DHCP discover message. |
| `discover` — Matches discover messages only. Client matches the client identity only if the discover message sent by the client matches. Values configured for request messages are ignored. |
| `request` — Matches request messages only. Client matches the client identity only if the request message sent by the client matches. Values configured for discover messages are ignored. |

Examples

rfs4000-229D58(config-client-identity-test)#dhcp-match-message-type all

rfs4000-229D58(config-client-identity-test)#show context
client-identity test
dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT5.0
dhcp-match-message-type all
rfs4000-229D58(config-client-identity-test)#

Related Commands

| `no` | Removes the DHCP message type to match |
4.1.29.2.3 no

client-identity-mode commands

Removes the DHCP options match criteria configurations

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [dhcp <1-16>|dhcp-match-message-type]

Parameters

- no [dhcp <1-16>|dhcp-match-message-type]

| dhcp <1-16> | Removes the DHCP option match criteria rule identified by the <1-16> keyword |
| dhcp-match-message-type | Removes the DHCP message type to match |

Examples

The following example shows the client identity ‘test’ settings before the ‘no’ commands are executed:

rfs4000-229D58(config-client-identity-test)#show context
client-identity test
dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT5.0
dhcp-match-message-type all
rfs4000-229D58(config-client-identity-test)#

The following example shows the client identity ‘test’ settings after the ‘no’ commands are executed:

rfs4000-229D58(config-client-identity-test)#no dhcp 2
rfs4000-229D58(config-client-identity-test)#no dhcp-match-message-type
rfs4000-229D58(config-client-identity-test)#show context
client-identity test
dhcp 1 message-type request option 60 exact ascii MSFT5.0
rfs4000-229D58(config-client-identity-test)#

Related Commands

</tr>
<tr>
<td>client-identity</td>
<td>Creates new client identity policy and enters its configuration mode</td>
<td>page 4-108</td>
</tr>
</tbody>
</table>
4.1.30.1 client-identity-group

Conffigures a new client identity group

A client identity group is a collection of client identities. Each client identity included in a client identity group is set a priority value that indicates the priority for that identity when device fingerprinting.

Device Fingerprinting relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

A client identity group can be attached to a profile or device, enabling device fingerprinting on them.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

client-identity-group <CLIENT-IDENTITY-GROUP-NAME>

Parameters

- client-identity-group <CLIENT-IDENTITY-GROUP-NAME>

Examples

rfs4000-229D58(config)#client-identity-group test
rfs4000-229D58(config-client-identity-group-test)#

<tr>
<td>no</td>
<td>Removes the client identity associated with this client identity group</td>
<td>page 4-115</td>
</tr>
</tbody>
</table>
4.1.30.2.1 client-identity

client-identity-group-mode commands

Associates an existing and configured client identity (device fingerprint) with this client identity group

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>

Parameters

- client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>

| client-identity <CLIENT-IDENTITY-NAME> | Associates a client identity with this group
| precedence <1-10000> | Determines the order in which client identity is used.

Note: The client identity rule is applied based on its precedence value. Lower the value, higher is the precedence. Therefore, a client identity with precedence 5 gets precedence over a client identity having precedence 20.

Examples

The following example shows two client identities created and configured:

```
rfs4000-229D58(config)#show context
!
! Configuration of RFS4000 version 5.8.1.0-021D
!
! version 2.1
!

client-identity Mac-OS-X precedence 1600
client-identity Android-4-1-X precedence 1700
client-identity Android-4-2-X precedence 1800

Related Commands

no

Removes the client identity associated with the client identity group
4.1.30.2.2 no

client-identity-group-mode commands

Removes the client identity associated with the client identity group

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no client-identity <CLIENT-IDENTITY-NAME>

Parameters

- no client-identity <CLIENT-IDENTITY-NAME>

<table>
<thead>
<tr>
<th>no client-identity &lt;CLIENT-IDENTITY-NAME&gt;</th>
<th>Disassociates a specified client identity from this client identity group</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;CLIENT-IDENTITY-NAME&gt;</td>
<td>• &lt;CLIENT-IDENTITY-NAME&gt; – Specify the client identity name.</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58(config-client-identity-group-test)#show context
client-identity-group test
rfs4000-229D58(config-client-identity-group-test)#

rfs4000-229D58(config-client-identity-group-test)#no client-identity test
rfs4000-229D58(config)#

Related Commands

<table>
<thead>
<tr>
<th>client-identity</th>
<th>Associates an existing and configured client identity (device fingerprinting) with this client identity group</th>
</tr>
</thead>
</table>
4.1.31 clone

Global Configuration Commands

Creates a replica of an existing object or device. The configuration of the new object or device is an exact copy of the existing object or device configuration. Use this command to copy existing configurations and then modifying only the required parameters.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

clone [TLO|device]

clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>

clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>

Parameters

- clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>

<table>
<thead>
<tr>
<th>TLO &lt;EXISTING-OBJECT-NAME&gt; &lt;NEW-OBJECT-NAME&gt;</th>
<th>Creates a new TLO by cloning an existing top-level object. The new object has the same configuration as the cloned object.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;EXISTING-OBJECT-NAME&gt; – Specify the existing object’s (to be cloned) name</td>
</tr>
<tr>
<td></td>
<td>• &lt;NEW-OBJECT-NAME&gt; – Provide the new object’s name.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Enter <code>clone</code> and press Tab to list objects available for cloning.</td>
</tr>
</tbody>
</table>

- clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>

<table>
<thead>
<tr>
<th>device &lt;EXISTING-DEVICE-MAC/NAME&gt; &lt;NEW-DEVICE-MAC&gt;</th>
<th>Configures a new device based on an existing device configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;EXISTING-DEVICE-MAC/NAME&gt; – Specify the existing device’s name or MAC address (the device to be cloned)</td>
</tr>
<tr>
<td></td>
<td>• &lt;NEW-DEVICE-MAC&gt; – Provide the new device’s MAC address.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Enter <code>clone &gt; device</code> and press Tab to list devices available for cloning.</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809(config)#clone rf_domain TechPubs Cloned_TechPubs2
nx9500-6C8809(config)#show context
! Configuration of NX9500 version 5.8.1.0-028D
!
version 2.3
!

  --More--
nx9500-6C8809(config)#
```
4.1.32 crypto-cmp-policy

Global Configuration Commands

Creates a crypto Certificate Management Protocol (CMP) policy and enters its configuration mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>

Parameters

- crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>

Examples

nx9500-6C8809(config)#crypto-cmp-policy CMP
nx9500-6C8809(config-cmp-policy-CMP)#?

CMP Policy Mode commands:

- ca-server: CMP CA Server configuration commands
- cert-key-size: Set key size for certificate request
- cert-renewal-timeout: Trigger a cert renewal request on timeout
- cross-cert-validate: Validate cross-cert using factory-cert
- no: Negate a command or set its defaults
- subjectAltName: Configure subjectAltName value
- trustpoint: Trustpoint for CMP
- use: Set setting to use

clrscr: Clears the display screen
commit: Commit all changes made in this session
do: Run commands from Exec mode
end: End current mode and change to EXEC mode
exit: End current mode and down to previous mode
help: Description of the interactive help system
revert: Revert changes
service: Service Commands
show: Show running system information
write: Write running configuration to memory or terminal

nx9500-6C8809(config-cmp-policy-CMP)#

Related Commands

| no | Resets values or disables commands |

NOTE: For more information on the crypto CMP policy, see Chapter 29, CRYPTO-CMP-POLICY.
4.1.33 **customize**

- **Global Configuration Command**

Customizes the output of the summary CLI commands. Use this command to define the data displayed as a result of various show commands.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
customize [cdp-lldp-info-column-width|hostname-column-width|show-adoption-status|
show-wireless-meshpoint|show-wireless-meshpoint-accelerated-multicast|
show-wireless-meshpoint-neighbor-stats|show-wireless-meshpoint-neighbor-stats-rf|

customize show-wireless-meshpoint-neighbor-stats (ap-hostname <1-64>, neighbor-hostname <1-64>, neighbor-ifid, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)
customize show-wireless-meshpoint-neighbor-stats-rf (ap-hostname <1-64>, average-retry-number, error-rate, neighbor-hostname <1-64>, neighbor-ifid, noise, q-index, rx-rate, signal, snr, t-index, tx-rate)
customize show-wireless-mint-client (client-alias <1-64>, client-bss, portal-alias <1-64>, portal-bss, up-time)
customize show-wireless-mint-client-stats (client-alias <1-64>, portal-alias <1-64>, portal-bss, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)
customize show-wireless-mint-client-stats-rf (average-retry-number, client-alias <1-64>, error-rate, noise, portal-alias <1-64>, portal-bss, q-index, rx-rate, signal, snr, tx-rate)
```
customize show-wireless-mint-portal (client-alias <1-64>, client-bss, portal-alias <1-64>, portal-bss, up-time)

customize show-wireless-mint-portal-stats (client-alias <1-64>, client-bss, portal-alias <1-64>, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)

customize show-wireless-mint-portal-stats-rf (average-retry-number, client-alias <1-64>, client-bss, error-rate, noise, portal-alias <1-64>, q-index, rx-rate, signal, snr, tx-rate)

customize show-wireless-radio (adopt-to, ap-name <1-64>, channel, location <1-64>, num-clients, power, radio-alias <3-67>, radio-id, radio-mac, rf-mode, state)

customize show-wireless-radio-stats (radio-alias <3-67>, radio-id, radio-mac, rx-bytes, tx-bytes, tx-dropped, tx-packets, tx-throughput)

customize show-wireless-radio-stats-rf (average-retry-number, error-rate, noise, q-index, radio-alias <3-67>, radio-id, radio-mac, rx-rate, signal, snr, t-index, tx-rate)

Parameters
• customize [cdp-lldp-info-column-width|hostname-column-width] <1-64>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname-column-width &lt;1-64&gt;</td>
<td>Configures default width of the hostname column in all show command outputs</td>
</tr>
<tr>
<td>• &lt;1-64&gt; – Sets the hostname column width from 1 - 64 characters</td>
<td></td>
</tr>
<tr>
<td>cdp-lldp-info-column-width &lt;1-64&gt;</td>
<td>Configures the column width in the show &gt; cdp/lldp &gt; [neighbor</td>
</tr>
<tr>
<td>• &lt;1-64&gt; – Sets the column width from 1 - 64 characters</td>
<td></td>
</tr>
<tr>
<td>• customize show-adoption-status (adopted-by, ap-name &lt;1-64&gt;, cdp-lldp-info, config-status, last-adoption, msgs, uptime, version)</td>
<td>Configures the information displayed in the show &gt; adoption &gt; status command output. Select the columns (information) displayed from the following options: adopted-by, ap-name, cdp-lldp-info, config-status, last-adoption, msgs, uptime, and version. These are recursive parameters and you can select multiple options at a time.</td>
</tr>
<tr>
<td>• Note: The columns displayed by default are: Device-Name, Version, Config-Status, MSGS, Adopted-By, Last-Adoption, and Uptime.</td>
<td></td>
</tr>
<tr>
<td>• Note: Where ever available, you can optionally use the &lt;1-64&gt; parameter to set the column width.</td>
<td></td>
</tr>
<tr>
<td>show-wireless-client (ap-name &lt;1-64&gt;, auth, client-identity &lt;1-32&gt;, bss, enc, hostname &lt;1-64&gt;, ip, last-active, location &lt;1-64&gt;, mac, radio-alias &lt;3-67&gt;, radio-id, radio-type, role &lt;1-32&gt;, state, username &lt;1-64&gt;, vendor, vlan, wlan)</td>
<td>Customizes the show &gt; wireless &gt; client command output</td>
</tr>
<tr>
<td>• Note: The columns displayed by default are: MAC, IPv4, Vendor, Radio-ID, WLAN, VLAN, and State.</td>
<td></td>
</tr>
<tr>
<td>ap-name &lt;1-64&gt;</td>
<td>Includes the ap-name column, which displays the name of the AP with which this client associates</td>
</tr>
<tr>
<td>• &lt;1-64&gt; – Sets the ap-name column width from 1 - 64 characters</td>
<td></td>
</tr>
<tr>
<td>auth</td>
<td>Includes the auth column, which displays the authorization protocol used by the wireless client</td>
</tr>
<tr>
<td>client-identity &lt;1-32&gt;</td>
<td>Includes the client-identity (device type) column, which displays details gathered from DHCP device fingerprinting feature (when enabled). For more information, see client-identity.</td>
</tr>
<tr>
<td>• &lt;1-32&gt; – Sets the client-identity column width from 1 - 32 characters</td>
<td></td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>bss</td>
<td>Includes the BSS column, which displays the BSS ID the wireless client is associated with</td>
</tr>
<tr>
<td>enc</td>
<td>Includes the enc column, which displays the encryption suite used by the wireless client</td>
</tr>
<tr>
<td>hostname &lt;1-64&gt;</td>
<td>Includes the hostname column, which displays the wireless client's hostname</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-64&gt; – Sets the hostname column width from 1 - 64 characters</td>
</tr>
<tr>
<td>ip</td>
<td>Includes the IP column, which displays the wireless client's current IP address</td>
</tr>
<tr>
<td>last-active</td>
<td>Includes the last-active column, which displays the time of last activity seen from the wireless client</td>
</tr>
<tr>
<td>location &lt;1-64&gt;</td>
<td>Includes the location column, which displays the location of the client's associated access points</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-64&gt; – Sets the location column width from 1 - 64 characters</td>
</tr>
<tr>
<td>mac</td>
<td>Includes the MAC column, which displays the wireless client's MAC address</td>
</tr>
<tr>
<td>radio-alias &lt;3-67&gt;</td>
<td>Includes the radio-alias column, which displays the radio alias with the AP’s hostname and radio interface number in the “HOSTNAME:RX” format</td>
</tr>
<tr>
<td></td>
<td>• &lt;3-64&gt; – Sets the radio-alias column width from 3 - 67 characters</td>
</tr>
<tr>
<td>radio-id</td>
<td>Includes the radio-id column, which displays the radio ID with the AP’s MAC address and radio interface number in the “AA-BB-CC-DD-EE-FF:RX” format</td>
</tr>
<tr>
<td>radio-type</td>
<td>Includes the radio-type column, which displays the wireless client's radio type</td>
</tr>
<tr>
<td>role &lt;1-32&gt;</td>
<td>Includes the role column, which displays the client’s role</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-32&gt; – Sets the role column width from 1 - 32 characters</td>
</tr>
<tr>
<td>state</td>
<td>Includes the state column, which displays the wireless client's current availability state</td>
</tr>
<tr>
<td>username &lt;1-64&gt;</td>
<td>Includes the username column, which displays the wireless client's username</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-64&gt; – Specify the username column width from 1 - 64 characters</td>
</tr>
<tr>
<td>vendor</td>
<td>Includes the vendor column, which displays the wireless client's vendor ID</td>
</tr>
<tr>
<td>vlan</td>
<td>Includes the VLAN column, which displays the wireless client's assigned VLAN</td>
</tr>
<tr>
<td>wlan</td>
<td>Includes the WLAN column, which displays the wireless client's assigned WLAN</td>
</tr>
</tbody>
</table>

- customize show-wireless-client-stats (hostname <1-64>, mac, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)

- show-wireless-client-stats
  Customizes the `show > wireless > client > statistics` command output
  **Note:** The columns displayed by default are: MAC, Tx bytes, RX bytes, Tx pkts, Rx pkts, and Tx bps, RX bps, T-Index, and Dropped pkts.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname &lt;1-64&gt;</td>
<td>Includes the hostname column, which displays the wireless client's hostname</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-64&gt; – Sets the hostname column width from 1 - 64 characters</td>
</tr>
<tr>
<td>mac</td>
<td>Includes the MAC column, which displays the wireless client's MAC address</td>
</tr>
<tr>
<td>rx-bytes</td>
<td>Includes the rx-bytes column, which displays the total number of bytes received by the wireless client</td>
</tr>
<tr>
<td>rx-errors</td>
<td>Includes the rx-error column, which displays the total number of errors received by the wireless client</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>rx-packets</td>
<td>Includes the rx-packets column, which displays the total number of packets received by the wireless client</td>
</tr>
<tr>
<td>rx-throughput</td>
<td>Includes the rx-throughput column, which displays the receive throughput at the wireless client</td>
</tr>
<tr>
<td>t-index</td>
<td>Includes the t-index column, which displays the traffic utilization index at the particular wireless client</td>
</tr>
<tr>
<td>tx-bytes</td>
<td>Includes the tx-bytes column, which displays the total number of bytes transmitted by the wireless client</td>
</tr>
<tr>
<td>tx-dropped</td>
<td>Includes the tx-dropped column, which displays the total number of dropped packets by the wireless client</td>
</tr>
<tr>
<td>tx-packets</td>
<td>Includes the tx-packets column, which displays the total number of packets transmitted by the wireless client</td>
</tr>
<tr>
<td>tx-throughput</td>
<td>Includes the tx-throughput column, which displays the transmission throughput at the wireless client</td>

</tbody>
</table>

- customize show-wireless-client-stats-rf (average-retry-number, error-rate, host-name <1-64>, mac, noise, q-index, rx-rate, signal, snr, tx-rate)

- **rx-packets**: Includes the rx-packets column, which displays the total number of packets received by the wireless client.
- **rx-throughput**: Includes the rx-throughput column, which displays the receive throughput at the wireless client.
- **t-index**: Includes the t-index column, which displays the traffic utilization index at the particular wireless client.
- **tx-bytes**: Includes the tx-bytes column, which displays the total number of bytes transmitted by the wireless client.
- **tx-dropped**: Includes the tx-dropped column, which displays the total number of dropped packets by the wireless client.
- **tx-packets**: Includes the tx-packets column, which displays the total number of packets transmitted by the wireless client.
- **tx-throughput**: Includes the tx-throughput column, which displays the transmission throughput at the wireless client.

**Note:** The columns displayed by default are: MAC, Signal (dBm), Noise (dBm), SNR (dB), TX Rate (Mbps), Retry Avg, Errors (pps), and Q-Index (%).

- **average-retry-number**: Includes the average-retry-number column, which displays the average number of retransmissions made per packet.
- **error-rate**: Includes the error-rate column, which displays the rate of error for the wireless client.
- **hostname <1-64>**: Includes the hostname column, which displays the wireless client’s hostname.  
  - `<1-64>` – Sets the hostname column width from 1 - 64 characters.
- **mac**: Includes the MAC column, which displays the wireless client’s MAC address.
- **noise**: Includes the noise column, which displays the noise (in dBm) as detected by the wireless client.
- **q-index**: Includes the q-index column, which displays the RF quality index.  
  - **Note:** Higher values indicate better RF quality.
- **rx-rate**: Includes the rx-rate column, which displays the receive rate at the particular wireless client.
- **signal**: Includes the signal column, which displays the signal strength (in dBm) at the particular wireless client.
- **snr**: Includes the snr column, which displays the signal to noise (SNR) ratio (in dB) at the particular wireless client.
- **tx-rate**: Includes the tx-rate column, which displays the packet transmission rate at the particular wireless client.
- customize show-wireless-meshpoint-accelerated-multicast (ap-hostname, group-addr, mesh-name, neighbor-hostname, neighbor-ifid, radio-alias, radio-id, radio-mac, subscriptions)

| show-wireless-meshpoint-accelerated-multicast | Configures the information displayed in the show > wireless > meshpoint > accelerated multicast command output. Select the columns (information) displayed from the following options: ap-hostname, group-addr, mesh-name, neighbor-hostname, neighbor-ifid, radio-alias, radio-id, radio-mac, subscriptions. These are recursive parameters and you can select multiple options at a time.  
**Note:** The columns displayed by default are: Mesh, Radio, Neighbor-IFID, Neighbor-Hostname, Group-MAC, and Subscriptions. |

- customize show-wireless-meshpoint (ap-mac, cfg-as-root, hops, hostname <1-64>, interface-ids, is-root, mesh-name <1-64>, mpid, next-hop-hostname <1-64>, next-hop-ifid, next-hop-use-time, path-metric, root-bound-time, root-hostname <1-64>, root-mpid)

| show-wireless-meshpoint | Customizes the show > wireless > meshpoint command output  
**Note:** The columns displayed by default are: Mesh, Hostname, Hops, Is-Root, Config-As-Root, Root-Hostname, Root-Bound-Time, Path-Metric, Next-Hop-Hostname, and Next-Hop-Use-Time. |
<table>
<thead>
<tr>
<th></th>
<th></th>

</tbody>
</table>

- customize show-wireless-meshpoint-neighbor-stats-rf (ap-hostname <1-64>, average-retry-number, error-rate, neighbor-hostname <1-64>, neighbor-ifid, noise, q-index, rx-rate, signal, snr, t-rate, tx-rate)
neighbor-hostname <1-64>
Includes the neighbor-hostname, which displays reported neighbor’s hostname
• <1-64> – Sets the neighbor-hostname column width from 1 - 64 characters

noise
Includes the noise column, which displays the noise level in dBm

q-index
Includes the q-index column, which displays the q-index

rx-rate
Includes the rx-rate column, which displays rate of receiving

signal
Includes the signal column, which displays the signal strength in dBm

snr
Includes the snr column, which displays the signal-to-noise ratio

t-index
Includes the t-index column, which displays t-index

tx-rate
Includes the tx-rate column, which displays rate of transmission

• customize show-wireless-mint-client (client-alias <1-64>, client-bss, portal-alias <1-64>, portal-bss, up-time)

show-wireless-mint-client
Configures the information displayed in the show > wireless > mint > client command output. Select the columns (information) displayed from the following options: client-alias, client-bss, portal-alias, portal-bss, and up-time. These are recursive parameters and you can select multiple options at a time.

Note: The columns displayed by default are: Portal, Portal-Radio-MAC, Client, Client-Radio-MAC, and Up-Time.

• customize show-wireless-mint-client-stats (client-alias <1-64>, portal-alias <1-64>, portal-bss, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)

show-wireless-mint-client-stats
Configures the information displayed in the show > wireless > mint > client > statistics command output. Select the columns (information) displayed from the following options: client-alias, portal-alias, portal-bss, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput. These are recursive parameters and you can select multiple options at a time.

Note: The columns displayed by default are: Portal, Portal-Radio-MAC, Client, Tx bytes, Rx bytes, TX pkts, Rx pkts, TX (bps), Rx (bps), T-Index (%), and Dropped pkts.

Note: Where ever available, you can optionally use the <1-64> parameter to set the column width.

• customize show-wireless-mint-client-stats-rf (average-retry-number, client-alias <1-64>, error-rate, noise, portal-alias <1-64>, portal-bss, q-index, rx-rate, signal, snr, tx-rate)

show-wireless-mint-client-stats-rf
Configures the information displayed in the show > wireless > mint > client > statistics > rf command output. Select the columns (information) displayed from the following options: average-retry-number, client-alias, error-rate, noise, portal-alias, portal-bss, q-index, rx-rate, signal, snr, and tx-rate. These are recursive parameters and you can select multiple options at a time.

Note: The columns displayed by default are: MAC, Signal (dBm), Noise (dBm), SNR (dB), Tx-Rate (Mbps), Rx-rate (Mbps), Retry Avg, Errors (pps), and Q-Index (%).

Note: Where ever available, you can optionally use the <1-64> parameter to set the column width.

### 4.1.34 device

> **Global Configuration Commands**

Enables simultaneous configuration of multiple devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
device {containing|filter}
```

```
device {containing <STRING>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|t5|vx9000]}
```

**Parameters**

- **device {containing <STRING>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|t5|vx9000]}

4.1.35 device-categorization

Global Configuration Commands

Categorizes devices as sanctioned or neighboring. Categorization of devices enables quick identification and blocking of unsanctioned devices in the network.

The following table summarizes the device categorization mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>device-categorization</td>
<td>Creates a device categorization list and enters its configuration mode</td>
<td>page 4-139</td>
</tr>
<tr>
<td>device-categorization-mode</td>
<td>Summarizes device categorization list configuration mode commands</td>
<td>page 4-140</td>
</tr>
</tbody>
</table>
4.1.35.1 device-categorization

- **device-categorization**

  Configures a device categorization list

  Proper classification and categorization of devices (access points, clients etc.) helps suppress unnecessary unauthorized access point alarms, allowing network administrators to focus on alarms on devices actually behaving in a suspicious manner. An intruder with a device erroneously authorized could potentially perform activities that harm your organization.

  Authorized access points and clients are generally known to you and conform with your organization’s security policies. Unauthorized devices are those detected as interoperating within the network, but are not approved. These devices should be filtered to avoid jeopardizing the data within a managed network. Use this command to apply the neighboring and sanctioned (approved) filters on peer devices operating within a wireless controller or access point’s radio coverage area. Detected client MAC addresses can also be filtered based on their classification.

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

  **Syntax**
  
  device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>

  **Parameters**
  - device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>

  **Examples**
  
  rfs7000-37FABE(config)#device-categorization rfs7000
  rfs7000-37FABE(config-device-categorization-rfs7000)#?

  Device Category Mode commands:
  - mark-device  Add a device
  - no           Negate a command or set its defaults
  - clrscr       Clears the display screen
  - commit       Commit all changes made in this session
  - do           Run commands from Exec mode
  - end          End current mode and change to EXEC mode
  - exit         End current mode and down to previous mode
  - help         Description of the interactive help system
  - revert       Revert changes
  - service      Service Commands
  - show         Show running system information
  - write        Write running configuration to memory or terminal

  rfs7000-37FABE(config-device-categorization-rfs7000)#

  **Related Commands**

  - **no**  Removes an existing device categorization list
4.1.35.2 device-categorization-mode commands

</tbody>
</table>
4.1.35.2.1 mark-device

device-categorization-mode commands

Adds a device to the device categorization list as sanctioned or neighboring. Devices are further classified as AP or client.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

mark-device <1-1000> [sanctioned|neighboring] [ap|client]
mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}

Parameters

- mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}

| <1-1000> | Configures the device categorization entry index number |
| sanctioned | Marks a device as sanctioned. A sanctioned device is authorized to use network resources. |
| neighboring | Marks a device as neighboring. A sanctioned device is a neighbor in the same network as this device. |
| ap {mac <MAC>|ssid <SSID>} | Marks a specified AP as sanctioned or neighboring based on its MAC address or SSID |
| • mac <MAC> – Optional. Specify the AP’s MAC address |
| • ssid <SSID> – Optional. Specify the AP’s SSID. After specifying the SSID, you can optionally specify its MAC address. |
| Note: All APs are marked if no specific MAC address or SSID is provided. |

- mark-device [sanctioned|neighboring] client {mac <MAC>}

| <1-1000> | Configures the device categorization entry index number |
| sanctioned | Marks the wireless client as sanctioned. A sanctioned device is authorized to use network resources. |
| neighboring | Marks the wireless client as neighboring. A sanctioned device is a neighbor in the same network as this device. |
| client {mac <MAC>} | Marks a specified wireless client as sanctioned or neighboring based on its MAC address |
| • mac <MAC> – Optional. Specify the wireless client’s MAC address. |

Examples

rfs7000-37FABE(config-device-categorization-rfs7000)#mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#show context
device-categorization rfs7000
mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#

Related Commands

no | Removes an entry from the device categorization list |
4.1.35.2.2 no

Removes a device from the device categorization list

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
no mark-device <1-1000> [neighboring|sanctioned] [ap|client] {mac <MAC>}
no mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}
no mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}

Parameters
- no <PARAMETERS>

| no <PARAMETERS> | Removes a mark device (AP or wireless client) entry from this device categorization list |

Examples
The following example shows the device categorization list 'rfs7000' settings before the 'no' command is executed:

rfs7000-37FABE(config-device-categorization-rfs7000)#show context device-categorization rfs7000
  mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#

rfs7000-37FABE(config-device-categorization-rfs7000)#no mark-device 1 sanctioned ap mac 11-22-33-44-55-66

The following example shows the device categorization list 'rfs7000' settings after the 'no' command is executed:

rfs7000-37FABE(config-device-categorization-rfs7000)#show context device-categorization rfs7000
rfs7000-37FABE(config-device-categorization-rfs7000)#

Related Commands

4.1.36 **dhcp-server-policy**

> **Global Configuration Commands**

Configures DHCPv4 server policy parameters, such as class, address range, and options. A new policy is created if it does not exist.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dhcp-server-policy <DHCP-SERVER-POLICY-NAME>

**Parameters**

- dhcp-server-policy <DHCP-SERVER-POLICY-NAME>

| <DHCP-SERVER-POLICY-NAME> | Specify the DHCPv4 server policy name. If the policy does not exist, it is created. |

**Examples**

rfs7000-37FABE(config)#dhcp-server-policy test
rfs7000-37FABE(config-dhcp-policy-test)#?

DHCP policy Mode commands:

- bootp: BOOTP specific configuration
- dhcp-class: Configure DHCP class (for address allocation using DHCP user-class options)
- dhcp-pool: Configure DHCP server address pool
- dhcp-server: Activating dhcp server based on criteria
- no: Negate a command or set its defaults
- option: Define DHCP server option
- ping: Specify ping parameters used by DHCP Server
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

rfs7000-37FABE(config-dhcp-policy-test)#

**Related Commands**

- **no** Removes an existing DHCP server policy

---

**NOTE:** For more information on DHCP policy, see *Chapter 12, DHCP-SERVER-POLICY.*
4.1.37 dhcpv6-server-policy

Global Configuration Commands

Creates a DHCPv6 server policy and enters its configuration mode.

DHCPv6 is a networking protocol for configuring IPv6 hosts with IP addresses, IP prefixes, or other configuration attributes required on an IPv6 network.

DHCPv6 servers pass IPv6 network addresses to IPv6 clients. The DHCPv6 address assignment feature manages non-duplicate addresses in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple pools. Additional options, such as the default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface or on multiple interfaces, or the server can automatically find the appropriate pool.

When configured and applied to a device, the DHCPv6 server policy enables the device to function as a stateless DHCPv6 server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>

Parameters

- dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>

Examples

rfs7000-6DCD4B(config)#dhcpv6-server-policy test
rfs7000-6DCD4B(config-dhcpv6-server-policy-test)#?

DHCPv6 server policy Mode commands:

dhcpv6-pool Configure DHCPv6 server address pool
no Negate a command or set its defaults
option Define DHCPv6 server option
restrict-vendor-options Restrict vendor specific options to be sent in server reply
server-preference Server preference value sent in the reply, by the server to client
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
show Show running configuration information
write Write running configuration to memory or terminal

</tbody>
</table>

*Table 4.14  DNS-Whitelist Config Commands*
4.1.38.1 dns-whitelist

`dns-whitelist` command

Configures a DNS whitelist. A DNS whitelist is a list of allowed DNS destination IP addresses pre-approved to access a controller, service platform, or access point managed captive portal.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dns-whitelist <DNS-WHITELIST-NAME>

Parameters

- `dns-whitelist <DNS-WHITELIST-NAME>`

<table>
<thead>
<tr>
<th>&lt;DNS-WHITELIST-NAME&gt;</th>
<th>Specify the DNS whitelist name. If the whitelist does not exist, it is created.</th>
</tr>
</thead>
</table>

Examples

rfs7000-37FABE(config)#dns-whitelist test
rfs7000-37FABE(config-dns-whitelist-test)#?

DNS Whitelist Mode commands:

- no Negate a command or set its defaults
- permit Match a host
- clrscr Clears the display screen
- commit Commit all changes made in this session
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-dns-whitelist-test)#

Related Commands

- `no` Removes an existing DNS Whitelist
The following table summarizes DNS Whitelist configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>permit</td>
<td>Permits a host, existing on a DNS whitelist, access to the network or captive portal</td>
<td>page 4-149</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts to default</td>
<td>page 4-150</td>
</tr>
</tbody>
</table>
4.1.38.2.1 permit

A whitelist is a list of host names and IP addresses permitted access to the network or captive portal. This command adds a host or destination IP address to the DNS whitelist.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
permit <IPv4/IPv6/HOSTNAME> {suffix}
```

**Parameters**

- `permit <IPv4/IPv6/HOSTNAME> {suffix}`

<table>
<thead>
<tr>
<th><code>&lt;IPv4/IPv6/HOSTNAME&gt;</code></th>
<th>Adds a device to the DNS whitelist</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--</code></td>
<td>Provide a hostname or numerical IPv4 or IPv6 address for each destination IP address or host included in the whitelist.</td>
</tr>
</tbody>
</table>

**Note:** A maximum of 256 entries can be made.

<table>
<thead>
<tr>
<th>suffix</th>
<th>Optional. Matches any hostname or domain name including the specified name as suffix</th>
</tr>
</thead>
</table>

**Examples**

```
rfs7000-37FABE(config-dns-whitelist-test)#permit example_company.com suffix

rfs7000-37FABE(config-dns-whitelist-test)#show context
dns-whitelist test
permit example_company.com suffix
rfs7000-37FABE(config-dns-whitelist-test)#
```

**Related Commands**

- `no` Removes a DNS whitelist entry
4.1.38.2.2 **no**

**dns-whitelist-mode commands**

Removes a specified host or IP address from the DNS whitelist, and prevents it from accessing network resources.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no permit <IPv4/IPv6/HOSTNAME>
```

**Parameters**

- `no permit <IPv4/IPv6/HOSTNAME>`

**Examples**

```
rfs7000-37FABE(config-dns-whitelist-test)#show context
dns-whitelist test
rfs7000-37FABE(config-dns-whitelist-test)#
```

```
rfs7000-37FABE(config-dns-whitelist-test)#no permit example_company.com
```

```
rfs7000-37FABE(config-dns-whitelist-test)#show context
dns-whitelist test
rfs7000-37FABE(config-dns-whitelist-test)#
```

**Related Commands**

- **permit** Adds a device to the DNS whitelist
4.1.39 **end**

*Global Configuration Commands*

Ends and exits the current mode and moves to the PRIV EXEC mode.

The prompt changes to the PRIV EXEC mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
end
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config)#end
rfs7000-37FABE#
```
### 4.1.40 event-system-policy

*Global Configuration Commands*

Configures how events are supported. Each event can be configured individually to perform an action such as sending an e-mail or forwarding a notification.

The following table lists event system configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>event-system-policy</td>
<td>Creates an event system policy and enters its configuration mode</td>
<td>page 4-153</td>
</tr>
<tr>
<td>event-system-policy-mode</td>
<td>Summarizes event system policy configuration mode commands</td>
<td>page 4-154</td>
</tr>
</tbody>
</table>
4.1.40.1 event-system-policy

`event-system-policy`

Configures a system wide events handling policy

Event system policies enable administrators to create notification mechanisms using one, some, or all of the SNMP, syslog, controller forwarding, or email notification options available to the controller or service platform. Each listed event can have customized notification settings defined and saved as part of an event policy. Thus, policies can be configured and administrated in respect to specific sets of client association, authentication or encryption, and performance events. Once policies are defined, they can be mapped to device profiles strategically as the likelihood of an event applies to particular devices.

To view an existing event system policy configuration details, use the `show > event-system-policy` command.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`event-system-policy <EVENT-SYSTEM-POLICY-NAME>`

**Parameters**
- `event-system-policy <EVENT-SYSTEM-POLICY-NAME>`

| `<EVENT-SYSTEM-POLICY-NAME>` | Specify the event system policy name. If the policy does not exist, it is created. |

**Examples**

```plaintext
rfs7000-37FABE(config)#event-system-policy event-testpolicy
rfs7000-37FABE(config-event-system-policy-event-testpolicy)#?
```

Event System Policy Mode commands:
- `event` Configure an event
- `no` Negate a command or set its defaults
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```plaintext
rfs7000-37FABE(config-event-system-policy-event-testpolicy)#
```

**Related Commands**

- `no` Removes an event system policy
4.1.40.2 event-system-policy-mode commands

The following table summarizes event system policy configuration mode commands:

Table 4.17 Event-System-Policy Mode Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>

<td>page 4-166</td>
</tr>
</tbody>
</table>
4.1.40.2.1 event

*event-system-policy-mode commands*

Configures an event and sets the action performed when the event happens

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

event <EVENT-TYPE> <EVENT-NAME> (email,forward-to-switch,snmp,syslog) [default|on|off]

The event types are:

</table>
4.1.40.2.2 no

*event-system-policy-mode commands*

Negates an event monitoring configuration

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no event <EVENT-TYPE> <EVENT-NAME> [email|forward-to-switch|snmp|syslog]
  [default|on|off]
```

**Parameters**

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes event monitoring and message forwarding activity based on the parameters passed</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> The system stops network monitoring for the occurrence of the specified event and no notification is sent if the event occurs.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-event-system-policy-TestPolicy)#event ap adopted syslog default
rfs7000-37FABE(config-event-system-policy-TestPolicy)#no event ap adopted syslog
```

**Related Commands**

- `event` Configures the action taken for each event

</tbody>
</table>
4.1.41.1 ex3500

`ex3500`

Creates an EX3500 time range list and enters its configuration mode.

An EX3500 time range list consists of a set of periodic and absolute time range rules. Periodic time ranges recur periodically at specified time periods, such as daily, weekly, weekends, weekdays, and on specific week days, for example on every successive Mondays. Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period (the starting and ending days and time are fixed).

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four Small Form Factor Pluggable (SFP) transceiver slots for fiber connectivity. The EX3500 series switch can adopt to a WiNG NOC controller and be managed by it. The EX3500 time range values configured here are used in EX3500 MAC ACL firewall rules that filters an EX3500's incoming and outgoing traffic. For more information on creating EX3500 MAC ACL rules, see `ex3500` and `access-group`.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

`ex3500 time-range <TIME-RANGE-NAME>`

**Parameters**

- `ex3500 time-range <TIME-RANGE-NAME>`

<table>

### 4.1.41.2.1 absolute

**ex3500-time-range-config-mode commands**

Configures an absolute time range rule for this EX3500 time range list

Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```plaintext
absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037> {end <0-23> <0-59> <1-31> <MONTH> <2013-2037>}
```

**Parameters**
- `absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037> {end <0-23> <0-59> <1-31> <MONTH> <2013-2037>}`

</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#absolute start 1 0 1 june 2015 end 1 0 30 june 2016
```

```
nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#show context ex3500 time-range EX3500-TimeRange-01
  absolute start 1 0 1 june 2015 end 1 0 30 june 2016
```

```
nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#af
```

**Related Commands**

| no | Removes this absolute time range rule from the EX3500 time range list |
4.1.41.2.2 periodic

**ex3500-time-range-config-mode commands**

Configures a periodic time range rule for this EX3500 time range list

Periodic time ranges are configured to recur based on periodicity such as daily, weekly, weekends, weekdays, and on specific week days, such as on every successive Sunday.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```plaintext
periodic [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend] <0-23> <0-59> to [<023> <0-59]|daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend] <0-23> <0-59> rule-precedence <1-7>
```

**Parameters**

- **periodic [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend]**
  Configures this periodic time range’s start day. The options are:
  - daily
  - friday
  - monday
  - saturday
  - sunday
  - thursday
  - tuesday
  - wednesday
  - weekdays
  - weekend

- **<0-23> <0-59>**
  After specifying the start day, specify the start time in hours (24 hours format) and minutes
  - **<0-23>** – Specify the start time from 0 - 23 hours.
  - **<0-59>** – Specify the start time from 0 - 59 minutes.

  For example, if the values provided are 12 hours and 30 minutes, the start time is 12:30 A.M on the specified day.

- **to [<023> <0-59]|daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend]**
  Configures this periodic time range’s end day. This is the day when the time range ends.
  The options available changes depending on the **start day** configured. The options are:
  - **<0-23> <0-59>** – Select this option to end the time range on the same day as it starts.
    Specify the end hour from 0 - 23 hours and the minutes from 0 - 59 minutes.
  - daily – Select this option if the time range starts and ends every day at a specified time
  - friday – Select this option if the time range ends on Fridays
  - monady – Select this option if the time range ends on Mondays
  - saturday – Select this option if the time range ends on Saturdays
  - sunday – Select this option if the time range ends on Sundays

Contd..
### Examples

- **nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#periodic daily 1 10 to daily 23 10 rule-precedence 1**

- **nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#show context ex3500 time-range EX3500-TimeRange-01 periodic daily 1 10 to daily 23 10 rule-precedence 1 absolute start 1 0 1 june 2015 end 1 0 30 june 2016**

</tr>
</tbody>
</table>
4.1.42.1 ex3500-management-policy

Creates an EX3500 management policy and enters its configuration mode. Once configured and applied on a
EX3500 switch, the management policy controls access to the switch from management stations using SNMP.
The EX3500 management policy is either applied:

- Individually on an adopted EX3500 series switch (in the device configuration mode), or
- To a EX3524 and/or EX3548 profile, which is then applied to an adopted EX3500 series switch.

EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-
BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the
IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent
that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP
Web agent and CLI, which in spite of being different from that of the WING operating system provides WING
controllers PoE and port management resources.

Going forward NX9500, NX7500, NX6500, NX4500 WING managed series service platforms and WING VMs can
discover, adopt, and partially manage EX3500 series Ethernet switches without modifying the proprietary
operating system running the EX3500 switches. The WING service platforms utilize standardized WING interfaces
to push configuration files to the EX3500 switches, and maintain a translation layer, understood by the EX3500
switch, for statistics retrieval.

WING can partially manage an EX3500 without using DHCP option 193, provided the EX3500 is directly
configured to specify the IPv4 addresses of potential WING adopters. To identify the potential WING adopter, in
the EX3500’s device configuration mode specify the adopter’s IPv4 address using the
controller > host > <IP-ADDRESS> command. WING service platforms leave the proprietary operating system
running the EX3500 switches unmodified, and partially manage them utilizing standardized WING interfaces.
WING service platforms use a translation layer to communicate with the EX3500.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX9500

Syntax

ex3500-management-policy <POLICY-NAME>

Parameters

- ex3500-management-policy <POLICY-NAME>

| <POLICY-NAME> | Specify the EX3500 management policy name. If the policy does not exist, it is created. |

Examples

nx9500-6C8809(config)#ex3500-management-policy test
nx9500-6C8809(config-ex3500-management-policy-test)#?

EX3500 Management Mode commands:

- enable: Modifies enable password parameters
- http: Hyper Text Terminal Protocol (HTTP)
- memory: Memory utilization
- no: Negate a command or set its defaults
- process-cpu: Process-cpu utilization
- snmp-server: Enable SNMP server configuration
- ssh: Secure Shell server connections
- username: Login TACACS server port
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes

4.1.42.2.1 enable

ex3500-management-policy config commands

Configures an executive password for this EX3500 management policy

Each EX3500 management policy can have a unique executive password with its own privilege level assigned. Utilize these passwords as specific EX3500 management sessions require priority over others.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
enable password [0|7|level]
```

```
enable password [0|7] <PASSWORD>
```

```
enable password level <0-15> [0 <PASSWORD>|7 <PASSWORD>]
```

Parameters

- `enable password [0|7] <PASSWORD>`

- `enable password level <0-15> [0 <PASSWORD>|7 <PASSWORD>]`

Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#enable password level 3 7 12345678901020304050607080929291
nx9500-6C8809(config-ex3500-management-policy-test)#show context ex3500-management-policy-test enable password level 3 7 12345678901020304050607080929291 snmp-server notify-filter 1 remote 127.0.0.1
```

Related Commands

| no |
| Removes a executive password from this EX3500 management policy |
4.1.42.2.2  http

Configures the HTTP server settings used to authenticate HTTP connection to a EX3500 switch.

Management access to an EX3500 switch can be enabled/disabled as required using separate interfaces and protocols (HTTP, SSH). Disabling un-used and insecure interfaces and unused management services can dramatically reduce an attack footprint and free resources within an EX3500 management policy.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax
http [port <1-65535>|secure-port <1-65535>|secure-server|server]

Parameters
- http [port <1-65535>|secure-port <1-65535>|secure-server|server]

<table>
<thead>
<tr>
<th>http</th>
<th>Configures following HTTP settings: port, secure-port, secure-server, and server</th>
</tr>
</thead>
<tbody>
<tr>
<td>port &lt;1-65535&gt;</td>
<td>Configures the HTTP port number. This is the port used to connect to the HTTP server.</td>
</tr>
<tr>
<td>secure-port &lt;1-65535&gt;</td>
<td>Enables secure HTTP connection over a designated secure port. Ensure that the HTTP server is enabled before specifying the secure-server port.</td>
</tr>
<tr>
<td>secure-server</td>
<td>Enables HTTP secure server. This option is disabled by default.</td>
</tr>
<tr>
<td>server</td>
<td>Enables HTTP server. This option is enabled by default. Consequently, HTTP management access is allowed by default.</td>
</tr>
</tbody>
</table>

Examples
nx9500-6C8809(config-ex3500-management-policy-test)#http secure-server

nx9500-6C8809(config-ex3500-management-policy-test)#show context ex3500-management-policy test
http secure-server
enable password level 3 7 12345678901020304050607080929291
snmp-server notify-filter 1 remote 127.0.0.1

Related Commands
- **no**  Reverts to default HTTP server settings (HTTP server enabled, HTTP port 80)
4.12.2.3 memory

ex3500-management-policy config commands

Configures the EX3500’s memory utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the memory utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500’s memory and CPU utilization’s upper and lower thresholds, you can avoid over utilization of the EX3500’s processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

Supported in the following platforms:
  • Wireless Controller — RFS7000
  • Service Platforms — NX7500, NX9500

Syntax
memory [falling-threshold|rising-threshold] <1-100>

Parameters
- memory [falling-threshold|rising-threshold] <1-100>

| memory | Configures the EX3500’s memory utilization rising and falling threshold values. The system generates a notification when either of these limits is exceeded. |
| falling-threshold <1-100> | Configures the falling threshold for the EX3500 memory utilization
  • <1-100> – Specify the falling threshold as a percentage from 1 - 100. The default is 70%. |
| rising-threshold <1-100> | Configures the rising threshold for the EX3500’s memory utilization
  • <1-100> – Specify the rising threshold as a percentage from 1 - 100. The default is 90%. |

Examples
nx9500-6C8809(config-ex3500-management-policy-test)#memory falling-threshold 50
nx9500-6C8809(config-ex3500-management-policy-test)#memory rising-threshold 95
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
  http secure-server
  enable password level 3 7 1234567890120304050607080929291
  snmp-server notify-filter 1 remote 127.0.0.1
  memory falling-threshold 50
  memory rising-threshold 95

Related Commands

| no | Reverts the memory utilization’s falling-threshold and/or rising threshold to 70% and 90% respectively |
4.1.42.2.4  process-cpu

Configures the EX3500’s CPU (processor) utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the CPU utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500’s memory and CPU utilization’s upper and lower thresholds, you can avoid over utilization of the EX3500’s processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
process-cpu [falling-threshold|rising-threshold] <1-100>
```

Parameters

- `process-cpu [falling-threshold|rising-threshold] <1-100>`

<table>
<thead>
<tr>
<th>process-cpu</th>
<th>Configures the EX3500’s CPU utilization rising and falling threshold values. The system generates a notification when either of these limits is exceeded.</th>
</tr>
</thead>
</table>
| falling-threshold <1-100> | Configures the falling threshold for the EX3500’s CPU utilization  
  - `<1-100>` – Specify the falling threshold as a percentage from 1 - 100. The default is 70%. |
| rising-threshold <1-100> | Configures the rising threshold for the EX3500’s CPU utilization  
  - `<1-100>` – Specify the rising threshold as a percentage from 1 - 100. The default is 90%. |

Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#process-cpu falling-threshold 60
nx9500-6C8809(config-ex3500-management-policy-test)#process-cpu rising-threshold 80
```

```
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
  http secure-server
  enable password level 3 7 1234567890120304050607080929291
  snmp-server notify-filter 1 remote 127.0.0.1
  memory falling-threshold 50
  memory rising-threshold 95
  process-cpu falling-threshold 60
  process-cpu rising-threshold 80
nx9500-6C8809(config-ex3500-management-policy-test)#
```

Related Commands

- `no` Reverts the CPU utilization’s falling-threshold and/or rising threshold to 70% and 90% respectively
4.1.42.2.5 snmp-server

**ex3500-management-policy config commands**

Configures Simple Network Management Protocol (SNMP) server settings. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP.

SNMP is an application layer protocol that facilitates the exchange of management information between the management stations and a managed EX3500 switch. SNMP-enabled devices listen on port 162 (by default) for SNMP packets from the management server. SNMP uses read-only and read-write community strings as an authentication mechanism to monitor and configure supported devices. The read-only community string is used to gather statistics and configuration parameters from a supported wireless device. The read-write community string is used by a management server to set device parameters. SNMP is generally used to monitor a system's performance and other parameters.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
snmp-server {community|contact|enable|engine-id|group|host|location|notify-filter|
user|view}

snmp-server {community <STRING> {ro|rw}}

snmp-server {contact <NAME>}

snmp-server {enable traps {authentication|link-up-down}}

snmp-server {engine-id [local <WORD>|remote <IP> <WORD>]} 

snmp-server {group <GROUP-NAME> [v1|v2c|v3 [auth|noauth|priv]] {notify <WORD>|read <WORD>|write <WORD>}}

snmp-server {host <IP> [inform]} 

{udp-port <1-65535>}

snmp-server {host <IP> inform [retry <0-255>|timeout <0-2147483647>]} <STRING>

version [v2c|v3 [auth|noauth|priv]] {udp-port <1-65535>}

snmp-server {location <WORD>}

snmp-server {notify-filter <WORD> remote <IP>}

snmp-server {user <USER-NAME> <GROUP-NAME> [remote-host|v1|v2c|v3]}

snmp-server {user <USER-NAME> <GROUP-NAME> remote-host <IP> v3 [auth|encrypted auth]

[md5|sha] <WORD> [priv [3des|aes128|aes192|aes256|des56] <WORD>]

snmp-server {user <USER-NAME> <GROUP-NAME> [v1|v2c|v3]}

snmp-server {view <VIEW-NAME> <OID-TREE-STRING> [excluded|included]}

**Parameters**

- **snmp-server {community <STRING> {ro|rw}}**

| snmp-server community <STRING> {ro|rw} | Configures SNMP-server related settings |
|----------------------------------------|----------------------------------------|
| • community – Optional. Configures an SNMP community access string used to authorize management access by clients using SNMP v1, v2c, or v3 |
| • <STRING> – Specify the SNMP community access string (should not exceed 32 characters). |

Contd..
### SNMP Configuration Commands

**snmp-server contact <NAME>**

Configures SNMP-server related settings
- contact – Optional. Configures the system’s contact information
  - <NAME> – Specify the contact person's name (should not exceed 255 characters).

**snmp-server enable traps {authentication|link-up-down}**

Configures SNMP-server related settings
- enable traps – Optional. Enables the EX3500 switch to send following SNMP traps or notifications:
  - authentication – Optional. Enables SNMP authentication trap. This option is disabled by default.
  - link-up-down – Optional. Enables SNMP link up and link down traps. This option is disabled by default.

**snmp-server engine-id [local <WORD> | remote <IP> <WORD>]**

Configures SNMP-server related settings
- engine-id – Optional. Configures an identification string for the SNMPv3 engine. The SNMP engine is an independent SNMP agent residing either on the logged switch or on a remote device. It prevents message replay, delay, and redirection. In SNMPv3, the engine ID in combination with user passwords generates the security keys that is used for SNMPv3 packet authentication and encryption.
  - local – Configures the SNMP engine on the logged switch
    - <WORD> – Specify the hexadecimal engine ID string identifying the SNMP engine (should be 9 - 64 characters in length).
  - remote <IP> <WORD> – Configures a remote device as the SNMP engine
    - <IP> – Specify the remote device’s IP address.
    - <WORD> – Specify the hexadecimal engine ID string identifying the SNMP engine (should be 9 - 64 characters in length).

Configure the remote engine ID when using SNMPv3 informs. The remote ID configured here is used to generate the security digest for authentication and encryption of packets exchanged between the switch and the and the remote host user. SNMP passwords are localized using the engine ID of the authoritative agent. For informs, the authoritative SNMP agent is the remote agent. You therefore need to configure the remote agent’s SNMP engine ID before you can send proxy requests or informs to it.
### snmp-server group <GROUP-NAME>

Configures SNMP-server related settings

- **group** – Optional. Configures an SNMP user group, mapping SNMP users to SNMP views
  - `<GROUP-NAME>` – Specify the SNMP group name (should not exceed 32 characters).

- **[v1|v2c|v3 [auth|noauth|priv]]**
  - Configures the SNMP version used for authentication by this user group
  - `v1` – Configures the SNMP version as v1.
  - `v2c` – Configures SNMP version as v2c.
  - `v3` – Configures the SNMP version as v3. If using SNMP v3, specify the authentication and encryption levels.
    - `auth` – Uses SNMP v3 with authentication and no privacy
    - `noauth` – Uses SNMP v3 with no authentication and no privacy
    - `priv` – Uses SNMP v3 with authentication and privacy

- **notify <WORD>**
  - Optional. Configures the notification view string
    - `<WORD>` – Specify the string (should not exceed 32 characters).

- **read <WORD>**
  - Optional. Configures the read view string
    - `<WORD>` – Specify the string (should not exceed 32 characters).

- **write <WORD>**
  - Optional. Configures the write view string
    - `<WORD>` – Specify the string (should not exceed 32 characters).

### snmp-server host <IP>

Configures SNMP-server related settings

- **host** – Optional. Configures the host(s) receiving the SNMP notifications. At least one SNMP server host should be configured in order to configure the switch to send notifications
  - `<IP>` – Specify the SNMP host’s IP address.

**Note:** You can configure a maximum of five (5) SNMP trap recipients per EX3500 management policy.

**Note:** Ensure that SNMP trap notification is enabled.

- **<STRING>**
  - Configures the SNMP community string. You can configure the SNMP community string here, or else use the string configured using the `snmp-server > community <STRING> > {ro|rw}` command. It is recommended that you configure the SNMP community string prior to configuring the SNMP host.
  - `<STRING>` – Specify the community string. The string configured here is sent in the SNMP traps to the SNMPv1 or SNMPv2c hosts.

- **version [v1|v2c|v3 [auth|noauth|priv]]**
  - Configures the SNMP version used
    - `v1` – Configures the SNMP version as 1. This is the default setting.
    - `v2c` – Configures SNMP version as 2c.
    - `v3` – Configures the SNMP version as 3. If using SNMPv3, specify the authentication and encryption levels.
      - `auth` – Uses SNMP v3 with authentication and no privacy
      - `noauth` – Uses SNMP v3 with no authentication and no privacy
      - `priv` – Uses SNMP v3 with authentication and privacy
GLOBAL CONFIGURATION COMMANDS

- **snmp-server {host <IP> inform [retry <0-255>|timeout <0-2147483647>] <STRING> version [v2c|v3 [auth|noauth|priv]]} udp-port <1-65535>}**

  - **snmp-server host <IP>**
    - Configures SNMP-server related settings
    - `host` – Optional. Configures the host(s) receiving the SNMP notifications
    - `<IP>` – Specify the SNMP host’s IP address.
    - **Note:** You can configure a maximum of five (5) SNMP trap recipients per EX3500 management policy.
    - **Note:** Ensure that SNMP trap notification is enabled.

  - **inform [retry <0-255>|timeout <0-2147483647>]**
    - Enables sending of SNMP notifications as inform messages, and configures inform message settings.
    - `retry <0-255>` – Configures the maximum number attempts made to re-send an inform message in case the specified SNMP host does not acknowledge receipt.
    - `<0-255>` – Specify a value from 0 - 255. The default is 3.
    - `timeout <0-2147483647>` – Configures the interval, in seconds, to wait for an acknowledgment from the SNMP host before re-sending an inform message.
    - `<0-2147483647>` – Specify a value from 0 - 2147483647 seconds. The default is 1500 seconds.
    - Inform messages are more reliable than trap messages since they include a request for acknowledgement of receipt. Using inform messages to communicate critical information would be good practice. However, since inform messages are retained in the memory until a response is received, they consume more memory and may also result in traffic congestion. Take into considerations these facts when configuring the notification format.

  - **<STRING>**
    - Configures the SNMP community string. You can configure the SNMP community string here, or else use the string configured using the `snmp-server > community <STRING> > {ro|rw} command. It is recommended that you configure the SNMP community string prior to configuring the SNMP host.
    - `<STRING>` – Specify the community string. The string configured here is sent in the SNMP inform messages to the SNMPv2c or SNMPv3 hosts.

  - **version [v2c|v3 [auth|noauth|priv]]**
    - Configures the SNMP version used
    - `v2c` – Configures the SNMP version as v2c
    - `v3` – Configures the SNMP version as v3. If using SNMP v3, specify the authentication and encryption levels.
      - `auth` – Uses SNMP v3 with authentication and no privacy
      - `noauth` – Uses SNMP v3 with no authentication and no privacy
      - `priv` – Uses SNMP v3 with authentication and privacy
    - **Note:** SNMP inform messages are not supported on SNMP v1.

- **udp-port <1-65535>**
  - Optional. After specifying the SNMP version, optionally specify the host UDP port
  - `<1-65535>` – Specify the UDP port. The default is 162.

- **snmp-server {location <WORD>}}**

  - **snmp-server location <WORD>**
    - Configures SNMP-server related settings
    - `location` – Optional. Configures the EX3500’s location string
    - `<WORD>` – Specify the location (should not exceed 255 characters).
### snmp-server

**snmp-server {notify-filter <WORD> remote <IP>}**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notify-filter &lt;WORD&gt;</td>
<td>Optional. Modifies the SNMP server's notify filter name.</td>
</tr>
<tr>
<td>remote &lt;IP&gt;</td>
<td>Optional. Configures the remote host's IP address.</td>
</tr>
</tbody>
</table>

### snmp-server user

**snmp-server user <USER-NAME> <GROUP-NAME> remote <IP> v3 {auth|encrypted auth} [md5|sha] <WORD> {priv [3des|aes128|aes192|aes256|des56] <WORD>}}**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user &lt;USER-NAME&gt;</td>
<td>Optional. Configures the name of the SNMP user (connecting to the SNMP agent) and adds the user to an existing SNMP group. It also specifies the SNMP version type used. In case of SNMP version 3, this command also configures the remote host's IP address and the authentication type used.</td>
</tr>
<tr>
<td>&lt;GROUP-NAME&gt;</td>
<td>Specify the SNMP group name to which this user is assigned.</td>
</tr>
<tr>
<td>remote &lt;IP&gt; v3</td>
<td>Configures the remote host on which the SNMPv3 engine is running.</td>
</tr>
<tr>
<td>{auth</td>
<td>encrypted auth} [md5</td>
</tr>
<tr>
<td>{priv [3des</td>
<td>aes128</td>
</tr>
</tbody>
</table>

**Note:** This option is available only for SNMPv3 engine. After configuring the remote host, optionally configure the authentication type and the corresponding authentication password used.

### Optional. Configures authentication and encryption settings

- **auth** – Specifies the authentication type used and configures the authentication password
- **encrypted** – Enables encryption. When enabled all communications between the user and the SNMP engine are encrypted. After enabling encryption, specify the authentication type and configure the authentication password.

The following parameters are common to the 'auth' and 'encrypted' keywords:

- **md5** – Uses MD5 to authenticate the user
- **sha** – Uses SHA to authenticate the user

The following parameter is common to the 'md5' and 'sha' keywords:

- **<WORD>** – Specify the authentication password.

**Note:** If the 'encrypted' option is not being used, enter an 8 - 40 characters ASCII password. Whereas, in case of an encrypted password enter a HEX characters password of 32 characters.

### Optional. Uses SNMPv3 with privacy.

Select one of the privacy options: des, aes128, aes192, aes256, des56

- **<WORD>** – Configures the privacy password. If the 'encrypted' option is not being used, enter an 8 - 40 characters long ASCII password. Whereas, the encrypted password should be 32 HEX characters.
snmp-server user
<USER-NAME>
<GROUP-NAME>
[v1|v2c|v3]

Configures SNMP-server related settings
- user – Optional. Configures the name of the SNMP user (connecting to the SNMP agent) and adds the user to an existing SNMP group. It also specifies the SNMP version type used. In case of SNMPv3, this command also configures the authentication type used and the enables encryption.
- <USER-NAME> – Specify the user’s name (should not exceed 32 characters).
- <GROUP-NAME> – Specify the SNMP group name to which this user is assigned.
- [v1|v2c|v3] – After specifying the group name, specify the SNMP version used. The options are SNMP version v1, SNMP version 2c, and SNMP version 3.

If using SNMP version 3, optionally specify the authentication type and the corresponding authentication password used. Please see previous table for SNMPv3 authentication and encryption configuration details.

snmp-server view
<VIEW-NAME>

Configures SNMP-server related settings
- view – Optional. Creates an SNMP view. SNMP views are used to control user access to the MIB.
- <VIEW-NAME> – Provide a name for this SNMP view (should not exceed 32 characters).

<OID-TREE-STRING>
[excluded|included]

Configures the object identifier (OID) of a branch within the MIB tree
- excluded – Specifies an excluded view
- included – Specifies an included view

Examples

Related Commands
no
Removes SNMP server related settings or reverts them to default
4.142.2.6 ssh

**ex3500-management-policy config commands**

Configures the SSH server settings used to authenticate Secure Shell (SSH) connection to a EX3500 switch. Management access to an EX3500 switch can be enabled/disabled as required using separate interfaces and protocols (HTTP, SSH). Disabling un-used and insecure interfaces and unused management services can dramatically reduce an attack footprint and free resources within an EX3500 management policy.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**
```
ssh [authentication-retries <1-5>|server|server-key size <512-1024>|timeout <1-120>]
```

**Parameters**
- `ssh [authentication-retries <1-5]|server|server-key size <512-1024]|timeout <1-120>]`

<table>
<thead>
<tr>
<th>ssh</th>
<th>Enables SSH management access to an EX3500 switch. This option is disabled by default. Use this command to configure SSH access settings.</th>
</tr>
</thead>
<tbody>
<tr>
<td>authentication-retries &lt;1-5&gt;</td>
<td>Configures the maximum number of retries made to connect to the SSH server resource.</td>
</tr>
<tr>
<td>server</td>
<td>Enables SSH server connection</td>
</tr>
<tr>
<td>server-key size &lt;512-1024&gt;</td>
<td>Configures the SSH server key size</td>
</tr>
<tr>
<td>timeout &lt;1-120&gt;</td>
<td>Configures the SSH server resource inactivity timeout value in seconds. When the specified time is exceeded, the SSH server resource becomes unreachable and must be re-authenticated.</td>
</tr>
</tbody>
</table>

**Examples**
```
nx9500-6C8809(config-ex3500-management-policy-test)#ssh authentication-retries 4
nx9500-6C8809(config-ex3500-management-policy-test)#ssh timeout 90
nx9500-6C8809(config-ex3500-management-policy-test)#ssh server-key size 600
nx9500-6C8809(config-ex3500-management-policy-test)#ssh server
```

**Related Commands**
```
no
```

Disables SSH management access to an EX3500 switch.
### 4.142.2.7 username

**ex3500-management-policy config commands**

Configures a EX3500 switch user settings

The EX3500 switch user details are stored in a local database on the NX9500, NX7500, NX6500, NX4500 or WiNG VM. You can configure multiple users, each having a unique name, access level, and password.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
username <USER-NAME> [access-level <0-15>|nopassword|password [0|7] <PASSWORD>]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username &lt;USER-NAME&gt;</td>
<td>Configures the TACACS server port username</td>
</tr>
<tr>
<td>access-level &lt;0-15&gt;</td>
<td>Configures the access level for this user. This value determines the access priority of each user requesting access and interoperability with EX3500 switch.</td>
</tr>
<tr>
<td>nopassword</td>
<td>Allows user to login without a password</td>
</tr>
<tr>
<td>password [0</td>
<td>7] &lt;PASSWORD&gt;</td>
</tr>
<tr>
<td></td>
<td>0 — Configures a plain text password</td>
</tr>
<tr>
<td></td>
<td>7 — Configures an encrypted password (should be 32 characters in length)</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-ex3500-management-policy-test)#username user1 access-level 5

nx9500-6C8809(config-ex3500-management-policy-test)#username user1 password 0 user1@1234

4.1.43.1  ex3500-qos-class-map-policy

`ex3500-qos-class-map-policy`

Creates a EX3500 Quality of Service (QoS) class map policy and enters its configuration mode.

A QoS class map policy contains a set of Differentiated Services (DiffServ) classification criteria that are used to classify incoming traffic into different category and provide differentiated service based on this classification. Each policy defines a set match criteria rules that use objects, such as access lists, IP precedence or DSCP values, and VLANs. When configured and applied, the policy classifies traffic based on layer 2, layer 3, or layer 4 information contained in each incoming packet.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax
`ex3500-qos-class-map-policy <POLICY-NAME>`

Parameters
- `ex3500-qos-class-map-policy <POLICY-NAME>`

Examples
```

| no | Removes this EX3500 QoS class map policy’s description |
4.1.43.2.2 match

**ex3500-qos-class-map-policy config commands**

Configures match criteria rules used to classify traffic.

Access lists, IP precedence, DSCP values, or VLANs are commonly used to classify traffic. Access lists select traffic based on layer 2, layer 3, or layer 4 information contained in each packet.

**Supported in the following platforms:**
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
```

**Parameters**

  Configures the match criteria. The options are: access-list, cos, ip, ipv6, vlan

  **Note:** Incoming packets matching the specified criteria are included in this QoS class map.

  | access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl] <ACL-NAME> | Uses access lists to provide the match criteria. You can use any one the following ACL types to classify traffic:
  | cos <0-7> | Configures the class of service (CoS) value used to apply user priority. CoS is a form of QoS applicable only to layer 2 Ethernet frames. It uses 3-bits (8 values) of the 802.1Q tag to differentiate and shape network traffic.
  | ip [dscp <0-63]|precedence <0-7>] | Configures the IPv4 DSCP value to match and/or the IP precedence value to match.

Contd...
Usage Guidelines
When configuring match entries, take into consideration the following points:

- Deny rules included in an ACL (associated with a EX3500 QoS class map policy) are ignored whenever an incoming packet matches the ACL.
- A class map policy cannot include both IP ACL or IP precedence rule and a VLAN rule.
- A class map policy containing a MAC ACL or VLAN rule cannot include either an IP ACL or a IP precedence rule.
- A class map policy can include a maximum of 16 match entries.

Examples
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#match ip dscp 3

nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context ex3500-qos-class-map-policy dscp
description "Matches packets marked for DSCP service 3"
match ip dscp 3

nx9500-6C8809(config-ex3500-qos-class-map-policy-test2)#match ip precedence 1

Related Commands

</tbody>
</table>
4.1.44.1  **ex3500-qos-policy-map**

> **ex3500-qos-policy-map**

Creates an EX3500 policy map and enters its configuration mode

An EX3500 policy map contains one or more EX3500 QoS class maps traffic classifications (existing and configured) and can be attached to multiple interfaces. Creates an EX3500 policy map, and then use the class parameter to configure policies for traffic that matches the criteria defined in the EX3500 QoS class map policy. For more information see, **match**.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>
```

**Parameters**

- **ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>**

### 4.1.44.2.1 `class`

- **ex3500-qos-policy-map config commands**

Creates a policy map class and enters its configuration mode. The policy map class is a traffic classification upon which a policy can act.

**Supported in the following platforms:**
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
class <EX3500-QoS-CLASS-MAP-POLICY-NAME>
```

**Parameters**

- `class <EX3500-QoS-CLASS-MAP-POLICY-NAME>`

**Examples**

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap)#class dscp
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#?
commands:
  no       Negate a command or set its defaults
  police   Defines a policer for classified traffic
  set      Classify IP traffic
  clrscr   Clears the display screen
  commit   Commit all changes made in this session

police Configures an enforcer for classified traffic
[trtcm-color-aware|trtcm-color-blind] <0-1000000> <0-16000000> <0-1000000> <0-16000000> conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]

exceed-action
[<0-63>|drop]
Configures the action applied when packet rates exceed the specified CIR and BC limits
• <0-63> – Applies a new DSCP value. Select the DSCP value from 0 -63.
• drops – Drops packets exceeding the specified CIR and BC limits

violate-action
[<0-63>|drop]
Configures the action applied when packet rates exceed the specified BE limit
• <0-63> – Applies a new DSCP value. Select the DSCP value from 0 -63.
• drops – Drops packets exceeding the specified BE limit

• police [trtcm-color-aware|trtcm-color-blind] <0-1000000> <0-16000000> <0-1000000> <0-16000000> conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]

police Configures an enforcer for classified traffic
[trtcm-color-aware|trtcm-color-blind] <0-1000000> <0-16000000> <0-1000000> <0-16000000>
• trtcm-color-blind - Two rate three color meter in color-blind mode
• trtcm-color-aware - Two rate three color meter in color-aware mode
  • <0-1000000> – Configures the CIR from 0 - 1000000 kilobits per second
  • <0-16000000> – Configures the BC from 0 - 16000000 bytes.
  • <0-1000000> – Configures the PIR from 0 - 1000000 kilobits per second
  • <0-16000000> – Configures the BP from 0 - 16000000 bytes

The meter operates in one of two modes. In the color-blind mode, the meter assumes that the packet stream is uncolored. In color-aware mode the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The marker (re)colors an IP packet according to the results of the meter. The color is coded in the DS field [RFC 2474] of the packet.

The behavior of the meter is specified in terms of its mode and two token buckets, P and C, which are based on the rates PIR and CIR, respectively. The maximum size of the token bucket P is BP and the maximum size of the token bucket C is BC.

The token buckets P and C are initially (at time 0) full, that is, the token count Tp(0) = BP and the token count Tc(0) = BC. Thereafter, the token count Tp is incremented by one PIR times per second up to BP and the token count Tc is incremented by one CIR times per second up to BC.

When a packet of size B bytes arrives at time t, the following happens if trTCM is configured to operate in color-blind mode:
• If Tp(t)-B < 0, the packet is red, else
• if Tc(t)-B < 0, the packet is yellow and Tp is decremented by B, else
• The packet is green and both Tp and Tc are decremented by B.

Contd..
### Usage Guidelines

When configuring the traffic class enforcer parameters, take into consideration the following factors:

1. You can configure up to 200 enforcers/policers (i.e., class maps) for ingress ports.
2. The committed-rate cannot exceed the configured interface speed, and the committed-burst cannot exceed 16 Mbytes.

### Examples

The following example uses the police trtcn-color-blind command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

```
config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)
police trtcn-color-blind 100000 4000 100000 6000 conform-action transmit exceed-action 0 violate-action drop
```

### Related Commands

- **no**
  - Removes the traffic enforcer settings
4.1.44.2.4  set

Sets class of service (CoS) value, per-hop behavior (PHB) value, and IP DSCP value in matching packets.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```bash
set [cos <0-7>|ip dscp <0-63>|phb <0-7>]
```

Parameters

- **set [cos <0-7>|ip dscp <0-63>|phb <0-7>]**

<table>
<thead>
<tr>
<th>set</th>
<th>Sets the match criteria used to identify and classify traffic into different classes. The match criteria options are: CoS, IP DSCP, and PHB values.</th>
</tr>
</thead>
<tbody>
<tr>
<td>cos &lt;0-7&gt;</td>
<td>Configures the CoS value for a matching packet (as specified by the match command) in the packet's VLAN tag. &lt;0-7&gt; — Specify a value from 0 - 7. The CoS is modified to the value specified here.</td>
</tr>
<tr>
<td>ip dscp &lt;0-63&gt;</td>
<td>Modifies the IP DSCP value in a matching packet (as specified by the match command) &lt;0-63&gt; — Specify a value from 0 - 63. The DSCP value is modified to the value specified here.</td>
</tr>
<tr>
<td>phb &lt;0-7&gt;</td>
<td>Configures a PHB value for a matching packets. &lt;0-7&gt; — Specify a value from 0 - 7. <strong>Note:</strong> The PHB label is composed of five bits, three bits for per-hop behavior, and two bits for the color scheme used to control queue congestion. A packet is marked green, yellow, or red as per the following: • green if it does not exceed the CIR and BC limits • yellow if it exceeds the CIR and BC limits, but not the BE limit, and • red otherwise.</td>
</tr>
</tbody>
</table>

Examples

The following example uses the `set > phb` command to classify the service that incoming packets will receive, and then uses the `police > trtcm-color-blind` command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000 bytes, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

```bash
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)#set phb 3
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)#police trtcm-color-blind 100000 4000 1000000 6000 conform-action transmit exceed-action 0 violate-action drop
```

The following example uses the `set > ip dscp` command to classify the service that incoming packets will receive, and then uses the `police > flow` command to limit the average bandwidth to 100,000 Kbps, the burst rate to 4000 bytes, and configure the response to drop any violating packets:

```bash
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#set ip dscp 3
```

ex3500-qos-policy-map-class-config commands

Removes this traffic classification’s settings

Supported in the following platforms:
• Wireless Controller — RFS7000
• Service Platforms — NX7500, NX9500

Syntax
no [police|set]

no police [flow|srtcm-color-aware|srtcm-color-blind|trtcm-color-aware|
  trtcm-color-blind]

no set [cos|ip dscp|phb]

Parameters
• no <PARAMETERS>

no <PARAMETERS> Removes this traffic class settings based on the parameters passed

Examples

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#show context
  class dscp
    set ip dscp 3
    police flow 100000 4000 conform-action transmit violate-action drop

### 4.1.44.2.6 description

**ex3500-qos-policy-map config commands**

Configures this EX3500 QoS policy map's description

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

description <LINE>

**Parameters**

- description <LINE>

<table>
<thead>
<tr>
<th>description &lt;LINE&gt;</th>
<th>Configures this EX3500 QoS policy map's description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;LINE&gt; – Enter a description that allows you to differentiate it from other policies with similar configuration (should not exceed 64 characters)</td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C8809(config-ex3500-qos-policy-map-test)#description "This is a test EX3500 QoS Policy Map"

nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
description "This is a test EX3500 QoS Policy Map"
class test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#

**Related Commands**

- **no** Removes this EX3500 QoS policy map's description
4.1.44.2.7 no

* ex3500-qos-policy-map config commands

Removes this EX3500 QoS policy map's settings. Use this keyword to remove the description and to remove the QoS traffic classification created.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
no [class <EX3500-QoS-POLICY-MAP-NAME>|description]
```

**Parameters**

- no <PARAMETERS>

 **Examples**

The following example shows the EX3500 QoS policy map 'test' settings before the 'no' command are executed:

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
description "This is a test EX3500 QoS Policy Map"
class test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#
```

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#no description
```

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#no class test
```

The following example shows the EX3500 QoS policy map 'test' settings after the 'no' command are executed:

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#
```
4.1.45 ex3524

Global Configuration Commands

Adds a EX3524 switch to the network

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four Small Form Factor Pluggable (SFP) transceiver slots for fiber connectivity.

To enable layer 3 adoption of the logged EX3524 switch to a NOC controller, navigate to the EX3524 switch’s device configuration mode and execute the following command: controller > host > <IP/HOSTANME>.

EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP Web agent and CLI, which in spite of being different from that of the WiNG operating system provides WiNG controllers PoE and port management resources.

Going forward NX9500, NX7500, NX6500, NX4500 WiNG managed series service platforms and WiNG VMs can discover, adopt, and partially manage EX3500 series Ethernet switches without modifying the proprietary operating system running the EX3500 switches. The WiNG service platforms utilize standardized WiNG interfaces to push configuration files to the EX3500 switches, and maintain a translation layer, understood by the EX3500 switch, for statistics retrieval.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

ex3524 <DEVICE-EX3524-MAC>

Parameters

- ex3524 <DEVICE-EX3524-MAC>

Examples

nx9500-6C8809(config)#ex3524 A1-C4-33-6D-66-07

nx9500-6C8809(config-device-A1-C4-33-6D-66-07)#?

EX35xx Device Mode commands:

- hostname Set system's network name
- interface Select an interface to configure
- ip Internet Protocol (IP)
- no Negate a command or set its defaults
- power EX3500 Power over Ethernet Command
- remove-override Remove configuration item override from the device (so profile value takes effect)
- upgrade Configures upgrade option for ex3500 system
- use Set setting to use
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

4.1.46 ex3548

Global Configuration Commands

Adds a EX3548 switch to the network

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
ex3548 <DEVICE-EX3548-MAC>
```

Parameters

- `ex3548 <DEVICE-EX3548-MAC>`

Examples

```
nx9500-6C8809(config)#ex3548 22-65-78-09-12-35
nx9500-6C8809(config-device-22-65-78-09-12-35)#?
```

<DEVICE-EX3548-MAC> | Specifies the MAC address of a EX3548 switch
--- | ---

EX35xx Device Mode commands:

- `hostname` Set system's network name
- `interface` Select an interface to configure
- `ip` Internet Protocol (IP)
- `no` Negate a command or set its defaults
- `power` EX3500 Power over Ethernet Command
- `remove-override` Remove configuration item override from the device (so profile value takes effect)
- `upgrade` Configures upgrade option for ex3500 system
- `use` Set setting to use
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
nx9500-6C8809(config-device-22-65-78-09-12-35)#
```

Related Commands

- `no` Removes a EX3548 switch from the network
4.1.47 firewall-policy

**Global Configuration Commands**

Configures a firewall policy. This policy defines a set of rules for managing network traffic and prevents unauthorized access to the network behind the firewall.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`firewall-policy <FIREWALL-POLICY-NAME>`

**Parameters**

- `firewall-policy <FIREWALL-POLICY-NAME>`

<table>
<thead>
<tr>
<th>&lt;FIREWALL-POLICY-NAME&gt;</th>
<th>Specify the firewall policy name. If a firewall policy does not exist, it is created.</th>
</tr>
</thead>
</table>

**Examples**

```
rfs7000-37FABE(config)#firewall-policy test
rfs7000-37FABE(config-fw-policy-test)#?
```

Firewall policy Mode commands:

- `acl-logging` Log on flow creating traffic
- `alg` Enable ALG
- `clamp` Clamp value
- `dhcp-offer-convert` Enable conversion of broadcast dhcp offers to unicast
- `dns-snoop` DNS Snooping
- `firewall` Wireless firewall
- `flow` Firewall flow
- `ip` Internet Protocol (IP)
- `ip-mac` Action based on ip-mac table
- `ipv6` Internet Protocol version 6 (IPv6)
- `ipv6-mac` Action based on ipv6-mac table
- `logging` Firewall enhanced logging
- `no` Negate a command or set its defaults
- `proxy-arp` Enable generation of ARP responses on behalf of another device
- `proxy-nd` Enable generation of ND responses (for IPv6) on behalf of another device
- `stateful-packet-inspection-l2` Enable stateful packet inspection in layer2 firewall
- `storm-control` Storm-control
- `virtual-defragmentation` Enable virtual defragmentation for IPv4 packets (recommended for proper functioning of firewall)

```
rfs7000-37FABE(config-fw-policy-test)#
```

**NOTE:** For more information on Firewall policy, see Chapter 13, FIREWALL-POLICY.
4.1.48 global-association-list

Configures a global list of client MAC addresses. Based on the deny or permit rules specified, clients are either allowed or denied access to the managed network.

The global association list serves the same purpose as an Association Access Control List (ACL). However, the Association ACL allows a limited number of entries, a few thousand only, and does not suffice the requirements of a large deployment. This gap is filled by a global association list, which is much larger (with tens of thousands of entries). Both lists co-exist in the system. When an access request comes in, the association ACL is looked up first and if the requesting MAC address is listed in one of the deny ACLs, the association is denied. But, if the requesting client is permitted access, or if in case none of the ACLs list the client's MAC address, the global association ACL is checked. Once authenticated, the client's credentials are cached on the access point, and subsequent requests are not referenced to the controller. An entry in an APs credential cache means a pass in the global association list.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

global-association-list <GLOBAL-ASSOC-LIST-NAME>

Parameters

- <GLOBAL-ASSOC-LIST-NAME>

Specify the global association list name. If a list with the same name does not exist, it is created.

**Note:** Map this global association list to a device (controller) or a controller profile. Once associated, the controller applies this association list to requests received from all adopted APs. For more information, see **use**.

**Note:** The global association list can also be mapped to a WLAN. The usage of global access lists is controlled on a per-WLAN basis. For more information, see **association-list**.

Examples

rfs4000-229D58(config)#global-association-list my-clients
rfs4000-229D58(config-global-assoc-list-my-clients)#?

Global Association List Mode commands:

<td>Summarizes guest management policy configuration mode commands</td>
<td>page 4-223</td>
</tr>
</tbody>
</table>

Table 4.27 Guest-Management Policy Config Command
4.1.49.1 guest-management

Configures a guest management policy that redirects guest users to a registration portal upon association to a captive portal SSID. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) where previously, not-registered guest users can register. The internally hosted captive portal registration page can be customized based on business requirements. For more information, see [webpage](#).

Use the guest management policy commands to configure parameters, such as E-mail host and SMS gateway along with the credentials required for sending pass code to guest via e-mail and SMS. You can configure up to 32 different guest management policies. Each guest management policy allows you to configure the SMS gateway, SMS message body, E-mail SMTP server, E-mail subject contents, and E-mail message body. Although, at any point-in-time, multiple guest management policies may exist, only one guest management policy can be active per device.

Guest registration is supported only on the NX9000 and NX7500 series service platforms as an adopting controller. But the number of user identity entries supported on each varies. It is 2 million and 1 million user identity entries for the NX9000 and NX7500 model service platforms respectively. Guest management and registration is not supported on any of the other WiNG supported platforms.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX75 20, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

guest-management <POLICY-NAME>

**Parameters**
- guest-management <POLICY-NAME>

**Examples**

```
nx9500-6C8809(config)#guest-management guest
nx9500-6C8809(config-guest-management-guest)#?
```

Guest Management Mode commands:
- email                  Email guest-notification configuration
- guest-database-backup  Configure guest-database-backup parameters
- no                     Negate a command or set its defaults
- sms                    SMS guest-notification configuration
- sms-over-smtp          Sms-over-smtp configuration to email sms gateway address
- clrscr                 Clears the display screen
- commit                 Commit all changes made in this session
- do                     Run commands from Exec mode
- end                    End current mode and change to EXEC mode
- exit                   End current mode and down to previous mode
- help                   Description of the interactive help system
- revert                 Revert changes
- service                Service Commands
- show                   Show running system information
- write                  Write running configuration to memory or terminal

```
nx9500-6C8809(config-guest-management-guest)#
```

4.1.49.2.1  email

guest-management-policy-mode commands

Configures guest user e-mail notification settings

Guest users can register themselves with their e-mail credentials as a primary key for authentication. The captive portal system provides the pass code for their registration. Guest users need to use their registered e-mail, mobile, or member ID and the received pass code for further login to the captive portal.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
email [host|message|subject]
email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>
  security [none|ssl|starttls] username <USER-NAME> password <PASSWORD>
email message <LINE>
email subject <LINE>
```

Parameters

- `email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>`
  - Configures the SMTP server resource’s IPv4 address or hostname used for guest management email traffic, guest user credential validation, and pass code reception. Optionally you can use an existing host alias to identify the SMTP server resource.
  - `<IP/HOSTNAME>` – Specify the SMTP server resource’s IP address or hostname.
  - `<HOST-ALIAS-NAME>` – Specify the host alias name (should be existing and configured). Consider providing the host as an alias. A host alias is a configuration item that maps the alias to a hostname. Once created, it can be used across different configuration modes. Where ever used the alias is replaced by the associated hostname.

- `sender <EMAIL-ADDRESS>`
  - Configures the sender’s e-mail address. The sender here is the guest user receiving the pass code. Guest users require this pass code for registering their guest e-mail credentials.
  - `<EMAIL-SENDER>` – Specify the e-mail address (should not exceed 100 characters).

- `security [none|ssl|starttls] username <USER-NAME> password <PASSWORD>`
  - Configures the encryption protocol used by the SMTP server when communicating the pass code.
  - `none` – No encryption used. Use if no additional user authentication is needed beyond the required username and password combination.
  - `SSL` – Uses SSL encryption. This is the default setting.
  - `STARTTLS` – Uses STARTTLS encryption.

- `username <USER-NAME>`
  - Configures a username unique to this SMS guest management configuration. After configuring the username, specify the associated password. Ensure that the password is correctly provided to receive the pass code required for registering guest user credentials with SMS.
  - `<USER-NAME>` – Specify the username (should not exceed 100 characters).

- `password <PASSWORD>`
  - Configures the password associated with the specified SMTP user name
  - `<PASSWORD>` – Specify the password (should not exceed 63 characters).
### email message <LINE>

4.1.49.2.2 guest-database-backup

Enables periodic backup of a captive portal’s guest registration user database. This option is enabled by default. Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
guest-database-backup enable {<TIME>}
```

**Parameters**

- `guest-database-backup enable {<TIME>}`

| guest-database-backup enable <TIME> | Enables periodic backup of a captive portal’s guest registration user database. This command also allows you to configure the time at which the system starts backing up the database. The default backup-start time is ‘00:00’ (midnight every day).
|-------------------------------------|----------------------------------------------------------------------------------------
| - `<TIME>` – Optional. Resets the periodic database backup-start time to a user-defined value in the HH;MM format. When specified, the system starts periodic backup of the database, every day, at the specified time. |

**Examples**

nx9500-6C8809(config-guest-management-test)#guest-database-backup enable 12:30

vx9500-6C8809(config-guest-management-test)#show context
guest-management test
guest-database-backup enable 12:30

nx9500-6C8809(config-guest-management-test)#

**Related Commands**

- `no` Disables periodic backup of a captive portal’s guest registration user database
### 4.1.49.2.3 sms

**guest-management-policy-mode commands**

Configures guest user SMS notification settings

SMS enables guest users to register themselves with their e-mail or mobile device ID as the primary key for authentication. The captive portal provides the pass code for registration. Guest users use their registered e-mail or mobile device ID and the received pass code for future login to the captive portal.

![Checkmark](image)

**NOTE:** When using SMS, ensure that the WLAN’s mode of authentication is set to *none* and the mode of registration is set to *user*. In other words, captive portal authentication must always enforce guest registration.

SMS is similar to MAC address-based self registration, but in addition the captive portal sends an SMS message, containing an access code, to the user’s mobile phone number provided at the time of registration. The captive portal verifies the code, returns the *Welcome* page and provides access. This allows the administrator to verify the phone number provided and can be traced back to a specific individual should the need arise.

The default gateway used with SMS is *Clickatell*. A pass code can be sent with SMS to the guest user directly using Clickatell, or the pass code can be sent via e-mail to the SMS Clickatell gateway server, and Clickatell sends the pass code SMS to the guest user.

Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
sms [host|message]
```

```
sms host clickatell username <USER-NAME> password <PASSWORD> api-id <ID> user-agent <PYCLICKATELL> {source-number <WORD>}
```

```
sms message <LINE>
```

**Parameters**

- `sms host clickatell username <USER-NAME> password <PASSWORD> api-id <ID> user-agent <PYCLICKATELL> {source-number <WORD>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sms</td>
<td>Configures guest user SMS notification settings</td>

<td>Since the SMS service provider by default is Clickatell, set the user agent name to <em>pyclickatell</em>. The user-agent value ensures the Clickatell SMS gateway server and its related credentials, needed for sending the pass code to guest users, are configured.</td>
</tr>
</tbody>
</table>
### Example

```bash
nx9500-6C8809(config-guest-management-test)#sms host clickatell username guest1 password guest1@123 api-id test user-agent pyclickatell
```

```bash
nx9500-6C8809(config-guest-management-test)#sms message Dear guest1, Your passcode for internet access is GM-guest1
```

```bash
nx9500-6C8809(config-guest-management-test)#show context
guest-management test
  email host 192.168.13.10 sender bob@zebra.com security ssl username guest1 password guest1@123
  sms host clickatell username guest1 password guest1@123 api-id test user-agent pyclickatell
  sms message Dear guest1, Your passcode for internet access is GM-guest1
```

### Related Commands

- `no` - Removes the SMS settings used to send SMS to the guest user
4.1.49.2.4  sms-over-smtp

Configures an e-mail host server (for example: smtp.gmail.com) along with sender related credentials and the recipient gateway e-mail address to which the message is E-mailed. The gateway server converts the e-mail into SMS and sends the message to the guest users's mobile device.

When sending an e-mail, the e-mail client interacts with a SMTP server to handle the content transmission. The SMTP server on the host may have conversations with other SMTP servers to deliver the e-mail.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```text
sms-over-smtp [host|message|subject]
```

```text
sms-over-smtp  host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>
security [none|ssl|starttls] username <USER-NAME> password <PASSWORD> recipient <EMAIL-ADDRESS>
```

```text
sms-over-smtp  message <LINE>
```

```text
sms-over-smtp  subject <LINE>
```

Parameters

- **sms-over-smtp host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>]**
  - `host` - Configures the SMS gateway server resource’s IPv4 address or hostname used for guest management SMS over SMTP traffic, guest user credential validation and pass code reception. Optionally you can use an existing host alias to identify the SMS gateway server resource.
    - <IP/HOSTNAME> – Specify the SMTP gateway server resource’s IP address or hostname.
    - <HOST-ALIAS-NAME> – Specify the host alias name (should existing and configured). Consider providing the host as an alias. A host alias is a configuration item that maps the alias to a hostname. Once created, it can be used across different configuration modes. Where ever used the alias is replaced by the associated hostname.

- **sms-over-smtp sender <EMAIL-ADDRESS>**
  - `sender` - Configures the sender’s e-mail address. The sender here is the guest user receiving the pass code. Guest users require this pass code for registering their guest e-mail credentials using SMTP.
    - <EMAIL-ADDRESS> – Specify the e-mail address (should not exceed 64 characters).

- **sms-over-smtp security [none|ssl|starttls]**
  - `security` - Configures the encryption protocol used by the SMTP server when communicating the pass code
    - none – No encryption used. Use if no additional user authentication is needed beyond the required username and password combination.
    - SSL – Uses SSL encryption. This is the default setting.
    - STARTTLS – Uses STARTTLS encryption

- **sms-over-smtp username <USER-NAME> password <PASSWORD> recipient <EMAIL-ADDRESS>**
  - `username` - Specifies the username for the SMTP server.
  - `password` - Specifies the password for the SMTP server.
  - `recipient` - Specifies the recipient e-mail address.
username <USER-NAME>  Configures a username unique to this SMTP guest management configuration. After configuring the username, specify the associated password. Ensure that the correct password is provided to receive the pass code required for registering guest user credentials with SMTP.
  • <USER-NAME> – Specify the username (should not exceed 64 characters).

password <PASSWORD>  Configures the password associated with the specified SMTP user name
  • <PASSWORD> – Specify the password (should not exceed 64 characters).

recipient <EMAIL-ADDRESS>  Configures the e-mail recipient's e-mail address
  • <EMAIL-ADDRESS> – Specify the recipient's e-mail address (should not exceed 64 characters in length).

• sms-over-smtp message <LINE>

sms-over-smtp  Configures guest user SMS over SMTP notification message content

message <LINE>  Configures the content of the SMS over SMTP sent to the guest user notifying the pass code (should not exceed 1024 characters)
  • <LINE> – Specify the message content. When entering the message, use the following tags:
    GM-NAME – for the guest user's name
    GM_PASSCODE – for the pass code
    CR-NL – to enter a new line
    For example: Dear GM_NAME, CR-NL your internet access pass code is GM_PASSCODE. CR-NL Use this access code for internet access.

• sms-over-smtp subject <LINE>

sms-over-smtp  Configures guest user e-mail notification subject line content

subject <LINE>  Configures the subject line of the SMS over SMTP sent to the guest user notifying the pass code (should not exceed 100 characters)
  • <LINE> – Specify the subject line content. When entering the subject line, use the following tag:
    GM-NAME – for the guest user's name
    For example: GM_NAME, your internet access code

Examples

4.1.50 **host**

- **Global Configuration Commands**

Enters the configuration context of a remote device using its hostname

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
host <DEVICE-NAME>
```

**Parameters**

- host <DEVICE-NAME>

  **<DEVICE-NAME>**

  Specify the device's hostname. All discovered devices are displayed when 'Tab' is pressed to auto complete this command.

**Examples**

```
rfs4000-229D58(config)#host rfs4000-229D58
rfs4000-229D58(config-device-00-23-68-22-9D-58)#
```
4.1.51 inline-password-encryption

Stores the encryption key in the startup configuration file

By default, the encryption key is not stored in the startup-config file. Use the inline-password-encryption command to move the encrypted key to the startup-config file. This command uses the master key to encrypt the password, then moves it to the startup-config file.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
inline-password-encryption

Parameters
None

Usage Guidelines
When the configuration file is imported to a different device, it first decrypts the encryption key using the default key and then decrypts the rest of the configuration using the administrator configured encryption key.

Examples
rfs7000-37FABE(config)#password-encryption secret 2 12345678
rfs7000-37FABE(config)#commit write memory

This command uses the specified password for encryption key and stores it outside of startup-config.

rfs7000-37FABE(config)#inline-password-encryption
This command moves the same password to the startup-config and encrypts it with the master key.

4.1.52 ip

Global Configuration Commands

Creates a IP access control list (ACL) and/or a SNMP IP ACL.

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ip [access-list|snmp-access-list]

ip access-list <IP-ACL-NAME>
ip snmp-access-list <IP-SNMP-ACL-NAME>

Parameters

- **ip access-list <IP-ACL-NAME>**
  - Access-list
  - <IP-ACL-NAME>
    - Creates an IP ACL and enters its configuration mode
    - <IP-ACL-NAME> — Specify the ACL name. If the access list does not exist, it is created.

- **ip snmp-access-list <IP-SNMP-ACL-NAME>**
  - Snmp-access-list
  - <IP-SNMP-ACL-NAME>
    - Creates a SNMP IP ACL and enters its configuration mode. An SNMP IP ACL is an access control mechanism that uses a combination of IP ACL and SNMP community string.
    - SNMP performs network management functions using a data structure called a Management Information Base (MIB). SNMP is widely implemented but not very secure, since it uses only text community strings for accessing controller or service platform configuration files.
    - Use SNMP ACLs (firewalls) to help reduce SNMP's vulnerabilities, as SNMP traffic can be easily exploited to produce a denial of service (DoS).
    - <IP-SNMP-ACL-NAME> — Specify the SNMP IP ACL name. If the access list does not exist, it is created. After creating the SNMP ACL, define the deny/permit rules based on the network and/or host IP addresses. Once created and configured, link this SNMP IP ACL with a SNMP community string.

  **Note:** To link the SNMP community string with the SNMP IP ACL, in the management-policy-config-mode, use the following command: `snmp-server > community <COMMUNITY-STRING> > [ro|rw] > ip-snmp-access-list <IP-SNMP-ACL-NAME>`. 
Examples

rfs7000-37FABE(config)#ip access-list test
rfs7000-37FABE(config-ip-acl-test)#?

NOTE: For more information on access control lists, see Chapter 11, ACCESS-LIST.
4.1.53 ipv6

▲ Global Configuration Commands

Creates a IPv6 ACL

An IPv6 ACL defines a set of rules that filter IPv6 packets flowing through a port or interface. Each rule specifies
the action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit,
the packet is allowed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX,
  AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530,
  NX9000, NX9500, NX9510, NX9600

Syntax

ipv6 access-list <IPv6-ACL-NAME>

Parameters

- ipv6 access-list <IPv6-ACL-NAME>

Examples

rfs4000-229D58 (config)#ipv6 access-list IPv6ACLTest
rfs4000-229D58 (config-ipv6-acl-IPv6ACLTest)#?
IPv6 Access Control Mode commands:
  deny Specify packets to reject
  no Negate a command or set its defaults
  permit Specify packets to forward
  clrscr Clears the display screen
  commit Commit all changes made in this session
  do Run commands from Exec mode
  end End current mode and change to EXEC mode
  exit End current mode and down to previous mode
  help Description of the interactive help system
  revert Revert changes
  service Service Commands
  show Show running system information
  write Write running configuration to memory or terminal

rfs4000-229D58 (config-ipv6-acl-IPv6ACLTest)#

Related Commands

- no Removes an IPv6 access control list

NOTE: For more information on access control lists, see Chapter 11, ACCESS-LIST.
4.1.54 *ipv6-router-advertisement-policy*

The following table lists the IPv6 *router advertisement* (RA) policy configuration commands:

<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
<th><strong>Reference</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6-router-advertisement-policy</td>
<td>Creates a new IPv6 RA policy and enters its configuration mode</td>
<td>page 4-238</td>
</tr>
<tr>
<td>ipv6-router-advertisement-policy-mode commands</td>
<td>Summarizes the IPv6 RA policy configuration mode commands</td>
<td>page 4-240</td>
</tr>
</tbody>
</table>
4.1.54.1 ipv6-router-advertisement-policy

ipv6-router-advertisement-policy

Creates an IPv6 RA policy and enters its configuration mode

An IPv6 router policy allows routers to advertise their presence in response to solicitation messages. After receiving a neighbor solicitation message, the destination node sends an advertisement message, which includes the link layer address of the source node. After receiving the advertisement, the destination device replies with a neighbor advertisement message on the local link. After the source receives the advertisement it can communicate with other devices.

Advertisement messages are also sent to indicate a change in link layer address for a node on the local link. With such a change, the multicast address becomes the destination address for advertisement messages.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ipv6-router-advertisement-policy <POLICY-NAME>

Parameters

- ipv6-router-advertisement-policy <POLICY-NAME>

Examples

rfs4000-229D58(config)#ipv6-router-advertisement-policy test
rfs4000-229D58(config-ipv6-radv-policy-test)#?

IPv6 Router Advertisement Policy Mode commands:

- advertise
- assist-neighbor-discovery
- check-ra-consistency
- dns-server
- domain-name
- managed-config-flag
- nd-reachable-time
- no
- ns-interval
- other-config-flag
- ra
- router-lifetime
- router-preference
- unicast-solicited-advertisement

Enter the RA policy name. If the policy does not exist, it is created.
### Global Configuration Commands

- **clrscr**: Clears the display screen

</table>
4.1.54.2 advertise

ipv6-router-advertisement-policy-mode commands

Enables advertisement of IPv6 MTU and hop-count value in RAs

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

advertise [hop-limit|mtu]

Parameters

- advertise [hop-limit|mtu]

| advertise [hop-limit|mtu] | Enables advertisement of IPv6 MTU and hop-count value in RAs. Both these features are disabled by default. |

Examples

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#advertise hop-limit

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#advertise mtu

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
advertise mtu
advertise hop-limit

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

no | Enables advertisement of IPv6 MTU and hop-count value in RAs
assist-neighbor-discovery

ipv6-router-advertisement-policy-mode commands

Enables advertisement of the source link layer address in RAs to facilitate neighbor discovery. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
assist-neighbor-discovery

Parameters
None

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#assist-neighbor-discovery

Related Commands

| no | Enables the advertisement of the source link layer address in RAs |
4.1.54.2.3 check-ra-consistency

IPv6 router-advertisement-policy-mode commands

Enables checking of consistency in RA values advertised by this router with those advertised by other routers, if any, on the same link. If the values advertised are inconsistent, a conflict is logged.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
check-ra-consistency
```

Parameters

None

Examples

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#check-ra-consistency
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test advertise mtu advertise hop-limit check-ra-consistency
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```

Related Commands

| no | Disables comparison of interface-specific parameters advertised by other routers, within the link, with those advertised with this router |
4.15.4.2.4 dns-server

**ipv6-router-advertisement-policy-mode commands**

Configures the DNS server’s IPv6 address and lifetime. The configured values are advertised in RAs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}

**Parameters**
- dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}

| dns-server <IPv6> | Configures the DNS server’s IPv6 address
| lifetime [<4-3600>|expired|infinite] | Enables the use of a DNS server to resolve host names to IPv6 addresses. When an IPv6 host is configured with the address of a DNS server, the host sends DNS name queries to the server for resolution.

|lifetime [<4-3600>| expired|infinite] | Optional. Configures the DNS server’s (identified by the <IPv6> parameter) lifetime
- <4-3600> – Configures a lifetime in seconds. Specify a value form 4 - 3600 seconds. The default is 600 seconds.
- expired – Advertises that this DNS server’s lifetime has expired and should not be used
- infinite – Advertises that this DNS server’s lifetime is infinite

**Examples**

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#dns-server 2002::2 lifetime 3000

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
advertise mtu
advertise hop-limit
check-ra-consistency
dns-server 2002::2 lifetime 3000
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

**Related Commands**

| no | Removes the DNS server settings advertised in RAs. Once removed these values are not advertised in RAs. |
4.1.54.2.5 domain-name

Configures the Domain name search label advertised in RAs.

Supported in the following platforms:
  • Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  • Wireless Controllers — RFS4000, RFS6000, RFS7000
  • Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

domain-name <WORD> {lifetime [<4-3600>|expired|infinite]}

Parameters
  • domain-name <WORD> {lifetime [<4-3600>|expired|infinite]}

| domain-name <WORD> | Configures the Domain name search label advertised in RAs. Enter a fully qualified domain name (FQDN), which is an unambiguous domain name available in a router advertisement resource. To distinguish an FQDN from a regular domain name, a trailing period is added. For example, somehost.example.com.
| lifetime [<4-3600>| expired|infinite] | Optional. Configures the Domain name search label's lifetime.
  • <4-3600> – Configures a lifetime in seconds. Specify a value form 4 - 3600 seconds. The default is 600 seconds.
  • expired – Advertises that this Domain name search label's lifetime has expired and should not be used.
  • infinite – Advertises that this Domain name search label's lifetime is infinite.

Examples

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
  advertise mtu
  advertise hop-limit
  check-ra-consistency
dns-server 2002::2 lifetime 3000
  domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

| no | Removes the Domain name settings advertised in RAs. Once removed these values are not advertised in RAs. |
4.1.54.2.6 managed-config-flag

Sets the managed address configuration flag in RAs. When set, it indicates that IPv6 addresses are available through DHCPv6. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
managed-config-flag

Parameters
None

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#managed-config-flag
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
  managed-config-flag
  advertise mtu
  advertise hop-limit
  check-ra-consistency
  dns-server 2002::2 lifetime 3000
  domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

4.1.54.2.7  nd-reachable-time

Enables advertisement of neighbor discovery reachable time in RAs. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
nd-reachable-time [<5000-3600000>|global]
```

Parameters

- `nd-reachable-time [<5000-3600000>|global]`

<table>
<thead>
<tr>

```
Disables advertisement of neighbor reachable time in RAs
4.1.54.2.8 no

*ipv6-router-advertisement-policy-mode commands*

Removes or reverts router advertisement policy settings. Use the no command to remove or revert the interface-specific parameters that are advertised by link router.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
no [advertise [hop-limit|mtu]|assist-neighbor-discovery|check-ra-consistency|
dns-server <IPv6>|domain-name <WORD>|managed-config-flag|nd-reachable-time|\nns-interval|other-config-flag|ra [interval|suppress]|router-lifetime|
unicast-solicited-advertisement]
```

**Parameters**

- no

**Examples**

```plaintext
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context

domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```

no <PARAMETERS> Removes or reverts this IPv6 router advertisement policy’s settings based on the parameters passed.
4.1.54.2.9 ns-interval

ipv6-router-advertisement-policy-mode commands

Configures the neighbor solicitation (NS) retransmit timer value advertised in RAs. This is the interval between two successive NS messages. When specified, it enables the sending of the specified value in RAs. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
ns-interval [<1000-3600000>|global]

Parameters
- ns-interval [<1000-3600000>|global]

| ns-interval [<1000-3600000]> | Configures the NS interval advertised in RAs. Use one of the following options:
|-------------------------------|---------------------------------------------------------------|
| global                        | • <1000-3600000> – Specify a value from 1000 - 3600000 milliseconds. The default is 1000 milliseconds.
|                               | • global – Advertises the NS interval configured for the system. This is configured on the device in the device configuration mode. For more information, see ipv6.

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#ns-interval 3000

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
managed-config-flag
nd-reachable-time global
ns-interval 3000
advertise mtu
advertise hop-limit
check-ra-consistency
dns-server 2002::2 lifetime 3000
domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

no Disables advertisement of NS interval in RAs
4.1.54.2.10  other-config-flag

Sets the other-configuration flag in RAs. When set, it indicates that other configuration details, such as DNS-related information, are available through DHCPv6. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
other-config-flag

Parameters
None

Examples
rfs7000-6DCD4B(config-ipv6-ra-radv-policy-test)#other-config-flag

4.1.54.2.11 ra

*ipv6-router-advertisement-policy-mode commands*

Configures RA related parameters, such as the interval between two unsolicited successive RAs. It also allows suppression of RAs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**
```
ra [interval <3-1800>|suppress]
```

**Parameters**
- `ra [interval <3-1800>|suppress]`

<table>
<thead>
<tr>
<th>interval &lt;3-1800&gt;</th>
<th>Configures the interval, in seconds, between two unsolicited successive RAs.</th>

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```

**Related Commands**
```
no
```

Removes the RA interval, and enables the sending of RAs.
4.1.54.2.12 router-lifetime

ipv6-router-advertisement-policy-mode commands

Configures the default router’s lifetime, in seconds, advertised in RAs

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
router-lifetime <0-9000>

Parameters
- router-lifetime <0-9000>

| router-lifetime <0-9000> | Configures the default router’s lifetime  
|--------------------------|-----------------------------------------------  
| <0-9000>                 | - <0-9000> – Specify a value from 0 - 9000 seconds. The default value is 1500 seconds. 
|                           | Note: A value of “0” indicates that this router is not the default router. |

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#router-lifetime 2000

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
ra suppress
ra interval 200
managed-config-flag
nd-reachable-time global
router-lifetime 2000

advertise hop-limit
check-ra-consistency
dns-server 2002::2 lifetime 3000
domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands
- no
  Removes the default router’s lifetime
4.1.54.2.13 router-preference

*ipv6-router-advertisement-policy-mode commands*

Configures the router preference field value advertised in RAs. The options are high, medium, and low. This value is used to prioritize and select the default router when multiple routers are discovered.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
router-preference [high|medium|low]
```

**Parameters**

- `router-preference [high|medium|low]`

---

| router-preference [high|medium|low] | Sets this router's preference over other routers, in the link, to be the default router. The options are high, low, and medium. The default value is medium. |
|--------------------------------------|------------------------------------------------------------------------------------------------|
| **Note:** The following points should be taken into consideration when configuring router preference: | |
| • For a router to be selected as a default router, the router's lifetime should not be equal to "0". | |
| • To enable default router selection, using router information contained in RAs, configure default router selection on that interface. | |

**Examples**

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#router-preference high
```

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
  ra suppress
  ra interval 200
  managed-config-flag
  nd-reachable-time global
  router-lifetime 2000
  advertise mtu
  advertise hop-limit
  router-preference high
  check-ra-consistency
dns-server 2002::2 lifetime 3000
domain-name TechPubbs lifetime infinite
```

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```
4.1.54.2.14 **unicast-solicited-advertisement**

*ipv6-router-advertisement-policy-mode commands*

Enables uncasting of solicited RAs. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
unicast-solicited-advertisement
```

**Parameters**

None

**Examples**

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#unicast-solicited-advertisement
```

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test

4.1.55 l2tpv3

Global Configuration Commands

Configures a Layer 2 Tunnel Protocol Version 3 (L2TPv3) tunnel policy, used to create one or more L2TPv3 tunnels. The L2TPv3 policy defines the control and encapsulation protocols needed for tunneling layer 2 frames between two IP nodes. This policy enables creation of L2TPv3 tunnels for transporting Ethernet frames between bridge VLANs and physical GE ports. L2TPv3 tunnels can be created between any vendor devices supporting L2TPv3 protocol.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

l2tpv3 policy <L2TPV3-POLICY-NAME>

Parameters

- l2tpv3 policy <L2TPV3-POLICY-NAME>

Examples

rfs7000-37FABE(config)#l2tpv3 policy L2TPV3Policy1
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#?

L2tpv3 Policy Mode commands:

- `cookie-size` – Size of the cookie field present in each l2tpv3 data message
- `failover-delay` – Time interval for re-establishing the tunnel after the failover (RF-Domain manager/VRRP-master/Cluster-master failover)
- `force-l2-path-recovery` – Enables force learning of servers, gateways etc., behind the l2tpv3 tunnel when the tunnel is established
- `hello-interval` – Configure the time interval (in seconds) between l2tpv3 Hello keep-alive messages exchanged in l2tpv3 control connection
- `no` – Negate a command or set its defaults
- `reconnect-attempts` – Maximum number of attempts to reestablish the tunnel.
- `reconnect-interval` – Time interval between the successive attempts to reestablish the l2tpv3 tunnel
- `retry-attempts` – Configure the maximum number of retransmissions for signaling message
- `retry-interval` – Time interval (in seconds) before the initiating a retransmission of any l2tpv3 signaling message
- `rx-window-size` – Number of signaling messages that can be received without sending the acknowledgement
- `tx-window-size` – Number of signaling messages that can be sent without receiving the acknowledgement

- `clrscr` – Clears the display screen
- `commit` – Commit all changes made in this session
- `end` – End current mode and change to EXEC mode
- `exit` – End current mode and down to previous mode
- `help` – Description of the interactive help system
- `revert` – Revert changes
- `service` – Service Commands
- `show` – Show running system information
write                   Write running configuration to memory or terminal

4.1.56  mac

Global Configuration Commands

Configures a MAC ACLs

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

mac access-list <MAC-ACL-NAME>

Parameters

- mac access-list <MAC-ACL-NAME>

Examples

rfs7000-37FABE(config)#mac access-list test
rfs7000-37FABE(config-mac-acl-test)#?

MAC Extended ACL Configuration commands:
- deny Specify packets to reject
- disable Disable rule if not needed
- no Negate a command or set its defaults
- permit Specify packets to forward
- clrscr Clears the display screen
- commit Commit all changes made in this session
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-mac-acl-test)#

Related Commands

no Removes a MAC access control list

NOTE: For more information on MAC access control lists, see Chapter 11, ACCESS-LIST.
4.1.57 **management-policy**

*Global Configuration Commands*

Configures a management policy. Management policies include services that run on a device, welcome messages, banners etc.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
management-policy <MANAGEMENT-POLICY-NAME>
```

**Parameters**

- `management-policy <MANAGEMENT-POLICY-NAME>`

---

### Examples

```
<DEVICE>(config)#management-policy test
<DEVICE>(config-management-policy-test)#?
```

Management Mode commands:

- `aaa-login` Set authentication for logins
- `banner` Define a login banner
- `ftp` Enable FTP server
- `http` Hyper Text Terminal Protocol (HTTP)
- `https` Secure HTTP
- `idle-session-timeout` Configure idle timeout for a configuration session (GUI or CLI)
- `ipv6` IPv6 Protocol
- `no` Negate a command or set its defaults
- `privilege-mode-password` Set the password for entering CLI privilege mode
- `restrict-access` Restrict management access to the device
- `snmp-server` SNMP
- `ssh` Enable ssh
- `t5` T5 configuration
- `telnet` Enable telnet
- `user` Add a user account
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
<DEVICE>(config-management-policy-test)#
```

### 4.1.58 meshpoint

**Global Configuration Commands**

Creates a new meshpoint and enters its configuration mode. Use this command to select and configure existing meshpoints.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
meshpoint [<MESHPOINT-NAME>|containing <WORD>]
```

**Parameters**

- `meshpoint [<MESHPOINT-NAME>|containing <WORD>]`

**Examples**

```plaintext
rfs7000-37FABE(config)#meshpoint TestMeshpoint
rfs7000-37FABE(config-meshpoint-TestMeshpoint)#?
```

**Mesh Point Mode commands:**

- `allowed-vlans` Set the allowed VLANs
- `beacon-format` The beacon format of this meshpoint
- `control-vlan` VLAN for meshpoint control traffic
- `data-rates` Specify the 802.11 rates to be supported on this meshpoint
- `description` Configure a description of the usage of this meshpoint
- `force` Force suboptimal paths
- `meshid` Configure the Service Set Identifier for this meshpoint
- `neighbor` Configure neighbor specific parameters
- `no` Negate a command or set its defaults
- `root` Set this meshpoint as root
- `security-mode` The security mode of this meshpoint
- `shutdown` Shutdown this meshpoint
- `use` Set setting to use
- `wpa2` Modify ccmp wpa2 related parameters

```plaintext
rfs7000-37FABE(config-meshpoint-TestMeshpoint)#
```

**Related Commands**

- `no` Removes an existing meshpoint
NOTE: For more information on Meshpoint configuration, see Chapter 26, MESHPOINT.
4.1.59 **meshpoint-qos-policy**

- **Global Configuration Commands**

Configures a set of parameters that defines the meshpoint quality of service (QoS) policy

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>
```

**Parameters**

- `meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>`

**Examples**

```
rfs7000-37FABE(config)#meshpoint-qos-policy TestMeshpointQoS
rfs7000-37FABE(config-meshpoint-qos-TestMeshpointQoS)#?
```

Mesh Point QoS Mode commands:

- `accelerated-multicast` Configure accelerated multicast streams address and forwarding QoS classification
- `no` Negate a command or set its defaults
- `rate-limit` Configure traffic rate-limiting parameters on a per-meshpoint/per-neighbor basis

- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-meshpoint-qos-TestMeshpointQoS)#
```

**Related Commands**

- `no` Removes an existing meshpoint QoS policy

---

**NOTE:** For more information on Meshpoint QoS policy configuration, see Chapter 26, MESHPOINT.
4.1.60 mint-policy

> Global Configuration Commands

Configures the global MiNT policy

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

mint-policy global-default

Parameters

- mint-policy global-default

| global-default | Configures the global default MiNT policy |

Examples

rfs7000-37FABE(config)#mint-policy global-default
rfs7000-37FABE(config-mint-policy-global-default)#?
Mint Policy Mode commands:
  level Mint routing level
  mtu Configure the global Mint MTU
  no Negate a command or set its defaults
  router Mint router
  udp Configure mint UDP/IP encapsulation
  clrscr Clears the display screen
  commit Commit all changes made in this session
  do Run commands from Exec mode
  end End current mode and change to EXEC mode
  exit End current mode and down to previous mode
  help Description of the interactive help system
  revert Revert changes
  service Service Commands
  show Show running system information
  write Write running configuration to memory or terminal

rfs7000-37FABE(config-mint-policy-global-default)#

Related Commands

| no | Removes an existing MiNT policy |

NOTE: For more information on MiNT policy configuration, see Chapter 14, MINT-POLICY.
4.1.61 nac-list

A Network Access Control (NAC) policy configures a list of devices that can access a network based on their MAC addresses.

The following table lists NAC list configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>nac-list</td>
<td>Creates a NAC list and enters its configuration mode</td>
<td>page 4-265</td>
</tr>
<tr>
<td>nac-list-mode commands</td>
<td>Summarizes NAC list configuration mode commands</td>
<td>page 4-266</td>
</tr>
</tbody>
</table>
4.1.61.1 nac-list

 Configures a NAC list that manages access to the network

 Supported in the following platforms:

 - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
 - Wireless Controllers — RFS4000, RFS6000, RFS7000
 - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

 Syntax

 nac-list <NAC-LIST-NAME>

 Parameters

 - nac-list <NAC-LIST-NAME>

 Examples

 rfs7000-37FABE(config)#nac-list test
 rfs7000-37FABE(config-nac-list-test)#?

 NAC List Mode commands:

 - exclude Specify MAC addresses to be excluded from the NAC enforcement list
 - include Specify MAC addresses to be included in the NAC enforcement list
 - no Negate a command or set its defaults

 clrscr Clears the display screen
 commit Commit all changes made in this session
 do Run commands from Exec mode
 end End current mode and change to EXEC mode
 exit End current mode and down to previous mode
 help Description of the interactive help system
 revert Revert changes
 service Service Commands
 show Show running system information
 write Write running configuration to memory or terminal

 rfs7000-37FABE(config-nac-list-test)#

 Related Commands

 no Removes a NAC list
4.1.61.2 nac-list-mode commands

The following table summarizes NAC list configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude</td>
<td>Specifies the MAC addresses excluded from the NAC enforcement list</td>
<td>page 4-267</td>
</tr>
<tr>
<td>include</td>
<td>Specifies the MAC addresses included in the NAC enforcement list</td>
<td>page 4-268</td>
</tr>
<tr>
<td>no</td>
<td>Cancels an exclude or include NAC list rule</td>
<td>page 4-269</td>
</tr>
</tbody>
</table>
4.1.61.2.1 exclude

nac-list-mode commands

Specifies the MAC addresses excluded from the NAC enforcement list

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
exclude <START-MAC> [<END-MAC> precedence <1-1000> | precedence <1-1000>]

Parameters
- exclude <START-MAC> [<END-MAC> precedence <1-1000> | precedence <1-1000>]

| <START-MAC> | Specifies a range of MAC addresses or a single MAC address to exclude from the NAC enforcement list
| --- | --- |
| • <START-MAC> | Specify the first MAC address in the range.
| Note: Use this parameter to specify a single MAC address.

| <END-MAC> | Specifies the last MAC address in the range (optional if a single MAC is added to the list)
| --- | --- |
| • <END-MAC> | Specify the last MAC address in the range.

| precedence <1-1000> | Sets the rule precedence. Exclude entries are checked in the order of their rule precedence.
| --- | --- |
| • <1-1000> | Specify a value from 1 - 1000.

Examples
rfs7000-37FABE(config-nac-list-test)#exclude 00-40-96-B0-BA-2A precedence 1

rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
  exclude 00-40-96-B0-BA-2A 00-40-96-B0-BA-2A precedence 1
rfs7000-37FABE(config-nac-list-test)#
4.1.61.2.2 include

* nac-list-mode commands

Specifies the MAC addresses included in the NAC enforcement list

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
include <START-MAC> [ <END-MAC> precedence <1-1000> | precedence <1-1000> ]

Parameters
- include <START-MAC> [ <END-MAC> precedence <1-1000> | precedence <1-1000> ]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;START-MAC&gt;</td>
<td>Specifies a range of MAC addresses or a single MAC address to include in the NAC enforcement list</td>
</tr>
<tr>
<td></td>
<td>• &lt;START-MAC&gt; – Specify the first MAC address in the range.</td>
</tr>
<tr>
<td>Note:</td>
<td>Use this parameter to specify a single MAC address.</td>
</tr>
<tr>
<td>&lt;END-MAC&gt;</td>
<td>Specifies the last MAC address in the range (optional if a single MAC is added to the list)</td>
</tr>
<tr>
<td></td>

<td>Sets the rule precedence. Include entries are checked in the order of their rule precedence.</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-1000&gt; – Specify a value from 1 - 1000.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-nac-list-test)#include 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
  exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
  include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#
4.1.61.2.3 no

- nac-list-mode commands

Cancels an exclude or include NAC list rule

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9560

Syntax

no [exclude|include]

no [exclude|include] <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]

Parameters

- no <PARAMETERS>

Examples

The following example shows the NAC list ‘test’ settings before the ‘no’ command is executed:

rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
  exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
  include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#

rfs7000-37FABE(config-nac-list-test)#no exclude 00-40-96-B0-BA-2A precedence 1

The following example shows the NAC list ‘test’ settings after the ‘no’ command is executed:

rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
  include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#

no wlan [<WLAN-NAME>|all|containing <WLAN-NAME-SUBSTRING>]

no service set [command-history|reboot-history|upgrade-history] {on <DEVICE-NAME>}

The following 'no' commands are specific to the RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, and NX9000 platforms:

no t5 <T5-DEVICE-MAC>

The following 'no' commands are specific to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 platforms:

no bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list]

The following 'no' commands are specific to the NX45XX, NX65XX, NX9000 series service platforms:

no smart-cache-policy <SMART-CACHE-POLICY-NAME>

no route-map <ROUTE-MAP-NAME>

The following 'no' commands are specific to the AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132, RFS4000, RFS6000, RFS7000, NX45XX and NX65XX platforms:

no url-filter <URL-FILTER-NAME>

The following 'no' command is specific to the NX9000 series service platforms:

no vx9000 <VX9000-MAC>

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes or resets settings, configurable in the global configuration mode, based on the parameters passed |

Examples

<DEVICE>(config)#no ?

</tbody>
</table>
4.1.63.1 nsight-policy

*nsight-policy*

Creates an NSight policy and enters its configuration mode

The NSight policy is an advance management, analytics, reporting, and troubleshooting tool, which when created and applied at the RF Domain level allows the RF Domain manager to send statistics (polled from devices within the RF Domain) to the NOC. The NOC, when enabled as the NSight server, stores this data in a locally or externally hosted MongoDB database. This large, complex data are collated and presented on the NOC’s GUI in visual forms that are easy to understand and manage. For large networks, enabling NSight removes the inadequacies of the existing data collection, presentation, and analytics framework.

The WING NSight implementation consists of the following components:

- An NSight server hosted on the NOC
- A MongoDB database hosted on the NOC. This database consists of AP statistics gathered by RF Domain managers.
- An NSight UI application running on the NOC
- An NSight client hosted on the RF Domain manager. This is the SSM statistics module that periodically gathers statistics from adopted APs and forwards to the NSight server.

---

**NOTE:** NSight is a licensed option. To enable the NSight, navigate to the NSight server’s device configuration mode and apply the NSight license.

---

To enable NSight, follow the steps given below:

1. Create an NSight policy to enable the NSight server.
   
   ```
   nx9500-6C8809(config-nsight-policy-nsight-for-noc)#enable
   nx9500-6C8809(config-nsight-policy-nsight-for-noc)#nsight-server
   nx9500-6C8809(config-nsight-policy-nsight-for-noc)#show context
   nsight-policy nsight-for-noc
   nsight-server
   nx9500-6C8809(config-nsight-policy-nsight-for-noc)#
   ```

2. Apply the policy configured in step 1 to the NOC. This enables the NOC to recognize itself as the NSight server.
   
   ```
   nx9500-6C8809(config)#self
   nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#use nsight-policy nsight-for-noc
   ```

3. Create another NSight policy pointing to the NSight server host.
   
   ```
   nx9500-6C8809(config-nsight-policy-nsight-for-rfdm)#enable
   nx9500-6C8809(config-nsight-policy-nsight-for-rfdm)#server host 192.168.13.13
   nx9500-6C8809(config-nsight-policy-nsight-for-rfdm)#show context
   nsight-policy nsight-for-rfdm
   server host 192.168.13.13 https
   ```

4. Apply the policy configured in step 3 to the RF Domain. This enables the domain manager to collect statistics from the access points and send to the NOC serving as the NSight server.
   
   ```
   nx9500-6C8809(config)#rf-domain TechPubs
   nx9500-6C8809(config-rf-domain-TechPubs)#use nsight-policy nsight-for-rfdm
   ```

---

**NOTE:** NSight is a licensed option. To enable the NSight, navigate to the NSight server’s device configuration mode and apply the NSight license.
The NOC stores the statistical data, received from RF Domain managers, in the MongoDB database. This data contains following information:

- Operating parameters of devices – Fixed information of devices, such as IP addresses, wired interface status, radio operating parameters (channel, power etc.)
- SMART RF neighbor information – SMART RF neighbors' data for every radio. This data is used to generate and display heat-maps on floor map. Any changes in the SMART RF data is reported to the MART server and stored in the database.
- Rogue AP information – Rogue AP list and rogue AP status. Any changes in the rouge AP list or status is reported to the MART server and stored in the database.
- Wireless client list – Details of wireless clients within the RF Domain
- Wireless access point statistics – Statistics of all the APs in the RF Domain. AP statistics includes details, such as number of bytes transferred since the last reporting interval, number of TX retries, signal-noise-ratio (SNR), noise, RF quality index, client count etc.
- Wireless client statistics – Statistics of all the wireless clients in the RF Domain. Wireless client statistics includes details, such as number of bytes transferred from last reporting interval, number of TX retries, SNR, RF quality index etc.
- Wired interface statistics – Statistics of wired interfaces of all APs. It includes details, such as interface status, number of bytes transferred from last reporting interval etc.
- Event history – Event details for all APs adopted by the NOC. These are events received by the Cfgd every 30 seconds and sent to the MART server. Each event consists of the RF Domain name, wireless client MAC if applicable, AP MAC, event mnemonic, event timestamp, and the event string itself.

Apart from the above mentioned data, the MongoDB database contains information that is reported to the NSight server by the Cfgd running on the NOC. These are:

- Device information – Information of all devices (APs and controllers) within the network, such as hostname, device type, firmware version, location, geo-coordinates etc. This information is collected and reported by the Cfgd running on the NOC.
- Configuration elements, such as RF Domains, RF Domain location hierarchy, WLANs.

**NOTE:** All network devices (APs and controllers) should be upgraded to the latest WiNG build for NSight and MongoDB implementation.

Supported in the following platforms:
- Service Platforms — NX7500, NX9500, NX9510, NX9600

**Syntax**

```plaintext
nsight-policy <NSIGHT-POLICY-NAME>
```

**Parameters**

- `nsight-policy <NSIGHT-POLICY-NAME>`

| `<NSIGHT-POLICY-NAME>` | Specify the NSight policy name. If the policy does not exist, it is created. |
Examples

```
nx9500-6C8809(config)#nsight-policy test
nx9500-6C8809(config-nsight-policy-test)#?
Nsight Policy Mode) commands:
    enable         Enable this Nsight policy
    no             Negate a command or set its defaults
    nsight-server  Enable Nsight server functionality
    server         Configure Nsight server
    clrscr         Clears the display screen
    commit         Commit all changes made in this session
    exit           End current mode and down to previous mode
    help           Description of the interactive help system
    revert         Revert changes
    service        Service Commands
    show           Show running system information
    write          Write running configuration to memory or terminal
```

### 4.1.63.2.1 enable

#### nsight-policy commands

Enables this NSight policy. The default setting is enabled.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

```
enable
```

**Parameters**

None

**Examples**

```
nx9510-6C8A5C(config-nsight-policy-test2)#enable
```

**Related Commands**

<table>

<td>Disables this NSight policy</td>
</tr>
</tbody>
</table>
### 4.1.63.2.2 nsight-server

#### nsight-policy commands

Enables NSight server functionality and configures the SMTP report delivery settings. When applied to a device (NOC), this policy enables the device to recognize itself as the NSight server.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

#### Syntax

```
nsight-server {smtp-report-delivery host <WORD> sender <EMAIL-ADD> [port <1-65535>|
  security [none|ssl|starttls]|username <USER-NAME> password [0|2|<WORD>]]
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsight-server</td>
<td>Enables NSight server functionality on the host using this NSight policy</td>
</tr>
</tbody>
</table>
| smtp-report-delivery host <WORD> | Optional. Configures SMTP report delivery settings  
  |  • host <WORD> – Configures the SMTP server host  
  |  • <WORD> – Specify the SMTP server host’s IP address or hostname.  |
| sender <EMAIL-ADD> | Optional. Configures the SMTP sender’s e-mail address  
  |  • <EMAIL-ADD> – Specify the sender’s e-mail address.  |
| port <1-65535> | Optional. Configures the SMTP server port  
  |  • <1-65535> – Specify the port from 1 - 65535.  |
| security [none|ssl|starttls] | Optional. Configures the encryption protocol used by the SMTP server. The options are:  
  |  • none – Uses no encryption  
  |  • ssl – Uses SSL encryption  
  |  • starttls – Uses STARTTLS encryption  |
| username <USER-NAME> password [0|2|<WORD>] | Optional. Configures the SMTP username  
  |  • <USER-NAME> Specify the user name  
  |  • password [0|2|<WORD>] – Configures the password associated with the above configured user  
  |  • 0 – Configures a clear text password  
  |  • 2 – Configures an encrypted password  
  |  • <WORD> – Enter the password.  |

#### Examples

```
nx9510-6C8A5C(config-nsight-policy-test2)#nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#show context nsight-policy test2
nx9510-6C8A5C(config-nsight-policy-test2)#
```

4.1.63.2.3 server

nsight-policy commands

Configures the NSight server host. This configuration is used by the NSight client to identify the NSight server host.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}

Parameters

- server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}

Examples

nx9510-6C8A5C(config-nsight-policy-test2)#server host 172.22.0.153 http

nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
server host 172.22.0.153 http
nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#

Related Commands

no

Removes NSight server host settings from this NSight policy
4.1.63.2.4  **no**

nsight-policy commands

Removes NSight policy settings

Supported in the following platforms:

- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
no [enable|nsight-server {smtp-report-delivery}|server host [<IP>|<HOSTNAME>|<X:X::X:]]
```

**Parameters**

- no <PARAMETERS>

---

**Examples**

The following example shows the NSight policy ‘test2’ settings before the ‘no’ command is executed:

```plaintext
nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
server host 172.22.0.153 http
nsight-server
```

```
nx9510-6C8A5C(config-nsight-policy-test2)#
```

```
nx9510-6C8A5C(config-nsight-policy-test2)#no server host 172.22.0.153
```

The following example shows the NSight policy ‘test2’ settings after the ‘no’ command is executed:

```
nx9500-6C8809(config-nsight-policy-test2)#show context
nsight-policy test2
nsight-server
```

```
nx9510-6C8A5C(config-nsight-policy-test2)#
```
4.1.64 passpoint-policy

Global Configuration Commands

Creates a new passpoint policy and enters its configuration mode.

The passpoint policy implements the Hotspot 2.0 Wi-Fi Alliance standard, enabling interoperability between clients, infrastructure, and operators. It makes a portion of the IEEE 802.11u standard mandatory and adds Hotspot 2.0 extensions that allow clients to query a network before actually attempting to join it.

The passpoint policy allows a single or set of Hotspot 2.0 configurations to be global and referenced by the devices that use it. It is mapped to a WLAN. However, only primary WLANs on a BSSID will have their passpoint policy configuration used.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
passpoint-policy <POLICY-NAME>

Parameters

- passpoint-policy <POLICY-NAME>

Examples
rfs4000-229D58(config)#passpoint-policy test
rfs4000-229D58(config-passpoint-policy-test)#?

Passpoint Policy Mode commands:
- 3gpp

**NOTE:** For more information on passpoint policy, see *Chapter 27, PASSPOINT POLICY.*
4.1.65 **password-encryption**

*Global Configuration Commands*

Enables password encryption

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
password-encryption secret 2 <LINE>
```

**Parameters**

- `secret 2 <LINE>`

<table>
<thead>
<tr>
<th>secret 2 &lt;LINE&gt;</th>
<th>Encrypts passwords with a secret phrase</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 – Specifies the encryption type as either SHA256 or AES256</td>
<td></td>
</tr>
<tr>
<td>&lt;LINE&gt; – Specify the encryption passphrase.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config)#password-encryption secret 2 example_company
```

**Related Commands**

| no | Disables password encryption |
4.1.66 profile

- **Global Configuration Commands**

  Configures profile related commands. If no parameters are given, all profiles are selected.

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|containing|filter|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}

```

**Parameters**

- **profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|containing|filter|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}**
  - Configures device profile commands. If no device profile is specified, the system configures all device profiles.
  - **<DEVICE-TYPE>** – Select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, and NX9600. After specifying the device type, specify the profile name.
  - **<DEVICE-PROFILE-NAME>** – Specify the profile name.

- **profile {containing <DEVICE-PROFILE-NAME>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600]}
  - Optional. Configures profiles that contain a specified sub-string in the hostname

- **profile {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600]}
  - Optional. Configures profiles that contain a specified sub-string in the profile name to filter profiles.
### Global Configuration Commands

**filter type** | Optional. An additional filter used to configure a specific type of device profile. If no device type is specified, the system configures all device profiles.
---|---
| • type – Filters profiles by the device type. Select a device type from the following options: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, and NX9600.

Note: The NX9600 profile option is only available on an NX9600 device.

| profile | Configures device profile commands
---|---
| filter type | Optional. An additional filter used to configure a specific type of device profile. If no device type is specified, the system configures all device profiles.
| • type – Filters profiles by the device type. Select a device type from the following options: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, and NX9600.

Note: The NX9600 profile option is only available on an NX9600 device.

### Examples

```bash
<DEVICE> (config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE> (config-profile-<PROFILE-NAME>)#?
```

Profile Mode commands:
- **adopter-auto-provisioning-policy-lookup** | Use centralized auto-provisioning policy when adopted by another controller
- **adoption** | Adoption configuration
- **alias** | Alias
- **application-policy** | Application Policy configuration
- **area** | Set name of area where the system is located
- **arp** | Address Resolution Protocol (ARP)
- **auto-learn-staging-config** | Enable learning network configuration of the devices that come for adoption
- **autogen-uniqueid** | Autogenerate a unique id
- **autoinstall** | Autoinstall settings
- **bluetooth-detection** | Detect Bluetooth devices using the Bluetooth USB module
- **bridge** | Ethernet bridge
- **captive-portal** | Captive portal
- **cdp** | Cisco Discovery Protocol
- **cluster** | Cluster configuration
- **configuration-persistence** | Enable persistence of configuration across reboots (startup config file)
- **controller** | WLAN controller configuration
- **critical-resource** | Critical Resource
- **crypto** | Encryption related commands
- **database-backup** | Scheduled Database Backup
- **device-upgrade** | Device firmware upgrade
- **dot1x** | 802.1X
- **dpi** | Enable Deep-Packet-Inspection (Application Assurance)
- **dscp-mapping** | Configure IP DSCP to 802.1p priority mapping for untagged frames
- **email-notification** | Email notification configuration
- **enforce-version** | Check the firmware versions of devices before interoperating
- **environmental-sensor** | Environmental Sensors Configuration

**4.1.67 radio-qos-policy**

*Global Configuration Commands*

Configures a radio quality-of-service (QoS) policy

Supported in the following platforms:
- Wireless Controllers — RFS4011

**Syntax**

```
radio-qos-policy <RADIO-QOS-POLICY-NAME>
```

**Parameters**

- `radio-qos-policy <RADIO-QOS-POLICY-NAME>`

---

<table>
<thead>
<tr>
<th><code>&lt;RADIO-QOS-POLICY-NAME&gt;</code></th>
<th>Specify the radio QoS policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
</table>

**Examples**

```
rfs7000-37FABE(config)#radio-qos-policy test
rfs7000-37FABE(config)#radio-qos-policy test?
```

Radio QoS Mode commands:

- `accelerated-multicast` Configure multicast streams for acceleration
- `admission-control` Configure admission-control on this radio for one or more access categories
- `no` Negate a command or set its defaults
- `smart-aggregation` Configure smart aggregation parameters
- `wmm` Configure 802.11e/Wireless MultiMedia parameters

- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-radio-qos-test)#
```

**Related Commands**

<table>
<thead>
<tr>
<th><code>no</code></th>
<th>Removes an existing Radio QoS policy</th>
</tr>
</thead>
</table>

---

**NOTE:** For more information on radio qos policy, see *Chapter 17, RADIO-QOS-POLICY.*
4.1.68 radius-group

Global Configuration Commands

Configures RADIUS user group parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

radius-group <RADIUS-GROUP-NAME>

Parameters

- radius-group <RADIUS-GROUP-NAME>

Examples

rfs7000-37FABE(config)#radius-group testgroup
rfs7000-37FABE(config-radius-group-testgroup)#?

Radius user group configuration commands:

- guest Make this group a Guest group
- no Negate a command or set its defaults
- policy Radius group access policy configuration
- rate-limit Set rate limit for group
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-radius-group-testgroup)#

Related Commands

- no Removes an existing RADIUS group

NOTE: For more information on RADIUS user group commands, see Chapter 16, RADIUS-POLICY.
4.1.69 radius-server-policy

**Global Configuration Commands**

Creates an onboard device RADIUS policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

radius-server-policy <RADIUS-SERVER-POLICY-NAME>

**Parameters**

- radius-server-policy <RADIUS-SERVER-POLICY-NAME>

**Examples**

```bash
rfs7000-37FABE(config)#radius-server-policy testpolicy
rfs7000-37FABE(config-radius-server-policy-testpolicy)#?
```

**Radius Configuration commands:**

- **authentication**  
  Radius authentication
- **bypass**  
  Bypass Certificate Revocation List (CRL) check
- **chase-referral**  
  Enable chasing referrals from LDAP server
- **crl-check**  
  Enable Certificate Revocation List (CRL) check
- **ldap-agent**  
  LDAP Agent configuration parameters
- **ldap-group-verification**  
  Enable LDAP Group Verification setting
- **ldap-server**  
  LDAP server parameters
- **local**  
  RADIUS local realm
- **nas**  
  RADIUS client
- **no**  
  Negate a command or set its defaults
- **proxy**  
  RADIUS proxy server
- **session-resumption**  
  Enable session resumption/fast reauthentication by using cached attributes
- **termination**  
  Enable EAP termination for proxy requests
- **use**  
  Set setting to use
- **clrscr**  
  Clears the display screen
- **commit**  
  Commit all changes made in this session
- **do**  
  Run commands from Exec mode
- **end**  
  End current mode and change to EXEC mode
- **exit**  
  End current mode and down to previous mode
- **help**  
  Description of the interactive help system
- **revert**  
  Revert changes
- **service**  
  Service Commands
- **show**  
  Show running system information
- **write**  
  Write running configuration to memory or terminal

**Related Commands**

- **no**  
  Removes an existing RADIUS server policy

---

**NOTE:** For more information on RADIUS server policy commands, see **Chapter 16, RADIUS-POLICY**.
4.1.70 radius-user-pool-policy

Global Configuration Commands

Configures a RADIUS user pool

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

radius-user-pool-policy <RADIUS-USER-POOL-POLICY-NAME>

Parameters

- radius-user-pool-policy <RADIUS-USER-POOL-POLICY-NAME>

Examples

rfs7000-37FABE(config)#radius-user-pool-policy testpool
rfs7000-37FABE(config-radius-user-pool-testpool)#?

Radius User Pool Mode commands:

duration Set a guest user’s access duration
no Negate a command or set its defaults
user Radius user configuration

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-radius-user-pool-testpool)#

Related Commands

no Removes an existing RADIUS user pool

NOTE: For more information on RADIUS user group commands, see Chapter 16, RADIUS-POLICY.
4.1.71 rename

Global Configuration Commands

Renames and existing TLO

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

rename tlo <TLO-NAME>

Parameters

- rename tlo <TLO-NAME> <NEW-TLO-NAME>

<table>
<thead>
<tr>
<th>rename tlo &lt;TLO-NAME&gt; &lt;NEW-TLO-NAME&gt;</th>
<th>Renames an existing TLO object</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;TLO-NAME&gt; – Specify the TLO’s name. This is the TLO that is to be renamed.</td>
<td></td>
</tr>
<tr>
<td>• &lt;NEW-TLO-NAME&gt; – Specify the new name for this TLO</td>
<td></td>
</tr>
</tbody>
</table>

Examples

The following example shows the top level objects available for renaming:

Enter rename and press Tab to list top level objects available for renaming.

```
rename tlo
```

```
rename tlo aaa_policy
rename tlo address_range_alias
rename tlo auto_provisioning_policy
rename tlo bonjour_gw_discovery_policy
rename tlo bonjour_gw_forwarding_policy
rename tlo captive_portal
rename tlo centro_policy

<tr>
<td>commands</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
rf-domain

rf-domain

Creates an RF Domain or enters the RF Domain configuration context for one or more RF Domains. If the RF Domain does not exist, it is created.

The configuration of controllers (wireless controllers, service platforms, and access points) comprises of RF Domains that define regulatory, location, and other relevant policies. At least one default RF Domain is assigned to each controller.

RF Domains allow administrators to assign configuration data to multiple devices deployed in a common coverage area, such as in a floor, building, or site. Each RF Domain contains policies that set the Smart RF or WIPS configuration.

RF Domains also enable administrators to override WLAN SSID name and VLAN assignments. This enables the deployment of a global WLAN across multiple sites and unique SSID name or VLAN assignments to groups of access points servicing the global WLAN. This WLAN override eliminates the need to define and manage a large number of individual WLANs and profiles.

A controller’s configuration contains:

- A default RF Domain - Each controller utilizes a default RF Domain. Access Points are assigned to this default RF Domain as they are discovered by the controller. A default RF Domain can be used for single-site and multi-site deployments.
  - Single-site deployment – The default RF Domain can be used for single site deployments, where regional, regulatory, and RF policies are common between devices.
  - Multi-site deployment – A default RF Domain can omit configuration parameters to prohibit regulatory configuration from automatically being inherited by devices as they are discovered. This is desirable in multi-site deployments with devices spanning multiple countries. Omitting specific configuration parameters eliminates the risk of an incorrect country code from being automatically assigned to a device.
- A user-defined RF Domain - Created by administrators. A user-defined RF Domain can be assigned to multiple devices manually or automatically.
  - Manually assigned – Use the CLI or UI to manually assign a user-defined RF Domain to controllers and service platforms.
  - Automatically assigned – Use a AP provisioning policy to automatically assign specific RF Domains to access points based on the access point’s model, serial number, VLAN, DHCP option, and IP address or MAC address. Automatic RF Domain assignments are useful in large deployments, as they enable plug-n-play access point deployments by automatically applying RF Domains to remote access points. For more information on auto provisioning policy, see Chapter 9, AUTO-PROVISIONING-POLICY.

Configure and deploy user-defined RF Domains for single or multiple sites where devices require unique regulatory and regional configurations, or unique Smart RF and WIPS policies. User-defined RF Domains can be used to:

- Assign unique Smart RF or WIPS policies to access points deployed on different floors or buildings within a site.
- Assign unique regional or regulatory configurations to devices deployed in different states or countries.
- Assign unique WLAN SSIDs and/or VLAN IDs to sites assigned a common WLAN without having to define individual WLANs for each site.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
**Syntax**

```
rf-domain {<RF-DOMAIN-NAME>|containing <RF-DOMAIN-NAME>}
```

**Parameters**

- `rf-domain {<RF-DOMAIN-NAME>|containing <RF-DOMAIN-NAME>}`

<table>
<thead>
<tr>
<th>rf-domain</th>
<th>Creates a new RF Domain or enters its configuration context</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;RF-DOMAIN-NAME&gt;</code></td>
<td>Optional. Specify the RF Domain name (should not exceed 32 characters and should represent the intended purpose). Once created, the name cannot be edited.</td>
</tr>
<tr>
<td><code>containing &lt;RF-DOMAIN-NAME&gt;</code></td>
<td>Optional. Identifies an existing RF Domain that contains a specified sub-string in the domain name</td>
</tr>
</tbody>
</table>

- `<RF-DOMAIN-NAME>` – Specify a sub-string of the RF Domain name.

**Examples**

```
rfs7000-37FABE(config)#rf-domain rfs7000
rfs7000-37FABE(config-rf-domain-rfs7000)#?
```

**RF Domain Mode commands:**

- `alias` Alias
- `channel-list` Configure channel list to be advertised to wireless clients
- `contact` Configure the contact
- `control-vlan` VLAN for control traffic on this RF Domain
- `controller-managed` RF Domain manager for this domain will be an adopting controller
- `country-code` Configure the country of operation
- `layout` Configure layout
- `location` Configure the location
- `mac-name` Configure MAC address to name mappings
- `no` Negate a command or set its defaults
- `override-smartrf` Configured RF Domain level overrides for smart-rf
- `override-wlan` Configure RF Domain level overrides for wlan
- `sensor-server` AirDefense sensor server configuration
- `stats` Configure the stats related setting
- `timezone` Configure the timezone
- `tree-node` Configure tree node under which this rf-domain appears
- `use` Set setting to use
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-rf-domain-rfs7000)#
```
This section describes the default commands under RF Domain. The following table summarizes RF Domain configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>Configures network, VLAN, and service aliases at the RF Domain level</td>
<td>page 4-301</td>
</tr>
<tr>
<td>channel-list</td>
<td>Configures the channel list advertised by radios</td>
<td>page 4-307</td>
</tr>
<tr>
<td>contact</td>
<td>Configures network administrator's contact information (needed in case of any problems impacting the RF Domain)</td>
<td>page 4-308</td>
</tr>
<tr>
<td>control-vlan</td>
<td>Configures VLAN for traffic control on a RF Domain</td>
<td>page 4-309</td>
</tr>
<tr>
<td>controller-managed</td>
<td>Configures the adopting controller or service platform as this RF Domain’s manager</td>
<td>page 4-310</td>
</tr>
<tr>
<td>country-code</td>
<td>Configures the country of operation</td>
<td>page 4-311</td>
</tr>
<tr>
<td>layout</td>
<td>Configures layout information</td>
<td>page 4-312</td>
</tr>
<tr>
<td>location</td>
<td>Configures the physical location of a RF Domain</td>
<td>page 4-314</td>
</tr>
<tr>
<td>mac-name</td>
<td>Maps MAC addresses to names</td>
<td>page 4-315</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts configured settings to their default</td>
<td>page 4-316</td>
</tr>
<tr>
<td>override-smart-rf</td>
<td>Configures RF Domain level overrides for Smart RF</td>
<td>page 4-317</td>
</tr>
<tr>
<td>override-wlan</td>
<td>Configures RF Domain level overrides for a WLAN</td>
<td>page 4-318</td>
</tr>
<tr>
<td>sensor-server</td>
<td>Configures an AirDefense sensor server on this RF Domain</td>
<td>page 4-321</td>
</tr>
<tr>
<td>stats</td>
<td>Configures stats related settings on this RF Domain. These settings define how RF Domain statistics are updated.</td>
<td>page 4-323</td>
</tr>
<tr>
<td>timezone</td>
<td>Configures a RF Domain’s geographic time zone</td>
<td>page 4-324</td>
</tr>
<tr>
<td>tree-node</td>
<td>Configures the hierarchical (tree-node) structure under which this RF Domain appears</td>
<td>page 4-325</td>
</tr>
<tr>
<td>use</td>
<td>Enables the use of a specified Smart RF and/or WIPS policy</td>
<td>page 4-327</td>
</tr>
</tbody>
</table>
4.1.72.2.1 alias

rf-domain-mode commands

Configures network, VLAN, host, string, and network-service aliases at the RF Domain level.

This command also allows you to associate existing aliases, created in the global configuration mode, and apply overrides to customize for use at the domain level.

For information on aliases, see alias.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

alias [address-range|host|network|network-group|network-service|number|string|vlan]

alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

alias host <HOST-ALIAS-NAME> <HOST-IP>

alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]

alias number <NUMBER-ALIAS-NAME> <0-4294967295>

alias string <STRING-ALIAS-NAME> <LINE>

alias vlan <VLAN-ALIAS-NAME> <1-4094>

Parameters

- address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

<table>
<thead>
<tr>
<th>address-range &lt;ADDRESS-RANGE-ALIAS-NAME&gt;</th>
<th>Creates a new address-range alias for this RF Domain. Or associates an existing address-range alias with this RF Domain. An address-range alias maps a name to a range of IP addresses.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ADDRESS-RANGE-ALIAS-NAME&gt;</td>
<td>Specify the address range alias name.</td>
</tr>
<tr>
<td>Note: Address-range alias name should begin with '$'.</td>
<td></td>
</tr>
<tr>
<td>&lt;STARTING-IP&gt; to &lt;ENDING-IP&gt;</td>
<td>Associates a range of IP addresses with this address range alias</td>
</tr>
<tr>
<td></td>
<td>• &lt;STARTING-IP&gt; — Specify the first IP address in the range.</td>
</tr>
<tr>
<td></td>
<td>• to &lt;ENDING-IP&gt; — Specify the last IP address in the range.</td>
</tr>
<tr>
<td>Note: If using an existing address-range alias, you can apply overrides to the alias at the RF Domain level.</td>
<td></td>
</tr>
</tbody>
</table>
### alias host `<HOST-ALIAS-NAME>` `<HOST-IP>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Creates a host alias for this RF Domain. Or associates an existing host alias with this RF Domain. A host alias maps a name to a single network host.</td>
</tr>
<tr>
<td><code>&lt;HOST-ALIAS-NAME&gt;</code></td>
<td>Specify the host alias name.</td>
</tr>
<tr>
<td><code>&lt;HOST-IP&gt;</code></td>
<td>Associates the network host's IP address with this host alias</td>
</tr>
<tr>
<td><strong>Note:</strong> Alias name should begin with <code>$</code>.</td>
<td></td>
</tr>
</tbody>
</table>

### alias network `<NETWORK-ALIAS-NAME>` `<NETWORK-ADDRESS/MASK>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>network</td>
<td>Creates a network alias for this RF Domain. Or associates an existing network alias with this RF Domain. A network alias maps a name to a single network address.</td>
</tr>
<tr>
<td><code>&lt;NETWORK-ALIAS-NAME&gt;</code></td>
<td>Specify the network alias name.</td>
</tr>
<tr>
<td><code>&lt;NETWORK-ADDRESS/MASK&gt;</code></td>
<td>Associates a single network with this network alias</td>
</tr>
<tr>
<td><strong>Note:</strong> Alias name should begin with <code>$</code>.</td>
<td></td>
</tr>
</tbody>
</table>

### alias network-group `<NETWORK-GROUP-ALIAS-NAME>` [address-range `<STARTING-IP>` to `<ENDING-IP>`] [host `<HOST-IP>`] [network `<NETWORK-ADDRESS/MASK>`]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>network-group</td>
<td>Creates a network-group alias for this RF Domain. Or associates an existing network-group alias with this RF Domain.</td>
</tr>
<tr>
<td><code>&lt;NETWORK-GROUP-ALIAS-NAME&gt;</code></td>
<td>Specify the network-group alias name.</td>
</tr>
<tr>
<td>**Note:**Alias name should begin with <code>$</code>.</td>
<td></td>
</tr>
<tr>
<td>After specifying the name, specify the following: a range of IP addresses, host addresses, or a range of network addresses.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> If using an existing network-group alias, you can apply overrides to the alias at the RF Domain level.</td>
<td></td>
</tr>
</tbody>
</table>

### address-range `<STARTING-IP>` to `<ENDING-IP>` [address-range `<STARTING-IP>` to `<ENDING-IP>`] [host `<HOST-IP>`] [network `<NETWORK-ADDRESS/MASK>`]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Associates a range of IP addresses with this network-group alias</td>
<td></td>
</tr>
<tr>
<td><code>&lt;STARTING-IP&gt;</code></td>
<td>Specify the first IP address in the range.</td>
</tr>
<tr>
<td><code>&lt;ENDING-IP&gt;</code></td>
<td>Specify the last IP address in the range.</td>
</tr>
<tr>
<td><strong>Note:</strong> Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured.</td>
<td></td>
</tr>
</tbody>
</table>

### host `<HOST-IP>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Associates a single or multiple hosts with this network-group alias</td>
<td></td>
</tr>
<tr>
<td><code>&lt;HOST-IP&gt;</code></td>
<td>Specify the hosts' IP address.</td>
</tr>
<tr>
<td><strong>Note:</strong> Specifies more than one host. A maximum of eight (8) hosts can be configured.</td>
<td></td>
</tr>
</tbody>
</table>

### network `<NETWORK-ADDRESS/MASK>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Associates a single or multiple networks with this network-group alias</td>
<td></td>
</tr>
<tr>
<td><code>&lt;NETWORK-ADDRESS/MASK&gt;</code></td>
<td>Specify the network's address and mask.</td>
</tr>
<tr>
<td><strong>Note:</strong> Specifies more than one network. A maximum of eight (8) networks can be configured.</td>
<td></td>
</tr>
</tbody>
</table>
Alias network-service `<NETWORK-SERVICE-ALIAS-NAME>` creates a network-service alias for this RF Domain. Or associates an existing network-service alias with this RF Domain. A network-service alias maps a name to network services and the corresponding source and destination software ports.

- `<NETWORK-SERVICE-ALIAS-NAME>` – Specify a network-service alias name.

**Note:** Alias name should begin with `$`.

**Note:** If using an existing network-service alias, you can apply overrides to the alias at the RF Domain level.

**proto** [0-254]|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp

Use one of the following options to associate an Internet protocol with this network-service alias:

- `<0-254>` – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the **Protocol** field of the IPv4 header and the **Next Header** field of IPv6 header. For example, the **User Datagram Protocol**'s (UDP) designated number is 17.
- `<WORD>` – Identifies the protocol by its name. Specify the protocol name.
- `gre` – Selects Generic Routing Encapsulation (GRE). The protocol number is 47.
- `igmp` – Selects Internet Group Management Protocol (IGMP). The protocol number is 2.
- `ospf` – Selects Open Shortest Path First (OSPF). The protocol number is 89.
- `vrrp` – Selects Virtual Router Redundancy Protocol (VRRP). The protocol number is 112.

**{<1-65535> | <WORD> | bgp|dns|ftp|ftp-data|gopher|https|ldap|ntp|ntp|pop3|proto|sip|smtp|sourceport `<1-65535>` | <WORD> | ssh|telnet|tftp|www})**

After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports.

- `<1-65535>` – Optional. Configures a destination port number from 1 - 65535
- `<WORD>` – Optional. Identifies the destination port by the service name provided. For example, the secure shell (SSH) service uses TCP port 22.
- `bgp` – Optional. Configures the default Border Gateway Protocol (BGP) services port (179)
- `dns` – Optional. Configures the default Domain Name System (DNS) services port (53)
- `ftp` – Optional. Configures the default File Transfer Protocol (FTP) control services port (21)
- `ftp-data` – Optional. Configures the default FTP data services port (20)
- `gopher` – Optional. Configures the default gopher services port (70)
- `https` – Optional. Configures the default HTTPS services port (443)
- `ldap` – Optional. Configures the default Lightweight Directory Access Protocol (LDAP) services port (389)
- `ntp` – Optional. Configures the default Newsgroup (NNTP) services port (119)

Contd..
• alias number <NUMBER-ALIAS-NAME> <0-4294967295>

Creates a new number alias or applies an existing number, identified by the <NUMBER-ALIAS-NAME> keyword,
• <NUMBER-ALIAS-NAME> – Specify the number alias name.
• <0-4294967295> – Specify the number, from 0 - 4294967295, assigned to the number alias created.

Note: Number aliases map a name to a numeric value. For example, 'alias number $NUMBER 100'.
• The number alias name is: $NUMBER
• The value assigned is: 100
The value referenced by alias $NUMBER, wherever used, is 100.

• alias string <STRING-ALIAS-NAME> <LINE>

Creates a string alias for this RF Domain. Or associates an existing string alias with this RF Domain. String aliases map a name to an arbitrary string value. For example, alias string $DOMAIN test.example_company.com'. In this example, the string alias name is: $DOMAIN and the string value it is mapped to is: test.example_company.com. In this example, the string alias refers to a domain name.
• <STRING-ALIAS-NAME> – Specify the string alias name.
• <LINE> – Specify the string value.

Note: Alias name should begin with ‘$’.

Note: If using an existing string alias, you can apply overrides to the alias at the RF Domain level.

• alias vlan <VLAN-ALIAS-NAME> <1-4094>

Creates a VLAN alias for this RF Domain. Or associates an existing VLAN alias with this RF Domain. A VLAN alias maps a name to a VLAN ID.
• <VLAN-ALIAS-NAME> – Specify the VLAN alias name.

Note: Alias name should begin with ‘$’.
### Examples

```
rfs4000-229D58(config)#show context
! Configuration of RFS4000 version 5.8.1.0-028D
!
version 2.3
!
alias network-group $TestNetGrpAlias network 192.168.13.0/24 192.168.16.0/24
alias network-group $TestNetGrpAlias address-range 192.168.13.7 to 192.168.13.16
192.168.13.20 to 192.168.13.25
!
alias network $TestNetworkAlias 192.168.13.0/24
!
alias host $TestHostAlias 192.168.13.10
!
alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
!
alias network-service $NetworkServAlias proto udp
!
alias network-service $kerberos proto tcp 749 750 80 proto udp 68 sourceport 67
!
alias vlan $TestVLANAlias 1
```

In the following examples, the global aliases `$kerberos` and `$TestVLANAlias` are associated with the RF Domain 'test' and overrides applied:

```
rfs4000-229D58(config-rf-domain-test)#alias network-service $kerberos proto tcp 749 750 80
rfs4000-229D58(config-rf-domain-test)#alias vlan $TestVLANAlias 10
```

Example 1:

In the following examples, the network-group alias `$test` is configured to include hosts 192.168.1.10 and 192.168.1.11, networks 192.168.2.0/24 and 192.168.3.0/24 and address-range 192.168.4.10 to 192.168.4.20.

```
rfs4000-229D58(config)#alias network-group $test host 192.168.1.10 192.168.1.11
rfs4000-229D58(config)#alias network-group $test network 192.168.2.0/24 192.168.3.0/24
rfs4000-229D58(config)#alias network-group $test address-range 192.168.4.10 to 192.168.4.20
```
Associate this network-group alias ‘$test’ to the RF Domain ‘test’ and override the ‘host’ element of the alias.

```
rfs4000-229D58(config-rf-domain-test)#alias network-group $test host 192.168.10.10
rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
  no country-code
  alias network-service $kerberos proto tcp 749 750 80
  alias network-group $test host 192.168.10.10
  alias network-group $test network 192.168.2.0/24 192.168.3.0/24
  alias network-group $test address-range 192.168.4.10 to 192.168.4.20
  alias vlan $TestVLANAlias 10
rfs4000-229D58(config-rf-domain-test)#
```

In the preceding example, the ‘host’ element of the network-group alias ‘$test’ has been overridden. But the ‘network’ and ‘address-range’ elements have been retained as is.

4.1.72.2.2 channel-list

rf-domain-mode commands

Configures the channel list advertised by radios. This command also enables a dynamic update of a channel list. Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

channel-list [2.4GHz|5GHz|dynamic]

channel-list dynamic

channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

Parameters

- channel-list dynamic

<table>
<thead>
<tr>
<th>dynamic</th>
<th>Enables a dynamic update of a channel list</th>
</tr>
</thead>
</table>

- channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

| 2.4GHz | Configures the channel list advertised by radios operating in the 2.4 GHz mode |
|<CHANNEL-LIST>|  • <CHANNEL-LIST> – Specify the list of channels separated by commas or hyphens. |

| 5GHz | Configures the channel list advertised by radios operating in the 5.0 GHz mode |
|<CHANNEL-LIST>|  • <CHANNEL-LIST> – Specify the list of channels separated by commas or hyphens. |

Examples

rfs7000-37FABE(config-rf-domain-default)#channel-list 2.4GHz 1-10

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  no country-code
channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
rfs7000-37FABE(config-rf-domain-default)#

Related Commands

no | Removes the list of channels configured on the selected RF Domain for 2.4 GHz and 5.0 GHz bands. Also disables dynamic update of a channel list. |
4.1.72.2.3  contact

rf-domain-mode commands

Configures the network administrator's contact details. The network administrator is responsible for addressing problems impacting the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
contact <WORD>

Parameters
- contact <WORD>

Examples
rfs7000-37FABE(config-rf-domain-default)#contact Bob+14082778691
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
  no country-code
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
rfs7000-37FABE(config-rf-domain-default)#

Related Commands
- no
  Removes a network administrator’s contact details
4.1.72.2.4 control-vlan

rf-domain-mode commands

Configures the VLAN designated for traffic control in this RF Domain

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
control-vlan <1-4094>

Parameters

- control-vlan <1-4094>

| <1-4094> | Specify the VLAN ID from 1 - 4094. The default is 1. |

Examples
rfs7000-37FABE(config-rf-domain-default)#control-vlan 1

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
contact Bob+14082778691
no country-code
channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
control-vlan 1
rfs7000-37FABE(config-rf-domain-default)#

Related Commands

- no
  Disables the VLAN designated for controlling RF Domain traffic
4.1.72.2.5 controller-managed

`rf-domain-mode commands`

Configures the adopting controller (wireless controller, access point, or service platform) as this RF Domain's manager. In other words, the RF Domain is controller managed, and the managing controller is the device managing the RF Domain.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**
controller-managed

**Parameters**
None

**Examples**
```
rfs4000-229D58(config-rf-domain-test)#controller-managed
rfs4000-229D58(config-rf-domain-test)#commit
rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
  country-code in
  controller-managed
  network-alias techPubs host 192.168.13.8
  network-alias techPubs address-range 192.168.13.10 to 192.168.13.15
  service-alias testing index 10 proto 9 destination-port range 21 21
rfs4000-229D58(config-rf-domain-test)#
```

**Related Commands**
```
no
```
Removes the adopting controller or service platform as this RF Domain’s manager
4.1.72.2.6 country-code

rf-domain-mode commands

Configures a RF Domain’s country of operation. Since device channels transmit in specific channels unique to the country of operation, it is essential to configure the country code correctly or risk using illegal operation.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

country-code <WORD>

Parameters

- country-code <WORD>

<table>
<thead>
<tr>
<th>country-code</th>

Related Commands

no

Removes the country of operation configured on a RF Domain
4.1.72.2.7 layout

rf-domain-mode commands

Configures the RF Domain layout in terms of area, floor, and location on a map. It allows users to place APs across the deployment map. A maximum of 256 layouts is permitted.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

layout [area|description|floor|map-location] { (area|description|floor|map-location)}

Parameters

- layout [area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME> {<1-4094>}|map-location <URL> units [feet|meters]}
  - area <AREA-NAME> Configures the RF Domain's layout in terms of the area of location
    - <AREA-NAME> – Specify the area name.
    - Note: After configuring the RF Domain's area of functioning, optionally specify the floor name (and number), description, and/or the location on map.
  - description <LINE> Configures a description for this RF Domain
    - <LINE> – Specify a description that enables you to identify the RF Domain. For a multi-worded string, use double quotes.
  - floor <FLOOR-NAME> <1-4094> Configures the RF Domain's layout in terms of the floor name and number
    - <FLOOR-NAME> – Specify the floor name.
    - <1-4094> – Optional. Specifies the floor number from 1 - 4094. The default floor number is 1.
    - Note: After configuring the RF Domain's floor name (and number), optionally specify the area name, description, and/or the location on map.
  - map-location <URL> units [feet|meters] Configures the location of the RF Domain on the map
    - <URL> – Specify the URL to configure the map location.
    - units [feet|meters] – Configures the map units. The options are: feet or meters
      - feet – Configures the map units in terms of feet
      - meters – Configures the map units in terms of meter
    - Note: After configuring the location of the RF Domain on the map, optionally specify the area name, floor name (and number), and/or description.

4.1.72.2.8 location

rf-domain-mode commands

Configures the RF Domain’s physical location. The location could be as specific as the building name or floor number. Or it could be generic and include an entire site. The location defines the physical area where a set of devices with common configurations are deployed and managed by a RF Domain policy.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

location <WORD>

Parameters

- location <WORD>

4.1.72.2.9 mac-name

rf-domain-mode commands

Configures a relevant name for each MAC address. Use this command to associate client names to specific connected client MAC addresses for improved client management.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
mac-name <MAC> <NAME>

Parameters
- mac-name <MAC> <NAME>

Assigns a user-friendly name to this RF Domain’s member access point’s connected client to assist in its easy recognition
- <MAC> – Specify the MAC address
- <NAME> – Specify the client name for the specified MAC address. The name specified here will be used in events and statistics.

Examples
rfs7000-37FABE(config-rf-domain-default)#mac-name 11-22-33-44-55-66 TestDevice

Removes the MAC address to name mapping
4.1.7.2.2.10 no

- **rf-domain-mode commands**

Negates a command or reverts configured settings to their default. When used in the config RF Domain mode, the *no* command negates or reverts RF Domain settings.

**Supported in the following platforms:**

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`no [alias|channel-list|contact|control-vlan|controller-managed|country-code|layout|location|mac-name|override-smartrf|override-wlan|sensor-server|stats|timezone|tree-node|use]`

**Parameters**

- `no <PARAMETERS>`

`no <PARAMETERS>` Removes or reverts this RF Domain’s settings based on the parameters passed

**Examples**

The following example shows the default RF Domain settings before the ‘no’ commands are executed:

```
no channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
no mac-name 11-22-33-44-55-66 TestDevice
```

The following example shows the default RF Domain settings after the ‘no’ commands are executed:

```
no channel-list 2.4GHz 1-10
no mac-name 11-22-33-44-55-66
no location
no control-vlan
```
4.72.2.11 override-smart-rf

rf-domain-mode commands

Enables dynamic channel switching for Smart RF radios. This command allows you to configure an override list of channels that Smart RF can use for channel compensations on 2.4 GHz and 5.0 GHz radios.

When a radio fails or is faulty, a Smart RF policy provides automatic recovery by instructing neighboring access points to increase their transmit power to compensate for the coverage loss. Once correct access point placement has been established, Smart-RF can optionally be leveraged for automatic detector radio selection. Smart-RF uses detector radios to monitor RF events and can ensure availability of adequate detector coverage.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
override-smart-rf channel-list [2.4GHz|5GHZ] <CHANNEL-LIST>
```

Parameters

- **override-smart-rf channel-list [2.4GHz|5GHZ] <CHANNEL-LIST>**

<table>

Related Commands

- **no** Removes the override-smart-rf list of channels configured for 2.4 GHz and 5.0 GHz radios
### 4.1.72.2.12 override-wlan

**rf-domain-mode commands**

Configures RF Domain level overrides for a WLAN

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
overrides-wlan <WLAN-NAME> [shutdown|ssid|vlan-pool|wep128|wpa-wpa2-psk]  
overrides-wlan <WLAN-NAME> [shutdown|ssid <SSID>|vlan-pool <1-4094> {limit <0-8192}>]  
  wpa-wpa2-psk <PASSPHRASE>]  
overrides-wlan <WLAN-NAME> wpa-wpa2-psk [0 <WORD>|2 <WORD>]  
overrides-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>]|  
  transmit-key <1-4>]  
```

#### Parameters

- **overrides-wlan <WLAN-NAME> [shutdown|ssid|vlan-pool|wep128|wpa-wpa2-psk]**
  - `<WLAN-NAME>` Configures the WLAN name
    - If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN’s coverage area. After creating the WLAN, configure its override parameters.
  - **shutdown** Shuts down WLAN operation on all mapped radios
  - **ssid <SSID>** Configures a override SSID associated with this WLAN
    - `<SSID>` – Specify the SSID (should not exceed 32 characters in length).
    - Each WLAN provides associated wireless clients with a SSID. This has limitations, because it requires wireless clients to associate with different SSIDs to obtain QoS and security policies. However, a WiNG-managed RF Domain can have WLANs assigned and advertise a single SSID, and yet allow users to inherit different QoS or security policies.
  - **vlan-pool <1-4094> {limit <0-8192}>**
    - Configures the override VLANs available to this WLAN
      - `<1-4094>` – Specify the VLAN ID from 1 - 4094.
      - `<limit <0-8192>>` – Optional. Sets a limit to the number of users on this VLAN from 0 - 8192. The default is 0.
    - Controllers and service platforms allow the mapping of a WLAN to more than one VLAN. Wireless clients associating with a WLAN are assigned VLANs, from the pool representative of the WLAN, in a way that ensures proper load balancing across VLANs. Clients are tracked per VLAN, and assigned to the least used/loaded VLAN. Client VLAN usage is tracked on a per-WLAN basis. The maximum allowed client limit is 8192 per VLAN.
### overrides-wlan <WLAN-NAME> wpa-wpa2-psk [0 <WORD>|2 <WORD>]

| <WLAN-NAME> | Configures the WLAN name  
If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN’s coverage area. After creating the WLAN, configure its override parameters. |
| wpa-wpa2-psk | Overrides a WLAN’s existing WPA-WPA2 pre-shared key or passphrase at the RF Domain level. WPA2 is a newer 802.11i standard that provides wireless security that is stronger than Wi-Fi Protected Access (WPA) and WEP.  
• <PASSPHRASE> – Specify a WPA-WPA2 key or passphrase. It is an alphanumeric string of 8 to 64 ASCII characters or 64 HEX characters as the primary string, which both the transmitting and receiving authenticators must share in this new override PSK. The alphanumeric string allows character spaces. The string is converted to a numeric value. This passphrase saves the you the necessity of entering the 256-bit key each time keys are generated. |

### overrides-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>]|transmit-key <1-4>]

| <WLAN-NAME> | Configures the WLAN name  
If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN’s coverage area. After creating the WLAN, configure its override parameters. |
| wep128 | Overrides a WLAN’s existing WEP128 keys at the RF Domain level (not the profile level). WEP128 uses a 104 bit key, which is concatenated with a 24-bit initialization vector (IV) to form the RC4 traffic key. WEP may be all a small-business user needs for the simple encryption of wireless data on the WLAN. However, networks that require more security are at risk from a WEP flaw. WEP is only recommended if there are client devices incapable of using higher forms of security. The existing 802.11 standard alone offers administrators no effective method to update keys.  
| key <1-4> hex | Configures the WEP128 key.  
A total of four keys can be configured.  
• <1-4> – Select the key index from 1- 4.  
• hex – Configures a hexadecimal key  
  • 0 <WORD> – Configures a clear text key  
  • 2 <WORD> – Configures an encrypted key  
The following parameter is common to both clear-text and encrypted key options:  
• <WORD> – Specify the WEP128/Keyguard key (should not exceed 26 hexadecimal characters in length). |
| transmit-key | Configures transmit WEP/Keyguard key settings  
• <1-4> – Transmit the key identified by the key index specified here. Specify the index from 1 - 4. |

4.1.72.2.13 sensor-server

rf-domain-mode commands

Configures an AirDefense sensor server on this RF Domain. Sensor servers allow network administrators to monitor and download data from multiple sensors remote locations using Ethernet TCP/IP or serial communications. This enables administrators to respond quickly to interferences and coverage problems. The **Wireless Intrusion Protection System** (WIPS) protects the controller managed network, wireless clients and access point radio traffic from attacks and unauthorized access. WIPS provides tools for standards compliance and around-the-clock wireless network security in a distributed environment. WIPS allows administrators to identify and accurately locate attacks, rogue devices and network vulnerabilities in real time and permits both a wired and wireless lockdown of wireless device connections upon acknowledgement of a threat.

In addition to dedicated AirDefense sensors, an access point radio can function as a sensor and upload information to a dedicated WIPS server (external to the controller). Unique WIPS server configurations can be used by RF Domains to ensure a WIPS server configuration is available to support the unique data protection needs of individual RF Domains.

WIPS is not supported on a WLAN basis, rather sensor functionality is supported on the access point radio(s) available to each controller managed WLAN. When an access point radio is functioning as a WIPS sensor, it is able to scan in sensor mode across all legal channels within the 2.4 and 5.0 GHz bands. Sensor support requires a AirDefense WIPS Server on the network. Sensor functionality is not provided by the access point alone. The access point works in conjunction with a dedicated WIPS server.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
sensor-server <1-3> ip <IP> {port [443|<1-65535>]}
```

Parameters

- **sensor-server <1-3> ip <IP> {port [443|<1-65535>]}**

4.1.72.2.14 stats

*rf-domain-mode commands*

Configures stats settings that define how RF Domain statistics are updated

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**
```
stats update-interval
```
```
stats update-interval [<5-300>|auto]
```

**Parameters**
```
• stats update-interval [<5-300>|auto]
```

| stats update-interval [<5-300>|auto] | Configures the interval at which RF Domain statistics are updated. The options are:
|--------------------------------------|--------------------------------------------------|
| <5-300> | Specify an update interval from 5 - 300 seconds.
| auto | The RF Domain manager automatically adjusts the update interval based on the load.

**Examples**
```
rfs7000-37FABE(config-rf-domain-default)#stats update-interval 200

4.1.72.2.15 timezone

rf-domain-mode commands

Configures the RF Domain’s geographic time zone. By default all WiNG devices are shipped with the time zone and time format set to Universal Time Coordinated (UTC) and 24-hour clock respectively. If the time zone is not reset, all devices within the RF Domain will display time relative to the UTC - Greenwich Time. Resetting the time zone is recommended, especially for RF Domains deployed across different geographical locations. The time zone can either be set on a specific device or on an RF Domain. When configured as RF Domain setting, it applies to all devices within the domain. For more information on configuring the time zone on a device, see timezone.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
timezone <TIMEZONE>
```

Parameters

- timezone <TIMEZONE>

Examples

```
$ rfs7000-37FABE(config-rf-domain-default)#timezone America/Los_Angeles

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
    contact Bob+14082778691
timezone America/Los_Angeles
stats update-interval 200
country-code us
sensor-server 2 ip 172.16.10.3
override-smartrf channel-list 2.4GHz 1,2,3
override-wlan test vlan-pool 2 limit 20
layout area Ecospace floor Floor5 map-location www.firstfloor.com units meters
rfs7000-37FABE(config-rf-domain-default)#
```

The built-in WiNG timezones are:

```
nx9500-6C8809(config-rf-domain-test)#timezone <TAB>
Africa/  Asia/  Atlantic/  Australia/  CET  CST6CDT
EET  EST5EDT  Etc/  Europe/  MST7MDT  Pacific/
PST8PDT  US/  America/
nx9500-6C8809(config-rf-domain-test)#
```

Each of these time zones are further differentiated into sub time zones. For example, as shown in the following example:

```
nx9500-6C8809(config-rf-domain-test)#timezone Africa/
Africa/Cairo  Africa/Casablanca  Africa/Harare
Africa/Johannesburg  Africa/Lagos  Africa/Nairobi
nx9500-6C8809(config-rf-domain-test)#
```

Related Commands

- **no** Removes a RF Domain’s time zone
4.1.72.2.16 tree-node

rf-domain-mode commands

Configures the hierarchical (tree-node) structure under which this RF Domain is located.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

tree-node [campus|city|country|region] {(campus|city|country|region)}

Parameters

- tree-node [campus|city|country|region] {(campus|city|country|region)}

Usage Guidelines

- Adding a country first is a good idea since region, city, and campus can all be added as sub-nodes in the tree structure. However, the selected country is an invalid tree node until a RF Domain is mapped.
- A city and campus can be added in the tree structure as sub-nodes under a region. An RF Domain can be placed anywhere down the hierarchy for a region and not just directly under a country. For example, a region can have city, campus, and one RF Domain mapped.
- Only a campus can be added as a sub-node under a city. The city is an invalid tree node until a RF Domain is mapped somewhere within the directory tree.
- A campus is the last node in the hierarchy before a RF Domain, and it is not valid unless it has a RF Domain mapped.
- After creating the tree structure do a commit and save for the tree configuration to take effect and persist across reboots.

Note: At least one of these four nodes must be defined. This feature is disabled by default.
Examples

```
rfs4000-229D58(config-rf-domain-test)#tree-node campus EcoSpace City Bangalore
country India region South
rfs4000-229D58(config-rf-domain-test)#

rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
country-code in
tree-node country India region South city Bangalore campus EcoSpace
rfs4000-229D58(config-rf-domain-test)#
```

4.1.72.2.17 use

rf-domain-mode commands

Enables the use of Smart RF and WIPS with this RF Domain

Assigns an existing Wireless IPS (WIPS) policy to the RF Domain

A WIPS policy provides protection against wireless threats and acts as a key layer of security complementing wireless VPNs, encryption and authentication. A WIPS policy uses a dedicated sensor for actively detecting and locating rogue AP devices. After detection, WIPS uses mitigation techniques to block the devices by manual termination, air lockdown, or port suppression.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

use [license|nsight-policy|smart-rf-policy|wips-policy]

use [license <WEB-FILTERING-LICENSE>|nsight-policy <POLICY-NAME>|smart-rf-policy <SMART-RF-POLICY-NAME>|wips-policy <WIPS-POLICY-NAME>]

Parameters

- use [license <LICENSE>|nsight-policy <POLICY-NAME>|smart-rf-policy <SMART-RF-POLICY-NAME>|wips-policy <WIPS-POLICY-NAME>]

<table>
<thead>
<tr>
<th>use</th>
<th>Uses a Smart RF policy with this RF Domain</th>
</tr>
</thead>
</table>
| license <WEB-FILTERING-LICENSE> | Obtains the specified Web filtering license from the adopting controller
  - <WEB-FILTERING-LICENSE> – Specify the WEBF license name. |
| nsight-policy <POLICY-NAME> | Applies an NSight policy to this RF Domain
  - <POLICY-NAME> – Specify the NSight policy name (Should be existing and configured). When applied, it enables the RF Domain manager to gather statistical data from access points within the domain and forward to the NOC running the NSight server. |
| smart-rf-policy <SMART-RF-POLICY-NAME> | Specifies a Smart RF policy
  - <SMART-RF-POLICY-NAME> – Specify the Smart RF policy name. For more information on configuring smart RF policy, see SMART-RF-POLICY. |
| wips-policy <WIPS-POLICY-NAME> | Specifies a WIPS policy
  - <WIPS-POLICY-NAME> – Specify the WIPS policy name. For more information on configuring WIPS policy, see WIPS-POLICY. |

4.1.73 rfs4000

Global Configuration Commands

Adds an RFS4000 wireless controller to the network

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

rfs4000 <DEVICE-RFS4000-MAC>

Parameters

- rfs4000 <DEVICE-RFS4000-MAC>

| <DEVICE-RFS4000-MAC> | Specify the RFS4000’s MAC address. |

Examples

rfs7000-37FABE(config)#rfs4000 10-20-30-40-50-60
rfs7000-37FABE(config-device-10-20-30-40-50-60)#

Related Commands

 NOTE: In this guide, NX9000, NX9500, and NX9510 are collectively represented as a NX9000 series service platform.
4.1.81 Roaming-Assist-Policy

Global Configuration Commands

Configures a roaming assist policy that enables access points to assist wireless clients in making roaming decisions, such as which access point to connect etc.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

roaming-assist-policy <POLICY-NAME>

Parameters

- roaming-assist-policy <POLICY-NAME>

Examples

rfs7000-37FABE(config)#roaming-assist-policy testPolicy
rfs7000-37FABE(config-roaming-assist-policy-testPolicy)#?

Roaming Assist Mode commands:

- action: Configure action - action is either to log / deauth client
- aggressiveness: Configure the roaming aggressiveness for a wireless client
- detection-threshold: Configure the detection threshold - when exceeded, client monitoring starts
- disassoc-time: Configure the disassociation time - time after which a disassociation is sent
- handoff-count: Configure the handoff count - number of times client can exceed handoff threshold
- handoff-threshold: Configure the handoff threshold - when exceeds an action is taken.
- monitoring-interval: Configure the monitoring interval - interval at which client monitoring occurs
- no: Negate a command or set its defaults
- sampling-interval: Configure the sampling interval - interval at which client rssi values are checked
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

rfs7000-37FABE(config-roaming-assist-policy-testPolicy)#

**NOTE:** For more information on roaming assist policy commands, see Chapter 30, ROAMING ASSIST POLICY.

Related Commands

- no: Removes an existing roaming assist policy
### 4.1.82 role-policy

**Global Configuration Commands**

Configures a role-based firewall policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

role-policy <ROLE-POLICY-NAME>

**Parameters**

- role-policy <ROLE-POLICY-NAME>

**Examples**

rfs7000-37FABE(config)#role-policy role1
rfs7000-37FABE(config-role-policy-role1)#?

Role Policy Mode commands:

- default-role  Configuration for Wireless Clients not matching any role
- ldap-deadperiod  Ldap dead period interval
- ldap-query  Set the ldap query mode
- ldap-server  Add a ldap server
- ldap-timeout  Ldap query timeout interval
- no  Negate a command or set its defaults
- user-role  Create a role
- clrscr  Clears the display screen
- commit  Commit all changes made in this session
- do  Run commands from Exec mode
- end  End current mode and change to EXEC mode
- exit  End current mode and down to previous mode
- help  Description of the interactive help system
- revert  Revert changes
- service  Service Commands
- show  Show running system information
- write  Write running configuration to memory or terminal

rfs7000-37FABE(config-role-policy-role1)#

---

**NOTE:** For more information on role policy commands, see Chapter 18, ROLE-POLICY.

---

**Related Commands**

- **no**  Removes an existing role policy
4.1.83 route-map

*Global Configuration Commands*

Creates a dynamic BGP route map and enters its configuration mode

BGP route maps are used by network administrators to define rules controlling redistribution of routes between routers and routing processes. These route maps are also used to control and modify routing information.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

**Syntax**

route-map <ROUTE-MAP-NAME>

**Parameters**

- route-map <ROUTE-MAP-NAME>

**Examples**

nx9500-6C8809(config)#route-map test

nx9500-6C8809(config-dr-route-map-test)#?

Route Map Mode commands:
- deny     Add a deny route map rule to deny set operations
- no       Negate a command or set its defaults
- permit   Add a permit route map rule to permit set operations
- clrscr   Clears the display screen
- commit   Commit all changes made in this session
- do       Run commands from Exec mode
- end      End current mode and change to EXEC mode
- exit     End current mode and down to previous mode
- help     Description of the interactive help system
- revert   Revert changes
- service  Service Commands
- show     Show running system information
- write    Write running configuration to memory or terminal

nx9500-6C8809(config-dr-route-map-test)#

**Related Commands**

- no          Removes an existing dynamic BGP route map

**NOTE:** For more information on BGP route maps, see *Chapter 28, BORDER GATEWAY PROTOCOL.*
### 4.1.84 `routing-policy`

**Global Configuration Commands**

Configures a routing policy

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
routing-policy <ROUTING-POLICY-NAME>
```

**Parameters**

- `routing-policy <ROUTING-POLICY-NAME>`

**Examples**

```
rfs7000-37FABE(config)#routing-policy TestRoutingPolicy
rfs7000-37FABE(config-routing-policy-TestRoutingPolicy)#?
```

Routing Policy Mode commands:

- `apply-to-local-packets` Use Policy Based Routing for packets generated by the device
- `logging` Enable logging for this Route Map
- `no` Negate a command or set its defaults
- `route-map` Create a Route Map
- `use` Set setting to use
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-routing-policy-TestRoutingPolicy)#
```

**NOTE:** For more information on routing policy commands, see Chapter 24, `ROUTING-POLICY`.

**Related Commands**

- `no` Removes an existing routing policy
4.1.85 self

Displays the logged device's configuration context

Supported in the following platforms:
  • Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  • Wireless Controllers — RFS4000, RFS6000, RFS7000
  • Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

self

Parameters

None

Examples

rfs7000-37FABE(config)#self
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#
### 4.1.86 smart-rf-policy

**Global Configuration Commands**

Configures a Smart RF policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

smart-rf-policy <SMART-RF-POLICY-NAME>

#### Parameters

- smart-rf-policy <SMART-RF-POLICY-NAME>

<table>
<thead>
<tr>
<th>&lt;SMART-RF-POLICY-NAME&gt;</th>
<th>Specify the Smart RF policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
</table>

#### Examples

rfs7000-37FABE(config)#smart-rf-policy test
rfs7000-37FABE(config-smart-rf-policy-test)#?

Smart RF Mode commands:

- area
  - Specify channel list/ power for an area
- assignable-power
  - Specify the assignable power during power-assignment
- avoidance-time
  - Time to avoid a channel once dfs/adaptivity avoidance is necessary
- channel-list
  - Select channel list for smart-rf
- channel-width
  - Select channel width for smart-rf
- coverage-hole-recovery
  - Recover from coverage hole
- enable
  - Enable this smart-rf policy
- group-by
  - Configure grouping parameters
- interference-recovery
  - Recover issues due to excessive noise and interference
- neighbor-recovery
  - Recover issues due to faulty neighbor radios
- no
  - Negate a command or set its defaults
- sensitivity
  - Configure smart-rf sensitivity (Modifies various other smart-rf configuration items)
- smart-ocs-monitoring
  - Smart off channel scanning
- clrscr
  - Clears the display screen
- commit
  - Commit all changes made in this session
- end
  - End current mode and change to EXEC mode
- exit
  - End current mode and down to previous mode
- help
  - Description of the interactive help system
- revert
  - Revert changes
- service
  - Service Commands
- show
  - Show running system information
- write
  - Write running configuration to memory or term

rfs7000-37FABE(config-smart-rf-policy-test)#

**Related Commands**

| no | Removes an existing Smart RF policy |
4.1.87 t5

Global Configuration Commands

Invokes the configuration mode of a t5 wireless controller

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

t5 <T5-DEVICE-MAC>

Parameters

- t5 <T5-DEVICE-MAC>

<table>
<thead>
<tr>
<th>t5 &lt;T5-DEVICE-MAC&gt;</th>
<th>Specify the t5 device’s MAC address. The system enters the identified device's configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The Customer Premises Equipment (CPEs) are the T5 controller managed radio devices using the IPX operating system. These CPEs use a Digital Subscriber Line (DSL) as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack. Note: After logging on to the T5 device, use the ‘cpe’ keyword and configure the following mandatory settings:</td>
</tr>
<tr>
<td></td>
<td>• vlan – Set a VLAN from 1 - 4,094 used as a virtual interface for connections between the T5 controller and its managed CPE devices.</td>
</tr>
<tr>
<td></td>
<td>• start ip – Set a starting IP address used in a range of addresses available to T5 controller connecting CPE devices.</td>
</tr>
<tr>
<td></td>
<td>• end ip – Set an end IP address used in a range of addresses available to T5 controller connecting CPE devices.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config)#t5 B4:C7:99:ED:5C:2C
rfs7000-37FABE(config-device-B4:C7:99:ED:5C:2C)#?

T5 Device Mode commands:

- adsp-sensor-server Configure WIPS server
- bridge Sets MAC address expiration time in the bridge address table
- clock Configure clock options
- cpe T5 CPE configuration
- hostname Set system’s network name
- interface Select an interface to configure
- ip Internet Protocol (IP)
- no Negate a command or set its defaults
- ntp Configure NTP
- override-wlan Configure RF Domain level overrides for wlan
- password T5 password configuration
- qos QoS settings
- radius-server Radius server settings
- t5 T5 configuration
- t5-logging Modify message logging facilities
use                  Set setting to use
clrscr               Clears the display screen
commit               Commit all changes made in this session
do                   Run commands from Exec mode
end                   End current mode and change to EXEC mode
exit                  End current mode and down to previous mode
help                  Description of the interactive help system
revert               Revert changes
service               Service Commands
show                  Show running system information
write                 Write running configuration to memory or terminal

<td>Summarizes the Web Filter policy configuration mode commands</td>
<td>page 4-347</td>
</tr>
</tbody>
</table>
4.1.88.1 web-filter-policy

web-filter-policy

Creates a Web Filtering policy and enters its configuration mode. This policy defines rules managing the local classification database and the cached data. When configured and applied, this policy also enables caching of URL classification records in a local database in a controller-based, hierarchically managed (HM) deployment. Use this option to specify the following: classification server details, size of the local database, time for which records are cached in the database, the action taken in case the classification server is unavailable etc.

The Web filter policy is applied at the profile or device level.

For more information on URL filtering, see url-filter.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

web-filter-policy <WEB-FILTER-POLICY-NAME>

Parameters

- web-filter-policy <WEB-FILTER-POLICY-NAME>

Examples

nx4500-5CFA2B(config)#web-filter-policy test
nx4500-5CFA2B(config-web-filter-policy-test)#?

Content Filter Mode commands:
- cache-max-recs Configure the maximum number of records in local cache
- cache-save-interval Configure the time a record is saved in local cache
- logging Select logging method
- no Negate a command or set its defaults
- server-host Configure URL classification server if it is not the adopted controller
- server-unreachable Permission to access website when classification server is unreachable (default is pass)
- uncategorized-url Permission to website when server fails to classify the URL request (default is pass)
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

<td>page 4-354</td>
</tr>
</tbody>
</table>
4.1.88.2.1 cache-max-recs

This command configures the maximum number of records (URL and Web page classification entries) cached in the local database.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

`cache-max-recs <1-100000>`

Parameters

- `cache-max-recs <1-100000>`

Specify the maximum number of records cached in the local database from 1 - 100000. When configuring this value take into consideration the type of device using the Web Filter policy. The value should approximately be as per the following information:

- NX95XX – <1-100000> (default is 100,000)
- NX45XX/NX65XX/NX75XX – <1-100000> (default is 10,000)
- RFS Switches – <1-10000> (default is 1,000)
- Access Points – <1-1500> (default is 500)

Examples

```
nx4500-5CFA2B(config-web-filter-policy-test)#cache-max-recs 9000
```

```
nx4500-5CFA2B(config-web-filter-policy-test)#show context web-filter-policy test
cache-max-recs 9000
```

Related Commands

`no`

Reverts the maximum number of stored records to default. Please see the parameter table for default values for the different device types.
4.1.88.2.2 cache-save-interval

Configure the maximum time period, in seconds, for which a record (URL and Web page classification entry) is cached in the local database. Once the specified time has expired the record is removed from the cache.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

\texttt{cache-save-interval <1-86400>}

Parameters

- \texttt{cache-save-interval <1-86400>}

| cache-save-interval \texttt{<1-86400>} | Specify the maximum time period, in seconds, for which a record is cached in the local database from 1 - 86400 seconds. The default is 60 seconds. |

Examples

\begin{verbatim}
nx4500-5CFA2B(config-web-filter-policy-test)#cache-save-interval 1000

nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000

nx4500-5CFA2B(config-web-filter-policy-test)#
\end{verbatim}

Related Commands

| no | Reverts the maximum time period for which a record (URL and Web page classification entry) is cached in the local database to default (60) |
4.1.88.2.3 logging

web-filter-policy-config-mode commands

Configures the method used to log Web filtering events

Supported in the following platforms:

• Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

logging [logfile|syslog]

Parameters

• logging [logfile|syslog]

| logging [logfile|syslog] | Selects the method used to log Web filtering events. The options are:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• logfile – Logs to a file.</td>
</tr>
<tr>
<td></td>
<td>• syslog – Logs to the syslog server. This is the default setting.</td>
</tr>
</tbody>
</table>

Examples

nx9500-6C8809(config-web-filter-policy-test)#logging logfile

nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
logging logfile
nx9500-6C8809(config-web-filter-policy-test)#
no

web-filter-policy-config-mode commands

Reverts the selected Web Filter policy settings to default, based on the parameters passed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

no [cache-max-recs|cache-save-interval|server-host|server-unreachable|uncategorized-url]

Parameters
- no <PARAMETERS>

Examples

The following example shows the Web Filter policy 'test' settings before the 'no' command is executed:

nx4500-5CFA2B(config-web-filter-policy-test)#no cache-max-recs
nx4500-5CFA2B(config-web-filter-policy-test)#no server-unreachable
nx4500-5CFA2B(config-web-filter-policy-test)#no uncategorized-url

The following example shows the Web Filter policy 'test' settings after the 'no' command has been executed:

nx4500-5CFA2B(config-web-filter-policy-test)#
4.1.88.2.5 server-host

Configures the URL classification server in case it is not the adopted controller

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

```
server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|
imint-id <SERVER-MiNT-ID>]
```

Parameters

- `server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|
imint-id <SERVER-MiNT-ID>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host-name</td>
<td>Identifies the classification server by its hostname.</td>
</tr>
<tr>
<td>ip-address</td>
<td>Identifies the classification server by its IP address.</td>
</tr>
<tr>
<td>mint-id</td>
<td>Identifies the classification server by its MiNT ID.</td>
</tr>
</tbody>
</table>

Examples

```
nx4500-5CFA2B(config-web-filter-policy-test)#server-host ip-address 192.168.13.13

nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
  server-host ip-address 192.168.13.13

nx4500-5CFA2B(config-web-filter-policy-test)#
```

Related Commands

- `no` Removes the URL classification server's configured details, such as hostname, ip-address, or MiNT ID.
4.1.88.2.6 server-unreachable

web-filter-policy-config-mode commands

Configures the action taken in case the classification server is unreachable. Based on the value configured the an end user’s request for a URL/Website is either blocked or passed.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

server-unreachable [block|pass]

Parameters

- server-unreachable [block|pass]

| server-unreachable [block|pass] | Configures the action taken in case the classification server is unreachable. The options are:
| | • block – Denies access to the requested URL/Website
| | • pass – Allows access to the requested URL/Website. This is the default value. |

Examples

nx4500-5CFA2B(config-web-filter-policy-test)#server-unreachable block

nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
  server-unreachable block
  server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#

Related Commands

- no | Reverts the action taken in case the classification server is unreachable to default (pass)
### 4.1.88.2.7 uncategorized-url

**web-filter-policy-config-mode commands**

Configures the action taken in case the classification server fails to classify a URL/Website. Based on the value configured the an end user’s request for a non-classified URL/Website is either blocked or passed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
uncategorized-url [block|pass]
```

**Parameters**

- `uncategorized-url [block|pass]`

  **Examples**

  - `nx4500-5CFA2B(config-web-filter-policy-test)#uncategorized-url block`
  - `nx4500-5CFA2B(config-web-filter-policy-test)#show context`
  - `web-filter-policy test`
  - `cache-max-recs 9000`
  - `cache-save-interval 1000`
  - `uncategorized-url block`
  - `server-unreachable block`
  - `server-host ip-address 192.168.13.13`
  - `nx4500-5CFA2B(config-web-filter-policy-test)#`

**Related Commands**

- `no`

  Reverts the action taken in case the classification server fails to classify a URL/Website to default (pass)
4.1.89 **wips-policy**

> **Global Configuration Commands**

Configures a WIPS policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
wips-policy <WIPS-POLICY-NAME>
```

**Parameters**

- `wips-policy <WIPS-POLICY-NAME>`

**Examples**

```
rfs7000-37FABE(config)#wips-policy test
rfs7000-37FABE(config-wips-policy-test)#?
```

Wips Policy Mode commands:

- `ap-detection` Rogue AP detection
- `enable` Enable this wips policy
- `event` Configure an event
- `history-throttle-duration` Configure the duration for which event duplicates are not stored in history
- `interference-event` Specify events which will contribute to smart-rf wifi interference calculations
- `no` Negate a command or set its defaults
- `signature` Signature to configure
- `use` Set setting to use

```
clrscr
commit
end
exit
help
revert
service
show
write
```

```
rfs7000-37FABE(config-wips-policy-test)#
```

**NOTE:** For more information on WIPS policy commands, see *Chapter 20, WIPS-POLICY.*

---

**Related Commands**

- `no` Removes an existing WIPS policy
4.1.90 wlan

Global Configuration Commands

Configures a Wireless Local Area Network (WLAN)

The following table lists WLAN configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan</td>
<td>Creates a new wireless LAN and enters its configuration mode</td>
<td>page 4-357</td>
</tr>
<tr>
<td>wlan-mode commands</td>
<td>Summarizes WLAN configuration mode commands</td>
<td>page 4-360</td>
</tr>
</tbody>
</table>
4.1.90.1 **wlan**

Configures a WLAN and enters its configuration mode. Use this command to modify an existing WLAN’s settings. A WLAN is a data-communications system that flexibly extends the functionality of a wired LAN. A WLAN links two or more computers or devices using spread-spectrum or Orthogonal Frequency Division Multiplexing (OFDM) modulation based technology. WLANs do not require lining up devices for line-of-sight transmission, and are thus, desirable for wireless networking. Roaming users can be handed off from one access point to another, like a cellular phone system. WLANs can therefore be configured around the needs of specific user groups, even when they are not in physical proximity.

WLANs can provide an abundance of services, including data communications (allowing mobile devices to access applications), e-mail, file, and print services or even specialty applications (such as guest access control and asset tracking).

Each WLAN configuration contains encryption, authentication and QoS policies and conditions for user connections. Connected access point radios transmit periodic beacons for each BSS. A beacon advertises the SSID, security requirements, supported data rates of the wireless network to enable clients to locate and connect to the WLAN.

WLANs are mapped to radios on each access point. A WLAN can be advertised from a single access point radio or can span multiple access points and radios. WLAN configurations can be defined to provide service to specific areas of a site. For example, a guest access WLAN may only be mapped to a 2.4 GHZ radio in a lobby or conference room providing limited coverage, while a data WLAN is mapped to all 2.4 GHZ and 5.0 GHZ radios at the branch site to provide complete coverage.

The maximum number of WLANs supported by different devices is as follows:

- RFS4000 and RFS6000 wireless controllers – 32 WLANs
- RFS7000 wireless controller – 256 WLANs
- NX4500 and NX6500 series service platforms – 32 WLANs
- NX9000 series service platforms – 1000 WLANs
- Access Points – 16 WLANs

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
wlan {<WLAN-NAME>|containing <WLAN-NAME>}
```

**Parameters**

- wlan {<WLAN-NAME>|containing <WLAN-NAME>}

  - wlan `<WLAN-NAME>` Configures a new WLAN
    - `<WLAN-NAME>` – Optional. Specify the WLAN name.
    - The WLAN name could be a logical representation of its coverage area (for example, engineering, marketing etc.). The name cannot exceed 32 characters.

  - containing `<WLAN-NAME>` Optional. Configures an existing WLAN’s settings
    - `<WLAN-NAME>` – Specify a sub-string in the WLAN name. Use this parameter to filter a WLAN. This option allows you to select and enter the configuration mode of one or more WLANs.
### Examples

```bash
rfs7000-37FABE(config)#wlan 1
rfs7000-37FABE(config-wlan-1)#?
```

Wireless LAN Mode commands:

<table>
<thead>
<tr>
<th>Command</th>

rfs7000-37FABE(config-wlan-1)#

The following example shows how to use the ‘containing’ keyword to enter the configuration mode of an existing WLAN:

rfs7000-37FABE(config)#wlan containing wlan1
rfs7000-37FABE(config-wlan-{'containing': 'wlan1'})#
4.1.90.2 wlan-mode commands

This section documents the WLAN configuration mode commands in detail.
Use the (config) instance to configure WLAN related parameters.
To navigate to this instance, use the following command:

```
<DEVICE>(config)#wlan <WLAN-NAME>
```

The following table summarizes WLAN configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>

4.1.90.2.1 accounting

Defines the WLAN’s accounting configuration

Accounting is the method of collecting user data, such as start and stop times, executed commands (for example, PPP), number of packets and number of bytes received and transmitted. This data is sent to the security server for billing, auditing, and reporting purposes. Accounting enables wireless network administrators to track the services and network resources accessed and consumed by users. When enabled, this feature allows the network access server to report and log user activity to a RADIUS security server in the form of accounting records. Each accounting record is comprised of AV pairs and is stored on the access control server. The data can be analyzed for network management, client billing, and/or auditing. Accounting methods must be defined through AAA policies.

Accounting can be enabled and applied to access point, wireless controller, or service platform managed WLANs. Once enabled, it uniquely logs accounting events specific to the managed WLAN. Accounting logs contain information about the use of remote access services by users. This information is of great assistance in partitioning local versus remote users and how to best accommodate each. Remote user information can be archived to a location outside of the access point for periodic network and user permission administration.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
accounting [radius|syslog|wait-client-ip]
accounting [radius|wait-client-ip]
accounting syslog [host|mac-address-format]
accounting syslog host <IP/HOSTNAME> {port <1-65535>}{proxy-mode [none|through-controller|through-rf-domain-manager]}
accounting syslog mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot] case [lower|upper]
```

Parameters

- accounting [radius|wait-client-ip]

| accounting radius | Enables support for WLAN RADIUS accounting messages. This option is disabled by default. When enabled, the WLAN uses an external RADIUS resource for accounting. Note: Use the use > aaa-policy > <AAA-POLICY-NAME> command to associate an appropriate AAA policy with this WLAN. This AAA policy should be existing and should define the accounting, authentication, and authorization parameters. |
| accounting wait-client-ip | Enables waiting for client’s IP before commencing the accounting procedure |

- accounting syslog host <IP/HOSTNAME> {port <1-65535>}{proxy-mode [none|through-controller|through-rf-domain-manager]}

<p>| accounting syslog | Enables support for WLAN syslog accounting messages in standard syslog format (RFC 3164). This option is disabled by default. |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host &lt;IP/HOSTNAME&gt;</td>
<td>Configures a syslog destination hostname or IP address for accounting records</td>
</tr>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Specify the IP address or name of the destination host.</td>
</tr>
<tr>
<td>port &lt;1-65535&gt;</td>
<td>Optional. Configures the syslog server’s UDP port (this port is used to connect to the server)</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-65535&gt; – Specify the port from 1 - 65535. Default port is 514.</td>
</tr>
<tr>
<td>proxy-mode [none</td>
<td>through-controller</td>
</tr>
<tr>
<td></td>
<td>• none – Requests are directly sent to the server from the device</td>
</tr>
<tr>
<td></td>
<td>• through-controller – Proxies requests through the controller (access point, wireless controller, or service platform) configuring the device</td>
</tr>
<tr>
<td></td>
<td>• through-rf-domain-manager – Proxies requests through the local RF Domain manager</td>
</tr>
<tr>
<td>accounting syslog</td>
<td>Enables support for WLAN syslog accounting messages</td>
</tr>
<tr>
<td>mac-address-format</td>
<td>Configures the MAC address format used in syslog messages</td>
</tr>
<tr>
<td>middle-hyphen</td>
<td>Configures the MAC address format with middle hyphen (AABBCC-DDEEFF)</td>
</tr>
<tr>
<td>no-delim</td>
<td>Configures the MAC address format without delimiters (AABBCCDDEEFF)</td>
</tr>
<tr>
<td>pair-colon</td>
<td>Configures the MAC address format with pair-colon delimiters (AA:BB:CC:DD:EE:FF)</td>
</tr>
<tr>
<td>pair-hyphen</td>
<td>Configures the MAC address format with pair-hyphen delimiters (AA-BB-CC-DD-EE-FF). This is the default setting.</td>
</tr>
<tr>
<td>quad-dot</td>
<td>Configures the MAC address format with quad-dot delimiters (AABB.CCDD.EEFF)</td>
</tr>
<tr>
<td>case [lower</td>
<td>upper]</td>
</tr>
<tr>
<td></td>
<td>• case – Specifies MAC address case (upper or lower)</td>
</tr>
<tr>
<td></td>
<td>• lower – Specifies MAC address is filled in lower case (for example, aa-bb-cc-dd-ee-ff)</td>
</tr>
<tr>
<td></td>
<td>• upper – Specifies MAC address is filled in upper case (for example, AA-BB-CC-DD-EE-FF)</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config-wlan-test)#accounting syslog host 172.16.10.4 port 2 proxy-mode none
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  accounting syslog host 172.16.10.4 port 2
rfs7000-37FABE(config-wlan-test)#
```

</tbody>
</table>
4.1.90.2.2 acl

Defines the actions taken based on an ACL rule configuration

Use the `use > ip-access-list <IP-ACCESS-LIST-NAME>` command to associate an ACL with the WLAN. The ACL rule is determined by the associated ACL's configuration.

A firewall is a mechanism enforcing access control, and is considered a first line of defense in protecting proprietary information within the network. The means by which this is accomplished varies, but in principle, a firewall can be thought of as mechanisms allowing and denying data traffic in respect to administrator defined rules. For an overview of firewalls, see `FIREWALL-POLICY`.

WLANs use firewalls like Access Control Lists (ACLs) to filter/mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of Access Control Entries (ACEs). Each ACE specifies an action and a set of conditions (rules) a packet must satisfy to match the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP based firewall rules are specific to source and destination IP addresses and the unique rules and precedence orders assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, administrators can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC Firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
_acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400>|disassociate}
```

Parameters

- `acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400>|disassociate}`

<table>
<thead>
<tr>
<th>acl exceed-rate</th>
<th>Sets the action taken based on an ACL rule configuration (for example, drop a packet)</th>
</tr>
</thead>
<tbody>
<tr>
<td>wireless-client-denied-traffic &lt;0-1000000&gt;</td>
<td>Sets the action to deny traffic to the wireless client when the rate exceeds the specified value</td>
</tr>
<tr>
<td></td>
<td>• &lt;0-1000000&gt; — Specify a allowed rate threshold of disallowed traffic in packets/sec.</td>
</tr>
<tr>
<td></td>
<td>• If enabled, this option allows an associated client, exceeding the thresholds configured for storm traffic, to be either de-authenticated or blacklisted depending on the action selected. This option is disabled by default.</td>
</tr>
<tr>
<td>blacklist &lt;0-86400&gt;</td>
<td>Optional. When enabled, sets the time interval, in seconds, to blacklist a wireless client.</td>
</tr>
<tr>
<td></td>
<td>• &lt;0-86400&gt; — Configures the blacklist duration from 0 - 86400 seconds. Offending clients are re-authenticated once the blacklist duration, configured here, has exceeded.</td>
</tr>
<tr>
<td>disassociate</td>
<td>Optional. When enabled, disassociates a wireless client.</td>
</tr>
</tbody>
</table>
Examples

rfs7000-37FABE(config-wlan-test)#acl exceed-rate wireless-client-denied-traffic 20 disassociate

rfs7000-37FABE(config-wlan-test)#show context wlan test
    ssid test
    bridging-mode tunnel
    encryption-type none
    authentication-type none
    accounting syslog host 172.16.10.4 port 2
    acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test) #

4.1.90.2.3 answer-broadcast-probes

Allows the WLAN to respond to probe requests that do not specify a SSID. These probes are for broadcast ESS. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
answer-broadcast-probes

Parameters
None

Examples
rfs7000-37FABE(config-wlan-1)#answer-broadcast-probes
rfs7000-37FABE(config-wlan-1)#

4.1.90.2.4 assoc-response

wlan-mode commands

Configures the deny-threshold and rssi-threshold values. These threshold values are considered when responding to a client’s association/authentication request.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]

Parameters
- assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]

<table>
<thead>
<tr>
<th>assoc-response</th>
<th>Configures the association response thresholds</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny-threshold &lt;1-12&gt;</td>
<td>Configures the number of times association/authentication request, from a client, is ignored if the RSSI is less than the configured RSSI threshold. This option is disabled by default.</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-12&gt; – Specify the deny-threshold from 1 - 12.</td>
</tr>
<tr>
<td>rssi-threshold &lt;-100--40&gt;</td>
<td>Configures an association response RSSI threshold value. If the RSSI is below the configured threshold value, the client’s association/authentication request is ignored. This option is disabled by default.</td>
</tr>
<tr>
<td></td>
<td>• rssi-threshold &lt;-100--40&gt; – Specify a value from -100 - -40 dBm.</td>
</tr>
</tbody>
</table>

Examples
nx9500-6C8809(config-wlan-test)#assoc-response rssi-threshold -60
nx9500-6C8809(config-wlan-test)#assoc-response deny-threshold 4

nx9500-6C8809(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none
  assoc-response rssi-threshold -60
  assoc-response deny-threshold 4

### 4.1.90.2.5 association-list

*Wlan-mode commands*

Attaches an existing global association list with this WLAN. For more information on global association lists, see `global-association-list`.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
association-list global <GLOBAL-ASSO-LIST-NAME>
```

**Parameters**
- `association-list global <GLOBAL-ASSO-LIST-NAME>`

**Examples**

```
rfs4000-229D58(config-wlan-test)#association-list global my-clients
rfs4000-229D58(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  association-list global my-clients
rfs4000-229D58(config-wlan-test)#
```

**Related Commands**

```
no
```

Removes the global association list's association with this WLAN.
### 4.1.90.2.6 authentication-type

* wlan-mode commands

Sets the WLAN's authentication type

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none]
```

#### Parameters

- `authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none]`

<table>
<thead>
<tr>
<th>authentication-type</th>
<th>Configures a WLAN's authentication type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The authentication types are: EAP, EAP-MAC, EAP-PSK, Kerberos, MAC, and none.</td>
</tr>
</tbody>
</table>

- `eap`

  Configures EAP authentication (802.1X)

  EAP is the de-facto standard authentication method used to provide secure authenticated access to controller managed WLANs. EAP provides mutual authentication, secured credential exchange, dynamic keying and strong encryption. 802.1X EAP can be deployed with WEP, WPA or WPA2 encryption schemes to further protect user information forwarded over controller managed WLANs.

  The EAP process begins when an unauthenticated supplicant (client device) tries to connect with an authenticator (in this case, the authentication server). An access point passes EAP packets from the client to an authentication server on the wired side of the access point. All other packet types are blocked until the authentication server (typically, a RADIUS server) verifies the client’s identity.

  If using EAP authentication ensure that a AAA policy is mapped to the WLAN.

- `eap-mac`

  Configures EAP or MAC authentication depending on client. (This setting is valid only with the None encryption type.

  EAP-MAC is useful when in a hotspot environment, as some clients support EAP and an administrator may want to authenticate based on just the MAC address of the device.

- `eap-psk`

  Configures EAP authentication or pre-shared keys depending on client. (This setting is only valid with Temporal Key Integrity Protocol (TKIP) or Counter Mode with Cipher Block Chaining Message Authentication Code Protocol (CCMP) encryption types.

  When using PSK with EAP, the controller sends a packet requesting a secure link using a pre-shared key. The controller and authenticating device must use the same authenticating algorithm and pass code during authentication. EAP-PSK is useful when transitioning from a PSK network to one that supports EAP.

  If using eap-psk authentication ensure that a AAA policy is mapped to the WLAN.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kerberos</td>
<td>Configures Kerberos authentication (encryption will change to WEP128 if it’s not already WEP128 or Keyguard) &lt;br&gt;Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection. Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses Network Time Protocol (NTP) for synchronizing the clocks of its Key Distribution Center (KDC) server(s).</td>
</tr>
<tr>
<td>mac</td>
<td>Configures MAC authentication (RADIUS lookup of MAC address) &lt;br&gt;MAC is a device level authentication method used to augment other security schemes when legacy devices are deployed using static WEP. MAC authentication can be used for device level authentication by permitting WLAN access based on device MAC address. MAC authentication is typically used to augment WLAN security options that do not use authentication (such as static WEP, WPA-PSK and WPA2-PSK) MAC authentication can also be used to assign VLAN memberships, Firewall policies and time and date restrictions. MAC authentication can only identify devices, not users. If using mac authentication ensure that a AAA policy is mapped to the WLAN.</td>
</tr>
<tr>
<td>none</td>
<td>No authentication is used or the client uses pre-shared keys. This is the default value.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-wlan-test)#authentication-type eap
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type eap
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test)#
```

**Related Commands**

- **no** | Resets the authentication mode used with this WLAN to default (none/pre-shared keys) |
4.1.90.2.7 bridging-mode

wlan-mode commands

Configures how packets are bridged to and from a WLAN

Use this command to define which VLANs are bridged, and how local VLANs are bridged between the wired and wireless sides of the network.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

bridging-mode [local|tunnel]

Parameters

- bridging-mode [local|tunnel]

<table>
<thead>
<tr>
<th>bridging-mode</th>
<th>Configures how packets are bridged to and from a WLAN. The options are local and tunnel.</th>
</tr>
</thead>
<tbody>
<tr>
<td>local</td>
<td>Bridges packets between WLAN and local ethernet ports. This is the default mode.</td>
</tr>
<tr>
<td>tunnel</td>
<td>Tunnels packets to other devices (typically a wireless controller or service platform)</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-wlan-test)#bridging-mode local

rfs7000-37FABE(config-wlan-test)#show context wlan test
ssid test
  bridging-mode local
  encryption-type none
  authentication-type eap
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test)#
4.1.90.2.8 broadcast-dhcp

- **wlan-mode commands**

Configures broadcast DHCP packet handling parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

broadcast-dhcp validate-offer

**Parameters**

- broadcast-dhcp validate-offer

<table>
<thead>
<tr>
<th>validate-offer</th>
<th>Enables validation of the broadcast DHCP packet destination (a wireless client associated to the radio) before forwarding over the air. This option is disabled by default.</th>
</tr>
</thead>
</table>

**Examples**

rfs7000-37FABE(config-wlan-test)#broadcast-dhcp validate-offer

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type eap
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
  broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#

**Related Commands**

- no | Disables validation of the broadcast DHCP packet destination (a wireless client associated to the radio) before forwarding over the air |
4.1.90.2.9 broadcast-ssid

Advertises the WLAN SSID in beacons. If a hacker tries to isolate and hack a SSID from a client, the SSID will display since the ESSID is in the beacon. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5600, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
broadcast-ssid

Parameters
None

Examples
rfs7000-37FABE(config-wlan-1)#broadcast-ssid
rfs7000-37FABE(config-wlan-1)#

Related Commands

|   no   | Disables the broadcasting of the WLAN’s SSID in beacons |
**4.1.90.2.10 captive-portal-enforcement**

- wlan-mode commands

Configures the WLAN’s captive portal enforcement

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**
captive-portal-enforcement {fall-back}

**Parameters**
- captive-portal-enforcement {fall-back}

<table>
<thead>
<tr>
<th>captive-portal-enforcement</th>
<th>Enables captive portal enforcement on a WLAN. This option is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>fall-back</td>
<td>Optional. Enforces captive portal validation if WLAN authentication fails (applicable to EAP or MAC authentication only)</td>
</tr>
</tbody>
</table>

**Examples**
rfs7000-37FABE(config-wlan-test)#captive-portal-enforcement fall-back
rfs7000-37FABE(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode local
 encryption-type none
 authentication-type eap
 accounting syslog host 172.16.10.4 port 2
 captive-portal-enforcement fall-back
 acl exceed-rate wireless-client-denied-traffic 20 disassociate
 broadcast-dhcp validate-offer
 rfs7000-37FABE(config-wlan-test)#

**Related Commands**

| no | Disables captive portal enforcement |
4.1.90.2.11 client-access

* wlan-mode commands

Enables WLAN client access (for normal data operations)

Supported in the following platforms:

  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

client-access

Parameters

None

Examples

rfs7000-37FABE(config-wlan-1)#client-access
rfs7000-37FABE(config-wlan-1)#

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Enables WLAN client access</td>
</tr>
</tbody>
</table>
4.1.90.2.12 client-client-communication

wlan-mode commands

Allows frame switching from one client to another on a WLAN

This option is enabled by default. It allows clients to exchange packets with other clients. It does not necessarily prevent clients on other WLANs from sending packets to this WLAN, but as long as this setting is also disabled on that WLAN, clients are not permitted to interoperate.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

client-client-communication

Parameters

None

Examples

rfs7000-37FABE(config-wlan-1)#client-client-communication
rfs7000-37FABE(config-wlan-1)#

Related Commands

no Disables frame switching from one client to another on a WLAN
### 4.1.90.2.13 client-load-balancing

#### wlan-mode commands

Enforces client load balancing on a WLAN’s access point radios. AP6522, AP6532, AP6562, AP81XX, and AP82XX models can support 256 clients per access point. AP6511 and AP6521 models can support up to 128 clients per access point. Loads are balanced by ignoring association and probe requests. Probe and association requests are not responded to, forcing a client to associate with another access point radio.

This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
client-load-balancing {allow-single-band-clients|band-discovery-intvl|
capability-ageout-time|max-probe-req|probe-req-intvl}

client-load-balancing {allow-single-band-clients 2.4ghz|5ghz|
band-discovery-intvl <0-10000>|capability-ageout-time <0-10000>}

client-load-balancing {max-probe-req|probe-req-intvl} 2.4ghz|5ghz <0-10000>
```

#### Parameters

- `client-load-balancing` Configures WLAN client load balancing

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>

broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#
```
4.1.90.2.14 controller-assisted-mobility

Enables controller or service platform assisted mobility to determine a wireless client’s VLAN assignment. When enabled, a controller or service platform’s mobility database is used to assist in roaming between RF Domains. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
controller-assisted-mobility

Parameters
None

Examples
rfs4000-229D58(config-wlan-test)#controller-assisted-mobility

Related Commands

- data-rates [2.4GHz|5GHz] custom [1|11|12|18|2|24|36|48|5.5|54|6|9|basic-1|basic-11|basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|basic-9|basic-mcs-1s|mcs-1s|mcs-2s|mcs-3s]
### custom

Configures a data rates list by specifying each rate individually. Use 'basic-' prefix before a rate to indicate it is used as a basic rate (For example, 'data-rates custom basic-1 basic-2 5.5 11').

The data-rates for 2.4 GHz and 5.0 GHz channels are the same with a few exceptions. The 2.4 GHz channel has a few extra data rates: 1, 11, 2, and 5.5.

### 1,11,2,5.5

The following data rates are specific to the 2.4 GHz channel:
- 1 – 1-Mbps
- 11 – 11-Mbps
- 2 – 2-Mbps
- 5.5 – 5.5-Mbps

### [12,18,24,36,48,54,6,9,basic-1,basic-11, basic-12,basic-18, basic-2,basic-36, basic-48,basic-5.5, basic-54,basic-6, basic-9, basic-mcs-1s, mcs-1s,mcs2s, mcs-3s]

The following data rates are common to both the 2.4 GHz and 5.0 GHz channels:
- 12 – 12 Mbps
- 18 – 18-Mbps
- 24 – 24 Mbps
- 36 – 36-Mbps
- 48 – 48-Mbps
- 54 – 54-Mbps
- 6 – 6-Mbps
- 9 – 9-Mbps
- basic-1 – basic 1-Mbps
- basic-11 – basic 11-Mbps
- basic-12 – basic 12-Mbps
- basic-18 – basic 18-Mbps
- basic-2 – basic 2-Mbps
- basic-36 – basic 36-Mbps
- basic-48 – basic 48-Mbps
- basic-5.5 – basic 5.5-Mbps
- basic-54 – basic 54-Mbps
- basic-6 – basic 6-Mbps
- basic-9 – basic 9-Mbps
- basic-mcs-1s – Modulation and coding scheme data rates for 1 Spatial Stream
- mcs-1s – Applicable to 1-spatial stream data rates
- mcs-2s – Applicable to 2-spatial stream data rates
- mcs-3s – Applicable to 3-spatial stream data rates
**Examples**

### 4.1.90.2.16 description

**wlan-mode commands**

Defines the WLAN description

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

description <LINE>

**Parameters**

- description <LINE>

<table>
<thead>
<tr>
<th>&lt;LINE&gt;</th>
<th>Specify a WLAN description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The WLAN's description should help differentiate it from others with similar configurations. The description should not exceed 64 characters.</td>
</tr>
</tbody>
</table>

**Examples**

```
    rfs7000-37FABE(config-wlan-test)#description TestWLAN
    rfs7000-37FABE(config-wlan-test)#show context wlan test
    description TestWLAN
    ssid test
    bridging-mode local
    encryption-type none
    authentication-type eap
    accounting syslog host 172.16.10.4 port 2
    data-rates 2.4GHz gn
    client-load-balancing probe-req-intvl 5ghz 5
    client-load-balancing band-discovery-intvl 2
    captive-portal-enforcement fall-back
    acl exceed-rate wireless-client-denied-traffic 20 disassociate
    broadcast-dhcp validate-offer
    rfs7000-37FABE(config-wlan-test)#
```

**Related Commands**

4.1.90.2.17 downstream-group-addressed-forwarding

wlan-mode commands

Enables forwarding of downstream broadcast/multicast (BC/MC) packets to a group on this WLAN. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
downstream-group-addressed-forwarding

Parameters
None

Examples
rfs4000-229D58(config-wlan-test)#downstream-group-addressed-forwarding
rfs4000-229D58(config-wlan-test)#

Related Commands

4.1.90.2.18 dynamic-vlan-assignment

* wlan-mode commands *

Enables dynamic VLAN assignment on this WLAN. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dynamic-vlan-assignment allowed-vlans <VLAN-ID>

**Parameters**
- dynamic-vlan-assignment allowed-vlans <VLAN-ID>

<table>
<thead>
<tr>
<th>dynamic-vlan-assignment allowed-vlans</th>
<th>Enables dynamic VLAN assignment and configures a list of VLAN IDs or VLAN alias allowed access to the WLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;VLAN-ID&gt;</td>
<td>Specify the list of VLAN IDs or the VLAN alias names. For example, 10-20, 25, 30-35, $guest. For information on VLAN aliases, see alias.</td>
</tr>
</tbody>
</table>

**Examples**

rfs4000-229D58(config-wlan-test)#dynamic-vlan-assignment allowed-vlans 10-20

rfs4000-229D58(config-wlan-test)#show context
wlan test
ssid test
bridging-mode tunnel
encryption-type none
authentication-type none
dynamic-vlan-assignment allowed-vlans 10-20
rfs4000-229D58(config-wlan-test)#

**Related Commands**

| no     | Disables dynamic VLAN assignment on this WLAN |
4.1.90.2.19 eap-types

- **wlan-mode commands**

Configures client access based on the EAP type used

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls]
{(aka|all|fast|peap|sim|tls|ttls)}
```

**Parameters**

- `eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls]`

| eap-types [allow|deny] | Configures a list of allowed or denied EAP types |
|------------------------|-----------------------------------------------|
| • allow                | Configures a list of EAP types allowed for WLAN client authentication |
| • deny                 | Configures a list of EAP types not allowed for WLAN client authentication |

| [aka|all|fast|peap|sim|tls|ttls] | The following EAP types are common to the ‘allow’ and ‘deny’ keywords: |
|----------------------------------------|---------------------------------------------------------------------|
| • aka – Configures EAP Authentication and Key Agreement (AKA) and EAP-AKA’ (AKA Prime). EAP-AKA is one of the methods in the EAP authentication framework. It uses Universal Mobile Telecommunications System (UMTS) and Universal Subscriber Identity Module (USIM) for client authentication and key distribution. |
| • all – Allows or denies usage of all EAP types on the WLAN. This is the default setting. |
| • peap – Configures Protected Extensible Authentication Protocol (PEAP). PEAP or Protected EAP uses encrypted and authenticated TLS tunnel to encapsulate EAP. |
| • sim – Configures EAP Subscriber Identity Module (SIM). EAP-SIM uses Global System for Mobile Communications (GSMC) SIM for client authentication and key distribution. |
| • tls – Configures EAP Transport Layer Security (TLS). EAP-TLS is an EAP authentication method that uses PKI to communicate with a RADIUS server or any other authentication server. |
| • ttls – Configures Tunneled Transport Layer Security (TTLS). EAP-TTLS is an extension of TLS. Unlike TLS, TTLS does not require every client to generate and install a CA- signed certificate. |

**Note:** These options are recursive, and more than one EAP type can be selected. The selected options are added to the allowed or denied EAP types list.
Examples

rfs7000-37FABE(config-wlan-test)#eap-types allow fast sim tls

rfs7000-37FABE(config-wlan-test)#show context
  wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  eap-types allow fast sim tls
rfs7000-37FABE(config-wlan-test)#

4.1.90.2.22 **fast-bss-transition**

* wlan-mode commands

Enables support for 802.11r *Fast-BSS Transition* (FT) on the selected WLAN. This feature is disabled by default. 802.11r is an attempt to undo the burden that security and QoS added to the handoff process, and restore it back to an original four message exchange process. The central application for the 802.11r standard is VOIP using mobile phones within wireless Internet networks. 802.11r FT redefines the security key negotiation protocol, allowing parallel processing of negotiation and requests for wireless resources.

Enabling FT standards provides wireless clients fast, secure and seamless transfer from one base station to another, ensuring continuous connectivity.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`fast-bss-transition {over-ds}`

**Parameters**

- `fast-bss-transition {over-ds}`

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>over-ds</td>
<td>Enables 802.11r FT support on this WLAN</td>
</tr>
<tr>
<td>over-ds</td>
<td>• over-ds – Optional. Enables 802.11r client roaming over the <em>Distribution System</em> (DS). When enabled, all client communication with the target AP is via the current AP. This communication, carried in FT action frames, is first sent by the client to the current AP, then forwarded to the target AP through the controller.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config-wlan-test)#fast-bss-transition
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  vlan 1
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  fast-bss-transition
rfs7000-37FABE(config-wlan-test)#
```

**Related Commands**

- **no** Disables support for 802.11r *Fast-BSS Transition* (FT) on a WLAN
4.1.90.2.23 http-analyze

* wlan-mode commands *

Enables HTTP URL analysis on the WLAN

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

http-analyze [filter|syslog]
http-analyze filter [images|post|query-string]
http-analyze syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}

**Parameters**

- **http-analyze filter [images|post|query-string]**
  - filter: Filters URLs, based on the parameters set, before forwarding them
  - images: Filters out URLs referring to images (does not forward URL requesting images)
  - post: Filters out URLs requesting POST (does not forward POST requests). This option is disabled by default.
  - query-string: Removes query strings from URLs before forwarding them (forwards requests and no data). This option is disabled by default.

- **http-analyze syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}

**Examples**

rfs4000-229D58(config-wlan-test)#http-analyze syslog host 192.168.13.10 port 21 proxy-mode through-controller

rfs4000-229D58(config-wlan-test)#show context

Related Commands

no Reset IP ARP or DHCP trust parameters to default. ARP trust is disabled, ARP mismatch verification is enabled, or DHCP trust is disabled.
4.1.90.2.25 ipv6

Sets the DHCPv6 and ICMPv6 neighbor discovery (ND) components for this WLAN

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ipv6 [dhcpv6|nd]
ipv6 dhcpv6 trust
ipv6 nd [header-mismatch-validation|raguard|trust]

Parameters

- ipv6 dhcpv6 trust
- ipv6 nd [header-mismatch-validation|raguard|trust]

<table>
<thead>
<tr>
<th>ipv6 dhcpv6 trust</th>
<th>Enables DHCPv6 trust state for DHCPv6 responses on this WLAN. When enabled, all DHCPv6 responses received on this WLAN are trusted and forwarded. This option is disabled by default.</th>

4.1.90.2.26  kerberos

wlan-mode commands

Configures Kerberos authentication parameters on a WLAN

Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection.

Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses Network Time Protocol (NTP) for synchronizing the clocks of its Key Distribution Center (KDC) server(s).

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

kerberos [password|realm|server]
kerberos password [0 <LINE>|2 <LINE>|<LINE>]
kerberos realm <REALM>
kerberos server [primary|secondary|timeout]
kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}
kerberos server timeout <1-60>

Parameters
- kerberos password [0 <LINE>|2 <LINE>|<LINE>]
- kerberos realm <REALM>
- kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}

</table>
4.1.90.2.27  mac-authentication

Enables MAC authentication. When enabled, the system uses cached credentials (RADIUS server lookups are skipped) to authenticate clients.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
mac-authentication [cached-credentials|enforce-always]

Parameters
- mac-authentication [cached-credentials|enforce-always]
  - cached-credentials: Uses cached credentials to skip RADIUS lookups. This option is disabled by default.
  - enforce-always: Enforces MAC authentication on this WLAN. When enabled, MAC authentication is enforced, each time a client logs in, even when the authentication type specified (using the authentication-type command) is not MAC authentication. This option is disabled by default.

Examples
rfs4000-229D58(config-wlan-test)#mac-authentication cached-credentials
rfs4000-229D58(config-wlan-test)#

Related Commands
no
  Disables MAC authentication related parameters: Disables use of cached credentials to skip RADIUS lookups, or disables enforcement of MAC authentication on this WLAN.
4.1.90.2.28  no

Negates WLAN mode commands and reverts values to their default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no accounting [radius|syslog|wait-client-ip]
no acl exceed-rate wireless-client-denied-traffic

no assoc-response [deny-threshold|rssi-threshold]
no http-analyze {filter|syslog}
no http-analyze {filter [images|post|query-string]}
no ip [arp|dhcp]
no ip arp [header-mismatch-validation|trust]
no ip dhcp trust

no ipv6 [dhcpp6|nd]
no ipv6 dhcpp6 trust
no ipv6 nd [header-mismatch-validation|guard|trust]

no kerberos [password|realm|server]
no kerberos server [primary host|secondary host|timeout]
no mac-authentication [cached-credentials|enforce-always]
no radio-resource-measurement {channel-report|neighbor-report {hybrid}}
no radius [dynamic-authorization|nas-identifier|nas-port-id|vlan-assignment]
no registration {external}
no relay-agent [dhcp-option82|dhcppv6-ldra]

no shutdown {on-critical-resource|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}
no time-based-access days [all|friday|monday|saturday|sunday|thursday|tuesday|
  wednesday|weekdays|weekends]

no use [aaa-policy|association-acl-policy|bonjour-gw-discovery-policy|captive-portal|
  ip-access-list|ipv6-access-list|mac-access-list|passpoint-policy|

no vlan-pool-member [<1-40 95>|<VLAN-ALIAS-NAME>]

no [wep128|wep64] [key {1-4}|transmit-key]

no wing-extension [move-command|smart-scan|wing-load-information|
  wmm-load-information]

no wireless-client [count-per-radio|cred-cache-ageout|hold-time|inactivity-timeout|
  max-firewall-sessions|reauthentication|roam-notification|t5-inactivity-timeout|
  tx-power|vlan-cache-ageout]

Parameters
- no <PARAMETERS>

no <PARAMETERS> Removes or reverts this WLAN's settings based on the parameters passed

Usage Guidelines
The no command negates any command associated with it. Wherever required, use the same parameters
associated with the command getting negated.

Examples
rfs7000-37FABE (config-wlan-test)#no?
  accounting Configure how accounting records are
  created for this wlan
  acl Actions taken based on ACL
  configuration [ packet drop being one
  of them]
  answer-broadcast-probes Do not Include this wlan when
  responding to probe requests that do
  not specify an SSID
  assoc-response Association response threshold
  association-list Configure the association list for
  the wlan
  authentication-type Reset the authentication to use on
  this wlan to default (none/Pre-shared
  keys)
  broadcast-dhcp Configure broadcast DHCP packet
  handling
  broadcast-ssid Do not advertise the SSID of the WLAN
  in beacons
  captive-portal-enforcement Configure how captive-portal is
  enforced on the wlan
  client-access Disallow client access on this wlan
  (no data operations)
  client-client-communication Disallow switching of frames from one
  wireless client to another on this
  wlan
  client-load-balancing Disable load-balancing of clients on
  this wlan
  controller-assisted-mobility Disable configure assisted mobility
  data-rates Reset data rate configuration to
default
  description Reset the description of the wlan
  downstream-group-addressed-forwarding Disable downstream group addressed
  forwarding of packets
  dynamic-vlan-assignment Dynamic VLAN assignment configuration
  eap-types Allow all EAP types on this wlan
  encryption-type Reset the encryption to use on this
  wlan to default (none)

Related Commands

no
4.1.90.2.29 opendns

Enables integration of access points, wireless controllers, and service platforms with OpenDNS. When configured, DNS queries from wireless clients are redirected to OpenDNS (208.67.220.220 OR 208.67.222.222). These OpenDNS resolvers act as proxy DNS servers that provide additional functionalities, such as Web filtering, reporting, and performance enhancement.

This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

opendns device-id <DEVICE-ID>

Parameters

- opendns device-id <DEVICE-ID>

<table>
<thead>
<tr>
<th>opendns device-id &lt;DEVICE-ID&gt;</th>
<th>Configures the device ID sent to OpenDNS</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DEVICE-ID&gt; – Specify the device ID. The device-id entered here is obtained from the OpenDNS site by executing the following command in the Privi Exec Mode: <code>opendns &gt; username &lt;WORD&gt; password &lt;WORD. label &lt;WORD&gt;</code>. For more information, see <code>opendns</code>.</td>
<td></td>
</tr>
<tr>
<td>Once configured on a WLAN, this value is embedded in each DNS query packet going out from an access point, wireless controller, or service platform to the OpenDNS server. The device ID is a sixteen (16) character hex string representing a 64 bit unsigned integer. Use the <code>no &gt; opendns &gt; device-id</code> command to remove the configured device-id.</td>
<td></td>
</tr>
<tr>
<td>Therefore, when a wireless client associates with a OpenDNS enabled WLAN, all DNS queries originating from the client are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> To enable redirection of DNS query to OpenDNS it is necessary that the DNS server's IP address provided in the DHCP Server policy (used by the client) should point to the OpenDNS IP address (208.67.220.220 OR 208.67.222.222). For more information, see <code>dns-server</code>.</td>
<td></td>
</tr>
<tr>
<td>For example: <code>dns-server</code></td>
<td></td>
</tr>
<tr>
<td>Contd...</td>
<td></td>
</tr>
</tbody>
</table>
Examples
Following examples show all configurations required to integrate access points and controllers with the OpenDNS service:

Step 1. In the Privilege Executable Mode:

```bash
ap7131-E6D512#opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7131-E6D512#
```

Step 2: To enable OpenDNS on a WLAN, apply the device-id, obtained in the preceding step, to the WLAN:

```bash
ap7131-E6D512(config)#wlan opendns
ap7131-E6D512(config-wlan-opendns)#opendns device-id 0014AADF8EDC6C59
ap7131-E6D512(config-wlan-opendns)#commit
ap7131-E6D512(config-wlan-opendns)#show context
```

The following examples show the other mandatory configurations needed to redirect wireless client DNS queries to the OpenDNS server:

```bash
ap7131-E6D512(config)#self
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#
```

Step 3: To enable DNS resolution on the access point or controller, execute the following commands:

```bash
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#ip name-server 144.189.100.51
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#ip dns-server-forward
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#show context
```

Note: To prevent wireless clients from bypassing the OpenDNS resolver by adding their own DNS servers, configure and apply an IP ACL on the access point, wireless controller, or service platform containing the following firewall rules:

```bash
rfs7000-37FABE(config-ip-acl-dns-list)#show context
ip access-list dns-list
  permit udp any host 208.67.222.222 eq dns rule-precedence 1 rule-description "allow dns queries only to OpenDNS"
  deny udp any any eq dns rule-precedence 10 rule-description "block all other dns queries"
  permit ip any any rule-precedence 100 rule-description "allow all other ip packets"
rfs7000-37FABE(config-ip-acl-dns-list)#
```
Step 4: To ensure that the OpenDNS-enabled WLAN’s client’s DNS queries are redirected to the OpenDNS server, execute the following commands:

```
ap7131-E6D512(config)#dhcp-server-policy dhcppolicy
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#dhcp-pool opendns
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#show context
dhcp-server-policy dhcppolicy
dhcp-pool dhcppool
  network 192.168.1.0/24
  address range 192.168.1.160 192.168.1.200
  default-router 192.168.1.105
dns-server 208.67.222.222
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#
ap7131-E6D512(config)#self
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#use dhcp-server-policy dhcppolicy
```

4.1.90.2.30 **protected-mgmt-frames**

* wlan-mode commands

Configures the WLAN's frame protection mode and security association (SA) query parameters. 802.11w provides protection for both unicast management frames and broadcast/multicast management frames. The 'robust management frames' are action, disassociation, and deauthentication frames. The standard provides one security protocol CCMP for protection of unicast robust management frames. Protected management frames (PMF) protocol only applies to robust management frames after establishment of RSNA PTK. Robust management frame protection is achieved by using CCMP for unicast management frames, broadcast/multicast integrity protocol (BIP) for broadcast/multicast management frames and SA query protocol for protection against (re)association attacks.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```bash
protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>| timeout <100-1000>]]
```

**Parameters**
- **mandatory**
  - Enforces **protected management frames** (PMF) on this WLAN (management frames are continually optionally protected)
- **optional**
  - Provides PMF only for those clients that support PMF (management frames are optionally protected)
- **sa-query [attempts <1-10>| timeout <100-1000>]**
  - Configures the following SA parameters:
    - attempts <1-10> – Configures the number of SA query attempts from 1 - 10. The default is 5.
    - timeout <100-1000> – Configures the interval, in milliseconds, used to timeout association requests that exceed the defined interval. Specify a value from 100 - 1000 milliseconds. The default value is 201 milliseconds.

**Examples**

```
rfs7000-37FABE(config-wlan-test)#protected-mgmt-frames mandatory
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  protected-mgmt-frames mandatory
rfs7000-37FABE(config-wlan-test)#
```

</table>
4.1.90.2.31 proxy-arp-mode

Enables proxy ARP mode for handling ARP requests

Proxy ARP is the technique used to answer ARP requests intended for another system. By faking its identity, the access point accepts responsibility for routing packets to the actual destination.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
proxy-arp-mode [dynamic|strict]

Parameters
- proxy-arp-mode [dynamic|strict]

<table>
<thead>
<tr>
<th>proxy-arp-mode</th>
<th>Enables proxy ARP mode for handling ARP requests. The options available are dynamic and strict.</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic</td>
<td>Forwards ARP requests to the wireless side (for which a response could not be proxied). This is the default setting.</td>
</tr>
<tr>
<td>strict</td>
<td>Does not forward ARP requests to the wireless side</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-wlan-test)#proxy-arp-mode strict

proxy-arp-mode strict
broadcast-dhcp validate-offer
http-analyze controller
rfs7000-37FABE(config-wlan-test)#

Related Commands
- no Reverts the proxy ARP mode to default (dynamic)
### 4.1.90.2.32 proxy-nd-mode

**wlan-mode commands**

Configures the proxy ND mode for this WLAN member clients as either strict or dynamic.

ND proxy is used in IPv6 to provide reachability by allowing a client to act as proxy. Proxy certificate signing can be done either dynamically (requiring exchanges of identity and authorization information) or statically when the network topology is defined.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
proxy-nd-mode [dynamic|strict]
```

**Parameters**

- `proxy-nd-mode [dynamic|strict]`

| proxy-nd-mode [dynamic|strict] | Configures the proxy ND mode for this WLAN member clients. The options are: dynamic and strict  
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
|                               | • dynamic – Forwards ND request to wireless for which a response could not be proxied. This is the default value.  
|                               | • strict – Does not forward ND requests to the wireless side  

**Examples**

```plaintext
rfs7000-37FABE(config-wlan-test)#proxy-nd-mode strict
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  wpa-wpa2 server-only-authentication
  proxy-nd-mode strict
  opendns device-id 44-55-66
  rfs7000-37FABE(config-wlan-test)#
```

**Related Commands**

| no | Reverts the proxy ND mode to default (dynamic) |
### 4.1.90.2.33 qos-map

> **wlan-mode commands**

Enables support for 802.11u QoS map element and frames

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
qos-map
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-wlan-test)#qos-map
rfs7000-37FABE(config-wlan-test)#show context
wlan test
 ssid test
 bridging-mode tunnel
 encryption-type none
 authentication-type none
 qos-map
 wpa-wpa2 server-only-authentication
 proxy-nd-mode strict
 opendns device-id 44-55-66

rfs7000-37FABE(config-wlan-test)#ac
```

4.1.90.2.34 radio-resource-measurement

wlan-mode commands

Enables support for 802.11k radio resource measurement capabilities (IEEE 802.11k) on this WLAN.

802.11k improves how traffic is distributed. In a WLAN, devices normally connect to the access point with the strongest signal. Depending on the number and location of clients, this arrangement can lead to excessive demand on one access point and underutilization of others, resulting in degradation of overall network performance. With 802.11k, if the access point with the strongest signal is loaded to its capacity, a client connects to an under-utilized access point. Even if the signal is weaker, the overall throughput is greater since it's an efficient use of the network's resources. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
radio-resource-measurement {channel-report|neighbor-report {hybrid}}

Parameters
- radio-resource-measurement {channel-report|neighbor-report {hybrid}}

<table>

4.1.90.2.35 radius

∇ wlan-mode commands

Configures RADIUS related parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

radius [dynamic-authorization|nas-identifier|nas-port-id|vlan-assignment]

radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|vlan-assignment]

Parameters

- radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|vlan-assignment]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic-authorization</td>
<td>Enables support for disconnect and change of authorization messages (RFC5176). When enabled, this option extends the RADIUS protocol to support unsolicited messages from the RADIUS server. These messages allow administrators to issue change of authorization (CoA) messages, which affect session authorization, or disconnect messages (DM) that terminate a session immediately. This option is disabled by default.</td>
</tr>
<tr>
<td>nas-identifier &lt;NAS-ID&gt;</td>
<td>Configures the network access server (NAS) identifier attribute, a value that identifies the access point or controller where the RADIUS messages originate. The value specified here is included in the RADIUS NAS-Identifier field for WLAN authentication and accounting packets.</td>
</tr>
<tr>
<td>nas-port-id &lt;NAS-PORT-ID&gt;</td>
<td>Configures the NAS port ID attribute, a value that identifies the port from where the RADIUS messages originate.</td>
</tr>
<tr>
<td>vlan-assignment</td>
<td>Configures the VLAN assignment of a WLAN. RADIUS VLAN assignment is disabled by default. When enabled, this option assigns clients to the RADIUS server specified VLANs, overriding the WLAN configuration. This option is disabled by default. If, as part of the authentication process, the RADIUS server returns a client's VLAN-ID in a RADIUS access-accept packet, and this feature is enabled, all client traffic is forwarded on that VLAN. If disabled, the RADIUS server returned VLAN-ID is ignored and the VLAN specified using the vlan/vlan-pool-member options (in the WLAN config mode) is used. Note: If both the RADIUS VLAN assignment and the post authentication VLAN options are enabled, then RADIUS VLAN assignment takes priority over post authentication VLAN configuration.</td>
</tr>

4.1.90.2.36 registration

wlan-mode commands

Configures settings enabling dynamic validation of devices by MAC address to continue the authentication process. When enabled, this option registers a device’s MAC address, and allows direct access to a previously registered device.

Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

registration [device|device-OTP|external|user]

registration [device|device-OTP|user] group-name <RAD-GROUP-NAME>

{agreement-refresh <0-144000>|expiry-time <1-43800>}

registration external host <IP/HOSTNAME> 

{proxy-mode [none|through-controller|through-rf-domain-manager]}

Parameters

- registration external host <IP/HOSTNAME> 

{proxy-mode [none|through-controller|through-rf-domain-manager]}

<table>
<thead>
<tr>
<th>registration</th>
<th>Enables dynamic user registration. This option is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>external</td>
<td>Forwards user information to an external device (i.e. WLAN authentication is handled by an external controller or access point). Use this option to specify the external controller or access point’s details. This option is disabled by default.</td>
</tr>
<tr>
<td>host &lt;IP/HOSTNAME&gt;</td>
<td>Specifies the external controller or access point’s IP address or hostname</td>
</tr>
<tr>
<td>proxy-mode</td>
<td>Optional. Specifies the proxy mode. If a proxy is needed for connection, specify the proxy mode as through-controller, through-rf-domain. If no proxy is needed, select none.</td>
</tr>
</tbody>
</table>
| {none|through-controller|through-rf-domain-manager} | - none – Requests are sent directly to the controller from the requesting device  
  - through-controller – Requests are proxied through the controller configuring the device  
  - through-rf-domain-manager – Requests are proxied through the local RF Domain manager |

registration [device|device-OTP|user] group-name <RAD-GROUP-NAME> 

{agreement-refresh <0-144000>|expiry-time <1-43800>}

<table>
<thead>
<tr>
<th>registration</th>
<th>Enables dynamic user registration</th>
</tr>
</thead>
</table>
| [device|device-OTP|user] | Configures self-registration type for this WLAN. Options include device, user and device-OTP  
  - device-OTP – Use this option for MAC registration of users and provision of a one-time-passcode (OTP). If using this option, set the WLAN authentication type as MAC authentication. In this scenario, captive-portal guest users authenticate using their User ID (e-mail address, mobile number, or member id) and the received OTP in order to complete registration.  
  - device – Use this option when captive portal device registration is through social media. When using this option, ensure that the captive portal is configured for guest user social authentication. For more information, see oauth.  
  - user – Use this option for guest users using one of the following options as their user ID during registration: e-mail address, mobile-number, or member-id. |
Examples

nx9500-6C8809(config-wlan-test)#registration user group-name guest agreement-refresh 14400 expiry-time 2000

nx9500-6C8809(config-wlan-test)#show context wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none
  registration user group-name guest expiry-time 2000 agreement-refresh 14400

Related Commands

no
Disables dynamic user registration and removes associated configurations. Also disables forwarding of user information to an external device.
4.1.90.2.37 relay-agent

wlan-mode commands

Enables support for DHCP/DHCPv6 relay agent information (option 82 and DHCPv6-LDRA) feature on this WLAN. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
relay-agent [dhcp-option82|dhcpv6-ldra]
```

Parameters

- relay-agent [dhcp-option82|dhcpv6-ldra]

| relay-agent | Enables support for the following DHCP and DHCPv6 options: option 82 and Lightweight DHCPv6 Relay Agent (LDRA) respectively. When enabled, this feature allows the DHCP/DHCPv6 relay agent to insert the relay agent information option (option 82, LDRA) in client requests forwarded to the DHCP/DHCPv6 server. This information provides the following:
| dhcp-option82 | Enables DHCP option 82. DHCP option 82 provides client physical attachment information. This option is disabled by default.
| dhcpv6-ldra | Enables the DHCPv6 relay agent. The DHCPv6 LDRA allows DHCPv6 messages to be transmitted on existing networks that do not currently support IPv6 or DHCPv6. This option is disabled by default.

Examples

```
rfs4000-229D58(config-wlan-test)#relay-agent dhcp-option82

rfs4000-229D58(config-wlan-test)#show context
wlan test
    ssid test
    vlan 1
    bridging-mode tunnel
    encryption-type none
    authentication-type none
    radio-resource-measurement
    relay-agent dhcp-option82
    controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#
```

```
rfs6000-81701D(config-wlan-test)#relay-agent dhcpv6-ldra

rfs6000-81701D(config-wlan-test)#show context
wlan test
    ssid test
    bridging-mode tunnel
    encryption-type none
    authentication-type none
    relay-agent dhcpv6-ldra
rfs6000-81701D(config-wlan-test)#
```

4.1.90.2.38 shutdown

Auto shuts down a WLAN

The auto shutdown mechanism helps regulate the availability of a WLAN based on an administrator defined access period. Use this feature to shut down a WLAN on specific days and hours and restrict periods when the WLAN traffic is either not desired or cannot be properly administrated. The normal practice is to shut down WLANs when there are no users on the network, such as after hours, weekends or holidays. This allows administrators more time to manage mission critical tasks since the WLAN's availability is automated.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
shutdown {on-critical-resource|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}
```

Parameters

- shutdown {on-critical-resource|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}

<table>
<thead>
<tr>
<th>shutdown</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>on-critical-resource</td>
<td>Optional. Auto shuts down the WLAN when critical resource failure occurs. Disabled by default.</td>
</tr>
<tr>
<td>on-meshpoint-loss</td>
<td>Optional. Auto shuts down the WLAN when the root meshpoint link fails (is unreachable). Disabled by default.</td>
</tr>
<tr>
<td>on-primary-port-link-loss</td>
<td>Optional. Auto shuts down the WLAN when a device losses its primary Ethernet port (ge1/up1) link. Disabled by default.</td>
</tr>
<tr>
<td>on-unadoption</td>
<td>Optional. Auto shuts down the WLAN when an adopted device becomes unadopted. Disabled by default.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If the shutdown on-meshpoint-loss feature is enabled, the WLAN status changes only if the meshpoint and the WLAN are mapped to the same VLAN. If the meshpoint is mapped to VLAN 1 and the WLAN is mapped to VLAN 2, then the WLAN status does not change on loss of the meshpoint.

Examples

```
rfs7000-37FABE(config-wlan-test)#shutdown on-unadoption
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none
  protected-mgmt-frames mandatory
  radius vlan-assignment
  wing-extensions wmm-load-information
  client-load-balancing probe-req-intvl 5ghz 5
  client-load-balancing band-discovery-intvl 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
  proxy-arp-mode strict
  broadcast-dhcp validate-offer
```
**shutdown on-unadoption**
_http-analyze controller_
_rfs7000-37FABE(config-wlan-test)#_

4.1.90.2.39  ssid

Wlan-mode commands

Configures a WLAN’s SSID

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ssid <SSID>

Parameters

- ssid <SSID>

<SSID> | Specify the WLAN's SSID. The WLAN SSID is case sensitive and alphanumeric. Its length should not exceed 32 characters.
---|---

Examples

```
  rfs7000-37FABE(config-wlan-test)#ssid testWLAN1
  rfs7000-37FABE(config-wlan-test)#show context
  wlan test
    ssid testWLAN1

### 4.1.90.2.40 t5-client-isolation

**wlan-mode commands**

Disallows clients connecting to the WLAN to communicate with one another. This setting applies exclusively to CPE devices managed by aT5 controller and is disabled by default.

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.

**NOTE:** This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

Supported in the following platforms:
- Wireless Controllers — RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

t5-client-isolation

**Parameters**

None

**Examples**

nx9500-6C8809(config-wlan-test)#t5-client-isolation

nx9500-6C8809(config-wlan-test)#show context wlan test ssid test bridging-mode local encryption-type none authentication-type none t5-client-isolation

4.1.90.2.41 t5-security

* wlan-mode commands

Configures T5 PowerBroadband security settings. A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

**NOTE:** This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

Supported in the following platforms:
- Wireless Controllers — RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```shell
    t5-security [static-wep|wpa-enterprise|wpa-personal]
    t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]
    t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp] version [mixed|wpa|wpa2]
```

**Parameters**

- **t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]**
  - `t5-security static-wep` Configures the T5 WLAN security type as static-wep
  - `encryption-type [wep128|wep64]` Applies one of the following encryption algorithms to the T5 support WLAN configuration: WEP64 or WEP128
  - `hex <STRING>` Configures the hex password (used to derive the security key)
    - `<STRING>` – Specify the hex password (should not exceed the 10 - 26 characters).
  - `passphrase <STRING>` Configures the passphrase shared by both transmitting and receiving authenticators
    - `<STRING>` – Specify the passphrase. It could either be an alphanumeric string of 8 to 63 ASCII characters or 64 HEX characters. The alphanumeric string allows character spaces. This string is converted to a numeric value. Configuring a passphrase saves you the need to create a 256-bit key each time keys are generated.

- **t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp] version [mixed|wpa|wpa2]**
  - `t5-security` Configures the T5 WLAN security type as: wpa-enterprise OR wpa-personal
Examples

```
nx9500-6C8809(config-wlan-test)#t5-security wpa-enterprise encryption-type ccmp
version wpa
```

```
nx9500-6C8809(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none

Removes the configured T5 PowerBroadband security settings
4.1.90.2.42 time-based-access

wlan-mode commands

Configures time-based client access to the network resources

Administrators can use this feature to assign fixed days and time of WLAN access for wireless clients

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

Syntax

time-based-access days [sunday|monday|tuesday|wednesday|thursday|friday|
saturday|all|weekends|weekdays] {start <START-TIME>} [end <END-TIME>]

Parameters
- day <option> Specifies the day or days on which the client can access the WLAN
  - sunday – Allows access on Sundays only
  - monday – Allows access on Mondays only
  - tuesday – Allows access on Tuesdays only
  - wednesday – Allows access on Wednesdays only
  - thursday – Allows access on Thursdays only
  - friday – Allows access on Fridays only
  - saturday – Allows access on Saturdays only
  - weekends – Allows access on weekends only
  - weekdays – Allows access on weekdays only
  - all – Allows access on all days
- start <START-TIME> Optional. Specifies the access start time in hours and minutes (HH:MM)
- end <END-TIME> Specifies the access end time in hours and minutes (HH:MM)

Usage Guidelines
Ensure the system clock is configured correctly.

Examples
rfs7000-37FABE(config-wlan-test)#time-based-access days weekdays start 10:00 end 16:30
rfs7000-37FABE(config-wlan-test)#show context

Wlan-mode commands

This command associates an existing captive portal with a WLAN.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

use [aaa-policy|application-policy|association-acl-policy|bonjour-gw-discovery-policy|
captive-portal|ip-access-list|ipv6-access-list|mac-access-list|passpoint-policy|
roaming-assist-policy|url-list|wlan-qos-policy]

use [aaa-policy <AAA-POLICY-NAME>|application-policy <POLICY-NAME>|
association-acl-policy <ASSOCIATION-POLICY-NAME>|
bonjour-gw-discovery-policy <POLICY-NAME>|captive-portal <CAPTIVE-PORTAL-NAME>|
passpoint-policy <PASSPOINT-POLICY-NAME>|
roaming-assist-policy <POLICY-NAME>|
url-filter <URL-FILTER-NAME>|
wlan-qos-policy <WLAN-QoS-POLICY-NAME>]

use ip-access-list [in|out] <IP-ACCESS-LIST-NAME>
use ipv6-access-list [in|out] <IPv6-ACCESS-LIST-NAME>
use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME>

Parameters

- use [aaa-policy <AAA-POLICY-NAME>|application-policy <POLICY-NAME>|
association-acl-policy <ASSOCIATION-POLICY-NAME>|
captive-portal <CAPTIVE-PORTAL-NAME>|
passpoint-policy <PASSPOINT-POLICY-NAME>|
roaming-assist-policy <POLICY-NAME>|
url-filter <URL-FILTER-NAME>|
wlan-qos-policy <WLAN-QoS-POLICY-NAME>]

<table>

</tr>
<tr>
<td></td>
<td>- &lt;ASSOCIATION-NAME&gt; — Specify the association ACL policy name.</td>
</tr>
<tr>
<td>bonjour-gw-discovery-policy &lt;POLICY-NAME&gt;</td>
<td>Uses an existing Bonjour GW Discovery policy with a WLAN. When associated, the Bonjour GW Discovery policy defines a list of services clients can discover across subnets. Bonjour enables discovery of services on a LAN. Bonjour allows the setting up a network (without any configuration) in which services such as printers, scanners and file-sharing servers can be found using Bonjour. Bonjour only works within a single broadcast domain. However, with a special DNS configuration, it can be extended to find services across broadcast domains.</td>
</tr>
<tr>
<td></td>
<td>- &lt;POLICY-NAME&gt; — Specify the Bonjour GW Discovery policy name (should be existing and configured).</td>
</tr>
</tbody>
</table>

Note: For more information on Bonjour GW Discovery policy, see bonjour-gw-discovery-policy.
| captive-portal `<CAPTIVE-PORTAL-NAME>` | Enables a WLAN’s captive portal authentication  
| | • `<CAPTIVE-PORTAL-NAME>` – Specify the captive portal name. |
| **passpoint-policy** `<PASSPOINT-POLICY-NAME>` | Associates a passpoint policy (Hotspot2 configuration) with this WLAN  
| | • `<PASSPOINT-POLICY-NAME>` – Specify the Hotspot 2.0 policy name.  
| | **Note:** For more information on passpoint policy, see `passpoint-policy`.  
| | Map a passpoint policy to a WLAN. Since the configuration gets applied to the radio by BSS, only the Hotspot 2.0 configuration of primary WLANs on a BSSID is used.  
| | Incoming Hotspot 2.0 GAQ/ANQP requests from clients are identified by their destination MAC addresses and are handled by the passpoint policy from the primary WLAN on that BSS.  
| | Define one passpoint policy for every WLAN configured. |
| roamng-assist-policy `<POLICY-NAME>` | Associates an existing roaming assist policy with this WLAN  
| | • `<POLICY-NAME>` – Specify the Roaming Assist policy name.  
| | **Note:** For more information on roaming assist policy, see `roaming-assist-policy`. |
| url-filter `<URL-FILTER-NAME>` | Associates an existing URL list with this WLAN  
| | • `<URL-FILTER-NAME>` – Specify the URL filter name.  
| | **Note:** For more information on configuring a URL list, see `url-list`. |
| wlan-qos-policy `<WLAN-QOS-POLICY-NAME>` | Uses an existing WLAN QoS policy with a WLAN  
| | • `<wlan-qos-policy-name>` – Specify the WLAN QoS policy name. |
| **ip-access-list** [in|out] `<IP-ACCESS-LIST-NAME>` | Specifies the IP access list for incoming and outgoing packets  
| | • in – Applies the IP ACL to incoming packets  
| | • out – Applies IP ACL to outgoing packets  
| | • `<IP-ACCESS-LIST-NAME>` – Specify the IP access list name. |
| **ipv6-access-list** [in|out] `<IPv6-ACCESS-LIST-NAME>` | Specifies the IPv6 access list for incoming and outgoing packets  
| | • in – Applies the IPv6 ACL to incoming packets  
| | • out – Applies IPv6 ACL to outgoing packets  
| | • `<IPv6-ACCESS-LIST-NAME>` – Specify the IPv6 access list name. |
| **mac-access-list** [in|out] `<MAC-ACCESS-LIST-NAME>` | Specifies the MAC access list for incoming and outgoing packets  
| | • in – Applies the MAC ACL to incoming packets  
| | • out – Applies MAC ACL to outgoing packets  
| | • `<MAC-ACCESS-LIST-NAME>` – Specify the MAC access list name. |
Usage Guidelines

IP and MAC ACLs act as firewalls within a WLAN. WLANs use ACLs as firewalls to filter or mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of Access Control Entries (ACEs). Each ACE specifies a set of conditions (rules) and the action taken in case of a match. The action can be permit, deny, or mark. Therefore, when a packet matches an ACE’s conditions, it is either forwarded, dropped, or marked depending on the action specified in the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP ACLs contain deny and permit rules specifying source and destination IP addresses. Each rule has a precedence order assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, you can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny, or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

Examples

```
rfs7000-37FABE(config-wlan-test)#use aaa-policy test

rfs7000-37FABE(config-wlan-test)#use association-acl-policy test

rfs7000-37FABE(config-wlan-test)#show context

4.1.90.2.44 vlan

Sets the VLAN where traffic from a WLAN is mapped

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```

Parameters

- `vlan [<1-4094>|<VLAN-ALIAS-NAME>]`

| <1-4094> | Sets a WLAN's VLAN ID. This command starts a new VLAN assignment for a WLAN index. All prior VLAN settings are erased. Use this command to assign just one VLAN to the WLAN. Utilizing a single VLAN per WLAN is a more typical deployment scenario than using a VLAN pool. |
| <VLAN-ALIAS-NAME> | Assigns a VLAN alias to the WLAN. The VLAN alias should to existing and configured. **Note:** A VLAN alias maps a name to a VLAN ID. When applied to ports (for example GE ports) using the trunk mode, a VLAN alias denies or permits traffic, on the port, to and from the VLANs specified in the alias. For more information on aliases, see `alias`. |

Examples

```
rfs7000-37FABE(config-wlan-test)#vlan 4
rfs7000-37FABE(config-wlan-test)#show context wlan test
ssid testWLAN1
vlan 4
bridging-mode local

```

Removes a WLAN's default VLAN mapping
4.1.90.2.45 vlan-pool-member

wlan-mode commands

Adds a member VLAN to a WLAN's VLAN pool. Use this option to define the VLANs available to this WLAN. Additionally, define the number of wireless clients supported by each VLAN.

NOTE: Configuration of a VLAN pool overrides the 'vlan' configuration.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`vlan-pool-member <WORD> {limit <0-8192>}

Parameters

- `vlan-pool-member <WORD> {limit <0-8192>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-pool-member &lt;WORD&gt;</code></td>
<td>Adds a member VLAN to a WLAN's VLAN pool</td>

➤ wlan-mode commands

Configures WEP128 parameters

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`wep128 [key|keys-from-passkey|transmit-key]`

`wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]`

`wep128 keys-from-passkey <WORD>`

`wep128 transmit-key <1-4>`

**Parameters**

- **wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]**

  Configures pre-shared hex keys
  - `<1-4>` – Configures a maximum of four key indexes. Select the key index from 1 - 4.
  - **ascii**
    - `[0 <WORD>|2 <WORD>|<WORD>]` Sets keys as ASCII characters (5 characters for WEP64, 13 for WEP128)
    - 0 <WORD> – Configures a clear text key
    - 2 <WORD> – Configures an encrypted key
    - <WORD> – Configures keys as 13 ASCII characters converted to hex, or 26 hexadecimal characters
  - **hex**
    - `[0 <WORD>|2 <WORD>|<WORD>]` Sets keys as hexadecimal characters (10 characters for WEP64, 26 for WEP128)
    - 0 <WORD> – Configures a clear text key
    - 2 <WORD> – Configures an encrypted key
    - <WORD> – Configures keys as 13 ASCII characters converted to hex, or 26 hexadecimal characters

- **wep128 keys-from-passkey <WORD>**

  Specifies a passphrase from which keys are derived
  - `<WORD>` – Specify a passphrase from 4 - 32 characters.

- **wep128 transmit-key <1-4>**

  Configures the key index used for transmission from an AP to a wireless client or service platform
  - `<1-4>` – Specify a key index from 1 - 4.
Examples
rfs7000-37FABE(config-wlan-test)#wep128 keys-from-passkey example@123

> **wlan-mode commands**

Configures WEP64 parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

## Syntax

- `wep64 [key|keys-from-passkey|transmit-key]`
- `wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]`
- `wep64 keys-from-passkey <WORD>`
- `wep64 transmit-key <1-4>`

## Parameters

- **wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]**
  - Configures pre-shared hex keys
  - `<1-4>` – Configures a maximum of four key indexes. Select a key index from 1 - 4.
  - **ascii**
    - `[0 <WORD>|2 <WORD>|<WORD>]` – Sets keys as ASCII characters (5 characters for WEP64, 13 for WEP128)
  - **hex**
    - `[0 <WORD>|2 <WORD>|<WORD>]` – Sets keys as hexadecimal characters (10 characters for WEP64, 26 for WEP128)
- **wep64 keys-from-passkey <WORD>**
  - Specifies a passphrase from which keys are derived
  - `<WORD>` – Specify a passphrase from 4 - 32 characters.
- **wep64 transmit-key <1-4>**
  - Configures the key index used for transmission from an AP to a wireless client or service platform
  - `<1-4>` – Specify a key index from 1 - 4.
Examples

rfs7000-37FABE(config-wlan-test)#wep64 key 1 ascii test1

4.1.90.2.48 wing-extensions

4.1.90.2.48 wing-extensions

- **wlan-mode commands**

Enables support for WiNG-specific client extensions to the IEEE 802.11x WLAN standards that potentially increase client roaming reliability and handshake speed.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
wing-extensions [ap-attributes-information {include-hostname}]
coverage-hole-detection {11k-clients|offset <5-20>|threshold <-80--60}]
ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}
smart-scan|wing-load-information|wmm-load-information]
```

**Parameters**

- **wing-extensions [ap-attributes-information {include-hostname}]
coverage-hole-detection {11k-clients|offset <5-20>|threshold <-80--60}]
ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}
smart-scan|wing-load-information|wmm-load-information]

<table>
<thead>
<tr>
<th>wing-extensions</th>
<th>Enables support for inclusion of WiNG-specific client extensions in radio transmissions</th>
</tr>
</thead>
</table>
| ap-attributes-information {include-hostname} | Enables support for AP attributes information element (IE)
  - include-hostname – Optional. When enabled, includes AP’s hostname, as a sub-element, in the AP attributes IE. The AP attributes IE is vendor-specific and, when enabled, is added to beacons and probe responses. Inclusion of AP attributes IE allows Zebra terminals to:
    - Recognize Zebra APs
    - Determine if the AP supports PAN BU features, irrespective of whether these features are enabled or not.
  **Note:** AP attributes IE is not added to beacons and probe responses by default. |
| coverage-hole-detection {11k-clients|offset <5-20>|threshold <-80--60} | Enables coverage hole detection (CHD) and configures CHD parameters. When enabled, allows clients (MUs) to inform an access point when it experiences a coverage hole. A coverage hole is an area of poor wireless coverage not supported by a WiNG managed access point radio. Enable radio resource measurement prior to enabling CHD. For enabling radio resource measurement, see radio-resource-measurement. CHD is disabled by default. After enabling CHD, optionally configure the following parameters:
  - 11k-clients – Optional. Provides coverage hole detection to 802.11k-only-capable clients. This is a reduced set of coverage hole detection capabilities (standard 11k messages and behaviors). This option is disabled by default.
  - offset <5-20> – Optional. Configures the offset added to the threshold to obtain the access point’s signal strength (as seen by the client) considered adequate. 
    - <5-20> – Specify the offset value from 5 - 20. The default is 5.
  - threshold – Optional. Configures the access point’s signal strength threshold. When Radio Resource Measurement and CVG Hole are enabled, specify a threshold for the AP’s signal strength (as seen by the client) below which a coverage hole incident is reported by the client.
    - <-80--60> – Specify the threshold from -80 - -60 dBm. The default is -70 dBm. |
### ft-over-ds-aggregate
Enables fast-transition (FT) aggregation of action frames. When enabled, increases roaming speed by eliminating separate key exchange handshake frames with potential roam candidates. Enable fast transition to complete an initial FT over distribution system (DS) handshake with multiple roam candidates (up to 6) at once, eliminating the need to send separate FT over DS handshakes to each roam candidate. This option is disabled by default.

### move-command
Enables use of Hyper Fast Secure Roaming (HFSR) for clients on this WLAN. This feature applies only to certain client devices. This option is disabled by default.

### scan-assist {channel-info-interval <6-9>}
Enables support for scanning assist. When enabled, allows faster roams on Dynamic Frequency Selection (DFS) channels by eliminating passive scans. Clients get channel information directly from possible roam candidates. This option is disabled by default.
- channel-info-interval <6-9> – Optional. Configures the interval at which channel information is periodically retrieved from potential roam candidates without requesting scan assist.
- <6-9> – Specify the interval from 6 - 9 seconds. When enabled, the default value is 8 seconds.

### smart-scan
Enables a smart scan to refine a client's channel scans to just a few channels as opposed to all available channels. This option is disabled by default.

### wing-load-information
Enables support for the WiNG load information element (Element ID 173) with legacy Symbol Technology clients, thus making them optimally interoperable with the latest Zebra access points. This option is enabled by default.

### wmm-load-information
Enables support for WiNG Wi-Fi MultiMedia (WMM) Load Information Element in radio transmissions with legacy clients. This option is disabled by default.

### Examples
```bash
rfs7000-37FABE(config-wlan-test)#wing-extensions wmm-load-information
```
```bash
rfs7000-37FABE(config-wlan-test)#show context wlan test
description TestWLAN ssid test bridging-mode local encryption-type tkip-ccmp authentication-type eap kerberos server timeout 12 kerberos server primary host 172.16.10.2 accounting syslog host 172.16.10.4 port 2 data-rates 2.4GHz gn wing-extensions wmm-load-information client-load-balancing probe-req-intvl 5ghz 5
--More--
rfs7000-37FABE(config-wlan-test)#
```

### Related Commands
- `no`
  Disables support for WiNG-specific client extensions to the IEEE 802.11x WLAN standards. Use the keywords provided to disable a specific wing-extension.
4.1.90.2.49 wireless-client

- wlan-mode commands

Configures the transmit power indicated to clients

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
wireless-client [count-per-radio|cred-cache-ageout|hold-time|inactivity-timeout|max-firewall-sessions|reauthentication|t5-inactivity-timeout|tx-power|vlan-cache-ageout]

wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|hold-time <1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|vlan-cache-ageout <60-86400>]

wireless-client roam-notification [after-association|after-data-ready|auto]

Parameters
- wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|hold-time <1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|vlan-cache-ageout <60-86400>]

<table>
<thead>
<tr>
<th>wireless-client</th>
<th>Configures the transmit power indicated to wireless clients for transmission</th>
</tr>
</thead>
</table>
| count-per-radio <0-256> | Configures the maximum number of clients allowed on this WLAN per radio  
  • <0-256> – Specify a value from 0 - 256. |
| cred-cache-ageout <60-86400> | Configures the timeout period for which client credentials are cached across associations  
  • <60-86400> – Specify a value from 60 - 86400 seconds. |
| hold-time <1-86400> | Configures the time period for which wireless client state information is cached post roaming  
  • <1-86400> – Specify a value from 1 - 86400 seconds. |
| inactivity-timeout <60-86400> | Configures an inactivity timeout period in seconds. If a frame is not received from a wireless client for this period of time, the client is disassociated.  
  • <60-86400> – Specify a value from 60 - 86400 seconds. |
| max-firewall-sessions <10-10000> | Configures the maximum firewall sessions allowed per client on a WLAN  
  • <10-10000> – Specify the maximum number of firewall sessions allowed from 10 - 10000. |
| reauthentication <30-86400> | Configures periodic reauthentication of associated clients  
  • <30-86400> – Specify the client reauthentication interval from 30 - 86400 seconds. |
| t5-inactivity-timeout <60-86400> | Configures an inactivity timeout, in seconds, for T5 devices. When configured, the T5 device is disassociated if the time lapsed after the last frame received from it exceeds the value specified here.  
  • <60-86400> – Specify a value from 60 - 86400 seconds. The default is 60 seconds. |
tx-power <0-20>  Configures the transmit power indicated to clients
•  <0-20> – Specify a value from 0 - 20 dBm.

vlan-cache-ageout <60-86400>  Configures the timeout period for which client VLAN information is cached across associations.
•  <60-86400> – Specify a value from 60 - 86400 seconds.

• wireless-client roam-notification [after-association|after-data-ready|auto]

wireless-client Configures the transmit power indicated to wireless clients for transmission
roam-notification Configures when a roam notification is transmitted
after-association Transmits a roam notification after a client has associated
after-data-ready Transmits a roam notification after a client is data-ready (after completion of authentication, handshakes etc.)
auto Transmits a roam notification upon client association (if the client is known to have authenticated to the network)

Related Commands

| no | Removes or reverts to default TKIP-CCMP (WPA/WPA2) related parameters |
**4.1.90.2.51 service**

Invokes service commands applicable in the WLAN configuration mode

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
service [allow-ht-only|allow-open-passpoint|cred-cache|eap-mac-mode|eap-mac-multicopy|
eap-mac-multikeys|eap-throttle|enforce-pmkid-validation|key-index|monitor|
radio-crypto|reauthentication|session-timeout|session-timeout mac|tx-deauth-on-roam-detection|
unresponsive-client|wpa-wpa2|show]

service [allow-ht-only|allow-open-passpoint|cred-cache clear-on-disconnect|
eap-mac-multicopy|eap-mac-multikeys|enforce-pmkid-validation|radio-crypto|
reauthentication seamless|session-timeout mac|tx-deauth-on-roam-detection|show cli]

service eap-mac-mode [mac-always|normal]

service eap-throttle <0-254>

service key-index eap-wep-unicast <1-4>

service monitor [aaa-server|adoption|captive-portal|dhcp|dns]

service monitor [aaa-server|adoption vlan <1-4094>|captive-portal external-server]

service [dhcp|dns] crm <RESOURCE-NAME> vlan <1-4094>

service unresponsive-client [attempts <1-1000>|timeout <1-60>]

service wpa-wpa2 exclude-ccmp
```

**Parameters**

- `allow-ht-only`: Only allows clients capable of High Throughput (802.11n) data rates to associate
- `allow-open-passpoint`: Enables non-WPA2 security for passpoint WLANs. For more information on passpoint policy and configuration, see PASSPOINT POLICY.
- `cred-cache clear-on-disconnect`: Clears credential cache after a client has disconnected from the network
- `eap-mac-multicopy`: Enables sending of multiple copies of broadcast and unicast messages
- `eap-mac-multikeys`: Enables configuration of different key indices for MAC authentication
- `enforce-pmkid-validation`: Validates the Predictive real-time pairwise master key identifier (PMKID) contained in a client’s association request against the one present in the wpa-wpa2 handshake. This functionality is based on the Proactive Key Caching (PKC) extension of the 802.11i EEEE standard. Whenever a wireless client successfully authenticates with a AP it receives a pairwise master key (PMK). PKC allows clients to cache this PMK and reuse it for future re-authentications with the same AP. The PMK is unique for every client and is identified by the PMKID. The PMKID is a combination of the hash of the PMK, a string, the station and the MAC addresses of the AP.

</tbody>
</table>

- **service wpa-wpa2 exclude-ccmp**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wpa-wpa2 exclude-ccmp</td>
<td>Configures exclusion of CCMP requests when the authentication mode is set to tkip-ccmp. When enabled, it provides compatibility for client devices not compliant with tkip-ccmp.</td>
</tr>
</tbody>
</table>

- **service monitor [aaa-server|adoption vlan <1-4094>|captive-portal external-server]**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>monitor</td>
<td>Enables critical resource monitoring. In a WLAN, service monitoring enables regular monitoring of external AAA servers, captive portal servers, access point adoption, DHCP and DNS servers. When enabled, it allows administrators to notify users of a service’s availability and make resource substitutions in case of unavailability of a service.</td>
</tr>
<tr>
<td>aaa-server</td>
<td>Enables external AAA server failure monitoring. When enabled monitors an external RADIUS server resource’s AAA activity and ensures its adoption and availability. This feature is disabled by default.</td>
</tr>
</tbody>
</table>
adoption_vlan <1-4094>

Enables adoption failure monitoring on an adopted AP. Also configures a adoption failover VLAN. This feature is disabled by default.

- **VLAN <1-4094>** – Specify the VLAN on which clients are placed when the connectivity between the AAP and the controller is lost.

**Note:** Configure a DHCP pool and gateway for the failover VLAN. Ensure the DHCP server is running on the AP. Also ensure that the DHCP pool is configured to have less lease time.

When this feature is enabled on a WLAN, it allows adopted APs to monitor their connectivity with the controller. If and when this connectivity is lost, all new clients are placed in the configured adoption failover VLAN. They are served an IP by the DHCP server running on the AP. In this situation if a client tries to access a Web URL, the AP redirects the client to a page stating that the service is down.

**Note:** When the AAP’s link to the switch is restored, clients are placed back in the WLAN’s configured VLAN, and are served an IP from the corresponding configured DHCP server (external or on the AP/controller).

captive-portal

enables external captive portal server failure monitoring. When enabled, monitors externally hosted captive portal activity, and user access to the controller or service platform managed network. This feature is disabled by default.

**Note:** When enabled, this feature enables APs to display, to an externally located captive portal's user, the no-service page when the captive portal's server is not reachable.

```
• service monitor [dhcp|dns] crm <RESOURCE-NAME> vlan <1-4094>]
```

monitor Enables DHCP and/or DNS server monitoring on this WLAN.

dhcp Enables monitoring of a specified DHCP server. When the connection to the DHCP server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default.

**Note:** Use the `crm` keyword to specify the DHCP server to monitor.

dns Enables monitoring of a specified DNS server. When the connection to the DNS server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default.

**Note:** Use the `crm` keyword to specify the DNS server to monitor.

crm <RESOURCE-NAME>

This keyword is common to the ‘dhcp’ and ‘dns’ parameters.

- **crm** – Identifies the DHCP and/or DNS server to monitor
- **<RESOURCE-NAME>** – Specify the name of the DHCP or DNS server.

**Note:** Once enabled, the CRM server monitors the DHCP/DNS server and updates their status as ‘up’ or ‘down’ depending on the availability of the resource. When either of these resources is down the wireless client is mapped to the failover VLAN and served with the ‘no-service’ page through the access point.

vlan <1-4094>

This keyword is common to the ‘dhcp’ and ‘dns’ parameters.

After specifying the DHCP/DNS sever resource, specify the failover VLAN.

- **VLAN <1-4094>** – Configures the failover VLAN from 1 - 4094.

**Note:** When the DHCP server resource becomes unavailable, the device falls back to the VLAN defined here. This VLAN has a DHCP server configured that provides a pool of IP addresses with a lease time less than the main DHCP server.

**Note:** When this DNS server resource becomes unavailable, the device falls back to the VLAN defined here. This VLAN has a DNS server configured that provides DNS address resolution until the main DNS server becomes available.
• service unresponsive-client [attempts <1-1000>|timeout <1-60>]

<table>

Configures a WLAN QoS policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
wlan-qos-policy <WLAN-QOS-POLICY-NAME>
```

**Parameters**

- `wlan-qos-policy <WLAN-QOS-POLICY-NAME>`

**Examples**

```
rfs7000-37FABE(config)#wlan-qos-policy test
rfs7000-37FABE(config-wlan-qos-test)#?
```

**WLAN QoS Mode commands:**

- `accelerated-multicast`: Configure accelerated multicast streams address assnd forwarding QoS classification
- `classification`: Select how traffic on this WLAN must be classified (relative prioritization on the radio)
- `multicast-mask`: Egress multicast mask (frames that match bypass the PSPqueue. This permits intercom mode operation without delay even in the presence of PSP clients)
- `no`: Negate a command or set its defaults
- `qos`: Quality of service
- `rate-limit`: Configure traffic rate-limiting parameters on a per-wlan/per-client basis
- `svp-prioritization`: Enable spectralink voice protocol support on this wlan
- `voice-prioritization`: Prioritize voice client over other client (for non-WMM clients)
- `wmm`: Configure 802.11e/Wireless MultiMedia parameters

</tbody>
</table>
4.1.92.1 smart-cache-policy

Creates a new smart cache policy and enters its configuration mode.

Content caching is a mechanism that allows temporary caching of frequently accessed content on intermediate network devices. When enabled, subsequent requests for the same content are serviced from the cache locally and not fetched from originating servers, resulting in reduced bandwidth usage, lower latency, and reduced data transfers from originating servers. The WiNG smart cache policy supports both forward caching and transparent caching.

Forward content caching stores content temporarily on the local network. This locally stored content can be retrieved, when required, without routing a request to an external server on the Internet.

Transparent content caching, on the other hand, acts as an intermediary for the originating servers and returns cached content to clients as if the data originated from the associated servers. Transparent caching proxies perform server load-balancing and compression to regulate load on the originating servers and reduce bandwidth usage.

The smart cache policy also supports dynamic content caching, allowing caching of content from popular video content sharing sites, such as youtube.com, cnn.com, msn.com etc.

Enabling content caching improves Web browsing (for data and video content) for consumers using Kiosks, tablets, and smart phones. A smart cache policy is enabled by associating it with a device or a profile.

Configure the policy’s forward proxy, transparent proxy and several additional settings before actual HTML pages can be defined for the smart caching configuration.

### Syntax

```
smart-cache-policy <SMART-CACHE-POLICY-NAME>
```

### Parameters

- `smart-cache-policy <SMART-CACHE-POLICY-NAME>`

### Examples

```
nx4500-5CFA2B(config)#smart-cache-policy ?
SMART-CACHE-POLICY Name of the content caching to be configured ( will be created if it does not exist )
```

```
nx4500-5CFA2B(config)#smart-cache-policy test
nx4500-5CFA2B(config-smart-cache-policy-test)#
```
nx4500-5CFA2B(config-smart-cache-policy-test)#?
Content Cache Policy Mode commands:
  access-log Log all client requests
  aging Configure the refresh pattern
  cache Configure cache management
  forward-proxy Configure address and port for forward caching proxy
  http-access Configure http filter
  no Negate a command or set its defaults
  parent-proxy Configure parent proxy
  pre-fetch Enable pre-fetching of a URL list
  smart-cache Content cache
  transparent-proxy Transparent caching proxy
  clrscr Clears the display screen
  commit Commit all changes made in this session
  do Run commands from Exec mode
  end End current mode and change to EXEC mode
  exit End current mode and down to previous mode
  help Description of the interactive help system
  revert Revert changes
  service Service Commands
  show Show running system information
  write Write running configuration to memory or terminal

4.1.92.2.1 access-log

*smart-cache-policy-mode commands*

Enables client request logging. When enabled, this feature logs client access details to the /var/log/smart-cache.log. This feature is enabled by default.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`access-log {rotate <0-10> rotate-type [duration <1-100> day|size <1-100> MB]}

**Parameters**

- `access-log {rotate <0-10> rotate-type [duration <1-100> day|size <1-100> MB]}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| rotate <0-10>      | Optional. Enables log file rotation, and configures the number of rotation. This is the number of log files retained (stored locally) out of the total generated.  
  - <0-10> – Optional. Specify the number of rotations from 0 - 10. The default is 10 rotations on every 1 MB. |
| rotate-type [duration <1-100> day|size <1-100> MB] | Optional. Configures access log file rotation conditions, such as duration and size  
  - duration <1-100> – Rotates log files by time. Specify the time from 1 - 100 days. The default is 1 day.  
  - size <1-100> – Rotates log files by file size. Specify the size from 1 - 100 MB. |

**Examples**

`nx4500-5CFA2B(config-smart-cache-policy-test)#access-log rotate 10 rotate-type duration 10 day`

`nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
  access-log rotate 10 rotate-type duration 10 day`

**Related Commands**

- `no` Disables client request logging
4.1.92.2.2 aging

* smart-cache-policy-mode commands

Configures the aging rule (refresh pattern) for specific content types

The aging parameters configured are the maximum and minimum age, freshness factor, and the URL regular expressions. These parameters enable the content caching engine to determine if a given request can be processed and the content loaded from the cache or not.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
aging precedence <1-100> [<WORD>|ignore-case <WORD>] min-age <0-525600>
  freshness-factor <0-100> max-age <0-525600> {(override-expire|override-lastmod|
  reload-into-ims)}
```

**Parameters**

- **aging precedence <1-100> [<WORD>|ignore-case <WORD>] min-age <0-525600>**
  - **freshness-factor <0-100> max-age <0-525600>**
  - `{(override-expire|override-lastmod|reload-into-ims)}`

<table>

4.1.92.2.3  cache

smart-cache-policy-mode commands

Configures cache management settings

This command specifies content cache rules that determine if a content is cached or not. Use this feature to filter content before caching. By default content is not cached.

Supported in the following platforms:
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`cache [media|precedence|size]`

`cache media {all|aol|bing|break|cnn|daily-motion|metacafe|vimeo|youtube}`

`cache precedence <1-100> [deny|permit] {destination-domain <DOMAIN-NAME>|destination-domain-regex <WORD>|destination-ip [<IP/M]|any]|source-ip <IP/M>|url-regex <URL>}`

`cache size <1-32>`

Parameters
• cache media {all|aol|bing|break|cnn|daily-motion|metacafe|vimeo|youtube}

<table>
<thead>
<tr>
<th>cache media</th>
<th>Enables content caching from the following video content sharing sites. The sites currently supported are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>aol.com</td>
<td></td>
</tr>
<tr>
<td>bing.com</td>
<td></td>
</tr>
<tr>
<td>break.com</td>
<td></td>
</tr>
<tr>
<td>dailymotion.com</td>
<td></td>
</tr>
<tr>
<td>metacafe.com</td>
<td></td>
</tr>
<tr>
<td>vimeo.com</td>
<td></td>
</tr>
<tr>
<td>cnn.com</td>
<td></td>
</tr>
<tr>
<td>youtube.com</td>
<td></td>
</tr>
<tr>
<td>Note: Select All to include the entire list of supported sites. Selected sites have their video content cached locally on the service platform and made available to clients that request the video content.</td>
<td></td>
</tr>
</tbody>
</table>

• cache precedence <1-100> [deny|permit] {destination-domain <DOMAIN-NAME>|destination-domain-regex <WORD>|destination-ip [<IP/M]|any]|source-ip <IP/M>|url-regex <URL>}

<table>
<thead>
<tr>
<th>cache precedence &lt;1-100&gt;</th>
<th>Configures cache filtering rules that determine if a content received from the originating server is to be cached or not. You can create multiple cache filtering rules and assign precedence values to each. These rules are applied in order of their precedence.</th>
</tr>
</thead>
<tbody>
<tr>
<td>[deny</td>
<td>permit]</td>
</tr>
</tbody>
</table>

| [deny|permit] | Configures the deny or permit caching parameters for this rule |
| --- | --- |
| permits – Caches content if it matches the defined permit parameters | |
| deny – Does not cache content if it matches the defined deny parameters | |
### Global Configuration Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
</table>
| `cache size <1-32>`   | Configures the maximum caching storage size. This is the upper limit on the disk space used for storing cached contents.  
  • `<1-32>` – Specify a value from 1 - 32 GB. The default is 32 GB. | nx4500-5CFA2B(config-smart-cache-policy-test)#cache size 30  
  nx4500-5CFA2B(config-smart-cache-policy-test)#show context  
  smart-cache-policy test  
  cache size 30  
  aging precedence 1 ignore-case \.jpg$ min-age 100 freshness-factor 75 max-age 200  
  reload-into-ims  
  access-log rotate 10 rotate-type duration 10 day  
  nx4500-5CFA2B(config-smart-cache-policy-test)# |
| `no`                  | Resets or removes cache management settings                                                            |                                                                         |

#### Related Commands

- `destination-domain <DOMAIN-NAME>`: Optional. Specifies the destination domain's hostname to match. The domain name can be an FQDN. The specified value is matched against the hostname part of the HTTP request URL.  
  - `<DOMAIN-NAME>` – Specify the domain name.  
  A leading asterisk or period in the domain name is treated as a wildcard. For example, `www.example-company.com`, `example-company.com`, `*.example-company.com` and `.com` are all valid values.  
  **Note:** The destination domain parameter will NOT match against URLs that have an IP address instead of a hostname.  

- `destination-domain-regex <WORD>`: Optional. Specifies a regular expression matching on originating server names.  
  • `<WORD>` – Specify the regular expression.  
  The destination domain regex is the same as the destination domain, but the destination domain regex allows you to use standard expression matching on originating server names.  

- `destination-ip [<IP/M>|any]`: Optional. Specifies the originating server's IP address, obtained from the HTTP request URL.  
  • `<IP/M>` – Specify the destination IP address and mask to match.  
  • `any` – Select to specify any destination IP address as the match criteria.  
  **Note:** Provide the IP address in the A.B.C.D/M format.  
  **Note:** Specify `any` to consider all originating servers.  

- `source-ip [<IP/M>|any]`: Optional. Specifies the source IP address (client's IP address) that is sent out as part of the HTTP request.  
  • `<IP/M>` – Specify the source IP address and mask to match.  
  • `any` – Select to specify any source IP address as the match criteria.  
  **Note:** Provide the IP address in the A.B.C.D/M format.  
  **Note:** Specify `any` to consider all client requests.  

- `url-regex <URL>`: Optional. Specifies regular expressions used to match any part of a requested URL, including the transfer protocol and origin server hostname.  
  • `<URL>` – Specify the regular expression to match.  

---

**Examples**

nx4500-5CFA2B(config-smart-cache-policy-test)#cache size 30  
xx4500-5CFA2B(config-smart-cache-policy-test)#show context  
smart-cache-policy test  
    cache size 30  
    aging precedence 1 ignore-case \.jpg$ min-age 100 freshness-factor 75 max-age 200  
    reload-into-ims  
    access-log rotate 10 rotate-type duration 10 day  
xx4500-5CFA2B(config-smart-cache-policy-test)#
4.1.92.2.4 forward-proxy

smart-cache-policy-mode commands

Enables forward proxy mode on this smart cache policy. This option is disabled by default. Devices using this smart-cache policy act as a forward proxy on specified VLANs.

This command configures the IP address and port on which the forward proxy server listens for incoming HTTP requests.

Forward content caching stores content temporarily on the local network. This locally stored content can be retrieved, when required, without routing a request to an external server on the Internet.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

forward-proxy {ip|protocol|vlan}

forward-proxy {ip <IP> port <1-32768>}

forward-proxy {protocol [all|ftp|gopher|https]}

forward-proxy {vlan <VLAN-ID>}

Parameters

- forward-proxy {ip <IP> port <1-32768>}

| ip <IP> port <1-32768> | Optional. Configures the IP address and TCP port for forward proxying. If no IP address is provided, the system uses the default smart caching proxy server’s IP (127.0.1.1). This is the IP address where the forward smart caching proxy server is listening. The default port is 3128. |

- protocol [all|ftp|gopher|https]

  Optional. Selects the additional forward proxy resource protocol for smart caching. The options are:
  - ftp – Selects FTP as the forward proxy resource protocol
  - gopher – Selects Gopher as the forward proxy resource protocol
  - https – Selects HTTPS as the forward proxy resource protocol
  - all – Selects all protocols (this is the default setting)

- vlan <VLAN-ID>

  Optional. Configures the VLAN(s) for which forward proxy mode (content caching) is enabled. By default content caching is disabled on all VLANs. This option is disabled by default.

Examples

nx4500-5CFA2B(config-smart-cache-policy-test)#forward-proxy vlan 10-20

nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
  forward-proxy vlan 10-20
  cache size 30
  aging precedence 1 ignore-case \\ .jgp$ min-age 100 freshness-factor 75 max-age 200
  reload-into-ims
  access-log rotate 10 rotate-type duration 10 day
  nx4500-5CFA2B(config-smart-cache-policy-test)#

4.1.92.2.5 **http-access**

*smart-cache-policy-mode commands*

Configures HTTP filters. This command configures rules to deny or permit HTTP access. A deny rule specifies the destination domains and source and destination IPs to deny content access. A permit rule specifies the destination domains and source and destination IPs to permit content access.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
http-access precedence <1-100> [deny|permit] {destination-domain <DOMAIN-NAME>|
  destination-domain-regex <WORD>|destination-ip <IP/M>|mimetype-regex <WORD>|
  source-ip <IP/M>|url-regex <URL>}
```

**Parameters**

- **http-access precedence <1-100> [deny|permit]**
  - **[deny|permit]** Configures the deny or permit access parameters for this rule
    - permits – Permits access if the specified parameters are matched
    - deny – Denies access if the specified parameters are matched

- **destination-domain <DOMAIN-NAME>**
  - Optional. Specifies the destination domain to match against the hostname in the HTTP request URL
    - <DOMAIN-NAME> – Specify the domain name.

- **destination-domain-regex <WORD>**
  - Optional. Specifies a regular expression matching on originating server names
    - <WORD> – Specify the regular expression.
    - The destination domain regex is the same as the destination domain, but the destination domain regex allows you to use standard expression matching on originating server names.

- **destination-ip [<IP/M>|any]**
  - Optional. Specifies the destination server’s IP address, obtained from the HTTP request URL
    - <IP/M> – Specify the destination server’s IP address and mask. This is used as the match criteria.
    - any – Select to specify any destination IP address as the match criteria.
    - **Note:** Provide the IP address in the A.B.C.D/M format.
    - **Note:** Specify any to consider all servers.

- **mimetype-regex <WORD>**
  - Optional. Specifies the regular expression used to match the mimetype of a HTTP request
### Examples

```
nx4500-5CFA2B(config-smart-cache-policy-test)#http-access precedence 4 deny destination-domain .TechPubs
```

```
nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
   forward-proxy vlan 10-20
   cache size 30
   aging precedence 1 ignore-case \.".jgp\$ min-age 100 freshness-factor 75 max-age 200
   reload-into-ims
   http-access precedence 4 deny destination-domain .TechPubs
   access-log rotate 10 rotate-type duration 10 day
```

4.1.92.2.6 no

smart-cache-policy-mode commands

Removes or resets smart cache policy settings

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [access-log|aging|cache|forward-proxy|http-access|parent-proxy|pre-fetch|
smart-cache|transparent-proxy]

Parameters

- no <PARAMETERS>

no <PARAMETERS> Removes or reverts this Smart Cache policy’s settings based on the parameters passed

Examples

The following example displays the content cache policy ‘test’ settings before the no commands are executed:

```
nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
  forward-proxy vlan 10-2
  aging precedence 1 ignore-case \\.jgp$ min-age 100 freshness-factor 75 max-age 200 preload-into-ims
  http-access precedence 4 deny destination-domain .TechPubs
  access-log rotate 10 rotate-type duration 10 day
nx4500-5CFA2B(config-smart-cache-policy-test)#
```

```
nx4500-5CFA2B(config-content-cache-policy-test)#no forward-proxy vlan 10-20
nx4500-5CFA2B(config-smart-cache-policy-test)#no aging precedence 1
nx4500-5CFA2B(config-smart-cache-policy-test)#no access-log rotate
```

The following example displays the content cache policy ‘test’ settings after the no commands are executed:

```
nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
  cache size 30
  http-access precedence 4 deny destination-domain .TechPubs
nx4500-5CFA2B(config-smart-cache-policy-test)#
```
4.1.92.2.7 pre-fetch

smart-cache-policy-mode commands

Pre-fetches a specified list of URLs (whose credentials can be stored in the local cache)
This command allows the content cache engine to pre-fetch URLs specified in a URL list. The pre-fetch function is performed immediately or at a scheduled time, based on configuration.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
pre-fetch <URL-LIST-NAME> schedule <TIME>

Parameters
- pre-fetch <URL-LIST-NAME> schedule <TIME>

<URL-LIST-NAME> | Pre-fetches a list of URLs identified by the <URL-LIST-NAME> keyword. URL lists are used to select highly utilized URLs for smart caching. The selected URLs are monitored and routed according to existing cache content policies. The URL list should be existing and configured. For more information on configuring URL lists, see url-list.

schedule <TIME> | Pre-fetches the specified URL list at a specified time.
- <TIME> – Specify the time in the HH:MM format.

Examples
nx4500-5CFA2B(config-content-cache-policy-test)#pre-fetch test schedule 12:30
nx4500-5CFA2B(config-content-cache-policy-test)#show context content-cache-policy test
forward-proxy vlan 10-20
cache media all
cache size 30
http-access precedence 100 deny destination-domain test destination-domainregex test
access-log rotate 10 every 50 day
pre-fetch test schedule 12:30
nx4500-5CFA2B(config-content-cache-policy-test)#

- no Removes an ACL
4.1.92.2.8 parent-proxy

smart-cache-policy-mode commands

Enables upper-layer parent proxy on this smart cache policy

The parent proxy server requires users to authenticate to access Web sites like WinRoute. This setting is disabled by default.

Supported in the following platforms:

• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

parent-proxy [enable|host <IP/HOST-NAME> port <1-32768>]

Parameters

- parent-proxy [enable|host <IP/HOST-NAME> port <1-32768>]

<table>
<thead>
<tr>
<th>enable</th>
<th>Enables parent proxy on this smart cache policy</th>
</tr>
</thead>
</table>
| host <IP/HOST-NAME> port <1-32768> | Configures the hostname or IP address of the parent proxy server

- <IP/HOST-NAME> – Specify the parent proxy server's IP address or hostname.
- port <1-32768> – Specify the TCP port number for the parent proxy server. The default port is 8080.

Examples

nx4500-5CFA2B(config-smart-cache-policy-test)#parent-proxy host 192.168.13.8 port 21

nx4500-5CFA2B(config-smart-cache-policy-test)#show context

parent-proxy host 192.168.13.8 port 21

http-access precedence 4 deny destination-domain .TechPubs

Related Commands

| no | Disables parent proxy on this smart cache policy |
4.1.92.2.9 smart-cache

*smart-cache-policy-mode commands*

Enables smart content caching

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**
smart-cache enable

**Parameters**
- smart-cache enable

| smart-cache enable | Enables smart content caching. When enabled, devices using this smart-cache policy act as forward proxy. |

**Examples**
nx4500-5CFA2B(config-smart-cache-policy-test)#smart-cache enable
nx4500-5CFA2B(config-smart-cache-policy-test)#

**Related Commands**
- no | Disables smart content caching |
4.1.92.2.10 transparent-proxy

*smart-cache-policy-mode commands*

Enables the transparent proxy mode on a device. This is the default mode of proxying.
When enabled, all packets are automatically routed to the port on which the content cache engine listens (3128) by default. The advantage of the transparent proxy mode is that clients need not be configured with an explicit proxy.

Transparent content caching, on the other hand, acts as an intermediary for the originating servers and returns cached content to clients as if the data originated from the associated servers. Transparent caching proxies perform server load-balancing and compression to regulate load on the originating servers and reduce bandwidth usage.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
transparent-proxy {protocol|vlan}
transparent-proxy {protocol {all|https}}
transparent-proxy {vlan <VLAN-ID>}
```

**Parameters**

- `transparent-proxy {protocol {all|https}}`
  - Optional. Selects the protocols used for transparent proxy mode
    - `https` – Optional. Enables HTTPS for transparent proxy
    - `all` – Optional. Enables all protocols for transparent proxy
  - `transparent-proxy {vlan <VLAN-ID>}`
    - Optional. Configures the VLAN(s) for which transparent proxy mode (content caching) is enabled. By default content caching is disabled on all VLANs.
    - `<VLAN-ID>` – Specify the list of VLANs.

**Examples**

```
nx4500-5CFA2B(config-smart-cache-policy-test)#transparent-proxy vlan 10-20

nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
  parent-proxy host 192.168.13.8 port 21
  transparent-proxy vlan 10-20
  cache size 30
  http-access precedence 4 deny destination-domain .TechPubs
```

**Related Commands**

- `no`Resets or removes transparent caching proxy settings
4.1.93 url-filter

The following table lists the commands that allow you to enter the URL filter configuration mode:

Table 4.43 Commands Creating a URL Filter

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>

<td>page 4-471</td>
</tr>
</tbody>
</table>
4.1.93.1 url-filter

Creating a new URL filter (Web filter) and enters its configuration mode. URL filtering is a licensed feature. When applied to a WiNG device the license allows you to enable URL filtering on the device, create and apply a URL filter defining the banned and/or allowed URLs. When enabled, the URL filter is applied to all user-initiated URL requests to determine if the requested URL is banned or allowed. Only if allowed is the user’s request (in the form of a HTTP request packet) forwarded to the Web server.

URL filters can be applied at any of the following points: the user’s application (browser/email reader), the network’s gateway, at the Internet service provider’s (ISP) end, and also on a Web portal. For wireless clients, the WLAN infrastructure is the best place to implement these filters.

A URL filter is a set of whitelist and/or blacklist rules. The whitelist allows access only to those Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the whitelist, are banned. On the other hand, the blacklist bans all Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the blacklist, are allowed.

To simplify URL filter configuration, Websites have been classified into pre-defined category-types and categories. The system provides 12 category-types and 64 categories. To further simplify configuration, these 12 category-types have been grouped into five (5) pre-defined levels. (See Usage Guidelines section for the list of category-types, categories, and levels). The actual classification of URLs (on the basis of the pre-defined factors mentioned above) is done by the classification server. A local database also helps by caching URL records for a user-defined time period. The classification server host is specified in the Web filter policy. The Web filter policy also defines the URL database parameters. For more information, see web-filter-policy.

The WiNG software also allows you to create URL lists. Each URL list contains a list of user-defined URLs. Use the URL list in a URL filter (whitelist or blacklist rule) to identify the URLs to ban or allow. For example, a URL list named SocialNetworking is created listing the following three sites: Facebook, Twitter, and LinkedIn. When applied to a URL filter’s blacklist these three sites are banned. Where as, when applied to a whitelist only these three sites are allowed. For more information on configuring a URL list, see url-list.

---

**NOTE:** URL filtering is a licensed feature. Procure and install the license in the device configuration mode. For more information, see license.

---

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

`url-filter <URL-FILTER-NAME>`

**Parameters**

- `url-filter <URL-FILTER-NAME>`

| `<URL-FILTER-NAME>` | Creates a new URL filter and enters its configuration mode. Specify the URL filter name. If the filter does not exist, it is created. |

</tbody>
</table>
4.1.93.2.1 blacklist

**url-filter-config-mode commands**

Creates a blacklist rule. A blacklist is a list of Websites and URLs denied access by clients. Clients requesting blacklisted URLs are presented with a page displaying the 'Web page blocked' message. Parameters relating to this page are configured using the 'blockpage' option.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the URL category-types and categories to include in the blacklist.

In addition to identifying URLs by the categories and category-types they are classified into, the system also provides five (5) levels of Web filtering (basic, high, low, medium, and medium-high). Each level identifies a specific set of URL categories to blacklist. For more information on category-types, categories, and URL filtering levels, see `url-filter`.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

blacklist [category-type|level|url-list]

blacklist category-type [adult-content|all|business|communication|entertainment|file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}

blacklist level [basic|high|low|medium|medium-high] precedence <1-500> {description <LINE>}

blacklist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}

**Parameters**

- blacklist category-type [adult-content|all|business|communication|entertainment|file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}

| blacklist category-type <SELECT-CATEGORY-TYPE> | Selects the category-type to blacklist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can be created with the URL List and added to the database. Websites have been classified into the following 12 category types: adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates. Select ‘all’ to blacklist all category-types. Some of the category-types are further classified into categories. For example, the ‘adult-content’ category-type is differentiated into the following categories: alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons. The system blocks all categories (URLs falling within their limits) within the selected category-type. |
| precedence <1-500> | Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first. |
### Description <LINE>
Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.

### blacklist level [basic|high|low|medium|medium-high] precedence <1-500> {description <LINE>}
- **blacklist level**
  - Configures the Web filtering level as basic, high, low, medium, or medium-high. Each of these filter-levels are pre-configured to use a set of category types and this mapping cannot be modified.

### precedence <1-500>
- Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.

### description <LINE>
Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.

### blacklist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}
- **blacklist url-list**
  - Associates a URL list with this URL filter. When associated with a blacklist rule, all URLs listed in the specified URL list are blacklisted.
  - URL lists are customized categories included in the custom filter-level setting. URL lists enable an administrator to blacklist or whitelist URLs in addition to the built-in categories.
  - For more information on configuring a URL list, see [url-list](#).
  - **<URL-LIST-NAME>** – Enter URL list name (should be existing and configured)

### precedence <1-500>
- Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.

### description <LINE>
Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.

### Examples
```
rfs7000-6DCD4B(config-url-filter-test)#blacklist level medium-high precedence 10
rfs7000-6DCD4B(config-url-filter-test)#blacklist category-type adult-content category alcohol-tobacco precedence 1
rfs7000-6DCD4B(config-url-filter-test)#blacklist category-type security-risk category botnets precedence 3
rfs7000-6DCD4B(config-url-filter-test)#show context
url-filter test
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
rfs7000-6DCD4B(config-url-filter-test)#
```

### Related Commands
```
no
```
- Removes a blacklist rule from this URL filter. Specify the category-type, category, and precedence to identify the blacklist rule. The identified rule is removed from the URL filter.
## 4.1.93.2.2 blockpage

### url-filter-config-mode commands

Configures the parameters that retrieve the page or content displayed by the client’s browser when a requested URL is blocked and cannot be viewed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

### Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`blockpage [external</td>
<td>internal</td>
</tr>
<tr>
<td>`blockpage path [external</td>
<td>internal]`</td>
</tr>
<tr>
<td><code>blockpage external url &lt;URL&gt;</code></td>
<td>Configures the internally hosted blocking page parameters, such as the content displayed, page footer and header, organization (the organization enforcing the Web page blocking) details (name, signature, and logo), and page title.</td>
</tr>
<tr>
<td>`blockpage internal [content</td>
<td>footer</td>
</tr>
</tbody>
</table>

### Parameters

- **blockpage path [external|internal]**

  Specifies if the location of the page displayed, to the client when a requested URL is blocked, is external or internal.
  - **external** – Indicates the page displayed is hosted on an external Web server resource. If selecting this option, use the `blockpage > external > url <URL>` command to provide the path to the external Web server hosting the page.
  - **internal** – Indicates the page displayed is hosted internally. This is the default setting. If selecting this option, use the `blockpage > internal > <SELECT-PAGE-TYPE> > <LINE/IMAGE-URL>` command to define the page configuration.

- **blockpage external url <URL>**

  Configures the URL of the external Web server hosting the page (displayed to the client when a requested URL is blocked).
  - **url <URL>** – Specify the URL of the Web server and the blocking page name.
    Valid URLs should begin with `http://` or `https://`.
    The URL can contain query strings.
    Use ‘&’ or ‘?’ character to separate field-value pair.
    Enter `ctrl-v` followed by ‘?’ to configure query strings.

- **blockpage internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title] <LINE/IMAGE-URL>**

  Configures the internally hosted blocking page parameters, such as the content displayed, page footer and header, organization (the organization enforcing the Web page blocking) details (name, signature, and logo), and page title.
  - **content** – Configures the text (message) displayed on the blocking page.
Examples

rfs7000-6DCD4B(config-url-filter-test)#blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test blacklist level medium-high precedence 10 blacklist category-type security-risk category botnets precedence 3 blacklist category-type adult-content category alcohol-tobacco precedence 1 blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#

Related Commands

no Removes the blocking page configurations
4.1.93.2.3 description

- url-filter-config-mode commands

Configures a description for this URL filter. Provide a description that enables you to identify the purpose of this URL filter.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax
description <LINE>

Parameters
- description <LINE>

| description <LINE> | Enter an appropriate description for this URL filter. The description should identify the URL filter’s purpose and should not exceed 80 characters in length. |

Examples
rfs7000-6DCD4B(config-url-filter-test)#description "Blacklists sites inappropriate for children and are security risks"
rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test
description "Blacklists\ sites\ inappropriate\ for\ children\ and\ are\ security\ risks"
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#

Related Commands
- no Removes this URL filter’s description
4.1.93.2.4 no

► url-filter-config-mode commands

Use the no command to remove this URL filter’s configured parameters

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax
no [blacklist|blockpage|description|whitelist]
no blacklist [category-type|level|url-list]
no blacklist [category-type <SELECT-CATEGORY-TYPE>|level <SELECT-LEVEL>|url-list <URL-LIST-NAME>] precedence <1-500>
no blockpage [external|internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title]|path]
no description
no whitelist [category-type|url-list]
no whitelist [category-type <SELECT-CATEGORY-TYPE>|url-list <URL-LIST-NAME>] precedence <1-500>

Parameters
- no <PARAMETERS>

no <PARAMETERS> Removes this URL filter’s configured parameters based on the values passed here

Examples
The following example displays the URL filter ‘test’ settings before the ‘no’ is executed:

rfs7000-6DCD4B(config-url-filter-test)#show context
url-filter test
description "Blacklists sites inappropriate for children and are security risks"
blacklist level medium-high precedence 10
blacklist category-type communication category chat precedence 7
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#

rfs7000-6DCD4B(config-url-filter-test)#no description
rfs7000-6DCD4B(config-url-filter-test)#no blacklist category-type adult-content category alcohol-tobacco precedence 1
rfs7000-6DCD4B(config-url-filter-test)#no whitelist category-type communication category chat precedence 7

The following example displays the URL filter ‘test’ settings after the ‘no’ is executed:

rfs7000-6DCD4B(config-url-filter-test)#show context
url-filter test
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#
4.1.93.2.5 whitelist

url-filter-config-mode commands

Creates a whitelist rule. A whitelist is a list of Websites and URLs allowed access by clients.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the category-types and categories to include in the whitelist.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

whitelist [category-type|url-list]
whitelist category-type [adult-content|all|business|communication|entertainment|file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
whitelist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}

Parameters

- category-type [adult-content|all|business|communication|entertainment|file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}

selects the category-type to add to this whitelist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can be created with the URL List and added to the database.

Websites have been classified into the following 12 category types: adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates.

Select 'all' to whitelist all category-types.

Some of the category-types are further classified into categories. For example, the 'adult-content' category-type is differentiated into the following categories:

- alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons.

The system allows all categories (URLs falling within their limits) within the selected category-type.

precedence <1-500> Configures the precedence value for this whitelist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.

description <LINE> Optional. Configures a description (not exceeding 80 characters) for this whitelist rule. Enter a description that allows you to identify the purpose of the rule.
**whitelist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>**

<table>
<thead>
<tr>
<th>whitelist url-list &lt;URL-LIST-NAME&gt;</th>
<th>Associates a URL list with this URL filter. When associated with a whitelist rule, all URLs listed in the specified URL list are allowed access. URL lists are customized categories included in the custom filter-level setting. URL lists enable an administrator to blacklist or whitelist URLs in addition to the built-in categories. For more information on configuring a URL list, see <code>url-list</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>precedence &lt;1-500&gt;</td>
<td>Configures the precedence value for this whitelist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.</td>
</tr>
<tr>
<td>description &lt;LINE&gt;</td>
<td>Optional. Configures a description (not exceeding 80 characters) for this whitelist rule. Enter a description that allows you to identify the purpose of the rule.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-6DCD4B(config-url-filter-test)#whitelist category-type communication category chat precedence 7

rfs7000-6DCD4B(config-url-filter-test)#show context
url-filter test
  description "Blacklists sites inappropriate for children and are security risks"
  blacklist level medium-high precedence 10
  whitelist category-type communication category chat precedence 7
  blacklist category-type security-risk category botnets precedence 3
  blacklist category-type adult-content category alcohol-tobacco precedence 1
  blcokpage internal content "The requested Web page is blocked and cannot be displayed for viewing"

rfs7000-6DCD4B(config-url-filter-test)#
```

**Related Commands**

| no | Removes a whitelist rule from this URL filter. Specify the category-type, category, and precedence to identify the blacklist rule. The identified rule is removed from the URL filter. |
4.1.94 url-list

*Global Configuration Commands*

The following table lists the commands that allow you to enter the URL list configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>url-list</td>
<td>Creates a new URL list and enters its configuration mode</td>
<td>page 4-481</td>
</tr>
<tr>
<td>url-list-config-mode</td>
<td>Summarizes the URL list configuration mode commands</td>
<td>page 4-482</td>
</tr>
</tbody>
</table>
4.1.94.1 url-list

url-list

Creates a URL list and enters its configuration mode. After creating the URL list, add URL entries to the list.

URL lists are used to pre-fetch content from the listed URLs. URL Lists are used to select highly utilized URLs for smart caching. The selected URLs are monitored and routed according to existing cache content policies. To enable pre-fetching of cached content, use the `smart-cache > pre-fetch-immediate > <URL-LIST-NAME>` command. For more information, see `smart-cache`.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

```
url-list <URL-LIST-NAME>
```

Parameters

- `url-list <URL-LIST-NAME>`

Examples

```
nx4500-5CFA2B(config)#url-list URLlist1
```

```
nx4500-5CFA2B(config-url-list-URLlist1)#?
```

```
URL List Mode commands:
  description  Description of the category
  no           Negate a command or set its defaults
  url          Add a URL entry
  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal
```

```
nx4500-5CFA2B(config-url-list-URLlist1)#
nx4500-5CFA2B(config-url-list-URLlist1)#url http://www.example_company.com depth 10
```

```
nx4500-5CFA2B(config-url-list-test)#show context
```

```
url-list test
  url http://www.example_company.com depth 10
nx4500-5CFA2B(config-url-list-URLlist1)#
```
4.1.94.2 url-list-config-mode commands

The following table summarizes URL list configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>Creates a blacklist rule defining a list of banned Web sites and URLs</td>
<td>page 4-483</td>
</tr>
<tr>
<td>url</td>
<td>Adds URL entries to this URL list</td>
<td>page 4-484</td>
</tr>
<tr>
<td>no</td>
<td>Removes this URL list's settings</td>
<td>page 4-485</td>
</tr>
</tbody>
</table>
4.1.94.2.1 description

Configures a description for this URL list. The description should be unique and enable you to identify the type of URLs listed in the URL list.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

description <LINE>

Parameters

- description <LINE>

Examples

nx4500-5CFA2B(config-url-list-test)#description “This URL list contains social media URLs”
nx4500-5CFA2B(config-url-list-test)#show context
url-list test
description “This URL list contains social media URLs”
nx4500-5CFA2B(config-url-list-test)#

Related Commands

| no | Removes this URL list’s description |
4.1.94.2.2  url

```markdown
url-list-config-mode commands
```

Adds URL entries to this URL list

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
url <WORD> {depth <1-10>}
```

**Parameters**

- `url <WORD> {depth <1-10>}`

<table>
<thead>
<tr>
<th><code>url &lt;WORD&gt; {depth &lt;1-10&gt;}</code></th>
<th>Adds a URL entry</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;WORD&gt;</code> – Specify the URL to add.</td>
<td></td>
</tr>
<tr>
<td><code>depth</code> – Optional. Sets number of levels to be cached. Since Web sites have different parameters to uniquely identify specific content, the same content may be stored on multiple origin servers. Smart caching uses subsets of these parameters to recognize that the content is the same and serves it from cache.</td>
<td></td>
</tr>
<tr>
<td><code>&lt;1-10&gt;</code> – Specify the depth from 1 - 10.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
nx4500-5CFA2B(config-url-list-test)#url http://www.facebook.com
```

```
nx4500-5CFA2B(config-url-list-test)#show context
description "This URL list contains social communication URLS"
url https://www.facebook.com depth 5
```

```
nx4500-5CFA2B(config-url-list-test)#
```

**Related Commands**

```
no
```

Removes a URL entry from this URL list
4.1.94.2.3 no

**url-list-config-mode commands**

Removes this URL list's settings

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

no [description|url]

no description

no url <WORD>

**Parameters**

- no <PARAMETERS>

| no <PARAMETERS> | Removes this URL's settings based on the parameters passed |

**Examples**

The following example displays the URL list 'test' settings before the 'no' command is executed:

```shell
nx4500-5CFA2B(config-url-list-test)#show context
url-list test
description "This URL list contains social communication URLs"
url https://www.facebook.com depth 5
```

```shell
nx4500-5CFA2B(config-url-list-test)#no url www.facebook.com
```

The following example displays the URL list 'test' settings after the 'no' command is executed:

```shell
nx4500-5CFA2B(config-url-list-test)#show context
url-list test
description "This URL list contains social communication URLs"
```
4.1.95 vx9000

Global Configuration Commands

Configures a Virtual WLAN Controller (V-WLC) in a virtual machine (VM) environment. V-WLC can be deployed on a shared, third-party server hardware, thereby reducing overhead costs of procuring and maintaining dedicated appliances. The external, third-party hardware needs to have installed hypervisors, such as VmWare, Xen, VirtualBox, KVM, Amazon EC2 or Hyper-V, enabling it to communicate with V-WLC software.

The V-WLC controls and manages access points and other controllers (at NOC or as a site-controller) in the network. The traffic between the access points and the V-WLC is over the layer-3 MINT protocol.

V-WLC is a licensed feature, and the WiNG software provides the following two new licenses:

- **VX** – When installed, this license activates VM controller instance, and enables the V-WLC to trigger adoption process allowing access points to adopt to the V-WLC. The adoption capacity of the V-WLC is determined by the number of licenses installed on it.

- **VX-DEMO** – This is a 60 day trial license. This license also activates VM controller instance, and enables the V-WLC to adopt access points. But, the access point adoption capacity is limited to 16. Having installed this license on a device, the only other license that you can install on it is the VX license. All existing installed licenses will continue to work as before. Since this license has a limited validity period, ensure that the system clock on the license generating tool and the device are in sync. preferably through NTP.

To install the VX or VX-DEMO license on an existing V-WLC instance, use the license command. For more information, see the examples provided in this section.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

\[ vx9000 \ <\text{MAC}> \]

**Parameters**

- **vx9000** \ <MAC>

**vx <MAC>**

<table>
<thead>
<tr>
<th>vx &lt;MAC&gt;</th>
<th>Configures a V-WLC and enters its configuration mode</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> The V-WLC configuration is the same as that of a normal controller.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C8809(config)#vx9000 11-22-33-44-55-66
nx9500-6C8809(config-device-11-22-33-44-55-66)#?

Device Mode commands:

- adopter-auto-provisioning-policy-lookup
- adoption
- adoption-site
- alias
- application-policy
- area
- arp
- auto-learn-staging-config
- autogen-uniqueid
- autoinstall
- bridge
- captive-portal
- cdp
- channel-list
- cluster
- configuration-persistence

Use centralized auto-provisioning policy when adopted by another controller
Adoption configuration
Set system's adoption site
Alias
Application Policy configuration
Set name of area where the system is located
Address Resolution Protocol (ARP)
Enable learning network configuration of the devices that come for adoption
Autogenerate a unique id
Autoinstall settings
Ethernet bridge
Captive portal
Cisco Discovery Protocol
Configure channel list to be advertised to wireless clients
Cluster configuration
Enable persistence of configuration
GLOBAL CONFIGURATION COMMANDS

**contact** Configure the contact
**controller** WLAN controller configuration
**country-code** Configure the country of operation
**critical-resource** Critical Resource
**crypto** Encryption related commands
**database-backup** Scheduled Database Backup
**device-upgrade** Device firmware upgrade
**dot1x** 802.1X Enable Deep-Packet-Inspection (Application Assurance)
**dpi** Configure IP DSCP to 802.1p priority mapping for untagged frames
**dscp-mapping** Configure layout coordinates for this device
**email-notification** Email notification configuration
**enforce-version** Check the firmware versions of devices before interoperating
**environmental-sensor** Environmental Sensors Configuration
**events** System event messages
**export** Export a file
**file-sync** File sync between controller and adoptees
**floor** Set the floor within an area where the system is located
**geo-coordinates** Configure geo coordinates for this device
**gre** GRE protocol
**hostname** Set system's network name
**http-analyze** Specify HTTP-Analysis configuration
**interface** Select an interface to configure
**ip** Internet Protocol (IP)
**ipv6** Internet Protocol version 6 (IPv6)
**l2tpv3** L2tpv3 protocol
**l3e-lite-table** L3e lite Table
**layout-coordinates** Configure layout coordinates for this device
**led** Turn LEDs on/off on the device
**led-timeout** Configure the time for the led to turn off after the last radio state change
**legacy-auto-downgrade** Enable device firmware to auto downgrade when other legacy devices are detected
**legacy-auto-update** Auto upgrade of legacy devices
**license** License management command
**lldp** Link Layer Discovery Protocol
**load-balancing** Configure load balancing parameter
**location** Configure the location
**logging** Modify message logging facilities
**mac-address-table** MAC Address Table
**mac-auth** 802.1x Configure MAC address to name mappings
**mac-name** Memory profile to be used on the device
**memory-profile** Configure meshpoint device parameters
**meshpoint-device** Configure meshpoint monitoring interval
**meshpoint-monitor-interval** Check controller connectivity after configuration is received
**min-misconfiguration-recovery-time** MiNT protocol
**mint** Mirroring
**mirror** Check controller connectivity after configuration is received
**misconfiguration-recovery-time** Configure neighbor inactivity timeout
**neighbor-inactivity-timeout** Configure neighbor information exchange interval

This chapter describes the CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes. The PRIV EXEC command set contains commands available within the USER EXEC mode. Some commands can be entered in either mode. Commands entered in either the USER EXEC or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.
5.1 Common Commands

The following table summarizes commands common to the User Exec, Priv Exec, and Global Config modes:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>clrscr</td>
<td>Clears the display screen</td>
<td>page 5-3</td>
</tr>
<tr>
<td>commit</td>
<td>Commits (saves) changes made in the current session</td>
<td>page 5-4</td>
</tr>
<tr>
<td>exit</td>
<td>Ends and exits the current mode and moves to the PRIV EXEC mode</td>
<td>page 5-5</td>
</tr>
<tr>
<td>help</td>
<td>Displays the interactive help system</td>
<td>page 5-6</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts values to their default settings</td>
<td>page 5-9</td>
</tr>
<tr>
<td>revert</td>
<td>Reverts changes to their last saved configuration</td>
<td>page 5-12</td>
</tr>
<tr>
<td>service</td>
<td>Invokes service commands to troubleshoot or debug instance configurations</td>
<td>page 5-13</td>
</tr>
<tr>
<td>show</td>
<td>Displays running system information</td>
<td>page 5-50</td>
</tr>
<tr>
<td>write</td>
<td>Writes the system’s running configuration to memory or terminal</td>
<td>page 5-52</td>
</tr>
</tbody>
</table>

**NOTE:** The input parameter <HOSTNAME> cannot include an underscore character. In other words, a device’s hostname cannot contain an underscore.
### 5.1.1 clrscr

**Common Commands**

Clears the screen and refreshes the prompt, irrespective of the mode

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

clrscr

**Parameters**

None

**Examples**

The terminal window or screen before the clrscr command is executed:

```
rfs4000-229D58# device-upgrade ?
  DEVICE-NAME    Name/MAC address of device
     all          Upgrade all devices
    ap621         Upgrade AP621 Device
    ap622         Upgrade AP622 Device
    ap650         Upgrade AP650 Device
    ap6511        Upgrade AP6511 Device
    ap6521        Upgrade AP6521 Device
    ap6522        Upgrade AP6522 Device
    ap6532        Upgrade AP6532 Device
    ap6562        Upgrade AP6562 Device
    ap71xx        Upgrade AP71XX Device
    ap7502        Upgrade AP7502 Device
    ap7522        Upgrade AP7522 Device
    ap7532        Upgrade AP7532 Device
    ap7562        Upgrade AP7562 Device
    ap81xx        Upgrade AP81XX Device
    ap82xx        Upgrade AP82XX Device
  cancel-upgrade Cancel upgrading the device
  load-image     Load the device images to controller for device-upgrades
  rf-domain      Upgrade all devices belonging to an RF Domain
    rfs4000      Upgrade RFS4000 Device
```

rfs4000-229D58#

The terminal window or screen after the clrscr command is executed:

```
rfs4000-229D58#
```
5.1.2 commit

Commits changes made in the active session. Use the commit command to save and invoke settings entered during the current transaction.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

commit {write}{memory}

Parameters

- commit {write}{memory}

<table>
<thead>
<tr>
<th>write</th>
<th>Optional. Commits changes made in the current session</th>
</tr>
</thead>
<tbody>
<tr>
<td>memory</td>
<td>Optional. Writes to memory. This option ensures current changes persist across reboots.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE#commit write memory
[OK]
rfs7000-37FABE#
5.1.3 exit

Common Commands

The exit command works differently in the User Exec, Priv Exec, and Global Config modes. In the Global Config mode, it ends the current mode and moves to the previous mode, which is Priv Exec mode. The prompt changes from (config)# to #. When used in the Priv Exec and User Exec modes, the exit command ends the current session, and connection to the terminal device is terminated. If the current session has changes that have not been committed, the system prompts you to either do a commit or a revert before terminating the session.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
exit
```

Parameters

None

Examples

```
rfs7000-37FABE(config)#exit
rfs7000-37FABE#
```
5.1.4 help

Common Commands

Describes the interactive help system

Use this command to access the advanced help feature. Use “?” anytime at the command prompt to access the help topic.

Two kinds of help are provided:

• Full help is available when ready to enter a command argument
• Partial help is provided when an abbreviated argument is entered and you want to know what arguments match the input (for example ‘show ve?’).

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

help {search}
help {search <WORD>} {detailed|only-show|skip-no|skip-show}

Parameters

• help {search <WORD>} {detailed|only-show|skip-no|skip-show}

<table>
<thead>
<tr>
<th>search &lt;WORD&gt;</th>
<th>Optional. Searches for CLI commands related to a specified target term</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt; – Specify a target term (for example, a feature or a configuration parameter). After specifying the term, select one of the following options: detailed, only-show, skip-no, or skip-show. The system displays information based on the option selected.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>detailed</th>
<th>Optional. Searches and displays help strings in addition to mode and commands</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>only-show</th>
<th>Optional. Displays only “show” commands. Does not display configuration commands</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>skip-no</th>
<th>Optional. Displays only configuration commands. Does not display “no” commands</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>skip-show</th>
<th>Optional. Displays only configuration commands. Does not display “show” commands</th>
</tr>
</thead>
</table>

rfs7000-37FAE>
5.1.5 no

**Common Commands**

Negates a command or sets its default. Though the `no` command is common to the User Exec, Priv Exec, and Global Config modes, it negates a different set of commands in each mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`no <PARAMETERS>`

**Parameters**

- no <PARAMETERS>

| no <PARAMETERS> | The no command is common across all configuration modes and sub modes. It resets or reverts settings based on the mode in which executed. For example, when executed in the AAA policy configuration mode, it allows you to reset or revert a specific AAA policy settings. Similarly, when executed in the global configuration mode, it only resets or reverts settings configured in the global configuration mode. |

**Usage Guidelines**

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

Enter configuration commands, one per line. End with CNTL/Z.

```text
rfs7000-37FABE(config)# no ?
aaa-policy                     Delete a aaa policy
aaa-tacacs-policy              Delete a aaa tacacs policy
alias                          Alias

5.1.6 revert

- **Common Commands**
  
  Reverts changes made, in the current session, to their last saved configuration

  Supported in the following platforms:
  
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

revert

**Parameters**

None

**Examples**

rfs7000-37FABE>revert
rfs7000-37FABE>
5.1.7 service

Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode. The User Exec mode and Priv Exec mode commands provide same functionalities with a few minor changes. The Global Config service command sets the size of history files. It also enables viewing the current mode's CLI tree.

This section consists of the following sub-sections:

- Syntax (User Exec Mode)
- Syntax (Privilege Exec Mode)
- Syntax (Privilege Exec Mode: NX9000, NX9500, and NX9510)
- Syntax (Global Config Mode)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax (User Exec Mode)

```

#### Parameters (User Exec Mode)

- **Service**
  - `service [block-adopter-config-update|request-full-config-from-adopter]`

<table>
<thead>
<tr>
<th>block-adopter-config-update</th>
<th>Blocks the configuration updates sent from the NOC server</th>
</tr>
</thead>
<tbody>
<tr>
<td>request-full-config-from-adopter</td>
<td>Configures a request for full configuration updates from the adopter device</td>
</tr>
</tbody>
</table>

In an **hierarchically managed** (HM) network devices are deployed in two levels. The first level consists of the **Network Operations Center** (NOC) controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (access points and site controllers) are referred to as the adoptee. The devices adopting the adoptee are the 'adopters'.
### Service Clear Adoption History

```bash
service clear adoption history {on <DEVICE-NAME>}
```

- **clear adoption history**: Clears adoption history on this device and its adopted access points.
- **on <DEVICE-NAME>**: Optional. Clears adoption history on a specified device.
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

### Service Clear Device Upgrade History

```bash
service clear device-upgrade history {on <DOMAIN-NAME>}
```

- **clear device-upgrade history**: Clears device upgrade history.
- **on <DOMAIN-NAME>**: Optional. Clears all firmware upgrade history in a specified RF Domain.
  - `<DOMAIN-NAME>` – Specify the RF Domain name.

### Service Clear DPI

```bash
service clear dpi [all|app|app-category] stats {on <DEVICE-OR-DOMAIN-NAME>}
```

- **clear dpi**: Clears Deep Packet Inspection (DPI) statistics.
- **[all|app|app-category] stats**: Use the following filter options to clear all or specific DPI statistics:
  - `all` – Clears all DPI related (application and app-category) statistics
  - `app` – Clears only application related statistics
  - `app-category` – Clears only app-category related statistics
- **on <DEVICE-OR-DOMAIN-NAME>**: Optional. Clears DPI statistics based on the parameters passed on a specified device or RF Domain.
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the access point, controller, service platform, or RF Domain.

### Service Clear File Synchronization History

```bash
service clear file-sync history {on <DOMAIN-NAME>}
```

- **clear file-sync history**: Clears client-bridge certificate synchronization statistics.
- **on <DOMAIN-NAME>**: Optional. Clears file synchronization history on all devices within a specified RF Domain.
  - `<DOMAIN-NAME>` – Specify the RF Domain name.

### Service Clear Captive Portal Page Upload History

```bash
service clear captive-portal-page-upload history {on <DOMAIN-NAME>}
```

- **clear captive-portal-page-upload history**: Clears captive portal page upload history.
- **on <DOMAIN-NAME>**: Optional. Clears captive portal page upload history on a specified RF Domain.
  - `<DOMAIN-NAME>` – Specify the RF Domain name.
### COMMON COMMANDS

- **service clear [command-history|reboot-history|upgrade-history|virtual-machine-history] {on <DEVICE-NAME>}

  - **clear [command-history|reboot-history|upgrade-history]**
    - Clears command history, reboot history, or device upgrade history

  - **clear virtual-machine-history**
    - Clears virtual-machine history on the logged device or a specified device
    - **Note:** This command is applicable only on the NX45XX, NX65XX, NX9500, and NX9510 series service platforms.

  - **on <DEVICE-NAME>**
    - Optional. Clears history on a specified device
    - • **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.
    - **Note:** When executing the clear virtual-machine-history command, provide the name of the service platform running the VMs.

- **service clear noc statistics**

  - **clear noc statistics**
    - Clears Network Operations Center (NOC) applicable statistics counters

- **service clear unsanctioned aps {on <DEVICE-OR-DOMAIN-NAME>}

  - **clear unsanctioned aps**
    - Clears the unsanctioned APs list

  - **on <DEVICE-OR-DOMAIN-NAME>**
    - Optional. Clears the unsanctioned APs list on a specified device or RF Domain
    - • **<DEVICE-OR-DOMAIN-NAME>** – Specify the name of the AP, wireless controller, service platform, or RF Domain.

- **service clear wireless [ap|client] {<MAC>} {on <DEVICE-OR-DOMAIN-NAME>}

  - **clear wireless [ap|client] statistics**
    - Clears wireless statistics counters based on the parameters passed
    - • ap statistics – Clears applicable AP statistics counters
    - • client statistics – Clears applicable wireless client statistics counters
    - • **<DEVICE-OR-DOMAIN-NAME>** – Specify the name of the AP, wireless controller, service platform, or RF Domain.

  - **<MAC>**
    - **on <DEVICE-OR-DOMAIN-NAME>**
      - The following keywords are common to the ‘ap’ and ‘client’ parameters:
      - • **<MAC>** – Optional. Clears statistics counters for a specified AP or client. Specify the AP/client MAC address.
      - • **on <DEVICE-OR-DOMAIN-NAME>** – Optional. Clears AP/client statistics counters on a specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain.

- **service clear wireless controller-mobility-database**

  - **clear wireless controller-mobility-database**
    - Clears the controller assisted mobility database

- **service clear web-filter cache {on <DEVICE-NAME>}

  - **clear web-filter cache**
    - Clears the cache used for Web filtering
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>on <code>&lt;DEVICE-NAME&gt;</code></td>
<td>Optional. Clears the Web filtering cache on a specified device. <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
<tr>
<td>• service clear wireless radio statistics <code>{&lt;MAC/HOSTNAME&gt;} {&lt;1-3&gt;} {&lt;on &lt;DEVICE-OR-DOMAIN-NAME&gt;}&gt;</code></td>
<td>Clears applicable wireless radio statistics counters. <code>&lt;MAC/HOSTNAME&gt;</code> <code>&lt;1-3&gt;</code> Optional. Specify the MAC address or hostname of the radio, or append the interface number to form the radio ID in the AA-BB-CC-DD-EE:FF:RX or HOSTNAME:RX format. <code>&lt;1-3&gt;</code> – Optional. Specify the radio interface index, if not specified as part of the radio ID. <code>&lt;on &lt;DEVICE-OR-DOMAIN-NAME&gt;&gt;</code> Optional. This is a recursive parameter, which clears wireless radio statistics on a specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain. <code>&lt;DEVICE-OR-DOMAIN-NAME&gt;</code> – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
<tr>
<td>clear wireless wlan statistics</td>
<td>Clears WLAN statistics counters. <code>&lt;WLAN-NAME&gt;</code> Optional. Clears statistics counters on a specified WLAN. Specify the WLAN name. <code>&lt;on &lt;DEVICE-OR-DOMAIN-NAME&gt;&gt;</code> Optional. This is a recursive parameter, which clears WLAN statistics on a specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain. <code>&lt;DEVICE-OR-DOMAIN-NAME&gt;</code> – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
<tr>
<td>• service clear xpath requests <code>{&lt;1-100000&gt;}</code></td>
<td>Clears XPATH related information. <code>&lt;1-100000&gt;</code> Optional. Specifies the session number (cookie from show sessions). <code>&lt;1-100000&gt;</code> – Specify the session number from 1 - 100000. Note: Omits clearing the current session’s pending XPATH get requests.</td>
</tr>
</tbody>
</table>
| cli-tables-skin [ansi|hashes|minimal|none|percent|stars|thick|thin|utf-8] {grid} | Selects a formatting layout or skin for CLI tabular outputs. ansi – Uses ANSI characters for borders hashes – Uses hashes (#) for borders minimal – Uses one horizontal line between title and data rows none – Displays space separated items with no decoration percent – Uses the percent sign (%) for borders Contd..

</tr>
</tbody>
</table>
- service guest-registration delete [all|email <EMAIL-ADD>|mac <MAC>|mobile <MOBILE-NUMBER>|name <CLIENT-FULL-NAME>]

    Deletes a specified user or all user records in the database
To delete a specific user, use one of the following options as an identification parameter: email, mac, mobile number, or name

    [all]
    email <EMAIL-ADD>  
    mac <MAC>  
    mobile <MOBILE-NUMBER>  
    name <CLIENT-FULL-NAME>

    Following are the user filtering options: The user identified by one of the following parameters is deleted from the client database.
    • email <EMAIL-ADD> – Identifies user by the e-mail address
    • <EMAIL-ADD> – Provide the user’s e-mail address.
    • mac <MAC> – Identifies user by the MAC address
    • <MAC> – Provide the user’s MAC address.
    • mobile <MOBILE-NUMBER> – Identifies user by the registered mobile number
    • <MOBILE-NUMBER> – Provide the user’s mobile number.
    • name <CLIENT-FULL-NAME> – Identifies user by the registered full name
    • <CLIENT-FULL-NAME> – Provide the user’s full name.

- service guest-registration export format [csv|json] <DEST-URL> { (rfdomain <DOMAIN-NAME>|time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]|wlan <WLAN-NAME>) }

    Exports guest registration user data files in the Comma-Separated Values (CSV) or JavaScript Object Notation (JSON) format
Use the ‘rfdomain’, ‘wlan’, and ‘time’ options to filter users for a specified RF Domain, WLAN, and/or time period. These are recursive parameters and you can apply all or any of these three filters.

    format [csv|json]  
    <DEST-URL>  
    rfdomain <DOMAIN-NAME>  
    wlan <WLAN-NAME>

    Specifies the file format. The options are:
    • CSV – Exports user data files in the CSV format
    • json – Exports user data files in the JSON format

    Configures the destination URL. The files are exported to the specified location. Both IPv4 and IPv6 address formats are supported.
    IPv4 URLs:
    • tftp://<hostname>[IP][:port]/path/file
    • ftp://<user>:<passwd>@<hostname>[IP][:port]/path/file
    • sftp://<user>:<passwd>@<hostname>[IP][:port]/path/file

    IPv6 URLs:
    • tftp://<hostname>[IPv6][:port]/path/file
    • ftp://<user>:<passwd>@<hostname>[IPv6][:port]/path/file
    • sftp://<user>:<passwd>@<hostname>[IPv6][:port]/path/file

    Optional. Filters user data based on RF Domain name. Only the filtered data are exported.
    • <DOMAIN-NAME> – Specify the RF Domain name.

    Optional. Filters user data based on WLAN name. Only the filtered data are exported.
    • <WLAN-NAME> – Specify the WLAN name.
### COMMON COMMANDS 5-21

<table>
<thead>
<tr>
<th>Time Interval</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-Day</td>
<td>Filters and exports previous day’s data</td>
</tr>
<tr>
<td>1-Month</td>
<td>Filters and exports previous month’s data</td>

<tr>
<td>1-Week</td>
<td>Filters and exports previous week’s data</td>
</tr>
<tr>
<td>2-Hours</td>
<td>Filters and exports last 2 hours data</td>
</tr>
<tr>
<td>30-Mins</td>
<td>Filters and exports last 30 minutes data</td>
</tr>
<tr>
<td>5-Hours</td>
<td>Filters and exports last 5 hours data</td>
</tr>
<tr>
<td>all</td>
<td>Exports the entire database</td>
</tr>
</tbody>
</table>

- **service guest-registration import format json <SOURCE-URL>**
  - Imports user data from a specified location
  - `format json`: Specifies the file format
    - `json`: Imports user data files in the JSON format
  - `<SOURCE-URL>`: Configures the Source URL. The files are imported from the specified location. Both IPv4 and IPv6 address formats are supported.
    - **IPv4 URLs:**
      - `tftp://<hostname|IP>[:port]/path/file`
      - `ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
      - `sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
    - **IPv6 URLs:**
      - `tftp://<hostname|IPv6>[:port]/path/file`
      - `ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file`
      - `sftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file`

- **service load-balancing clear-client-capability [<MAC]|all] {on <DEVICE-NAME>]**
  - Enables wireless load balancing by clearing client capability records
  - `<MAC>`: Clears capability records of a specified client. Specify the client’s MAC address in the AA-BB-CC-DD-EE-FF format.
  - `all`: Clears the capability records of all clients
  - `<DEVICE-NAME>`: Optional. Clears client capability records on a specified device

- **service load-ssh-authorized-keys <PUBLIC-KEY> {on <DEVICE-NAME>]**
  - Loads SSH public (client) key on a device
  - `<PUBLIC-KEY>`: Enter the public key. The public key should be in the OpenSSH rsa/dsa format.
  - `<DEVICE-NAME>`: Optional. Loads the specified public key on a specified device
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| service locator `<1-60>` `(on <DEVICE-NAME>)` | Enables LEDs. Sets LED flashing time from 1 - 60 seconds. The following keyword is recursive and common to the `<1-60>` parameter:  
  - `<on <DEVICE-NAME>>` – Optional. Enables LEDs on a specified device.  
  - `<DEVICE-NAME>` – Specify name of the AP, wireless controller, or service platform. |
| service radio `<1-3>` adaptivity | Configures radio's parameters. `<1-3>` – Specify the radio index from 1 - 3. |
| radio `<1-3>` channel-switch `<36-196>` `[160|20|40|80|80-80]` | Enables channel switching. `<36-196>` – Specifies the channel to switch to from 36 - 196.  
  - `[160|20|40|80|80-80]` – Specifies the bandwidth for the above specified channel. Select the appropriate option. |
| service radius test `<IP>|<HOSTNAME>` `<WORD>` `<USERNAME>` `<PASSWORD>` `{wlan `<WLAN-NAME>` ssid `<SSID>`}` `(on <DEVICE-NAME>)` | Tests RADIUS server's account. This command sends an access-request packet to the RADIUS server. Use this command to confirm time and data/bandwidth parameters for valid wireless clients.  
  - `<test>` – Tests the RADIUS server's account with user provided parameters.  
  - `<IP>` – Specifies the RADIUS server’s IP address.  
  - `<HOSTNAME>` – Specifies the RADIUS server’s hostname.  
  - `<USERNAME>` – Specify username for authentication.  
  - `<PASSWORD>` – Specify the password. |

</table>
| adopted-devices on `<DEVICE-NAME>` | Displays adopted devices status in dpd2  
  - on `<DEVICE-NAME>` – Optional. Displays MiNT protocol details for a specified device. If no device is specified, the system displays information for the logged device.  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| ports | Displays MiNT ports used by various services and features |
| `service show pm {history} {(on <DEVICE-NAME>)}` | |
| `service show rf-domain-manager [diag|info] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}` | Displays RF Domain manager information  
  - `<MAC/HOSTNAME>` Optional. Specify the MAC address or hostname of the RF Domain manager.  
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain. |
| `service show sites` | Displays NOC sites related information |
| `service show virtual-machine-history {on <DEVICE-NAME>}` | Displays virtual machine history based on the passed parameters  
  **Note:** This command is applicable only to the NX45XX, NX65XX, and NX9500, and NX9510 series service platforms. It is also available on the Privilege Executable Mode of these devices.  
  - `<DEVICE-NAME>` – Specify the name of the service platform. |
- **service show wireless [aaa-stats|adaptivity-status|credential-cache|dns-cache|radar-status|vlan-usage] \{on <DEVICE-NAME>\}**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show</td>
<td>Displays running system statistics based on the parameters passed</td>
</tr>
<tr>
<td>wireless</td>
<td>Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage etc.)</td>
</tr>
<tr>
<td>aaa-stats</td>
<td>Displays AAA policy statistics</td>
</tr>
<tr>
<td>adaptivity-status</td>
<td>Displays the current list of channels (with interference levels exceeding the configured threshold resulting in adaptivity kicking in) and time when adaptivity kicked in on a device</td>
</tr>
<tr>
<td>credential-cache</td>
<td>Displays clients cached credentials statistics (VLAN, keys etc.)</td>
</tr>
<tr>
<td>dns-cache</td>
<td>Displays cache of resolved names of servers related to wireless networking</td>
</tr>
</tbody>
</table>
| radar-status | Displays radar discovery status. This option displays following information:  
• If a radar has been discovered by the AP  
• The time of discovery |
| vlan-usage | Displays VLAN statistics across WLANs |
| on <DEVICE-NAME> | The following keywords are common to all of the above:  
• on <DEVICE-NAME> – Optional. Displays running system statistics on a specified device. If no device is specified, the system displays information for the logged device.  
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **service show wireless [config-internal|log-internal|neighbors]**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| show     | Displays running system statistics based on the parameters passed  
**Note:** This command is not supported on the NX45XX, NX65XX, and NX9000 series service platforms. |
| wireless | Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage etc.) |
| config-internal | Displays internal configuration parameters |
| log-internal | Displays recent internal wireless debug logs (info and above severity) |
| neighbors | Displays neighboring device statistics for roaming and flow migration |

- **service show wireless [client|meshpoint neighbor] proc [info|stats] \{<MAC>\} \{on <DEVICE-OR-DOMAIN-NAME>\}**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show</td>
<td>Displays running system statistics based on the parameters passed</td>
</tr>
<tr>
<td>wireless</td>
<td>Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage etc.)</td>
</tr>
<tr>
<td>client</td>
<td>Displays WLAN client statistics</td>
</tr>
<tr>
<td>meshpoint neighbor</td>
<td>Displays meshpoint related proc entries</td>
</tr>
</tbody>
</table>
### COMMON COMMANDS

| proc | The following keyword is common to client and meshpoint neighbor parameters:
|      | • proc – Displays dataplane proc entries based on the parameter selected
|      | **Note:** These proc entries provide statistics on each wireless client on the WLAN.
|      | **Note:** For the meshpoint parameter, it displays proc entries about neighbors.
| info | This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified device (wireless client or neighbor) or RF Domain
| stats | This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified device (wireless client or neighbor) or RF Domain
| <MAC> | Displays information for a specified device (wireless client or neighbor) or RF Domain
| on <DEVICE-OR-DOMAIN-NAME> | This parameter is common to client and meshpoint neighbor parameters. Displays information for a specified device (wireless client or neighbor) or RF Domain.
|      | • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

- service show wireless radio-internal [radio1|radio2] <LINE>

| show | Displays running system statistics based on the parameters passed
| wireless | Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage, etc.)
| radio-internal | Displays radio internal debug logs. Select the radio from the following options:
|      | • radio1 – Selects radio 1
|      | • radio2 – Selects radio 2.
| <LINE> | Specify the radio internal debug command to enable.

- service show wireless reference [channels|frame|handshake|mcs-rates|reason-codes|status-codes]

| show | Displays running system statistics based on the parameters passed
| wireless | Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage, etc.)
| reference | Displays look up reference information related to standards, protocols etc.
| channels | Displays 802.11 channels information
| frame | Displays 802.11 frame structure
| handshake | Displays a flow diagram of 802.11 handshakes
| mcs-rates | Displays MCS rate information
| reason-codes | Displays 802.11 reason codes (for deauthentication, disassociation etc.)
| status-codes | Displays 802.11 status codes (for association response etc.)

- service show wireless stats-client diag {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}

| show | Displays running system statistics based on the parameters passed
| wireless | Displays WLAN statistics (WLAN AAA policy, configuration parameters, VLAN usage, etc.)
| stats-client | Displays managed AP statistics
### smart-rf

Enables Smart RF management

<table>
<thead>
<tr>
<th><strong>clear-config</strong></th>
<th>Clears WLAN Smart RF configuration on a specified device or on all devices</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&lt;MAC&gt;</strong></td>
<td>Optional. Clears WLAN Smart RF configuration on a device identified by its MAC address. Specify the device’s MAC address in the AA-BB-CC-DD-EE-FF format.</td>
</tr>
<tr>
<td><strong>&lt;DEVICE-NAME&gt;</strong></td>
<td>Optional. Clears WLAN Smart RF configuration on a device identified by its hostname. Specify the device’s hostname.</td>
</tr>
<tr>
<td><strong>on &lt;DOMAIN-NAME&gt;</strong></td>
<td>Optional. Clears WLAN Smart RF configuration on all devices in a specified RF Domain</td>
</tr>
</tbody>
</table>

- service smart-rf clear-config {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>}

### SNMP

Customizes a new sysObjectID (sysoid), in the MIB, for devices running WiNG 5.X devices

<table>
<thead>
<tr>
<th><strong>snmp sysoid wing5</strong></th>
<th>Configures a new sysObjectID (sysoid), in the MIB, for devices running WiNG 5.X devices</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>When configured, the SNMP manager returns sysoid for WiNG 5.X OS. Hardwares running the WiNG 4.X and WiNG 5.X images have different sysoids. For example, the sysoid for a RFS4000 using the WiNG 4.X image differs from another RFS4000 running the WiNG 5.X image.</td>
</tr>
<tr>
<td></td>
<td>This command is applicable only to RFS4000, RFS6000, and RFS7000 platforms, since they have the same sysoid supported in WiNG 4.X and WiNG 5.X.</td>
</tr>
<tr>
<td></td>
<td>The WiNG 4.X sysoids are:</td>
</tr>
<tr>
<td></td>
<td>• RFS4000 – 1.3.6.1.4.1.388.18</td>
</tr>
<tr>
<td></td>
<td>• RFS6000 – 1.3.6.1.4.1.388.16</td>
</tr>
<tr>
<td></td>
<td>• RFS7000 – 1.3.6.1.4.1.388.15</td>
</tr>
<tr>
<td></td>
<td>The WiNG 5.X sysoids are:</td>
</tr>
<tr>
<td></td>
<td>• RFS4000 – 1.3.6.1.4.1.388.50.1.1.35</td>
</tr>
<tr>
<td></td>
<td>• RFS6000 – 1.3.6.1.4.1.388.50.1.1.36</td>
</tr>
<tr>
<td></td>
<td>• RFS7000 – 1.3.6.1.4.1.388.50.1.1.37</td>
</tr>
</tbody>
</table>
### COMMON COMMANDS

**service ssm dump-core-snapshot**

| ssm dump-core-snapshot | Triggers a debug core dump of the SSM module |

**service syslog test {level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings]} {(on <DEVICE-NAME>)}**

| syslog test | Sends a test message to the syslog server to confirm server availability |
| level | Optional. Sets the logging level. In case syslog server is unreachable, an event is logged based on the logging level defined. This is an optional parameter, and the system configures default settings, if no logging severity level is specified. |
| <0-7> | Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows: |
| alerts | Immediate action needed (severity=1) |
| critical | Critical conditions (severity=2) |
| debugging | Debugging messages (severity=7) |
| emergencies | System is unusable (severity=0) |
| errors | Error conditions (severity=3) |
| informational | Informational messages (severity=6) |
| notifications | Normal but significant conditions (severity=5) |
| warnings | Warning conditions (severity=4). This is the default setting. |
| on <DEVICE-NAME> | Optional. Executes the command on a specified device |
| <DEVICE-NAME> | Specify the name of the AP, wireless controller, or service platform. |

**service ssm trace pattern <WORD> {on <DEVICE-NAME>**

| ssm trace | Displays the SSM module trace based on parameters passed |
| pattern <WORD> | Configures the pattern to match |
| <WORD> | Specify the pattern to match. |
| on <DEVICE-NAME> | Optional. Displays the SSM module trace on a specified device |
| <DEVICE-NAME> | Specify the name of the AP, wireless controller, or service platform. |

| wireless client beacon-requests | Sends beacon measurement requests to a wireless client |
| <MAC> | Specify the wireless client’s MAC address. |
| mode [active|passive|table] | Specifies the beacon measurement mode. The following modes are available: |
| active | Requests beacon measurements in the active mode |
| passive | Requests beacon measurements in the passive mode |
| table | Requests beacon measurements in the table mode |
| ssid [<SSID>|any] | Specifies if the measurements have to be made for a specified SSID or for any SSID |
| <SSID> | Requests beacon measurement for a specified SSID |
| any | Requests beacon measurement for any SSID |
| on <DEVICE-NAME> | Optional. Executes the command on a specified device |
| <DEVICE-NAME> | Specify the name of the AP, wireless controller, or service platform. |
## channel-report

- **<CHANNEL-LIST>**
  - Configures channel report in the request. The request can include a list of channels or can apply to all channels.
  - **<CHANNEL-LIST>** – Request includes a list of channels. The client has to send beacon measurements only for those channels included in the request
  - **none** – Request applies to all channels

- **on <DEVICE-NAME>**
  - Optional. Sends requests on a specified device
  - **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

### service wireless client quiet-element [start|stop]

<table>
<thead>
<tr>
<th>wireless client quiet-element</th>
<th>Enables the quite-element information in beacons sent to wireless clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>Enables the quite-element information in beacons sent to wireless clients. This is the interval for which all wireless clients are to remain quiet.</td>
</tr>
<tr>
<td>stop</td>
<td>Disables the quite-element information in beacons sent to wireless clients. Once disabled, this information is no longer included in beacons.</td>
</tr>
</tbody>
</table>

### service wireless client trigger-bss-transition

- **mac <MAC>**
  - Specifies the wireless client’s MAC address

- **timeout <0-65535>**
  - Specifies the time remaining, for this client, before BSS transition is initiated. In other words on completion of the specified time period, BSS transition is triggered.
  - **<0-65535>** – Specify a time from 0 - 65535 seconds.

- **url <URL>**
  - Optional. Specifies session termination URL

- **on <DEVICE-OR-DOMAIN-NAME>**
  - Optional. Sends request on a specified device
  - **<DEVICE-OR-DOMAIN-NAME>** – Specify the name of the AP, wireless controller, service platform, or RF Domain.

### service wireless client trigger-wnm

- **mac <MAC>**
  - Specifies the wireless client’s MAC address

- **type [deauth-imminent|subscription-remediation]**
  - Configures the WNM notification type
  - **deauth-imminent** – Sends a de-authentication imminent frame
  - **subscription-remediation** – Sends a subscription remediation needed frame

- **uri <WORD>**
  - Optional. Specifies the unique resource identifier (URI)

### service wireless dump-core-snapshot

- **wireless client dump-core-snapshot**
  - Triggers a debug core dump of the wireless module
### Service Wireless Meshpoint ZL

Triggers a zonal level debug of a specified meshpoint’s modules

**<MESHPOINT-NAME>**
Specify the meshpoint name

**on <DEVICE-NAME>**
Triggers zonal level debug of a specified meshpoint’s modules on a specified device
- **<DEVICE-NAME>** – Specify the name of the device (AP, wireless controller, or service platform)

**<ARGS>**
Optional. Specifies the zonal arguments. These zonal arguments represent the meshpoint modules identified by the zonal and subzonal arguments passed here. Also specify the debug level from 0 - 7. Please see the *Examples* section, at the end of this topic, for more information.

**timeout <1-65535>**
Optional. Specifies a timeout value from 1 - 65535 seconds. When specified, meshpoint logs are debugged for the time specified here.

### Service Wireless QoS Delete-TSpec

Sends a delete TSPEC request to a wireless client

**<MAC>**
Specify the MAC address of the wireless client.

**tid <0-7>**
Deletes the Traffic Identifier (TID)
- **<0-7>** – Select the TID from 0 - 7.

### Service Wireless Trace Pattern

Displays the wireless module trace based on parameters passed

**pattern <WORD>**
Configures the pattern to match
- **<WORD>** – Specify the pattern to match.

**on <DEVICE-NAME>**
Optional. Displays the wireless module trace on a specified device
- **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

### Service Wireless Unsanctioned AP Air-Terminate

Enables unsanctioned access points termination

**<MAC>**
Configures the unsanctioned access points’ BSSID (MAC address)

**on <DOMAIN-NAME>**
Optional. Specifies the RD Domain of the access point
- **<DOMAIN-NAME>** – Specify the name of the RF Domain.

### Service Wireless WIPS Clear-Client-Blacklist

Enables management of WIPS parameters

**all| mac <MAC>**

clear-client-blacklist  
[all|mac <MAC>]  
Removes a specified client or all clients from the blacklist  
• all – Removes all clients from the blacklist  
• mac <MAC> – Removes a specified client form the blacklist  
• <MAC> – Specify the wireless client’s MAC address.

- service wireless wips clear-event-history {on <DEVICE-OR-DOMAIN-NAME>}

wireless wips  Enables WIPS management

clear-event-history  Clears event history

on <DEVICE-OR-DOMAIN-NAME>  Optional. Clears event history on a device or RF Domain  
• <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller,  
  service platform, or RF Domain.

Syntax (Privilege Exec Mode)

NOTE: The "service" command of the Priv Exec Mode is the same as the  
service command in the User Exec Mode. There a few modifications that have  
been documented in this section. For the syntax and parameters of the other  
commands refer to the (User Exec Mode) syntax and (User Exec Mode)  
parameters sections of this chapter.

service

service [block-adopter-config-updates|clear|cli-tables-skin|cluster|copy|

- service clear crash-info \{on \<DEVICE-NAME\>\}

<table>
<thead>
<tr>
<th>clear crash-info</th>
<th>Clears all crash files</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears crash files on a specified device. These crash files are core, panic, and AP dump.</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- service delete sessions \<SESSION-COOKIES\>

<table>
<thead>
<tr>
<th>delete sessions &lt;SESSION-COOKIES&gt;</th>
<th>Deletes session cookies</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;SESSION-COOKIES&gt; – Provide a list of cookies to delete.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>mint</th>
<th>Enables MiNT protocol management (clears LSP database, enables debug logging, enables running silence etc.)</th>
</tr>
</thead>
</table>
| clear [lsp-dp|mlcp] | Clears LSP database and MiNT Link Control Protocol (MLCP) links  
  - lsp-dp – Clears MiNT Label Switched Path (LSP) database  
  - mlcp – Clears MLCP links |
| debug-log [flash-and-syslog|flash-only] | Enables debug message logging  
  - flash-and-syslog – Logs debug messages to the flash and syslog files  
  - flash-only – Logs debug messages to the flash file only |
| expire [lsp|spf] | Forces expiration of LSP and recalculation of Shortest Path First (SPF)  
  - lsp – Forces expiration of LSP  
  - spf – Forces recalculation of SPF |
| flood [csnp|lsp] | Floods control packets  
  - csnp – Floods our Complete Sequence Number Packets (CSNP)  
  - lsp – Floods our LSP |

• **service pm stop {on <DEVICE-NAME>}**

<table>
<thead>
<tr>
<th>pm</th>
<th>Stops the Process Monitor (PM)</th>
</tr>
</thead>
<tbody>
<tr>
<td>stop</td>
<td>Stop the PM from monitoring all daemons</td>
</tr>
</tbody>
</table>
| on <DEVICE-NAME> | Optional. Stops the PM on a specified device  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

• **service pktcap on [bridge|deny|drop|ext-vlan|rim|router|vpn|wireless]  
  {(acl-name <ACL>, count <1-1000000>, direction [any|inbound|outbound], filter, hex,  
  rate <1-100>, snap <1-2048>, tcpdump, verbose, write [file|url|tzsp <IP/TZSP-HOSTNAME>]}**

| pktcap on | Captures data packets crossing at a specified location  
  - on – Defines the packet capture location |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>bridge</td>
<td>Captures packets transiting through the Ethernet bridge</td>

<tr>
<td>ext-vlan</td>
<td>Captures packets forwarded to or from an extended VLAN</td>
</tr>
<tr>
<td>rim</td>
<td>Captures packets at the Radio Interface Module (RIM)</td>
</tr>
<tr>
<td>router</td>
<td>Captures packets transiting through an IP router</td>
</tr>
<tr>
<td>vpn</td>
<td>Captures packets forwarded to or from a VPN link</td>
</tr>
<tr>
<td>wireless</td>
<td>Captures packets forwarded to or from a wireless device</td>
</tr>
<tr>
<td>acl-name &lt;ACL&gt;</td>
<td>Optional. Specify the ACL that matches the acl-name for the 'deny' location</td>
</tr>
<tr>
<td>count &lt;1-1000000&gt;</td>
<td>Optional. Limits the captured packet count. Specify a value from 1 -1000000.</td>
</tr>
</tbody>
</table>
### COMMON COMMANDS

**direction**
- *Optional.* Changes the packet direction with respect to a device. The direction can be set as any, inbound, or outbound.
- **[any|inbound|outbound]**

**filter**
- *Optional.* Filters packets based on the option selected (must be used as a last option)
- **<LINE>|arp|capwap|cdp|dot11|dropreason|dst|ether|failed|host|icmp|icmp6|igmp|ip|ipv6|l2|l3|l4|lldp|mint|net|not|port|priority|radio|rssi|src|stp|tcp|tcp6|udp|udp6|vlan|wlan**
- The filter options are:
  - `<LINE>` – Defines user defined packet capture filter
  - `arp` – Matches ARP packets
  - `capwap` – Matches CAPWAP packets
  - `cdp` – Matches CDP packets
  - `dot11` – Matches 802.11 packets
  - `dropreason` – Matches packet drop reason
  - `dst` – Matches IP destination
  - `ether` – Matches Ethernet packets
  - `failed` – Matches failed 802.11 transmitted frames
  - `host` – Matches host destination
  - `icmp` – Matches ICMP packets
  - `icmp6` – Matches ICMPv6 frames
  - `ip` – Matches IPV4 packets
  - `ipv6` – Matches IPV6 packets
  - `l2` – Matches L2 header
  - `l3` – Matches L3 header
  - `l4` – Matches L4 header
  - `lldp` – Matches LLDP packets
  - `mint` – Matches MiNT packets
  - `net` – Matches IP in subnet
  - `not` – Filters out any packet that matches the filter criteria (For example, if not TCP is used, all tcp packets are filtered out)
  - `port` – Matches TCP or UDP port
  - `priority` – Matches packet priority
  - `radio` – Matches radio
  - `rssi` – Matches Received Signal Strength Indication (RSSI) of received radio signals
  - `src` – Matches IP source
  - `stp` – Matches STP packets
  - `tcp` – Matches TCP packets
  - `tcp6` – Matches TCP over IPv6 packets
  - `udp` – Matches UDP packets
  - `udp6` – Matches UDP over IPv6 packets
  - `vlan` – Matches VLAN
  - `wlan` – Matches WLAN

**hex**
- *Optional.* Provides binary output of the captured packets

**rate <1-100>**
- *Optional.* Specifies the packet capture rate
  - `<1-100>` – Specify a value from 1 - 100 seconds.

**snap <1-2048>**
- *Optional.* Captures the data length
  - `<1-2048>` – Specify a value from 1 - 2048 characters.
### service pktcap on radio

- `<1-1024>` – specify the radio index from 1 - 1024.
- `all` – captures data packets on all radios

#### acl-name <ACL>

Optional. Specify the ACL that matches the ACL name for the 'deny' location

#### count <1-1000000>

Optional. Sets a specified number of packets to capture
- `<1-1000000>` – Specify a value from 1 - 1000000.

#### direction

- `[any|inbound|outbound]` – changes the packet direction with respect to a device. The direction can be set as any, inbound, or outbound.

#### filter <LINE>

Optional. Filters packets based on the option selected (must be used as a last option)
- `<LINE>` – Define a packet capture filter or select any one of the available options.

#### hex

Optional. Provides binary output of the captured packets

#### rate `<1-100>`

Optional. Specifies the packet capture rate
- `<1-100>` – Specify a value from 1 - 100 seconds.

#### snap `<1-2048>`

Optional. Captures the data length
- `<1-2048>` – Specify a value from 1 - 2048 characters.

#### tcpdump

Optional. Decodes the TCP dump

#### verbose

Optional. Provides verbose output
| write | Captures packets to a specified file. Specify the location to capture file:  
  FILE – flash:/path/file  
  usbX:/path/file  
  nvram:startup-config  
  Note: The number of USB ports available varies with type. For example, RFS6000 has one (1) port, NX4500 has four (4) ports.  
  URL – Specify the location URL to capture file. Both IPv4 and IPv6 address formats are supported.  
  tftp://<hostname|IPv4/IPv6>[:port]/path/file  
  ftp://<user>:<passwd>@<hostname|IPv4/IPv6>[:port]/path/file  
  sftp://<user>@<hostname|IPv4/IPv6>[:port]/path/file  
  tzsp – The TZSP host. Specify the TZSP host's IP address or hostname. |
|------------------|----------------------------------------------------------------------------------|
| service pktcap on interface [<INTERFACE>|ge <1-4>|me|port-channel <1-2>|vlan <1-4094>] | Captures data packets at a specified interface  
  on – Specify the capture location. |
| interface [<INTERFACE>|ge <1-4>|me1|port-channel <1-2>|vlan <1-4094>] | Captures packets at a specified interface. The options are:  
  • <INTERFACE> – Specify the interface name.  
  • ge <1-4> – Selects a GigabitEthernet interface index from 1 - 4  
  • me1 – Selects the FastEthernet interface  
  • port-channel <1-2> – Selects a port-channel interface index from 1 - 2  
  • vlan <1-4094> – Selects a VLAN ID from 1 - 4094 |
| acl-name <ACL> | Optional. Specify the ACL that matches the ACL name for the 'deny' location |
| count <1-1000000> | Optional. Sets a specified number of packets to capture  
  • <1-1000000> – Specify a value from 1 - 1000000. |
| direction [any|inbound|outbound] | Optional. Changes the packet direction with respect to a device. The direction can be set as any, inbound, or outbound. |
| filter <LINE> | Optional. Filters packets based on the option selected (must be used as a last option)  
  • <LINE> – Define a packet capture filter or select any one of the available options. |
| hex | Optional. Provides binary output of the captured packets |
| rate <1-100> | Optional. Specifies the packet capture rate  
  • <1-100> – Specify a value from 1 - 100 seconds. |
| snap <1-2048> | Optional. Captures the data length  
  • <1-2048> – Specify a value from 1 - 2048 characters. |
| tcpdump | Optional. Decodes the TCP dump |
| verbose | Optional. Provides verbose output |
service show last-passwd

show Displays running system statistics based on the parameters passed

last-passwd Displays the last password used to enter shell

• service signal [abort <PROCESS-NAME> | kill <PROCESS-NAME>]

signal Sends a signal to a process
  • tech-support – Copies extensive system information useful for troubleshooting

abort Sends an abort signal to a process, and forces it to dump to core
  • <PROCESS-NAME> – Specify the process name.

kill Sends a kill signal to a process, and forces it to terminate without a core
  • <PROCESS-NAME> – Specify the process name.

• service start-shell

start-shell Provides shell access

• service trace <PROCESS-NAME> {summary}

trace Traces a process for system calls and signals

<PROCESS-NAME> Specifies the process name

summary Optional. Generates summary report of the specified process

Syntax (Privilege Exec Mode: NX9000, NX9500, and NX9510)

service

The following service commands are specific to the NX9000, NX9500, and NX9510 series service platforms:

service copy analytics-support [ <FILE> | <URL> ]

Parameters (Privilege Exec Mode: NX9000, NX9500, and NX9510)

• service copy analytics-support [ <FILE> | <URL> ]

copy analytics-support Enables copying of analytics information to a specified. Use one of the following options to specify the file:

  Note: This information is useful to troubleshoot issues by the Technical Support team.
Usage Guidelines
The NX9500 and NX9510 model service platforms (NOC) provide granular and robust analytic reporting for a RFS4000, RFS6000, RFS7000, NX45XX, or NX65XX device managed network. The data analyzed is collected at intervals specified by the administrator.

To enable data analytics, procure and apply a separate hot spare analytics license at the NOC. The license restricts the number of access point streams processed at the NOC or forwarded to partner systems for further processing. The analytics feature can be turned on at select APs by enabling them in configuration. This way the customer can enable analytics on a select set of APs and not the entire system as long as the number of APs on which it is enabled is less than or equal to the total number of AP analytics licenses available at the NOC controller.

In an NOC managed network, the analytics engine parses and processes Smart RF events as they are received. The analytics engine parses the new channel and power information from the Smart RF event, as opposed to retrieving the event from the devices themselves.

Syntax (Global Config Mode)

service

service [set|show cli]

service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100]|virtual-machine-history <10-200> {on <DEVICE-NAME>}

service show cli

Parameters (Global Config Mode)

- service set [command-history <10-300>|upgrade-history <10-100>]
  
- reboot-history <10-100]|virtual-machine-history <10-200> {on <DEVICE-NAME>}

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>set</td>
<td>Sets the size of history files</td>
</tr>
<tr>
<td>command-history &lt;10-300&gt;</td>
<td>Sets the size of the command history file</td>
</tr>
<tr>
<td>upgrade-history &lt;10-100&gt;</td>
<td>Sets the size of the upgrade history file</td>
</tr>
<tr>
<td>reboot-history &lt;10-100&gt;</td>
<td>Sets the size of the reboot history file</td>
</tr>
<tr>
<td>virtual-machine-history &lt;10-200&gt;</td>
<td>Sets the size of the virtual-machine history file</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Sets the size of history files on a specified device</td>
</tr>
</tbody>
</table>

Note: This command is applicable only to the NX45XX, NX65XX, NX9500, and NX9510 series service platforms. Use the no > service > set > virtual-machine-history > {on <DEVICE-NAME>} command to revert the history file size to 100.

Example:

```
set command-history 200
```
service show cli

show cli Displays running system configuration details
  • cli – Displays the CLI tree of the current mode

```

In the preceding example,

- The meshpoint name is `mesh_root`
- The device on which the command is executed is `ROOT1-ap81xx-71174C`
- The vertical `ZONE` column represents meshpoint modules. For example, `3-ND` presents the Neighbor Discovery module.
- The `SUBZONE` 0 to 7 represents the available processes for each of the zonal modules.
- Debugging is disabled for all modules for the mesh-root meshpoint. A value of 0 (Zero) represents debugging disabled.
To enable meshpoint module debugging, specify the module number and the process number separated by a period (.) And then specify the debugging level from 0 - 7.

ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 3.2 7

In the preceding command,
- The meshpoint module number provided is 3 (ND)
- The process number provided is 2 (RX - Received signals from neighbors)
- The debugging level provided is 7 (highest level - warning)

ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C

| SUBZONE | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
---|---|---|---|---|---|---|---|---|
| ZONE | GEN | TX | RX | BEA | TXF |
| 2-LLC | 0 | 0 | 0 | 0 | 0 |
| 3-ND | 0 | 0 | 7(D) | 0 | 0 | 0 |
| 4-ORL | 0 | GEN | TX | RX | HEL | PRO |
| 5-LQ | 0 | 0 | 0 | 0 | 0 |
| 6-PS | 0 | GEN | ROOT | NBR | REC |
| 7-RS | 0 | 0 | 0 | 0 |
| 8-IA | 0 | GEN | SET | GET |
| 11-MGT | 0 | 0 | 0 |
| 13-LSA | GEN | RX | TX | R0 | LMST | LSUP | LKEY | KEY |
| 14-ACS | GEN | SCAN | TRIG |
| 15-EAP | 0 | GEN |
| 16-L2P | 0 |

In the preceding example, level 7 debugging has been enabled only for the ND module’s received signals. Note that debugging for all other modules and processes are still disabled.

To disable debugging for all modules, specify 0 (zero) in the command. For example:

ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 0
To enable debugging for all modules, specify the debugging level number. For example:

```
ROOT1-ap81xx-71174C# service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 5
```

```

5.1.8 show

Common Commands

Displays specified system component settings. There are a number of ways to invoke the show command:

- When invoked without any arguments, it displays information about the current context. If the current context contains instances, the show command (usually) displays a list of these instances.
- When invoked with the display parameter, it displays information about that component.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5650, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```sh
show <PARAMETERS>
```

Parameters

- `show <PARAMETERS>`

The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy’s current settings. The example below shows the configuration details that can be viewed in the Priv Executable mode.

Examples

```sh
rfs7000-37FABE#show ?
adoption Display information related to adoption to wireless controller
bonjour Bonjour Gateway related commands
boot Display boot configuration.
captive-portal Captive portal commands
captive-portal-page-upload Captive portal advanced page upload
cdp Cisco Discovery Protocol
classify-url Query the category of an URL
clock Display system clock
cluster Cluster Protocol
cmp-factory-certs Display the CMP certificate status
commands Show command lists
context Information about current context
critical-resources Critical Resources
crypto Encryption related commands
dev unsigned Debugging functions
dev unsigned Debugging functions
device-upgrade Device Upgrade
dot1x 802.1X
dpi Deep Packet Inspection
environmental-sensor Display Environmental Sensor Module status
event-history Display event history
event-system-policy Display event system policy
ex3500 EX3500 device details
extdev External device (T5, Ex3500..)
file Display filesystem information
file-sync File sync between controller and adoptees
firewall Wireless Firewall
global Global-level information
gre Show gre tunnel info
interface Interface Configuration/Statistics commands
ip Internet Protocol (IP)
ip-access-list IP ACL
```
ipv6                        Internet Protocol version 6 (IPv6)
ipv6-access-list            IPV6 ACL
l2tpv3                      L2TPv3 information
ldap-agent                  LDAP Agent Configuration
licenses                    Show installed licenses and usage
lldp                        Link Layer Discovery Protocol
logging                     Show logging information
mac-access-list             MAC Access list
mac-address-table           Display MAC address table
mac-auth                    MAC authentication
mac-auth-clients            MAC authenticated clients
mint                        MiNT protocol
ntp                         Network time protocol
password-encryption         Password encryption
pppoe-client                PPP Over Ethernet client
privilege                   Show current privilege level
radius                      RADIUS statistics commands
reload                      Scheduled reload information
remote-debug                Show details of remote debug sessions
rf-domain-manager           Show RF Domain Manager selection details
role                        Role based firewall
route-maps                  Display Route Map Statistics
rtls                        RTLS Statistics
running-config              Current operating configuration
session-changes             Configuration changes made in this session
session-config              This session configuration
sessions                    Display CLI sessions
site-config-diff            Difference between site configuration on the NOC and actual site configuration
smart-rf                    Smart-RF Management Commands
spanning-tree               Display spanning tree information
startup-config              Startup configuration
t5                          T5 details
terminal                    Display terminal configuration parameters
timezone                    The timezone
traffic-shape               Display traffic shaping
upgrade-status              Display last image upgrade status
version                     Display software & hardware version
vrrp                        VRRP protocol
web-filter                  Web filter
what                        Perform global search
wireless                    Wireless commands
wwan                        Display wireless WAN Status

NOTE: For more information on the show command, see Chapter 6, SHOW COMMANDS
5.1.9 write

Common Commands

Writes the system running configuration to memory or terminal

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

write [memory|terminal]

Parameters

- write [memory|terminal]

<table>
<thead>
<tr>
<th>memory</th>
<th>Writes to the non-volatile (NV) memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>terminal</td>
<td>Writes to the terminal</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE>write memory
[OK]
rfs7000-37FABE>
Show commands display configuration settings or statistical information. Use this command to view the current running configuration as well as the start-up configuration. The show command also displays the current context’s configuration.

This chapter describes the ‘show’ CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes. Commands entered in either USER EXEC mode or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.

This chapter also describes the ‘show’ commands in the ‘GLOBAL CONFIG’ mode. The commands can be entered in all three modes, except commands like file, IP access list statistics, MAC access list statistics, and upgrade statistics, which cannot be entered in the USER EXEC mode.

---

**NOTE:** The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
## 6.1 show commands

### SHOW COMMANDS

The following table summarizes show commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>show</td>
<td>Displays settings for the specified system component</td>
<td>page 6-6</td>
</tr>
<tr>
<td>adoption</td>
<td>Displays information related to adoption</td>
<td>page 6-12</td>
</tr>
<tr>
<td>boot</td>
<td>Displays a device boot configuration</td>
<td>page 6-16</td>
</tr>
<tr>
<td>bonjour</td>
<td>Displays the configured Bonjour services available on local and remote sites</td>
<td>page 6-17</td>
</tr>
<tr>
<td>captive-portal</td>
<td>Displays WLAN hotspot functions</td>
<td>page 6-18</td>
</tr>
<tr>
<td>captive-portal-page-upload</td>
<td>Displays captive portal page related information</td>
<td>page 6-20</td>
</tr>
<tr>
<td>cdp</td>
<td>Displays a Cisco Discovery Protocol (CDP) neighbor table</td>
<td>page 6-21</td>
</tr>
<tr>
<td>classify-url</td>
<td>Queries a specified global data center or a pre-configured classification server for the category of a specified URL.</td>
<td>page 6-23</td>
</tr>
<tr>
<td>clock</td>
<td>Displays the software system clock</td>
<td>page 6-24</td>
</tr>
<tr>
<td>cluster</td>
<td>Displays cluster commands</td>
<td>page 6-25</td>
</tr>
<tr>
<td>cmp-factory-certs</td>
<td>Displays factory installed CMP certificates</td>
<td>page 6-26</td>
</tr>
<tr>
<td>commands</td>
<td>Displays command list</td>
<td>page 6-27</td>
</tr>
<tr>
<td>context</td>
<td>Displays information about the current context</td>
<td>page 6-28</td>
</tr>
<tr>
<td>critical-resources</td>
<td>Displays critical resource information</td>
<td>page 6-29</td>
</tr>
<tr>
<td>crypto</td>
<td>Displays encryption mode information</td>
<td>page 6-30</td>
</tr>
<tr>
<td>database</td>
<td>Displays database-related statistics and status</td>
<td>page 6-33</td>
</tr>
<tr>
<td>device-upgrade</td>
<td>Displays device firmware upgradation information for devices adopted by a wireless controller or access point</td>
<td>page 6-34</td>
</tr>
<tr>
<td>dot1x</td>
<td>Displays dot1x information on interfaces</td>
<td>page 6-37</td>
</tr>
<tr>
<td>dpi</td>
<td>Displays statistics for all configured and canned applications</td>
<td>page 6-39</td>
</tr>
<tr>
<td>environmental-sensor</td>
<td>Displays environmental sensor’s historical data (applicable only to AP8132)</td>
<td>page 6-42</td>
</tr>
<tr>
<td>event-history</td>
<td>Displays event history</td>
<td>page 6-45</td>
</tr>
<tr>
<td>event-system-policy</td>
<td>Displays event system policy configuration information</td>
<td>page 6-46</td>
</tr>
<tr>
<td>ex3500</td>

</table>
6.1.1 show

show commands

The show command displays following information:

- A device’s current configuration
- A device’s start-up configuration
- A device’s current context configuration, such as profiles and policies

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show <PARAMETERS>

Parameters

- show <PARAMETERS>

The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy’s current settings. The examples below show the configuration parameters that can be viewed in the User Executable, Priv Executable, and Global Configurable modes.

Examples

The following examples list the show commands in the User Exec, Priv Exec, and Global Config modes:

GLOBAL CONFIG Mode

<DEVICE>(config)#show ?
  adoption Display information related to adoption to
  bonjour wireless controller
  boot Bonjour Gateway related commands
  captive-portal Display boot configuration.
  captive-portal-page-upload Captive portal commands
  cdp Captive portal advanced page upload
  classify-url Cisco Discovery Protocol
  clock Query the category of an URL
  clock Display system clock
  cluster Cluster Protocol
  cmp-factory-certs Display the CMP certificate status
  commands Show command lists
  context Information about current context
  critical-resources Critical Resources
  crypto Encryption related commands
  database Database
  debug Debugging functions
  debugging Debugging functions
  device-upgrade Device Upgrade

nx9500-6C874D(config)#
### 6.1.2 adoption

#### show commands

Displays adoption related information, and is common to the User Exec, Priv Exec, and Global Config modes.

In an hierarchically managed (HM) network devices are deployed in two levels. The first level consists of the Network Operations Center (NOC) controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (access points and second-level controllers) are referred to as the adoptee. The devices adopting the adoptee are the ‘adopters’.

Use this command to confirm if a device is an adoptee or an adopter. This command also allows you to determine the devices adopted by an adopter device.

**NOTE:** A NOC controller’s capacity is equal to or higher than a site controller’s capacity. The following devices can be deployed at NOC and sites:

- NOC controller – RFS6000, RFS7000, NX65XX, NX9000, NX9500, NX9510, or NX9600.
- Site controller – NX45XX, NX65XX, RFS7000, RFS6000, or RFS4000.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`show adoption [config-errors|controllers|history|info|log|offline|pending|status|timeline]`

`show adoption offline`

`show adoption config-errors <DEVICE-NAME>`

`show adoption log [adoptee|adopter {<MAC>}] {on <DEVICE-NAME>}`

`show adoption [controllers|history|info|pending|status|timeline] {on <DEVICE-NAME>}`

**Parameters**

- show adoption offline

| adoption | Displays adoption related information. It also displays configuration errors. |
| offline | Displays non-adopted status of the logged device and its adopted access points |

- show adoption config-errors <DEVICE-NAME>

| adoption | Displays adoption related information. It also displays configuration errors. |
| config-errors <DEVICE-NAME> | Displays configuration errors for a specified adopted device
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |

- show adoption log [adoptee|adopter {<MAC>}] {on <DEVICE-NAME>}

| adoption | Displays adoption related information. It also displays configuration errors. |
show adoption history [history|controllers|info|pending|status|timeline] {on <DEVICE-NAME>}

- **adoption**
  Displays adoption related information. It also displays configuration errors.

- **controllers**
  Displays information about adopted controllers. This is applicable in a Hierarchically managed network, where site controllers are adopted by the NOC controllers.

- **history**
  Displays adoption history of the logged device and its adopted access points

- **info**
  Displays adopted device information

- **pending**
  Displays information for devices pending adoption

- **status**
  Displays adoption status for logged devices

- **timeline**
  Displays the logged device’s adoption timeline. It also shows the adoption time for logged device’s adopted APs. To view the adoption timeline of a specific device, use the on <device-name> option to specify the device.

- **on <DEVICE-NAME>**
  The following keywords are common to all of the above parameters:
  - on <DEVICE-NAME> – Optional. Displays a device’s adoption information, based on the parameter passed.
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- **log [adoptee|adopter {MAC}] {on <DEVICE-NAME>}
  Displays adoption logs, for the specified device. If no device name is specified, the system displays logs for the logged device.
  
  - adoptee – Displays adoption logs for adoptee devices (APs, wireless controllers, and service platforms). To view logs for a specified adoptee, specify the device’s name. If no device name is specified, the system displays logs for the logged device. If the logged device is not an adoptee, the system states that the device is a controller.
    For example, 2013-01-19 22:00:13:MLCP_TAG_CLUST Master not present and this device is a controller. Ignoring
  
  - on <DEVICE-NAME> – Optional. Displays adoptee status and details for the device identified by the <DEVICE-NAME> keyword
    - <DEVICE-NAME> – Specify the device’s name.
  
  - adopter – Displays adoption logs for adopter devices (APs, wireless controllers, and service platforms). To view logs for a specified adopter, specify the device’s name. If no device name is specified, the system displays logs for the logged device.
    - <MAC> – Optional. Filters adopters by the adopted device’s MAC address. Specify the adopted device’s MAC address. The system displays logs for the device that has adopted the device identified by the <MAC> keyword.
    - on <DEVICE-NAME> – Optional. Displays adopter status and details for the device identified by the <DEVICE-NAME> keyword.
    - <DEVICE-NAME> – Specify the adopter device’s name.

- **Note:** A wireless controller or service platform cannot be configured as an adoptee and an adopter simultaneously. In other words, an adopted wireless controller or service platform cannot be configured to adopt another device and vice versa.
Usage Guidelines

In a device's Global Config mode, use the `customize > show-adoption-status` command to customize the `show > adoption > status` command output. The following columns can be added to the output:

```
adopted-by     Device name to which the AP is adopted
ap-name        Host-name of the adopted AP
cdp-lldp-info  Cdp/lldp info of the Adopted AP
config-status  Configuration status of the adopted AP
last-adoption  Last known adoption time
msgs           Messages status
uptime         Uptime of the adopted AP
version        Current version of the adopted AP
```

For more information on the `customize` command, see `customize`.

Examples

The following example displays details of the:

- logged device (`rfs6000-81742D`), and
- devices adopted (`ap8132-711728`) by the logged device.

```

6.1.3 boot

*show commands*

Displays a device’s boot configuration. Use this command to view the primary and secondary image details, such as Build Date, Install Date, and Version. This command also displays the current boot and next boot information.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show boot {on <DEVICE-NAME>}
```

**Parameters**

- **on** `<DEVICE-NAME>`

<table>
<thead>
<tr>
<th>Command</th>

</tbody>
</table>

rfs7000-37FABE#
### 6.1.5 captive-portal

#### show captive-portal

Displays WLAN captive portal information. Use this command to view a configured captive portal's client information.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
show captive-portal sessions {include-ipv6|on <DEVICE-OR-DOMAIN-NAME>|statistics}
```

#### Parameters

- **captive-portal sessions**
  - Displays active captive portal client session details
- **include-ipv6**
  - Optional. Includes IPv6 address (if known) of captive portal clients
  - **Note:** By default the system only displays IPv4 addresses. The include-ipv6 parameter includes IPv6 address (if known) of each client.
- **statistics**
  - Optional. Displays statistical information regarding client sessions
- **on <DEVICE-OR-DOMAIN-NAME>**
  - Optional. Displays active captive portal session details on a specified device or RF Domain.
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.
- **filter**
  - This parameter is recursive and can be used with any of the above parameters to define additional filters.
  - Optional. Defines additional filters. Use one of the following options: captive-portal, ip, ipv6, state, vlan, or wlan.
- **captive-portal [<CAPTIVE-PORTAL>|not <CAPTIVE-PORTAL>]**
  - Optional. Displays captive portal client and client session information, based on the captive portal name passed
  - `<CAPTIVE-PORTAL>` – Specify the captive portal name. Displays client details for the specified captive portal.
  - not `<CAPTIVE-PORTAL>` – Inverts the match selection. Displays client details for all captive portals other than the specified captive portal.
- **ip [<IPv4>|not <IPv4>]**
  - Optional. Displays captive portal client/client sessions information, based on the IPv4 address passed
  - `<IPv4>` – Specify the client's IPv4 address. Displays information of the client identified by the `<IPv4>` parameter
  - not `<IPv4>` – Inverts the match selection. Displays client details for all clients other than the one identified by the `<IPv4>` parameter.
### Examples

```
rfs4000-229D58#show captive-portal sessions
=======================================================================================
CLIENT               IPv4     CAPTIVE-PORTAL   WLAN/PORT    VLAN  STATE SESSION  TIME
---------------------------------------------------------------------------------------
00-26-55-F4-5F-79  192.168.3.99 cappo     rfs4000-229D58:ge2    400     Success     23:58:35
=======================================================================================
Total number of captive portal sessions displayed: 1
rfs4000-229D58#
```
### 6.1.6 captive-portal-page-upload

**show commands**

Displays captive portal page information, such as upload history, upload status, and page file download status

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show captive-portal-page-upload [history|load-image-status|status]
show captive-portal-page-upload load-image-status
show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}
show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>|<RF-DOMAIN-MANAGER>]} 
```

**Parameters**

- `show captive-portal-page-upload load-image-status`
- `show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}
- `show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>|<RF-DOMAIN-MANAGER>]}`  

**Examples**

```
rfs7000-37FABE>show captive-portal-page-upload status
Number of APs currently being uploaded : 0
Number of APs waiting in queue to be uploaded : 0

--------------------------------------------------------------------------------
AP STATE UPLOAD TIME PROGRESS RETRIES LAST UPLOAD ERROR    UPLOADED BY
--------------------------------------------------------------------------------
--------------------------------------------------------------------------------
rfs7000-37FABE>
```
```
rfs7000-37FABE>show captive-portal-page-upload history
---------------------------------------------------------------------------------------
AP RESULT TIME RETRIES Uploaded-By LAST-UPLOAD-ERROR
---------------------------------------------------------------------------------------
No upload history is present
rfs7000-37FABE>
```
```
rfs7000-37FABE>show captive-portal-page-upload load-image-status
No captive portal advanced page file download is in progress
rfs7000-37FABE>
```
### 6.1.7 cdp

- **show commands**

  Displays the *Cisco Discovery Protocol* (CDP) neighbor table

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

  **Syntax**

  ```
  show cdp [neighbors/report] {detail {on <DEVICE-NAME>}}|on <DEVICE-NAME>
  ```

  **Parameters**

  - `show cdp [neighbors/report] {detail {on <DEVICE-NAME>}}|on <DEVICE-NAME>`

  - **cdp [neighbors/report]** Displays CDP neighbors table or aggregated CDP neighbors table
  - **detail {on <DEVICE-NAME>**} Optional. Displays detailed CDP neighbors table or aggregated CDP neighbors table
  - **on <DEVICE-NAME>** Optional. Displays table details on a specified device

  - `<DEVICE-NAME>` Specify the name of the AP, wireless controller, or service platform.

  **Examples**

  The following example shows detailed CDP neighbors table:

  ```
  nx4500-5CFA2B#show cdp neighbors detail
  -------------------------
  Device ID: rfs4000-880DA7
  Entry address(es):
    IP Address: 192.168.13.8
    IP Address: 192.168.0.1
    IP Address: 1.2.3.4
  Platform: RFS-4011-11110-US, Capabilities: Router Switch
  Interface: up1, Port ID (outgoing port): ge1
  Hold Time: 154 sec
  -------------------------
  Device ID: ap5142-587258
  Entry address(es):
  IP Address: 192.168.13.24
  Platform: AP-5142-66040-WR, Capabilities: Router
  Interface: up1, Port ID (outgoing port): ge1
  Hold Time: 178 sec
  --More--
  nx4500-5CFA2B#
  ```
The following example shows a non-detailed CDP neighbors table:

```
nx4500-5CFA2B#show cdp neighbors
+-------------------------------+-----------------+-------------------+----------+-------+
| Device ID                     | Platform        | Local Interface   | Port ID  | Duplex|

6.1.8 classify-url

Displays a specified URL's category. Use this command to query the category of a specific URL. The query is sent to a configured classification server. This option is available only if a valid URL filter license is available.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]
```

**Parameters**

- `show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]`

<table>
<thead>
<tr>
<th>classify-url</th>
<th>Queries the category of a specified URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;URL-TO-QUERY&gt;</td>
<td>Specify the URL to query. The query is sent to the configured classification server.</td>
</tr>
<tr>
<td>datacenter</td>
<td>The query is sent to a global classification datacenter</td>
</tr>
<tr>
<td>&lt;URL-TO-QUERY&gt;</td>
<td>• &lt;URL-TO-QUERY&gt; – Specify the URL to query.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx4500-5CFA2B# show classify-url www.google.com
Categories: search-engines-portals,
Custom Categories:
nx4500-5CFA2B#
```

```
nx4500-5CFA2B# show classify-url www.ndtv.com
Categories: news,
Custom Categories: list1,
nx4500-5CFA2B#
```
### 6.1.9 clock

*show commands*

Displays a selected system’s clock

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show clock {on <DEVICE-NAME>}
```

**Parameters**

- `show clock {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clock</td>
<td>Displays a system’s clock</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays system clock on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config)#show clock
2015-06-05 05:48:46 UTC
rfs7000-37FABE(config)#
```
6.1.10 cluster

> show commands

Displays cluster information (cluster configuration parameters, members, status etc.)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show cluster [configuration|members|status]
show cluster [configuration|members {detail}|status]
```

**Parameters**

- `show cluster [configuration|members {detail}|status]`

<table>
<thead>
<tr>
<th>cluster</th>
<th>Displays cluster information</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Displays cluster configuration parameters</td>
</tr>
<tr>
<td>members {detail}</td>
<td>Displays cluster members configured on the logged device</td>
</tr>
<tr>
<td>status</td>
<td>Displays cluster status</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config)#show cluster configuration

    Name                               : TechPubsLan
    Configured Mode                    : Active
    Master Priority                    : 128
    Force configured state             : Disabled
    Force configured state delay       : 5 minutes
    Handle STP                         : Disabled
    Radius Counter DB Sync Time        : 5 minutes
```

```
rfs7000-37FABE(config)#show cluster members detail

<table>
<thead>
<tr>
<th>ID</th>
<th>MAC</th>
<th>MODE</th>
<th>AP COUNT</th>
<th>AAP COUNT</th>
<th>AP LICENSE</th>
<th>AAP LICENSE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>19.6D.CD.4B</td>
<td>B4-C7-99-6D-CD-4B</td>

<td>0</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>5.8.1.0-034B</td>
</tr>
</tbody>
</table>
```

```
rfs7000-37FABE(config)#show cluster status

    Cluster Runtime Information
    Protocol version    : 1
    Cluster operational state : active
    AP license          : 0
    AAP license         : 0
    AP count            : 0
    AAP count           : 0
    Max AP adoption capacity : 1024
    Number of connected member(s) : 0
```

rfs7000-37FABE(config)#
6.1.11 **cmp-factory-certs**

Displays factory installed CMP certificates

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show cmp-factory-certs {all}
```

**Parameters**

- `show cmp-factory-certs {all}`

**Examples**

```
nx9500-6C8809>show cmp-factory-certs
No CMP factory certificate exist
nx9500-6C8809>
```
### 6.1.12 commands

**show commands**

Displays commands available for the current mode

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`show commands`

**Parameters**

None

**Examples**

```bash
rfs4000-229D58(config)#show commands
help
help search WORD (|detailed|only-show|skip-show|skip-no)
show commands
show adoption log adoptee(|(on DEVICE-NAME))
show adoption log adopter (|mac AA-BB-CC-DD-EE-FF)(|(on DEVICE-NAME))
show adoption info (|(on DEVICE-NAME))
show adoption status (|(on DEVICE-NAME))
show adoption config-errors DEVICE-NAME
show adoption offline
show adoption pending (|(on DEVICE-NAME))
show adoption history (|(on DEVICE-NAME))
show debugging ([|on DEVICE-OR-DOMAIN-NAME])
show debugging cfdg
show debugging fib(|(on DEVICE-NAME))
show debugging adoption ([|on DEVICE-OR-DOMAIN-NAME])
show debugging wireless ([|on DEVICE-OR-DOMAIN-NAME])
show debugging snmp (|(on DEVICE-NAME))
show debugging ssn (|(on DEVICE-NAME))
show debugging voice (|(on DEVICE-OR-DOMAIN-NAME))

```

--More--

```bash
nx4500-5CFA2B(config)#
```
6.1.13 context

- show commands
  Displays the current context details

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
show context {include-factory|session-config {include-factory}}

Parameters
- show context {include-factory|session-config {include-factory}}

<table>
<thead>
<tr>
<th>include-factory</th>
<th>Optional. Includes factory defaults</th>
</tr>
</thead>
<tbody>
<tr>
<td>session-config</td>
<td>Optional. Displays running system information in the current context</td>
</tr>
<tr>
<td>{include-factory}</td>
<td>• include-factory – Optional. Includes factory defaults</td>
</tr>
</tbody>
</table>

Examples
rfs4000-229D58(config)#show context
!

rfs4000-229D58(config)#
### 6.1.14 critical-resources

*show commands*

Displays critical resource information. Critical resources are resources vital to the network.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```bash
show critical-resources {on <DEVICE-NAME>}
```

**Parameters**

- `show critical-resources {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>critical-resources</th>
<th>Displays critical resources information</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays critical resource information on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```bash
rfs4000-229D58(config)#show critical-resources
-------------------------------------------------------------------------
CRITICAL RESOURCE IP        VLAN          PING-MODE            STATE
-------------------------------------------------------------------------
172.168.1.103                1             arp-icmp             up
-------------------------------------------------------------------------

rfs4000-229D58(config)#
```
6.1.15 crypto

> show commands

Displays encryption mode information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show crypto [cmp|ike|ipsec|key|pki]
```

```
show crypto cmp request status
```

```
show crypto ike sa {detail|on|peer <IP>} {on <DEVICE-NAME>}
```

```
show crypto ike sa {version [1|2]} {peer <IP>} {on <DEVICE-NAME>}
```

```
show crypto ipsec sa {detail|on|peer}
```

```
show crypto ipsec sa {detail} {on <DEVICE-NAME>}
```

```
show crypto key rsa {on|public-key-detail}
```

```
show crypto key rsa {public-key-detail} {on <DEVICE-NAME>}
```

```
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all|on}
```

```
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all} {on <DEVICE-NAME>}
```

Parameters

- **show crypto cmp request status**

  Displays current status of in-progress certificate management protocol (CMP) requests

  **Note:** For more information, see Chapter 29, CRYPTO-CMP-POLICY.

- **show crypto ike sa {detail|on|peer <IP>} {on <DEVICE-NAME>}

  Displays Internet Key Exchange (IKE) security association (SA) statistics

  **peer <IP>**

  Optional. Displays IKE SA statistics for a specified peer

  - <IP> – Specify the peer’s IP address in the A.B.C.D format

  **on <DEVICE-NAME>**

  Optional. Displays IKE SA statistics on a specified device

  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- **show crypto ike sa {version [1|2]} {peer <IP>} {on <DEVICE-NAME>}

  Displays IKE SA details

  **version [1|2]**

  Optional. Displays IKE SA version statistics

  - 1 – Displays IKEv1 statistics
  - 2 – Displays IKEv2 statistics
<table>

### 6.1.16 database

**show commands**

Displays database-related statistics and status

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510

**Syntax**

`show database [statistics|status] {on <DEVICE-NAME>}`

**Parameters**

- `show database [statistics|status] {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>database</th>
<th>Displays database-related statistics and status</th>
</tr>
</thead>
<tbody>
<tr>
<td>statistics</td>
<td>Displays database-related statistics, such as name of the database (NSight or captive portal), data size, storage size, free disk space available etc.</td>
</tr>
<tr>
<td>status</td>
<td>Displays database status, such as online time.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays database-related information on a specified device</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9510-6C8A5C# show database status
--------------------------------------------------------------------------------
MEMBER     STATE                  ONLINE TIME
--------------------------------------------------------------------------------
localhost (self) PRIMARY               1 hours 31 min 54 sec
--------------------------------------------------------------------------------

6.1.17 device-upgrade

show commands

Displays device firmware upgradation information for devices adopted by a wireless controller or access point

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show device-upgrade [history|load-image-status|status|versions]
show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status|
versions {on <DEVICE-OR-DOMAIN-NAME>}
show device-upgrade status {on {[<DOMAIN-NAME>]|rf-domain-manager]}
summary {on <DOMAIN-NAME>}}
```

Parameters

- `show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status|versions {on <DEVICE-OR-DOMAIN-NAME>}]`
- `show device-upgrade status {on {[<DOMAIN-NAME>]|rf-domain-manager]}
summary {on <DOMAIN-NAME>}}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>device-upgrade</code></td>
<td>Displays device upgrade information based on the parameters passed</td>
</tr>
<tr>
<td><code>history {on &lt;DOMAIN-NAME&gt;}</code></td>
<td>Displays device upgrade history</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DOMAIN-NAME&gt; – Optional. Displays upgrade history for all devices within a specified RF Domain. Specify the RF Domain name.</td>
</tr>
<tr>
<td><code>load-image-status</code></td>
<td>Displays firmware image loading status. The output displays the &lt;DEVICE&gt; image loading status in percentage.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td><code>#show device-upgrade load-image-status</code></td>
</tr>
<tr>
<td></td>
<td>Download of ap81xx firmware file is 47 percent complete</td>
</tr>
<tr>
<td><code>versions {on &lt;DEVICE-OR-DOMAIN-NAME&gt;}</code></td>
<td>Displays firmware image versions</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; – Optional. Displays firmware image versions loaded on specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>
| `show device-upgrade status {on {[<DOMAIN-NAME>]|rf-domain-manager]}
summary {on <DOMAIN-NAME>}}` | Optional. Displays in progress upgrade status of all devices within a specified RF Domain, or all devices upgraded by the RF Domain manager. Use this option to view upgrade status of multiple devices. |
|                               | • <DOMAIN-NAME> – Specify the RF Domain name.                                                         |
|                               | • rf-domain-manager – Select to view devices upgraded by the RF Domain manager.                       |

```
**SHOW COMMANDS 6-35**

<table>
<thead>
<tr>
<th>summary</th>
<th>Displays a summary of in-progress upgrade processes</th>
</tr>
</thead>
</table>
| {on <DOMAIN-NAME>} | • on <DOMAIN-NAME> – Optional. Displays in-progress upgrade processes within a specified RF Domain  
• <DOMAIN-NAME> – Specify the RF Domain name. |

rfs7000-37FABE#
### 6.1.18 dot1x

> **show commands**

Displays dot1x information on interfaces

Dot1x (or 802.1x) is an IEEE standard for network authentication. Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

Supported in the following platforms:

- **Access Points** — AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7532, AP7562, AP81XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524

**NOTE:** Dot.1x supplicant configuration is supported on the following platforms:

- **Access Points** — AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX6524

**NOTE:** Dot.1x authenticator configuration is supported on the following platforms:

- **Access Points** — ES6510, AP6511, AP6522, AP6532, AP6562, AP71XX, AP81XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524

#### Syntax

```
show dot1x {all | interface | on}
show dot1x {all {on <DEVICE-NAME>} | on <DEVICE-NAME>}
show dot1x {interface {<INTERFACE-NAME>|ge <1-4}|port-channel <1-2>} {on <DEVICE-NAME>}
```

#### Parameters

- **show dot1x {all | interface | on}**
  - Optional. Displays dot1x information for all interfaces
  - **<DEVICE-NAME>** — Specify the name of the AP, wireless controller, or service platform.

- **show dot1x {all {on <DEVICE-NAME>} | on <DEVICE-NAME>}**
  - Optional. Displays dot1x information for all interfaces on a specified device
  - **<DEVICE-NAME>** — Specify the name of the AP, wireless controller, or service platform.

- **show dot1x {interface {<INTERFACE-NAME>|ge <1-4}|port-channel <1-2>} {on <DEVICE-NAME>}}**
  - Optional. Displays dot1x information for interfaces on a specified device
  - **<DEVICE-NAME>** — Specify the name of the AP, wireless controller, or service platform.

- **show dot1x {interface {<INTERFACE-NAME>|ge <1-4}|port-channel <1-2>} {on <DEVICE-NAME>}}**
  - Optional. Displays dot1x information for a specified interface or interface type

- **<INTERFACE-NAME>**
  - Displays dot1x information for the layer 2 (Ethernet port) interface specified by the `<INTERFACE-NAME>` parameter
ge <1-4> | Displays `dot1x` for a specified GigabitEthernet interface
| • <1-4> – Select the interface index from 1 - 4.

| port-channel <1-2> | Displays `dot1x` for a specified port channel interface
| • <1-2> – Select the interface index from 1 - 2.

| on <DEVICE-NAME> | The following keywords are common to all of the above parameters:
| • on <DEVICE-NAME> – Optional. Displays `dot1x` interface information on a specified device
| • <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

**Examples**

```
rfs7000-37FABE(config)#show dot1x all
SysAuthControl is disabled
Guest-Vlan is disabled
AAA-Policy is none

Dot1x info for interface GE1
-----------------------------------
Supplicant MAC N/A
Auth SM State = FORCE AUTHORIZED
Bend SM State = REQUEST
Port Status = AUTHORIZED
Host Mode = SINGLE
Auth Vlan = None
Guest Vlan = None

Dot1x info for interface GE2
-----------------------------------
Supplicant MAC N/A
Auth SM State = FORCE AUTHORIZED
Bend SM State = REQUEST
Port Status = AUTHORIZED
Host Mode = SINGLE
Auth Vlan = None
Guest Vlan = None
--More--
rfs7000-37FABE(config)#
```

```
rfs7000-37FABE(config)#show dot1x interface ge 3
Dot1x info for interface GE3
-----------------------------------
Supplicant MAC N/A
Auth SM State = FORCE AUTHORIZED
Bend SM State = REQUEST
Port Status = AUTHORIZED
Host Mode = SINGLE
Auth Vlan = None
Guest Vlan = None

rfs7000-37FABE(config)#
```
6.1.19 dpi

Displays **Deep Packet Inspection (DPI)** statistics for all configured and canned applications. DPI is an advanced packet filtering technique functioning at the application layer. Use DPI to find, identify, classify, reroute or block packets containing specific data or codes that other packet filtering techniques (examining only packet headers) cannot detect.

RF Domain member devices inspect every byte of each application header packet allowed to pass through the WING managed network. When an application is recognized and classified by the WING application recognition engine, administrator defined actions can be applied to that specific application.

**NOTE:** The `show > dpi` command returns results only if executed on a device that supports DPI and has DPI logging enabled. DPI logging can be enabled either on the device or on the profile applied to the device. For more information, see `dpi`.

Supported in the following platforms:
- Access Points — AP7522, AP7532, AP7562
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
show dpi [app|app-category|application|per-category]
show dpi app wireless-clients stats <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
show dpi [app|app-category] stats [<APPLICATION/APP-CATEGORY-NAME>|all] {on <DEVICE-OR-DOMAIN-NAME>}
show dpi application brief
show dpi per-category stats <APP-CATEGORIES> [bytes-in|bytes-out|total-bytes] {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

- `show dpi app wireless-clients stats <MAC> {<DEVICE-OR-DOMAIN-NAME>}`
  - Displays application-related statistics for all or a specified wireless clients
  - `<MAC>` – Displays statistics for a specified wireless client. Specify the client’s MAC address.

- `on <DEVICE-OR-DOMAIN-NAME>`
  - Optional. Displays statistical data on a specified device or RF Domain
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the access point, wireless controller, service platform, or RF Domain.

- `show dpi [app|app-category] stats [<APPLICATION/APP-CATEGORY-NAME>|all] {on <DEVICE-OR-DOMAIN-NAME>}`
  - Displays statistics for a application or application category
  - `<app>` – Displays statistics for a specified application or all applications
  - `<app-category>` – Displays statistics for a specified application category or all categories.

**Note:** The applications are the RF Domain member allowed applications whose data (bytes) are passing through the WING managed network. And, the application categories are existing WING or user defined application groups (video, streaming, mobile, audio etc.) that assist administrators to permit or deny forwarding of application data.
| **<APPLICATION/APP-CATEGORY-NAME>|all>** | This parameter is common to the ‘app’ and ‘app-category’ keywords.  
• `<APPLICATION/APP-CATEGORY-NAME>` – Displays statistics for a specified application or application category, depending on the option selected in the previous step. Specify the application name or application category name.  
• all – Displays statistics for all application or application category, depending on the option selected in the previous step |
| **on <DEVICE-OR-DOMAIN-NAME>** | Optional. Displays statistical data on a specified device or RF Domain  
• `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the access point, wireless controller, service platform, or RF Domain. |

- **show dpi application brief**

| dpi application brief | Displays a brief summary of applications their status and configuration |

- **show dpi per-category stats <APP-CATEGORIES> [bytes-in|bytes-out|total-bytes] \{on <DEVICE-OR-DOMAIN-NAME>\}**

| dpi per-category stats | Displays statistics for the top ten applications based on the application category and the Sort ID specified. The Sort ID options are: bytes-in, bytes-out or total-bytes. |
| <APP-CATEGORIES> | Specify the application category name. The system displays statistics for the top ten applications in this category. |
| [bytes-in|bytes-out|total-bytes] | Filters and displays statistical data (for the top ten RF Domain member applications in the category specified in the previous step) based on the Sort ID selected.  
• bytes-in – Displays total data bytes uploaded through the RF Domain member WiNG managed network. If this application data is not aligned with application utilization expectations, consider allowing or denying additional applications and categories or adjusting their precedence (priority).  
• bytes-out – Displays total data bytes downloaded through the RF Domain member WiNG managed network. If this application data is not aligned with application utilization expectations, consider allowing or denying additional applications and categories or adjusting their precedence (priority).  
• total-bytes – Displays total data bytes (uploaded and downloaded) through the RF Domain member WiNG managed network. These are only the administrator allowed applications approved for proliferation within the RF Domain member device. |
| **on <DEVICE-OR-DOMAIN-NAME>** | Optional. Displays statistical data on a specified device or RF Domain  
• `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the access point, wireless controller, service platform, or RF Domain. |

6.1.20 environmental-sensor

Displays environmental sensor’s recorded data. The environmental sensor has to be enabled and configured in order to collect data related to humidity, light, motion, and temperature.

For more information on enabling and configuring environmental sensor settings, see environmental-sensor.

**NOTE:** The environmental sensor is supported only on an AP8132. When executed on any controller (other than an AP8132), the `show > environmental-sensor > <parameters>` command displays environmental-sensor details for adopted AP8132s (if any).

Supported in the following platforms:
- Access Points — AP8132

**Syntax**

```plaintext
show environmental-sensor [history|humidity|light|motion|summary|temperature|version]
show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}
show environmental-sensor [humidity|light|motion|summary|temperature|version]
```

**Parameters**

- `show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}`

| environmental-sensor history | Displays environmental sensor history once in every hour, 20 minutes, or 24 hours.  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1-hour</td>
<td>Optional. Displays environmental sensor history once in every 1 (one) hour</td>
</tr>
<tr>
<td>20-minute</td>
<td>Optional. Displays environmental sensor history once in every 20 minutes</td>
</tr>
<tr>
<td>24-hour</td>
<td>Optional. Displays environmental sensor history once in every 24 hours</td>
</tr>
</tbody>
</table>

- `show environmental-sensor [humidity|light|motion|summary|temperature|version]`

| environmental-sensor         | Displays environmental sensor’s recorded data, based on the parameters passed. The system displays the specified recorded data.  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>

rfs7000-37FABE(config)#
```
### 6.1.23 ex3500

#### show commands
Displays EX3500-related statistical data

Supported in the following platforms:
- Wireless Controllers — RFS7000
- Service Platforms — NX7500, NX9500

#### Syntax

```
show ex3500 [dir|interfaces|system|upgrade|version|whichboot]
show ex3500 dir {boot-rom|config|on|opcode} {<FILE-NAME>} {on <EX3500-DEVICE-NAME>}
show ex3500 interfaces counters [ether-like stats|ethernet <1-1> <1-52>| ext-if-table stats|if-table stats|portUtil stats|rmon stats] {on <EX3500-DEVICE-NAME>}
show ex3500 [system|upgrade|version|whichboot] {on <EX3500-DEVICE-NAME>}
```

#### Parameters

- **show ex3500 dir {boot-rom|config|on|opcode} {<FILE-NAME>} {on <EX3500-DEVICE-NAME>}
  - **<FILE-NAME>** Displays the contents of a specified file identified by the `<FILE-NAME>` keyword. This is the name of configuration file or code image.
  - **on <EX3500-DEVICE-NAME>** Optional. Executes the command on a specified EX3500 device
    - `<DEVICE-NAME>` – Specify the device’s name.

- **show ex3500 interfaces counters [ether-like stats|ethernet <1-1> <1-52>| ext-if-table stats|if-table stats|portUtil stats|rmon stats] {on <EX3500-DEVICE-NAME>}
  - **ether-like stats** Displays Managed Information Base (MIB) object statistics for Ethernet-like interfaces
  - **ethernet <1-1> <1-52>** Displays the Ethernet port statistics based on the unit identifier and port number selected
    - `<1-1>` – Specify the EX3500 unit’s identifier from 1 - 1.
    - `<1-52>` – Specify the port number from 1 - 52. This range varies for the EX3524 (1-28) and EX3548 (1-52) devices.
    - **Note:** This option displays the following for the selected Ethernet interface:
      - extended interface table stats, interface table stats, port utilization information, and remote monitoring stats.
  - **ext-if-table stats** Displays only the extended interface table statistics
if-table stats | Displays only the interface table statistics
---|---
portUtil stats | Displays only the port utilization information
---|---
rmon stats | Displays only remote monitoring (RMon) statistics
---|---
on <EX3500-DEVICE-NAME> | Optional. Executes the command on a specified EX3500 device
• <DEVICE-NAME> – Specify the device's name.
---|---

Examples

```
nx9500-6C8809#show ex3500 interfaces counters ethernet 1 17

▶ show commands

Displays external device (T5 or EX3500) configuration error history

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX9000, NX9500, NX9510

Syntax
show extdev error history {on <T5/EX3500-DEVICE-NAME>}

Parameters
- show extdev error history {on <T5/EX3500-DEVICE-NAME>}

<table>
<thead>
<tr>
<th>extdev error history</th>
<th>Displays external device error history. This command is applicable only to the external devices T5, and EX3500 series switch. Use this command to view configuration error history for all or a specified external device adopted and managed by a WiNG NX9500 series service platform.</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;T5/EX3500-DEVICE-NAME&gt;</td>
<td>Optional. Displays configuration error history on a specified T5 or EX3500 device&lt;br&gt;• &lt;T5/EX3500-DEVICE-NAME&gt; – Specify the name of the device.</td>
</tr>
</tbody>
</table>

Examples
nx9500-6C8809# show extdev error history on t5-ED5EAC<br>%% No History for this device<br>nx9500-6C8809#
6.1.25 file

SHOW COMMANDS 6-51

This command is not available in the USER EXEC mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show file [information <FILE>|systems]
```

Parameters

- show file [information <FILE>|systems]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Displays file system related information</td>
</tr>
<tr>
<td>information &lt;FILE&gt;</td>
<td>Displays information for a specified file</td>
</tr>
<tr>
<td>&lt;FILE&gt;</td>
<td>Specify the file name.</td>
</tr>
<tr>
<td>systems</td>
<td>Lists all file systems present in the system</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809#show file systems
File Systems:

    Size(Mb)   Free(Mb)  Use%   Type    Prefix
    23471      22107     5    flash   nvram:

    644901     609787    5    flash   internal (/vms)
nx9500-6C8809#
```

```
nx9500-6C8809#show file information
flash:/ nvram:/ startup-config system:/ running-config
```

```
nx9500-6C8809#show file information flash:
flash:/
  type is directory
```

```
nx9500-6C8809#
```
6.1.26 file-sync

show commands

Displays file synchronization settings and status on a controller.

The `file-sync` command syncs EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points. The `show > file-sync` command displays information related to this process.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
show file-sync [configuration|history|load-file-status|status] {on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

- `file-sync` Displays the following file-synchronization related information: configuration, history, load-file-status, and status
- `configuration` Displays the following file-synchronization configuration details:
  - automatic file-syncing enabled or disabled. The default setting is disabled.
  - Number of access points the certificate can be simultaneously uploaded. The default is 10.
  - Scheduled certificate upload, if any, details, such time and date of upload.
- `history` Displays file synchronization history. Use this option to view statistical data relating to client-bridge certificate synchronization between staging controller and adoptee access points. When executed, a list of all certificate transfers made to the client-bridge is displayed, with the latest transfer listed at the top.
- `load-file-status` Displays the status of PKCS#12 certificate upload to the controller. Use this command to view the status of a in-progress certificate upload.
- `status` Displays status of the PKCS#12 certificate synchronization between the controller and the client-bridge access point.

- `on <DEVICE-OR-DOMAIN-NAME>` Optional. Displays file synchronization settings and status on a specified device or RF Domain
  - `<DEVICE-OR-DOMAIN-NAME>` — Specify the name of the controller, service platform, or RF Domain.
Examples

nx9500-6C8809# show file-sync configuration
File Sync Configuration Information
   Auto : Disabled
   Simultaneous Upload Count : 128
nx9500-6C8809#

nx9500-6C8809# show file-sync load-file-status
Download of wireless_bridge certificate is complete
nx9500-6C8809#

nx9500-6C8809# show file-sync history

nx9500-6C8809#
6.1.27 firewall

■ show commands
Displays wireless firewall information, such as Dynamic Host Configuration Protocol (DHCP) snoop table entries, denial of service statistics, active session summaries etc.

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

Syntax

show firewall [dhcp|dos|flows|neighbors]

show firewall [dhcp snoop-table|dos stats] {on <DEVICE-NAME>}

show firewall flows {filter|management|on|stats|wireless-client}

show firewall flows {filter} {dir|dst port <1-65535>|ether|flow-type|icmp|icmpv6|igmp|ip|ipv6|max-idle|min-bytes|min-idle|min-pkts|not|port|src|tcp|udp}

show firewall flows {management} {on <DEVICE-NAME>}{stats} {on <DEVICE-NAME>}

show firewall neighbors snoop-table {on <DEVICE-NAME>}

Parameters

• show firewall [dhcp snoop-table|dos stats] {on <DEVICE-NAME>}

| firewall dhcp snoop-table | Displays DHCP snoop table entries
|---------------------------|----------------------------------
|                           | • snoop-table – Displays DHCP snoop table entries
|                           | DHCP snooping acts as a firewall between non-trusted hosts and the DHCP server.
|                           | Snoop table entries contain MAC address, IP address, lease time, binding type, and
|                           | interface information of non-trusted interfaces.

| dos stats | Displays Denial of Service (DoS) statistics
|-----------|----------------------------------
|           | Note: This option is not available in the User Exec mode.

| on <DEVICE-NAME> | The following keyword is common to the ‘DHCP snoop table’ and ‘DoS stats’ parameters:
|------------------|----------------------------------
|                   | • on <DEVICE-NAME> – Optional. Displays snoop table entries, or DoS stats on a
|                   | specified device
|                   | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or
|                   | service platform.

• show firewall flows {filter} {dir|dst|ether|flow-type|icmp|icmpv6|igmp|ip|ipv6|max-idle|min-bytes|min-idle|min-pkts|not|port|src|tcp|udp}

| firewall flows | Notifies a session has been established
|----------------|----------------------------------
| filter | Optional. Defines additional firewall flow filter parameters

|-----------------------------------|----------------------------------
| wired-wired – Wired to wired flows
| wired-wireless – Wired to wireless flows
| wireless-wired – Wireless to wired flows
| wireless-wireless – Wireless to wireless flows

6.1.28 global

show commands

Displays global information for network devices based on the parameters passed

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show global [device-list|domain]

show global device-list {filter {offline|online|rf-domain}}
show global device-list {filter {offline|online}}
show global device-list {filter rf-domain [<DOMAIN-NAME>|not <DOMAIN-NAME>]}

show global domain managers

Parameters

- show global device-list {filter {offline|online}}

<table>
<thead>
<tr>
<th>global device-list</th>
<th>Displays global information for all network devices. Use the following keywords to specify additional filters: offline, online, and rf-domain.</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter {offline</td>
<td>online}</td>
</tr>
<tr>
<td></td>
<td>• offline – Optional. Displays global information for offline devices only</td>
</tr>
<tr>
<td></td>

```

rfs7000-6DCD4B(config)#
6.1.29 **gre**

> **show commands**

Displays layer 2 *Generic Routing Encapsulation* (GRE) tunnel traffic flow information

GRE is one of the available tunneling mechanisms which uses IP as the transport protocol and can be used for carrying many different passenger protocols. The tunnels behave as virtual point-to-point links that have two endpoints identified by the tunnel source and tunnel destination addresses at each endpoint.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`show gre info {detail} {(on <DEVICE-NAME>)}`

**Parameters**

- `show gre info {detail} {(on <DEVICE-NAME>)}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>gre info</code></td>
<td>Displays GRE tunnel information</td>
</tr>
<tr>
<td><code>detail</code></td>
<td>Optional. Displays GRE tunnel information in detail, such as tunnel state,</td>
</tr>
<tr>
<td></td>
<td>tunnel's remote-end peer device's IP address, session ID of an operational</td>
</tr>
<tr>
<td></td>
<td>tunnel, total number of packets received and transmitted through the tunnel,</td>
</tr>
<tr>
<td></td>
<td>and the number of dropped packets during tunneled exchanges between access</td>
</tr>
<tr>
<td></td>
<td>point and a peer at the remote end of the tunnel.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>Optional. Executes the command on a specified device</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the access point, controller, or</td>
</tr>
<tr>
<td></td>
<td>service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx4500-5CFA2B>show gre info
Gre Tunnel info:
  {'No tunnel found': 0}
nx4500-5CFA2B>
```
6.1.30 **guest-registration**

Displays guest registration statistics based on the option and time entered

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
show guest-registration [age-range|backup-snapshots|browsers|devices|gender|notification-status|os|social|user-trends|visitors] {on <DEVICE-NAME>}
```

```
show guest-registration backup-snapshots
```

```
show guest-registration [age-range|browsers|devices|gender|os|user-trends|visitors] time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] {(rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>)}
```

```
show guest-registration client [email|mac|member|mobile|name|time]
```

```
show guest-registration client [email <EMAIL-ADDRESS>|mac <MAC>|member <MEMBER-ID>|mobile <MOBILE-NUMBER>|name <NAME>]
```

```
show guest-registration client time [1-Hour|10-Mins|15-Mins|2-Mins|30-Mins|30-Secs|5-Mins] {(rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>)}
```

```
show guest-registration notification-status
```

```
show guest-registration social time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] {(facebook|rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>|google)}
```

**Parameters**

- **show guest-registration backup-snapshots**

<table>
<thead>
<tr>
<th>guest-registration</th>
<th>Displays guest registration statistics based on the parameters passed</th>
</tr>
</thead>
<tbody>
<tr>
<td>backup-snapshots</td>
<td>Displays a list of periodically backed up snapshots of the database. By default, the system maintains a snapshot of the database on a daily basis. <strong>Note:</strong> Use the `service &gt; guest-registration &gt; backup [delete</td>
</tr>
</tbody>
</table>

</table>
| **time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]** | Displays guest registration statistics, for a specified time period. The stats displayed depends on the option selected in the previous step. Specify the time period using one of the following options:  
  - 1-Day – Displays previous day’s statistics  
  - 1-Month – Displays previous month’s statistics  
  - 1-Week – Displays previous week’s statistics  
  - 2-Hours – Displays last 2 hours statistics  
  - 30-Mins – Displays last 30 minutes statistics  
  - 5-Hours – Displays last 5 hours statistics  
  - all – Displays statistics from the day the database was created |
| **[rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>]** | Use the following options as additional filters:  
  - <DOMAIN-NAME> – Specify the RF Domain name.  
  - wlan <WLAN-NAME> – Optional. Displays guest registration statistics for a specified WLAN.  
  - <WLAN-NAME> – Specify the WLAN name. |

- **show guest-registration client [email <EMAIL-ADDRESS>|mac <MAC>|member <MEMBER-ID>|mobile <MOBILE-NUMBER>|name <NAME>]**

### 6.1.31 interface

#### show commands
Displays configured system interfaces and their status

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
show interface {<INTERFACE-NAME>|brief|counters|ge|me1|port-channel|pppoe1|
switchport|vlan|wwan1} {on <DEVICE-NAME>}
show interface {<INTERFACE-NAME>|brief|counters|ge <1-4>|me1|port-channel <1-2>|
pppoe1|switchport|vlan <1-4094>|wwan1} {on <DEVICE-NAME>}
```

#### Parameters
- `<INTERFACE-NAME>`
  - Optional. Displays the interface specified by the `<INTERFACE-NAME>` parameter. Specify the interface name.
- `brief`
  - Optional. Displays a brief summary of the interface status and configuration
- `counters`
  - Optional. Displays interface Tx or Rx counters
- `ge <1-4>`
  - Optional. Displays Gigabit Ethernet interface status and configuration
    - `<1-4>` – Select the Gigabit Ethernet interface index from 1 - 4.
    - **Note:** For the NX45XX and NX65XX service platforms the index range is <1 - 24>.
- `me1`
  - Optional. Displays Fast Ethernet interface status and configuration
- `port-channel <1-2>`
  - Optional. Displays port channel interface status and configuration
    - `<1-2>` – Specify the port channel index from 1 - 2.
- `pppoe1`
  - Optional. Displays PPP over Ethernet interface status and configuration
- `switchport`
  - Optional. Displays layer 2 interface status
- `vlan <1-4094>`
  - Optional. Displays VLAN interface status and configuration
    - `<1-4094>` – Specify the Switch Virtual Interface (SVI) VLAN ID from 1 - 4094.
- `wwan1`
  - Optional. Displays Wireless WAN interface status, configuration, and counters
- `on <DEVICE-NAME>`
  - The following keywords are common to all of the above interfaces:
    - `on <DEVICE-NAME>` – Optional. Displays interface related information on a specified device
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.
Examples

Following interfaces are available on a RFS7000 controller:

```
rfs7000-6DCD4B(config)#show interface ?
WORD          Interface name
brief         Brief summary of interface status and configuration
counters      Interface tx/rx counters
ge            GigabitEthernet interface
me1           FastEthernet interface
on            On AP/Controller
port-channel  Port-Channel interface
pppoe1        PPP Over Ethernet interface
switchport    Status of Layer2 interfaces
vlan          Switch VLAN interface
wwan1         Wireless WAN interface
|             Output modifiers
>             Output redirection
>>            Output redirection appending
<cr>
```

 Following interfaces are available on a NX45XX and NX65XX series service platform:

```
nx4500-5CFA2B(config)#show interface ?
WORD        Interface name
brief       Brief summary of interface status and configuration
counters    Interface tx/rx counters
ge          GigabitEthernet interface
on          On AP/Controller
pppoe1      PPP Over Ethernet interface
serial      Serial interface
switchport  Status of Layer2 interfaces
t1e1        T1/E1 interface
up          WAN Ethernet interface
vlan        Switch VLAN interface
vmif        Virtual Machine interface
wwan1       Wireless WAN interface
|           Output modifiers
>           Output redirection
>>          Output redirection appending
<cr>
```

rfs7000-6DCD4B(config)#show interface switchport

<table>
<thead>
<tr>
<th>INTERFACE</th>
<th>STATUS</th>
<th>MODE</th>
<th>VLAN(S)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ge1</td>

nx4500-5CFA8E(config)#
6.1.32 ip

show commands

Displays IP related information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show ip [arp|bgp|ddns|default-gateways|dhcp|dhcp-vendor-options|domain-name|
    extcommunity-list|igmp|interface|name-server|nat|ospf|route|routing]

show ip arp {<VLAN-NAME>} {on <DEVICE-NAME>}

show ip bgp {<IP>|<IP/M>|community|community-list|filter-list|neighbors|on|paths|
    prefix-list|regexp|route-map|state|summary}

show ip ddns bindings {on <DEVICE-NAME>}

show ip dhcp [binding|networks|status]

show ip dhcp binding [manual] {on <DEVICE-NAME>}

show ip dhcp [networks|status] {on <DEVICE-NAME>}

show ip [default-gateways|dhcp-vendor-options|domain-name|name-server|routing]
    {on <DEVICE-NAME>}

show ip extcommunity-list [1-500]|<NAME>]

show ip igmp snooping [mrouter|querier|vlan]

show ip igmp snooping [mrouter|querier] vlan <1-4095> {on <DEVICE-NAME>}

show ip interface {<INTERFACE-NAME>|brief|on}

show ip interface {<INTERFACE-NAME>|brief} {on <DEVICE-NAME>}

show ip nat translations verbose {on <DEVICE-NAME>}

show ip route {<INTERFACE-NAME>|ge|me1|on|port-channel|pppoel|vlan|wwan1}

show ip route {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|vlan <1-4094>|
    pppoe1|wwan1} {on <DEVICE-NAME>}

show ip ospf {border-router|interface|neighbor|on|route|state}

show ip ospf {border-router|neighbor|route|on|state} {on <DEVICE-NAME>}

show ip ospf [interface] {vlan|on}

show ip ospf [interface] {vlan <1-4094>} {on <DEVICE-NAME>}

---

**NOTE:** The show ip ospf command is also available under the 'profile' and 'device' modes.

### Parameters

- **show ip arp {<VLAN-NAME>}** {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip arp</td>
<td>Displays Address Resolution Protocol (ARP) mappings</td>
</tr>
<tr>
<td>&lt;VLAN-NAME&gt;</td>
<td>Optional. Displays ARP mapping on a specified VLAN. Specify the VLAN name.</td>
</tr>
<tr>
<td>Keyword</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| on <DEVICE-NAME> | The following keyword is recursive and common to the 'vlan-name' parameter:  
  - on <DEVICE-NAME> – Optional. Displays ARP configuration details on a specified device  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| ip bgp        | Displays BGP routing table statistics based on the match criteria specified here. Routes matching the specified criteria are filtered. Use available options to filter the information displayed.  
  **Note:** This command is applicable to the RFS4000, RFS6000, NX45XX, NX65XX, NX9XXX model devices. |
| <IP>          | Optional. Filters routes matching the specified IP address                                              |
| <IP/M>        | Optional. Filters routes matching the specified network                                               |
| community     | Optional. Filters routes based on the community attribute specified. The options are:  
  - AA:NN – Filters routes based on the community number (AA: is the autonomous system number (ASN), NN: is the community number within the specified ASN)  
  - local-as – Filters routes carrying the local-as attribute (these routes are not sent outside the local AS)  
  - no-advertise – Filters routes carrying the no-advertise attribute (these routes are not advertised to any peers)  
  - no-export – Filters routes carrying no-export attribute (these routes are not exported to next AS) |
| community-list| Optional. Displays routes that are members of communities included in the specified BGP community-list  
  - <1-500> – Specify the community-list number.  
  - <WORD> – Specify the community-list name. |
| filter-list   | Optional. Filters routes having AS-path matching the specified AS-path access list. Specify the AS-path ACL name. |
| neighbors     | Optional. Displays BGP neighbor details. Specify the IP address, to view a specific neighbor details. Use one of the following options to filter information:  
  - advertised-routes – Displays route information for routes advertised to the selected neighbor device  
  - received-routes – Displays route information for routes received from the selected neighbor device  
  - routes – Displays the route information for routes learned from the selected neighbor device  
  **Note:** If no neighbor IP address is specified, the system displays all neighbor-related routes on the logged device. |
| on <DEVICE-NAME> | Optional. Displays BGP routing table statistics on a specified device  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
<p>| paths         | Optional. Displays BGP path details                                                                       |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show ip ddns bindings</strong> <em>(on &lt;DEVICE-NAME&gt;)</em></td>
<td>Displays Dynamic Domain Name Server (DDNS) configuration details.</td>
</tr>
<tr>
<td><em>ip ddns</em></td>
<td>Displays DDNS address bindings.</td>
</tr>
<tr>
<td><em>bindings</em> <em>(on &lt;DEVICE-NAME&gt;)</em></td>
<td>Displays DDNS address bindings.</td>
</tr>
<tr>
<td><em>regexp &lt;LINE&gt;</em></td>
<td>Displays routes matching the specified AS path regular expression.</td>
</tr>
<tr>
<td><em>route-map &lt;ROUTE-MAP-NAME&gt;</em>**</td>
<td>Displays routes matching the specified route map.</td>
</tr>
<tr>
<td><em>prefix-list &lt;PREFIX-LIST-NAME&gt;</em></td>
<td>Displays routes confirming to the specified prefix-list.</td>
</tr>
<tr>
<td><em>regexp &lt;LINE&gt;</em></td>
<td>Displays routes matching the specified AS path regular expression.</td>
</tr>
<tr>
<td><em>route-map &lt;ROUTE-MAP-NAME&gt;</em></td>
<td>Displays routes matching the specified route map.</td>
</tr>
</tbody>
</table>

**Note:**
- This command is applicable to the RFS4000, RFS6000, NX45XX, NX65XX, NX9XXX model devices.
### SHOW COMMANDS

<td><code>show ip domain-name</code></td>
<td>Displays the DNS default domain</td>
</tr>
<tr>
<td><code>show ip name-server</code></td>
<td>Displays the DNS name server details</td>
</tr>
<tr>
<td><code>show ip routing</code></td>
<td>Displays routing status</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>The following keywords are common to all of the above parameters:</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays IP related information, based on the parameters passed, on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip igmp snooping mrouter</code></td>
<td>Displays the IGMP snooping configuration</td>
</tr>
<tr>
<td><code>show ip igmp snooping querier</code></td>
<td>Displays the IGMP snooping multicast querier configuration</td>
</tr>
<tr>
<td><code>show ip igmp snooping vlan &lt;1-4095&gt;</code></td>
<td>Displays the IGMP snooping multicast router (mrouter) configuration for a VLAN</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-4095&gt; – Specify the VLAN ID from 1 - 4095.</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays the IGMP snooping mrouter configuration on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP or wireless controller.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip igmp snooping vlan &lt;1-4095&gt; {&lt;IP&gt;} {on &lt;DEVICE-NAME&gt;}</code></td>
<td>Displays the VLAN IGMP snooping configuration</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-4095&gt; – Specify the VLAN ID from 1 - 4095.</td>
</tr>
<tr>
<td></td>
<td>• &lt;IP&gt; – Optional. Specifies the multicast group IP address</td>
</tr>
<tr>
<td></td>
<td>on &lt;DEVICE-NAME&gt; – The following keyword is recursive and common to the 'ip' parameter:</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays configuration details on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP or wireless controller.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip interface</code></td>
<td>Displays an administrative and operational status of all layer 3 interfaces or a specified layer 3 interface</td>
</tr>
<tr>
<td><code>&lt;INTERFACE-NAME&gt;</code></td>
<td>Optional. Displays a specified interface status. Specify the interface name.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td><code>show ip route</code></td>
<td>Displays route table details. The route tables use flags to distinguish between routes. The different flags are: C – Connected, G – Gateway, O – OSPF route, S – Static route. Note: Flags ‘S’ and ‘O’ identify static learned routes and dynamic learned routes respectively.</td>
</tr>
<tr>
<td><code>brief</code></td>
<td>Optional. Displays a brief summary of all interface status and configuration.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>The following keyword is recursive and common to the ‘interface-name’ and ‘brief’ parameters: on &lt;DEVICE-NAME&gt; – Optional. Displays interface status and summary, based on the parameters passed, on a specified device. &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
<tr>
<td><code>ip ospf</code></td>
<td>Displays overall OSPF information.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>The following keywords are recursive and common to all of the above parameters: on &lt;DEVICE-NAME&gt; – Displays route table details, based on the parameters passed, on a specified device. &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Example Commands:**

- `show ip nat translations verbose {on <DEVICE-NAME>}`
- `show ip route {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|vlan <1-4094>|pppoe1|wwan1} {on <DEVICE-NAME>}`
- `show ip ospf {border-router|interface|neighbor|route|on|state} {on <DEVICE-NAME>}`

### 6.1.33 ip-access-list

**show commands**

Displays IP access list statistics

---

**NOTE:** This command is not available in the USER EXEC Mode.

---

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail|on}
show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>}
{(on <DEVICE-NAME>)}
```

**Parameters**

- `show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail|on}`
- `{<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>}`
- `(on <DEVICE-NAME>)`

- **ip-access-list stats**
  - Displays IP access list statistics

- **<IP-ACCESS-LIST-NAME>**
  - Optional. Displays statistics for a specified IP access list. Specify the IP access list name.

- **detail**
  - `<IP-ACCESS-LIST-NAME>`
  - Optional. Displays detailed statistics for a specified IP access list. Specify the IP access list name.

- **on <DEVICE-NAME>**
  - The following keyword is recursive and common to the 'IP-ACCESS-LIST-NAME' and 'detail' parameters:
    - `on <DEVICE-NAME>` – Optional. Displays all or a specified IP access list statistics on a specified device.
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

**Examples**

```
rfs7000-37FABE(config)#show ip-access-list stats
IP Access-list: # Restrict Management ACL #
   permit tcp any any eq ftp rule-precedence 1       Hitcount: 0
   permit tcp any any eq www rule-precedence 2       Hitcount: 4
   permit tcp any any eq ssh rule-precedence 3       Hitcount: 448
   permit tcp any any eq https rule-precedence 4      Hitcount: 0
   permit udp any any eq snmp rule-precedence 5       Hitcount: 0
   permit tcp any any eq telnet rule-precedence 6      Hitcount: 4
rfs7000-37FABE(config)#
```
The following example displays the 'auto-tunnel-acl' IP ACL configuration:

```
rfs4000-229D58(config)#ip access-list auto-tunnel-acl
rfs4000-229D58(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2
permit ip host 200.200.200.99 any rule-precedence 3
rfs4000-229D58(config-ip-acl-auto-tunnel-acl)#
```

The following example displays the statistics for the 'auto-tunnel-acl' ACL:

```
rfs4000-229D58#show ip-access-list stats
IP Access-list: auto-tunnel-acl
permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2 Hitcount: 0
permit ip host 200.200.200.99 any rule-precedence 3 Hitcount: 0
rfs4000-229D58#
```

```
x6524-5483B0#show ip-access-list stats scaleacl | i 125
Hitcount: 893 Hardware
Hitcount: 3120
permit ip host 125.1.1.1 any rule-precedence 125 Hitcount: 0
permit ip host 125.2.1.1 any rule-precedence 346 Hitcount: 0
x6524-5483B0#
```
### 6.1.34 ipv6

> **show commands**

Displays IPv6 related information

**Supported in the following platforms:**

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show ipv6 [default-gateways|delegated-prefix|dhcp|hop-limit|interface|mld|name-server|neighbors|route]
show ipv6 [default-gateways|delegated-prefix|hop-limit|name-server] {on <DEVICE-NAME>}
show ipv6 dhcp [client received-options|relay status|status] {on <DEVICE-NAME>}
show ipv6 interface {<IF-NAME>|brief} {on <DEVICE-NAME>}
show ipv6 mld snooping [mrouter vlan <1-4095>|querier vlan <1-4095>|vlan <1-4095>] {on <DEVICE-NAME>}
show ipv6 neighbors <VLAN-NAME> {on <DEVICE-NAME>}
show ipv6 route {<IF-NAME>|ge <1-X>|me1|port-channel <1-2>|pppoe1|serial <1-4>|t1e1 <1-4> |<1-4> |up|vlan <1-4095>|vmif <1-X>|wwan1|xge} {on <DEVICE-NAME>}
```

**Parameters**

- `ipv6` Displays IPv6 related information
- `default-gateways` Displays all learnt default gateways
- `delegated-prefix` Displays prefix delegation information
- `hop-limit` Displays the configured IPv6 hop count value
- `name-server` Displays DNS name servers
- `on <DEVICE-NAME>` This parameter is common to all of the above keywords.
  - `on <DEVICE-NAME>` – Optional. Displays the specified information on a device (access point, wireless controller, or service platform)
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- `show ipv6 dhcp [client received-options|relay status|status] {on <DEVICE-NAME>}`

6.1.35 ipv6-access-list

Display IPv6 access list statistics

NOTE: This command is not available in the USER EXEC Mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {(on <DEVICE-NAME>)}

Parameters
- show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {(on <DEVICE-NAME>)}

Examples
rfs6000-6DB5D4#show ipv6-access-list stats
IPV6 Access-list: test
deny ipv6 any any rule-precedence 20 Hitcount: 4
rfs6000-6DB5D4#
### 6.1.36 l2tpv3

**show commands**

Displays a Layer 2 Tunnel Protocol Version 3 (L2TPV3) session information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
l2tpv3 {on|tunnel|tunnel-summary}
l2tpv3 {on <DEVICE-NAME>}
l2tpv3 {tunnel <L2TPV3-TUNNEL-NAME>} {session <L2TPV3-SESSION-NAME>}
{ (on <DEVICE-NAME>) }
l2tpv3 {tunnel-summary} { down|on|up }
l2tpv3 {tunnel-summary} { on <DEVICE-NAME> }
l2tpv3 {tunnel-summary} { down|up} { on <DEVICE-NAME> }
```

**Parameters**
- **l2tpv3 {on <DEVICE-NAME>}**

  Displays a L2TPv3 tunnel and session details or summary
  - on <DEVICE-NAME> – Optional. Displays L2TPv3 information on a specified access point or wireless controller
  - <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

- **l2tpv3 {tunnel <L2TPV3-TUNNEL-NAME>} {session <L2TPV3-SESSION-NAME>}**

  Optional. Displays a specified L2TPv3 tunnel information
  - <L2TPV3-TUNNEL-NAME> – Specify the L2TPv3 tunnel name.

- **l2tpv3 {on <DEVICE-NAME>}**

  Optional. Displays a specified L2TPv3 tunnel session information
  - <L2TPV3-SESSION-NAME> – Specify the session name.

- **on <DEVICE-NAME>**

  The following keyword is recursive and common to the ‘session <L2TPV3-SESSION-NAME>’ parameter.
  - on <DEVICE-NAME> – Optional. Displays a L2TPv3 tunnel and session details, based on the parameters passed, on a specified device.
  - <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

**NOTE:** This command is not available in the USER EXEC mode.
l2tpv3 {tunnel-summary} {on <DEVICE-NAME>}

- **l2tpv3**: Displays L2TPv3 tunnel and session details or summary.
- **tunnel-summary**: Optional. Displays L2TPv3 tunnel summary.
  - {on <DEVICE-NAME>}: Optional. Displays a L2TPv3 tunnel summary on a specified device.
  - <DEVICE-NAME>: Specify the name of AP, wireless controller, or service platform.

Note: For an L2TPv3 tunnel over Auto IPSec, the tunnel status is displayed as: Established (secured by ipsec).

Examples

```

ap7131-11B6C4#
6.1.37 **ldap-agent**

 Displays an LDAP agent's join status (join status to a LDAP server domain)

Use this command When LDAP is specified the external resource (as opposed to local RADIUS resources) to validate PEAP-MS-CHAP v2 authentication requests, user credentials, and password information needs to be made available locally to successfully connect to the external LDAP server. Up to two LDAP Agents (primary and secondary external resources) can be defined as external resources for PEAP-MS-CHAP v2 authentication requests.

**NOTE:** This command is not available in the USER EXEC Mode.

**Syntax**

```plaintext
show ldap-agent join-status {on <DEVICE-NAME>}
```

**Parameters**

- `show ldap-agent join-status {on <DEVICE-NAME>}`

**Examples**

```plaintext
rfs6000-81701D#show ldap-agent join-status
Primary LDAP Server's agent join-status : Joined domain TEST.
Secondary LDAP Server's agent join-status : Not Configured
rfs6000-81701D#
```
6.1.38 licenses

show commands
Displays installed licenses and usage information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
show licenses {borrowed|lent}

Parameters
- licenses {borrowed|lent} Displays installed licenses and usage information
  - borrowed – Optional. Displays information on licenses borrowed
  - lent – Optional. Displays information on licenses lent

Usage Guidelines
The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single Network Operations Center (NOC) controller. The NOC and the site controllers constitute the first and second tiers of the hierarchy respectively. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy. The site controllers may or may not be grouped to form clusters.

At the time of adoption, access points and adaptive access points are provided license by the adopting controller. These license packs can be installed on both the NOC and site controllers. When a AP/AAP is adopted by a controller, the controller pushes a license on to the device. At this point the various possible scenarios are:
- AP/AAP license packs installed on the NOC controller only.
  - The NOC controller provides the site controllers with the AP licenses, ensuring that per platform limits are not exceeded.
- AP/AAP license packs installed on the NOC and site controllers.
  - The site controller uses its installed licenses and, in case of a shortage, the site controller borrows additional licenses from the NOC. If the NOC controller is unable to allocate sufficient licenses, the site controller unadopts some of the AP/AAPs.
- AP/AAP license packs installed on one controller within a cluster.
  - The site controller shares its installed and borrowed licenses with other cluster controllers.

Examples
rfs4000-229D58#show licenses
Serial Number : 9184521800027

Device Licenses:
  AP-LICENSE
    String       : DEFAULT-6AP-LICENSE
    Value        : 6
    Borrowed     : 0
    Total        : 6
    Used         : 0
  AAP-LICENSE
    String       :
    Value        : 0
    Borrowed     : 0
    Total        : 0
    Used         : 0
The following example shows the show > licenses command output on a NOC controller:

```
nx4500-5CFA2B#show licenses

nx4500-5CFA2B#
In the following example, the ‘VALIDITY(HRS)’ column specifies the validity period, in days and hours, of a lent license. On a NOC controller, a ‘VALIDITY(HRS)’ value of ‘current’ implies that the site controller is currently adopted. Whereas, a numerical ‘VALIDITY(HRS)’ value indicates the days and hours the lent license is valid for a site controller that is not reachable.

6-94 WiNG 5.8.1 CLI Reference Guide

6.1.39 lldp

show commands
Displays Link Layer Discovery Protocol (LLDP) information

Supported in the following platforms:
• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
show lldp [neighbors|report]
show lldp neighbors {on <DEVICE-NAME>}
show lldp report {detail|on}
show lldp report {detail} {on <DEVICE-OR-DOMAIN-NAME>}

Parameters
• show lldp neighbors {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>lldp</th>
<th>Displays an LLDP neighbors table or aggregated LLDP neighbors table</th>
</tr>
</thead>
<tbody>
<tr>
<td>neighbors</td>
<td>Displays an LLDP neighbors table</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays an LLDP neighbors table on a specified device</td>
</tr>
<tr>
<td>{on &lt;DEVICE-OR-DOMAIN-NAME&gt;}</td>
<td>The following keyword is recursive and common to the ‘report detail’ parameter:</td>
</tr>
<tr>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>lldp</th>
<th>Displays an LLDP neighbors table or aggregated LLDP neighbors table</th>
</tr>
</thead>
<tbody>
<tr>
<td>report detail</td>
<td>Displays an aggregated LLDP neighbors table</td>
</tr>
<tr>
<td>{on &lt;DEVICE-OR-DOMAIN-NAME&gt;}</td>
<td>The following keyword is recursive and common to the ‘report detail’ parameter:</td>
</tr>
<tr>
<td>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; – Displays an aggregated LLDP neighbors table on a specified device or RF Domain</td>
<td></td>
</tr>
<tr>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain</td>
<td></td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config)#show lldp neighbors
-------------------------
Chassis ID: 00-23-68-22-9D-58
System Name: L3-Router
Platform: RFS-4010-00010-WR, Version 5.8.1.0-022D
Capabilities: Bridge  Router
Enabled Capabilities: Bridge  Router
Local Interface: ge1, Port ID (outgoing port): ge2
TTL: 148 sec
Management Addresses: 10.2.0.1,172.18.0.1
rfs7000-37FABE(config)#
6.1.40 logging

Displays the network’s activity log

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show logging \{on <DEVICE-NAME>\}

Parameters

- show logging \{on <DEVICE-NAME>\}

<table>
<thead>
<tr>
<th>logging {on &lt;DEVICE-NAME&gt;}</th>
<th>Displays logging information on a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- on &lt;DEVICE-NAME&gt; – Optional. Executes the command on a specified device.</td>
</tr>
<tr>
<td></td>
<td>- &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Examples

nx9500-6C8809#show logging

Logging module: enabled
Aggregation time: disabled
Console logging: level debugging
Monitor logging: disabled
Buffered logging: level warnings
Syslog logging: level warnings
Facility: local7

nx9500-6C8809#
6.1.41 mac-access-list

show commands

Displays MAC access list statistics

NOTE: This command is not present in USER EXEC mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show mac-access-list stats {<MAC-ACCESS-LIST-NAME>|on}
show mac-access-list stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>)}

Parameters

- show mac-access-list-stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>)}

Examples

nx6524-5483B0#show mac-access-list stats scalemacacl | i 311
permit D0-67-E5-3F-C0-00 FF-FF-FF-FF-F0-00 host 00-1E-EC-F2-0A-76 rule-precedence 311
Hitcount: 0        Hardware Hitcount: 0
nx6524-5483B0#
6.1.42 **mac-address-table**

- **show commands**

Displays MAC address table entries

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show mac-address-table {on <DEVICE-NAME>}
```

**Parameters**

- `show mac-address-table {on <DEVICE-NAME>}`

**Examples**

```
rfs7000-6DCD4B(config)#show mac-address-table

Total number of MACs displayed: 20
```
rfs7000-6DCD4B(config)#
```
6.1.43 mac-auth

Displays details of wired ports that have MAC address authentication enabled.

Use this command to view MAC authentication configuration and authentication state. The command displays the current authentication state of the wired host, the authorization state of the Ge1 port, and the wired hosts’ MAC address. The port status displays as Authorized if the wired host has successfully authenticated and Not Authorized if the wired host has not authenticated or has failed MAC authentication.

For more information on enabling MAC address authentication on a wired port, see mac-auth.

Supported in the following platforms:
- Access Points — AP6511
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

```
show mac-auth {all|interface|on}
show mac-auth {all|interface [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|t1e1 <1-4>|up <1-2]|vmif <1-X>|xge <1-4>]} {on <DEVICE-NAME>}
```

Parameters

- **show mac-auth {all|interface [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|t1e1 <1-4>|up <1-2]|vmif <1-X>|xge <1-4>]} {on <DEVICE-NAME>}

  - **mac-auth** Displays MAC authentication related information for all interfaces or all interfaces
  - **all** Optional. Displays MAC authentication related information for all interfaces
  - **interface** Optional. Displays MAC authentication related information for a specified interface. Specify the interface using one of the following options:
    - **<INTERFACE-NAME>** – Selects the interface identified by the <INTERFACE-NAME> keyword
    - **ge <1-5>** – Selects the GigabitEthernet interface identified by the index number
    - **port-channel <1-3>** – Selects the port channel interface identified by the index number
    - **t1e1 <1-4>** – Selects the layer 2 interface (Ethernet port)
    - **up <1-2>** – Selects the WAN Ethernet interface identified by the index number
    - **vmif <1-X>** – Selects the virtual machine interface (VMIF) identified by the index number
    - **xge <1-4>** – Selects the TenGigabitEthernet interface identified by the index number
  - **on <DEVICE-NAME>** The following keywords are common to the 'all' and 'interface' parameters:
    - **on <DEVICE-NAME>** – Optional. Displays MAC authentication related information on a specified device
    - **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

**Note:** When the ‘on’ keyword is used exclusively, without the ‘all’ and ‘interface’ options, the system displays MAC authentication related information for interfaces configured on the specified device.
Examples
rfs4000-229D58(config)#show mac-auth all
AAA-Policy is none

Mac Auth info for interface GE1

### 6.1.44 mac-auth-clients

- **show commands**

Displays MAC authenticated clients

Supported in the following platforms:
- Access Points — AP6511
- Wireless Controllers — RFS4000, RFS6000, RFS7000

#### Syntax

```plaintext
show mac-auth-clients [all|interface]
show mac-auth-clients all {on <DEVICE-NAME>}
show mac-auth-clients interface {<INF-NAME>|ge <1-X>|port-channel <1-2>|vmif <1-8>|xge <1-4>}
```

#### Parameters

- **show mac-auth-clients all {on <DEVICE-NAME>}

- **show mac-auth-clients interface {<INF-NAME>|ge <1-X>|port-channel <1-2>|vmif <1-8>|xge <1-4>}

<table>

ap7532-15E6E4#
6.1.46 ntp

Displays Network Time Protocol (NTP) information. NTP enables clock synchronization within a network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show ntp [associations|status]
show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]  

Parameters

- show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]  

| ntp associations {detail|on} | Displays existing NTP associations. The interaction between the controller or service platform and a SNTP server constitutes an association. SNTP associations are of two kinds:
| OFFSET | DISPERSION |
| 0.0 | 15937.5 |
| 0.0 | 15937.5 |
| 0.0 | 15937.5 |

| ntp status {on <DEVICE-NAME>} | Displays the performance (status) information relative to the NTP association status. Use this command to view the access point, controller, or service platform’s current NTP resource. Use this command to view the access point, controller, or service platform’s current NTP resource. |
| STATUS | NTP SERVER IP ADDR | REF CLOCK | IP ADDR | STRATUM | WHEN | POLL | REACH | DELAY |
| 0.0 | 12.12.12.12 | INIT | 16 | - | 1024 | 0 | 0.0 |
| 0.0 | 11.11.11.11 | INIT | 16 | - | 1024 | 0 | 0.0 |
| 0.0 | 10.10.10.10 | INIT | 16 | - | 1024 | 0 | 0.0 |

Note: If the ‘on’ keyword is used without the ‘detail’ keyword, the system displays a summary of existing NTP associations on the specified device or RF Domain.

Examples

nx9500-6C8809#show ntp associations

| STATUS | NTP SERVER IP ADDR | REF CLOCK | IP ADDR | STRATUM | WHEN | POLL | REACH | DELAY |
| 0.0 | 12.12.12.12 | INIT | 16 | - | 1024 | 0 | 0.0 |
| 0.0 | 11.11.11.11 | INIT | 16 | - | 1024 | 0 | 0.0 |
| 0.0 | 10.10.10.10 | INIT | 16 | - | 1024 | 0 | 0.0 |

STATUS Notation: * master (synced), # master (unsynced), + selected, - candidate, - configured
nx9500-6C8809#

nx9500-6C8809#show ntp status

nx9500-6C8809#
6.1.47 password-encryption

Displays password encryption status (enabled/disabled)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
show password-encryption status

Parameters
- show password-encryption status

| password-encryption status | Displays password encryption status (enabled/disabled) |

Examples
rfs7000-37FABE(config)#show password-encryption status
Password encryption is enabled
rfs7000-37FABE(config)#
### 6.1.48 `pppoe-client`

#### show commands

Displays **Point-to-Point Protocol over Ethernet** (PPPoE) client information

Use this command to view PPPoE statistics derived from access to high-speed data and broadband networks. PPPoE uses standard encryption, authentication, and compression methods as specified by the PPPoE protocol. PPPoE enables point-to-points connection to an ISP over existing Ethernet interface.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
show pppoe-client [configuration|status] {on <DEVICE-NAME>}
```

#### Parameters

- `configuration` Displays detailed PPPoE client configuration
- `status` Displays detailed PPPoE client status
- `on <DEVICE-NAME>` The following keywords are common to ‘configuration’ and ‘status’ parameters:
  - `on <DEVICE-NAME>` – Optional. Displays detailed PPPoE client status or configuration on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

#### Examples

```
rfs7000-37FABE(config)#show pppoe-client configuration
PPPoE Client Configuration:
+-------------------------------------------
| Mode          : Disabled                  |
| Service Name  :                        |
| Auth Type     : pap                      |
| Username      :                        |
| Password      :                        |
| Idle Time     : 600                      |
| Keepalive     : Disabled                 |
| Local n/w     : vlan1                    |
| Static IP     : 0.0.0.0                  |
| MTU           : 1492                      |
+-------------------------------------------
```

```
rfs7000-37FABE(config)#
```
6.1.49 privilege

> show commands

Displays a device's existing privilege level

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show privilege

Parameters

None

Examples

rfs7000-37FABE(config)#show privilege
Current user privilege: superuser
rfs7000-37FABE(config)#
6.1.50 radius

`show commands`

Displays the amount of access time consumed and the amount of access time remaining for all guest users configured on a RADIUS server.

Every captive portal guest user can access the captive portal for a specified duration. This results in following three scenarios:

- Scenario 1: Access duration not specified (in this case the default of 1440 minutes is applied)
- Scenario 2: Access duration is specified and is greater than 0
- Scenario 3: Access duration is specified and equals to 0 (in this case the guest user has unlimited access)

In all the three scenarios the access time consumed is the duration for which the guest user has logged. But the access time remaining varies. It is calculated as follows:

- Scenarios 1 & 2 - It is the lesser of the following two values: difference between the configured access duration and the time consumed AND the time until user account expiration.
- Scenario 3 - It is the time until user account expiration

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`show radius guest-users {<GUEST-USER-NAME>}`

**Parameters**

- `show radius guest-users {<GUEST-USER-NAME>}`

<table>
<thead>
<tr>
<th>radius guest-users {&lt;GUEST-USER-NAME&gt;}</th>
<th>Displays RADIUS server’s guest user’s access details: total time for which the user has logged in, and the amount of access time remaining.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;GUEST-USER-NAME&gt;</code> – Optional. Provide the name of the guest user (whose access details are to be viewed). If no name is provided, the system displays details of all guest users who have successfully logged in at least once.</td>
</tr>
<tr>
<td></td>
<td>Use this command in the captive-portal context to view time and data statistics for guest user(s) having bandwidth-based or time-based vouchers configured. In such a scenario, the system displays the following information: data configured, data remaining, configured and current bandwidths (for both downlink and uplink), time configured, and time remaining. If bandwidth-based voucher is not applicable to a guest user, the data configured and data remaining values are displayed as 'unlimited'. The bandwidth columns are blank. If time-based voucher is not applicable to a guest user, the only value displayed is the time remaining (which is the time till the expiration of the guest user’s account).</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For more information on configuring bandwidth-based and time-based vouchers, see <code>user</code>.</td>
</tr>
</tbody>
</table>
Examples
rfs4000-229D58#show radius guest-users

```
TIME (min:sec)  USED    REMAINING   GUEST USER
0:00         9:00   time9
0:00         5:00   time5
0:00        15:00   time15
0:00    305416:35   notime
2:31         7:29   time10
```
rfs4000-229D58#

The following example shows a RADIUS user pool with guest users having bandwidth-based, time-based, bandwidth and time based, and no bandwidth or time based vouchers:

```
rfs4000-229D58(config-captive-portal-wdws)#show context
radius-user-pool-policy wdws
  user time_and_data password 0 both group wdws guest expiry-time 12:00 expiry-date 12/31/2015 access-duration 8000 data-limit 500 committed-downlink 3000 committed-uplink 2000 reduced-downlink 1000 reduce4
  user neither password 0 nine group wdws guest expiry-time 12:00 expiry-date 12/31/2015
  user data_only password 0 data group wdws guest expiry-time 12:00 expiry-date 12/31/2015 data-limit 125 committed-downlink 1000 committed-uplink 800 reduced-downlink 500 reduced-uplink 400
  user time_only password 0 time group wdws guest expiry-time 12:00 expiry-date 12/31/2015 access-duration 5000
rfs4000-229D58(config-captive-portal-wdws)#
```

The following example shows the captive portal access details for the above mentioned RADIUS user pool users:

```
rfs4000-229D58(config-captive-portal-wdws)#show radius guest-users

```
```
GUEST USER   TIME (DD:HH:MM:SS)   DATA (kilobytes)   BANDWIDTH (kbps)
  DN  CFGD DN  CURREN DN  CFGD UP  CURR DN  CFGD DN  CURREN DN  CFGD DN  CURREN
```
```
time_and_data  5:13:20:00  5:12:00:50
neither         till expiry 221:19:44:54
2000           until expiry
```
```
data_only  512000  433727
800             127587
```
```
time_only     3:11:20:00  3:11:19:47
800             127587
```
```
```
```
```
Current time: 17:15:07
rfs4000-229D58(config-captive-portal-wdws)#
```
6.1.51 `reload`

Displays scheduled reload information for a specific device

```plaintext
NOTE: This command is not present in the USER EXEC mode.
```

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**
```
show reload {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**
- `show reload {on <DEVICE-OR-DOMAIN-NAME>}`

<table>
<thead>
<tr>
<th>reload {on &lt;DEVICE-OR-DOMAIN-NAME&gt;}</th>
<th>Displays scheduled reload information for a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt; – Optional. Displays configuration on a specified device</td>
<td></td>
</tr>
<tr>
<td>&lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**
```
rfs7000-37FABE(config)#show reload
No reload is scheduled.
rfs7000-37FABE(config)#
```
6.1.52 rf-domain-manager

Displays RF Domain manager selection details

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show rf-domain-manager
```

**Parameters**

- `on <DEVICE-OR-DOMAIN-NAME>`

<table>
<thead>
<tr>
<th>rf-domain-manager</th>
<th>Displays RF Domain manager selection details</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>Optional. Displays RF Domain manager selection details on a specified device or domain</td>
</tr>
</tbody>
</table>

| <DEVICE-OR-DOMAIN-NAME> | - specify the name of the AP, wireless controller, service platform, or RF Domain. |

**Examples**

```
rfs7000-37FABE(config)#show rf-domain-manager
RF Domain RFDOMAIN_TechPubsLabLan
RF Domain Manager:
    ID: 70.37.FA.BE
    Priority: 180
    Has IP MiNT link
    Has wired MiNT links
Device under query:
    Priority: 180
    Has IP MiNT links
    Has wired MiNT links
rfs7000-37FABE(config)#
```
6.1.53 role

show commands

Displays role based firewall information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show role [ldap-stats|wireless-clients]
show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}

Parameters

- show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>role ldap-stats</th>
<th>Displays LDAP server status and statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>role wireless-clients</td>
<td>Displays clients associated with roles</td>
</tr>
</tbody>
</table>

on <DEVICE-NAME>

The following parameters are common to the 'ldap-stats' and 'wireless-clients' keywords:

- on <DEVICE-NAME> – Optional. Displays clients associated with roles on a specified device
- <DEVICE-NAME> – Specify the name of the AP, wireless controller, and service platform.

Examples

rfs7000-37FABE(config)#show role wireless-clients
No ROLE statistics found.
rfs7000-37FABE(config)#
### 6.1.54 route-maps

- **show commands**
  - Displays route map statistics for defined device routes

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show route-maps {on <DEVICE-NAME>}
```

**Parameters**

- `show route-maps {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-maps</td>
<td>Displays configured route map statistics for all defined routes</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>For more information on route maps, see <a href="#">route-map on page 24-6</a>.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays route map statistics on a specified device</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```bash
rfs7000-37FABE(config)#show route-maps
rfs7000-37FABE(config)#
```
### 6.1.55 rtls

Display the Real Time Location Service (RTLS) statistics for access points contributing locationing information.

#### Supported Platforms
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
show rtls [aeroscout|ekahau] {<MAC/HOSTNAME>} {on <DEVICE-OR-DOMAIN-NAME>}
```

#### Parameters
- **rtls**
  - Displays access point RTLS statistics
- **aeroscout**
  - Displays access point Aeroscout statistics
- **ekahau**
  - Displays access point Ekahau statistics
- **<MAC/HOSTNAME>**
  - Optional. Displays Aeroscout or Ekahau statistics for a specified access point. Specify the MAC address or hostname of the access point.
- **on <DEVICE-OR-DOMAIN-NAME>**
  - The following keyword is recursive and common to ‘Aeroscout’ and ‘Ekahau’ parameters:
    - **on <DEVICE-OR-DOMAIN-NAME>**
      - Optional. Displays Aeroscout or Ekahau statistics on a specified device or domain.
    - **<DEVICE-OR-DOMAIN-NAME>**
      - Specify the name of the AP, wireless controller, service platform, or RF Domain.

#### Examples

```
rfs4000-229D58(config)#show rtls aeroscout

Aeroscout Engine IP: 0.0.0.0 Port: 0
Send Count : 0
Recv Count : 0
Tag Reports : 0
Nacks : 0
Acks : 0
Lbs : 0
AP Status : 0
AP Notif : 0
Send Err : 0
Errmsg Count : 0

Total number of APs displayed: 1
rfs4000-229D58(config)#
```
6.1.56 **running-config**

Displays configuration files (where all configured MAC and IP access lists are applied to an interface)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show running-config {aaa-policy|application|application-policy|association-acl-policy|auto-provisioning-policy|captcha-portal-policy|device|device-overrides|dhcp-server-policy|dhcv6-server-policy|ex3500-management-policy|ex3500-qos-class-map-policy|ex3500-qos-policy-map|firewall-policy|guest-management-policy|include-factory|interface|ip-access-list|ipv6-access-list|mac-access-list|management-policy|nsight-policy|radio-qos-policy|rf-domain|roaming-assist-policy|smart-cache-policy|smart-rf-policy|url-filter|url-list|web-filter-policy|wlan|wlan-qos-policy} {include-factory}
```

```
```

```
show running-config {device {<MAC>|self}} {include-factory}
```

```
show running-config {device-overrides {brief}}
```

```
show running-config {include-factory}
```

```
show running-config {interface} {<INTERFACE-NAME>|ge|include-factory|me|port-channel|pppoel|vlan|wwan1}
```

```
show running-config {interface} {<INTERFACE-NAME>|ge <1-4>|include-factory|me1|port-channel <1-2>|pppoel|vlan <1-4094>|wwan1} {include-factory}
```

```
show running-config {ip-access-list <IP-ACCESS-LIST-NAME>|ipv6-access-list <IPV6-ACCESS-LIST-NAME>|mac-access-list <MAC-ACCESS-LIST-NAME} {include-factory}
```

```
show running-config {meshpoint <MESHPOINT-NAME>} {include-factory}
```

```
show running-config {profile [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rf4000|rf6000|rf7000|nx45xx|nx5550|nx65xx|nx75xx|nx9000|nx9600} {include-factory}
```

```
show running-config {rf-domain <DOMAIN-NAME>} {include-factory}
```

```
show running-config {wlan <WLAN-NAME>} {include-factory}
```

```
show running-config url-filter <URL-FILTER-NAME>
```

```
show running-config url-list <URL-LIST-NAME} {include-factory}
```
### Parameters

- **show running-config** *(device [<MAC>|self]) {include-factory}

- **show running-config** *(device-overrides {brief})

- **show running-config** *(include-factory)

| running-config | Optional. Displays current running configuration
|----------------|------------------------------------------------------------------------------------------------------------------|
| device [<MAC>|self] | Optional. Displays device configuration
| include-factory | The following keyword is common to all policies:
| brief | Optional. Displays a brief summary of device overrides

| include-factory | Optional. Includes factory defaults

### running-config

- **<POLICY-TYPE> <POLICY-NAME>**
  - Optional. Select the policy type, for example, aaa-policy, auto-provisioning-policy, captive-portal-policy etc., and then specify the policy name. The system displays the selected policy’s configuration.
  - **<POLICY-TYPE>**
  - **<POLICY-NAME>** – Specify the name of the policy (should be existing and configured).

- **include-factory**
  - Optional. Includes factory defaults

### device

- **device [<MAC>|self]**
  - Displays a specified device configuration. Specify the MAC address of the device.
  - **<MAC>** – Displays a specified device configuration. Specify the MAC address of the device.
  - **self** – Displays the logged device’s configuration

- **include-factory**
  - The following keyword is common to the `<MAC>` and ‘self’ parameters:
  - **Optional. Displays factory defaults**

### device-overrides

- **device-overrides {brief}**

- **brief** – Optional. Displays a brief summary of device overrides

### interface

- **interface**
  - Optional. Displays interface configuration
  - **<INTERFACE-NAME>**

- **include-factory**
  - Optional. Displays a specified interface configuration. Specify the interface name.
<table>
<thead>
<tr>

3      27      admin     2015-06-11 08:42:43   192.168.100.109    superuser
```

nx4500-5CFA2B>
6.1.60 site-config-diff

Displays the difference in site configuration available on the NOC and a site.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single Network Operations Center (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

NOC controllers possess default site configuration details. Overrides applied at the site level result in a mismatch of configuration at the site and the default site configuration available on the NOC controller. Use this command to view this difference.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show site-config-diff <SITE-NAME>

Parameters

- show site-config-diff <SITE-NAME>

Examples

nx9500-6C874D#show site-config-diff 5C-0E-8B-18-06-F4
---- Config diff for switch 5C-0E-8B-18-06-F4 ----
rfs6000 5C-0E-8B-18-06-F4
interface pppoe1
  no shutdown
nx9500-6C874D#
6.1.61 smart-rf

show commands

Displays Self-Monitoring At Run Time (Smart RF) statistical history to assess adjustments made to device configurations to compensate for detected coverage holes or device failures

When invoked by an administrator, Smart RF instructs access point radios to change to a specific channel and begin beaoming using the maximum available transmit power. Within a well-planned deployment, any RF Domain member access point radio should be reachable by at least one other radio. Smart RF records signals received from its neighbors as well as signals from external, un-managed radios. AP-to-AP distance is recorded in terms of signal attenuation. The information from external radios is used during channel assignment to minimize interference.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show smart-rf [ap|channel-distribution|history|history-timeline|interfering-ap|interfering-neighbors|radio]

show smart-rf ap {<MAC>|<DEVICE-NAME>|activity|energy|neighbors|on <DOMAIN-NAME>}
show smart-rf ap {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME>}
show smart-rf ap {activity|energy|neighbors} [<MAC>|<DEVICE-NAME>] {on <DOMAIN-NAME>}

show smart-rf [channel-distribution|history|history-timeline] {on <DOMAIN-NAME>}

show smart-rf radio {<MAC>|activity|all-11an|all-11bgn|channel|energy|neighbors|on <DOMAIN-NAME>}
show smart-rf radio {<MAC>|all-11an|all-11bgn|energy <MAC>} {on <DOMAIN-NAME>}
show smart-rf radio {activity|neighbors} [<MAC]|all-11an|all-11bgn} {on <DOMAIN-NAME>}

show smart-rf interfering-ap {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>}
show smart-rf interfering-neighbors {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>|threshold <50-100>}

Parameters

- show smart-rf ap {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>smart-rf</th>
<th>Displays Smart RF related information</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap</td>
<td>Displays access point related Smart RF information</td>
</tr>
<tr>
<td>&lt;MAC&gt;</td>
<td>Optional. Uses MAC addresses to identify access points. Displays all access points, if no MAC address is specified.</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Optional. Uses an administrator defined name to identify an access point</td>
</tr>
<tr>
<td>on &lt;DOMAIN-NAME&gt;</td>
<td>Optional. Displays access point details on a specified RF Domain</td>
</tr>
<tr>
<td></td>
<td>• &lt;DOMAIN-NAME&gt; — Specify the domain name.</td>
</tr>
</tbody>
</table>

| show smart-rf ap (activity|energy|neighbors) [<MAC]|<DEVICE-NAME>] {on <DOMAIN-NAME>}) |

<table>
<thead>
<tr>
<th>smart-rf</th>
<th>Displays Smart RF related information</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap</td>
<td>Displays AP related Smart RF information</td>
</tr>
<tr>
<td>Command</td>

</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>show smart-rf</code></td>
<td>Displays Smart RF related information</td>
</tr>
<tr>
<td></td>
<td>• <code>channel-distribution</code> - Displays Smart RF channel distribution information. This provides an overview of how RF Domain member devices are utilizing different channels to optimally support connect devices and avoid congestion and interference with neighboring devices. Assess whether the channel spectrum is being effectively utilized and whether channel changes are warranted to improve RF Domain member device performance.</td>
</tr>
<tr>
<td></td>
<td>• <code>history</code> - Displays Smart RF calibration history. Use this option to view description and types of Smart RF events impacting RF Domain member devices.</td>
</tr>
<tr>
<td><code>activity</code></td>
<td>Optional. Displays Smart RF activity related information Use this option to view the following:</td>
</tr>
<tr>
<td></td>
<td>• Time-period – Lists the frequency Smart RF activity is trended for the RF Domain. Trending periods include the current hour, last 24 hours, or the last seven days. Comparing Smart RF adjustments versus the last seven days enables an administrator to assess whether periods of interference and poor performance were relegated to just specific periods.</td>
</tr>
<tr>
<td></td>
<td>• Power changes – Displays the number of Smart RF initiated power level changes needed for RF Domain member devices during each of the three trending periods. Determine whether power compensations were relegated to known device outages or if compensations were consistent over the course of a day or week.</td>
</tr>
<tr>
<td></td>
<td>• Channel changes – Lists the number of Smart RF initiated channel changes needed for RF Domain member devices during each of the three trending periods. Determine if channel adjustments were relegated to known device count increases or decreases over the course of a day or week.</td>
</tr>
<tr>
<td></td>
<td>• Coverage changes – Displays the number of Smart RF initiated coverage changes needed for RF Domain member devices during each of the three trending periods. Determine if coverage changes were relegated to known device failures or known periods of interference over the course of a day or week.</td>
</tr>
<tr>
<td><code>energy</code></td>
<td>Optional. Displays AP energy for a specified AP or all APs Use this option to view an RF Domain member access point’s operating channels, noise level and neighbor count. This information helps assess whether Smart RF neighbor recovery is needed in respect to poorly performing access points.</td>
</tr>
<tr>
<td><code>neighbors</code></td>
<td>Optional. Displays AP neighbors Use this option to view attributes of neighbor radio resources available for Smart RF radio compensations for other RF Domain member device radios.</td>
</tr>
<tr>
<td>`{&lt;MAC&gt;</td>
<td>&lt;DEVICE-NAME&gt;}`</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;MAC&gt;</code> – Displays all of the above mentioned information for a specified AP, identified by its MAC address. Specify the AP’s MAC address.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;DEVICE-NAME&gt;</code> – Displays all of the above mentioned information for a specified AP, identified by its hostname. Specify the AP’s hostname.</td>
</tr>
<tr>
<td><code>on &lt;DOMAIN-NAME&gt;</code></td>
<td>Optional. Displays access point details on a specified RF Domain</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;DOMAIN-NAME&gt;</code> – Specify the domain name.</td>
</tr>
</tbody>
</table>
### SHOW COMMANDS

#### history-timeline
Displays extended Smart RF calibration history on an hourly or daily timeline
Use this option to view the time stamp when Smart RF status was updated on behalf of a Smart RF adjustment within the selected RF Domain.

<table>
<thead>
<tr>
<th>on &lt;DOMAIN-NAME&gt;</th>
<th>The following keyword is common to all of the above parameters:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• on &lt;DOMAIN-NAME&gt; – Optional. Displays Smart RF configuration, based on the parameters passed, on a specified RF Domain</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DOMAIN-NAME&gt; – Specify the RF Domain name.</td>
</tr>
</tbody>
</table>

- `show smart-rf radio {<MAC>|all-11an|all-11bgn|energy <MAC>} {on <DOMAIN-NAME>}`

#### smart-rf
Displays Smart RF related information

#### radio
Displays radio related commands

- `<MAC>` Optional. Displays details of a specified radio. Specify the radio’s MAC address in the AA-BB-CC-DD-EE-FF format.
- `all-11an` Optional. Displays all 11a radios currently in the configuration
- `all-11bgn` Optional. Displays all 11bg radios currently in the configuration

- `energy {<MAC>}` Optional. Displays radio energy
  - `<MAC>` – Optional. Specify the radio’s MAC address in the AA-BB-CC-DD-EE-FF format.
  - Use this option to view an RF Domain member access point radio’s operating channel, noise level and neighbor count. This information helps assess whether Smart RF neighbor recovery is needed in respect to poorly performing radios.

- `on <DOMAIN-NAME>` The following keyword is common to all of the above parameters:
  - `on <DOMAIN-NAME>` – Optional. Displays radio details on a specified RF Domain
  - `<DOMAIN-NAME>` – Specify the RF Domain name.

- `show smart-rf radio {activity|neighbors} {<MAC>|all-11an|all-11bgn} {on <DOMAIN-NAME>}`

#### smart-rf
Displays Smart RF related information

#### radio
Displays Smart RF radio related commands

- `activity` Optional. Displays changes related to radio power, number of radio channels, or coverage holes. Use additional filters to view specific details.
- `<MAC>` Optional. Displays radio activity for a specified radio
  - `<MAC>` – Specify the radio’s MAC address.
- `all-11an` Optional. Displays radio activity of all 11a radios in the configuration
- `all-11bgn` Optional. Displays radio activity of all 11bg radios in the configuration

- `on <DOMAIN-NAME>` Optional. Displays radio activity of all radios within a specified RF Domain
  - `<DOMAIN-NAME>` – Specify the RF Domain name.

- `show smart-rf interfering-ap {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>}`

#### smart-rf
Displays Smart RF related information

#### interfering-ap
Displays interfering access points (requiring potential isolation) information
show smart-rf interfering-neighbors {<MAC>|<DEVICE-NAME>|on <DOMAIN-NAME>|threshold <50-100>}

smart-rf Displays Smart RF related information
interfering-ap Displays interfering neighboring access point information

<MAC> Optional. Displays interfering neighboring access point information
• <MAC> – Specify the access point’s MAC address.

Note: Considers all APs if this parameter is omitted

<DEVICE-NAME> Optional. Displays interfering neighboring access point information on a specified device
• <DEVICE-NAME> – Specify the device name.

Note: Considers all APs if this parameter is omitted

on <DOMAIN-NAME> Optional. Displays all interfering neighboring access point information within a specified RF Domain
• <DOMAIN-NAME> – Specify the RF Domain name.

threshold <50-100> Optional. Specifies the maximum attenuation threshold of interfering neighbors.
• <50-100> – Specify a value from 50 -100 dB.
Attenuation is a measure of the reduction of signal strength during transmission. Attenuation is the opposite of amplification, and is normal when a signal is sent from one point to another. If the signal attenuates too much, it becomes unintelligible. Attenuation is measured in decibels.

on <DOMAIN-NAME> Optional. Displays radio activity of all radios within a specified RF Domain
• <DOMAIN-NAME> – Specify the RF Domain name.

rfs7000-37FABE(config)#
6.1.62 spanning-tree

Displays spanning tree utilization information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show spanning-tree mst {configuration|detail|instance|on <DEVICE-NAME>}
show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}
show spanning-tree mst {detail} {interface|on}
show spanning-tree mst {detail} interface {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {(on <DEVICE-NAME>)}
show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>} {(on <DEVICE-NAME>)}

Parameters

- show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}

<table>

Contd..
**show spanning-tree mst**

{instance <1-15>} {interface <INTERFACE-NAME>}

**on <DEVICE-NAME>**

The following keyword is common to all interfaces:

- on <DEVICE-NAME> – Optional. Displays detailed MST configuration on a specified device
- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

```
• show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>}
{on <DEVICE-NAME>)}
```

---

**spanning-tree**

Displays spanning tree information

**mst**

Displays MST configuration. Use additional filters to view specific details.

**instance <1-15>**

Optional. Displays information for a particular MST instance

- <1-15> – Specify the instance ID from 1 - 15.

**interface <INTERFACE-NAME>**

Optional. Displays MST configuration for a specific interface instance. The options are:

- <INTERFACE-NAME> – Displays MST configuration for a specified interface. Specify the interface name.

**on <DEVICE-NAME>**

Optional. Displays MST configuration on a specified device

- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

---

### Examples

**rfs7000-37FABE(config)#show spanning-tree mst configuration**

### 6.1.63 startup-config

#### Show commands

Displays complete startup configuration script

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show startup-config {include-factory}
```

**Parameters**

- `include-factory` — Optional. Includes factory defaults

**Examples**

```
nx4500-5CFA2B# show startup-config

! Configuration of NX4500 version 5.8.1.0-037B

```
6.1.64 t5

Show commands
Displays adopted T5 controller statistics
Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7510, NX7520, NX9000,
  NX9500, NX9510, NX9600

NOTE: This command is applicable only on WiNG controllers with adopted and managed T5 controllers.

Syntax
show t5 [boot|clock|cpe|interface|mac|system|temperature|uptime|version|wireless] {on <DEVICE-NAME>}

Parameters
- show t5 [boot|clock|cpe|interface|mac|system|temperature|uptime|version|wireless] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>t5</th>
<th>Displays adopted T5 controller statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>boot</td>
<td>Displays the T5 device’s boot details. Use this option to view the primary and secondary image files available to use for booting up.</td>
</tr>
<tr>
<td>clock</td>
<td>Displays the T5 controller’s system time, as reported from the controller itself or its remote NTP time resource</td>
</tr>
<tr>
<td>cpe</td>
<td>Displays the following details for T5 controller managed CPEs:</td>
</tr>
<tr>
<td></td>
<td>• address – Displays each CPE’s current IP address used as its network identifier</td>
</tr>
<tr>
<td></td>
<td>• boot – Displays the primary and secondary firmware versions available to each CPE, along with status of the most recent upgrade operation.</td>
</tr>
<tr>
<td></td>
<td>• ether port status – Displays Ethernet port status</td>
</tr>
<tr>
<td></td>
<td>• led – Displays whether the CPEs currently have their LEDs enabled or disabled. In places like hospitals, its not uncommon for access points to be operational, but their LEDs off as to not disturb patients.</td>
</tr>
<tr>
<td></td>
<td>• reset – Displays the number times a CPE has been reset</td>
</tr>
<tr>
<td></td>
<td>• system – Displays device hardware and SKU information for each CPE. Use this information to assess whether a controller is managing the correct CPE devices out of the total number of CPEs available.</td>
</tr>
<tr>
<td></td>
<td>• uptime – Displays the time each CPE device has been actively deployed and operational</td>
</tr>
<tr>
<td></td>
<td>• version – Displays the application and boot versions utilized by the CPE devices</td>
</tr>
</tbody>
</table>

Note: Use this screen to verify each CPE address credentials and whether currently disconnected or ready for radio coverage area support.
interface Displays T5 interface-related statistics. The interface options are:
- dsl – Displays DSL interface related information
- fe – Displays FE interface related information
- ge – Displays GE interface related information
- radio – Displays radio interface related information
The system displays the following information for the DSL, GE, and FE ports:
- counters – Displays the following:
  - Number of octets (bytes) received and transmitted on this port
  - Number of data packets received and transmitted on this port
  - Number of flow control (layer 2) packets received and transmitted on this port
- description – Displays the following:
  - The selected port’s name
  - The numeric index assignable to each port
  - The 64 character maximum, unique, administrator-assigned description to each port
- status – Displays the following:
  - The selected port’s name
  - Whether the port is currently up or down as a T5 controller transmit and receive resource
  - The port’s current speed in MB
  - Whether pause packet utilization is currently off or on for the port
  - Whether each listed port is enabled or disabled by the administrator
- utilization – Displays the following:
  - The selected port’s name
  - The port’s receive and transmit data rates (in Kbps)
  - A packet per second port receive and transmit rate (p/s)
  - Each port’s receive and transmit direction utilization as a percentage of transmit bandwidth available
The system displays the following information specific to the DSL port:
- custom – Displays the following DSL-related data:
  - Lists each DSL’s average response time in microseconds.
  - Lists each DSL’s maximum (best to date since last refresh) response time in microseconds.
  - Lists the number of seconds downstream DSL transmissions were negatively impacted by code violations.
  - Lists the number of seconds downstream DSL transmissions were severely negatively impacted by code violations.
  - Lists the number of seconds upstream DSL transmissions were negatively impacted by code violations.
  - Lists the number of seconds upstream DSL transmissions were severely negatively impacted by code violations.
• **errors** – Displays the following DSL-related errors:
  - The name of the DSL utilized by each T5 controller connected CPE device.
  - The number of Fecs detected in the downstream direction. *Forward Error Correction* (FEC) or channel coding is used for controlling errors over unreliable or noisy communication channels.
  - The number of CPE DSL coding violations (badly coded packets) detected in the downstream direction.
  - The number of Fecs detected in the upstream direction.
  - The number of CPE DSL coding violations (badly coded packets) detected in the upstream direction.

The system displays the following information for each listed **radio** interface:

• **status** – Displays the following:
  - Administrator assigned name of each listed CPE radio as its unique identifier.
  - Whether the selected radio is currently up or down in its ability to be a radio coverage resource for its managing T5 controller.
  - The factory encoded MAC address.
  - The configured transmit power.
  - The current transmit channel.

• **statistics** – Displays the following:
  - The radio's receive and transmit data rate (in Kbps). Use this information to assess RF activity versus other T5 managed CPE radios in the same radio coverage area.
  - The number of octets (bytes) received and transmitted with no errors by the CPE radio.
  - The number of data packets received or transmitted by the CPE radio.

• **WLAN map** – Displays the following:
  - The managed WLAN(s) to which each listed radio has been mapped.

| **mac** | Displays T5 MAC address table. Use the additional filters to filter on the basis of the VLAN or DSL interface. |
| **system** | Displays T5 controller’s system information, which includes the T5 controller’s hostname, MAC address, RF Domain, system clock, uptime. |
| **temperature** | Displays T5 controller’s current temperature. |
| **uptime** | Displays the T5 controller’s uptime (the time it has been actively deployed and operational). |
| **version** | Displays the T5 controller’s primary and secondary firmware images. |
**Examples**

The following examples are for show commands executed on the 't5-ED5EE8' controller adopted by the 'rfs7000-37FABE' wireless controller:

```
rfs7000-37FABE#show t5 boot on t5-ED5EE8

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`show terminal`

**Parameters**

None

**Examples**

```
show terminal
Terminal Type: xterm
Length: 24    Width: 200
```

```
rfs7000-37FABE(config)#show terminal
```
6.1.66 timezone

- **show commands**
  Displays a device’s timezone

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`show timezone`

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config)#show timezone
Timezone is America/Los_Angeles
rfs7000-37FABE(config)#
```
### 6.1.67 traffic-shape

> **show commands**

Displays traffic-shaping related configuration details and statistics.

Traffic shaping regulates network data transfers to ensure a specific performance level. Traffic shaping delays the flow of packets defined as less important than prioritized traffic streams. Traffic shaping enables traffic control out an interface to match its flow to the speed of a remote target’s interface and ensure traffic conforms applied policies. Traffic can be shaped to meet downstream requirements and eliminate network congestion when data rates are in conflict.

Apply traffic shaping to specific applications to apply application categories. When application and ACL rules are conflicting, ACL rules take precedence for the traffic shaping class. Using traffic shaping, an application takes precedence over an application category.

Supported in the following platforms:

- Access Points — AP622, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530

#### Syntax

```
show traffic-shape [priority-map|statistics {class <1-4>}|status] {on <DEVICE-NAME>}
```

#### Parameters

- **show traffic-shape [priority-map|statistics {class <1-4>}|status] {on <DEVICE-NAME>}**

<table>
<thead>
<tr>
<th>traffic-shape</th>
<th>Displays traffic-shaping related configuration details and statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority-map</td>
<td>Displays the traffic shaper queue priority. There are 8 queues (0 - 7), and traffic is queued in each based on incoming packets 802.1p markings.</td>
</tr>
<tr>
<td>statistics class &lt;1-4&gt;</td>
<td>Displays traffic-shaping related statistics for all traffic shaper classes or for a selected class</td>
</tr>
<tr>
<td>status</td>
<td>Displays the controller or service platform’s traffic shaping status (whether running or not)</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays traffic-shaping related configuration details and statistics on a specified device</td>
</tr>
</tbody>
</table>

#### Examples

```
ap7532-DEB9B0#show traffic-shape priority-map
----------------------------------------------------------
DOT1P-PRIORITY   TX-SHAPER-PRIORITY
0                2

### 6.1.68 upgrade-status

<table>
<thead>
<tr>
<th>show commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the last image upgrade status</td>
</tr>
</tbody>
</table>

**NOTE:** This command is not available in the USER EXEC Mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show upgrade-status {detail|on}
show upgrade-status {detail} {(on <DEVICE-NAME>)}
```

**Parameters**

- `show upgrade-status {detail|on}`
- `on <DEVICE-NAME>`

<table>
<thead>
<tr>
<th>upgrade-status</th>
<th>Displays last image upgrade status and log</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail</td>
<td>Optional. Displays last image upgrade status in detail</td>
</tr>
</tbody>
</table>

- The following keyword is recursive and common to the `detail` parameter:
  - `on <DEVICE-NAME>` – Optional. Displays last image upgrade status on a specified device
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

**Note:** If the `on` keyword is used without the `detail` keyword, the system displays a summary of upgrade status and log on the specified device.

**Examples**

```
rfs4000-229D58# show upgrade-status
Last Image Upgrade Status: In_Progress (3 percent completed)
Last Image Upgrade Time: 2015-06-08 08:37:45
rfs4000-229D58#
```

```
rfs4000-229D58# show upgrade-status
Last Image Upgrade Status: Successful
Last Image Upgrade Time: 2015-06-08 08:45:54
rfs4000-229D58#
```

```
rfs4000-229D58(config)# show upgrade-status detail

rfs4000-229D58(config)#
6.1.69 version

> show commands

Displays a device’s software and hardware version

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show version {on <DEVICE-NAME>}
```

Parameters

- `show version {on <DEVICE-NAME>}`

| version {on <DEVICE-NAME>} | Displays software and hardware versions on all devices or a specified device  
- on <DEVICE-NAME> – Optional. Displays software and hardware versions on a specified device  
- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

Examples

```
rfs4000-229D58(config)#show version
RFS4000 version 5.8.1.0-037B
Copyright (c) 2004-2015 Symbol Technologies, Inc. All rights reserved.
Booted from secondary

CPU is Cavium Networks Octeon CN50XX V0.1
Base ethernet MAC address is 00-23-68-22-9D-58
System serial number is 9184521800027
Model number is RFS-4010-00010-WR
PoE firmware version is 211 build 1
FPGA version is 2.26
Radio HAL version is 92 (DFS:73)
```

```
rfs4000-229D58(config)#
```
### 6.1.70 vrrp

**show commands**

Displays the following Virtual Router Redundancy Protocol (VRRP) related statistics: configuration error, router redundancy information in brief and detail. VRRP configuration errors include mismatch of authentication credentials, invalid packet checksums, invalid packet types, invalid virtual route IDs, TTL errors, packet length errors and invalid (non matching) VRRP versions.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show vrrp [brief|details|stats] {<1-255>} {(on <DEVICE-NAME>)}
show vrrp error-stats {on <DEVICE-NAME>}
```

**Parameters**

- **vrrp [brief|details|stats] {<1-255>} {(on <DEVICE-NAME>)}**
  - **brief** Displays VRRP related statistics in brief or in detail depending on the option selected.
  - **details** Displays virtual router information in brief.
  - **stats** Displays virtual router information in detail.
  - **<1-255>** The following keyword is common to all of the above parameters:
    - **<1-255>** – Optional. Displays information for a specified Virtual Router. Specify the router's ID from 1 - 255.
  - **on <DEVICE-NAME>** The following keyword is recursive and common to the '<1-255>' parameter:
    - **on <DEVICE-NAME>** – Optional. Displays specified router information on a specified device.
    - **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

- **show vrrp error-stats {on <DEVICE-NAME>**

```
error-stats {on <DEVICE-NAME>}
```

- **error-stats {on <DEVICE-NAME>**
  - **error-stats** Displays VRRP related statistics in brief or in detail depending on the option selected.
  - **on <DEVICE-NAME>** Displays global error statistics:
    - **on <DEVICE-NAME>** – Optional. Displays global error statistics on a specified device.
    - **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.
**Examples**

```plaintext
rfs7000-37FABE(config)#show vrrp error-stats
Last protocol error reason: none
IP TTL errors: 0
Version mismatch: 0
Packet Length error: 0
Checksum error: 0
Invalid virtual router id: 0
Authentication mismatch: 0
Invalid packet type: 0
rfs7000-37FABE(config)#
```

```plaintext
rfs7000-37FABE(config)#show vrrp details
VRRP Group 1:
  version 2
  interface none
  configured priority 1
  advertisement interval 1 sec
  preempt enable, preempt-delay 0
  virtual mac address 00-00-5E-00-01-01
  sync group disable
rfs7000-37FABE(config)#
```
### 6.1.71 web-filter

* show commands

Displays Web filtering related information

Use this command to view information on Web requests for content and whether the requests were blocked or approved based on URL filter settings defined for the selected controller or service platform. A URL filter is comprised of several filter rules. A whitelist bans all sites except the categories and URL lists defined in the whitelist. The blacklist allows all sites except the categories and URL lists defined in the blacklist.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
show web-filter [category|category-type|config|filter-level [basic|high|low|medium|medium-high]|statistics {on <DEVICE-NAME>}|status]
```

**Parameters**

- `show web-filter [category|category-type|config|filter-level [basic|high|low|medium|medium-high]|statistics {on <DEVICE-NAME>}|status]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>web-filter</td>
<td>Displays an existing and configured Web filter details</td>
</tr>
<tr>
<td>category</td>
<td>Displays Web filter categories. A category is a pre-defined URL list available in the WiNG software.</td>
</tr>
<tr>
<td>category-type</td>
<td>Displays the Web filter category types. This is a pre-configured list of categories and sub-categories in which commonly accessed URLs have been classified.</td>
</tr>
<tr>
<td>config</td>
<td>Displays all existing Web filters and their configuration details</td>
</tr>
<tr>
<td>filter-level [basic</td>
<td>high</td>
</tr>
<tr>
<td>statistics {on &lt;DEVICE-NAME&gt;}</td>
<td>Displays Web filter statistics on a specified device</td>
</tr>
<tr>
<td>status {on &lt;DEVICE-NAME&gt;}</td>
<td>Displays Web filter status on a specified device</td>
</tr>
</tbody>
</table>

**Note:** Web filtering is a licensed feature, and only when enforced can the system display Web filtering statistics.
Examples

```
nx9500-6C8809(config)#show web-filter category
    advertisement-popups
        Sites that provide advertising graphics or other ad content files such as banners and pop-ups.
    alcohol-tobacco
        Sites that promote or sell alcohol- or tobacco-related products or services.
    anonymizers
        Sites and proxies that act as an intermediary for surfing to other websites in an anonymous fashion, whether to circumvent web filtering or for other reasons.
    arts
        Sites with artistic content or relating to artistic institutions such as theaters, museums, galleries, dance companies, photography, and digital graphic resources.
    botnets
        Sites that use bots (zombies) including command-and-control sites.
--More--
nx9500-6C8809(config)#
```

```
nx9500-6C8809(config)#show web-filter config
URL filters configured for this device are:
    WebFilter_ShoppingSites
        Blacklisted categories:
            shopping,
        Whitelisted categories:
            <AllowedShopping>,
nx9500-6C8809(config)#
```
### 6.1.72 what

**show commands**

Displays details of a specified search phrase (performs global search)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show what [contain|is] <WORD> {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contain &lt;WORD&gt;</td>
<td>Searches on all the items that contain a specified word</td>
</tr>
<tr>
<td></td>
<td>• &lt;WORD&gt; – Specify a word to search (for example, MAC address, hostname etc.)</td>
</tr>
<tr>
<td>is &lt;WORD&gt;</td>
<td>Searches on an exact match</td>
</tr>
<tr>
<td></td>
<td>• &lt;WORD&gt; – Specify a word to search (for example, MAC address, hostname etc.)</td>
</tr>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>Optional. Performs global search on a specified device or RF Domain</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller,</td>
</tr>
<tr>
<td></td>
<td>service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58#show what contain default
---------------------------------------------------------------------------------------
NO. CATEGORY             MATCHED                        OTHER KEY INFO (1)             OTHER KEY INFO (2)             OTHER KEY INFO (3)             OTHER
NAME/VALUE                     NAME/VALUE                     NAME/VALUE                     NAME/VALUE                     NAME/VALUE

6.1.73 wireless

- **show commands**
  Displays wireless configuration parameters

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```bash
show wireless [ap|bridge|client|meshpoint|mobility-database|radio|regulatory|rf-domain|sensor-server|unsanctioned|wips|wlan]

show wireless ap {configured|detail|load-balancing|on <DEVICE-NAME>}
show wireless ap {configured}
show wireless ap {detail} {<MAC/HOST-NAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
show wireless ap {load-balancing} {client-capability|events|neighbors} {(on <DEVICE-NAME>)}

show wireless bridge {candidate-ap|certificate|config|hosts|on|statistics}
show wireless bridge {candidate-ap} {<MAC/HOSTNAME> {1-3}} {(filter radio-mac <RADIO-MAC>) {(on <DEVICE-OR-DOMAIN-NAME>)}}

### Command Overview

- **show wireless ap**
  - `load-balancing` {client-capability|events|neighbors}
  - `{on <DEVICE-NAME>}`
  - Displays wireless configuration parameters.
  - Displays managed access point information.

- **show wireless bridge**
  - `candidate-ap` {<MAC/HOSTNAME> {<1-3>}}
  - `{filter radio-mac <RADIO-MAC>}`
  - `{on <DEVICE-OR-DOMAIN-NAME>}`
  - Optional. Displays information about the candidate infrastructure access points as well as the infrastructure access point that the client-bridge radio has selected.
  - Note: When enabled, the client-bridge radio scans its defined channels to locate the best candidate access point servicing the infrastructure WLAN.

- **show wireless bridge certificate status** `{on <DEVICE-NAME>}`
  - Displays all client bridges in configuration and the status of their PKCS#12 certificates.
  - Optional. Executes the command on a specified device or devices within a specified RF Domain.
  - `on <DEVICE-OR-DOMAIN-NAME>` – Specify the AP, controller, service platform, or Domain name.

### Command Details

- **load-balancing**
  - `client-capability|events|neighbors` Optional. Displays load balancing status. Use additional filters to view specific details.
    - `events` – Optional. Displays client events.
    - `neighbors` – Optional. Displays neighboring clients.

- **on <DEVICE-NAME>**
  - The following keyword is recursive and common to the ‘client-capability’, ‘events’, and ‘neighbors’ parameters.
    - `on <DEVICE-NAME>` – Optional. Displays load balancing information, based on the parameters passed, on a specified device.
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- **bridge candidate-ap**
  - Optional. Displays information about the candidate infrastructure access points as well as the infrastructure access point that the client-bridge radio has selected.

- **<MAC/HOSTNAME> <1-3>**
  - Optional. Specify the client-bridge access point’s hostname or MAC address. Optionally append the radio interface’s number to form client-bridge in the form of AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX.
  - `<1-3>` – Optional. Radio interface index if not specified as part of mesh ID.

- **filter radio-mac <RADIO-MAC>**
  - This is a recursive parameter and common to all of the above options.
  - `filter radio-mac` – Optional. Provides additional filters to specifically identify the radio by its MAC address.
  - `<RADIO-MAC>` – Specify the radio’s MAC address.

- **on <DEVICE-OR-DOMAIN-NAME>**
  - This is a recursive parameter and common to all of the above options.
  - `on <DEVICE-OR-DOMAIN-NAME>` – Optional. Executes the command on a specified device or devices within a specified RF Domain.
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the AP, controller, service platform, or Domain name.

### Additional Commands

- **show wireless bridge {certificate} status {on <DEVICE-NAME>]**
  - Displays wireless configuration statistics.

- **show wireless bridge {config}**
  - Displays wireless configuration statistics.
### bridge config
Optional. Displays all client bridges in configuration
The output displays the configured client-bridges’ hostname, MAC address, profile, RF Domain, SSID, band, encryption, authentication, and EAP username.

### show wireless bridge {hosts} {on <DEVICE-OR-DOMAIN-NAME>}

### wireless
Displays wireless configuration statistics

### bridge hosts
Optional. Displays the client bridge host information
The output displays the configured client-bridges’ host’s MAC Address, bridge MAC address, IPv4 address, bridging status, and activity
**Note:** The HOST MAC column displays real MAC addresses of wired hosts, while the BRIDGE MAC column displays the translated MAC addresses. The BRIDGE MAC column is based on the radio 2 base MAC address and increments by 1 for each wired host connected to the client bridges Ge1 port.

### on <DEVICE-OR-DOMAIN-NAME>
Optional. Executes the command on a specified device or devices within a specified RF Domain
• <DEVICE-OR-DOMAIN-NAME> – Optional. Specify the AP, controller, service platform, or Domain name.

### show wireless bridge {statistics} {rf|traffic} {on <DEVICE-OR-DOMAIN-NAME>}

### wireless
Displays wireless configuration statistics

### bridge statistics
Optional. Displays the client-bridge related statistics

### rf
Optional. Displays the client-bridge related RF statistics
The output displays the signal, noise, SNR, TX/RX rates, retries, and errors.

### traffic
Optional. Displays the client-bridge related traffic statistics
The output displays TX/RX bytes, TX/RX packets, TX/RX bits/second, and dropped packets.

### on <DEVICE-OR-DOMAIN-NAME>
Optional. Executes the command on a specified device or devices within a specified RF Domain
• on <DEVICE-OR-DOMAIN-NAME> – Optional. Specify the AP, controller, service platform, or Domain name.

### show wireless client {association-history <MAC>} {on <DEVICE-OR-DOMAIN-NAME>}

### wireless
Displays wireless configuration parameters

### client
Displays client information based on the parameters passed

### association-history <MAC>
Optional. Displays association history for a specified client
• <MAC> – Specify the MAC address of the client.

### on <DEVICE-OR-DOMAIN-NAME>
Optional. Displays association history on a specified device or RF Domain
• <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

### show wireless client {detail <MAC>} {on <DEVICE-OR-DOMAIN-NAME>}

### wireless
Displays wireless configuration parameters

### client
Displays client information based on the parameters passed

</tbody>
</table>
| include-ipv6 {filter} | Optional. Includes IPv6 address (if known) of wireless clients  
  • filter – Optional. Defines additional filters. Use one of the following options to filter clients: ip, ipv6, state, and wlan  
  **Note:** By default the system only displays the IPv4 address of clients. The include-ipv6 parameter includes the known IPv6 address of each client. |
| ip [<IPv4>|not <IPv4>] | Optional. Displays wireless client information based on the IPv4 address passed  
  • <IPv4> – Displays information of the client identified by the <IPv4> parameter  
  • not <IPv4> – Inverts the match selection |
| ipv6 [<IPv6>|not <IPv6>] | Optional. Displays wireless client information based on the IPv6 address passed  
  • <IPv6> – Displays information of the client identified by the <IPv6> parameter  
  • not <IPv6> – Inverts the match selection |
| filter state [data-ready|not [data-ready|roaming]|roaming] | Optional. Filters wireless client information based on their state  
  • data-ready – Displays information of wireless clients in the data-ready state  
  • not [data-ready|roaming] – Inverts match selection. Displays information of wireless clients neither ready nor roaming  
  • Roaming – Displays information of roaming clients |
| wlan [<WLAN-NAME>|not <WLAN-NAME>] | Optional. Displays wireless client information based on the WLAN name passed  
  • <WLAN-NAME> – Specify the WLAN name.  
  • not <WLAN-NAME> – Inverts match selection |

• show wireless meshpoint {config} {filter {device <DEVICE-NAME>|rf-domain <DOMAIN-NAME>}}

| wireless | Displays wireless configuration parameters. Use this option to view detailed statistics on each Mesh-capable client available within controller’s adopted access point’s radio coverage area.  
  A mesh network is where one where each node is able to communicate with other nodes and maintain more then one path to the other mesh nodes within the mesh network. A mesh network provides robust, reliable and redundant connectivity to all the members of the mesh network. When one member of the mesh network becomes unavailable, the other mesh nodes are still able to communicate with one another either directly or indirectly through intermediate nodes. |
| meshpoint | Displays meshpoint related information |
show wireless meshpoint
{detail} {<MESHPOINT-NAME>}

wireless
Displays wireless configuration parameters

meshpoint
Displays meshpoint related information. Use this option to view detailed statistics on each Mesh-capable client available within controller’s adopted access point’s radio coverage area.

A mesh network is where one where each node is able to communicate with other nodes and maintain more then one path to the other mesh nodes within the mesh network. A mesh network provides robust, reliable and redundant connectivity to all the members of the mesh network. When one member of the mesh network becomes unavailable, the other mesh nodes are still able to communicate with one another either directly or indirectly through intermediate nodes.

detail
{<MESHPOINT-NAME>}
Optional. Displays detailed information for all meshpoints or a specified meshpoint

• <MESHPOINT-NAME> – Optional. Displays detailed information for a specified meshpoint. Specify the meshpoint name.

show wireless meshpoint
{multicast|path|proxy|root|security|statistics}
[<MESHPOINT-NAME>|detail] {on <DEVICE-OR-DOMAIN-NAME>}

wireless
Displays wireless configuration parameters

meshpoint
Displays meshpoint related information. Use this option to view detailed statistics on each Mesh-capable client available within controller’s adopted access point’s radio coverage area.

SHOW COMMANDS 6-167

Usage Guidelines

The customize command enables you to customize the `show > wireless` command output.

```
rfs7000-37FABE(config)#customize ?
hostname-column-width                  Customize hostname column width
show-adoption-status                   Customize the output of (show adoption status) command
show-wireless-client                  Customize the output of (show wireless client) command
show-wireless-client-stats           Customize the output of (show wireless client stats) command
show-wireless-client-stats-rf        Customize the output of (show wireless client stats rf) command
show-wireless-legacy-mesh-client-stats Customize the output of (show wireless legacy-mesh client stats) command
show-wireless-legacy-mesh-client-stats-detail Customize the output of (show wireless legacy-mesh client stats detail) command
show-wireless-legacy-mesh-client-stats-rf Customize the output of (show wireless legacy-mesh client stats rf) command
show-wireless-meshpoint              Customize the output of (show wireless meshpoint) command
show-wireless-meshpoint-accelerated-multicast Customize the output of (show wireless meshpoint accelerated-multicast) command
show-wireless-meshpoint-neighbor-stats Customize the output of (show wireless meshpoint neighbor stats) command
show-wireless-meshpoint-neighbor-stats-rf Customize the output of (show wireless meshpoint neighbor stats rf) command
show-wireless-radio                  Customize the output of (show wireless radio) command
show-wireless-radio-stats           Customize the output of (show wireless radio stats) command
show-wireless-radio-stats-rf        Customize the output of (show wireless radio stats rf) command
```

The default setting for the `show > wireless > client` command is as follows:

```
rfs7000-37FABE(config)#show wireless client
---------------------------------------------------------------------------------------
MAC      IPv4    VENDOR             RADIO-ID             WLAN                 VLAN         STATE
---------------------------------------------------------------------------------------
---------------------------------------------------------------------------------------
Total number of wireless clients displayed: 0
```

The above output can be customized, using the `customize > show-wireless-client` command, as follows:
For more information on the customize command, see *customize*.

### 6.1.74 wwan

**show commands**

Displays wireless WAN status

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

- `show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}`

<table>

2    []   wing   Enabled
3    []   wing   Enabled
4    []   wing   Enabled
-----------------------------
nx4500-5CFA2B>
```
6.1.76 smart-cache

show commands
Displays details on the cached entry for a specific URL or all URLs

NOTE: Smart content caching is a licensed feature and can be enabled only if a license is procured and applied to the device. For more information, see smart-rf-policy.

Supported in the following platforms:
• Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax
show smart-cache [active-requests|clients|purge-requests|statistics content-type|storage] {on <DEVICE-NAME>}

Parameters
• show smart-cache [active-requests|clients|purge-requests|statistics content-type|storage] {on <DEVICE-NAME>}

Examples
nx4500-5CFA2B>show smart-cache statistics
Warning: no smart-cache license installed, smart-cache is not running.
Warning: name-server not configured, smart-cache may not work.
-------------------------------------------------------------------------------
| DURATION   | DATA (KB)   | BANDWIDTH (Kbps) | REQUESTS |

```
6.1.77 virtual-machine

show commands

Displays the virtual-machine (VM) configuration, logs, and statistics

Supported in the following platforms:
  • Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

show virtual-machine [configuration|debugging|export|statistics]

show virtual-machine [configuration|statistics] {<VM-NAME>|team-urc|team-rls|team-vowlan} {(on <DEVICE-NAME>)}

show virtual-machine debugging {level|on}
show virtual-machine debugging {level [debug|error|info|warning]} {on <DEVICE-NAME>}

show virtual-machine export <VM-NAME> {on <DEVICE-NAME>}

The NX9500 and NX9510 series service platforms support ADSP and TEAM-CMT virtual machines only. The following show commands are specific to the NX9500 and NX9510 devices:

show virtual-machine [configuration|statistics] {<VM-NAME>|adsp|team-cmt}

Parameters

• show virtual-machine [configuration|statistics] {<VM-NAME>|team-urc|team-rls|team-vowlan} {(on <DEVICE-NAME>)}

<table>
<thead>
<tr>
<th>virtual-machine</th>
<th>Displays the following VM-related information: configuration or statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Displays detailed VM configuration</td>
</tr>
<tr>
<td>statistics</td>
<td>Displays VM statistics</td>
</tr>
<tr>
<td>[ &lt;VM-NAME&gt;</td>

</tr>
<tr>
<td></td>
<td>• &lt;VM-NAME&gt; – Optional. Displays VM configuration or statistics for the virtual machine identified by the &lt;VM-NAME&gt; keyword. Specify the VM name.</td>
</tr>
<tr>
<td></td>
<td>• team-urc – Optional. Displays TEAM-URC (IP-PBX) VM configuration/statistics</td>
</tr>
<tr>
<td></td>
<td>• team-rls – Optional. Displays TEAM-RLS (Radio Link Server) VM configuration/statistics</td>
</tr>
<tr>
<td></td>
<td>• team-vowlan – Optional. Displays TEAM-VoWLAN (Voice over WLAN) VM configuration/statistics</td>
</tr>
<tr>
<td></td>
<td>Note: These keywords are specific to the NX45XX and NX65XX series service platforms.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Specifies the name of the device on which the command is executed</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the service platform.</td>
</tr>
</tbody>
</table>

• show virtual-machine [configuration|statistics] {<VM-NAME>|adsp|team-cmt} {(on <DEVICE-NAME>)}

<table>
<thead>
<tr>
<th>virtual-machine</th>
<th>Displays the following VM-related information: configuration or statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Displays detailed VM configuration</td>
</tr>
<tr>
<td>statistics</td>
<td>Displays VM statistics</td>
</tr>
</tbody>
</table>
### Command Syntax

```
show virtual-machine configuration team-urc
VM: team-urc
  autostart       : start
  bootloader      : /usr/bin/pygrub
  cpus            : ['3', '2']
  disk            : file:/vms/test/team-centro/disk,xvda,w
  maxmem          : 3584 MB
  maxvcpus        : 2
  memory          : 1200 MB
  name            : team-urc
  on_crash        : coredump-restart
  on_poweroff     : destroy
  on_reboot       : restart
  serial          : pty
  tty             : /dev/pts/1
  uuid            : b80f8e19-a1f6-02c9-cbbc-10c1ae0a170
```

### Command Description

- **Show Commands**: Displays the following VM-related information: configuration or statistics.
- **Virtual Machine**: Displays VM logs.
- **Export**: Displays VM configuration export related information.
- **Level**: Optional. Displays VM logs based on the selected level.
- **Device Name**: Optional. Specifies the name of the device on which the command is executed.

### Examples

```
nx4500-5CFA2B# show virtual-machine configuration team-urc
VM: team-urc
  autostart       : start
  bootloader      : /usr/bin/pygrub
  cpus            : ['3', '2']
  disk            : file:/vms/test/team-centro/disk,xvda,w
  maxmem          : 3584 MB
  maxvcpus        : 2
  memory          : 1200 MB
  name            : team-urc
  on_crash        : coredump-restart
  on_poweroff     : destroy
  on_reboot       : restart
  serial          : pty
  tty             : /dev/pts/1
  uuid            : b80f8e19-a1f6-02c9-cbbc-10c1ae0a170
```
vcpus : 1

6.1.78 mirroring

*show commands*

Displays the port mirroring sessions

For more information on configuring port mirroring sessions, see *mirror*.

Supported in the following platforms:

- Service Platforms — NX4524, NX6524

**Syntax**

`show mirroring`

**Parameters**

- `show mirroring`

<table>
<thead>
<tr>
<th>mirroring</th>
<th>Displays the port mirroring sessions</th>
</tr>
</thead>
</table>

**Examples**

```
nx4524-470984#show mirroring
+---------+----------+----------+--------+
| Session | Source   | Destination | Direction |
+---------+----------+----------+--------+
| 1       | ge3      | ge24     | any    |
| 2       | ge7      | ge24     | inbound|
| 3       | ge5      | ge24     | outbound|
+---------+----------+----------+--------+
nx4524-470984#    ```
6.1.79 raid

- show commands

Displays Redundant Array of Independent Disks (RAID) related information, such as array status, consistency check status, and RAID log.

Use this command to assess the RAID array’s drive utilization and whether the drives are currently online. Since there is only one RAID array controller reporting status to the service platform, it is important to know if other drives house hot spare drives as additional resources should one of the dedicated drives fail. This command also displays whether a physical within the RAID array has a drive installed, and whether the drive is currently online.

For more information on configuring RAID, see raid.

Supported in the following platforms:
- Service Platforms — NX9500

**Syntax**

show raid {on <DEVICE-NAME>}

**Parameters**

- show raid {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>raid on &lt;DEVICE-NAME&gt;</th>
<th>Displays the RAID array status and statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional. Displays RAID status and statistics on a specified device</td>
<td></td>
</tr>
<tr>
<td>- &lt;DEVICE-NAME&gt; — Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C874D(config)#show raid
Logical drive info:
  Size 930 GB, State optimal
  Alarm enabled
  Last check: Sat Aug 10 02:56:54 2013
  Last check result: ending

Physical drive info:

  Drive  0: online
  Drive  1: online
  Drive  2: not-installed
  Drive  3: not-installed
  Drive  4: not-installed

nx9500-6C874D(config)#
Profiles enable administrators to assign a common set of configuration parameters, policies, WLANs, wireless parameters, and security parameters to service platforms, wireless controllers, and access points across a large, multi-segment site. The configuration parameters within a profile are based on the hardware model the profile was created to support.

The service platforms, wireless controllers, and access points support both default and user-defined profiles. Each default and user-defined profile contains policies and configurations that are applied to devices assigned to the profile. Changes made to these configurations are automatically inherited by the assigned devices. Therefore, the central benefit of a profile is its ability to update devices collectively without having to modify individual device configurations.

Default profiles are system maintained and are automatically applied to service platforms and wireless controllers. The default AP profile is automatically applied to an AP (discovered by a wireless controller or service platform) unless an AP auto-provisioning policy is defined specifically assigning the AP to a user-defined profile. After adoption, changes made to a profile’s parameters are reflected across all devices using the profile. Default profiles are ideal for single site deployments where service platforms, wireless controllers, and access points share a common configuration.

User-defined profiles, on the other hand, are manually created for each supported service platform, wireless controller, and access point model. The use of user-defined profiles is recommended in larger deployments when groups of devices (on different floors, buildings, or sites) share a common configuration. These user-defined profiles can be manually or automatically assigned to access points using an AP auto-provisioning policy. An AP auto-provisioning policy provides the means to assign profiles to access points based on model, serial number, VLAN ID, DHCP options, IP address (subnet) and MAC address. For more information, see Chapter 9, AUTO-PROVISIONING-POLICY.

A user-defined profile can be created for each of the following device type:

- AP621 – Adds an AP621 access point profile
- AP622 – Adds an AP622 access point profile
- AP650 – Adds an AP650 access point profile
- AP6511 – Adds an AP6511 access point profile
- AP6521 – Adds an AP6521 access point profile
- AP6522 – Adds an AP6522 access point profile
- AP6532 – Adds an AP6532 access point profile
- AP6562 – Adds an AP6562 access point profile
- AP71XX – Adds an AP71XX access point profile supporting the AP7131, AP7161, and AP7181 models
- AP7502 – Adds an AP7502 access point profile
• AP7522 – Adds an AP7522 access point profile
• AP7532 – Adds an AP7532 access point profile
• AP7562 – Adds an AP7562 access point profile
• AP81XX – Adds an AP81XX access point profile supporting the AP8122, AP8132, and AP8163 models
• AP82XX – Adds an AP82XX access point profile supporting the AP8222 and AP8232 models
• EX3524 – Adds an EX3524 wireless controller profile
• EX3548 – Adds an EX3548 wireless controller profile
• RFS4000 – Adds an RFS4000 wireless controller profile
• RFS6000 – Adds an RFS6000 wireless controller profile
• RFS7000 – Adds an RFS7000 wireless controller profile
• NX45XX – Adds an NX45XX series service platform profile supporting the NX4500 and NX4524 models
• NX5500 – Adds an NX5500 wireless controller profile
• NX65XX – Adds an NX65XX series service platform profile supporting the NX6500 and NX6524 models
• NX7500 – Adds an NX75XX series service platform profile supporting the NX7510, NX7520, and NX7530 models
• NX9XXX – Adds an NX9XXX series service platform profile supporting the NX9000, NX9500, and NX9510 models
• NX9600 – Adds an NX9600 service platform profile. Supported only on a NX9600 model device.
• T5 – Adds a T5 controller profile
• vx9000 – Adds a VX9000 profile

NOTE: A T5 profile can be created only on the following platforms: RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, and NX9510.

NOTE: A VX9000 profile can be created only on the NX9000 series service platforms.

Although profiles assign a common set of configuration parameters across devices, individual devices can still be assigned unique configuration parameters that follow the flat configuration model. As individual device updates are made, these devices no longer share the profile based configuration they originally supported. Therefore, changes made to a profile are not automatically inherited by devices who have had their configuration customized. These devices require careful administration, as they cannot be tracked as profile members. Their customized configurations overwrite their profile configurations until the profile is re-applied.

NOTE: The commands present under ‘Profiles’ are also available under the ‘Device mode’. The additional commands specific to the ‘Device mode’ are listed separately.

This chapter is organized into the following topics:
• Profile Config Commands
• Device Config Commands
• T5 Profile Config Commands
• EX3524 & EX3548 Profile/Device Config Commands
To view the list of device profiles supported, use the following command:

```
<DEVICE>(config)#profile ?
anyap       Any access point profile
ap621       AP621 access point profile
ap622       AP622 access point profile
ap650       AP650 access point profile
ap6511      AP6511 access point profile
ap6521      AP6521 access point profile
ap6522      AP6522 access point profile
ap6532      AP6532 access point profile
ap6562      AP6562 access point profile
ap71xx      AP71XX access point profile
ap7502      AP7502 access point profile
ap7522      AP7522 access point profile
ap7532      AP7532 access point profile
ap7562      AP7562 access point profile
ap81xx      AP81XX access point profile
ap82xx      AP82XX access point profile
containing Specify profiles that contain a sub-string in the profile name
ex3524      EX3524 wireless controller profile
ex3548      EX3548 wireless controller profile
filter      Specify addition selection filter
nx45xx      NX45XX integrated services platform profile
nx5500      NX5500 wireless controller profile
nx65xx      NX65XX integrated services platform profile
nx75xx      NX75XX wireless controller profile
nx9000      NX9000 wireless controller profile
nx9600      NX9600 wireless controller profile
rfs4000      RFS4000 wireless controller profile
rfs6000      RFS6000 wireless controller profile
rfs7000      RFS7000 wireless controller profile
t5          T5 wireless controller profile
vx9000      VX9000 wireless controller profile
```

```
<DEVICE>(config)#
```

```
<rfs7000-37FABE(config)#profile rfs7000 default-rfs7000
rfs7000-37FABE(config-profile-default-rfs7000)#
```

```
<rfs7000-37FABE(config)#profile ap71xx default-ap71xx
rfs7000-37FABE(config-profile-default-ap71xx)#
```

The following example shows the commands specific to a NX45XX and NX65XX series service platform profile:

```
nx4500-5CFA2B(config)#profile ?
anyap       Any access point profile
ap621       AP621 access point profile
ap622       AP622 access point profile
ap650       AP650 access point profile
ap6511      AP6511 access point profile
ap6521      AP6521 access point profile
ap6522      AP6522 access point profile
ap6532      AP6532 access point profile
ap6562      AP6562 access point profile
ap71xx      AP71XX access point profile
ap7502      AP7502 access point profile
ap7522      AP7522 access point profile
ap7532      AP7532 access point profile
ap7562      AP7562 access point profile
ap81xx      AP81XX access point profile
ap82xx      AP82XX access point profile
containing Specify profiles that contain a sub-string in the profile name
ex3524      EX3524 wireless controller profile
ex3548      EX3548 wireless controller profile
filter      Specify addition selection filter
nx45xx      NX45XX integrated services platform profile
nx65xx      NX65XX integrated services platform profile
rfs4000      RFS4000 wireless controller profile
rfs6000      RFS6000 wireless controller profile
rfs7000      RFS7000 wireless controller profile
```

```
nx4500-5CFA2B(config)#
```
t5          T5 wireless controller profile
<cr>

nx4500-5CFA2B(config)#

<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#?

Profile Mode commands:
adopter-auto-provisioning-policy-lookup  Use centralized auto-provisioning policy when adopted by another controller
adoption                                   Adoption configuration
alias                                      Alias
application-policy                        Application Policy configuration
area                                       Set name of area where the system is located
arp                                        Address Resolution Protocol (ARP)
auto-learn-staging-config                 Enable learning network configuration of the devices that come for adoption
autogen-uniqueid                          Autogenerate a unique id
autoinstall                               Autoinstall settings
bluetooth-detection                       Detect Bluetooth devices using the Bluetooth USB module
bridge                                     Ethernet bridge
captive-portal                            Captive portal
cdp                                        Cisco Discovery Protocol
cluster                                    Cluster configuration
configuration-persistence                 Enable persistence of configuration across reloads (startup config file)
controller                                WLAN controller configuration
critical-resource                        Critical Resources
database-backup                           Scheduled Database Backup
crypto                                     Encryption related commands
device-upgrade                             Device firmware upgrade
dot1x                                      802.1X
dpi                                        Enable Deep-Packet-Inspection (Application Assurance)
dscp-mapping                              Configure IP DSCP to 802.1p priority mapping for untagged frames
e-mail-notification                       Email notification configuration
enforce-version                           Check the firmware versions of devices before interoperating
environmental-sensor                      Environmental Sensors Configuration
events                                     System event messages
export                                     Export a file
file-sync                                  File sync between controller and adoptees
floor                                      Set the floor within a area where the system is located
gre                                        GRE protocol
http-analyze                              Specify HTTP-Analysis configuration
interface                                 Select an interface to configure
ip                                         Internet Protocol (IP)
ipv6                                       Internet Protocol version 6 (IPv6)
l2tpv3                                     L2tpv3 protocol
l3e-lite-table                            L3e lite Table
led                                        Turn LEDs on/off on the device
led-timeout                                Configure the time for the led to turn off after the last radio state change
legacy-auto-downgrade                     Enable device firmware to auto downgrade when other legacy devices are detected
legacy-auto-update                        Auto upgrade of legacy devices
lldp                                       Link Layer Discovery Protocol
load-balancing Configure load balancing parameter
logging Modify message logging facilities
mac-address-table MAC Address Table
mac-auth 802.1X
memory-profile Memory profile to be used on the device
meshpoint-device Configure meshpoint device parameters
meshpoint-monitor-interval Configure meshpoint monitoring interval
min-misconfiguration-recovery-time Check controller connectivity after configuration is received
mint MiNT protocol
misconfiguration-recovery-time Configure neighbor inactivity timeout
neighbor-inactivity-timeout Configure neighbor information exchange interval
no Negate a command or set its defaults
noc Configure the noc related setting
ntp Ntp server A.B.C.D
offline-duration Set duration for which a device remains unadopted before it generates offline event
power-config Configure power mode
preferred-controller-group Controller group this system will prefer for adoption
preferred-tunnel-controller Tunnel Controller Name this system will prefer for tunneling extended vlan traffic
radius Configure device-level radius authentication parameters
raid RAID
remove-override Remove configuration item override from the device (so profile value takes effect)
rf-domain-manager RF Domain Manager
router Dynamic routing
slot PCI expansion Slot
spanning-tree Spanning tree
traffic-class-mapping Configure IPv6 traffic class to 802.1p priority mapping for untagged frames
traffic-shape Traffic shaping
trustpoint Assign a trustpoint to a service
tunnel-controller Tunnel Controller group this controller belongs to
use Set setting to use
vrrp VRRP configuration
vrrp-state-check Publish interface via OSPF/BGP only if the interface VRRP state is not BACKUP
wep-shared-key-auth Enable support for 802.11 WEP shared key authentication
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode[end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write

Write running configuration to memory or terminal

<DEVICE>(config-profile-<PROFILE-NAME>)#

<DEVICE>(config-profile-<T5-PROFILE-NAME>)#?

T5 Profile Mode commands:
cpe T5 CPE configuration
interface Select an interface to configure
ip Internet Protocol (IP)
no Negate a command or set its defaults
ntp Configure NTP
override-wlan Configure RF Domain level overrides for wlan
t5 T5 configuration
t5-logging Modify message logging facilities
use Set setting to use
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

<DEVICE>(config-profile-<T5-PROFILE-NAME>)#

<DEVICE>(config-profile-<EX3524/EX3548-PROFILE-NAME>)#?

EX3500 Profile Mode commands:
interface Select an interface to configure
ip Internet Protocol (IP)
no Negate a command or set its defaults
power Ex3500 Power over Ethernet Command
upgrade Configures upgrade option for ex3500 system
use Set setting to use
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

<DEVICE>(config-profile-<EX3524/EX3548-PROFILE-NAME>)#

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
# 7.1 Profile Config Commands

The following table summarizes profile configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>adopter-auto-provisioning-policy-lookup</td>
<td>Enables the use of a centralized auto provisioning policy on this profile</td>
<td>page 7-11</td>
</tr>
<tr>
<td>adoption</td>
<td>Configures a minimum and maximum delay time in the initiation of the device adoption process</td>
<td>page 7-12</td>
</tr>
<tr>
<td>alias</td>
<td>Configures network, network-group, network-service, VLAN, and string aliases on this profile</td>
<td>page 7-13</td>
</tr>
<tr>
<td>application-policy</td>
<td>Associates a RADIUS server provided application policy with this profile. When associated, the application policy allows wireless clients (MUs) to always find the RADIUS-supplied application policy in the dataplane.</td>
<td>page 7-20</td>
</tr>
<tr>
<td>area</td>
<td>Sets the system’s area of location (the area name)</td>
<td>page 7-21</td>
</tr>
<tr>
<td>arp</td>
<td>Configures static address resolution protocol</td>
<td>page 7-22</td>
</tr>
<tr>
<td>auto-learn-staging-config</td>
<td>Enables network configuration learning of devices</td>
<td>page 7-24</td>
</tr>
<tr>
<td>autogen-uniqueid</td>
<td>Autogenerates a unique local ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device.</td>
<td>page 7-25</td>
</tr>
<tr>
<td>autoinstall</td>
<td>Configures the automatic install feature</td>
<td>page 7-27</td>
</tr>
<tr>
<td>bluetooth-detection</td>
<td>Enables detection of Bluetooth devices. These are devices using the Bluetooth USB module.</td>
<td>page 7-28</td>
</tr>
<tr>
<td>bridge</td>
<td>Configures bridge specific parameters</td>
<td>page 7-29</td>
</tr>
<tr>
<td>captive-portal</td>
<td>Configures captive portal advanced Web page upload on a device profile</td>
<td>page 7-55</td>
</tr>
<tr>
<td>cdp</td>
<td>Enables Cisco Discovery Protocol (CDP) on a device</td>
<td>page 7-56</td>
</tr>
<tr>
<td>cluster</td>
<td>Configures a cluster name</td>
<td>page 7-57</td>
</tr>
<tr>
<td>configuration-persistence</td>
<td>Enables persistence of configuration across reloads</td>
<td>page 7-60</td>
</tr>
<tr>
<td>controller</td>
<td>Configures a wireless controller or service platform</td>
<td>page 7-61</td>
</tr>
<tr>
<td>critical-resource</td>
<td>Monitors resources that are critical to the health of the service platform, wireless controller, or access point managed network. These critical resources are identified by their configured IP addresses.</td>
<td>page 7-65</td>
</tr>
<tr>
<td>crypto</td>
<td>Configures data encryption related protocols and settings</td>
<td>page 7-72</td>
</tr>
<tr>
<td>database-backup</td>
<td>Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server. When applied to devices, this profile enables the back up of the specified database.</td>
<td>page 7-133</td>
</tr>
<tr>
<td>device-upgrade</td>
<td>Configures device firmware upgrade settings on this profile</td>
<td>page 7-134</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>dot1x</td>
<td>Configures 802.1x standard authentication controls</td>
<td>page 7-136</td>
</tr>
<tr>
<td>dpi</td>
<td>Enables Deep Packet Inspection (DPI) on this profile</td>
<td>page 7-138</td>
</tr>
<tr>
<td>dscp-mapping</td>
<td>Configures an IP DSCP to 802.1p priority mapping for untagged frames</td>
<td>page 7-140</td>
</tr>
<tr>
<td>email-notification</td>
<td>Configures e-mail notification settings</td>
<td>page 7-141</td>
</tr>
<tr>
<td>enforce-version</td>
<td>Enables checking of a device's firmware version before attempting adoption or clustering</td>
<td>page 7-143</td>
</tr>
<tr>
<td>environmental-sensor</td>
<td>Configures the environmental sensor settings on this profile (applicable to AP8132 model access point only)</td>
<td>page 7-144</td>
</tr>
<tr>
<td>events</td>
<td>Enables system event logging and message generation. This command also configures event message forwarding settings.</td>
<td>page 7-146</td>
</tr>
<tr>
<td>export</td>
<td>Enables export of startup.log file after every boot</td>
<td>page 7-147</td>
</tr>
<tr>
<td>file-sync</td>
<td>Configures parameters enabling synching of PKCS#12 certificate between the staging-controller and adoptee AP6522/AP6562 client bridges</td>
<td>page 7-148</td>
</tr>
<tr>
<td>floor</td>
<td>Sets the floor name where the system is located</td>
<td>page 7-149</td>
</tr>
<tr>
<td>gre</td>
<td>Enables Generic Routing Encapsulation (GRE) tunneling on this profile</td>
<td>page 7-150</td>
</tr>
<tr>
<td>http-analyze</td>
<td>Configures HTTP analysis settings</td>
<td>page 7-162</td>
</tr>
<tr>
<td>http-analyze (NX45XX, NX65XX, and NX9000)</td>
<td>Configures HTTP analysis settings on a NX series service platform</td>
<td>page 7-164</td>
</tr>
<tr>
<td>interface</td>
<td>Configures an interface (VLAN, radio, GE etc.)</td>
<td>page 7-167</td>
</tr>
<tr>
<td>ip</td>
<td>Configures IPv4 components</td>
<td>page 7-347</td>
</tr>
<tr>
<td>ipv6</td>
<td>Configures IPv6 components</td>
<td>page 7-357</td>
</tr>
<tr>
<td>l2tpv3</td>
<td>Defines the Layer 2 Tunnel Protocol (L2TP) protocol for tunneling layer 2 payloads using Virtual Private Networks (VPNs)</td>
<td>page 7-361</td>
</tr>
<tr>
<td>l3e-lite-table</td>
<td>Configures L3e Lite Table with this profile</td>
<td>page 7-363</td>
</tr>
<tr>
<td>led</td>
<td>Turns device LEDs on or off</td>
<td>page 7-364</td>
</tr>
<tr>
<td>led-timeout</td>
<td>Configures LED-timeout timer. This command is specific to the NX9000 series service platforms.</td>
<td>page 7-365</td>
</tr>
<tr>
<td>legacy-auto-downgrade</td>
<td>Auto downgrades a legacy device firmware</td>
<td>page 7-367</td>
</tr>
<tr>
<td>legacy-auto-update</td>
<td>Auto upgrades a legacy device firmware</td>
<td>page 7-368</td>
</tr>
<tr>
<td>lldp</td>
<td>Configures Link Layer Discovery Protocol (LLDP)</td>
<td>page 7-369</td>
</tr>
<tr>
<td>load-balancing</td>
<td>Configures load balancing parameters</td>
<td>page 7-371</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>logging</td>
<td>Modifies message logging settings</td>
<td>page 7-376</td>
</tr>
<tr>
<td>mac-address-table</td>
<td>Configures the MAC address table</td>
<td>page 7-378</td>
</tr>
<tr>
<td>mac-auth</td>
<td>Enables 802.1x user authentication protocol on this profile</td>
<td>page 7-380</td>
</tr>
<tr>
<td>memory-profile</td>
<td>Configures the memory profile used on the device</td>
<td>page 7-383</td>
</tr>
<tr>
<td>meshpoint-device</td>
<td>Configures a meshpoint device parameters</td>
<td>page 7-384</td>
</tr>
<tr>
<td>meshpoint-monitor-interval</td>
<td>Configures meshpoint monitoring interval</td>
<td>page 7-385</td>
</tr>
<tr>
<td>min-misconfiguration-recovery-time</td>
<td>Configures the minimum device connectivity verification time</td>
<td>page 7-386</td>
</tr>
<tr>
<td>mint</td>
<td>Configures MiNT protocol settings</td>
<td>page 7-387</td>
</tr>
<tr>
<td>misconfiguration-recovery-time</td>
<td>Verifies device connectivity after a configuration is received</td>
<td>page 7-394</td>
</tr>
<tr>
<td>neighbor-inactivity-timeout</td>
<td>Configures neighbor inactivity timeout</td>
<td>page 7-395</td>
</tr>
<tr>
<td>neighbor-info-interval</td>
<td>Configures neighbor information exchange interval</td>
<td>page 7-396</td>
</tr>
<tr>
<td>no</td>
<td>Removes or reverts settings to their default. The no command, when used in the profile configuration mode, removes the selected profile’s settings or reverts them to their default.</td>
<td>page 7-397</td>
</tr>
<tr>
<td>noc</td>
<td>Configures NOC settings</td>
<td>page 7-399</td>
</tr>
<tr>
<td>ntp</td>
<td>Configures NTP server settings</td>
<td>page 7-400</td>
</tr>
<tr>
<td>offline-duration</td>
<td>Sets the duration, in minutes, for which a device remains unadopted before it generates offline event</td>
<td>page 7-403</td>
</tr>
<tr>
<td>power-config</td>
<td>Configures the power mode</td>
<td>page 7-404</td>
</tr>
<tr>
<td>preferred-controller-group</td>
<td>Specifies the wireless controller or service platform group preferred for adoption</td>
<td>page 7-406</td>
</tr>
<tr>
<td>preferred-tunnel-controller</td>
<td>Configures the tunnel wireless controller or service platform preferred by the system to tunnel extended VLAN traffic</td>
<td>page 7-407</td>
</tr>
<tr>
<td>radius</td>
<td>Configures device-level RADIUS authentication parameters</td>
<td>page 7-408</td>
</tr>
<tr>
<td>raid</td>
<td>Enables alarm on the array. This command is supported only on the NX9500 and NX9510 series service platform profile/device config modes.</td>
<td>page 7-474</td>
</tr>
<tr>
<td>rf-domain-manager</td>
<td>Enables devices using this profile to be elected as RF Domain manager. Also sets the priority value for devices using this profile in the RF Domain manager election process.</td>
<td>page 7-409</td>
</tr>
<tr>
<td>router</td>
<td>Configures dynamic router protocol settings</td>
<td>page 7-410</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>spanning-tree</td>
<td>Configures spanning tree related settings</td>
<td>page 7-412</td>
</tr>
<tr>
<td>traffic-class-mapping</td>
<td>Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority</td>
<td>page 7-415</td>
</tr>
<tr>
<td>traffic-shape</td>
<td>Enables traffic shaping and configures traffic shaping parameters</td>
<td>page 7-417</td>
</tr>
<tr>
<td>trustpoint (profile-config-mode)</td>
<td>Configures the trustpoint assigned for validating a CMP auth Operator</td>
<td>page 7-422</td>
</tr>
<tr>
<td>tunnel-controller</td>
<td>Configures the name of tunneled WLAN (extended VLAN) wireless controller or service platform</td>
<td>page 7-424</td>
</tr>
<tr>
<td>use</td>
<td>Uses pre configured policies with this profile</td>
<td>page 7-425</td>
</tr>
<tr>
<td>vrrp</td>
<td>Configures Virtual Router Redundancy Protocol (VRRP) group settings</td>
<td>page 7-430</td>
</tr>
<tr>
<td>vrrp-state-check</td>
<td>Publishes interface via OSPF or BGP based on VRRP status</td>
<td>page 7-434</td>
</tr>
<tr>
<td>wep-shared-key-auth</td>
<td>Enables support for 802.11 WEP shared key authentication</td>
<td>page 7-438</td>
</tr>
<tr>
<td>service</td>
<td>Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode</td>
<td>page 7-436</td>
</tr>
<tr>
<td>slot</td>
<td>Assigns a physical slot for running Team-Centro VM on this profile/device. This feature is support only on the NX45XX and NX65XX series service platforms.</td>
<td>page 7-441</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
7.1.1 adopter-auto-provisioning-policy-lookup

Profile Config Commands

Enables the use of a centralized auto provisioning policy on this profile or device. This option is applicable in a hierarchically managed (HM) network. When enabled, the auto-provisioning policy applied on the NOC gets precedence over the one applied at the site controller level. Optionally, use the ‘evaluate-always’ option to set flag to run centralized auto-provisioning policy every time a device (access point/controller) is adopted. The device’s previous adoption status is not taken into consideration.

When applied on devices adopted by a controller, this profile allows the devices to use a centralized auto provisioning policy.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

adopter-auto-provisioning-policy-lookup {evaluate-always}

Parameters

- adopter-auto-provisioning-policy-lookup {evaluate-always}

Examples

rfs7000-6DCD4B(config-profile-default-rfs7000)#adopter-auto-provisioning-policy-lookup evaluate-always

Related Commands

no | Disables the application of centralized auto provisioning policy on this profile or device
7.1.2 adoption

Profile Config Commands

Configures a minimum and maximum delay time in the initiation of the device adoption process. When configured, devices do not attempt adoption immediately on coming up. The process is initiated after the lapse of a specified period of time (configured using this command as the start-delay minimum time).

Once configured and applied, this setting is applicable on all devices using this profile. This option is also available in the device-configuration mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
adoption start-delay min <0-30> max <0-30>

Parameters
- adoption start-delay min <0-30> max <0-30>

Examples
rfs7000-6DCD4B(config-profile-default-rfs7000)#adoption start-delay min 10 max 30
rfs7000-6DCD4B(config-profile-default-rfs7000)#show context

  adoption start-delay min 10 max 30
rfs7000-6DCD4B(config-profile-default-rfs7000)#

Related Commands

no

Removes the configured minimum start-delay value. When removed, devices attempt adoption immediately on coming up.
### 7.1.3 alias

**Profile Config Commands**

Configures network, VLAN, and service aliases. The aliases defined on this profile applies to all devices using this profile. Aliases can be also defined at the device level.

---

**NOTE:** You can apply overrides to aliases at the device level. For more information on aliases, see `alias`. Overrides applied at the device level take precedence.

---

**Supported in the following platforms:**

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX9000, NX9500, NX9510, NX9600

**Syntax**

- `alias [address-range|host|network|network-group|network-service|number|string|vlan]`
- `alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>`
- `alias host <HOST-ALIAS-NAME> <HOST-IP>`
- `alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>`
- `alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]`
- `alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP>] [host <HOST-IP> [<HOST-IP>]] [network <NETWORK-ADDRESS/MASK> [<NETWORK-ADDRESS/MASK>]]`
- `alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport|ssh|telnet|tftp|www}]
- `alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport <1-65535>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<WORD>|<W
### Parameters

- alias address-range `<ADDRESS-RANGE-ALIAS-NAME>` `<STARTING-IP>` to `<ENDING-IP>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;ADDRESS-RANGE-ALIAS-NAME&gt;</code></td>
<td>Creates a new address-range alias for this profile. Or associates an existing address-range alias with this profile. An address-range alias maps a name to a range of IP addresses. Use this option to create unique address-range aliases for different deployment scenarios. For example, if an ACL defines a pool of network addresses as 192.168.10.10 through 192.168.10.100 for an entire network, and a remote location’s network range is 172.16.13.20 through 172.16.13.110, the remote location’s ACL can be overridden using an alias. At the remote location, the ACL works with the 172.16.13.20-110 address range. A new ACL need not be created specifically for the remote deployment location.</td>
</tr>
<tr>
<td><code>&lt;STARTING-IP&gt;</code> to <code>&lt;ENDING-IP&gt;</code></td>
<td>Associates a range of IP addresses with this address range alias</td>
</tr>
<tr>
<td><code>&lt;ADDRESS-RANGE-ALIAS-NAME&gt;</code></td>
<td>– Specify the address range alias name.</td>
</tr>
<tr>
<td><code>&lt;STARTING-IP&gt;</code></td>
<td>– Specify the first IP address in the range.</td>
</tr>
<tr>
<td><code>&lt;ENDING-IP&gt;</code></td>
<td>– Specify the last IP address in the range.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If using an existing address-range alias, you can apply overrides to the alias at the profile level.</td>
</tr>
</tbody>
</table>

- alias host `<HOST-ALIAS-NAME>` `<HOST-IP>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;HOST-ALIAS-NAME&gt;</code></td>
<td>Creates a new host alias for this profile. Or associates an existing host alias with this profile. A host alias configuration is for a particular host device’s IP address. Use this option to create unique host aliases for different deployment scenarios. For example, if a central network DNS server is set a static IP address, and a remote location’s local DNS server is defined, this host can be overridden at the remote location. At the remote location, the network is functional with a local DNS server, but uses the name set at the central network. A new host need not be created at the remote location. This simplifies creating and managing hosts and allows an administrator to better manage specific local requirements.</td>
</tr>
<tr>
<td><code>&lt;HOST-IP&gt;</code></td>
<td>Associates the network host’s IP address with this host alias</td>
</tr>
<tr>
<td><code>&lt;HOST-ALIAS-NAME&gt;</code></td>
<td>– Specify the host alias name.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Alias name should begin with ‘$’.</td>
</tr>
</tbody>
</table>

- alias network `<NETWORK-ALIAS-NAME>` `<NETWORK-ADDRESS/MASK>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;NETWORK-ALIAS-NAME&gt;</code></td>
<td>Creates a new network alias for this profile. Or associates an existing network alias with this profile. A network alias configuration is utilized for an IP address on a particular network. Use this option to create unique Network aliases for different deployment scenarios. For example, if a central network ACL defines a network as 192.168.10.0/24, and a remote location’s network range is 172.16.10.0/24, the ACL can be overridden at the remote location to suit their local (but remote) requirement. At the remote location, the ACL functions with the 172.16.10.0/24 network. A new ACL need not be created specifically for the remote deployment. This simplifies ACL definition and allows an administrator to better manage specific local requirements.</td>
</tr>
<tr>
<td><code>&lt;NETWORK-ADDRESS/MASK&gt;</code></td>
<td>– Specify the network alias name.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Alias name should begin with ‘$’.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| `<NETWORK-ADDRESS/MASK>` | Associates a single network with this network alias  
  • `<NETWORK-ADDRESS/MASK>` – Specify the network’s address and mask.  
  **Note:** If using an existing network alias, you can apply overrides to the alias at the profile level. |
| `network <NETWORK-GROUP-ALIAS-NAME>` | Creates a new network-group alias for this profile. Or associates an existing network-group alias with this profile.  
  • `<NETWORK-GROUP-ALIAS-NAME>` – Specify the network-group alias name.  
  **Note:** Alias name should begin with `$`.  
  **Note:** The network-group aliases are used in ACLs, to define the network-specific components. ACLs using aliases can be used across sites by re-defining the network-group alias elements at the device or profile level.  
  After specifying the name, specify the following: a range of IP addresses, host addresses, or a range of network addresses.  
  **Note:** If using an existing network-group alias, you can apply overrides to the alias at the profile level. |
| `address-range <STARTING-IP> to <ENDING-IP>` {<STARTING-IP> to <ENDING-IP>}` | Associates a range of IP addresses with this network-group alias  
  • `<STARTING-IP>` – Specify the first IP address in the range.  
  • to `<ENDING-IP>` – Specify the last IP address in the range.  
  • `<STARTING-IP>` to `<ENDING-IP>` – Optional. Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured. |
| `host <HOST-IP>` {<HOST-IP>}` | Associates a single or multiple hosts with this network-group alias  
  • `<HOST-IP>` – Specify the hosts’ IP address.  
  • `<HOST-IP>` – Optional. Specifies more than one host. A maximum of eight (8) hosts can be configured. |
| `network <NETWORK-ADDRESS/MASK>` {<NETWORK-ADDRESS/MASK>}` | Associates a single or multiple networks with this network-group alias  
  • `<NETWORK-ADDRESS/MASK>` – Specify the network’s address and mask.  
  • `<NETWORK-ADDRESS/MASK>` – Optional. Specifies more than one network. A maximum of eight (8) networks can be configured. |
| `alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp] {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntpxpop3|proto|sip|smtp|sourceport [<1-65535]|<WORD>|ssh|telnet|tftp|www})` | Creates a new network-service alias for this profile. Or associates an existing network-service alias with this profile. A network service alias is a set of configurations that consist of protocol and port mappings. Both source and destination ports are configurable. For each protocol, up to 2 source port ranges and up to 2 destination port ranges can be configured. A maximum of 4 protocol entries can be configured per network service alias.  
  • `<NETWORK-SERVICE-ALIAS-NAME>` – Specify a network-service alias name.  
  **Note:** Alias name should begin with `$`.  
  **Note:** The network-service aliases are used in ACLs, to define the service-specific components. ACLs using aliases can be used across sites by re-defining the network-service alias elements at the device or profile level.  
  **Note:** If using an existing network-service alias, you can apply overrides to the alias at the profile level. |
proto \[<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp]\]

Use one of the following options to associate an Internet protocol with this network-service alias:

- <0-254> – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the Protocol field of the IPv4 header and the Next Header field of IPv6 header. For example, the User Datagram Protocol’s (UDP) designated number is 17.
- <WORD> – Identifies the protocol by its name. Specify the protocol name.
- gre – Selects Generic Routing Encapsulation (GRE). The protocol number is 47.
- igmp – Selects Internet Group Management Protocol (IGMP). The protocol number is 2.
- ospf – Selects Open Shortest Path First (OSPF). The protocol number is 89.
- vrrp – Selects Virtual Router Redundancy Protocol (VRRP). The protocol number is 112.

\{(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport\[<1-65535>|<WORD>|ssh|telnet|tftp|www}\}

After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports.

- <1-65535> – Optional. Configures a destination port number from 1 - 65535.
- <WORD> – Optional. Identifies the destination port by the service name provided. For example, the secure shell (SSH) service uses TCP port 22.
- bgp – Optional. Configures the default Border Gateway Protocol (BGP) services port (179).
- dns – Optional. Configures the default Domain Name System (DNS) services port (53).
- ftp – Optional. Configures the default File Transfer Protocol (FTP) control services port (21).
- ftp-data – Optional. Configures the default FTP data services port (20).
- gopher – Optional. Configures the default gopher services port (70).
- https – Optional. Configures the default HTTPS services port (443).
- nntp – Optional. Configures the default Newsgroup (NNTP) services port (119).
- ntp – Optional. Configures the default Network Time Protocol (NTP) services port (123).
- proto – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step.
- pop3 – Optional. Configures the default Post Office Protocol (POP3) services port (110).
- smtp – Optional. Configures the default Simple Mail Transfer Protocol (SMTP) services port (25).
- sip – Optional. Configures the default Session Initiation Protocol (SIP) services port (5060).
- sourceport \[<1-65535>|<WORD>\] – Optional. After specifying the destination port, you may specify a single or range of source ports.
  - <1-65535> – Specify the source port from 1 - 65535.
  - <WORD> – Specify the source port range, for example 1-10.

Contd..
- **ssh** – Optional. Configures the default SSH services port (22)
- **telnet** – Optional. Configures the default Telnet services port (23)
- **tftp** – Optional. Configures the default *Trivial File Transfer Protocol* (TFTP) services port (69)
- **www** – Optional. Configures the default HTTP services port (80)

**alias number** `<NUMBER-ALIAS-NAME>` `<0-4294967295>`

Creates a number alias identified by the `<NUMBER-ALIAS-NAME>` keyword. Number aliases map a name to a numeric value. For example, ‘alias number $NUMBER 100’

- The number alias name is: $NUMBER
- The value assigned is: 100

The value referenced by alias $NUMBER, wherever used, is 100.

- `<NUMBER-ALIAS-NAME>` – Specify the number alias name.
- `<0-4294967295>` – Specify the number, from 0 - 4294967295, assigned to the number alias created.

**Note:** Alias name should begin with ‘$’.

**alias string** `<STRING-ALIAS-NAME>` `<LINE>`

Creates a new string alias for this profile. Or associates an existing string alias with this profile. String aliases map a name to an arbitrary string value. Use this option to create unique string aliases for different deployment scenarios. For example, if the main domain at a remote location is called loc1.domain.com and at another deployment location it is called loc2.domain.com, the alias can be overridden at the remote location to suit the local (but remote) requirement. At one remote location, the alias functions with the loc1.domain.com domain and at the other with the loc2.domain.com domain.

- `<STRING-ALIAS-NAME>` – Specify the string alias name.
- `<LINE>` – Specify the string value.

**Note:** Alias name should begin with ‘$’.

**Note:** If using an existing string alias, you can apply overrides to the alias at the RF Domain level.

**alias vlan** `<VLAN-ALIAS-NAME>` `<1-4094>`

Creates a new VLAN alias for this profile. Or associates an existing VLAN alias with this profile. A VLAN alias maps a name to a VLAN ID. A VLAN alias is a configuration for optimal VLAN re-use and management for local and remote deployments. Use this option to create unique VLAN aliases for different deployment scenarios. For example, if a VLAN ID is set as 10 for the central network, and the VLAN is set as 26 at a remote location, the VLAN can be overridden at the remote location using an alias. At the remote location, the network is functional with an ID of 26, but utilizes the name defined at the central local network. A new VLAN need not be created specifically at the remote location.

- `<VLAN-ALIAS-NAME>` – Specify the VLAN alias name.

**Note:** Alias name should begin with ‘$’.

- `<1-4094>` Maps the VLAN alias to a VLAN ID
  - `<1-4094>` – Specify the VLAN ID from 1 - 4094.

**Note:** If using an existing VLAN alias, you can apply overrides to the alias at the profile level.
Examples

The following example shows the global aliases configured. Note the network-service alias '$kerberos' settings.

```bash
rfs4000-229D58(config)#show context
!
Configuration of RFS4000 version 5.8.1.0-025D
!
!
version 2.3
!
alias network-group $TestNetGrpAlias network 192.168.13.0/24 192.168.16.0/24
alias network-group $TestNetGrpAlias address-range 192.168.13.7 to 192.168.13.16
192.168.13.20 to 192.168.13.25
!
alias network $TestNetworkAlias 192.168.13.0/24
!
alias host $TestHostAlias 192.168.13.10
!
alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
!
alias network-service $NetworkServAlias proto udp
!
alias network-service $kerberos proto tcp 749 750 80 proto udp 68 sourceport 67
!
alias vlan $TestVLANAlias 1
--More--
rfs4000-229D58(config)#
```

The following examples show the overrides applied to the network-service alias '$kerberos' at the profile level:

```bash
rfs4000-229D58(config-profile-TestRFS4000)#alias network-service $kerberos proto tcp 88 proto udp 80
rfs4000-229D58(config-profile-TestRFS4000)#
```

The following example shows the overrides applied to the network-service alias '$kerberos' at the profile level:

```bash
rfs4000-229D58(config-profile-TestRFS4000)#show context
profile rfs4000 TestRFS4000
no autoinstall configuration
no autoinstall firmware
...........................

service pm sys-restart
router ospf
alias network-service $kerberos proto tcp 88 proto udp 80
rfs4000-229D58(config-profile-TestRFS4000)#
```

7.1.4 application-policy

**Profile Config Commands**

Associates a RADIUS server provided application policy with this profile. This command is also applicable to the device configuration mode. When associated, the application policy allows wireless clients (MUs) to always find the RADIUS-supplied application policy in the dataplane.

Supported in the following platforms:
- Access Points — AP7522, AP7532, AP7562
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

```
application-policy radius <APP-POLICY-NAME>
```

**Parameters**

- `application-policy radius <APP-POLICY-NAME>`

**Examples**

```
nx9500-6C8809(config)#show context include-factory | include application-policy

application-policy Bing
  no use application-policy
  no use application-policy
  no use application-policy
  no use application-policy
  no use application-policy
  no use application-policy
  no use application-policy
  no use application-policy

nx9500-6C8809(config-profile-testNX9000)#application-policy radius Bing

nx9500-6C8809(config-profile-testNX9000)#show context include-factory | include application-policy

application-policy radius Bing

nx9500-6C8809(config-application-Bing)#Show context

application Bing
  app-category streaming
  use url-list Bing
```

**Related Commands**

```
no
```

Removes the RADIUS-server provided application policy associated with this profile.
### 7.1.5 area

- **Profile Config Commands**

Sets the system's area of location (the physical area of deployment)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
area <WORD>
```

**Parameters**

- `<WORD>`

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000)# area Ecospace
rfs7000-37FABE(config-profile-default-rfs7000)# show context
```

**Related Commands**

- **no** Resets the configured area name

7.1.6 arp

Profile Config Commands

Adds a static Address Resolution Protocol (ARP) IP address in the ARP cache.

The ARP protocol maps an IP address to a hardware MAC address recognized on the network. ARP provides protocol rules for making this correlation and providing address conversion in both directions.

When an incoming packet destined for a host arrives, ARP finds a physical host or MAC address that matches the IP address. ARP looks in its ARP cache and, if it finds the address, provides it so the packet can be converted to the right packet length, formatted, and sent to its destination. If no entry is found for the IP address, ARP broadcasts a request packet in a special format on the LAN to locate a device that recognizes the IP address. A device that recognizes the IP address as its own returns a reply indicating it. ARP updates the ARP cache for future reference and then sends the packet to the MAC address that replied.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
arp [<IP>|timeout]
```

```
arp <IP> <MAC> arpa [<L3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1|serial <1-4> <1-1> <1-1> [dhcp-server|router]
```

```
arps timeout <15-86400>
```

Parameters

- **arp <IP> <MAC> arpa [<L3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1|serial <1-4> <1-1> <1-1> [dhcp-server|router]**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arp &lt;IP&gt;</td>
<td>Adds a static ARP IPv4 address in the ARP cache.</td>
</tr>

</tr>
<tr>
<td>wwan1</td>
<td>Configures static ARP entry for Wireless WAN interface.</td>
</tr>
</tbody>
</table>
### serial <1-4> <1-1> <1-1>

Configures the static ARP entry for serial interface

- **<1-4>** – Specify the Slot ID
- **<1-1>** – Specify the port ID.
- **<1-1>** – Specify the Channel group ID.

The serial interface is applicable for the NX45XX and NX65XX series service platforms only.

### {dhcp-server|router}

The following keywords are common to all of the above interface types:

- dhcp-server – Optional. Sets ARP entries for a DHCP server
- router – Optional. Sets ARP entries for a router

### arp timeout <15-86400>

Sets ARP entry timeout

- **<TIME>** – Sets the ARP entry timeout in seconds. Specify a value from 15 - 86400 seconds. The default is 3600 seconds.

### Examples

rfs7000-37FABE(config-profile-default-rfs7000)#arp timeout 2000

7.1.7 auto-learn-staging-config

Profile Config Commands

Enables controllers or service platforms to maintain a local configuration record of devices requesting adoption and provisioning. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

auto-learn-staging-config

Parameters

None

Examples

rfs7000-37FABE(config-profile-default-rfs7000)#auto-learn-staging-config
rfs7000-37FABE(config-profile-default-rfs7000)#

7.1.8 **autogen-uniqueid**

> **Profile Config Commands**

Autogenerates a unique ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device.

A device’s unique ID is a combination of a user-defined string (prefix, suffix, or both) and a substitution token. The WiNG implementation provides two built-in substitution tokens: $SN and $MiNT-ID that represent the device’s serial number and MiNT-ID respectively. The value referenced by these substitution tokens are internally retrieved and combined with the user-defined string to auto generate a unique identity for the device.

The general format of this command is: `<PREFIX><SUBSTITUTION-TOKEN><SUFFIX>`. You can provide both (prefix and suffix) or just a prefix or suffix.

For example, given the following set of inputs:
- user-defined prefix – TestAP6522
- substitution token – $SN

The unique ID is generated using TestAP6522$SN, where $SN is replaced with the device’s serial number.

When executed on an AP6522 (having serial number B4C7996C8809), the autogen-uniqueid TestAP6522$SN command generates the unique ID: TestAP6522B4C7996C8809. When configured on an AP6522 profile, all AP6522s using the profile autogenerate a unique ID in which the device’s serial number is preceded by the string ‘TestAP6522’.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`autogen-uniqueid <WORD>`

**Parameters**

- `autogen-uniqueid <WORD>`

| autogen-uniqueid <WORD> | Autogenerates a device’s unique ID (not exceeding 64 characters in length) The ID generated is a combination of the text provided and the value referenced through the substitution token $SN or $MiNT-ID. Where ever the autogen-uniqueid is used the device’s serial number OR MiNT-ID is referenced depending on the substitution token used.
| | • `<WORD>` – Specify a auto generate unique ID format using one of the following substitution tokens:
| | | Available tokens:
| | | $SN     - references SERIAL NUMBER of the device
| | | $MiNT-ID - references MiNT-ID of the device
| | For example, Test-$SN-TechPubs. In this example ‘Test’ and ‘TechPubs’ represent the user-defined prefix and suffix respectively. And $SN is the substitution token. |
Examples

```bash
nx4500-5CFA2B(config-profile-testAP6522)#autogen-uniqueid TestAP6522$SN

nx4500-5CFA2B(config-profile-testAP6522)#show context

### 7.1.10 bluetooth-detection

**Profile Config Commands**

Enables detection of Bluetooth devices. These are devices using the Bluetooth USB module.

When enabled, the access point scans for Bluetooth devices over the WiNG managed 2.4 GHz access point radio. Bluetooth is a technology for exchanging data over short distances using short-wavelength UHF radio waves in the 2.4 GHz band from mobile wireless clients.

---

**NOTE:** Enabling Bluetooth detection results in interference on the access point's 2.4 GHz radio when in WLAN mode. WLANs are susceptible to sources of interference by Bluetooth devices.

---

Supported in the following platforms:
- Access Points — AP81XX

**Syntax**

```
bluetooth-detection
```

**Parameters**

None

**Examples**

```
nx9500-6C8809(config-profile-default-ap81xx)#bluetooth-detection
```

```

</tbody>
</table>
7.1.11.1 bridge

Bridge configurations VLAN Ethernet bridging parameters. Use this command to configure a Bridge NAT or Bridge VLAN settings.

Configuring bridge Network Address Translation (NAT) parameters, allows management of Internet traffic originating at a remote site. In addition to traditional NAT functionality, bridge NAT provides a means of configuring NAT for bridged traffic through an access point. NAT rules are applied to bridged traffic through the access point, and matching packets are NATed to the WAN link instead of being bridged on their way to the router. Using bridge NAT, a tunneled VLAN (extended VLAN) is created between the NOC and a remote location. When a remote client needs to access the Internet, Internet traffic is routed to the NOC, and from there routed to the Internet. This increases the access time for the end user on the client. To resolve latency issues, bridge NAT identifies and segregates traffic heading towards the NOC and outwards towards the Internet. Traffic towards the NOC is allowed over the secure tunnel. Traffic towards the Internet is switched to a local WLAN link with access to the Internet.

A Virtual LAN (VLAN) is a separately administrated virtual network within the same physical managed network. VLANs are broadcast domains defined within wireless controllers or service platforms to allow control of broadcast, multicast, unicast, and unknown unicast within a layer 2 device. For example, say several computers are used in conference room X and some in conference Y. The systems in conference room X can communicate with one another, but not with the systems in conference room Y. The VLAN enables the systems in conference rooms X and Y to communicate with one another even though they are on separate physical subnets. The systems in conference rooms X and Y are managed by the same single wireless controller or service platform, but ignore the systems that are not using the same VLAN ID. Administrators often need to route traffic between different VLANs. Bridging VLANs are only for non-routable traffic, like tagged VLAN frames destined to some other device, which will untag it. When a data frame is received on a port, the VLAN bridge determines the associated VLAN based on the port of reception. Using forwarding database information, the bridge VLAN forwards the data frame on the appropriate port(s). VLANs are useful to set separate networks to isolate some computers from others, without actually having to have separate cabling and Ethernet switches. Controllers can do this on their own, without need for the computer or other gear to know itself what VLAN it is on (this is called port-based VLAN, since it is assigned by port of the switch). Another common use is to put specialized devices like VoIP Phones on a separate network for easier configuration, administration, security, or quality of service.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Switch Note: For more information on the interface types and the devices supporting them, see interface.

Syntax

bridge [nat|vlan]

bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500> interface
  [<LAYER3-INTERFACE-NAME>|pppoel|vlan <1-4094>|wwan1] [{(address|interface|overload|pool <NAT-POOL-NAME>)}]

bridge vlan [<1-4094>|<VLAN-ALIAS-NAME>]
**Parameters**

- `bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500> interface [<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [(address|interface|overload|pool <NAT-POOL-NAME>)]`

<td>Specify a VLAN alias name.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Creating customized filter schemes for bridged networks limits the amount of unnecessary traffic processed and distributed by the bridging equipment.

If a bridge does not hear *Bridge Protocol Data Units* (BPDUs) from the root bridge within the specified interval, defined in the max-age (seconds) parameter, assume the network has changed and recomputed the spanning-tree topology.
Examples

rfs7000-37FABE(config-profile-default-rfs7000)#bridge vlan 1
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#?

Bridge VLAN Mode commands:
- **bridging-mode**: Configure how packets on this VLAN are bridged
- **captive-portal**: Captive Portal
- **description**: Vlan description
- **edge-vlan**: Enable edge-VLAN mode
- **firewall**: Enable vlan firewall (IPv4)
- **http-analyze**: Forward URL and Data to controller
- **ip**: Internet Protocol (IP)
- **ipv6**: Internet Protocol version 6 (IPv6)
- **l2-tunnel-broadcast-optimization**: Enable broadcast optimization
- **no**: Negate a command or set its defaults
- **stateful-packet-inspection-l2**: Enable stateful packet inspection in layer2 firewall
- **tunnel**: Vlan tunneling settings
- **tunnel-over-level2**: Tunnel extended VLAN traffic over level 2 MiNT links
- **use**: Set setting to use
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

### 7.1.11.2.1 bridging-mode

**bridge-vlan-mode commands**

Configures how packets are bridged on the selected VLAN

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
bridging-mode [auto|isolated-tunnel|local|tunnel]
```

**Parameters**

- **bridging-mode [auto|isolated-tunnel|local|tunnel]**

<table>
<thead>
<tr>
<th>bridging-mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Automatically selects the bridging mode to match the WLAN, VLAN and bridging mode configurations. When selected, the controller or access point determines the best bridging mode for the VLAN. (default setting)</td>
</tr>
<tr>
<td>isolated-tunnel</td>
<td>Bridges packets between local Ethernet ports and local radios, and passes tunneled packets through without de-tunneling. Select this option for a dedicated tunnel for bridging VLAN traffic.</td>
</tr>
<tr>
<td>local</td>
<td>Bridges packets normally between local Ethernet ports and local radios (if any). Local mode is typically configured in remote branch offices where traffic on remote private LAN segments need to be bridged locally. Local mode implies that traffic, wired and wireless, is to be bridged locally.</td>
</tr>
<tr>
<td>tunnel</td>
<td>Bridges packets between local Ethernet ports, local radios, and tunnels to other APs, wireless controllers, or service platforms. Select this option to use a shared tunnel for bridging VLAN traffic. In tunnel mode, the traffic at the AP is always forwarded through the best path. The APs decide the best path to reach the destination and forward packets accordingly. Setting the VLAN to tunnel mode ensures packets are bridged between local Ethernet ports, any local radios, and tunnels to other APs, wireless controllers, and service platforms.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

ACLs can only be used with tunnel or isolated-tunnel modes. They do not work with the local and automatic modes.

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#bridging-mode isolated-tunnel
```

```
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#show context bridge vlan 1 bridging-mode isolated-tunnel ip igmp snooping ip igmp snooping querier
```

```
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#
```

**Related Commands**

- **no** Resets bridging mode to auto
7.11.2.2 captive-portal

*bridge-vlan-mode commands*

Enables IP packet snooping on wired captive portals, and also configures the subnet to snoop. When enabled, IP packets received from wired captive portal clients, on the specified subnet, are snooped to learn IP to MAC mapping.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controller
- Access Points — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M>
{excluded-address <IPv4|IPv6>}

**Parameters**

- captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M> {excluded-address <IPv4|IPv6>}

| captive-portal [ipv4-snooping|ipv6-snooping] | Enables snooping of IPv4 or IPv6 packets (based on the option selected) for wired captive portal clients |
| subnet <IPv4/M|IPv6/M> | Enables IPv4 or IPv6 packet snooping on a specified subnet
- <IPv4/M|IPv6/M> – Specify the subnet address in the A.B.C.D/M or X:X::X:X/M format to identify an IPv4 or IPv6 subnet respectively. |
| excluded-address <IPv4|IPv6> | Optional. Configures the IPv4 or IPv6 address excluded from snooping
- <IPv4|IPv6> – Specify the IPv4 or IPv6 address. Use this parameter to configure the gateway’s address. |

**Examples**

```plaintext	nx9500-6C8809(config-profile NX9000Test-bridge-vlan-4)#captive-portal ip-snooping subnet 192.168.13.0/24 excluded-address 192.168.13.7
	nx9500-6C8809(config-profile NX9000Test-bridge-vlan-4)#show context
bridge vlan 4
captive-portal ip-snooping subnet 192.168.13.0/24 excluded-address 192.168.13.7
ip igmp snooping
ip igmp snooping querier
ipv6 mld snooping
ipv6 mld snooping querier
nx9500-6C8809(config-profile NX9000Test-bridge-vlan-4)#
```

**Related Commands**

| no | Disables IP packet snooping on wired captive portals |
7.1.11.2.3 description

Configures VLAN bridge description

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

description <WORD>

Parameters
- <WORD> — Enter a description. The description should be unique to the VLAN’s specific configuration to help differentiate it from other VLANs with similar configurations.

Examples

rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#description “This is a description for the bridged VLAN”

rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#show context
  bridge vlan 1
description This\ is\ a\ description\ for\ the\ bridged\ VLAN
  bridging-mode isolated-tunnel
  ip igmp snooping
  ip igmp snooping querier
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#

Related Commands

no

Removes VLAN bridge description
7.11.2.4 edge-vlan

*bridge-vlan-mode commands*

Enables the edge VLAN mode. In the edge VLAN mode, a protected port does not forward traffic to another protected port on the same wireless controller or service platform. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dedge-vlan

**Parameters**

None

**Examples**

rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#edge-vlan
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#

7.1.12.5 firewall

*bridge-vlan-mode commands*

Enables IPv4 firewall on this bridge VLAN interface. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5524, NX6500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`firewall`

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#firewall
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#
```

### 7.1.11.2.6 http-analyze

#### bridge-vlan-mode commands

Enables the analysis of URLs and data traffic on this Bridge VLAN. When enabled, URLs and data are forwarded to the controller running the HTTP analytics engine.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
http-analyze {filter [images|post|query-string]}
```

#### Parameters

- `http-analyze {filter [images|post|query-string]}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`http-analyze filter [images</td>
<td>post</td>
</tr>
<tr>
<td>- filter – Optional. Filters out specific URLs</td>
<td></td>

### 7.1.11.2.7 ip

**bridge-vlan-mode commands**

Configures VLAN bridge IP components

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
ip [arp|dhcp|igmp]
ip [arp|dhcp] trust
ip igmp snooping {forward-unknown-multicast|mrouter|querier}
ip igmp snooping
{forward-unknown-multicast}
ip igmp snooping {mrouter [interface|learn]}
ip igmp snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}
ip igmp snooping {querier} {address|max-response-time|timer|version}
ip igmp snooping {querier} {address <IP>|max-response-time <1-25>|timer expiry <60-300>|version <1-3>}
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip [arp</td>
<td>dhcp] trust</td>
</tr>
<tr>
<td></td>
<td>- trust – Trusts ARP responses on the VLAN bridge</td>
</tr>
<tr>
<td>ip dhcp trust</td>
<td>Configures the DHCP trust parameter. Uses DHCP packets, from a DHCP server, as trusted and permissible within the access point, wireless controller, or service platform managed network. DHCP packets are used to update the DHCP snop table to prevent IP spoof attacks. This feature is enabled by default.</td>
</tr>
<tr>
<td></td>
<td>- trust – Trusts DHCP responses on the VLAN bridge</td>
</tr>
<tr>
<td>ip igmp snooping {forward-unknown-multicast}</td>
<td>Configures Internet Group Management Protocol (IGMP) snooping parameters. IGMP snooping is enabled by default. IGMP establishes and maintains multicast group memberships for interested members. Multicasting allows a networked device to listen to IGMP network traffic and forward IGMP multicast packets to radios on which the interested hosts are connected. The device also maintains a map of the links that require multicast streams, thereby reducing unnecessary flooding of the network with multicast traffic.</td>
</tr>
<tr>
<td>forward-unknown-multicast</td>
<td>Optional. Enables forwarding of multicast packets from unregistered multicast groups. If disabled, the unknown multicast forward feature is also disabled for individual VLANs. This option is enabled by default.</td>
</tr>
</tbody>
</table>
- `ip igmp snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>Configures the VLAN bridge IP parameters</td>
</tr>
<tr>
<td>igmp snooping</td>
<td>Configures the IGMP snooping parameters</td>
</tr>
<tr>
<td>mrouter</td>
<td>Optional. Configures the multicast router parameters</td>
</tr>
<tr>
<td>interface &lt;INTERFACE-LIST&gt;</td>
<td>Configures the multicast router interfaces. This option is disabled by default.</td>
</tr>
<tr>
<td>learn pim-dvmrp</td>
<td>Configures the multicast router learning protocols. This option is disabled by default.</td>
</tr>
</tbody>
</table>

- `ip igmp snooping {querier} {address <IP>|max-response-time <1-25>| timer expiry <60-300>|version <1-3>}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>Configures the VLAN bridge IP parameters</td>
</tr>
<tr>
<td>igmp snooping</td>
<td>Configures the IGMP snooping parameters</td>
</tr>
<tr>
<td>querier</td>
<td>Optional. Configures the IGMP querier parameters. This option is disabled by default. Enables IGMP querier. IGMP snooping querier keeps host memberships alive. It is primarily used in a network where there is a multicast streaming server and hosts subscribed to the server and no IGMP querier present. The access point, wireless controller, or service platform performs the IGMP querier role. An IGMP querier sends out periodic IGMP query packets. Interested hosts reply with an IGMP report packet. IGMP snooping is only conducted on wireless radios. IGMP multicast packets are flooded on wired ports. IGMP multicast packet are not flooded on the wired port. IGMP membership is also learnt on it and only if present, then it is forwarded on that port.</td>
</tr>
<tr>
<td>address &lt;IP&gt;</td>
<td>Optional. Configures the IGMP querier source IP address. This address is used as the default VLAN querier IP address.</td>
</tr>
<tr>
<td>max-response-time &lt;1-25&gt;</td>
<td>Optional. Configures the IGMP querier maximum response time. This option is disabled by default.</td>
</tr>
<tr>
<td>timer expiry &lt;60-300&gt;</td>
<td>Optional. Configures the IGMP querier expiry time. The value specified is used as the timeout interval for other querier resources. This option is disabled by default.</td>
</tr>
<tr>
<td>version &lt;1-3&gt;</td>
<td>Optional. Configures the IGMP version. This option is disabled by default.</td>
</tr>
</tbody>
</table>

7.1.11.2.8 ipv6

**bridge-vlan-mode commands**

Configures this VLAN bridge's IPv6 components

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

ipv6 [dhcpv6|firewall|mld|nd]

ipv6 dhcpv6 trust
ipv6 firewall
ipv6 mld snooping {forward-unknown-multicast|mrouter|querier}
ipv6 mld snooping {forward-unknown-multicast}
ipv6 mld snooping {mrouterm [interface|learn]}
ipv6 mld snooping {mrouterm [interface INTERFACE-LIST]|learn pim-dvmrp}
ipv6 mld snooping {querier} {max-response-time|timer|version}
ipv6 mld snooping {querier} {max-response-time <1-25000>|timer expiry <60-300>}

ipv6 nd raguard

**Parameters**

- ipv6 dhcpv6 trust

  Configures the VLAN bridge IPv6 parameters
  dhcpv6 trust Enables the DHCPv6 trust option. When enabled all DHCPv6 responses are trusted on this bridge VLAN. This option is enabled by default.
  - trust – Trusts DHCPv6 responses on this bridge VLAN

- ipv6 firewall

  Configures the VLAN bridge IPv6 parameters
  firewall Enables IPv6 firewall on this bridge VLAN. This option is enabled by default. Devices utilizing IPv6 addressing require firewall protection unique to IPv6 traffic. IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons. IPv6 hosts can configure themselves automatically when connected to an IPv6 network using the **neighbor discovery** (ND) protocol via ICMPv6 router discovery messages. When first connected to a network, a host sends a link-local router solicitation multicast request for its configuration parameters. Routers respond to such a request with a **router advertisement** (RA) packet that contains Internet layer configuration parameters.
### ipv6 mld snooping \{forward-unknown-multicast\}

<table>
<thead>
<tr>
<th>ipv6</th>
<th>Configures the VLAN bridge IPv6 parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>mld snooping</td>
<td>Configures Multicast Listener Discovery Protocol (MLD) snooping parameters. MLD snooping enables a access point, wireless controller, or service platform to examine MLD packets and make forwarding decisions based on the content. MLD is used by IPv6 devices to discover devices wanting to receive multicast packets destined for specific multicast addresses. MLD uses multicast listener queries and multicast listener reports to identify which multicast addresses have listeners and join multicast groups. MLD snooping caps the flooding of IPv6 multicast traffic on controller, service platform or access point VLANs. When enabled, MLD messages between hosts and multicast routers are examined to identify the hosts receiving multicast group traffic. The access point, wireless controller, or service platform forward multicast traffic only to those interfaces connected to interested receivers instead of flooding traffic to all interfaces. This option is enabled by default.</td>
</tr>
<tr>
<td>forward-unknown-multicast</td>
<td>Optional. Enables forwarding of multicast packets from unregistered multicast groups. If disabled, the unknown multicast forward feature is also disabled for individual VLANs. This option is enabled by default.</td>
</tr>

**bridge-vlan-mode commands**

Negates a command or reverts settings to their default. The no command, when used in the bridge VLAN mode, negates the VLAN bridge settings or reverts them to their default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no [bridging-mode|captive-portal|description|edge-vlan|firewall|http-analyze|ip|ipv6|
    l2-tunnel-broadcast-optimization|stateful-packet-inspection-12|tunnel|
    tunnel-over-level2|use]
```

```

```

**Parameters**

- no <PARAMETERS>

| no <PARAMETERS> | Resets or reverts this bridge VLAN’s settings based on the parameters passed |

---
Examples

The following example displays bridge VLAN 20 settings before the ‘no’ commands are executed:

```
  nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20)#show context
  bridge vlan 20
    ip igmp snooping
    ip igmp snooping querier
    ipv6 mld snooping
    ipv6 mld snooping querier
  nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20)#
```

nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20)# no ip igmp snooping
nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20)# no ipv6 mld snooping querier

The following example displays bridge VLAN 20 settings after the ‘no’ commands are executed:

```
  nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20)#show context
  bridge vlan 20
    no ip igmp snooping
    no ip igmp snooping querier
    ipv6 mld snooping
    no ipv6 mld snooping querier
  nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20)#
```
7.1.11.2.11 stateful-packet-inspection-l2

- **bridge-vlan-mode commands**

  Enables a stateful packet inspection at the layer 2 firewall

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
stateful-packet-inspection-l2
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#stateful-packet-inspection-l2
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#
```

7.1.11.2.12 tunnel

*bridge-vlan-mode commands*

Enables tunneling of unicast messages, to unknown MAC destinations, on the selected VLAN bridge

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

tunnel [rate-limit|unknown-unicast]

tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024>
  {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}

tunnel unknown-unicast

**Parameters**
- **tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024>
  {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}**

<table>
<thead>
<tr>
<th>tunnel rate-limit level2</th>
<th>Configures a rate-limit parameters (max-burst-size and rate) for tunneled VLAN traffic over level 2 MiNT links</th>
</tr>
</thead>
<tbody>
<tr>
<td>rate &lt;50-1000000&gt;</td>
<td>• rate – Optional. Configures the data rate, in kilobits per second, for the incoming and outgoing extended VLAN traffic tunneled over MiNT level 2 links</td>
</tr>
<tr>
<td>max-burst-size &lt;2-1024&gt;</td>
<td>• &lt;50-1000000&gt; – Specify a value from 50 - 1000000 Kbps. The default is 5000 Kbps.</td>
</tr>
<tr>
<td></td>
<td>• max-burst-size – Optional. Configures the maximum burst size</td>
</tr>
<tr>
<td></td>
<td>• &lt;2-1024&gt; – Specify the maximum burst size from 2 - 1024 kbytes. The default is 320 kbytes.</td>
</tr>
</tbody>
</table>

After specifying the max-burst-size, optionally specify the red-threshold value for the different traffic class. The red-threshold is configured as a % of the specified max-burst-size.

- red-threshold – Optional. Configures the random early detection threshold for the different traffic class
  - background – Configures the red-threshold for low priority traffic from 0 -100. The default is 50% of the specified max-burst-size.
  - best-effort – Configures the red-threshold for normal priority traffic from 0 -100. The default is 50% of the specified max-burst-size.
  - video – Configures the red-threshold for video traffic from 0 -100. The default is 25% of the specified max-burst-size.
  - voice – Configures the red-threshold for voice traffic from 0 -100. The default is 0% of the specified max-burst-size.

- **tunnel unknown-unicast**

| tunnel unknown-unicast | Enables tunneling of unicast packets destined for unknown MAC addresses |
Examples
rfs7000-37FABE(config-profile TestAP81xx-bridge-vlan-1)#tunnel unknown-unicast
rfs7000-37FABE(config-profile TestAP81xx-bridge-vlan-1)#no tunnel unknown-unicast

7.111.2.13 tunnel-over-level2

▶ bridge-vlan-mode commands

Enables extended VLAN (tunneled VLAN) traffic over level 2 MiNT links. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
tunnel-over-level2

Parameters
None

Examples
rfs4000-229D58(config-profile testRFS4000-bridge-vlan-1)#tunnel-over-level2
rfs4000-229D58(config-profile testRFS4000-bridge-vlan-1)#show context

Related Commands

no

Disables extended VLAN traffic over level 2 MiNT links
### 7.1.11.2.14 `use`

**bridge-vlan-mode commands**

Associates a captive-portal, access control list (IPv4, IPv6, or MAC), and/or a URL filter with this bridge VLAN

**Supported in the following platforms:**

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
use [application-policy|captive-portal|ip-access-list|ipv6-access-list|mac-access-list|url-filter]
```

- `use application-policy <APP-POLICY-NAME>`
- `use captive-portal <CAPTIVE-PORTAL-NAME>`
- `use [ip-access-list|ipv6-access-list|mac-access-list] tunnel out <IP/IPv6/MAC-ACCESS-LIST-NAME>`
- `use url-filter <URL-FILTER-NAME>`

**Parameters**

- **use application-policy <APP-POLICY-NAME>**
  
<table>
<thead>
<tr>
<th><strong>use application-policy &lt;APP-POLICY-NAME&gt;</strong></th>
<th>Enforces application detection on this VLAN bridge</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;APP-POLICY-NAME&gt;</code> – Specify the application policy name (should be existing and configured).</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For more information on application definitions and application policies, see application and application-policy.</td>
</tr>
</tbody>
</table>

- **use captive-portal <CAPTIVE-PORTAL-NAME>**

  A captive portal is an access policy for providing temporary and restrictive access using a standard Web browser. Captive portals provide authenticated access by capturing and re-directing a wireless user's Web browser session to a captive portal login page where the user must enter valid credentials to access to the network. Once logged into the captive portal, additional terms and agreement, welcome, fail, and no-service pages provide the administrator with a number of options on captive portal screen flow and user appearance.

  - `<CAPTIVE-PORTAL-NAME>` – Specify the captive portal name.

- **use [ip-access-list|ipv6-access-list|mac-access-list] tunnel out <IP/IPv6/MAC-ACCESS-LIST-NAME>**

<table>
<thead>
<tr>
<th><strong>use</strong></th>
<th>Sets this VLAN bridge policy to use an IPv4/IPv6 access list or a MAC access list</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ip-access-list</strong></td>
<td>Associates a pre-configured IPv4 access list with this VLAN-bridge interface</td>
</tr>
<tr>
<td><strong>ipv6-access-list</strong></td>
<td>Associates a pre-configured IPv6 access list with this VLAN-bridge interface</td>
</tr>
</tbody>
</table>
### Mac-access-list

Associates a pre-configured MAC access list with this VLAN bridge interface.

### Tunnel out

**<IP/IPv6/MAC-ACCESS-LIST-NAME>**

The following keywords are common to the 'IPv4/IPv6 access list' and 'MAC access list' parameters:
- **tunnel** – Applies IPv4/IPv6 access list or MAC access list to all packets going into the tunnel
- **out** – Applies IPv4/IPv6 access list or MAC access list to all outgoing packets
- **<IP/IPv6/MAC-ACCESS-LIST-NAME>** – Specify the IP/IPv6 access list or MAC access list name.

#### Examples

```bash
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#use mac-access-list tunnel out PERMIT-ARP-AND-IPv4
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#show context
  bridge vlan 1
  ip igmp snooping
  ip igmp snooping querier
use mac-access-list tunnel out PERMIT-ARP-AND-IPv4
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#
```

### Related Commands

- **no**
  
  Disables or reverts VLAN Ethernet bridge settings.
7.1.12 captive-portal

Profile Config Commands

Configures captive portal advanced Web page uploads on this profile. These Web pages are uploaded to access points supporting the captive portal.

A captive portal is a means of providing guests temporary and restrictive access to the controller managed wireless network. A captive portal provides secure authenticated controller access by capturing and re-directing a wireless user’s Web browser session to a captive portal login page, where the user must enter valid credentials. Once the user is authenticated and logged into the controller managed network, additional agreement, welcome, and fail pages provide the administrator with options to control the captive portal’s screen flow and user appearance.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
captive-portal page-upload count <1-20>
```

Parameters

- **captive-portal page-upload count <1-20>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>page-upload</td>
<td>Enables captive portal advanced Web page upload</td>
</tr>
<tr>
<td>count &lt;1-20&gt;</td>
<td>Sets the maximum number of APs that can be uploaded concurrently</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-20&gt; – Set a value from 1 - 20. The default is 10.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-profile-default-rfs7000)#captive-portal page-upload count 10
rfs7000-37FABE(config-profile-default-rfs7000)#
```
### 7.1.13 cdp

#### Profile Config Commands

Enables Cisco Discovery Protocol (CDP), a proprietary data link layer network protocol implemented in Cisco networking equipment and used to share network information amongst different vendor wireless devices.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```
cdp [holdtime|run|timer]
cdp [holdtime <10-1800>|run|timer <5-900>]
```

### Parameters

- `cdp [holdtime <10-1800>|run|timer <5-900>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>holdtime &lt;10-1800&gt;</code></td>
<td>Specifies the holdtime after which transmitted packets are discarded</td>
</tr>
<tr>
<td><code>run</code></td>
<td>Enables CDP sniffing and transmit globally. This feature is enabled by default.</td>
</tr>
<tr>
<td><code>timer &lt;5-900&gt;</code></td>
<td>Specifies the interval, in seconds, between successive CDP packet transmission</td>
</tr>
</tbody>
</table>

### Examples

```
rfs7000-37FABE(config profile-default-rfs7000)#cdp run
rfs7000-37FABE(config profile-default-rfs7000)#cdp holdtime 1000
rfs7000-37FABE(config profile-default-rfs7000)#cdp timer 900
rfs7000-37FABE(config-profile-default-rfs7000)#show context
```

### Related Commands

- `no` Disables CDP on this profile
7.1.14 cluster

Profile Config Commands

Sets the cluster configuration

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

cluster [force-configured-state|force-configured-state-delay <3-1800>|handle-stp|master-priority <1-255>]

cluster member [ip|vlan]

cluster member [ip <IP> {level [1|2]}|vlan <1-4094>]

cluster mode [active|standby]

cluster name <CLUSTER-NAME>

cluster radius-counter-db-sync-time <1-1440>

Parameters

- force-configured-state
  - Forces adopted APs to auto revert when a failed wireless controller or service platform (in a cluster) restarts
  - When an active controller (wireless controller, or service platform) fails, a standby controller in the cluster takes over APs adopted by the failed active controller. If the failed active controller were to restart, it starts a timer based on the ‘force-configured-state-delay’ interval specified. At the expiration of this interval, the standby controller releases all adopted APs and goes back to a monitoring mode. If the active controller fails during this interval, the ‘force-configured-state-delay’ timer is stopped. The timer restarts as soon as the active controller comes back up.
  - This feature is disabled by default.

- force-configured-state-delay <3-1800>
  - Forces cluster transition to the configured state after a specified interval
  - <3-1800> – Specify a delay from 3 - 1800 minutes. The default is 5 minutes.
  - This is the interval a standby controller waits before releasing adopted APs when a failed primary controller becomes active again.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle-stp</td>
<td>Enables Spanning Tree Protocol (STP) convergence handling. This feature is disabled by default. In layer 2 networks, this protocol is enabled to prevent network looping. If enabled, the network forwards data only after STP convergence. Enabling STP convergence delays the redundancy state machine execution until the STP convergence is completed (the standard protocol value for STP convergence is 50 seconds). Delaying the state machine is important to load balance APs at startup.</td>
</tr>
</tbody>
</table>
| master-priority <1-255> | Configures cluster master priority  
  • <1-255> – Specifies cluster master election priority. Assign a value from 1 - 255. Higher the value higher is the precedence. The default is 128.  
  In a cluster environment one device from the cluster is elected as the cluster master. A device’s master priority value decides the device’s priority to become cluster master. |
| member                  | Adds a member to the cluster. It also configures the cluster VLAN where members can be reached.                                                                                                             |
| ip <IP> level [1|2]    | Adds IP address of the new cluster member  
  • <IP> – Specify the IP address.  
  • level – Optional. Configures routing level for the new member. Select one of the following routing levels:  
    • 1 – Level 1, local routing  
    • 2 – Level 2, In-site routing |
| vlan <1-4094>           | Configures the cluster VLAN where members can be reached  
  • <1-4094> – Specify the VLAN ID from 1- 4094. |
| mode [active|standby]         | Configures cluster member’s mode as active or standby  
  • active – Configures cluster mode as active. This is the default setting.  
  • standby – Configures cluster mode as standby  
  A member can be in either an Active or Standby mode. All active member controllers can adopt access points. Standby members only adopt access points when an active member has failed or sees an access point not adopted by a controller. |
| name <CLUSTER-NAME>     | Configures the cluster name  
  • <CLUSTER-NAME> – Specify the cluster name. |
| radius-counter-db-sync-time <1-1440> | Configures the interval, in minutes, at which the RADIUS counter database is synchronized with the dedicated NTP server resource.  
  • <1-1440> – Specify a value from 1 - 1440 minutes. The default is 5 minutes.  
  **Note:** Use the `show > cluster > configuration` command to view RADIUS counter DB sync time. |

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000)#cluster name cluster1
rfs7000-37FABE(config-profile-default-rfs7000)#cluster member ip 172.16.10.3
```
rfs7000-37FABE(config-profile-default-rfs7000)#cluster mode active
