WiNG 5.8.4

Wireless Controller, Service Platform, and Access Point

CLI Reference Guide

MN-002845-01
# TABLE OF CONTENTS

## ABOUT THIS GUIDE

### Chapter 1, INTRODUCTION
1.1 CLI Overview ......................................................... 1-2
1.2 Getting Context Sensitive Help ......................................................... 1-8
1.3 Using the No Command ......................................................... 1-10
   1.3.1 Basic Conventions ......................................................... 1-10
1.4 Using CLI Editing Features and Shortcuts ................................. 1-10
   1.4.1 Moving the Cursor on the Command Line ......................... 1-10
   1.4.2 Completing a Partial Command Name .............................. 1-11
   1.4.3 Command Output Pagination ......................................... 1-12
1.5 Using CLI to Create Profiles and Enable Remote Administration ......................................................... 1-12
   1.5.1 Creating Profiles ......................................................... 1-12
   1.5.2 Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface .................. 1-13
   1.5.3 Enabling Remote Administration ................................. 1-13

### Chapter 2, USER EXEC MODE COMMANDS
2.1 User Exec Commands ......................................................... 2-3
   2.1.1 captive-portal-page-upload ........................................ 2-5
   2.1.2 change-passwd ......................................................... 2-8
   2.1.3 clear ................................................................. 2-9
   2.1.4 clock ............................................................... 2-20
   2.1.5 cluster ............................................................. 2-21
   2.1.6 connect ............................................................ 2-22
   2.1.7 create-cluster ..................................................... 2-23
   2.1.8 crypto ............................................................. 2-25
   2.1.9 crypto-cmp-cert-update ........................................ 2-34
   2.1.10 database ......................................................... 2-35
   2.1.11 database-backup ................................................ 2-36
   2.1.12 database-restore .............................................. 2-37
   2.1.13 device-upgrade .................................................. 2-38
   2.1.14 disable ......................................................... 2-48
   2.1.15 enable ......................................................... 2-49
   2.1.16 file-sync ......................................................... 2-50
Chapter 3, PRIVILEGED EXEC MODE COMMANDS

3.1 Privileged Exec Mode Commands ................................................................. 3-3
  3.1.1 archive ........................................................................................................ 3-6
  3.1.2 boot .............................................................................................................. 3-8
  3.1.3 captive-portal-page-upload .......................................................................... 3-9
  3.1.4 cd .................................................................................................................. 3-12
  3.1.5 change-passwd ............................................................................................ 3-13
  3.1.6 clear ............................................................................................................ 3-14
  3.1.7 clock ............................................................................................................ 3-27
  3.1.8 cluster ........................................................................................................ 3-28
  3.1.9 configure .................................................................................................... 3-29
  3.1.10 connect ..................................................................................................... 3-30
  3.1.11 copy .......................................................................................................... 3-31
  3.1.12 cpe ............................................................................................................. 3-32
  3.1.13 create-cluster .......................................................................................... 3-34
  3.1.14 crypto ....................................................................................................... 3-36
  3.1.15 crypto-cmp-cert-update .............................................................................. 3-45
  3.1.16 database .................................................................................................. 3-46
  3.1.17 database-backup ....................................................................................... 3-47
  3.1.18 database-restore ...................................................................................... 3-48
  3.1.19 delete ...................................................................................................... 3-49
  3.1.20 device-upgrade ....................................................................................... 3-50
  3.1.21 diff .......................................................................................................... 3-58
  3.1.22 dir .......................................................................................................... 3-59
  3.1.23 disable .................................................................................................... 3-60
  3.1.24 edit ........................................................................................................ 3-61
  3.1.25 enable .................................................................................................... 3-62
  3.1.26 erase ...................................................................................................... 3-63
  3.1.27 ex3500 .................................................................................................. 3-65
  3.1.28 factory-reset ......................................................................................... 3-72
  3.1.29 file-sync .................................................................................................. 3-76
  3.1.30 format ................................................................................................... 3-78
  3.1.31 halt ...................................................................................................... 3-79
Chapter 4, GLOBAL CONFIGURATION COMMANDS

4.1 Global Configuration Commands

4.1.1 aaa-policy ................................................................. 4-10
4.1.2 alias ................................................................. 4-11
4.1.3 aaa-tacacs-policy ................................................................. 4-18
4.1.4 ap621 ................................................................. 4-19
4.1.5 ap622 ................................................................. 4-20
4.1.6 ap650 ................................................................. 4-21
4.1.7 ap6511 ................................................................. 4-22
4.1.8 ap6521 ................................................................. 4-23
4.1.9 ap6522 ................................................................. 4-24
4.1.10 ap6532 ................................................................. 4-25
4.1.11 ap6562 ................................................................. 4-26
4.1.12 ap71xx ................................................................. 4-27
4.1.13 ap7502 ................................................................. 4-28
4.1.14 ap7522 ................................................................. 4-29
4.1.15 ap7532 ................................................................. 4-30
4.1.16 ap7562 ................................................................. 4-31
4.1.17 ap81xx ................................................................. 4-32
4.1.18 ap82xx ................................................................. 4-33
4.1.19 ap8432 ................................................................. 4-34
4.1.20 ap8533 .......................................................... 4-35
4.1.21 application .................................................. 4-36
4.1.22 application-policy ........................................ 4-45
4.1.23 association-acl-policy .................................. 4-67
4.1.24 auto-provisioning-policy .............................. 4-68
4.1.25 bgp .............................................................. 4-69
4.1.26 bonjour-gw-discovery-policy ...................... 4-71
4.1.27 bonjour-gw-forwarding-policy ..................... 4-73
4.1.28 bonjour-gw-query-forwarding-policy ............ 4-74
4.1.29 captive portal .............................................. 4-75
4.1.30 clear ........................................................... 4-120
4.1.31 client-identity ............................................. 4-121
4.1.32 client-identity-group .................................. 4-129
4.1.33 clone .......................................................... 4-136
4.1.34 crypto-cmp-policy ....................................... 4-137
4.1.35 customize .................................................. 4-138
4.1.36 database-client-policy ............................... 4-149
4.1.37 database-policy .......................................... 4-155
4.1.38 device ........................................................ 4-162
4.1.39 device-categorization .................................. 4-164
4.1.40 dhcp-server-policy ...................................... 4-169
4.1.41 dhcpv6-server-policy ................................. 4-170
4.1.42 dns-whitelist ............................................. 4-172
4.1.43 end .............................................................. 4-177
4.1.44 event-system-policy .................................. 4-178
4.1.45 ex3500 ........................................................ 4-193
4.1.46 ex3500-management-policy ...................... 4-200
4.1.47 ex3500-qos-class-map-policy ..................... 4-218
4.1.48 ex3500-qos-policy-map ............................. 4-226
4.1.49 ex3524 ........................................................ 4-240
4.1.50 ex3548 ........................................................ 4-242
4.1.51 firewall-policy .......................................... 4-243
4.1.52 global-association-list ............................... 4-245
4.1.53 guest-management ..................................... 4-247
4.1.54 host ............................................................ 4-258
4.1.55 inline-password-encryption ...................... 4-259
4.1.56 ip ............................................................... 4-260
4.1.57 ipv6 ............................................................ 4-262
4.1.58 ipv6-router-advertisement-policy ............... 4-263
4.1.59 l2tpv3 ........................................................ 4-281
4.1.60 mac ............................................................ 4-283
4.1.61 management-policy ................................. 4-284
4.1.62 meshpoint ............................................... 4-286
4.1.63 meshpoint-qos-policy ............................... 4-288
4.1.64 mint-policy ............................................... 4-289
4.1.65 nac-list ...................................................... 4-290
4.1.66 no ............................................................... 4-296
4.1.67 nsight-policy ............................................. 4-300
4.1.68 passpoint-policy ........................................ 4-312
4.1.69 password-encryption ................................. 4-314
4.1.70 profile ...................................................... 4-315
4.1.71 radio-qos-policy ........................................ 4-319
4.1.72 radius-group ............................................. 4-320
4.1.73 radius-server-policy ................................. 4-321
4.1.74 radius-user-pool-policy ............................ 4-322
Chapter 5, COMMON COMMANDS

5.1 Common Commands .................................................................5-2
  5.1.1 clrscr ................................................................................5-3
  5.1.2 commit .............................................................................5-4
  5.1.3 exit ..................................................................................5-5
  5.1.4 help ................................................................................5-6
  5.1.5 no ....................................................................................5-9
  5.1.6 revert .............................................................................5-12
  5.1.7 service ...........................................................................5-13
  5.1.8 show ..............................................................................5-53
  5.1.9 write ...............................................................................5-55

Chapter 6, SHOW COMMANDS

6.1 show commands .....................................................................6-2
  6.1.1 show ..............................................................................6-6
  6.1.2 adoption ........................................................................6-12
  6.1.3 bluetooth .......................................................................6-16
  6.1.4 boot ...............................................................................6-18
  6.1.5 bonjour ..........................................................................6-19
  6.1.6 captive-portal .................................................................6-20
  6.1.7 captive-portal-page-upload ..............................................6-22
  6.1.8 cdp ...............................................................................6-24
  6.1.9 classify-url .................................................................6-26
Chapter 7, PROFILES

7.1 Profile Config Commands

7.1.1 adopter-auto-provisioning-policy-lookup
7.1.2 adoption
7.1.3 alias
7.1.4 application-policy
7.1.5 area
7.1.6 arp
7.1.7 auto-learn
7.1.8 autogen-uniqueid
7.1.9 autoinstall
7.1.10 bridge
7.1.11 captive-portal
7.1.12 cdp
7.1.13 cluster
7.1.14 configuration-persistence
7.1.15 controller
7.1.16 critical-resource
7.1.17 crypto
7.1.18 database
7.1.19 device-upgrade
7.1.20 dot1x
7.1.21 dpi
7.1.22 dscp-mapping
7.1.23 email-notification
7.1.24 enforce-version
7.1.25 environmental-sensor
7.1.26 events
7.1.27 export
7.1.28 file-sync
7.1.29 floor
7.1.30 gre
7.1.31 guest-manager-server
7.1.32 http-analyze
7.1.33 http-analyze (NX45XX, NX65XX, and NX9000)
7.1.34 interface
7.1.35 local
7.1.36 log
7.1.37 login
7.1.38 mail
7.1.39 mld
7.1.40 mls
7.1.41 monitor
7.1.42 mrp
7.1.43 ntp
7.1.44 osi
7.1.45 rip
7.1.46 sample
7.1.47 smtp
7.1.48 snmp
7.1.49 spam
7.1.50 static-route
7.1.51 syslog
7.1.52 tcp
7.1.53 tftp
7.1.54 tftp-multicast
7.1.55 tunnel
7.1.56 update
7.1.57 version
7.1.58 virtual-machine
7.1.59 wwan
7.1.60 what
7.1.61 wireless
7.1.62 wireless-config
7.1.63 wlan
7.1.64 wlan-packaging
7.1.65 wireless
7.1.66 t5
7.1.67 terminal
7.1.68 timezone
7.1.69 traffic-shape
7.1.70 upgrade-status
7.1.71 version
7.1.72 vrrp
7.1.73 web-filter
7.1.74 what
7.1.75 wireless
7.1.76 wwan
7.1.77 slot
7.1.78 smart-cache
7.1.79 virtual-machine
7.1.80 mirroring
7.1.81 raid
7.1.35 ip ................................................................. 7-355
7.1.36 ipv6 ......................................................... 7-365
7.1.37 l2tpv3 ...................................................... 7-369
7.1.38 l3e-lite-table ........................................... 7-371
7.1.39 led ............................................................ 7-372
7.1.40 led-timeout ................................................ 7-373
7.1.41 legacy-auto-downgrade .............................. 7-375
7.1.42 legacy-auto-update ..................................... 7-376
7.1.43 lldp ........................................................... 7-377
7.1.44 load-balancing .......................................... 7-379
7.1.45 logging .................................................... 7-384
7.1.46 mac-address-table ................................. 7-386
7.1.47 mac-auth .................................................. 7-388
7.1.48 management-server .................................. 7-391
7.1.49 memory-profile ........................................ 7-392
7.1.50 meshpoint-device ..................................... 7-393
7.1.51 meshpoint-monitor-interval ....................... 7-394
7.1.52 min-misconfiguration-recovery-time .......... 7-395
7.1.53 mint .......................................................... 7-396
7.1.54 misconfiguration-recovery-time .................. 7-403
7.1.55 neighbor-inactivity-timeout ....................... 7-404
7.1.56 neighbor-info-interval ............................... 7-405
7.1.57 no ............................................................. 7-406
7.1.58 noc .......................................................... 7-408
7.1.59 nsight ...................................................... 7-409
7.1.60 ntp ........................................................... 7-414
7.1.61 offline-duration ........................................ 7-417
7.1.62 power-config ........................................... 7-418
7.1.63 preferred-controller-group ....................... 7-420
7.1.64 preferred-tunnel-controller ....................... 7-421
7.1.65 radius ...................................................... 7-422
7.1.66 rf-domain-manager ................................. 7-423
7.1.67 router ..................................................... 7-424
7.1.68 spanning-tree .......................................... 7-426
7.1.69 traffic-class-mapping ............................... 7-429
7.1.70 traffic-shape ............................................ 7-431
7.1.71 trustpoint (profile-config-mode) ............... 7-436
7.1.72 tunnel-controller ...................................... 7-438
7.1.73 use .......................................................... 7-439
7.1.74 vrrp ........................................................ 7-445
7.1.75 vrrp-state-check ...................................... 7-449
7.1.76 wep-shared-key-auth ............................... 7-450
7.1.77 service .................................................... 7-451
7.1.78 slot .......................................................... 7-457

7.2 Device Config Commands ............................... 7-459
7.2.1 adoption-site .............................................. 7-466
7.2.2 area .......................................................... 7-467
7.2.3 channel-list .............................................. 7-468
7.2.4 contact ...................................................... 7-469
7.2.5 country-code ............................................. 7-470
7.2.6 floor .......................................................... 7-471
7.2.7 geo-coordinates ........................................ 7-472
7.2.8 hostname .................................................. 7-473
7.2.9 layout-coordinates ..................................... 7-474
7.2.10 license ..................................................... 7-475
Chapter 8, AAA-POLICY

8.1 aaa-policy .......................................................... .8-3
  8.1.1 accounting ...................................................... .8-4
  8.1.2 attribute ........................................................ .8-8
  8.1.3 authentication ................................................ .8-11
  8.1.4 health-check .................................................. .8-16
  8.1.5 mac-address-format ....................................... .8-17
  8.1.6 no ................................................................. .8-18
  8.1.7 proxy-attribute .............................................. .8-20
  8.1.8 server-pooling-mode ...................................... .8-21
  8.1.9 use ............................................................... .8-22

Chapter 9, AUTO-PROVISIONING-POLICY

9.1 auto-provisioning-policy .......................................... .9-4
  9.1.1 adopt .......................................................... .9-5
  9.1.2 auto-create-rfd-template ............................... .9-10
  9.1.3 default-adoption .......................................... .9-12
  9.1.4 deny ........................................................... .9-13
  9.1.5 evaluate-always ........................................... .9-16
  9.1.6 redirect ....................................................... .9-17
  9.1.7 upgrade ....................................................... .9-21
| 15.1.10 privilege-mode-password | 15-18 |
| 15.1.11 rest-server | 15-19 |
| 15.1.12 restrict-access | 15-20 |
| 15.1.13 snmp-server | 15-22 |
| 15.1.14 ssh | 15-26 |
| 15.1.15 t5 | 15-27 |

Chapter 13, FIREWALL-POLICY

13.1 firewall-policy ......................................... 13-3
13.1.1 acl-logging ............................................. 13-4
13.1.2 alg ........................................................ 13-5
13.1.3 clamp .................................................... 13-7
13.1.4 dhcp-offer-convert ................................. 13-8
13.1.5 dns-snoop .............................................. 13-9
13.1.6 firewall .................................................. 13-10
13.1.7 flow ...................................................... 13-11
13.1.8 ip .......................................................... 13-13
13.1.9 ip-mac .................................................... 13-20
13.1.10 ipv6 ...................................................... 13-23
13.1.11 ipv6-mac .............................................. 13-26
13.1.12 logging ............................................... 13-28
13.1.13 no ....................................................... 13-30
13.1.14 proxy-arp ............................................ 13-32
13.1.15 proxy-nd ............................................. 13-33
13.1.16 stateful-packet-inspection-12 ................. 13-34
13.1.17 storm-control ....................................... 13-35
13.1.18 virtual-defragmentation ......................... 13-37

Chapter 14, MINT-POLICY

14.1 mint-policy ................................................. 14-2
14.1.1 level ...................................................... 14-3
14.1.2 lsp ....................................................... 14-4
14.1.3 mtu ....................................................... 14-5
14.1.4 router ................................................. 14-6
14.1.5 udp ...................................................... 14-7
14.1.6 no ....................................................... 14-8

Chapter 15, MANAGEMENT-POLICY

15.1 management-policy ..................................... 15-3
15.1.1 aaa-login ............................................. 15-4
15.1.2 allowed-locations ................................. 15-6
15.1.3 banner ............................................... 15-7
15.1.4 ftp ...................................................... 15-8
15.1.5 http ..................................................... 15-10
15.1.6 https .................................................. 15-11
15.1.7 idle-session-timeout ............................... 15-13
15.1.8 ipv6 .................................................... 15-14
15.1.9 no ...................................................... 15-16
15.1.10 privilege-mode-password ..................... 15-18
15.1.11 rest-server ......................................... 15-19
15.1.12 restrict-access .................................... 15-20
15.1.13 snmp-server ...................................... 15-22
15.1.14 ssh .................................................. 15-26
15.1.15 t5 ..................................................... 15-27
# Chapter 23, ROUTER-MODE COMMANDS

**23.1 router-mode** .......................................................... 23-3
- **23.1.1 area** ............................................................. 23-4
- **23.1.2 auto-cost** ..................................................... 23-13
- **23.1.3 default-information** ................................. 23-14
- **23.1.4 ip** ............................................................... 23-15
- **23.1.5 network** ..................................................... 23-16
- **23.1.6 ospf** ........................................................... 23-17
- **23.1.7 passive** ..................................................... 23-18
- **23.1.8 redistribute** .............................................. 23-19
- **23.1.9 route-limit** ............................................... 23-20
- **23.1.10 router-id** ............................................... 23-21
- **23.1.11 no** ............................................................ 23-22

# Chapter 24, ROUTING-POLICY

**24.1 routing-policy-commands** ........................................ 24-3
- **24.1.1 apply-to-local-packets** .............................. 24-4
- **24.1.2 logging** .................................................... 24-5
- **24.1.3 route-map** ................................................ 24-6
- **24.1.4 route-map-mode** ..................................... 24-8
- **24.1.5 use** ........................................................... 24-16
- **24.1.6 no** ............................................................. 24-17

# Chapter 25, AAA-TACACS-POLICY

**25.1 aaa-tacacs-policy** .................................................. 25-2
- **25.1.1 accounting** .............................................. 25-3
- **25.1.2 authentication** .......................................... 25-6
- **25.1.3 authorization** .......................................... 25-9
Chapter 26, MESHPOINT

26.1 meshpoint-config-instance .................................................................................................................. 26-2
26.1.1 allowed-vlans ....................................................................................................................................... 26-4
26.1.2 beacon-format ..................................................................................................................................... 26-5
26.1.3 control-vlan ...................................................................................................................................... 26-6
26.1.4 data-rates ......................................................................................................................................... 26-7
26.1.5 description ...................................................................................................................................... 26-11
26.1.6 force ............................................................................................................................................... 26-12
26.1.7 meshid .............................................................................................................................................. 26-13
26.1.8 neighbor ......................................................................................................................................... 26-14
26.1.9 no ................................................................................................................................................... 26-15
26.1.10 root ............................................................................................................................................... 26-17
26.1.11 security-mode ................................................................................................................................. 26-19

C.1 Support Center | C-1
This manual supports the following wireless controllers, service platforms, and access points:

- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**NOTE:** ES6510 is an *Ethernet Switch* managed by a wireless controller or service platform, such as RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, and NX9600. ES6510 does not have radios and does not provide WLAN support.

**NOTE:** In this guide,
- AP7131, AP7161, and AP7181 are collectively represented as AP71XX.
- AP8122, AP8132, and AP8163 are collectively represented as AP81XX. AP8163 is an outdoor mesh supporting access point.
- AP8222 and AP8232 are collectively represented as AP82XX.
- NX4500 and NX4524 are collectively represented as NX45XX.
- NX6500 and NX6524 are collectively represented as NX65XX.
- NX7510, NX7520, and NX7530 are collectively represented as NX7500 series.
- NX9000, NX9500, and NX9510 are collectively represented as NX9000 series.

A simplified version of the WiNG operating system *user interface* (UI) is available on the following access point and service platform models with the E-SKU:
- AP6511, AP6521, AP6522, AP6562, AP7502, AP7522, AP7532, and AP7562
- NX7510
This new UI, referred to as the WiNG Express (WE) UI, simplifies configuration and monitoring of small access point deployments by limiting monitoring, analytics, and configuration capabilities. The WE UI is designed for single-site access point deployments not exceeding more than 24 access points of the same model.

---

**CAUTION:** If using the WiNG Express (WE) UI, to configure a WE access point, use the WE UI exclusively. Do not use the command line interface (CLI) along with it. Similarly, when using the CLI to configure the WE access point, do not use the WE UI along with it.

---

This section is organized into the following topics:

- *Document Conventions*
- *Notational Conventions*
- *End-User Software License Agreement*
Document Conventions

The following conventions are used in this document to draw your attention to important information:

- **NOTE**: Indicates tips or special requirements.

- **CAUTION**: Indicates conditions that can cause equipment damage or data loss.

- **WARNING!**: Indicates a condition or procedure that could result in personal injury or equipment damage.

- **Switch Note**: Indicates caveats unique to a RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, or NX9600 model controller.
Notational Conventions

The following notational conventions are used in this document:

- Italics are used to highlight specific items in the general text, and to identify chapters and sections in this and related documents
- Bullets (•) indicate:
  - lists of alternatives
  - lists of required steps that are not necessarily sequential
  - action items
- Sequential lists (those describing step-by-step procedures) appear as numbered lists

Understanding Command Syntax

| `<variable>` | Variables are described with a short description enclosed within a '<' and a '>' pair. For example, the command, `rfs7000-37FABE>show interface ge 1` is documented as: `show interface ge <1-4>` where:
| `|` | • show – is the command – displays information
| `|` | • interface – is the keyword – represents the interface type
| `|` | • `<1-4>` – is the variable – represents the ge interface index value
| `|` | The pipe symbol. This is used to separate the variables/keywords in a list. For example, the command, `rfs7000-37FABE> show ......` is documented as: `show [adoption|bonjour|boot] ......` where:
| `|` | • show – is the command – displays information
| `|` | • `[adoption|bonjour|......]` – indicates the different keywords that can be combined with the show command. However, only one of the above option can be used at a time.
| `|` | show adoption ...
| `|` | show bonjour ...
| `|` | show boot ....
<p>|
|</p>
<table>
<thead>
<tr>
<th>Keywords and Variables</th>
<th>Description</th>
</tr>
</thead>
</table>
| Of the different keywords and variables listed inside a ‘[ & ]’ pair, only one can be used. Each choice in the list is separated with a ‘|’ (pipe) symbol. | For example, the command, 
\[ \text{rfs7000-37FABE}\#\text{clear ...} \] is documented as: 
\[ \text{clear [arp-cache|bonjour|cdp|counters|crypto|event-history|firewall|gre|ip|ipv6|l2tpv3-stats|license|lldp|logging|mac-address-table|mint|role|rtls|spanning-tree|traffic-shape|vrrp]} \] where: 
• clear – is the command 
• [arp-cache|cdp|event-history|firewall|gre|ip|ipv6|l2tpv3-stats|license|lldp|logging|mac-address-table|mint|role|rtls|spanning-tree|traffic-shape|vrrp] – indicates that these keywords are available for this command. However, only one can be used at a time. |
| Any command/keyword/variable or a combination of them inside a ‘{ & }’ pair is optional. All optional commands follow the same conventions as listed above. However, they are displayed italicized. | For example, the command, 
\[ \text{rfs7000-37FABE}>\text{show adoption ...} \] is documented as: 
\[ \text{show adoption info } \{ \text{on } <\text{DEVICE-NAME}> \} \] here: 
• show adoption info – is the command. This command can also be used as: 
\[ \text{show adoption info} \] The command can also be extended as: 
\[ \text{show adoption info } \{ \text{on } <\text{DEVICE-NAME}> \} \] here: 
• \{on <DEVICE-NAME>\} – is the keyword, which is optional. |
| The first word is always a command. Keywords are words that must be entered as is. Commands and keywords are mandatory. | For example, the command, 
\[ \text{rfs7000-37FABE}>\text{show wireless} \] is documented as: 
\[ \text{show wireless} \] where: 
• show – is the command 
• wireless – is the keyword |
(Any command/keyword/variable or a combination of them inside a '()' pair are recursive. All recursive commands can be listed in any order and can be used once along with the rest of the commands.

For example, the command,

```
crypto pki export request generate-rsa-key test autogen-subject-name ...
```

is documented as:

```
rfs7000-37FABE#crypto pki export request generate-rsa-key test autogen-subject-name ...
```

here:

- crypto pki export request generate-rsa-key <RSA-KEYPAIR-NAME> auto-gen-subject-name – is the command
- <RSA-KEYPAIR-NAME> – is the RSA keypair name (in this example, the keypair name is 'test'), and is a variable
- (<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>) – is the set of recursive parameters (separated by commas) that can be used in any order.
End-User Software License Agreement

BY INSTALLING AND/OR USING THIS PRODUCT, YOU ACKNOWLEDGE THAT YOU HAVE READ THIS AGREEMENT, UNDERSTAND IT AND AGREE TO BE BOUND ITS TERMS. IF YOU DO NOT AGREE TO THE TERMS OF THIS AGREEMENT, ZEBRA IS NOT WILLING TO LICENSE THE PRODUCT TO YOU, AND YOU MUST NOT INSTALL OR USE THIS PRODUCT.

GRANT OF LICENSE. Zebra Technologies Corporation (“Zebra”) grants you (“Licensee” or “you”) a personal, nonexclusive, nontransferable, revocable, nonassignable, limited license to use the software and documentation (“Product(s)”) subject to the terms and conditions of this Agreement. You shall use the Products only for your internal business purposes, exclusively to support Zebra devices. Any use of the Products outside of the conditions set forth herein is strictly prohibited and will be deemed a breach of this Agreement resulting in immediate termination of your License. In the event of a breach of this Agreement, Zebra will be entitled to all available remedies at law or in equity (including immediate immediate termination of the license without notice, immediate injunctive relief and repossess of all Products unless Licensee is a Federal agency of the United States Government).

You shall not distribute, sublicense, rent, loan, lease, export, re-export, resell, ship or divert or cause to be exported, re-exported, resold, shipped or diverted, directly or indirectly, the Products under this Agreement. You shall not, and shall not permit others to: (i) modify, translate, decompile, bootleg, reverse engineer, disassemble, or extract the inner workings of the Products, (ii) copy the look-and-feel or functionality of the Products; (iii) remove any proprietary notices, marks, labels, or logos from the Products; (iv) rent or transfer all or some of the Products to any other party without Zebra’s prior written consent; or (v) utilize any computer software or hardware which is designed to defeat any copy protection device, should the Products be equipped with such a protection device.

Title to all copies of Products will not pass to Licensee at any time and remains vested exclusively in Zebra. All intellectual property developed, originated, or prepared by Zebra in connection with the Products remain vested exclusively in Zebra, and this Agreement does not grant to Licensee any intellectual property rights.

Portions of the Products are protected by United States patent and copyright laws, international treaty provisions, and other applicable laws. Therefore, you must treat the Products like any other copyrighted material (e.g., a book or musical recording) except that you may make one copy of the Product solely for back-up purposes. Unauthorized duplication of the Products constitutes copyright infringement, and in the United States is punishable in federal court by fine and imprisonment.

LIMITED WARRANTY. Zebra warrants for a period of ninety (90) days from your receipt of the Products to you that the Software, under normal use, will perform substantially in accordance with Zebra’s published specifications for that release level of the Software. The written materials are provided “AS IS” and without warranty of any kind. Zebra’s entire liability and your sole and exclusive remedy for any breach of the foregoing limited warranty will be, at Zebra's option, the provision of a downloadable patch or replacement code, or a refund of the unused portion of your bargained for contractual benefit up to the amount paid for the Products.

DISCLAIMER. THIS LIMITED WARRANTY IS THE ONLY WARRANTY PROVIDED BY ZEBRA, AND ZEBRA MAKES, AND YOU RECEIVE, NO OTHER WARRANTIES OF ANY KIND, WHETHER EXPRESS, IMPLIED, STATUTORY, OR IN ANY COMMUNICATION WITH YOU. ZEBRA SPECIFICALLY DISCLAIMS ANY WARRANTY INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY, NONINFRINGEMENT, OR FITNESS FOR A PARTICULAR PURPOSE. ZEBRA DOES NOT WARRANT THAT THE PRODUCTS WILL MEET YOUR REQUIREMENTS, OR THAT THE OPERATION OF THE PRODUCTS WILL BE UNINTERRUPTED OR ERROR FREE, OR THAT DEFECTS IN THE PRODUCTS WILL BE CORRECTED. ZEBRA MAKES NO WARRANTY WITH RESPECT TO THE CORRECTNESS, ACCURACY, OR RELIABILITY OF THE PRODUCTS. Some jurisdictions do not allow the exclusion of implied warranties, so the above exclusion may not apply to you.

LIMITATION OF LIABILITY. THE TOTAL LIABILITY OF ZEBRA UNDER THIS AGREEMENT FOR DAMAGES SHALL NOT EXCEED THE FAIR MARKET VALUE OF THE PRODUCTS LICENSED UNDER THIS AGREEMENT. IN NO EVENT WILL ZEBRA BE LIABLE IN ANY WAY FOR INCIDENTAL, CONSEQUENTIAL, INDIRECT, SPECIAL OR PUNITIVE DAMAGES OF ANY NATURE, INCLUDING WITHOUT LIMITATION, LOST BUSINESS PROFITS, OR LIABILITY OR INJURY TO THIRD PERSONS, WHETHER FORESEEABLE OR NOT, REGARDLESS OF WHETHER ZEBRA HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. Some jurisdictions do not permit limitations of liability for incidental or consequential damages, so the above exclusions may not apply to you. This Limitation of Liability provision survives the termination of this Agreement.
and applies notwithstanding any contrary provision in this Agreement. Licensee must bring any action under this Agreement within one (1) year after the cause of action arises.

MAINTENANCE. Unless provided for in a separate agreement, Zebra shall not be responsible for maintenance or field service of the Products.

HIGH RISK ACTIVITIES. The Products are not fault-tolerant and are not designed, manufactured or intended for use or resale as on-line control software in hazardous environments requiring fail-safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life support machines, or weapons systems, in which the failure of the Products could lead directly to death, personal injury, or severe physical or environmental damage (“High Risk Activities”).

Zebra and its suppliers specifically disclaim any express or implied warranty of fitness for High Risk Activities, and if you elect to use the Products in any High Risk Activities, you agree to indemnify, defend, and hold Zebra harmless from and against any and all costs, damages, and losses related to that use.

U.S. GOVERNMENT. If you are acquiring the Products on behalf of any unit or agency of the U.S. Government, the following shall apply. Use, duplication, or disclosure of the Products is subject to the restrictions set forth in subparagraphs (c) (1) and (2) of the Commercial Computer Software - Restricted Rights clause at FAR 52.227-19 (JUNE 1987), if applicable, unless being provided to the Department of Defense. If being provided to the Department of Defense, use, duplication, or disclosure of the Products is subject to the restricted rights set forth in subparagraph (c) (1) (ii) of the Rights in Technical Data and Computer Software clause at DFARS 252.227-7013 (OCT 1988), if applicable. Products may or may not include a Restricted Rights notice, or other notice referring specifically to the terms and conditions of this Agreement. The terms and conditions of this Agreement shall each continue to apply, but only to the extent that such terms and conditions are not inconsistent with the rights provided to you under the aforementioned provisions of the FAR and DFARS, as applicable to the particular procuring agency and procurement transaction.

ASSIGNMENT. Except as otherwise provided in this section, neither party may assign this Agreement, or any of its rights or obligations under this Agreement, without the prior written approval of the other party, which will not be unreasonably withheld. Any attempted assignment, delegation, or transfer without the necessary approval will be void. Notwithstanding the foregoing, for any Zebra acquisition, merger, consolidation, reorganization, or similar transaction, or any spin-off, divestiture, or other separation of a Zebra business, Zebra may, without the prior written consent of the other party: (i) assign its rights and obligations under this Agreement, in whole or in part, or (ii) split and assign its rights and obligations under this Agreement so as to retain the benefits of this Agreement for both Zebra and the assignee entity(ies) (and their respective Affiliates) following the split.

GOVERNING LAW. This Agreement shall be governed by the laws of the United States of America to the extent that they apply and otherwise by the laws of the State of New York without regard to its conflict of laws provisions or by the internal substantive laws of the country to which the Products is shipped if end-user customer is a sovereign governmental entity. The terms of the U.N. Convention on Contracts for the International Sale of Goods do not apply. In the event that the Uniform Computer information Transaction Act, any version of this Act, or a substantially similar law (collectively “UCITA”) becomes applicable to a Party’s performance under this Agreement, UCITA does not govern any aspect of this End User License Agreement or any license granted under this End-User License Agreement, or any of the parties’ rights or obligations under this End User License Agreement. The governing law will be that in effect prior to the applicability of UCITA.

COMPLIANCE WITH LAWS. Licensee will comply with all applicable laws and regulations, including export laws and regulations of the United States. Licensee will not, without the prior authorization of Zebra and the appropriate governmental authority of the United States, in any form export or re-export, sell or resell, ship or reship, or divert, through direct or indirect means, any item or technical data or direct or indirect products sold or otherwise furnished to any person within any territory for which the United States Government or any of its agencies at the time of the action, requires an export license or other governmental approval. Violation of this provision will be a material breach of this Agreement, permitting immediate termination by Zebra.

THIRD PARTY SOFTWARE. The Products may contain one or more items of Third-Party Software. The terms of this Agreement govern your use of any Third-Party Software UNLESS A SEPARATE THIRD-PARTY SOFTWARE LICENSE IS INCLUDED, IN WHICH CASE YOUR USE OF THE THIRD-PARTY SOFTWARE WILL THEN BE GOVERNED BY THE SEPARATE THIRD-PARTY LICENSE.
OPEN SOURCE SOFTWARE. The Products may contain one or more items of Open Source Software. Open Source Software is software covered by a publicly available license governed solely under Copyright law, whereas the complete terms and obligations of such license attach to a licensee solely through the act of copying, using and/or distribution of the licensed software, such obligations often include one or more of attribution obligations, distribution obligations, copyleft obligations, and intellectual property encumbrances. The use of any Open Source Software is subject to the terms and conditions of this Agreement as well as the terms and conditions of the corresponding license of each Open Source Software package. If there is a conflict between the terms and conditions of this Agreement and the terms and conditions of the Open Source Software license, the applicable Open Source Software license will take precedence. Copies of the licenses for the included Open Source Software, if any, as well as their attributions, acknowledgements, and software information details, are provided in the electronic copy of this Agreement, which is available in the Legal Notices or README file associated with the Product. Zebra is required to reproduce the software licenses, acknowledgments and copyright notices as provided by the authors and owners, thus, all such information is provided in its native language form, without modification or translation. Depending on the license terms of the specific Open Source Software, source code may not be provided. Please reference and review the entire Open Source Software information to identify which Open Source Software packages have source code provided or available. For instructions on how to obtain a copy of any source code made publicly available by Zebra related to Open Source Software distributed by Zebra, you may send your request (including the Zebra Product name and version, along with the Open Source Software specifics) in writing to: Zebra Technologies Corporation, Open Source Software Director, Legal Department, 3 Overlook Point, Lincolnshire, IL 60069 USA.

CHAPTER 1
INTRODUCTION

This chapter describes the commands available within a device’s Command Line Interface (CLI) structure. CLI is available for wireless controllers, access points (APs), and service platforms.

Access the CLI by using:

- A terminal emulation program running on a computer connected to the serial port on the device (access point, wireless controller, and service platform).
- A Telnet session through Secure Shell (SSH) over a network.

**Configuration for connecting to a Controller using a terminal emulator**

If connecting through the serial port, use the following settings to configure your terminal emulator:

<table>
<thead>
<tr>
<th>Bits Per Second</th>
<th>19200</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> For AP8432, AP8533, AP7502, AP7522, AP7532, AP7562, AP6511, AP6522, AP6532, AP6562 model access points set this value to 115200.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Data Bits</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parity</td>
<td>None</td>
</tr>
<tr>
<td>Stop Bit</td>
<td>1</td>
</tr>
<tr>
<td>Flow Control</td>
<td>None</td>
</tr>
</tbody>
</table>

When a CLI session is established, complete the following (user input is in **bold**):

```
login as: <username>
administrator’s login password: <password>
```

**User Credentials**

Use the following credentials when logging into a device for the first time:

<table>
<thead>
<tr>
<th>User Name</th>
<th>admin</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Password</strong></td>
<td>admin123</td>
</tr>
</tbody>
</table>

When logging into the CLI for the first time, you are prompted to change the password.
Examples in this reference guide
Examples used in this reference guide are generic to each supported wireless controller, service platform, and AP model. Commands that are not common, are identified using the notation “Supported in the following platforms:” For an example, see below:

Supported in the following platforms:
• Wireless Controller – RFS6000

The above example indicates the command is only available for a RFS6000 model wireless controller.

This chapter is organized into the following sections:
• CLI Overview
• Getting Context Sensitive Help

1.1 CLI Overview

INTRODUCTION

The CLI is used for configuring, monitoring, and maintaining the network. The user interface allows you to execute commands on supported wireless controllers, service platforms, and APs, using either a serial console or a remote access method.

This chapter describes basic CLI features. Topics covered include an introduction to command modes, navigation and editing features, help features and command history.

The CLI is segregated into different command modes. Each mode has its own set of commands for configuration, maintenance, and monitoring. The commands available at any given time depend on the mode you are in, and to a lesser extent, the particular model used. Enter a question mark (?) at the system prompt to view a list of commands available for each command mode/instance.

Use specific commands to navigate from one command mode to another. The standard order is: USER EXEC mode, PRIV EXEC mode and GLOBAL CONFIG mode.

![Hierarchy of User Modes](image)
**Command Modes**

A session generally begins in the USER EXEC mode (one of the two access levels of the EXEC mode). For security, only a limited subset of EXEC commands are available in the USER EXEC mode. This level is reserved for tasks that do not change the device’s (wireless controller, service platform, or AP) configuration.

```
rfs7000-37FABE>
```

The system prompt signifies the device name and the last three bytes of the device MAC address.

To access commands, enter the PRIV EXEC mode (the second access level for the EXEC mode). Once in the PRIV EXEC mode, enter any EXEC command. The PRIV EXEC mode is a superset of the USER EXEC mode.

```
rfs7000-37FABE>enable
rfs7000-37FABE#
```

Most of the USER EXEC mode commands are one-time commands and are not saved across device reboots. Save the command by executing 'commit' command. For example, the show command displays the current configuration and the clear command clears the interface.

Access the GLOBAL CONFIG mode from the PRIV EXEC mode. In the GLOBAL CONFIG mode, enter commands that set general system characteristics. Configuration modes, allow you to change the running configuration. If you save the configuration later, these commands are stored across device reboots.

Access a variety of protocol specific (or feature-specific) modes from the global configuration mode. The CLI hierarchy requires you to access specific configuration modes only through the global configuration mode.

```
rfs7000-37FABE#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config)#
```

You can also access sub-modes from the global configuration mode. Configuration sub-modes define specific features within the context of a configuration mode.

```
rfs7000-37FABE(config)#aaa-policy test
rfs7000-37FABE(config-aaa-policy-test)#
```

The following table summarizes available CLI commands:

<table>
<thead>
<tr>
<th>User Exec Mode</th>
<th>Priv Exec Mode</th>
<th>Global Configuration Mode</th>

1.2 Getting Context Sensitive Help

INTRODUCTION

Enter a question mark (?) at the system prompt to display a list of commands available for each mode. Obtain a
list of arguments and keywords for any command using the CLI context-sensitive help.

Use the following commands to obtain help specific to a command mode, command name, keyword or argument:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(prompt)#help</td>
<td>Displays a brief description of the help system</td>
</tr>
<tr>
<td>(prompt)#abbreviated-command-entry?</td>
<td>Lists commands in the current mode that begin with a particular character string</td>
</tr>
<tr>
<td>(prompt)#abbreviated-command-entry[TAB]</td>
<td>Completes a partial command name</td>
</tr>
<tr>
<td>(prompt)#?</td>
<td>Lists all commands available in the command mode</td>
</tr>
<tr>
<td>(prompt)#command ?</td>
<td>Lists the available syntax options (arguments and keywords) for the command</td>
</tr>
<tr>
<td>(prompt)#command keyword ?</td>
<td>Lists the next available syntax option for the command</td>
</tr>
</tbody>
</table>

NOTE: The system prompt varies depending on the configuration mode.

NOTE: Enter Ctrl + V to use ? as a regular character and not as a character used for displaying context sensitive help. This is required when the user has to enter a URL that ends with a ?

NOTE: The escape character used throughout the CLI is “\”. To enter a “\” use “\\” instead.

When using context-sensitive help, the space (or lack of a space) before the question mark (?) is significant. To obtain a list of commands that begin with a particular sequence, enter the characters followed by a question mark (?). Do not include a space. This form of help is called word help, because it completes a word.

rfs7000-37FABE#service?
service Service Commands
rfs7000-37FABE#service
Enter a question mark (?) (in place of a keyword or argument) to list keywords or arguments. Include a space before the “?”. This form of help is called command syntax help. It shows the keywords or arguments available based on the command/keyword and argument already entered.

rfs7000-37FABE#service ?
block-adopter-config-update  Block configuration updates from the adopter
bluetooth                Bluetooth service commands
clear                    Clear adoption history
cli-tables-skin          Choose a formatting layout/skin for CLI tabular outputs
cluster                  Cluster Protocol
copy                     Copy from one file to another
delete                   Delete sessions
delete-offline-aps       Delete Access Points that are configured but offline
force-send-config        Resend configuration to the device
force-update-vm-stats    Force VM statistics to be pushed up to the NOC
load-balancing           Wireless load-balancing service commands
load-ssh-authorized-keys Load Ssh authorized keys
locator                  Enable leds flashing on the device
mint                     MiNT protocol
pktcap                   Start packet capture
pm                       Process Monitor
radio                    Radio parameters
radius                   Radius test
request-full-config-from-adopter Request full configuration from the adopter
set                      Set validation mode
show                     Show running system information
signal                   Send a signal to a process
smart-rf                 Smart-RF Management Commands
snmp                     Snmp
ssm                      Command related to ssm
start-shell              Provide shell access
syslog                   Test the syslog server configuration
trace                    Trace a process for system calls and signals
troubleshoot             Troubleshooting
wireless                 Command related to wireless

rfs7000-37FABE#

It is possible to abbreviate commands and keywords to allow a unique abbreviation. For example, “configure terminal” can be abbreviated as config t. Since the abbreviated command is unique, the controller accepts the abbreviation and executes the command.

Enter the help command (available in any command mode) to provide the following description:

rfs7000-37FABE>help

When using the CLI, help is provided at the command line when typing '?'.

If no help is available, the help content will be empty. Backup until entering a '?' shows the help content.

There are two styles of help provided:
1. Full help. Available when entering a command argument (e.g. 'show ?'). This will describe each possible argument.

2. Partial help. Available when an abbreviated argument is entered. This will display which arguments match the input (e.g. 'show ve?').

rfs7000-37FABE>
1.3 Using the No Command

INTRODUCTION
Almost every command has a no form. Use no to disable a feature or function or return it to its default. Use the command without the no keyword to re-enable a disabled feature.

1.3.1 Basic Conventions
Keep the following conventions in mind while working within the CLI structure:
- Use ? at the end of a command to display available sub-modes. Type the first few characters of the sub-mode and press the tab key to add the sub-mode. Continue using ? until you reach the last sub-mode.
- Pre-defined CLI commands and keywords are case-insensitive: cfg = Cfg = CFG. However (for clarity), CLI commands and keywords are displayed (in this guide) using mixed case. For example, apPolicy, trapHosts, channellInfo.
- Enter commands in uppercase, lowercase, or mixed case. Only passwords are case sensitive.

1.4 Using CLI Editing Features and Shortcuts

INTRODUCTION
A variety of shortcuts and edit features are available. The following sections describe these features:
- Moving the Cursor on the Command Line
- Completing a Partial Command Name
- Command Output Pagination

1.4.1 Moving the Cursor on the Command Line

Using CLI Editing Features and Shortcuts
The following table shows the key combinations or sequences to move the command line cursor. Ctrl defines the control key, which must be pressed simultaneously with its associated letter key. Esc means the escape key (which must be pressed first), followed by its associated letter key. Keys are not case sensitive. Specific letters are used to provide an easy way of remembering their functions.

<table>
<thead>
<tr>
<th>Keystrokes</th>
<th>Function Summary</th>
<th>Function Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left Arrow or Ctrl-B</td>
<td>Back character</td>
<td>Moves the cursor one character to the left When entering a command that extends beyond a single line, press the Left Arrow or Ctrl-B keys repeatedly to move back to the system prompt.</td>
</tr>
<tr>
<td>Right Arrow or Ctrl-F</td>
<td>Forward character</td>
<td>Moves the cursor one character to the right</td>
</tr>
<tr>
<td>Esc- B</td>
<td>Back word</td>
<td>Moves the cursor back one word</td>
</tr>
<tr>
<td>Esc- F</td>
<td>Forward word</td>
<td>Moves the cursor forward one word</td>
</tr>
<tr>
<td>Ctrl-A</td>
<td>Beginning of line</td>
<td>Moves the cursor to the beginning of the command line</td>
</tr>
<tr>
<td>Ctrl-E</td>
<td>End of line</td>
<td>Moves the cursor to the end of the command line</td>
</tr>
<tr>
<td>Ctrl-D</td>
<td></td>
<td>Deletes the current character</td>
</tr>
<tr>
<td>Ctrl-U</td>
<td></td>
<td>Deletes text up to cursor</td>
</tr>
</tbody>
</table>
1.4.2 Completing a Partial Command Name

Using CLI Editing Features and Shortcuts

If you cannot remember a command name (or if you want to reduce the amount of typing you have to perform), enter the first few letters of a command, then press the Tab key. The command line parser completes the command if the string entered is unique to the command mode. If your keyboard does not have a Tab key, press Ctrl-L.

The CLI recognizes a command once you have entered enough characters to make the command unique. If you enter "conf" within the privileged EXEC mode, the CLI associates the entry with the configure command, since only the configure command begins with `conf`.

In the following example, the CLI recognizes a unique string in the privileged EXEC mode when the Tab key is pressed:

```
rfs7000-37FABE#conf[TAB]
rfs7000-37FABE#configure
```

When using the command completion feature, the CLI displays the full command name. The command is not executed until the Return or Enter key is pressed. Modify the command if the full command was not what you intended in the abbreviation. If entering a set of characters (indicating more than one command), the system lists all commands beginning with that set of characters.

Enter a question mark (?) to obtain a list of commands beginning with that set of characters. Do not leave a space between the last letter and the question mark (?).

For example, entering U lists all commands available in the current command mode:

```
rfs7000-37FABE#co?
commit     Commit all changes made in this session
configure  Enter configuration mode
connect    Open a console connection to a remote device
copy       Copy from one file to another
rfs7000-37FABE#
```

### Table 1.2 Keystrokes Details

<table>
<thead>
<tr>
<th>Keystrokes</th>
<th>Function Summary</th>
<th>Function Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl-K</td>
<td>Deletes from the cursor to end of the line</td>
<td></td>
</tr>
<tr>
<td>Ctrl-P</td>
<td>Obtains the prior command from memory</td>
<td></td>
</tr>
<tr>
<td>Ctrl-N</td>
<td>Obtains the next command from memory</td>
<td></td>
</tr>
<tr>
<td>Esc-C</td>
<td>Converts the letter at the cursor to uppercase</td>
<td></td>
</tr>
<tr>
<td>Esc-L</td>
<td>Converts the letter at the cursor to lowercase</td>
<td></td>
</tr>
<tr>
<td>Esc-D</td>
<td>Deletes the remainder of a word</td>
<td></td>
</tr>
<tr>
<td>Ctrl-W</td>
<td>Deletes the word up to the cursor</td>
<td></td>
</tr>
<tr>
<td>Ctrl-Z</td>
<td>Returns to the root prompt</td>
<td></td>
</tr>
<tr>
<td>Ctrl-T</td>
<td>Transposes the character to the left of the cursor with the character located at the cursor</td>
<td></td>
</tr>
<tr>
<td>Ctrl-L</td>
<td>Clears the screen</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE:** The characters entered before the question mark are reprinted to the screen to complete the command entry.
1.4.3 Command Output Pagination

- Using CLI Editing Features and Shortcuts

Output often extends beyond the visible screen length. For cases where output continues beyond the screen, the output is paused and a

--More--

prompt displays at the bottom of the screen. To resume the output, press the Enter key to scroll down one line or press the Spacebar to display the next full screen of output.

1.5 Using CLI to Create Profiles and Enable Remote Administration

- INTRODUCTION

The following sections describe the following essential procedures:

- Creating Profiles
- Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface
- Enabling Remote Administration

1.5.1 Creating Profiles

- Using CLI to Create Profiles and Enable Remote Administration

Profiles are sort of a ‘template’ representation of configuration. The system has:

- a default profile for each of the following devices:
  - RFS4000, RFS6000, RFS7000
- a default profile for each of the following service platforms:
  - NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
- a default profile for each of the following access points:
  - AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533

To modify the default profile to assign an IP address to the management port:

```
rfs7000-37FABE(config)#profile rfs7000 default-rfs7000
rfs7000-37FABE(config-profile-default-rfs7000)#interface me1
rfs7000-37FABE(config-profile-default-rfs7000-if-me1)#ip address 172.16.10.2/24
rfs7000-37FABE(config-profile-default-rfs7000-if-me1)#commit
rfs7000-37FABE(config-profile-default-rfs7000)#exit
rfs7000-37FABE(config)#
```

The following command displays a default AP71XX profile:

```
rfs7000-37FABE(config)#profile ap71xx default-ap71xx
rfs7000-37FABE(config-profile-default-ap71xx)#show context
```

The following command displays a default AP71XX profile:

```
rfs7000-37FABE(config-profile-default-ap71xx)#show context
```

```
profile ap71xx default-ap71xx
  autoinstall configuration

  ip dhcp trust
  qos trust dscp
  qos trust 802.1p
interface ge2
  ip dhcp trust
  qos trust dscp

1.5.2 Changing the default profile by creating vlan 150 and mapping to ge3

Physical interface

Using CLI to Create Profiles and Enable Remote Administration

Logon to the controller in config mode and follow the procedure below:

rfs7000-37FABE(config-profile-default-rfs7000)#interface vlan 150
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan150)#ip address 192.168.150.20/24
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan150)#exit
rfs7000-37FABE(config-profile-default-rfs7000)#interface ge 3
rfs7000-37FABE(config-profile-default-rfs7000)#interface ge 3
rfs7000-37FABE(config-profile-default-rfs7000-if-ge3)#switchport access vlan 150
rfs7000-37FABE(config-profile-default-rfs7000-if-ge3)#commit write
[OK]

rfs7000-37FABE(config-profile-default-rfs7000-if-ge3)#show interface vlan 150
Interface vlan150 is UP
  Hardware-type: vlan, Mode: Layer 3, Address: 00-15-70-37-FA-BE
  Index: 8, Metric: 1, MTU: 1500
  IP-Address: 192.168.150.20/24
  input packets 43, bytes 12828, dropped 0, multicast packets 0
  input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
  output packets 0, bytes 0, dropped 0
  output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
  collisions 0

1.5.2.1 Viewing Configured APs

To view previously configured APs, enter the following command:

rfs7000-6DCD4B#show wireless ap configured

<table>
<thead>
<tr>
<th>IDX</th>
<th>NAME</th>
<th>MAC</th>
<th>PROFILE</th>
<th>RF-DOMAIN</th>
<th>ADOPTED-BY</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ap7131-11E6C4</td>

</table>

rfs7000-6DCD4B#

1.5.3 Enabling Remote Administration

Using CLI to Create Profiles and Enable Remote Administration

A terminal server may function in remote administration mode if either the terminal services role is not installed on the machine or the client used to invoke the session has enabled the admin controller.

- A terminal emulation program running on a computer connected to the serial port on the controller. The serial port is located on the front of the controller.
- A Telnet session through a Secure Shell (SSH) over a network. The Telnet session may or may not use SSH depending on how the controller is configured. It is recommended you use SSH for remote administration tasks.

This section is organized into the following sub sections:

- Configuring Telnet for Management Access
- Configuring SSH
1.5.3.1 Configuring Telnet for Management Access

**Enabling Remote Administration**

Login through the serial console. Perform the following:

1. A session generally begins in the USER EXEC mode (one of the two access levels of the EXEC mode).
2. Access the GLOBAL CONFIG mode from the PRIV EXEC mode.
   ```
   rfs7000-37FABE>en
   rfs7000-37FABE#configure terminal
   Enter configuration commands, one per line. End with CNTL/Z.
   ```
3. Go to 'default-management-policy' mode.
   ```
   rfs7000-37FABE(config)#management-policy ?
   rfs7000-37FABE(config)#management-policy default
   rfs7000-37FABE(config-management-policy-default)#
   ```
4. Enter Telnet and the port number at the command prompt. The port number is optional. The default port is 23. Commit the changes after every command. Telnet is enabled.
   ```
   rfs7000-37FABE(config-management-policy-default)#telnet
   rfs7000-37FABE(config-management-policy-default)#commit write
   ```
5. Connect to the controller through Telnet using its configured IP address. Use the following credentials when logging on to the device for the first time:

<table>
<thead>
<tr>
<th>User Name</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin</td>
<td>admin123</td>
</tr>
</tbody>
</table>

When logging into the controller for the first time, you are prompted to change the password.

To change user credentials:

1. Enter the username, password, role and access details.
   ```
   rfs7000-37FABE(config-management-policy-default)#user testuser password test@123
   role helpdesk access all
   ```
   ```
   rfs7000-37FABE(config-management-policy-default)#commit
   ```
   ```
   rfs7000-37FABE(config-management-policy-default)#show context
   management-policy default
telnet
http server
https server
ssh
user admin password 1
ba7da2bf2f7945af1d3ae1b8b762b541bd5bac1f80a54cd4488f38ed44b91ec

rfs7000-37FABE(config-management-policy-default)#
   ```
2. Logon to the Telnet console and provide the user details configured in the previous step to access the controller.
   ```
   rfs7000 release 5.8.4.0-008D
   rfs7000-37FABE login: testuser
   Password:
   Welcome to CLI
   Starting CLI...
   rfs7000-37FABE>
   ```
1.5.3.2 Configuring SSH

Enabling Remote Administration

By default, SSH is enabled from the factory settings on the controller. The controller requires an IP address and login credentials.

To enable SSH access in the default profile, login through the serial console. Perform the following:

1. Access the GLOBAL CONFIG mode from the PRIV EXEC mode.
   
   rfs7000-37FABE>en
   rfs7000-37FABE#configure

   Enter configuration commands, one per line. End with CNTL/Z.

2. Go to ‘config-management-policy-default’ mode.

   rfs7000-37FABE(config)#management-policy default
   rfs7000-37FABE(config-management-policy-default)#

3. Enter SSH at the command prompt.

   rfs7000-37FABE(config-management-policy-default)#ssh

4. Log into the controller through SSH using appropriate credentials.

5. Use the following credentials when logging on to the device for the first time:

<table>
<thead>
<tr>
<th>User Name</th>
<th>admin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>admin123</td>
</tr>
</tbody>
</table>

When logging into the controller for the first time, you are prompted to change the password.

To change the user credentials:

rfs7000 release 5.8.4.0-008D
rfs7000-37FABE login: testuser
Password:
Welcome to CLI
Starting CLI...
rfs7000-37FABE>
CHAPTER 2
USER EXEC MODE COMMANDS

Logging in to the wireless controller places you within the USER EXEC command mode. Typically, a login requires a user name and password. You have three login attempts before the connection attempt is refused. USER EXEC commands (available at the user level) are a subset of the commands available at the privileged level. In general, USER EXEC commands allow you to connect to remote devices, perform basic tests, and list system information.

To list available USER EXEC commands, use ? at the command prompt. The USER EXEC prompt consists of the device host name followed by an angle bracket (>).

<DEVICE>>?
Command commands:
captive-portal-page-upload Captive portal advanced page upload
change-passwd Change password
clear Clear
clock Configure software system clock
cluster Cluster commands
commit Commit all changes made in this session
connect Open a console connection to a remote device
create-cluster Create a cluster
crypto Encryption related commands
crypto-cmp-cert-update Update the cmp certs
database Database
database-backup Backup database
database-restore Restore database
debug Debugging functions
device-upgrade Device firmware upgrade
disable Turn off privileged mode command
enable Turn on privileged mode command
file-sync File sync between controller and adoptees
help Description of the interactive help system
join-cluster Join the cluster
l2tpv3 L2tpv3 protocol
logging Modify message logging facilities
mint MiNT protocol
no Negate a command or set its defaults
on On RF-Domain
opendns Opendns username/password configuration
page Toggle paging
ping Send ICMP echo messages
ping6 Send ICMPv6 echo messages
revert Revert changes
service Service Commands
show Show running system information
smart-cache Content Cache Operation
ssh Open an ssh connection
telnet Open a telnet connection
terminal Set terminal line parameters
time-it
  Check how long a particular command took between
  request and completion of response
traceroute
  Trace route to destination
traceroute6
  Trace route to destination(IPv6)
virtual-machine
  Virtual Machine
watch
  Repeat the specific CLI command at a periodic
  interval
write
  Write running configuration to memory or
  terminal
clrscr
  Clears the display screen
exit
  Exit from the CLI
<DEVICE>>
# 2.1 User Exec Commands

The following table summarizes the User Exec Mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal-page-upload</td>
<td>Uploads captive portal advanced pages</td>
<td>page 2-5</td>
</tr>
<tr>
<td>change-passwd</td>
<td>Changes the password of a logged user</td>
<td>page 2-8</td>
</tr>
<tr>
<td>clear</td>
<td>Resets the last saved command</td>
<td>page 2-9</td>
</tr>
<tr>
<td>clock</td>
<td>Configures the system clock</td>
<td>page 2-20</td>
</tr>
<tr>
<td>cluster</td>
<td>Accesses the cluster context</td>
<td>page 2-21</td>
</tr>
<tr>
<td>connect</td>
<td>Establishes a console connection to a remote device</td>
<td>page 2-22</td>
</tr>
<tr>
<td>create-cluster</td>
<td>Creates a new cluster on a specified device</td>
<td>page 2-23</td>
</tr>
<tr>
<td>crypto</td>
<td>Enables encryption</td>
<td>page 2-25</td>
</tr>
<tr>
<td>crypto-cmp-cert-update</td>
<td>Triggers a CMP certificate update on a specified device or devices</td>
<td>page 2-34</td>
</tr>
<tr>
<td>database</td>
<td>Enables automatic repairing (vacuuming) and dropping of databases</td>
<td>page 2-35</td>
</tr>
<tr>
<td>database-backup</td>
<td>Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server</td>
<td>page 2-36</td>
</tr>
<tr>
<td>database-restore</td>
<td>Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored to the original database.</td>
<td>page 2-37</td>
</tr>
<tr>
<td>device-upgrade</td>
<td>Configures device firmware upgrade settings</td>
<td>page 2-38</td>
</tr>
<tr>
<td>disable</td>
<td>Turns off (disables) the privileged mode command set</td>
<td>page 2-48</td>
</tr>
<tr>
<td>enable</td>
<td>Turns on (enables) the privileged mode command set</td>
<td>page 2-49</td>
</tr>
<tr>
<td>file-sync</td>
<td>Configures parameters enabling syncing of PKCS#12 certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points</td>
<td>page 2-50</td>
</tr>
<tr>
<td>join-cluster</td>
<td>Adds a device (access point, wireless controller, or service platform) to an existing cluster of devices</td>
<td>page 2-53</td>
</tr>
<tr>
<td>l2tpv3</td>
<td>Establishes or brings down Layer 2 Tunneling Protocol Version 3 (L2TPV3) tunnels</td>
<td>page 2-55</td>
</tr>
<tr>
<td>logging</td>
<td>Modifies message logging facilities</td>
<td>page 2-57</td>
</tr>
<tr>
<td>mint</td>
<td>Configures MiNT protocol</td>
<td>page 2-59</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or sets its default</td>
<td>page 2-61</td>
</tr>
<tr>
<td>on</td>
<td>Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, show</td>
<td>page 2-63</td>
</tr>
</tbody>
</table>
### Table 2.1 User Exec Mode Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>opendns</td>
<td>Connects to the OpenDNS site using OpenDNS registered credentials (username, password) to obtain the device-id. This command is a part of the process integrating access points and controllers with the OpenDNS service.</td>
<td>page 2-64</td>
</tr>
<tr>
<td>page</td>
<td>Toggles a device’s (access point, wireless controller, or service platform) paging function</td>
<td>page 2-66</td>
</tr>
<tr>
<td>ping</td>
<td>Sends ICMP echo messages to a user-specified location</td>
<td>page 2-67</td>
</tr>
<tr>
<td>ping6</td>
<td>Sends ICMPv6 echo messages to a user-specified IPv6 address</td>
<td>page 2-69</td>
</tr>
<tr>
<td>ssh</td>
<td>Opens an SSH connection between two network devices</td>
<td>page 2-70</td>
</tr>
<tr>
<td>telnet</td>
<td>Opens a Telnet session</td>
<td>page 2-71</td>
</tr>
<tr>
<td>terminal</td>
<td>Sets the length and width of the terminal window</td>
<td>page 2-72</td>
</tr>
<tr>
<td>time-it</td>
<td>Verifies the time taken by a particular command between request and response</td>
<td>page 2-73</td>
</tr>
<tr>
<td>traceroute</td>
<td>Traces the route to its defined destination</td>
<td>page 2-74</td>
</tr>
<tr>
<td>traceroute6</td>
<td>Traces the route to a specified IPv6 destination</td>
<td>page 2-75</td>
</tr>
<tr>
<td>watch</td>
<td>Repeats a specific CLI command at a periodic interval</td>
<td>page 2-76</td>
</tr>
<tr>
<td>smart-cache</td>
<td>Pre-fetches content cache from the specified list of URLs. This command is specific to the NX45XX, NX65XX, NX9XXX series service platforms.</td>
<td>page 2-78</td>
</tr>
<tr>
<td>virtual-machine</td>
<td>Installs, configures, and monitors the status of virtual machines (VMs). This command is specific to the NX45XX, NX65XX, NX9XXX series service platforms.</td>
<td>page 2-79</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS.*

**NOTE:** The input parameter `<HOSTNAME>`, if used in syntaxes across this chapter, cannot include an underscore (_) character.
### 2.1.1 captive-portal-page-upload

**User Exec Commands**

Uploads captive portal advanced pages to connected access points. Use this command to provide connected access points with specific captive portal configurations so that they can successfully provision login, welcome, and condition pages to requesting clients attempting to access the wireless network using the captive portal.

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

- captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME>|all]
  
- captive-portal-page-upload <CAPTIVE-PORTAL-NAME> <FILE-NAME>

**Parameters**

- captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all]
  - captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [all|rf-domain]
  - captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [all]
  - captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [all]
  - captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [rf-domain]
  - captive-portal-page-upload cancel-upload [all|on rf-domain]
  - captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>
  - captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>

- captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [all|rf-domain]
  - captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>

**Uploads advanced pages of the captive-portal identified by the <CAPTIVE-PORTAL-NAME> parameter**

- **<CAPTIVE-PORTAL-NAME>** – Specify the captive portal’s name (should be existing and configured).
- **<MAC/HOSTNAME>** – Uploads to a specified AP
- **all** – Uploads to all APs
- **upload-time <TIME>** – Optional. Schedules an AP upload time
- **<TIME>** – Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format.

**Note:** The scheduled upload time is your local system’s time. It is not the access point, controller, service platform, or virtual controller time and it is not synched with the device.

**Note:** To view a list of uploaded captive portal files, execute the `show > captive-portal-page-upload > list-files <CAPTIVE-PORTAL-NAME>` command.

---

**NOTE:** Ensure that the captive portal pages uploaded are *.tar files.
**captive-portal-page-upload** `<CAPTIVE-PORTAL-NAME>` rf-domain `[<DOMAIN-NAME>|all] {from-controller} {(upload-time <TIME>)}

<table>

<td>-</td>
<td>None</td>
</tr>
</tbody>
</table>
```

**IPv4 URLs:**
- `tftp://<hostname|IP>[:port]/path/file`
- `ftp://<user>:@<hostname|IP>[:port]/path/file`
- `sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
- `http://<hostname|IP>[:port]/path/file`
- `cf:/path/file`
- `usb<n>:/path/file`

**IPv6 URLs:**
- `tftp://<hostname|[IPv6]>[:port]/path/file`
- `sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file`

**Note:** The captive portal pages are downloaded to the controller from the location specified here. After downloading use the `captive-portal-page-upload > CAPTIVE-PORTAL-NAME > DEVICE-OR-DOMAIN-NAME` command to upload these pages to APs.
2.1.2 change-passwd

User Exec Commands

Changes the password of a logged user. When this command is executed without any parameters, the password can be changed interactively.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

change-passwd {<OLD-PASSWORD>} <NEW-PASSWORD>

Parameters

- change-passwd {<OLD-PASSWORD>} <NEW-PASSWORD>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;OLD-PASSWORD&gt;</td>
<td>Optional. Specify the password to be changed.</td>
</tr>
<tr>
<td>&lt;NEW-PASSWORD&gt;</td>
<td>Specify the new password.</td>
</tr>
</tbody>
</table>

Note: The password can also be changed interactively. To do so, press [Enter] after the command.

Usage Guidelines

A password must be from 1 - 64 characters.

Examples

rfs7000-37FABE>change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory{write memory} to be persistent.
rfs7000-37FABE#write memory
OK
rfs7000-37FABE>
2.1.3 clear

User Exec Commands

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared, using this command, depends on the mode where the clear command is executed.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
clear [arp-cache|bonjour|cdp|counters|crypto|event-history|gre|ip|ipv6|lldp|
  mac-address-table|mint|role|rtls|smart-cache|spanning-tree|traffic-shape|vrrp]
clear arp-cache {on <DEVICE-NAME>}
clear bonjour cache {on <DEVICE-NAME>}
clear [cdp|lldp] neighbors {on <DEVICE-NAME>}
clear counters [ap|radio|wireless-client]
clear counters [ap {<MAC>}|radio {<MAC>/DEVICE-NAME>} {<1-X>}|wireless-client {<MAC>}
  {on <DEVICE-OR-DOMAIN-NAME>})
clear crypto [ike|ipsec] sa
  clear crypto ike sa [{<IP>}|all] {on <DEVICE-NAME>}
clear crypto ipsec sa {on <DEVICE-NAME>}
clear event-history
clear gre stats {on <DEVICE-NAME>}
clear ip [bgp|dhcp|ospf]
clear ip bgp [<IP>|all|external|process]
clear ip bgp [<IP]|all external} {in|on|out|soft}
clear ip bgp [<IP>|all external} {in prefix-filter} {on <DEVICE-NAME>}
clear ip bgp [<IP]|all external} {out} {on <DEVICE-NAME>])
clear ip bgp [<IP]|all external} {soft} {in|out}} {on <DEVICE-NAME>}
clear ip bgp process {on <DEVICE-NAME>}
clear ip dhcp bindings [{<IP}|all] {on <DEVICE-NAME>}
clear ip ospf process {on <DEVICE-NAME>}
clear ipv6 neighbor-cache {on <DEVICE-NAME>}
clear mac-address-table {address|interface|vlan} {on <DEVICE-NAME>}
clear mac-address-table {address <MAC>|vlan <1-4094>} {on <DEVICE-NAME>}
clear mac-address-table {interface [IF-NAME]|ge <1-X}|port-channel <1-X>
  |t1e1 <1-4}|<1-1}|up <1-X}|vmif <1-X}|xge <1-4>} {on <DEVICE-NAME>}
clear mint mlcp history {on <DEVICE-NAME>}
clear role ldap-stats {on <DEVICE-NAME>}
```
clear rtls [aeroscout|ekahau]
clear rtls [aeroscout|ekahau] \{<MAC/DEVICE-NAME> \{on <DEVICE-OR-DOMAIN-NAME>\}\}
on <DEVICE-OR-DOMAIN-NAME>

clear spanning-tree detected-protocols \{interface|on\}
clear spanning-tree detected-protocols \{on <DEVICE-NAME>\}
clear spanning-tree detected-protocols \{interface \{<INTERFACE-NAME>|ge <1-X>|me1|port-channel <1-X>|pppoe1|up1|vian <1-4094>|wwan1|vmif <1-X>\}\} \{on <DEVICE-NAME>\}

clear traffic-shape statistics class <1-4> \{(on <DEVICE-NAME>\}]
clear vrrp [error-stats|stats] \{on <DEVICE-NAME>\}

The following clear command is specific to the NX45XX, NX65XX, and NX9XXX series service platforms:

clear smart-cache storage [all|url-regex <WORD>] \{on <DEVICE-NAME>\}

**Parameters**

- **clear arp-cache** \{on <DEVICE-NAME>\}

<table>
<thead>
<tr>
<th>arp-cache</th>
<th>Clears Address Resolution Protocol (ARP) cache entries on a device. This protocol matches layer 3 IP addresses to layer 2 MAC addresses.</th>
</tr>
</thead>
</table>
| on <DEVICE-NAME> | Optional. Clears ARP cache entries on a specified device  
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **clear bonjour cache** \{on <DEVICE-NAME>\}

<table>
<thead>
<tr>
<th>bonjour cache</th>
<th>Clears all Bonjour cached statistics. Once cleared the system has to re-discover available Bonjour services.</th>
</tr>
</thead>
</table>
| on <DEVICE-NAME> | Optional. Clears all Bonjour cached statistics on a specified device  
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **clear [cdp|lldp] neighbors** \{on <DEVICE-NAME>\}

| cdp | Clears Cisco Discovery Protocol (CDP) table entries |
| lldp | Clears Link Layer Discovery Protocol (LLDP) table entries |
| neighbors | Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step |
| on <DEVICE-NAME> | Optional. Clears CDP or LLDP neighbor table entries on a specified device  
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **clear counters [ap \{<MAC>\}|radio \{<MAC/DEVICE-NAME>\} \{<1-X>\}|wireless-client \{<MAC>\}] \{(on <DEVICE-OR-DOMAIN-NAME>\}]

| counters | Clears counters based on the parameters passed. The options are: AP, radio, and wireless clients. |
| ap <MAC> | Clears counters for all APs or a specified AP  
  • <MAC> – Optional. Specify the AP’s MAC address. |
<p>| <strong>Note:</strong> If no MAC address is specified, all AP counters are cleared. |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **radio**  
<MAC/DEVICE-NAME> <1-X> | Clears radio interface counters on a specified device or on all devices  
• <MAC/DEVICE-NAME> – Optional. Specify the device’s hostname or MAC address. Optionally, append the radio interface number (to the radio ID) using one of the following formats: AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX (where RX is the interface number).  
• <1-X> – Optional. Identifies the radio interface by its index. Specify the radio interface index, if not specified as part of the radio ID. The number of radio interfaces available varies with the access point type.  
If no device name or MAC address is specified, all radio interface counters are cleared. |
| **wireless-client**  
<MAC> | Clears counters for all wireless clients or a specified wireless client  
• <MAC> – Optional. Specify the wireless client’s MAC address.  
If no MAC address is specified, all wireless client counters are cleared. |
| **on <DEVICE-OR-DOMAIN-NAME>** | The following option is common to all of the above keywords:  
• on <DEVICE-OR-DOMAIN-NAME> – Optional. Clears AP, radio, or wireless client counters on a specified device  
• <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain. |
| **crypto**  
ike sa [<IP>|all] {on <DEVICE-NAME>} | Clears encryption module database  
ike sa [<IP>|all] | Clears Internet Key Exchange (IKE) security associations (SAs)  
• <IP> – Clears IKE SA entries for the peer identified by the <IP> keyword  
• all – Clears IKE SA entries for all peers |
| **on <DEVICE-NAME>** | Optional. Clears IKE SA entries, for a specified peer or all peers, on a specified device  
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| **clear crypto ike sa [<IP>|all] {on <DEVICE-NAME>}** |  
• clear crypto ike sa [<IP>|all] {on <DEVICE-NAME>} |
| **crypto**  
ipsec sa on <DEVICE-NAME> | Clears encryption module database  
ipsec sa on <DEVICE-NAME> | Clears Internet Protocol Security (IPSec) database SAs  
• on <DEVICE-NAME> – Optional. Clears IPSec SA entries on a specified device  
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| **clear crypto ipsec sa {on <DEVICE-NAME>}** |  
• clear crypto ipsec sa {on <DEVICE-NAME>} |
| **gre stats**  
on <DEVICE-NAME> | Clears GRE tunnel statistics  
on <DEVICE-NAME> | Optional. Clears GRE tunnel statistics on a specified device  
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| **clear gre stats {on <DEVICE-NAME>}** |  
• clear gre stats {on <DEVICE-NAME>} |
| **event-history** | Clears event history cache entries  
event-history |
### clear ip bgp [<IP>|all|external] {in prefix-filter} {on <DEVICE-NAME>}

**ip bgp [<IP>|all|external]**
- Clears on-going BGP sessions based on the option selected
  - `<IP>` – Clears BGP session with the peer identified by the `<IP>` keyword. Specify the BGP peer’s IP address.
  - `all` – Clears all BGP peer sessions
  - `external` – Clears external BGP (eBGP) peer sessions

This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, NX9000, and NX9600 platforms.

Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy, etc.) take effect only after on-going BGP sessions are cleared. The `clear > ip > bgp` command clears BGP sessions. To reduce loss of route updates during the process, use the ‘soft’ option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.

**in prefix-filter**
- Optional. Clears inbound route updates
  - prefix-filter – Optional. Clears the existing Outbound Route Filtering (ORF) prefix-list

**on <DEVICE-NAME>**
- Optional. Clears route updates on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP or service platform.

### clear ip bgp [<IP>|all|external] {out} {on <DEVICE-NAME>}

**ip bgp [<IP>|all|external]**
- Clears on-going BGP sessions based on the option selected
  - `<IP>` – Clears BGP session with the peer identified by the `<IP>` keyword. Specify the BGP peer’s IP address.
  - `all` – Clears all BGP peer sessions
  - `external` – Clears eBGP peer sessions

This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, NX9000, and NX9600 platforms.

Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy, etc.) take effect only after on-going BGP sessions are cleared. The `clear > ip > bgp` command clears BGP sessions. To reduce loss of route updates during the process, use the ‘soft’ option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.

**out**
- Optional. Clears outbound route updates. Optionally specify the device on which to execute this command.

**on <DEVICE-NAME>**
- The following keyword is recursive and optional.
  - on <DEVICE-NAME> – Optional. Clears BGP sessions on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP or service platform.

### clear ip bgp [<IP>|all|external] {soft {in|out}} {on <DEVICE-NAME>}

**ip bgp [<IP>|all|external]**
- Clears on-going BGP sessions based on the option selected
  - `<IP>` – Clears the BGP peer session with the peer identified by the `<IP>` keyword. Specify the BGP peer’s IP address.
  - `all` – Clears all BGP peer sessions

Contd..
### USER EXEC MODE COMMANDS 2-13

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip &lt;DEVICE-NAME&gt; bgp</td>
<td>Clears BGP sessions. To reduce loss of route updates during the process, use the ‘soft’ option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage.</td>
</tr>
<tr>
<td>soft {in</td>
<td>out}</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Initiates soft reconfiguration inbound/outbound route updates on a specified device</td>
</tr>
<tr>
<td>ip bgp process</td>
<td>Clears all BGP processes running. This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, NX9000, and NX9600 platforms.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears all BGP processes on a specified device</td>
</tr>
<tr>
<td>clear ip dhcp bindings</td>
<td>Clears DHCP connections and server bindings</td>
</tr>
<tr>
<td>&lt;IP&gt;</td>
<td>Clears specific address binding entries. Specify the IP address to clear binding entries.</td>
</tr>
<tr>
<td>all</td>
<td>Clears all address binding entries</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears a specified address binding or all address bindings on a specified device</td>
</tr>
<tr>
<td>ip ospf process</td>
<td>Clears already enabled Open Shortest Path First (OSPF) process and restarts the process. OSPF is a link-state interior gateway protocol (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighboring routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer, which makes routing decisions based solely on the destination IP address found in IP packets.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears OSPF process on a specified device</td>
</tr>
<tr>
<td>clear ipv6 neighbor-cache {on &lt;DEVICE-NAME&gt;}</td>
<td></td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>clear ipv6 neighbor-cache</td>
<td>Clears IPv6 neighbor cache entries</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears IPv6 neighbor cache entries on a specified device</td>
</tr>
<tr>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>

| clear mac-address-table {address <MAC>|vlan <1-4094>} {on <DEVICE-NAME>} |
|-----------------------------------------------------------------------------|
| mac-address-table | Clears the MAC address forwarding table |
| address <MAC> | Optional. Clears a specified MAC address from the MAC address table. |
| • <MAC> – Specify the MAC address in one of the following formats: AAbb-CC-DD-EE-FF or AA:BB:CC:DD:EE:FF or AAbb.CCDD.EEFF |
| vlan <1-4094> | Optional. Clears all MAC addresses for a specified VLAN |
| • <1-4094> – Specify the VLAN ID from 1 - 4094. |
| on <DEVICE-NAME> | Optional. Clears a single MAC entry or all MAC entries, for the specified VLAN on a specified device |
| • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| On the NX45XX and NX65XX series service platform, this command clears the MAC address forwarding table on the device’s hardware and not the dataplane. |

<p>| clear mac-address-table interface [&lt;IF-NAME&gt;|ge &lt;1-X&gt;|port-channel &lt;1-X&gt;|t1e1 &lt;1-4&gt; &lt;1-1&gt;|up &lt;1-2&gt;|vmif &lt;1-X&gt;|xge &lt;1-4&gt;] {on &lt;DEVICE-NAME&gt;} |
|----------------------------------------------------------------------------------------------|
| mac-address-table | Clears the MAC address forwarding table |
| interface | Clears all MAC addresses for the selected interface. Use the options available to specify the interface. |
| &lt;IF-NAME&gt; | Clears MAC address forwarding table for the specified layer 2 interface (Ethernet port) |
| • &lt;IF-NAME&gt; – Specify the layer 2 interface name. |
| ge &lt;1-X&gt; | Clears MAC address forwarding table for the specified GigabitEthernet interface |
| • &lt;1-X&gt; – Specify the GigabitEthernet interface index from 1 - X. |
| The number of Ethernet interfaces supported varies for different device types. For example the NX45XX and NX65XX support 24 GE interfaces. Where as, RFS4000 supports 5 GE interfaces. |
| port-channel &lt;1-X&gt; | Clears MAC address forwarding table for the specified port-channel interface |
| • &lt;1-X&gt; – Specify the port-channel interface index from 1 - X. |
| The number of port-channel interfaces supported varies for different device types. For example the NX45XX and NX65XX support 13 port-channels. Where as, RFS4000 supports 3 port-channels. |
| t1e1 &lt;1-4&gt; &lt;1-1&gt; | Clears MAC address forwarding table for the specified T1E1L interface |
| • &lt;1-4&gt; – Specify the T1E1 interface index from 1 - 4. A maximum of 4 slots are available. Select the slot to clear the MAC address forwarding table. |
| • &lt;1-1&gt; – Specify the T1E1 port ID from 1 - 1. |
| The T1E1 interfaces are supported only on the NX45XX and NX65XX series service platforms. |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **up <1-X>**     | Clears MAC address forwarding table for the WAN Ethernet interface  
The number of WAN Ethernet interfaces supported varies for different devices. The RFS4000 and RFS6000 devices support 1 WAN Ethernet interface. The NX45XX supports 2 WAN Ethernet interfaces. |
| **vmif <1-X>**   | Clears MAC address forwarding table for the VM interface  
• <1-X> – Specify the VM interface index from 1 - X.  
The VMIF interfaces are supported only on the NX45XX, NX65XX, NX9500, and NX9510 series service platforms. The number of supported VMIFs varies for different device types. |
| **xge <1-4>**    | Clears MAC address forwarding table for the specified TenGigabitEthernet interface  
• <1-4> – Specify the GigabitEthernet interface index from 1 - 4.  
This interface is supported only on the NX9000 series service platforms. |
| **on <DEVICE-NAME>** | Optional. Clears the MAC address forwarding table, for the selected interface, on a specified device  
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| **mint**         | Clears MiNT related information                                                                                                                                                                            |
| **mlcp history** | Clears MiNT Link Creation Protocol (MLCP) client history                                                                                                                                                      |
| **on <DEVICE-NAME>** | Optional. Clears MLCP client history on a specified device  
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| **role ldap-stats** | Clears Lightweight Directory Access Protocol (LDAP) server statistics                                                                                                                                            |
| **on <DEVICE-NAME>** | Optional. Clears LDAP server statistics on a specified device  
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| **clear rts [aeroscout|ekahau] <MAC/DEVICE-NAME> [on <DEVICE-OR-DOMAIN-NAME>]** | Clears Real Time Location Service (RTLS) statistics  
This keyword is common to the ‘aeroscout’ and ‘ekahau’ parameters.  
• <MAC/DEVICE-NAME> – Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified AP, wireless controller, or service platform. Specify the AP’s MAC address or hostname. |
| **rts**          | Clears Real Time Location Service (RTLS) statistics                                                                                                                                                           |
| **aeroscout**    | Clears RTLS Aeroscout statistics                                                                                                                                                                              |
| **ekahau**       | Clears RTLS Ekahau statistics                                                                                                                                                                                |

*Note: The number of WAN Ethernet interfaces supported varies for different devices. The RFS4000 and RFS6000 devices support 1 WAN Ethernet interface. The NX45XX supports 2 WAN Ethernet interfaces.*
<table>
<thead>
<tr>

Total number of MACs displayed: **15**
2.1.4 clock

User Exec Commands

Sets a device’s system clock. By default all WiNG devices are shipped with the time zone and time format set to UTC and 24-hour clock respectively. If a device’s clock is set without resetting the time zone, the time is displayed relative to the Universal Time Coordinated (UTC) – Greenwich Time. For example, San Jose is approximately 7 or 8 hours (depending on the time of the year) behind the UTC time. If the time at Greenwich, UK is 15:00:00 UTC, at San Jose it will display as 8:00:00 or 7:00:00 UTC. To display time in the local time zone format, in the device’s configuration mode, use the timezone command to reset the time zone. You can also reset the time zone at the RF Domain level. When configured as RF Domain setting, it applies to all devices within the domain. Configuring the local time zone prior to setting the clock is recommended. For more information on configuring RF Domain time zone, see timezone.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}

Parameters

- clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clock set</td>
<td>Sets a device’s software system clock</td>
</tr>
<tr>
<td><a href="">HH:MM:SS</a></td>
<td>Sets the current time (in military format hours, minutes, and seconds)</td>
</tr>
<tr>
<td>Note:</td>
<td>By default, the WiNG software displays time in the 24-hour clock format. This setting cannot be changed.</td>
</tr>
<tr>
<td>&lt;1-31&gt;</td>
<td>Sets the numerical day of the month</td>
</tr>
<tr>
<td>&lt;MONTH&gt;</td>
<td>Sets the month of the year (Jan to Dec)</td>
</tr>
<tr>
<td>&lt;1993-2035&gt;</td>
<td>Sets a valid four digit year from 1993 - 2035</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Sets the clock on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Examples

The following commands set the time zone and clock for the logged device:

nx4500-5CFA8E(config-device-B4-C7-99-5C-FA-8E)#timezone America/Los_Angeles

nx4500-5CFA8E>clock set 11:24:00 14 Jan 2016

nx4500-5CFA8E>show clock
2016-01-14 11:24:07 PDT

nx4500-5CFA8E>

Note, if the clock is set without resetting the time zone, the time displays as UTC time, as shown in the following example:

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show clock
2016-01-14 11:35:10 UTC

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
2.1.5 **cluster**

*User Exec Commands*

Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member.

Commands executed under this context are executed on all members of the cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**
```
cluster start-election
```

**Parameters**
- `start-election`

**Examples**
```
rfs7000-37FABE>cluster start-election
rfs7000-37FABE>
```

2.1.6 connect

User Exec Commands

Begins a console connection to a remote device using the remote device’s MiNT ID or name.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]

Parameters
- connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]

<table>
<thead>
<tr>
<th>mint-id &lt;MINT-ID&gt;</th>
<th>Connects to the remote system using its MiNT ID</th>
</tr>
</thead>
<tbody>

AP8132 release 5.8.4.0-008D
ap8132-711728 login:
2.1.7 create-cluster

User Exec Commands

Creates a new device cluster with the specified name and assigns it an IP address and routing level.

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member's failure.

A cluster's load is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

create-cluster name <CLUSTER-NAME> ip <IP> {level [1/2]}

Parameters

- create-cluster name <CLUSTER-NAME> ip <IP> {level [1/2]}

<table>
<thead>
<tr>
<th>create-cluster</th>
<th>Creates a cluster</th>
</tr>
</thead>
<tbody>
<tr>
<td>name &lt;CLUSTER-NAME&gt;</td>
<td>Configures the cluster name</td>
</tr>
<tr>
<td></td>
<td>• &lt;CLUSTER-NAME&gt; – Specify a cluster name. Define a name for the cluster name unique to its configuration or profile support requirements. The name cannot exceed 64 characters.</td>
</tr>
<tr>
<td>ip &lt;IP&gt;</td>

2.1.8 crypto

User Exec Commands

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name, etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate Certificate Signing Request (CSR).

This command also enables trustpoint configuration. Trustpoints contain the CA's identity and configuration parameters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

crypto [key|pki]

crypto key [export|generate|import|zeroize]

crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|on|passphrase}

crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}

crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|on|passphrase}

crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}

crypto pki [authenticate|export|generate|import|zeroize]

crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background}

{(on <DEVICE-NAME>)}

crypto pki export [request|trustpoint]

crypto pki export request [generate-rsa-key|short|use-rsa-key] <RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]

crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name <EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>, ip-address <IP>

crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> <EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>

crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]

crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name (email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)

crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> (email <SEND-TO-EMAIL>,fqdn <FQDN>, ip-address <IP>,on <DEVICE-NAME>)}
crypto pki import [certificate|crl|trustpoint]
crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
  {background} {(on <DEVICE-NAME>)}
crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
  {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}

Parameters

- crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL>
  {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

  key Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.

  export rsa <RSA-KEYPAIR-NAME>
  Exports an existing RSA Keypair to a specified destination
  • <RSA-KEYPAIR-NAME> – Specify the RSA Keypair name.

  <EXPORT-TO-URL>
  Specify the RSA Keypair destination address. Both IPv4 and IPv6 address formats are supported.
  After specifying the destination address (where the RSA Keypair is exported), configure one of the following parameters: background or passphrase.

  background Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on.

  passphrase <KEY-PASSPHRASE> background
  Optional. Encrypts RSA Keypair before exporting
  • <KEY-PASSPHRASE> – Specify a passphrase to encrypt the RSA Keypair.
  • background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.

  on <DEVICE-NAME>
  The following parameter is recursive and common to all of the above parameters:
  • on <DEVICE-NAME> – Optional. Performs export operation on a specified device
    • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

  • crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}

  key Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.

  generate rsa <RSA-KEYPAIR-NAME> [2048|4096]
  Generates a new RSA Keypair
  • <RSA-KEYPAIR-NAME> – Specify the RSA Keypair name.
  • [2048|4096] – Sets the size of the RSA key in bits. The options are 2048 bits and 4096 bits. The default size is 2048 bits.
  After specifying the key size, optionally specify the device (access point or controller) to generate the key on.

  on <DEVICE-NAME>
  Optional. Generates the new RSA Keypair on a specified device
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

  • crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL>
    {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

  key Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.
### USER EXEC MODE COMMANDS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `import rsa <RSA-KEYPAIR-NAME>` | Imports a RSA Keypair from a specified source  
  • `<RSA-KEYPAIR-NAME>` – Specify the RSA Keypair name. |
| `<IMPORT-FROM-URL>` | Specify the RSA Keypair source address. Both IPv4 and IPv6 address formats are supported.  
  After specifying the source address (where the RSA Keypair is imported from), configure one of the following parameters: background or passphrase. |
| `background` | Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on. |
| `passphrase <KEY-PASSPHRASE>` | Optional. Decrypts the RSA Keypair after importing  
  • `<KEY-PASSPHRASE>` – Specify the passphrase to decrypt the RSA Keypair.  
  • background – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point, controller, or service platform) to perform the import on. |
| `on <DEVICE-NAME>` | The following parameter is recursive and common to the ‘background’ and ‘passphrase’ keywords:  
  • `on <DEVICE-NAME>` – Optional. Performs import operation on a specific device  
  • `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| `zeroize rsa <RSA-KEYPAIR-NAME>` | Deletes a specified RSA Keypair  
  • `<RSA-KEYPAIR-NAME>` – Specify the RSA Keypair name.  
  **Note:** All device certificates associated with this key will also be deleted. |
| `force` | Optional. Forces deletion of all certificates associated with the specified RSA Keypair. Optionally specify a device on which to force certificate deletion. |
| `on <DEVICE-NAME>` | The following parameter is recursive and optional:  
  • `on <DEVICE-NAME>` – Optional. Deletes all certificates associated with the RSA Keypair on a specified device  
  • `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| `crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}{}` |
| `key` | Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key. |
| `zeroize rsa <RSA-KEYPAIR-NAME>` | Deletes a specified RSA Keypair  
  • `<RSA-KEYPAIR-NAME>` – Specify the RSA Keypair name.  
  **Note:** All device certificates associated with this key will also be deleted. |
| `force` | Optional. Forces deletion of all certificates associated with the specified RSA Keypair. Optionally specify a device on which to force certificate deletion. |
| `on <DEVICE-NAME>` | The following parameter is recursive and optional:  
  • `on <DEVICE-NAME>` – Optional. Deletes all certificates associated with the RSA Keypair on a specified device  
  • `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| `crypto pki authenticate <TRUSTPOINT-NAME> <URL> {background} {(on <DEVICE-NAME>)}{}` |
| `pki` | Enables Private Key Infrastructure (PKI) management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated Certificate Authority (CA) certificates. |
| `authenticate <TRUSTPOINT-NAME>` | Authenticates a trustpoint and imports the corresponding CA certificate  
  • `<TRUSTPOINT-NAME>` – Specify the trustpoint name. |
| `<URL>` | Specify CA's location. Both IPv4 and IPv6 address formats are supported.  
  **Note:** The CA certificate is imported from the specified location. |
<table>
<thead>
<tr>
<th><strong>background</strong></th>
<th>Optional. Performs authentication in the background. If selecting this option, you can optionally specify the device (access point, controller, or service platform) to perform the export on.</th>
</tr>
</thead>
</table>
| **on <DEVICE-NAME>** | The following parameter is recursive and optional:  
  - on <DEVICE-NAME> – Optional. Performs authentication on a specified device  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| **crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)** | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| **export request** | Exports CSR to the CA for a digital identity certificate. The CSR contains applicant’s details and RSA Keypair’s public key. |
| **[generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>** | Generates a new RSA Keypair or uses an existing RSA Keypair  
  - generate-rsa-key – Generates a new RSA Keypair for digital authentication  
  - use-rsa-key – Uses an existing RSA Keypair for digital authentication  
  - <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| **autogen-subject-name** | Auto generates subject name from configuration parameters. The subject name identifies the certificate. |
| **<EXPORT-TO-URL>** | Specify the CA’s location. Both IPv4 and IPv6 address formats are supported. Note: The CSR is exported to the specified location. |
| **email <SEND-TO-EMAIL>** | Exports CSR to a specified e-mail address  
  - <SEND-TO-EMAIL> – Specify the CA’s e-mail address. |
| **fqdn <FQDN>** | Exports CSR to a specified Fully Qualified Domain Name (FQDN)  
  - <FQDN> – Specify the CA’s FQDN. |
| **ip-address <IP>** | Exports CSR to a specified device or system  
  - <IP> – Specify the CA’s IP address. |
| **crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>,email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>)** | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| **export request** | Exports CSR to the CA for a digital identity certificate. The CSR contains applicant’s details and RSA Keypair’s public key. |
| **[generate-rsa-key|short [generate-rsa-key|use-rsa-key]|use-rsa-key] <RSA-KEYPAIR-NAME>** | Generates a new RSA Keypair or uses an existing RSA Keypair  
  - generate-rsa-key – Generates a new RSA Keypair for digital authentication  
  - short [generate-rsa-key|use-rsa-key] – Generates and exports a shorter version of the CSR  
  - generate-rsa-key – Generates a new RSA Keypair for digital authentication. If generating a new RSA Keypair, specify a name for it. Contd.. |
• use-rsa-key – Uses an existing RSA Keypair for digital authentication. If using an existing RSA Keypair, specify its name.
• use-rsa-key – Uses an existing RSA Keypair for digital authentication
  • <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.

| subject-name <COMMON-NAMESPACE> | Configures a subject name, defined by the <COMMON-NAMESPACE> keyword, to identify the certificate
  • <COMMON-NAMESPACE> – Specify the common name used with the CA certificate. The name should enable you to identify the certificate easily (2 to 64 characters in length).

| <COUNTRY> | Sets the deployment country code (2 character ISO code)
| <STATE> | Sets the state name (2 to 64 characters in length)
| <CITY> | Sets the city name (2 to 64 characters in length)
| <ORGANIZATION> | Sets the organization name (2 to 64 characters in length)
| <ORGANIZATION-UNIT> | Sets the organization unit (2 to 64 characters in length)
| <EXPORT-TO-URL> | Specify the CA’s location. Both IPv4 and IPv6 address formats are supported.
  Note: The CSR is exported to the specified location.
| email <SEND-TO-EMAIL> | Exports CSR to a specified e-mail address
  • <SEND-TO-EMAIL> – Specify the CA’s e-mail address.
| fqdn <FQDN> | Exports CSR to a specified FQDN
  • <FQDN> – Specify the CA’s FQDN.
| ip-address <IP> | Exports CSR to a specified device or system
  • <IP> – Specify the CA’s IP address.

• crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
| export trustpoint <TRUSTPOINT-NAME> | Exports a trustpoint along with CA certificate, Certificate Revocation List (CRL), server certificate, and private key
  • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).
| <EXPORT-TO-URL> | Specify the destination address. Both IPv4 and IPv6 address formats are supported.
  The trustpoint is exported to the address specified here.
| background | Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on
| passphrase <KEY-PASSPHRASE> background | Optional. Encrypts the key with a passphrase before exporting
  • <KEY-PASSPHRASE> – Specify the passphrase to encrypt the trustpoint.
  • background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.
### `crypto pki generate self-signed <TRUSTPOINT-NAME>` [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name [{(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)}]

### pki

Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates.

### generate

Generates a certificate and a trustpoint

### self-signed

Generates a self-signed certificate and a trustpoint

### [generate-rsa-key|use-rsa-key]

Generates a new RSA Keypair, or uses an existing RSA Keypair

### auto-gen-subject-name

Auto generates the subject name from the configuration parameters. The subject name helps to identify the certificate.

### email <SEND-TO-EMAIL>

Optional. Exports the self-signed certificate to a specified e-mail address

### fqdn <FQDN>

Optional. Exports the self-signed certificate to a specified FQDN

### ip-address <IP>

Optional. Exports the self-signed certificate to a specified device or system

### on <DEVICE-NAME>

Optional. Exports the self-signed certificate on a specified device

### crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT> [{(email <SEND-TO-EMAIL>,fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>)}]

### pki

Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates.

### generate self-signed

Generates a self-signed certificate and a trustpoint

### [generate-rsa-key|use-rsa-key]

Generates a new RSA Keypair, or uses an existing RSA Keypair

### auto-gen-subject-name

Auto generates the subject name from the configuration parameters. The subject name helps to identify the certificate.

### email <SEND-TO-EMAIL>

Optional. Exports the self-signed certificate to a specified e-mail address

### fqdn <FQDN>

Optional. Exports the self-signed certificate to a specified FQDN

### ip-address <IP>

Optional. Exports the self-signed certificate to a specified device or system

### on <DEVICE-NAME>

Optional. Exports the self-signed certificate on a specified device
**subject-name**

**<COMMON-NAME>**

Configures a subject name, defined by the `<COMMON-NAME>` keyword, to identify the certificate

- `<COMMON-NAME>` – Specify the common name used with this certificate. The name should enable you to identify the certificate easily and should not exceed 2 to 64 characters in length.

**<COUNTRY>**

Sets the deployment country code (2 character ISO code)

**<STATE>**

Sets the state name (2 to 64 characters in length)

**<CITY>**

Sets the city name (2 to 64 characters in length)

**<ORGANIZATION>**

Sets the organization name (2 to 64 characters in length)

**<ORGANIZATION-UNIT>**

Sets the organization unit (2 to 64 characters in length)

**email**

**<SEND-TO-EMAIL>**

Optional. Exports the self-signed certificate to a specified e-mail address

- `<SEND-TO-EMAIL>` – Specify the e-mail address.

**fqdn**

**<FQDN>**

Optional. Exports the self-signed certificate to a specified FQDN

- `<FQDN>` – Specify the FQDN.

**ip-address**

**<IP>**

Optional. Exports the self-signed certificate to a specified device or system

- `<IP>` – Specify the device’s IP address.

- **crypto pki import**

  `[certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} {(on <DEVICE-NAME>)}

**pki**

Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

**import**

Imports certificates, Certificate Revocation List (CRL), or a trustpoint to the selected device

**[certificate|crl]**

**<TRUSTPOINT-NAME>**

Imports a signed server certificate or CRL

- `certificate` – Imports signed server certificate
- `crl` – Imports CRL

- `<TRUSTPOINT-NAME>` – Specify the trustpoint name (should be authenticated).

**<IMPORT-FROM-URL>**

Specify the signed server certificate or CRL source address. Both IPv4 and IPv6 address formats are supported.
The server certificate or the CRL (based on the parameter passed in the preceding step) is imported from the location specified here.

**background**

Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.

**on <DEVICE-NAME>**

The following parameter is recursive and optional:

- `on <DEVICE-NAME>` – Optional. Performs import operation on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- **crypto pki import trustpoint**

  `<TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

**pki**

Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.
<table>

<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>import</td>
<td>Imports certificates, CRL, or a trustpoint to the selected device</td>
</tr>
</tbody>
</table>
| trustpoint <TRUSTPOINT-NAME> | Imports a trustpoint and its associated CA certificate, server certificate, and private key  
  • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated). |
| <IMPORT-FROM-URL> | Specify the trustpoint source address. Both IPv4 and IPv6 address formats are supported. |
| background | Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on. |
| passphrase <KEY-PASSPHRASE> background | Optional. Decrypts trustpoint with a passphrase after importing  
  • <KEY-PASSPHRASE> – Specify the passphrase. After specifying the passphrase, optionally specify the device to perform import on.  
  • background – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional:  
  • on <DEVICE-NAME> – Optional. Performs import operation on a specified device  
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| zeroize trustpoint <TRUSTPOINT-NAME> | Deletes a trustpoint and its associated CA certificate, server certificate, and private key  
  • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated). |
| del-key | Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional:  
  • on <DEVICE-NAME> – Optional. Deletes the trustpoint on a specified device  
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

**Usage Guidelines**

The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

- IPv4 URLs:
  - tftp://<hostname|IP>[[:port]/path/file
  - ftp://<username>:<password>@<hostname|IP>[[:port]/path/file
  - sftp://<username>@<hostname|IP>[[:port]/path/file
  - http://<hostname|IP>[[:port]/path/file
  - cf:/path/file
  - usb<n>:/path/file
- IPv6 URLs:
  
  - tftp://<hostname>[IPv6]>[:port]/path/file
  - ftp://<user>:<passwd>@<hostname>[IPv6]>[:port]/path/file
  - sftp://<user>:<passwd>@<hostname>[IPv6]>[:port]/path/file

Examples

```
rfs7000-37FABE> crypto key generate rsa key 1025
RSA Keypair successfully generated
rfs7000-37FABE>
```

```
rfs7000-37FABE> crypto key import rsa test123 url passphrase word background
RSA key import operation is started in background
rfs7000-37FABE>
```

```
rfs7000-37FABE> crypto pki generate self-signed word generate-rsa-key word auto-gen-
subject-name fqdn word
Successfully generated self-signed certificate
rfs7000-37FABE>
```

```
rfs7000-37FABE> crypto pki zeroize trustpoint word del-key
Successfully removed the trustpoint and associated certificates
%Warning: Applications associated with the trustpoint will start using default-trustpoint
rfs7000-37FABE>
```

```
rfs7000-37FABE> crypto pki authenticate word url background
Import of CA certificate started in background
rfs7000-37FABE>
```

```
rfs7000-37FABE> crypto pki import trustpoint word url passphrase word
Import operation started in background
rfs7000-37FABE>
```

2.1.9 crypto-cmp-cert-update

User Exec Commands

Triggers a Certificate Management Protocol (CMP) certificate update on a specified device or devices

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

Parameters

- crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

Triggers a CMP certificate update on a specified device or devices

- <TRUSTPOINT-NAME> – Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the crypto-cmp-policy context mode to configure the trustpoint.
- on <DEVICE-NAME> – Optional. Initiates a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list.

Examples

rfs4000-229D58>crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
rfs4000-229D58>
2.1.10 database

User Exec Commands

Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight). Vacuuming a database refers to the process of finding and reclaiming space left over from previous DELETE statements.

Supported in the following platforms:

- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

database [drop|repair]

database drop [all|captive-portal|nsight]

database repair {on <DEVICE-NAME>}

Parameters

- database drop [all|captive-portal|nsight]
  
- database repair {on <DEVICE-NAME>}

Examples

nx9500-6C8809>database repair on nx9500-6C8809

Related Commands

database-backup

Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server

database-restore

Restores a previously exported database [captive-portal and/or NSight]
### 2.1.11 database-backup

- **User Exec Commands**

Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

#### Syntax

database-backup database [captive-portal|nsight] <URL>

#### Parameters
- database-backup database [captive-portal|nsight] <URL>

| database-backup database [captive-portal|nsight] | Backs up captive portal and/or NSight database to a specified location and file. Select the database to backup |
| <URL> | Configures the destination location. The database is backed up at the specified location. Specify the location URL in one of the following formats: |
| ftp://<user>:<passwd>@<hostname|IP>[[:port]]/path/file.tar.gz | sftp://<user>:<passwd>@<hostname|IP>[[:port]]/path/file.tar.gz |
| tftp://<hostname|IP>[[:port]]/path/file.tar.gz | 

#### Examples

nx9500-6C8809>database-backup database nsight ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz

#### Related Commands

| database | Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight) |
| database-restore | Restores a previously exported (backed up) database [captive-portal and/or NSight] |
### 2.1.12 database-restore

#### User Exec Commands

Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored from the backed-up location to the original database.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

#### Syntax

```
database-restore database [captive-portal|nsight] <URL>
```

#### Parameters

- `database-restore database [captive-portal|nsight] <URL>`

| **database-restore database [captive-portal|nsight]** | Restores previously exported (backed up) captive-portal and/or NSight database. Specify the database type:
|-----------------------------------------------------|---------------------------------------------------------------|
|                                                     | • captive-portal – Restores captive portal database
|                                                     | • nsight – Restores NSight database
|                                                     | After specifying the database type, configure the destination location and file name from where the files are restored.
| **<URL>**                                           | Configures the destination location. The database is restored from the specified location. Specify the location URL in one of the following formats:
|                                                     | ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz
|                                                     | sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz
|                                                     | tftp://<hostname|IP>[:port]/path/file.tar.gz

#### Examples

```
nx9500-6C8809>database-restore database nsight
ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

2.1.13 **device-upgrade**

> **User Exec Commands**

Enables firmware upgrade on an adopted device or a set of adopted devices (access points, wireless controllers, and service platforms). In an **hierarchically managed** (HM) network, this command enables centralized device upgradation across the network.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single **Network Operations Center** (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

---

**NOTE:** Hierarchical management allows the NOC controller to upgrade controllers and access points that are directly or indirectly adopted to it. However, ensure that the NOC controller is loaded with the correct firmware version.

---

All adopted devices (access points and second-level controllers) are referred to as the 'adoptee'. The adopting devices are the 'adopters'. A controller cannot be configured as an adoptee and an adopter simultaneously. In other words, a controller can either be an adopter (adopts another controller) or an adoptee (is adopted by another controller).

Network administrators can use the device-upgrade command to schedule firmware upgrades across adopted devices within the network. Devices are upgraded based on their device names, MAC addresses, or RF Domain. The firmware image used for the upgrade can either be user-defined or built-in.

The user-defined image is pulled from the defined location and applied to the device(s). Use the `device-upgrade > load-image` command to provide the image file name and location. User-defined images always get precedence over built-in images.

NOC and site controllers possess built-in firmware images for the various device types. If the administrator has not specified an image file name and location, the image on the controller is used to upgrade the device. The following example describes the various scenarios possible in the absence of a user-defined image.

A site controller has been scheduled to upgrade all adopted AP6562s. Before executing the upgrade, the site controller compares the image it possesses with the image on the NOC controller. In case of an image version mismatch, the site controller does the following:

1. If the site controller is a cluster member, it pulls the image:
   - From a cluster peer, provided the AP6562 image version on the peer and the NOC controller matches.
   - From the NOC controller, if the AP6562 image version on the peer and the NOC controller are mismatched.
   - From the NOC controller, if none of the cluster members possess a AP6562 image.

2. If the site controller is not a cluster member, it pulls the image from the NOC controller.

When upgrading devices in a RF Domain, the process is controlled and driven by the NOC controller. For example, in case of a scheduled upgrading of all AP6562s within an RF Domain, the NOC controller:

1. Adopts all controllers, in the RF Domain, to the NOC cluster and gets the status of each controller.

2. Upgrades all controllers, in the cluster, without rebooting them.

   Once the upgrade is complete, the following two scenarios are possible:

   **Scenario 1:** *If the upgrade/reboot options ARE NOT specified by the network administrator, the NOC controller:*
   
   a. Pushes the AP6562 image on to the RF Domain manager.
   b. Reboots the active controller within the RF Domain.
   c. Reboots standby controllers after the active controller has successfully rebooted.

   If the controllers are auto upgrade enabled, all AP6562s are upgraded after the controllers have rebooted and the APs have been re-adopted.

   **Scenario 2:** *If the upgrade/reboot options ARE specified by the network administrator, the NOC controller:*
a. Reboots the active controller followed by the standby controllers.
b. Pushes the AP6562 image file on to the RF Domain manager.
c. Initiates upgrades on all AP6562 within the RF Domain.

Ensure the RF Domain controllers are auto upgrade enabled.

**NOTE:** If the **persist-images** option is selected, the RF Domain manager retains the old firmware image, or else deletes it. For more information on enabling device upgrade on profiles and devices (including the 'persist-images' option), see **device-upgrade**.

**NOTE:** A NOC controller’s capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller – RFS7000, NX9000, NX95XX (NX9500 and NX9510), NX9600
- Site controller – RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX9000, or NX95XX

Within a HM network, the devices deployed as site controllers depends on the NOC controller device type. For more information on the adoption capabilities of various NOC controller devices, see Usage Guidelines (**NOC controller adoption matrix**).

**NOTE:** Standalone devices have to be manually upgraded.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

device-upgrade [<MAC/HOSTNAME>] all|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|rfs7000|nx45xx|nx55xx|nx65xx|nx75xx|nx9000|nx9600|vx9000|cancel-upgrade|load-image|rf-domain

device-upgrade <MAC/HOSTNAME> {no-reboot|reboot-time <TIME>|upgrade-time <TIME>} {no-reboot|reboot-time <TIME>}

device-upgrade all {force|no-reboot|reboot-time <TIME>|upgrade-time <TIME>} {no-reboot|reboot-time <TIME>}

device-upgrade [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|rfs7000|nx45xx|nx55xx|nx65xx|nx75xx|nx9000|nx9600|vx9000] all {force|no-reboot|reboot-time <TIME>|upgrade-time <TIME>} {no-reboot|reboot-time <TIME>}

device-upgrade cancel-upgrade [<MAC/HOSTNAME>] all|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|rfs7000|nx45xx|nx55xx|nx65xx|nx75xx|nx9000|nx9600|vx9000|on rf-domain [<RF-DOMAIN-NAME>] all]
device-upgrade load-image [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7562|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|rfs7000|nx45XX|nx5500|nx65XX|nx9000|nx9600|vx9000] {<IMAGE-URL>|on <DEVICE-OR-DOMAIN-NAME>}

device-upgrade rf-domain [<RF-DOMAIN-NAME>|all|containing <WORD>|filter location <WORD>] {<MAC/HOSTNAME>|force|from-controller|no-reboot|reboot-time <TIME>|staggered-reboot|upgrade-time <TIME>}

Parameters
- device-upgrade <MAC/HOSTNAME> {no-reboot|reboot-time <TIME>|upgrade-time <TIME> {no-reboot|reboot-time <TIME>}}

<table>
<thead>
<tr>
<th>&lt;MAC/HOSTNAME&gt;</th>
<th>Upgrades firmware on the device identified by the &lt;MAC/HOSTNAME&gt; keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td>no-reboot</td>
<td>Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)</td>
</tr>
<tr>
<td>reboot-time &lt;TIME&gt;</td>
<td>Optional. Schedules an automatic reboot after a successful upgrade</td>
</tr>
<tr>
<td>upgrade-time &lt;TIME&gt;</td>
<td>Optional. Schedules an automatic device firmware upgrade on a specified day and time</td>
</tr>
</tbody>
</table>

- device-upgrade all {force|no-reboot|reboot-time <TIME>|upgrade-time <TIME> {no-reboot|reboot-time <TIME>}} {(staggered-reboot)}

<table>
<thead>
<tr>
<th>all</th>
<th>Upgrades firmware on all devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>force</td>
<td>Optional. Select this option to force upgrade on the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.</td>
</tr>
<tr>
<td>no-reboot</td>
<td>Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)</td>
</tr>
<tr>
<td>reboot-time &lt;TIME&gt;</td>
<td>Optional. Schedules an automatic reboot after a successful upgrade</td>
</tr>
<tr>
<td>upgrade-time &lt;TIME&gt;</td>
<td>Optional. Schedules an automatic device firmware upgrade on all devices on a specified day and time</td>
</tr>
</tbody>
</table>

- staggered-reboot | This keyword is recursive and common to all of the above. |
|                   | Optional. Enables staggered device reboot (one at a time) without network impact |
### DEVICE-UPGRADE COMMAND

**device-upgrade** `<DEVICE-TYPE>` *all*

- **Upgrades firmware on all devices of a specific type.** Select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000.

- **After selecting the device type, schedule an automatic upgrade and/or an automatic reboot.**

**force**

- **Optional.** Select this option to force upgrade on the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.

**no-reboot**

- **Optional.** Disables automatic reboot after a successful upgrade (the device must be manually restarted)

**reboot-time** `<TIME>`

- **Optional.** Schedules an automatic reboot after a successful upgrade
  
  - `<TIME>` – Optional. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

**upgrade-time** `<TIME>`

- **Optional.** Schedules an automatic firmware upgrade on all devices, of the specified type, on a specified day and time
  
  - `<TIME>` – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format.

**staggered-reboot**

- **This keyword is recursive and common to all of the above.**
  
  - Optional. Enables staggered device reboot (one at a time) without network impact

### CANCEL-UPGRADE COMMAND

**cancel-upgrade** `[<MAC/HOSTNAME>|all]` *all* `ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|vx9000`

**on rf-domain** `[<RF-DOMAIN-NAME>|all]`

- **Cancels a scheduled firmware upgrade based on the parameters passed.** This command provides the following options to cancel scheduled firmware upgrades:
  
  - Cancels upgrade on specific device(s). The devices are identified by their MAC addresses or hostnames.
  - Cancels upgrade on all devices within the network
  - Cancels upgrade on all devices of a specific type. Specify the device type.
  - Cancels upgrade on specific device(s) or all device(s) within a specific RF Domain or all RF Domains. Specify the RF Domain name.

**cancel-upgrade** `[<MAC/HOSTNAME>|all]`

- **Cancels a scheduled firmware upgrade on a specified device or on all devices**
  
  - `<MAC/HOSTNAME>` – Cancels a scheduled upgrade on the device identified by the `<MAC/HOSTNAME>` keyword. Specify the device’s MAC address or hostname.
  - `all` – Cancels scheduled upgrade on all devices
<table>

<td>• filter location &lt;WORD&gt; – Filters devices by their location. All devices with location matching the &lt;WORD&gt; keyword are upgraded.</td>
</tr>
</tbody>
</table>

| <DEVICE-TYPE> | After specifying the RF Domain, select the device type. The options are: AP621, AP622, AP650, AP651, AP652, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, RX45XX, RX5500, RX65XX, RX75XX, RX9000, RX9600, RX9000. |

| <MAC/HOSTNAME> | Optional. Use this option to identify specific devices for upgradation. Specify the device’s MAC address or hostname. The device should be within the specified RF Domain and of the specified device type. After identifying the devices to upgrade, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller. |
|                | **Note:** If no MAC address or hostname is specified, all devices of the type selected are upgraded. |

| force | Optional. Select this option to force upgrade for the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time. |

| from-controller | Optional. Upgrades a device through the adopted device. If initiating an upgrade through the adopting controller, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time. |

| no-reboot | Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted) |
| {staggered-reboot} | |

| reboot-time <TIME> | Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format. |
| {staggered-reboot} | |

| staggered-reboot | This keyword is common to all of the above. |
| Optional. Enables staggered reboot (one at a time) without network impact |

| upgrade-time <TIME> | Optional. Schedules an automatic firmware upgrade |
| {no-reboot} | |
| reboot-time <TIME>} | After a scheduled upgrade, the following actions can be performed. |
• no-reboot – Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
• reboot-time <TIME> – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

Usage Guidelines (NOC controller adoption matrix)
The following table displays NOC controllers and the corresponding site-level controllers supported by each:

+---------------------------------------------------+

Total number of APs displayed: 2

rfs6000-6DB5D4>
Both APs and the controller are running the same image. Therefore, the device-upgrade command fails. This is shown in the following example:

```
$rfs6000-6DB5D4>device-upgrade rf-domain TechPubs ap6522
In progress ....
---------------------------------------------------------------------------------------
CONTROLLER     STATUS                              MESSAGE
---------------------------------------------------------------------------------------
B4-C7-99-6D-B5-D4   Fail    TechPubs(Upgrade not required in TechPubs)
---------------------------------------------------------------------------------------
$rfs6000-6DB5D4>
```

Use the ‘force’ parameter to forcefully upgrade the APs.

```
rfs6000-6DB5D4>device-upgrade rf-domain TechPubs ap6522 force
In progress ....
---------------------------------------------------------------------------------------
CONTROLLER     STATUS                              MESSAGE
---------------------------------------------------------------------------------------
B4-C7-99-6D-B5-D4   Success    TechPubs(device type(s) ap6522 added for upgrade),
---------------------------------------------------------------------------------------
```

```
rfs6000-6DB5D4>show device-upgrade status

```

The following examples show the upgradation of devices in a HM network.

The HM setup is as follows:

```
rfs7000-6DCD4B (NOC) > l3-adoption > rfs6000-81701D (SITE-CONTROLLER) > l2-adoption > ap8132-711728 (access point)
```

Step 1: Load AP81XX firmware on the NOC (rfs7000-6DCD4B):

```
rfs7000-6DCD4B>device-upgrade load-image ap81XX
ftp://anonymous:anonymous@192.168.13.10/LatestBuilds/W583/AP81XX-012D.img
--------------------------------------------------------------------------------
CONTROLLER          STATUS                      MESSAGE
--------------------------------------------------------------------------------
rfs7000-6DCD4B        Success    Successfully initiated load image
--------------------------------------------------------------------------------
rfs7000-6DCD4B>
```

```
rfs7000-6DCD4B>show device-upgrade load-image-status
Download of ap81xx firmware file is complete
rfs7000-6DCD4B>
```
Step 2: Execute the upgrade command on the NOC. This pushes the AP81XX image through the Site Controller on to the adopted AP81XX (ap8132-711728).

```bash
rfs7000-6DCD4B>device-upgrade ap8132-711728
```

```
+-----------------+-----------------+------------------+

2.1.14 disable

User Exec Commands

This command can be executed in the Priv Exec Mode only. This command turns off (disables) the privileged mode command set and returns to the User Executable Mode. The prompt changes from rfs7000-37FABE# to rfs7000-37FABE>

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
disable

Parameters
None

Examples
rfs7000-37FABE#disable
rfs7000-37FABE>
2.1.15 enable

User Exec Commands

Turns on (enables) the privileged mode command set. The prompt changes from rfs7000-37FABE> to rfs7000-37FABE#. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

enable

Parameters

None

Examples

rfs7000-37FABE>enable
rfs7000-37FABE#
2.1.16 file-sync

User Exec Commands

Syncs EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points. Use this command to configure parameters that enable syncing of PKCS#12 certificate.

When enabling file syncing, consider the following points:

• The X.509 certificate needs synchronization only if the access point's radio2, the client-bridge radio, is configured to use EAP-TLS authentication
• Execute the command on the controller adopting the access point
• Ensure that the X.509 certificate file is installed on the controller
• If the adopting device is a site controller with layer 3 adoption to the NOC, ensure that the X.509 certificate is synced across the hierarchically managed setup – between the NOC, site-controller (the staging-controller), and the client-bridge access points.

Syncing of wireless client-bridge certificate can be automated. To automate file syncing, in the controller's device/profile configuration mode, execute the following command: `file-sync [auto]count <1-20>`. For more information, see `file-sync`

For more information on configuring a AP client-bridge, see `bridge`

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
file-sync [cancel|load-file|trustpoint|wireless-bridge]
file-sync cancel wireless-bridge [DEVICE-NAME|all|rf-domain [DOMAIN-NAME|all]]
file-sync load-file [trustpoint TRUSTPOINT-NAME|wireless-bridge] URL
file-sync trustpoint TRUSTPOINT-NAME [DEVICE-NAME|all|rf-domain [DOMAIN-NAME|all]
  {from-controller} {reset-radio|upload-time <TIME>}
file-sync wireless-bridge [DEVICE-NAME|all|rf-domain [DOMAIN-NAME|all]
  {from-controller} {reset-radio|upload-time <TIME>}
```

Parameters

- `file-sync cancel wireless-bridge [DEVICE-NAME|all|rf-domain [DOMAIN-NAME|all]]`
  - Cancels scheduled wireless client-bridge certificate synchronization on a specified AP, or all APs, or APs within an RF Domain
    - `<DEVICE-NAME>` – Cancels scheduled certificate synchronization on the AP identified by the `<DEVICE-NAME>` parameter. Specify the AP's hostname or MAC address.
    - `all` – Cancels scheduled certificate synchronization on all APs
    - `rf-domain [DOMAIN-NAME|all]` – Cancels scheduled certificate synchronization on all APs in a specified RF Domain or in all RF Domains
    - `<DOMAIN-NAME>` – Cancels scheduled certificate synchronization on all APs within the RF Domain identified by the `<DOMAIN-NAME>` parameter. Specify the RF Domain's name.
    - `all` – Cancels scheduled certificate synchronization on all RF Domains
- `file-sync load-file wireless-bridge <URL>`

  Loads the client-bridge certificate to the staging controller. Use this command to load the certificate to the controller before scheduling or initiating a certificate synchronization.

  - `<URL>` – Provide the certificate location using one of the following formats:
    - `tftp://<hostname|IP>[:port]/path/file`
    - `ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
    - `sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
    - `http://<hostname|IP>[:port]/path/file`
    - `cf:/path/file`
    - `usb<n>:/path/file`

  **Note:** Both IPv4 and IPv6 address types are supported.

- `file-sync trustpoint <TRUSTPOINT-NAME> [ <DEVICE-NAME>|all|rf-domain [ <DOMAIN-NAME>|all ] from-controller ] { reset-radio|upload-time <TIME> }`

  Configures file-syncing parameters

  - `trustpoint <TRUSTPOINT-NAME>` – Enables syncing of a specified trustpoint between controller and its adopted devices
  - `<TRUSTPOINT-NAME>` – Specify the trustpoint name.

  These file-sync options can be applied to a specified AP, all APs, or all APs within a specified RF Domain or on all RF Domains.

  After specifying the trustpoint name, configures the following file-sync parameters:

  - `<DEVICE-NAME>` – Applies these parameters to the AP identified by the `<DEVICE-NAME>` parameter. Specify the AP's hostname or MAC address.
  - `all` – Applies these parameters to all APs
  - `rf-domain [ <DOMAIN-NAME>|all ] from-controller` – Applies these parameters to all APs in a specified RF Domain or in all RF Domains
    - `<DOMAIN-NAME>` – Select to apply to APs within the RF Domain identified by the `<DOMAIN-NAME>` parameter. Specify the RF Domain's name.
    - `all` – Select to apply these parameters to APs in all RF Domains
    - `from-controller` – Optional. Loads certificate to the APs from the adopting controller and not the RF Domain manager

  After specify the access points, specify the following options: `reset-radio` and `upload-time`.

- `reset-radio`

  This keyword is recursive and applicable to all of the above parameters.

  Optional. Resets the radio after file synchronization. Reset the radio in case the certificate is renewed along with no changes made to the 'bridge EAP username' and 'bridge EAP password'.

- `upload-time <TIME>`

  This keyword is recursive and applicable to all of the above parameters.

  - `upload-time` – Optional. Schedules certificate upload at a specified time
    - `<TIME>` – Specify the time in the MM/DD/YYYY-HH:MM or HH:MM format. If no time is configured, the process is initiated as soon as the command is executed.
- **file-sync wireless-bridge** 
  
  - `<DEVICE-NAME>`: Applies these parameters to the AP identified by the `<DEVICE-NAME>` parameter. Specify the AP's hostname or MAC address.
  - `all`: Applies these parameters to all APs
  - `rf-domain [ <DOMAIN-NAME> | all ]`: Applies these parameters to all APs in a specified RF Domain or in all RF Domains.
    - `<DOMAIN-NAME>`: Select to apply to APs within the RF Domain identified by the `<DOMAIN-NAME>` parameter. Specify the RF Domain's name.
    - `all`: Select to apply these parameters to all APs in all RF Domains
  - `from-controller`: Optional. Loads certificate to the APs from the adopting controller and not the RF Domain manager

After specifying the access points to load certificates, specify the following options: `reset-radio` and `upload-time`.

- **reset-radio**: This keyword is recursive and applicable to all of the above parameters. Optional. Resets the radio after file synchronization. Reset the radio in case the certificate is renewed along with no changes made to the 'bridge EAP username' and 'bridge EAP password'.

- **upload-time <TIME>**: This keyword is recursive and applicable to all of the above parameters. Optional. Schedules certificate upload at a specified time.
  - `<TIME>`: Specify the time in the `MM/DD/YYYY-HH:MM` or `HH:MM` format. If no time is configured, the process is initiated as soon as the command is executed.

### Examples

**rfs7000-6DCD4B>** file-sync wireless-bridge ap7131-11E6C4 upload-time 12/12/2015-12:30

```
+-----------------+---------------------+-------------------------------------+-------------------------------------+-------------------------------------+
| CONTROLLER      | STATUS              | MESSAGE                            | MESSAGE                            |
|-----------------|---------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| B4-C7-99-6D-CD-4B | Success            | Queued 1 APs to upload             |                                     |
```

**rfs7000-6DCD4B>

The following uploads certificate to all access points:

**rfs6000-6DB5D4>** file-sync wireless-bridge all upload-time 06/05/2015-23:42

**rfs6000-6DB5D4>**
### 2.1.17 join-cluster

**User Exec Commands**

Adds a device (access point, wireless controller, or service platform), as a member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
join-cluster <IP> user <USERNAME> password <WORD> {level|mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}
```

**Parameters**

- `join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IP&gt;</code></td>
<td>Specify the cluster member’s IP address.</td>
</tr>
<tr>
<td>user <code>&lt;USERNAME&gt;</code></td>
<td>Specify a user account with super user privileges on the new cluster member</td>
</tr>
<tr>
<td>password <code>&lt;WORD&gt;</code></td>
<td>Specify password for the account specified in the user parameter</td>
</tr>
<tr>
<td>level [1</td>
<td>2]</td>
</tr>
<tr>
<td></td>
<td>• 1 – Configures level 1 routing</td>
</tr>
<tr>
<td></td>
<td>• 2 – Configures level 2 routing</td>
</tr>
<tr>
<td>mode [active</td>
<td>standby]</td>
</tr>
<tr>
<td></td>
<td>• active – Configures this cluster as active</td>
</tr>
<tr>
<td></td>
<td>• standby – Configures this cluster to be on standby mode</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To add a device to an existing cluster:
- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding the device to a cluster, execute the “write memory” command to ensure the configuration persists across reboots.

**Examples**

```
rfs7000-37FABE>join-cluster 192.168.13.15 user admin password superuser level 1 mode standby
... connecting to 192.168.13.15
... applying cluster configuration
... committing the changes
... saving the changes
[OK]
rfs7000-37FABE>
```
rfs7000-37FABE>show context
!

### 2.1.18 l2tpv3

#### User Exec Commands

Establishes or brings down an *Layer 2 Tunnel Protocol Version 3* (L2TPV3) tunnel

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

- `l2tpv3 tunnel [〈TUNNEL-NAME〉|all]`
- `l2tpv3 tunnel 〈TUNNEL-NAME〉 [down|up] {on 〈DEVICE-NAME〉}
- `l2tpv3 tunnel 〈TUNNEL-NAME〉 session 〈SESSION-NAME〉 [down|up] {on 〈DEVICE-NAME〉}
- `l2tpv3 tunnel all [down|up] {on 〈DEVICE-NAME〉}

#### Parameters

- **l2tpv3 tunnel 〈TUNNEL-NAME〉 [down|up] {on 〈DEVICE-NAME〉}**

<table>
<thead>
<tr>
<th>l2tpv3 tunnel</th>
<th>Establishes or brings down L2TPv3 tunnels</th>

</thead>
<tbody>
<tr>
<td>〈TUNNEL-NAME〉 [down</td>
<td>up]</td>
</tr>
<tr>
<td></td>
<td>• down – Brings down the specified tunnel</td>
</tr>
<tr>
<td></td>
<td>• up – Establishes the specified tunnel</td>
</tr>
<tr>
<td>on 〈DEVICE-NAME〉</td>
<td>Optional. Establishes or brings down a tunnel on a specified device</td>
</tr>
<tr>
<td></td>
<td>• 〈DEVICE-NAME〉 – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- **l2tpv3 tunnel 〈TUNNEL-NAME〉 session 〈SESSION-NAME〉 [down|up] {on 〈DEVICE-NAME〉}**

<table>
<thead>
<tr>
<th>l2tpv3 tunnel</th>
<th>Establishes or brings down L2TPv3 tunnels</th>
</tr>
</thead>
<tbody>
<tr>
<td>〈TUNNEL-NAME〉 [session 〈SESSION-NAME〉] [down</td>
<td>up]</td>
</tr>
<tr>
<td></td>
<td>• 〈TUNNEL-NAME〉 – Specify the tunnel name.</td>
</tr>
<tr>
<td></td>
<td>• session 〈SESSION-NAME〉 – Identifies a specific session</td>
</tr>
<tr>
<td></td>
<td>• 〈SESSION-NAME〉 – Specify the session name.</td>
</tr>
<tr>
<td></td>
<td>• down – Brings down the session identified by the 〈SESSION-NAME〉 keyword</td>
</tr>
<tr>
<td></td>
<td>• up – Establishes the session identified by the 〈SESSION-NAME〉 keyword</td>
</tr>
<tr>
<td>on 〈DEVICE-NAME〉</td>
<td>Optional. Establishes or brings down a tunnel session on a specified device</td>
</tr>
<tr>
<td></td>
<td>• 〈DEVICE-NAME〉 – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

- **l2tpv3 tunnel all [down|up] {on 〈DEVICE-NAME〉}**

<table>
<thead>
<tr>
<th>l2tpv3 tunnel</th>
<th>Establishes or brings down L2TPv3 tunnels</th>
</tr>

<tr>
<td>---------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE>l2tpv3 tunnel Tunnell session TunnellSession1 up on rfs7000-37FABE
```

**NOTE:** For more information on the L2TPv3 tunnel configuration mode and commands, see *Chapter 22, L2TPV3-POLICY*. 
2.1.19 logging

User Exec Commands

Modifies message logging settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}

Parameters

- logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}

Examples

rfs7000-6DCD4B(config-device-B4-C7-99-6D-CD-4B)#logging on
rfs7000-6DCD4B>logging monitor debugging
rfs7000-6DCD4B>show logging

Logging module: enabled
Aggregation time: disabled
Console logging: level debugging
Monitor logging: disabled
Buffered logging: level warnings
Syslog logging: level warnings
Facility: local7

Log Buffer (103 bytes):

2.1.20 mint

User Exec Commands

Uses MiNT protocol to perform a ping and traceroute to a remote device

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

mint [ping|traceroute]
mint ping <MINT-ID> {(count <1-10000>|size <1-64000>|timeout <1-10>)}
mint traceroute <MINT-ID> {(destination-port <1-65535>|max-hops <1-255>|source-port <1-65535>|timeout <1-255>)}

Parameters

- ping <MINT-ID> Sends a MiNT echo message to a specified destination
  - <MINT-ID> – Specify the destination device’s MiNT ID.
- count <1-10000> Optional. Sets the pings to the MiNT destination
  - <1-10000> – Specify a value from 1 - 10000. The default is 3.
- size <1-64000> Optional. Sets the MiNT payload size in bytes
  - <1-64000> – Specify a value from 1 - 64000 bytes. The default is 64 bytes.
- timeout <1-10> Optional. Sets a response time in seconds
  - <1-10> – Specify a value from 1 sec - 10 sec. The default is 1 second.

- traceroute <MINT-ID> Prints the route packets trace to a device
  - <MINT-ID> – Specify the destination device’s MiNT ID.
- destination-port <1-65535> Optional. Sets the Equal-cost Multi-path (ECMP) routing destination port
  - <1-65535> – Specify a value from 1 - 65535. The default port is 45.
- max-hops <1-255> Optional. Sets the maximum number of hops a traceroute packet traverses in the forward direction
  - <1-255> – Specify a value from 1 - 255. The default is 30.
- source-port <1-65535> Optional. Sets the ECMP source port
  - <1-65535> – Specify a value from 1 - 65535. The default port is 45.
- timeout <1-255> Optional. Sets the minimum response time period in seconds
  - <1-255> – Specify a value from 1 sec - 255 sec. The default is 30 seconds.
Examples

rfs7000-37FABE>mint ping 68.22.9D.58 count 5 size 120
MiNT ping 68.22.9D.58 with 120 bytes of data.
Response from 68.22.9D.58: id=1 time=0.341 ms
Response from 68.22.9D.58: id=2 time=0.313 ms
Response from 68.22.9D.58: id=3 time=0.314 ms
Response from 68.22.9D.58: id=4 time=0.333 ms
Response from 68.22.9D.58: id=5 time=0.291 ms

--- 68.22.9D.58 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.291/0.318/0.341 ms
rfs7000-37FABE>
2.1.21 no

User Exec Commands

Use the `no` command to revert a command or to set parameters to their default. This command turns off an enabled feature or reverts settings to default.

**NOTE:** The commands have their own set of parameters that can be reset.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```markdown
no [adoption|captive-portal|crypto|debug|logging|page|service|terminal|virtual-machine|wireless]
```

```markdown
no adoption {on <DEVICE-OR-DOMAIN-NAME>}
```

**NOTE:** The `no > adoption` command resets the adoption state of a specified device (and all devices adopted to it) or devices within a specified RF Domain. When executed without specifying the device or RF Domain, the command resets the adoption state of the logged device and all devices, if any, adopted to it.

```markdown
no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>] {on <DEVICE-OR-DOMAIN-NAME>}
```

```markdown
no crypto pki [server|trustpoint]
no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>} | on <DEVICE-NAME>}
```

```markdown
no logging monitor
```

```markdown

Parameters
- no <PARAMETERS>

| no <PARAMETERS> | Resets or reverts settings based on the parameters passed |

Usage Guidelines
The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples
rfs7000-37FABE>no adoption
rfs7000-37FABE>no page
2.1.22 on

User Exec Commands

Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
on rf-domain [RF-DOMAIN-NAME]|all]```

Parameters

- on rf-domain [RF-DOMAIN-NAME]|all]

| on rf-domain [RF-DOMAIN-NAME]|all] | Enters the RF Domain context based on the parameter specified |
|-------------------------------|------------------------------------------------------------|
| [RF-DOMAIN-NAME]|all] | • <RF-DOMAIN-NAME> – Specify the RF Domain name. Enters the specified RF Domain context. |
| [RF-DOMAIN-NAME]|all] | • all – Specifies all RF Domains. |

Examples

```
nx9500-6C8809(rf-domain-all)>?
on RF-Domain Mode commands:
    clrscr  Clears the display screen
    do  Run commands from Exec mode
    end  End current mode and change to EXEC mode
    exit  End current mode and down to previous mode
    help  Description of the interactive help system
    service  Service Commands
    show  Show running system information

nx9500-6C8809(rf-domain-all)>```
### 2.1.23 opendns

Retrieves the OpenDNS device-id from the OpenDNS site

This command integrates access points and controllers with OpenDNS. It obtains the device-id (16 character hex-string) from OpenDNS. This device-id is configured under all WLANs that are to be OpenDNS enabled. When configured and enabled on a WLAN, DNS queries from all wireless clients on the WLAN are redirected to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers. These OpenDNS resolvers act as proxy DNS servers, and also provide additional features, such as Web filtering, performance improvements, etc.

**Syntax**

`opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>`

**Parameters**

- **username**
  
  Configures the OpenDNS user name (should be valid username registered with OpenDNS)
  
  - `<USERNAME>` – Provide the OpenDNS user name.

- **password**
  
  Configures the password associated with the user configured in the previous step
  
  - `<OPENDNS-PSWD>` – Provide the OpenDNS password for the user.

- **label**
  
  Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal.
  
  - `<LABEL>` – Specify your OpenDNS server label.
  
  **Note:** For every unique set of username, password, and label only one device-id is returned. Apply this device-id in WLANs that are to be OpenDNS enabled. For information on configuring the device-id in the WLAN context, see `opendns`.

**Supported in the following platforms:**

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**NOTE:**

OpenDNS is a free, alternative DNS service that is faster and more reliable than other DNS services available. OpenDNS enables swift navigation of the Web without the outages that are frequent in other ISP provided DNS services. It also blocks inappropriate Web sites, phishing sites, and prevents virus and malware attacks.

**NOTE:**

The ‘username’ and ‘password’ values passed in this command should be pre-registered with the OpenDNS site. The ‘label’ can be any value. Only with a combination of a valid ‘username’, ‘password’, and any ‘label’ the OpenDNS server returns a device-id.
Usage Guidelines
Use your OpenDNS credentials to logon to the opendns.org site and use the labels, edit settings, and customize content filtering options to configure Web filtering settings.

Examples
ap7131-E6D512>opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7131-E6D512>
2.1.24 page

- **User Exec Commands**

  Toggles a device’s paging function. Enabling this command displays the CLI command output page by page, instead of running the entire output at once.

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
page
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE>page
rfs7000-37FABE>
```

2.1.25 ping

User Exec Commands

Sends Internet Controller Message Protocol (ICMP) echo messages to a user-specified location.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|source [<IP>|pppoe|vlan <1-4094>|wwan]}
```

Parameters

- `<IP/HOSTNAME>` Specify the destination IP address or hostname. When entered without any parameters, this command prompts for an IP address or a hostname.
- `count <1-10000>` Optional. Sets the pings to the specified destination.
  - `<1-10000>` – Specify a value from 1 - 10000. The default is 5.
- `dont-fragment {count|size}` Optional. Sets the don’t fragment bit in the ping packet. Packets with the dont-fragment bit specified are not fragmented. When a packet, with the dont-fragment bit specified, exceeds the specified maximum transmission unit (MTU) value, an error message is sent from the device trying to fragment it.
  - `count <1-10000>` – Optional. Sets the pings to the specified destination from 1 - 10000. The default is 5.
  - `size <1-64000>` – Optional. Sets the ping payload size from 1 - 64000 bytes. The default is 100 bytes.
- `size <1-64000>` Optional. Sets the ping payload size in bytes
  - `<1-64000>` – Specify the ping payload size from 1 - 64000. The default is 100 bytes.
- `source [<IP>|pppoe|vlan <1-4094]|wwan]` Optional. Sets the source address or interface name. This is the source of the ICMP packet to the specified destination.
  - `<IP>` – Specifies the source IP address
  - `pppoe` – Selects the PPP over Ethernet interface
  - `vlan <1-4094>` – Selects the VLAN interface from 1 - 4094
  - `wwan` – Selects the wireless WAN interface

Examples

```
rfs7000-37FABE>ping 172.16.10.4 count 6
PING 172.16.10.4 (172.16.10.4): 100 data bytes

2.1.26 ping6

User Exec Commands
Sends ICMPv6 echo messages to a user-specified IPv6 address

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
ping6 <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}

Parameters
- ping <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}

<table>
<thead>
<tr>
<th>&lt;IPv6/HOSTNAME&gt;</th>
<th>Specify the destination IPv6 address or hostname.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Specify the interface name for link local/broadcast address</td>
</tr>
<tr>
<td>count &lt;1-10000&gt;</td>
<td>Optional. Sets the pings to the specified IPv6 destination</td>
</tr>
<tr>
<td>size &lt;1-64000&gt;</td>
<td>Optional. Sets the IPv6 ping payload size in bytes</td>
</tr>
</tbody>
</table>

Usage Guidelines
To configure a device’s IPv6 address, in the VLAN interface configuration mode, use the
ipv6 > address <IPv6-ADDRESS> command. After configuring the IPv6 address, use the ipv6 > enable command to enable IPv6. For more information, see ipv6.

Examples
rfs4000-1B3596(config-device-00-23-68-1B-35-96-if-ge4)#show ipv6 interface brief
- INTERFACE IP6 MODE IPV6-ADDRESS/MASK TYPE STATUS PROTOCOL

rfs4000-229D58>
2.1.27 ssh

User Exec Commands

Opens a Secure Shell (SSH) connection between two network devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

Parameters

- `ssh <IP/HOSTNAME> <USER-NAME> {<INF-NAME/LINK-LOCAL-ADD>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IP/HOSTNAME&gt;</code></td>
<td>Specify the remote system’s IP address or hostname.</td>
</tr>
<tr>
<td><code>&lt;USER-NAME&gt;</code></td>
<td>Specify the name of the user requesting SSH connection with the remote system.</td>
</tr>
<tr>
<td><code>&lt;INF-NAME/LINK-LOCAL-ADD&gt;</code></td>
<td>Optional. Specify the interface’s name or link local address.</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809>ssh 192.168.13.15 admin
admin@192.168.13.15's password:
rfs7000-37FABE>
```
2.2.18 telnet

User Exec Commands

Opens a Telnet session between two network devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

Parameters

- telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Configures the destination remote system’s IP (IPv4 or IPv6) address or hostname. The Telnet session is established between the connecting system and the remote system.</td>
</tr>
<tr>
<td></td>
<td>• &lt;IP/HOSTNAME&gt; – Specify the remote system’s IPv4 or IPv6 address or hostname.</td>
</tr>
<tr>
<td>&lt;TCP-PORT&gt;</td>
<td>Optional. Specify the Transmission Control Protocol (TCP) port number.</td>
</tr>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Optional. Specify the interface name for the link local address.</td>
</tr>
</tbody>

2.1.29 terminal

### User Exec Commands
Sets the length and width of the CLI display window on a terminal

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax
```
terminal [length|width] <0-512>
```

### Parameters
- `terminal [length|width] <0-512>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>length &lt;0-512&gt;</code></td>
<td>Sets the number of lines displayed on the terminal window. You can specify a value from 0 to 512.</td>
</tr>
<tr>
<td><code>width &lt;0-512&gt;</code></td>
<td>Sets the width (the number of characters displayed in one line) of the terminal window. You can specify a value from 0 to 512.</td>
</tr>
</tbody>
</table>

### Examples
```
rfs7000-37FABE>terminal length 150
rfs7000-37FABE>terminal width 215
```

```
rfs7000-37FABE>show terminal
Terminal Type: xterm
Length: 150  Width: 215
```

### Related Commands
- `no`: Resets the width or length of the terminal window.
2.1.30 time-it

- **User Exec Commands**
  Verifies the time taken by a particular command between request and response

- Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
time-it <COMMAND>
```

**Parameters**

- `time-it <COMMAND>`

**Examples**

```
rfs7000-37FABE>time-it enable
That took 0.00 seconds..
rfs7000-37FABE#
```
2.1.31 traceroute

User Exec Commands

Traces the route to a defined destination

Use ‘--help’ or ‘-h’ to display a complete list of parameters for the traceroute command

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

traceroute <LINE>

Parameters

• traceroute <LINE>

traceroute <LINE> Traces the route to a destination IP address or hostname

• <LINE> – Specify the destination IPv6 address or hostname.

Examples

rfs7000-37FABE>traceroute --help
BusyBox v1.14.1 () multi-call binary

Usage: traceroute [-FIldnrv] [-f 1st_ttl] [-m max_ttl] [-p port#] [-q nqueries] 
[-s src_addr] [-t tos] [-w wait] [-g gateway] [-i iface] 
[-z pausemsecs] HOST [data size]
Trace the route to HOST
Options:

-F Set the don't fragment bit
-I Use ICMP ECHO instead of UDP datagrams
-l Display the ttl value of the returned packet
-d Set SO_DEBUG options to socket
-n Print hop addresses numerically rather than symbolically
-r Bypass the normal routing tables and send directly to a host
-v Verbose
-m max_ttl Max time-to-live (max number of hops)
-p port# Base UDP port number used in probes (default is 33434)
-q nqueries Number of probes per 'ttl' (default 3)
-s src_addr IP address to use as the source address
-t tos Type-of-service in probe packets (default 0)
-w wait Time in seconds to wait for a response (default 3 sec)
-g Loose source route gateway (0 max)

rfs7000-37FABE>

rfs7000-6DCD4B>traceroute 192.168.13.16
traceroute to 192.168.13.16 (192.168.13.16), 30 hops max, 38 byte packets
  1 192.168.13.16 (192.168.13.16) 5.071 ms 0.294 ms 0.283 ms
rfs7000-6DCD4B>
2.1.32 traceroute6

User Exec Commands

Traces the route to a specified IPv6 destination

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

traceroute6 <LINE>

Parameters

- traceroute6 <LINE>

<table>
<thead>
<tr>
<th>traceroute6 &lt;LINE&gt;</th>

rfs4000-229D58>
2.1.33 watch

User Exec Commands

Repeats the specified CLI command at periodic intervals

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

watch <1-3600> <LINE>

Parameters

- watch <1-3600> <LINE>

<table>
<thead>
<tr>
<th>watch</th>
<th>Repeats a CLI command at a specified interval (in seconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-3600&gt;</td>
<td>Select an interval from 1 - 3600 sec. Pressing CTRL-Z halts execution of the command.</td>
</tr>
<tr>
<td>&lt;LINE&gt;</td>
<td>Specify the CLI command.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-6DCD4B>watch 40 ping 192.168.13.16
PING 192.168.13.16 (192.168.13.16) 100(128) bytes of data.
108 bytes from 192.168.13.16: icmp_seq=1 ttl=64 time=0.565 ms

--- 192.168.13.16 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3997ms
rtt min/avg/max/mdev = 0.344/0.417/0.565/0.082 ms

rfs7000-6DCD4B>
2.1.34 exit

User Exec Commands

Ends the current CLI session and closes the session window

For more information, see exit.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

exit

Parameters

None

Examples

rfs7000-37FABE>exit
2.1.35 smart-cache

Pre-fetches cached content from the specified list of URLs

Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files, etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see smart-cache-policy.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

smart-cache pre-fetch-immediate <URL-LIST-NAME>

Parameters

- smart-cache pre-fetch-immediate <URL-LIST-NAME>

<table>
<thead>
<tr>
<th>smart-cache</th>
<th>Pre-fetches content from the specified list of URLs</th>
</tr>
</thead>
<tbody>
<tr>
<td>pre-fetch-immediate</td>
<td>Provide the URL list names (should be existing and configured). For more information on configuring URL lists, see url-list.</td>
</tr>
</tbody>
</table>

Examples

nx4500-5CFA2B>smart-cache pre-fetch-immediate ?
  URL-LIST  URL List to be Pre Fetched

nx4500-5CFA2B>
2.1.36 virtual-machine

User Exec Commands

Installs, configures, and monitors the status of third-party virtual machines (VMs)

In addition to the WiNG VMs, the NX45XX, NX65XX, NX9500, and NX9510 series service platforms support the installation and administration of third-party VMs. However, the third-party VMs supported by these devices varies.

The third-party VMs supported on NX45XX and NX65XX are:

- TEAM-URC
- TEAM-RLS
- TEAM-VoWLAN

The VM supported on NX9500 and NX9510 is:

- ADSP

Use the virtual-machine command to install the third-party VMs, and configure parameters, such as install media type and location, number of Virtual Central Processing Units (VCPUS), VM memory, VM disk, number of Virtual Network Interfaces (VIFs), and Virtual Networking Computing (VNC) port.

Installing third-party VMs saves on hardware cost and provides a unified VM management interface.

This section is organized into the following sub-sections:

- Syntax NX45XX, NX65XX
- Syntax NX9500 and NX9510

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax NX45XX, NX65XX

virtual-machine [assign-usb-ports|console|export|install|restart|set|start|stop|uninstall]

virtual-machine stop hard [{<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine stop hard [{<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine stop hard [{<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine stop hard [{<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

virtual-machine stop hard [{<VM-NAME>|team-urc|team-rls|team-vowlan}
virtual-machine uninstall \(<\text{VM-NAME}>|\text{team-urc}|\text{team-rls}|\text{team-vowlan}\) \{on \<\text{DEVICE-NAME}>\}

**Parameters NX45XX, NX65XX**

- virtual-machine assign-usb-ports team-vowlan \{on \<\text{DEVICE-NAME}>\}

assign-usb-ports

\begin{tabular}{|l|}
\hline
\textbf{team-vowlan} \{on \<\text{DEVICE-NAME}>\} \tab \text{Assigns USB ports to TEAM-VoWLAN} \\
\hline
\textbf{team-urc} \tab \text{TEAM Unified Retail Communication’s (URC) (IP-PBX) console} \\
\hline
\textbf{team-rls} \tab \text{TEAM Radio Link Service (RLS) server’s console} \\
\hline
\textbf{team-vowlan} \tab \text{TEAM-VoWLAN’s (Voice over WLAN) console} \\
\hline
\end{tabular}

Use the \texttt{no > virtual-machine > assign-usb-ports} command to reassign the port to WiNG.

**Note:** TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.

virtual-machine console \[\<\text{VM-NAME}>|\text{team-urc}|\text{team-rls}|\text{team-vowlan}\]

virtual-machine export \<\text{VM-NAME}> \[\<\text{FILE}|\<\text{URL}\] \{on \<\text{DEVICE-NAME}>\}

virtual-machine install \<\text{VM-NAME}> type \[\text{disk}|\text{iso disk-size <SIZE}>|\text{vm-archive}\] install-media \[\<\text{FILE}|\<\text{URL}|\<\text{USB}\] \{\text{autostart}|\text{memory}|\text{on}|\text{vcpus}|\text{vif-count}|\text{vnc}\}

virtual-machine install \<\text{VM-NAME}> type \[\text{disk}|\text{iso disk-size <SIZE}>|\text{vm-archive}\] install-media \[\<\text{FILE}|\<\text{URL}|\<\text{USB}\] \{\text{autostart}|\text{memory}|\text{on}|\text{vcpus}|\text{vif-count}|\text{vnc}\}

The VM should be in a stop state during the export process.

If the destination is a device, the image is copied to a predefined location (VM archive).
• iso disk-size <SIZE> – Specifies the install media type as ISO file. This is a single file, which contains the OS bootable install media.
• disk-size <SIZE> – If the install media type is ISO, specify the disk size in GB.
• vm-archive – Specifies the install media type as VM archive. The VM archive file is a tar.gz file consisting of a pre-installed OS disk image and an associated configuration file. The configuration is a standard libvirt VM template consisting of VM specific information.

Note: After specifying the install media type, specify the location of the image. The image can be located in any of the following supported locations: FLASH, USB, or a remote location, such as http, ftp, sftp, tftp.

install-media [<FILE>|<URL>|<USB>] {autostart|memory|on|vcpus|vif-count|vnc}

Specifies the install media location
• <FILE> – Specifies the install-media file is located on flash, for example flash:/cache
• <URL> – Specifies the install-media file is located on a remote URL. Provide the URL using one of the following formats:
tftp://<hostname|IP>[:port]/path/file
ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
http://<hostname|IP>[:port]/path/file
• <USB> – Specifies the install-media file is located on a USB. Provide the USB path and file name using the following format:
usb<n>:/path/file

After specifying the image location, you may provide the following information:
• autostart – Optional. Specifies whether to autostart the VM on system reboot
• ignore – Enables autostart on each system boot/reboot
• start – Disables autostart (default setting)
• memory – Optional. Defines the VM memory size
  • <512-8192> – Specify the VM memory from 512 - 8192 MB. The default is 2048 MB.
• on – Optional. Executes the command on a specified device
  • <DEVICE-NAME> – Specify the service platform name.
• vcpus – Optional. Specifies the number of VCPUS for this VM
  • <1-4> – Specify the number of VCPUS from 1- 4. The default setting is 4.
• vif-count – Optional. Configures or resets the VIF number for this VM
  • <0-2> – Specify the VIF number from 0 - 2. the default setting is 1. If assigning a virtual network interface for the VM, optionally specify the following parameters:
    • vif-mac – Sets the MAC index for the virtual interfaces 1 & 2.
    • vif-to-vmif – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8. VMIFs are layer 2 interfaces on the WiNG bridge. Each custom VM can have up to a maximum of 2 virtual Ethernet interfaces. By default, these interfaces are internally connected to the Dataplane bridge through VMIF1, which is an untagged port with access VLAN 1.
  • vnc – Enables VNC on the virtual interfaces 1 & 2
• vnc – Optional. Disables/enables VNC port. When enabled, provides remote access to VGA through the noVNC client.
  • disable – Disables VNC
  • enable – Enables VNC (default setting)
### virtual-machine install [team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process. Select one of the following options:

- **team-urc** – Installs the VM TEAM-URC image
- **team-rls** – Installs the VM TEAM-RLS image
- **team-vowlan** – Installs the VM TEAM-VoWLAN image

The following keywords are common to all of the above parameters:

- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

### virtual-machine restart [<VM-NAME>|hard|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

Restarts the VM

- **<VM-NAME>** – Restarts the VM identified by the <VM-NAME> keyword
- **team-urc** – Restarts the VM TEAM-URC
- **team-rls** – Restarts the VM TEAM-RLS
- **team-vowlan** – Restarts the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

The option 'hard' forces the specified VM to restart.

Configures the VM settings

- **autostart** – Specifies whether to autostart the VM on system reboot
- **ignore** – Enables autostart on each system reboot
- **start** – Disables autostart
- **memory** – Defines the VM memory size
  - **<512-8192>** – Specify the VM memory from 512 - 8192 MB. The default is 1024 MB.
  - **vcpus** – Specifies the number of VCPUS for this VM
    - **<1-4>** – Specify the number of VCPUS from 1 - 4.
  - **vif-count** – Configures or resets the VM’s VIFs
    - **<0-2>** – Specify the Virtual Interface (VIF) number from 0 - 2.
  - **vif-mac** – Configures the MAC address of the selected virtual network interface
    - **<MAC-INDEX>** – Specify the MAC index for the selected VIF from 1 - 8.
    - **<MAC>** – Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format.

Contd..
Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the ‘set’ keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the dataplane (referred to as VMIF). These VMIFs are standard l2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM’s interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the `vif-to-vmif` command to map a VIF to a VMIF on the DP bridge.

- `vif-to-vmif` – Maps the virtual interface (1 or 2) to the selected VMIF interface.
  Specify the VMIF interface index from 1 - 8.
- `<VIF-INDEX>` – Selects the VIF index from 1 - 2.
- `<VMIF-INDEX>` – Specify the VMIF index from 1 - 8.

WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two VM interfaces. Each VM interface can be mapped to one of the eight VMIF ports for NX4500 and NX6500 service platforms and twelve ports for NX9500 on the dataplane bridge. This mapping determines the destination for service platform routing.

By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1, by default, is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.

- `vnc` – Disables/enables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client.
- `disable` – Disables VNC port
- `enable` – Enables VNC port

After configuring the VM settings, identify the VM to apply the settings.

- `<VM-NAME>` – Applies these settings to the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Applies these settings to the VM TEAM-URC
- `team-rls` – Applies these settings to the VM TEAM-RLS
- `team-vowlan` – Applies these settings to the VM TEAM-VoWLAN
  - on `<DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

### virtual-machine start

| `<VM-NAME>` | `<DEVICE-NAME>` |
| `team-urc` | `team-rls` | `team-vowlan` |

Starts the VM, based on the parameters passed. Select one of the following options:

- `<VM-NAME>` – Starts the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Starts the VM TEAM-URC
- `team-rls` – Starts the VM TEAM-RLS
- `team-vowlan` – Starts the VM TEAM-VoWLAN

Contd..
virtual-machine stop [\(<VM-NAME>\)|hard|team-urc|team-rls|team-vowlan] \(\{on <DEVICE-NAME>\}\)

Stops the VM, based on the parameters passed. Select one of the following options:
- \(<VM-NAME>\) – Stops the VM identified by the \(<VM-NAME>\) keyword. Specify the VM name.
- team-urc – Stops the VM TEAM-URC
- team-rls – Stops the VM TEAM-RLS
- team-vowlan – Stops the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:
- \(\{on <DEVICE-NAME>\}\) – Optional. Executes the command on a specified device or devices
- \(<DEVICE-NAME>\) – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

The option 'hard' forces the selected VM to shutdown.

virtual-machine uninstall [\(<VM-NAME>\)|team-urc|team-rls|team-vowlan] \(\{on <DEVICE-NAME>\}\)

Uninstalls the specified VM
- \(<VM-NAME>\) – Uninstalls the VM identified by the \(<VM-NAME>\) keyword. Specify the VM name.
- team-urc – Uninstalls the VM TEAM-URC
- team-rls – Uninstalls the VM TEAM-RLS
- team-vowlan – Uninstalls the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:
- \(\{on <DEVICE-NAME>\}\) – Optional. Executes the command on a specified device or devices
- \(<DEVICE-NAME>\) – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Note: This command releases the VM's resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.

Syntax NX9500 and NX9510

\(\uparrow virtual-machine\)

virtual-machine console adsp
virtual-machine install [adsp] \(\{on <DEVICE-NAME>\}\)
virtual-machine restart [adsp] \(\{on <DEVICE-NAME>\}\)
virtual-machine set disk-size <100-500> adsp \(\{on <DEVICE-NAME>\}\)
virtual-machine set memory <512-8192> adsp \(\{on <DEVICE-NAME>\}\)
virtual-machine set wing-memory <12288-32739>
virtual-machine [start|stop] adsp \(\{on <DEVICE-NAME>\}\)
virtual-machine uninstall adsp \(\{on <DEVICE-NAME>\}\)

Note: On an NX95XX, you can use the install, start, stop, restart, and set commands to manage a third-party VM running on a NX45XX and NX65XX. You can also configure a third-party VM's settings through a NX95XX series service platform.
### Parameters NX9500 and NX9510

- **virtual-machine console adsp**

  Connects to the *Air-Defense Services Platform (ADSP)* VM's management console. When ADSP is running on the NX9500 and NX9510 model service platforms, WiNG communicates with ADSP using a *single sign-on (SSO)* authentication mechanism. Once the user is logged in, WiNG gains access to ADSP without being prompted to login again at ADSP. However, the WiNG and ADSP databases are not synchronized. ADSP has its own user database, stored locally within its VM, which is accessed whenever a user logs directly into ADSP.

  WiNG and ADSP must be consistent in the manner events are reported up through a network hierarchy to ensure optimal interoperability and event reporting. To provide such consistency, WiNG has added support for an ADSP-like hierarchal tree. The tree resides within WiNG, and ADSP reads it from WiNG and displays the network hierarchy in its own ADSP interface. The hierarchal tree can also be used to launch ADSP modules (like Spectrum Analyzer) directly from WiNG. For more information on configuring WiNG tree-node structure, see [tree-node](#).

- **virtual-machine install adsp {on <DEVICE-NAME>}**

  Installs the ADSP VM
  - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

  Before installing the ADSP VM, execute the upgrade command, giving the path and file name of the ADSP firmware image. This extracts the image on to the device (NX9500 or NX9510) on which the command has been executed. On successful completion of this process, execute the reload command to reboot the device. Once the device has been successfully rebooted, execute the `virtual-machine > install > adsp` command.

  For example:
  ```
  #upgrade tftp://20.1.1.60/adsp-9.1.1May 29 15:12:41 2015:
  %DAEMON-6-INFO: lighttpd[2405]: 127.0.0.1 127.0.0.1:443 -
  "POST /mapi.fcgi HTTP/1.1" 200 192 "-" "-
  03-5.8.4.0-008D.img
  May 29 15:12:51 2016: nx9500-6C874D : %DIAG-6-
  NEW_LED_STATE: LED state message FIRMWARE_UPGRADE_STARTED
  from module led_msg
  Running from partition /dev/sda8
  Validating image file header
  Extracting files (this may take some time).....May 29
  15:12:53 2014: %DAEMON-6-INFO: lighttpd[2405]: 127.0.0.1
  127.0.0.1:443 - "POST /mapi.fcgi HTTP/1.1" 200 923 "-" "-
  "...........
  ```

- **virtual-machine restart adsp {on <DEVICE-NAME>}**

  Restarts the ADSP VM
  - adsp – Sets the VM as ADSP
  - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.
### virtual-machine set disk-size <100-500> adsp {on <DEVICE-NAME>}

Sets the ADSP VM's disk size (in GB):
- `<100-500>` – Specify a value from 100 - 500 GB.
- `adsp` – Sets the VM as ADSP
- `on <DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Stop the ADSP VM before executing this command.

### virtual-machine set memory <512-8192> adsp {on <DEVICE-NAME>}

Modifies the ADSP VM's memory:
- `<512-8192>` – Specify a value from 512 - 8192 MB.
- `adsp` – Sets the VM as ADSP
- `on <DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

### virtual-machine set wing-memory <12288-32739>

Specifies the WiNG memory size in MB
This command is applicable only to the NX9500 and NX9510 service platforms. Use the `show > virtual-machine-configuration` command to view the configured memory allocation. Use the `show > virtual-machine-statistics` to view the current allocated memory allocation.
- `<12288-32739>` – Specify a value from 12288 - 32739 MB. The default is 18432 MB.

The new memory setting takes effect only after the next boot.

### virtual-machine [start|stop] adsp {on <DEVICE-NAME>}

Starts/stops the ADSP VM:
- `adsp` – Sets the VM as ADSP
  - `start` – Starts the ADSP VM. Use this command to boot a shut down VM (in a stop state).
  - `stop` – Stops a running ADSP VM. Use this command to shut down a running VM.
- `on <DEVICE-NAME>` – Optional. Executes the start/stop command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

### virtual-machine uninstall adsp {on <DEVICE-NAME>}

Uninstalls the ADSP VM:
- `adsp` – Sets the VM as ADSP
- `on <DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.
Examples

The following examples show the VM installation process:

**Installation media: USB**

```
<DEVICE>>virtual-machine install <VM-NAME> type iso disk-size 8 install-media usb1://vms/win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable
```

**Installation media: pre-installed disk image**

```
<DEVICE>>virtual-machine install <VM-NAME> type disk install-media flash:/vms/win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on <DEVICE-NAME>
```

In the preceding example, the command is executed on the device identified by the `<DEVICE-NAME>` keyword. In such a scenario, the disk-size is ignored if specified. The VM has the install media as first boot device.

**Installation media: VM archive**

```
<DEVICE>>virtual-machine install type vm-archive install-media flash:/vms/<VM-NAME> vcpus 3
```

In the preceding example, the default configuration attached with the VM archive overrides any parameters specified.

**Exporting an installed VM:**

```
<DEVICE>>virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>
```

In the preceding example, the command copies the VM archive on to the URL (VM should be in stop state).

```
nx4500-5CFA2B>virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.
nx4500-5CFA2B>
```

---

**NOTE:** Use the `show > virtual-machine > [configuration|debugging|export|statistics]` command to view installed VM details.

CHAPTER 3
PRIVILEGED EXEC MODE COMMANDS

Most PRIV EXEC commands set operating parameters. Privileged-level access should be password protected to prevent unauthorized use. The PRIV EXEC command set includes commands contained within the USER EXEC mode. The PRIV EXEC mode also provides access to configuration modes, and includes advanced testing commands.

The PRIV EXEC mode prompt consists of the hostname of the device followed by a pound sign (#).

To access the PRIV EXEC mode, enter the following at the prompt:

<DEVICE>>enable
<DEVICE>#

The PRIV EXEC mode is often referred to as the enable mode, because the enable command is used to enter the mode.

There is no provision to configure a password to get direct access to PRIV EXEC (enable) mode.

<DEVICE>#!
Privileged command commands:
archive                     Manage archive files
boot                        Boot commands
captive-portal-page-upload Captive portal internal and advanced page upload
cd                          Change current directory
change-passwd               Change password
clear                       Clear
clock                       Configure software system clock
cluster                     Cluster commands
commit                      Commit all changes made in this session
configure                   Enter configuration mode
connect                     Open a console connection to a remote device
copy                        Copy contents of one dir to another
cpe                         T5 CPE configuration
create-cluster              Create a cluster
crypto                      Encryption related commands
crypto-cmp-cert-update      Update the cmp certs
database                    Database
database-backup             Backup database
database-restore            Restore database
debug                       Debugging functions
delete                      Deletes specified file from the system
device-upgrade              Device firmware upgrade
diff                        Display differences between two files
dir                          List files on a filesystem
disable                     Turn off privileged mode command
dir                         Edit a text file
enable                      Turn on privileged mode command
erase                       Erase a filesystem
ex3500                      EX3500 commands
factory-reset               Delete startup configuration on device(s),
                            reload the device(s) and remove configuration
                            entry from the controller
file-sync                   File sync between controller and adoptees
format                      Format file system
halt                        Halt the system
help                        Description of the interactive help system
join-cluster                Join the cluster
l2tpv3                      L2tpv3 protocol
logging                     Modify message logging facilities
mint                        MiNT protocol
mkdir                       Create a directory
more                        Display the contents of a file
no                          Negate a command or set its defaults
on                          On RF-Domain
opendns                     Opendns username/password configuration
page                        Toggle paging
ping                        Send ICMP echo messages
ping6                       Send ICMPv6 echo messages
pwd                         Display current directory
raid                        RAID operations
re-elect                    Perform re-election
reload                      Halt and perform a warm reboot
remote-debug                Troubleshoot remote system(s)
rename                      Rename a file
revert                      Revert changes
rmdir                       Delete a directory
self                        Config context of the device currently logged
                            into
service                     Service Commands
show                        Show running system information
smart-cache                 Content Cache Operation
ssh                         Open an ssh connection
t5                          T5 commands
telnet                      Open a telnet connection
terminal                    Set terminal line parameters
time-it                     Check how long a particular command took between
                            request and completion of response
traceroute                  Trace route to destination
traceroute6                 Trace route to destination(IPv6)
upgrade                     Upgrade software image
upgrade-abort               Abort an ongoing upgrade
virtual-machine             Virtual Machine
watch                       Repeat the specific CLI command at a periodic
                            interval
write                       Write running configuration to memory or
                            terminal
clrscr                      Clears the display screen
exit                        Exit from the CLI

<DEVICE>#

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across
this chapter, cannot include an underscore (_) character.
## 3.1 Privileged Exec Mode Commands

The following table summarizes the PRIV EXEC Mode commands:

<tr>
<td>enable</td>
<td>Turns on (enables) the privileged mode commands set</td>
<td>page 3-62</td>
</tr>
<tr>
<td>erase</td>
<td>Erases a file system</td>
<td>page 3-63</td>
</tr>
<tr>
<td>ex3500</td>
<td>Enables EX3500 switch firmware management. Use this command to perform the following operations: boot, copy, delete, and IP related configurations.</td>
<td>page 3-65</td>
</tr>
<tr>
<td>factory-reset</td>
<td>Erases startup configuration on a specified device or all devices within a specified RF Domain</td>
<td>page 3-72</td>
</tr>
<tr>
<td>file-sync</td>
<td>Configures parameters enabling syncing of PKCS#12 certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points</td>
<td>page 3-76</td>
</tr>
<tr>
<td>format</td>
<td>Formats a device’s compact flash file system</td>
<td>page 3-78</td>
</tr>
<tr>
<td>halt</td>
<td>Halts a device (access point, wireless controller, or service platform)</td>
<td>page 3-79</td>
</tr>
<tr>
<td>join-cluster</td>
<td>Adds a device (access point, wireless controller, or service platform), as cluster member, to an existing cluster of devices</td>
<td>page 3-80</td>
</tr>
<tr>
<td>l2tpv3</td>
<td>Establishes or brings down Layer 2 Tunneling Protocol Version 3 (L2TPV3) tunnels</td>
<td>page 3-82</td>
</tr>
<tr>
<td>logging</td>
<td>Modifies message logging parameters</td>
<td>page 3-84</td>
</tr>
<tr>
<td>mint</td>
<td>Configures MiNT protocols</td>
<td>page 3-86</td>
</tr>
<tr>
<td>mkdir</td>
<td>Creates a new directory in the file system</td>
<td>page 3-88</td>
</tr>
<tr>
<td>more</td>
<td>Displays the contents of a file</td>
<td>page 3-89</td>
</tr>
<tr>
<td>no</td>
<td>Reverts a command or sets values to their default</td>
<td>page 3-90</td>
</tr>
<tr>
<td>on</td>
<td>Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, show</td>
<td>page 3-92</td>
</tr>
<tr>
<td>opendns</td>
<td>Connects to the OpenDNS site using OpenDNS registered credentials (username, password) to obtain the device-id. This command is a part of the process integrating access points and controllers with the OpenDNS service.</td>
<td>page 3-93</td>
</tr>
<tr>
<td>page</td>
<td>Toggles a device’s (access point, wireless controller, or service platform) paging function</td>
<td>page 3-95</td>
</tr>
<tr>
<td>ping</td>
<td>Sends ICMP echo messages to a user-specified location</td>
<td>page 3-96</td>
</tr>
<tr>
<td>ping6</td>
<td>Sends ICMPv6 echo messages to a user-specified location</td>
<td>page 3-98</td>
</tr>
<tr>
<td>pwd</td>
<td>Displays the current directory</td>
<td>page 3-99</td>
</tr>
<tr>
<td>re-elect</td>
<td>Re-elects the tunnel controller (wireless controller, service platform, or access point)</td>
<td>page 3-100</td>
</tr>
<tr>
<td>reload</td>
<td>Halts a device (wireless controller, service platform, or access point) and performs a warm reboot</td>
<td>page 3-101</td>
</tr>
</tbody>
</table>
### Table 3.1 Privileged Exec Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>rename</td>
<td>Renames a file in the existing file system</td>

<tr>
<td>terminal</td>
<td>Sets the length and width of the terminal window</td>
<td>page 3-113</td>
</tr>
<tr>
<td>time-it</td>
<td>Verifies the time taken by a particular command between request and response</td>
<td>page 3-114</td>
</tr>
<tr>
<td>traceroute</td>
<td>Traces the route to a defined destination</td>
<td>page 3-115</td>
</tr>
<tr>
<td>traceroute6</td>
<td>Sends ICMPv6 echo messages to a user-specified location</td>
<td>page 3-116</td>
</tr>
<tr>
<td>upgrade</td>
<td>Upgrades the software image</td>
<td>page 3-117</td>
</tr>
<tr>
<td>upgrade-abort</td>
<td>Aborts an ongoing software image upgrade</td>
<td>page 3-121</td>
</tr>
<tr>
<td>watch</td>
<td>Repeats a specified CLI command at a periodic interval</td>
<td>page 3-122</td>
</tr>
<tr>
<td>smart-cache</td>
<td>Pre-fetches content cache from the specified list of URLs. This command is specific to the NX45XX and NX65XX series service platforms.</td>
<td>page 3-124</td>
</tr>
<tr>
<td>virtual-machine</td>
<td>Installs, configures, and monitors the status of virtual machines (VMs). This command is specific to the NX45XX, NX65XX, NX9500, NX9510, and NX9600 series service platforms.</td>
<td>page 3-125</td>
</tr>
<tr>
<td>raid</td>
<td>Enables RAID management. This command is specific to the NX9500 series service platforms.</td>
<td>page 3-135</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.

**NOTE:** The input parameter `<HOSTNAME>`, if used in syntaxes across this chapter, cannot include an underscore (_) character.
### 3.1.1 archive

**Privileged Exec Mode Commands**

Manages file archive operations

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
archive tar /table [<FILE>|<URL>]
archive tar /create [<FILE>|<URL>] <FILE>
archive tar /xtract [<FILE>|<URL>] <DIR>
```

**Parameters**

1. `archive tar /table [<FILE>|<URL>]`
   - **tar** Manipulates (creates, lists, or extracts) a tar file
   - `/table` Lists the files in a tar file
   - `<FILE>` Defines a tar filename
   - `<URL>` Sets the tar file URL

2. `archive tar /create [<FILE>|<URL>] <FILE>`
   - **tar** Manipulates (creates, lists or extracts) a tar file
   - `/create` Creates a tar file
   - `<FILE>` Defines tar filename
   - `<URL>` Sets the tar file URL

3. `archive tar /xtract [<FILE>|<URL>] <DIR>`
   - **tar** Manipulates (creates, lists or extracts) a tar file
   - `/xtract` Extracts content from a tar file
   - `<FILE>` Defines tar filename
   - `<URL>` Sets the tar file URL
   - `<DIR>` Specify a directory name. When used with /create, dir is the source directory for the tar file. When used with /xtract, dir is the destination file where contents of the tar file are extracted.
Examples

Following examples show how to zip the folder flash:/log/?

nx9500-6C8809# dir flash:/

nx9500-6C8809#
3.1.2 boot

Privileged Exec Mode Commands

Specifies the image used after reboot

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

boot system [primary|secondary] {on <DEVICE-NAME>}

Parameters

- boot system [primary|secondary] {on <DEVICE-NAME>}

system [primary|secondary] Specifies the image used after a device reboot
  - primary – Uses the primary image after reboot
  - secondary – Uses the secondary image after reboot

on <DEVICE-NAME> Optional. Specifies the primary or secondary image location on a specified device
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

nx9500-6C8809# show boot

```
+--------------+-----------+----------------+---------+
|              | IMAGE     | BUILD DATE      | INSTALL DATE | VERSION |

3.1.3 captive-portal-page-upload

Privileged Exec Mode Commands

Uploads captive portal advanced pages to connected access points. Use this command to provide connected access points with specific captive portal configurations so they can successfully provision login, welcome, and condition pages to requesting clients attempting to access the wireless network using the captive portal.

NOTE: Ensure that the captive portal pages to be uploaded are *.tar files.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

captive-portal-page-upload [<CAPTIVE-PORTAL-NAME>|cancel-upload|delete-file|load-file]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all|rf-domain]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all]
{upload-time <TIME>}
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME]|all]
{from-controller} {(upload-time <TIME>)}
captive-portal-page-upload cancel-upload [<MAC/HOSTNAME]|all|on rf-domain
[<DOMAIN-NAME]|all]]
captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>

Parameters
- captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all]
{upload-time <TIME>}

<table>
<thead>
<tr>
<th>captive-portal-page-upload &lt;CAPTIVE-PORTAL-NAME&gt;</th>
<th>Uploads advanced pages specified by the <code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;CAPTIVE-PORTAL-NAME&gt;</code></td>
<td>Specify captive portal name (should be existing and configured).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>&lt;MAC/HOSTNAME&gt;</code></th>
<th>Uploads to a specified AP</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;MAC/HOSTNAME&gt;</code></td>
<td>Specify the AP’s MAC address or hostname.</td>
</tr>
</tbody>
</table>

| all | Uploads to all APs |

<table>
<thead>
<tr>
<th>upload-time <code>&lt;TIME&gt;</code></th>
<th>Optional. Schedules an upload time</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;TIME&gt;</code></td>
<td>Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format.</td>
</tr>
</tbody>
</table>

Note: The scheduled upload time is your local system’s time. It is not the access point, controller, service platform, or virtual controller time and it is not synched with the device.

Note: To view a list of uploaded captive portal files, execute the `show > captive-portal-page-upload > list-files <CAPTIVE-PORTAL-NAME>` command.
### captive-portal-page-upload `<CAPTIVE-PORTAL-NAME>` rf-domain [ `<DOMAIN-NAME>` | all ]

Uploads advanced pages specified by the `<CAPTIVE-PORTAL-NAME>` parameter

- `<CAPTIVE-PORTAL-NAME>` – Specify captive portal name (should be existing and configured).

| rf-domain [ `<DOMAIN-NAME>` | all ] |
|-----------------------------|
| Uploads to all APs within a specified RF Domain or all RF Domains |

- `<DOMAIN-NAME>` – Uploads to APs within a specified RF Domain. Specify the RF Domain name.
- all – Uploads to APs across all RF Domains

<table>
<thead>
<tr>
<th>from-controller</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional. Uploads to APs from the adopted device</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>upload-time <code>&lt;TIME&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional. Schedules an AP upload</td>
</tr>
</tbody>
</table>

- `<TIME>` – Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format.

**Note:** The scheduled upload time is your local system’s time. It is not the access point, controller, service platform, or virtual controller time and it is not synched with the device.

### captive-portal-page-upload cancel-upload [ `<MAC/HOSTNAME>` | all | on rf-domain [ `<DOMAIN-NAME>` | all ] ]

Cancels a scheduled AP upload

| cancel-upload [ `<MAC/HOSTNAME>` | all | on rf-domain [ `<DOMAIN-NAME>` | all ] ] |
|---------------------------------------|
| Select one of the following options: |

- `<MAC/HOSTNAME>` – Cancels a scheduled upload to a specified AP. Specify the AP MAC address or hostname.
- all – Cancels all scheduled AP uploads
- on rf-domain – Cancels all scheduled uploads within a specified RF Domain or all RF Domains
  - `<DOMAIN-NAME>` – Cancels scheduled uploads within a specified RF Domain. Specify RF Domain name.
  - all – Cancels scheduled uploads across all RF Domains

### captive-portal-page-upload delete-file `<CAPTIVE-PORTAL-NAME>` `<FILE-NAME>`

Deletes a specified captive portal's uploaded captive-portal internal page files

<table>
<thead>
<tr>
<th>delete-file <code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> <code>&lt;FILE-NAME&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Deletes a captive portal's, identified by the <code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> keyword, uploaded internal page files</td>
</tr>
</tbody>
</table>

- `<CAPTIVE-PORTAL-NAME>` – Specify the captive portal’s name.
- `<FILE-NAME>` – Specify the file name. The specified internal captive portal page is deleted.

### captive-portal-page-upload load-file `<CAPTIVE-PORTAL-NAME>` `<URL>`

Loads captive-portal advanced pages

<table>
<thead>
<tr>
<th>load-file <code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> <code>&lt;URL&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Loads captive-portal advanced pages</td>
</tr>
<tr>
<td><strong>&lt;CAPTIVE-PORTAL-NAME&gt; &lt;URL&gt;</strong></td>
</tr>
<tr>
<td>---------------------------------</td>
</tr>
<tr>
<td>• <strong>&lt;URL&gt;</strong> – Specifies location of the captive-portal's advanced pages. Use one of the following formats:</td>
</tr>
<tr>
<td><strong>IPv4 URLs:</strong></td>
</tr>
<tr>
<td>tftp://&lt;hostname</td>
</tr>
<tr>
<td>ftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname</td>
</tr>
<tr>
<td>sftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname</td>
</tr>
<tr>
<td>http://&lt;hostname</td>
</tr>
<tr>
<td>cf:/path/file</td>
</tr>
<tr>
<td>usb&lt;n&gt;:/path/file</td>
</tr>
<tr>
<td><strong>IPv6 URLs:</strong></td>
</tr>
<tr>
<td>tftp://&lt;hostname</td>
</tr>
<tr>
<td>ftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname</td>
</tr>
<tr>
<td>sftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname</td>
</tr>
<tr>
<td><strong>Note:</strong> The captive portal pages are downloaded to the controller from the location specified here. After downloading use the <code>captive-portal-page-upload &lt;CAPTIVE-PORTAL-NAME&gt; &lt;DEVICE-OR-DOMAIN-NAME&gt;</code> command to upload these pages to APs.</td>
</tr>
</tbody>
</table>

**Examples**

```bash
ap6562-B1A214# captive-portal-page-upload load-file captive_portal_test tftp://89.89.89.17/pages_new_only.tar
```

```bash
ap6562-B1A214# show captive-portal-page-upload load-image-status
Download of captive_portal_test advanced page file is complete
```

```bash
ap6562-B1A214# captive-portal-page-upload captive_portal_test all
```

<table>
<thead>
<tr>
<th>CONTROLLER</th>

```

```bash
nx7500-7F2C13#```
Privileged Exec Mode Commands

Changes the current directory

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
cd {<DIR>}
```

Parameters

- `cd {<DIR>}`
  
  `<DIR>` Optional. Changes the current directory to the directory identified by the `<DIR>` keyword. If a directory name is not provided, the system displays the current directory.

Examples

```
rfs7000-37FABE# cd flash:/log/
rfs7000-37FABE# pwd
flash:/log/
rfs7000-37FABE# pwd
```
3.1.5 change-passwd

Privileged Exec Mode Commands

Changes the password of a logged user. When this command is executed without any parameters, the password can be changed interactively.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

change-passwd \{<OLD-PASSWORD>\} <NEW-PASSWORD>

Parameters

- change-passwd \{<OLD-PASSWORD>\} <NEW-PASSWORD>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;OLD-PASSWORD&gt;</td>
<td>Optional. Specify the password to be changed.</td>
</tr>
<tr>
<td>&lt;NEW-PASSWORD&gt;</td>
<td>Specify the new password.</td>
</tr>
</tbody>
</table>

Note: The password can also be changed interactively. To do so, press [Enter] after the command.

Usage Guidelines

A password must be from 1 - 64 characters.

Examples

rfs7000-37FABE#change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory\{write memory\} to be persistent.
rfs7000-37FABE#write memory
OK
rfs7000-37FABE#
### 3.1.6 clear

**Privileged Exec Mode Commands**

Clears parameters, cache entries, table entries, and other entries. The clear command is available for specific commands only. The information cleared using this command varies depending on the mode where the clear command is executed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

---

**NOTE:** When using the `clear` command, refer to the interface details provided in Chapter 7, `interface`.

---

**Syntax**

```
clear [arp-cache|bonjour|cdp|counters|crypto|event-history|firewall|gre|ip|ipv6|
    l2tpv3-stats|license|lldp|logging|mac-address-table|mint|role|rtls|smart-cache|
    spanning-tree|traffic-shape|vrrp]

clear spanning-tree detected-protocols {interface [<INTERFACE-NAME>|ge <1-x>|me1|port-channel <1-x>|pppoe1|vlan <1-4094>|wwan1|vmif <1-X>|xge <1-4>} {on <DEVICE-NAME>}

clear traffic-shape statistics {class <1-4>} {(on <DEVICE-NAME>)}

clear vrrp [error-stats|stats] {on <DEVICE-NAME>}

The following clear command is specific to the NX45XX, NX65XX, and NX9XXX series service platforms:
clear smart-cache storage [all|url-regex <WORD>] {on <DEVICE-NAME>}

clear logging analytics {on <DEVICE-NAME>}

Parameters

• clear arp-cache {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>arp-cache</th>
<th>Clears Address Resolution Protocol (ARP) cache entries on a device. This protocol matches layer 3 IP addresses to layer 2 MAC addresses.</th>
</tr>
</thead>
</table>
| on <DEVICE-NAME>  | Optional. Clears ARP cache entries on a specified device  
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

• clear bonjour cache {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>bonjour cache</th>
<th>Clears all Bonjour cached statistics. Once cleared, the system has to re-discover available Bonjour services.</th>
</tr>
</thead>
</table>
| on <DEVICE-NAME>  | Optional. Clears all Bonjour cached statistics on a specified device  
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

• clear [cdp|lldp] neighbors {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>cdp</th>
<th>Clears Cisco Discovery Protocol (CDP) table entries</th>
</tr>
</thead>
<tbody>
<tr>
<td>ldp</td>
<td>Clears Link Layer Discovery Protocol (LLDP) neighbor table entries</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>• <code>ge &lt;1-X&gt;</code> – Clears GigabitEthernet interface counters. Specify the GigabitEthernet interface index from 1 - X.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The number of Ethernet interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 24 GE interfaces. Where as, RFS4000 supports 5 GE interfaces.</td>
</tr>
<tr>
<td></td>
<td>• me1 – Clears FastEthernet interface counters</td>
</tr>
<tr>
<td></td>
<td>• port-channel <code>&lt;1-X&gt;</code> – Clears port-channel interface counters. Specify the port channel interface index from 1 - X.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The number of port-channel interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 13 port-channels. Where as, RFS4000 supports 3 port-channels.</td>
</tr>
</tbody>
</table>

Contd..
**clear counters radio**

- **<MAC/HOSTNAME> <1-X>**
  - Clears counters of a radio identified by the `<MAC/HOSTNAME>` keyword.
  - Optional. Specify the hostname or MAC address. Optionally, append the interface number to form radio ID in the form of AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX.
  - `<1-X>` – Optional. Specify the radio index (if not specified as part of the radio ID). The maximum number of radio antennas supported varies with the access point type.

**Note:** If no MAC address or radio index is specified, the system clears all radio counters.

- **on <DEVICE-OR-DOMAIN-NAME>**
  - The following keyword is recursive and is applicable to the `<MAC>` parameter:
  - Optional. Clears AP/wireless-client counters on a specified device or RF Domain.

**Note:** If no MAC address is specified, the system clears all AP or wireless client counters on the specified AP, wireless controller, service platform, or RF Domain.

**clear crypto ike sa**

- **<IP>|all**
  - Clears `Internet Key Exchange` (IKE) security associations (SAs)
  - `<IP>` – Clears IKE SAs for a certain peer
  - all – Clears IKE SAs for all peers

**Note:**<br>
Optional. Clears IKE SA entries, for a specified peer or all peers, on a specified device
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

**clear crypto ipsec sa**

- **<DEVICE-NAME>**
  - Clears `Internet Protocol Security` (IPSec) database SAs
  - Optional. Clears IPSec SA entries on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.
### clear event-history

| clear event-history | Clears event history cache entries |

### clear firewall [dhcp snoop-table|dos stats|flows [ipv4|ipv6]|neighbors snoop-table] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>clear firewall</th>
<th>Clears firewall event entries</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp snoop-table</td>
<td>Clears DHCP snoop table entries</td>
</tr>
<tr>
<td>dos stats</td>
<td>Clears denial of service statistics</td>

<tr>
<td>flows [ipv4</td>
<td>ipv6]</td>
</tr>
<tr>
<td>neighbors snoop-table</td>
<td>Clears IPv6 neighbors snoop-table entries</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>The following keywords are common to the DHCP, DOS, and flows parameters:</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Clears DHCP snoop table entries, denial of service statistics, or the established firewall sessions on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

### clear gre stats {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>clear gre stats</th>
<th>Clears GRE tunnel statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. GRE tunnel statistics on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

### clear ip bgp [<IP>|all|external] {in prefix-filter} {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>clear ip bgp</th>
<th>Clears BGP routing table information based on the option selected</th>
</tr>
</thead>
<tbody>
<tr>
<td>[&lt;IP&gt;</td>
<td>all</td>
</tr>
<tr>
<td></td>
<td>• all – Clears Route Updates Received From All BGP Peers</td>
</tr>
<tr>
<td></td>
<td>• external – Clears route updates received from external BGP peers</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, NX9000, and NX9600 series service platforms.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> In case of a change in routing policy it is necessary to clear BGP routing table entries in order for the new policy to take effect.</td>
</tr>
<tr>
<td>in prefix-filter</td>
<td>Optional. Clears soft-reconfiguration inbound route updates</td>
</tr>
<tr>
<td></td>
<td>• prefix-filter – Optional. Clears the existing Outbound Route Filtering (ORF) prefix-list.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears soft-reconfiguration inbound route updates on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP or service platform.</td>
</tr>
</tbody>
</table>
• clear ip bgp [<IP>|all|external] {out} {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip bgp</td>
<td>Clears BGP routing table information based on the option selected</td>
</tr>
</tbody>
</table>
| [<IP>|all|external] | - <IP> – Clears the BGP peer identified by the <IP> keyword. Specify the BGP peer’s IP address.  
- all – Clears route updates received from all BGP peers  
- external – Clears route updates received from external BGP peers  
| Note: | This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 series service platforms.  
| Note: | In case of a change in routing policy it is necessary to clear BGP routing table entries in order for the new policy to take effect. |
| out | Optional. Clears soft-reconfiguration outbound route updates. Optionally specify the device on which to execute this command. |
| on <DEVICE-NAME> | The following keyword is recursive and optional. |
| | - on <DEVICE-NAME> – Optional. Clears BGP sessions on a specified device  
| | - <DEVICE-NAME> – Specify the name of the AP or service platform. |

• clear ip bgp [<IP>|all|external] {soft {in|out}} {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip bgp</td>
<td>Clears BGP routing table information based on the option selected</td>
</tr>
</tbody>
</table>
| [<IP>|all|external] | - <IP> – Clears the BGP peer identified by the <IP> keyword. Specify the BGP peer’s IP address.  
- all – Clears route updates received from all BGP peers  
- external – Clears route updates received from external BGP peers  
| Note: | This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 series service platforms.  
| Note: | In case of a change in routing policy it is necessary to clear BGP routing table entries in order for the new policy to take effect. |
| soft {in|out} | Optional. Enables soft-reconfiguration of route updates for the specified IP address. This option allows routing tables to be reconfigured without clearing BGP sessions.  
| | - in – Optional. Enables soft reconfiguration of inbound route updates  
| | - out – Optional. Enables soft reconfiguration of outbound route updates  
| Note: | Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy, etc.) take effect only after on-going BGP sessions are cleared. The clear > ip > bgp command clears BGP sessions. To reduce loss of route updates during the process, use the ‘soft’ option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage. |
| on <DEVICE-NAME> | Optional. Clears soft-reconfiguration inbound/outbound route updates on a specified device  
| | - <DEVICE-NAME> – Specify the name of the AP or service platform. |

• clear ip bgp process {on <DEVICE-NAME>}

## PRIVILEGED EXEC MODE COMMANDS 3-21

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear license borrowed {on &lt;DEVICE-NAME&gt;}</td>
<td>Releasess or revokes all licenses borrowed by a site controller. Specifies the borrowing controller's name.</td>
</tr>
<tr>
<td>clear license lent to &lt;DEVICE-NAME&gt; {on &lt;DEVICE-NAME&gt;}</td>
<td>NOC controller releases or revokes all licenses loaned to a site controller. Specifies the controller's name.</td>
</tr>
<tr>
<td>clear mac-address-table {address &lt;MAC&gt;</td>
<td>vlan &lt;1-4094&gt;} {on &lt;DEVICE-NAME&gt;}</td>
</tr>
<tr>
<td>clear mac-address-table interface [&lt;IF-NAME&gt;</td>
<td>ge &lt;1-X&gt;</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| `ge <1-X>` | Clears MAC address forwarding table for the specified GigabitEthernet interface  
  - `<1-X>` – Specify the GigabitEthernet interface index from 1 - X.  
  **Note:** The number of Ethernet interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 24 GE interfaces. Where as, RFS4000 supports 5 GE interfaces. |
| `port-channel <1-X>` | Clears MAC address forwarding table for the specified port-channel interface  
  - `<1-X>` – Specify the port-channel interface index from 1 - X.  
  **Note:** The number of port-channel interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 13 port-channels. Where as, RFS4000 supports 3 port-channels. |
| `t1e1 <1-4> <1-1>` | Clears MAC address forwarding table for the specified T1E1L interface  
  - `<1-4>` – Specify the T1E1 interface index from 1 - 4. A maximum of 4 slots are available. Select the slot to clear the MAC address forwarding table.  
  - `<1-1>` – Specify the T1E1 port ID from 1 - 1.  
  **Note:** The T1E1 interfaces are supported only on the NX45XX and NX65XX series service platforms. |
| `up <1-X>` | Clears MAC address forwarding table for the WAN Ethernet interface  
  **Note:** The number of WAN Ethernet interfaces supported varies for different devices. The RFS4000 and RFS6000 devices support 1 WAN Ethernet interface. The NX45XX supports 2 WAN Ethernet interfaces. |
| `vmif <1-X>` | Clears MAC address forwarding table for the VM interface  
  - `<1-X>` – Specify the VM interface index from 1 - X.  
  **Note:** The VMIF interfaces are supported only on the NX45XX, NX65XX, NX9500, NX9510, NX9600 series service platforms. The number of supported VMIFs varies for different device types. |
| `xge <1-4>` | Clears MAC address forwarding table for the specified TenGigabitEthernet interface  
  - `<1-4>` – Specify the GigabitEthernet interface index from 1 - 4.  
  **Note:** This interface is supported only on the NX9000 series service platforms. |
| `on <DEVICE-NAME>` | Optional. Clears the MAC address forwarding table, for the selected interface, on a specified device  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| **clear mint mlcp history** **{on <DEVICE-NAME>**} | Clears MiNT related information |
| `mint` | Clears MiNT related information |
| `mlcp history` | Clears MiNT Link Creation Protocol (MLCP) client history |
| `on <DEVICE-NAME>` | Optional. Clears MLCP client history on a specified device  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| **clear role ldap-stats** **{on <DEVICE-NAME>**} | Clears role based Lightweight Directory Access Protocol (LDAP) server statistics |
| `role ldap-stats` | Clears role based LDAP server statistics on a specified device  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
### clear rtls [aeroscout|ekahau] {<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>}}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rtls</td>
<td>Clears Real Time Location Service (RTLS) statistics</td>
</tr>
<tr>
<td>aeroscout</td>
<td>Clears RTLS Aeroscout statistics</td>
</tr>
<tr>
<td>ekahau</td>
<td>Clears RTLS Ekahau statistics</td>
</tr>
</tbody>
</table>

#### <MAC/DEVICE-NAME>
- Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified AP, wireless controller, or service platform. Specify the AP’s MAC address or hostname.

#### on <DEVICE-OR-DOMAIN-NAME>
- Optional. Clears Aeroscout or Ekahau RTLS statistics on a specified device or RF Domain.

### clear spanning-tree detected-protocols {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spanning-tree</td>
<td>Clears spanning tree protocols on an interface, and also restarts protocol migration</td>
</tr>
<tr>
<td>detected-protocols</td>
<td>Restarts protocol migration</td>
</tr>
</tbody>
</table>

#### on <DEVICE-NAME>
- Optional. Clears spanning tree protocols on a specified device.

### clear spanning-tree detected-protocols {interface [<INTERFACE-NAME>|ge <1-X>|me1|port-channel <1-X>|pppoe1|vlan <1-4094>|wwan1|vmif <1-X>|xge <1-4>]} {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spanning-tree</td>
<td>Clears spanning tree protocols on an interface and restarts protocol migration</td>
</tr>
<tr>
<td>detected-protocols</td>
<td>Restarts protocol migration</td>
</tr>
</tbody>
</table>

#### interface [<INTERFACE-NAME>|ge <1-X>|me1|port-channel <1-X>|pppoe1|vlan <1-4094>|wwan1|vmif <1-X>|xge <1-4>]
- Optional. Clears spanning tree entries on different interfaces.
  - <INTERFACE-NAME> – Clears detected spanning tree entries on a specified interface. Specify the interface name.
  - ge <1-X> – Clears detected spanning tree entries for the selected GigabitEthernet interface. Select the GigabitEthernet interface index from 1 - X.

**Note:** The number of Ethernet interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 24 GE interfaces. Where as, RFS4000 supports 5 GE interfaces.
- me1 – Clears FastEthernet interface spanning tree entries
- port-channel <1-X> – Clears detected spanning tree entries for the selected port channel interface. Select the port channel index from 1 - X.

**Note:** The number of port-channel interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 13 port-channels. Where as, RFS4000 supports 3 port-channels.
- pppoe1 – Clears detected spanning tree entries for PPPoE interface.
- vlan <1-4094> – Clears detected spanning tree entries for the selected VLAN interface. Select a SVI VLAN ID from 1 - 4094.

Contd..
### clear traffic-shape statistics

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>traffic-shape statistics</td>
<td>Clears traffic shaping statistics on a selected device.</td>
</tr>
<tr>
<td>class &lt;1-4&gt;</td>
<td>Optional. Clears traffic shaping statistics for a specific traffic class.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Specifies the name of the access point, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

#### Note:
If the traffic class is not specified, the system clears all traffic shaping statistics.

### clear vrrp [error-stats|stats] on <DEVICE-NAME>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>Clears Virtual Router Redundancy Protocol (VRRP) statistics for a device.</td>
</tr>
<tr>
<td>error-stats</td>
<td>Clears VRRP global error statistics on a selected device.</td>
</tr>
<tr>
<td>stats</td>
<td>Clears VRRP related statistics on a selected device.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Specifies the name of the access point, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

#### Note:
For more information on configuring traffic-shape, see [traffic-shape](#).

### clear smart-cache storage [all|url-regex <WORD>] on <DEVICE-NAME>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>smart-cache</td>
<td>Clears the smart-cache storage.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Specifies the name of the access point, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

#### Note:
Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files, etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see [smart-cache-policy](#).
storage [all|regex <WORD>]  Clears stored content based on the parameters passed  
  • all – Clears all cached content  
  • regex <WORD> – Clears only those URLs matching the specified expression  
  • <WORD> – Provide the URL in the following format: e.g. \(.xxx\)/\.+\.(flv|mp4)

on <DEVICE-NAME>  Optional. Clears stored content on a specified device  
  • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

nx4500-5CFA2B#
### 3.1.7 clock

**Privileged Exec Mode Commands**

Sets a device’s system clock. By default all WiNG devices are shipped with the time zone and time format set to UTC and 24-hour clock respectively. If a device’s clock is set without resetting the time zone, the time is displayed relative to the *Universal Time Coordinated* (UTC) – Greenwich Time. For example, San Jose is approximately 7 or 8 hours (depending on the time of the year) behind the UTC time. If the time at Greenwich, UK is 15:00:00 UTC, at San Jose it will display as 8:00:00 or 7:00:00 UTC. To display time in the local time zone format, in the device’s configuration mode, use the timezone command to reset the time zone. You can also reset the time zone at the RF Domain level. When configured as RF Domain setting, it applies to all devices within the domain. Configuring the local time zone prior to setting the clock is recommended. For more information on configuring RF Domain time zone, see `timezone`.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}
```

**Parameters**

- `clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;HH:MM:SS&gt;</code></td>
<td>Sets the current time (in military format hours, minutes and seconds)</td>
</tr>
<tr>
<td><strong>Note:</strong> By default the WiNG software displays time in the 24-hour clock format. This setting cannot be changed.</td>
<td></td>
</tr>
<tr>
<td><code>&lt;1-31&gt;</code></td>
<td>Sets the numerical day of the month</td>
</tr>
<tr>
<td><code>&lt;MONTH&gt;</code></td>
<td>Sets the month of the year from Jan - Dec</td>
</tr>
<tr>
<td><code>&lt;1993-2035&gt;</code></td>
<td>Sets a valid four digit year from 1993 - 2035</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Sets the clock on a specified device</td>
</tr>
<tr>
<td><strong>•</strong></td>
<td><strong>&lt;DEVICE-NAME&gt;</strong> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

The following commands set the time zone and clock for the logged device:

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#timezone America/Los_Angeles
nx9500-6C8809#clock set 10:25:10 04 Feb 2016
nx9500-6C8809#show clock
2016-02-04 10:25:48 PST
nx9500-6C8809#
```

Note, if the clock is set without resetting the time zone, the time displays as UTC time as shown in the following example:

```
nx4500-5CFA2B#show clock
2015-09-08 06:19:34 UTC
nx4500-5CFA2B#
```
3.1.8 cluster

Privileged Exec Mode Commands

Initiates the cluster context. The cluster context provides centralized management to configure all cluster members from any one member. Commands executed under this context are executed on all members of the cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
cluster start-election

Parameters
- cluster start-election

rfs7000-37FABE#

Related Commands
- create-cluster | Creates a new cluster on a specified device
- join-cluster | Adds a controller, as cluster member, to an existing cluster of devices
3.1.9 configure

Privileged Exec Mode Commands

Enters the configuration mode. Use this command to enter the current device’s configuration mode, or enable configuration from the terminal.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

configure {self|terminal}

Parameters

- configure {self|terminal}

| self       | Optional. Enables the current device’s configuration mode |
| terminal   | Optional. Enables configuration from the terminal       |

Examples

rfs7000-37FABE#configure self
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#

rfs7000-37FABE#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config)#
### 3.1.10 connect

**Privileged Exec Mode Commands**

 Begins a console connection to a remote device using the remote device’s MiNT ID or name

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]`

**Parameters**

- `connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]`

<table>
<thead>
<tr>
<th>mint-id &lt;MINT-ID&gt;</th>
<th>Connects to a remote system using the MiNT ID</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;MINT-ID&gt;</code> – Specify the remote device’s MiNT ID.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&lt;REMOTE-DEVICE-NAME&gt;</th>
<th>Connects to a remote system using its name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;REMOTE-DEVICE-NAME&gt;</code> – Specify the remote device’s name.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-6DCD4B#show mint lsp-db
6 LSPs in LSP-db of 19.6D.CD.4B:
LSP 19.58.72.58 at level 1, hostname "ap5142-587258", 5 adjacencies, seqnum 748149

3.11 copy

Privileged Exec Mode Commands

Copies a file (config, log, txt...etc) from any location to the access point, wireless controller, or service platform and vice-versa

NOTE: Copying a new config file to an existing running-config file merges it with the existing running-config file on the wireless controller. Both the existing running-config and the new config file are applied as the current running-config.

Copying a new config file to a start-up config file replaces the existing start-up config file with the parameters of the new file. It is better to erase the existing start-up config file and then copy the new config file to the startup config.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

copy [<SOURCE-FILE>|<SOURCE-URL>] [<DESTINATION-FILE>|<DESTINATION-URL>]

Parameters

- copy [<SOURCE-FILE>|<SOURCE-URL>] [<DESTINATION-FILE>|<DESTINATION-URL>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;SOURCE-FILE&gt;</td>
<td>Specify the source file to copy.</td>
</tr>
<tr>
<td>&lt;SOURCE-URL&gt;</td>
<td>Specify the source file’s location (URL).</td>
</tr>
<tr>
<td>&lt;DESTINATION-FILE&gt;</td>
<td>Specify the destination file to copy to.</td>
</tr>
<tr>
<td>&lt;DESTINATION-URL&gt;</td>
<td>Specify the destination file’s location (URL).</td>
</tr>
</tbody>
</table>

Examples

Transferring file snmpd.log to remote TFTP server.
rfs7000-37FABE#copy flash:/log/snmpd.log tftp://157.235.208.105:/snmpd.log

Accessing running-config file from remote TFTP server into switch running-config.
rfs7000-37FABE#copy tftp://157.235.208.105:/running-config running-config
### 3.1.12 cpe

**Privileged Exec Mode Commands**

Enables a WiNG controller to perform certain operations on *Customer Premises Equipment* (CPEs) through an adopted T5 controller.

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a *Digital Subscriber Line* (DSL) as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

<table>
<thead>
<tr>
<th>Command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>cpe [boot</td>
<td>reload</td>
</tr>
<tr>
<td>cpe boot system cpe [&lt;1-24&gt;</td>
<td>all] [primary</td>
</tr>
<tr>
<td>cpe [&lt;1-24&gt;</td>
<td>all] {on &lt;T5-DEVICE-NAME&gt;}</td>
</tr>
<tr>
<td>cpe {reload</td>
<td>upgrade &lt;IMAGE-LOCATION&gt;} cpe [&lt;1-24&gt;</td>
</tr>
</tbody>
</table>

**Parameters**

- **cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}**
  - **Changes the image used by a CPE to boot. When reloading, the CPE uses the specified image.**
  - **Identifies the CPE(s) on which this change is implemented**
    - `<1-24>` – Reloads only those CPEs whose IDs have been specified. Specify the ID from 1 - 24.
    - `all` – Reloads all CPEs
  - **Select the next boot image**
    - `primary` – Uses the primary image when reloading
    - `secondary` – Uses the secondary image when reloading
  - **Optional. Performs this operation on a specified T5 device**
    - `<T5-DEVICE-NAME>` – Specify the T5 device’s hostname.

- **cpe {reload|upgrade <IMAGE-LOCATION>} cpe [<1-24>|all] {on <T5-DEVICE-NAME>}**
  - **Performs the following operations on CPEs**
    - `reload` – Reloads the device
    - `upgrade <IMAGE-LOCATION>` – Upgrades the device
    - `<IMAGE-LOCATION>` – Specify the location of the firmware image. Both IPv4 and IPv6 addresses are supported.
Use one of the following options to provide the location:
IPv4 URLs: tftp://<hostname|IP>[:port]/path/file
ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
http://<hostname|IP>[:port]/path/file
cf:/path/file
usb<n>:/path/file
IPv6 URLs: tftp://<hostname|IPv6>[:port]/path/file
ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file
sftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file
http://<hostname|IPv6>[:port]/path/file
After specifying the operation to perform, identify the device(s).

cpe [<1-24>|all] Identifies the CPE(s) on which the operation is performed
• <1-24> – Configures the CPE’s ID from 1 - 24
• all – Configures all CPEs

on <T5-DEVICE-NAME> Optional. Performs this operation on a specified T5 device
• <T5-DEVICE-NAME> – Specify the T5 device’s hostname.

Examples
nx9500-6C8809#show t5 cpe boot on t5-ED7C6C

3.1.13 create-cluster

Privileged Exec Mode Commands

Creates a new device cluster, with the specified name, and assigns it an IP address and routing level.

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member's failure.

A cluster’s load is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}

Parameters

- create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}

<table>
<thead>
<tr>
<th>create-cluster</th>
<th>Creates a cluster</th>
</tr>
</thead>
<tbody>
<tr>
<td>name &lt;CLUSTER-NAME&gt;</td>
<td>Configures the cluster name</td>
</tr>
<tr>
<td>• &lt;CLUSTER-NAME&gt; – Specify a cluster name. Define a name for the cluster name unique to its configuration or profile support requirements. The name cannot exceed 64 characters.</td>
<td></td>
</tr>
<tr>
<td>ip &lt;IP&gt;</td>
<td>Specifies the device’s IP address used for cluster creation</td>
</tr>
<tr>
<td>• &lt;IP&gt; – Specify the device’s IP address in the A.B.C.D format.</td>
<td></td>
</tr>
<tr>
<td>level [1</td>
<td>2]</td>
</tr>
<tr>
<td>• 1 – Configures level 1 (local) routing</td>
<td></td>
</tr>
<tr>
<td>• 2 – Configures level 2 (inter-site) routing</td>
<td></td>
</tr>
</tbody>
</table>

3.1.14 crypto

Privileged Exec Mode Commands

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name, etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate Certificate Signing Request (CSR).

This command also enables trustpoint configuration. Trustpoints contain the CA’s identity and configuration parameters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

crypto [key|pki]
crypto key [export|generate|import|zeroize]
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|on|passphrase}
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}
crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|passphrase}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}
crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {on <DEVICE-NAME>}
crypto pki [authenticate|export|generate|import|zeroize]
crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background}

autogen-subject-name <EMAIL> <SEND-TO-EMAIL>,
fqdn <FQDN>,ip-address <IP>,on <DEVICE-NAME>}
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>
subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
<ORGANIZATION> <ORGANIZATION-UNIT> {email <SEND-TO-EMAIL>,fqdn <FQDN>,
ip-address <IP>,on <DEVICE-NAME>}

crypto pki import [certificate|crl|trustpoint] 
{background} {(on <DEVICE-NAME>)}
crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
{background} {(on <DEVICE-NAME>)}
crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}

Parameters
- crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> 
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
- crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] 
{on <DEVICE-NAME>}
- crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> 
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

<table>
<thead>
<tr>
<th>key</th>
<th>Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.</th>
</tr>
</thead>
</table>
| export rsa <RSA-KEYPAIR-NAME> | Exports an existing RSA Keypair to a specified destination
|  | • <RSA-KEYPAIR-NAME> – Specify the RSA Keypair name. |
| <EXPORT-TO-URL> | Specify the RSA Keypair destination address. Both IPv4 and IPv6 address formats are supported.
|  | After specifying the destination address (where the RSA keypair is exported), configure one of the following parameters: background or passphrase. |
| background | Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on. |
| passphrase <KEY-PASSPHRASE> background | Optional. Encrypts RSA Keypair before exporting
|  | • <KEY-PASSPHRASE> – Specify a passphrase to encrypt the RSA keypair.
|  | • background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on. |
| on <DEVICE-NAME> | The following parameter is recursive and common to all of the above parameters:
|  | • on <DEVICE-NAME> – Optional. Performs export operation on a specified device
|  | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] 
{on <DEVICE-NAME>}

<table>

• <RSA-KEYPAIR-NAME> – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name. |
| **autogen-subject-name** | Auto generates subject name from configuration parameters. The subject name identifies the certificate. |
| **<EXPORT-TO-URL>** | Specify the CA’s location. Both IPv4 and IPv6 address formats are supported.  
**Note:** The CSR is exported to the specified location. |
| **email <SEND-TO-EMAIL>** | Exports CSR to a specified e-mail address  
• <SEND-TO-EMAIL> – Specify the CA’s e-mail address. |
| **fqdn <FQDN>** | Exports CSR to a specified *Fully Qualified Domain Name* (FQDN)  
• <FQDN> – Specify the CA’s FQDN. |
| **ip-address <IP>** | Exports CSR to a specified device or system  
• <IP> – Specify the CA’s IP address. |
<p>| <strong>crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]| use-rsa-key] &lt;RSA-KEYPAIR-NAME&gt; subject-name &lt;COMMON-NAME&gt; &lt;COUNTRY&gt; &lt;STATE&gt; &lt;CITY&gt; &lt;ORGANIZATION&gt; &lt;ORGANIZATION-UNIT&gt; (&lt;EXPORT-TO-URL&gt;,email &lt;SEND-TO-EMAIL&gt;,fqdn &lt;FQDN&gt;, ip-address &lt;IP&gt;)</strong> | |
| <strong>pki</strong> | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| <strong>export request</strong> | Exports CSR to the CA for a digital identity certificate. The CSR contains applicant’s details and RSA Keypair’s public key. |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>[generate-rsa-key]</strong></td>
<td>Generates a new RSA Keypair or uses an existing RSA Keypair</td>
</tr>

</tr>
</tbody>
</table>
• crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}

pki Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

import Imports certificates, CRL, or a trustpoint to the selected device.

trustpoint <TRUSTPOINT-NAME> Imports a trustpoint and its associated CA certificate, server certificate, and private key

• <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).

<IMPORT-FROM-URL> Specify the trustpoint source address. Both IPv4 and IPv6 address formats are supported.

background Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on.

passphrase <KEY-PASSPHRASE> background Optional. Decrypts trustpoint with a passphrase after importing

• <KEY-PASSPHRASE> – Specify the passphrase. After specifying the passphrase, optionally specify the device to perform import on.

• background – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on.

on <DEVICE-NAME> The following parameter is recursive and optional:

• on <DEVICE-NAME> – Optional. Performs import operation on a specified device

• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

• crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {on <DEVICE-NAME>}

pki Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

zeroize trustpoint <TRUSTPOINT-NAME> Deletes a trustpoint and its associated CA certificate, server certificate, and private key

• <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).

del-key Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on.

on <DEVICE-NAME> The following parameter is recursive and optional:

• on <DEVICE-NAME> – Optional. Deletes the trustpoint on a specified device

• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Usage Guidelines
The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

• IPv4 URLs:
  tftp://<hostname>[::port]/path/file
  ftp://<user>:<passwd>@<hostname>[::port]/path/file
  sftp://<user>@<hostname>[::port]/path/file
  http://<hostname>[::port]/path/file
  cf://path/file
usb<n>:/path/file

- IPv6 URLs:
  - tftp://<hostname[[IPv6]][:port]/path/file
  - ftp://<user>:<passwd>@<hostname[[IPv6]][:port]/path/file
  - sftp://<user>:<passwd>@<hostname[[IPv6]][:port]>/path/file
  - http://<hostname[[IPv6]][:port]/path/file

Examples

rfs7000-37FABE#crypto key generate rsa key 1025
RSA Keypair successfully generated
rfs7000-37FABE#

rfs7000-37FABE#crypto key import rsa test123 url passphrase word background
RSA key import operation is started in background
rfs7000-37FABE#

rfs7000-37FABE#crypto pki generate self-signed word generate-rsa-key word autogen-subject-name fqdn word
Successfully generated self-signed certificate
rfs7000-37FABE#

rfs7000-37FABE#crypto pki zeroize trustpoint word del-key
Successfully removed the trustpoint and associated certificates
%Warning: Applications associated with the trustpoint will start using default-trustpoint
rfs7000-37FABE#

rfs7000-37FABE#crypto pki authenticate word url background
Import of CA certificate started in background
rfs7000-37FABE#

rfs7000-37FABE#crypto pki import trustpoint word url passphrase word
Import operation started in background
rfs7000-37FABE#

3.1.15  crypto-cmp-cert-update

Privileged Exec Mode Commands

Triggers a Certificate Management Protocol (CMP) certificate update on a specified device or devices.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

Parameters

- crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>crypto-cmp-cert-update &lt;TRUSTPOINT-NAME&gt; {on &lt;DEVICE-NAME&gt;}</th>
<th>Triggers a CMP certificate update on a specified device or devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;TRUSTPOINT-NAME&gt; – Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the crypto-cmp-policy context to configure the trustpoint.</td>
<td></td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt; – Optional. Triggers a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list.</td>
<td></td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58#crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
rfs4000-229D58#
3.1.16 database

Privileged Exec Mode Commands

Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight). Vacuuming a database refers to the process of finding and reclaiming space left over from previous DELETE statements. Supported in the following platforms:
  • Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

database [drop|repair]
database drop [all|captive-portal|nsight]
database repair {on <DEVICE-NAME>}

Parameters

- database drop [all|captive-portal|nsight]
- database repair {on <DEVICE-NAME>}

Examples

nx9500-6C8809#database repair on nx9500-6C8809
nx9500-6C8809#

Related Commands

database-backup | Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server

database-restore | Restores a previously exported database [captive-portal and/or NSight]
### 3.1.17 database-backup

*Privileged Exec Mode Commands*

Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

database-backup database [captive-portal|nsight] <URL>

**Parameters**
- database-backup database [captive-portal|nsight] <URL>

| database-backup database [captive-portal|nsight] | Backs up captive portal and/or NSight database to a specified location and file. Select the database to backup
|--------------------------------------------------|--------------------------------------------------
| • captive-portal – Backs up captive portal database
| • nsight – Backs up NSight database
| After specifying the database type, configure the destination location and file name. |

| <URL> | Configures the destination location. The database is backed up at the specified location. Specify the location URL in one of the following formats: ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz
|--------------------------------------------------|--------------------------------------------------
| sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz |

**Examples**

nx9500-6C8809#database-backup database nsight ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz

**Related Commands**

</tr>
</tbody>
</table>
3.1.18 database-restore

Privileged Exec Mode Commands

Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored from the backed-up location to the original database.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

database-restore database [captive-portal|nsight] <URL>

Parameters
- database-restore database [captive-portal|nsight] <URL>

| database-restore  | Restores previously exported (backed up) captive-portal and/or NSight database. Specify the database type:
| database          | • captive-portal – Restores captive portal database
| database          | • nsight – Restores NSight database
| <URL>             | After specifying the database type, configure the destination location and file name from where the files are restored.

<URL> Configures the destination location. The database is restored from the specified location. Specify the location URL in one of the following formats:
- ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz
- sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz

Examples

nx9500-6C8809#database-restore database nsight
ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz

Related Commands

| database         | Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight)
| database-backup  | Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server |
3.1.19 delete

Deletes a specified file from the device's file system

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
```
delete [/force <FILE>|/recursive <FILE>|<FILE>]
```

Parameters
- `/force <FILE>` Forces deletion without a prompt
- `/recursive <FILE>` Performs a recursive delete
- `<FILE>` Specifies the file name
  - Deletes the file specified by the `<FILE>` parameter

Examples
```
rfs7000-37FABE#delete flash:/out.tar flash:/out.tar.gz
Delete flash:/out.tar [y/n]? y
Delete flash:/out.tar.gz [y/n]? y

rfs7000-37FABE#delete /force flash:/tmp.txt
rfs7000-37FABE#
```
```
rfs7000-37FABE#delete /recursive flash:/backup/
Delete flash:/backup//fileMgmt_350_180B.core
[y/n]? y
Delete flash:/backup//fileMgmt_350_18212X.core_bk
[y/n]? n
Delete flash:/backup//imish_1087_18381X.core.gz
[y/n]? n
rfs7000-37FABE#
```
3.20 device-upgrade

Privileged Exec Mode Commands

Enables firmware upgrade on an adopted device or a set of adopted devices (access points, wireless controllers, and service platforms)

This command simplifies device upgradation within a hierarchically managed (HM) network. For more information on HM networks, see device-upgrade.

NOTE: A NOC controller’s capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller – RFS7000, NX9000, NX95XX (NX9500 and NX9510), NX9600
- Site controller – RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, or NX95XX

Within a HM network, the devices deployed as site controllers depends on the NOC controller device type. For more information on the adoption capabilities of various NOC controller devices, see Usage Guidelines (NOC controller adoption matrix).

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

device-upgrade <MAC/HOSTNAME> 
{force|no-reboot|reboot-time <TIME>|upgrade-time <TIME> {no-reboot|reboot-time <TIME>}}

device-upgrade all 
{force|no-reboot|reboot-time <TIME>|upgrade-time <TIME> {no-reboot|reboot-time <TIME>}} 
{(staggered-reboot)}

device-upgrade cancel-upgrade <MAC/HOSTNAME> 
{force|no-reboot|reboot-time <TIME>|upgrade-time <TIME> {no-reboot|reboot-time <TIME>}} 
{(staggered-reboot)}

device-upgrade load-image <MAC/HOSTNAME>
{<IMAGE-URL>|on <DEVICE-OR-DOMAIN-NAME>}

device-upgrade rf-domain <RF-DOMAIN-NAME>
{<MAC/HOSTNAME>|all}|containing <WORD>|filter location <WORD> 
{all|<MAC/HOSTNAME>|<DEVICE-OR-DOMAIN-NAME>}

device-upgrade rf-domain <RF-DOMAIN-NAME> 
{<MAC/HOSTNAME>|all|force|no-reboot|from-controller|reboot-time <TIME>|staggered-reboot|upgrade-time <TIME>}

NOTE: A NOC controller’s capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller – RFS7000, NX9000, NX95XX (NX9500 and NX9510), NX9600
- Site controller – RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, or NX95XX

Within a HM network, the devices deployed as site controllers depends on the NOC controller device type. For more information on the adoption capabilities of various NOC controller devices, see Usage Guidelines (NOC controller adoption matrix).
### Parameters

- **device-upgrade <MAC/HOSTNAME> {no-reboot|reboot-time <TIME>|upgrade-time <TIME> {no-reboot|reboot-time <TIME>}}**

</tbody>
</table>
device-upgrade <DEVICE-TYPE> all

Upgrades firmware on all devices of a specific type. Select the device type. The options are: AP621, AP622, AP650, AP6511, AP6522, AP6521, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX75XX, NX9000, NX9600, VX9000.

After selecting the device type, schedule an automatic upgrade and/or an automatic reboot.

force

Optional. Select this option to force upgrade on selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.

no-reboot

Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)

reboot-time <TIME>

Optional. Schedules an automatic reboot after a successful upgrade

- <TIME> – Optional. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

upgrade-time <TIME>

{no-reboot|reboot-time <TIME>}

Optional. Schedules an automatic firmware upgrade on all devices of the specified type, on a specified day and time

- <TIME> – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format.

upgrade-time <TIME>

{no-reboot|reboot-time <TIME>}

Optional. Schedules an automatic firmware upgrade on all devices of the specified type, on a specified day and time

- <TIME> – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format.

- no-reboot – Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)

- reboot-time <TIME> – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

staggered-reboot

This keyword is recursive and common to all of the above.

- Optional. Enables staggered device reboot (one at a time), without network impact

cancel-upgrade

Cancels a scheduled firmware upgrade based on the parameters passed. This command provides the following options to cancel scheduled firmware upgrades:

- Cancels upgrade on specific device(s). The devices are identified by their MAC addresses or hostnames.
- Cancels upgrade on all devices within the network
- Cancels upgrade on all devices of a specific type. Specify the device type.
- Cancels upgrade on specific device or all device(s) within a specific RF Domain or all RF Domains. Specify the RF Domain name.

cancel-upgrade [MAC/HOSTNAME]|all

Cancels a scheduled firmware upgrade on a specified device or on all devices

- <MAC/HOSTNAME> – Cancels a scheduled upgrade on the device identified by the <MAC/HOSTNAME> keyword. Specify the device’s MAC address or hostname.
- all – Cancels scheduled upgrade on all devices
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cancel-upgrade &lt;DEVICE-TYPE&gt; all</td>
<td>Cancels scheduled firmware upgrade on all devices of a specific type. Select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000.</td>
</tr>
<tr>
<td>cancel-upgrade on rf-domain [&lt;RF-DOMAIN-NAME&gt;]</td>
<td>Cancels scheduled firmware upgrade on all devices in a specified RF Domain or all RF Domains • &lt;RF-DOMAIN-NAME&gt; – Cancels scheduled device upgrade on all devices in a specified RF Domain. Specify the RF Domain name. • all – Cancels scheduled device upgrade on all devices across all RF Domains</td>
</tr>
<tr>
<td>load-image &lt;DEVICE-TYPE&gt;</td>
<td>Loads device firmware image from a specified location. Select the device type and provide the location of the required device firmware image. • &lt;DEVICE-TYPE&gt; – Specify the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000. After specifying the device type, provide the location of the required device firmware image.</td>
</tr>
<tr>
<td>&lt;IMAGE-URL&gt;</td>
<td>Specify the device’s firmware image location in one of the following formats: IPv4 URLs: tftp://&lt;hostname</td>
</tr>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>Optional. Specifies the name of a device or RF Domain. The image, of the specified device type is loaded from the device specified here. In case of an RF Domain, the image available on the RF Domain manager is loaded. • &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>
**device-upgrade** rf-domain [<RF-DOMAIN-NAME>|all|containing <WORD>|filter location <WORD>] [all|ap621|ap622|ap650|ap651|ap652|ap6522|ap6542|ap6552|ap6562|ap71xx|ap7502|ap7512|ap7522|ap7552|ap7562|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|rfs7000|nx45XX|nx5500|nx65XX|nx75xx|nx9000|nx9600|vx9000] {(<MAC/HOSTNAME>|force|from-controller|no-reboot|reboot-time <TIME>|staggered-reboot|upgrade-time <TIME>)}

| rf-domain [<RF-DOMAIN-NAME>|all|containing <WORD>|filter location <WORD>] | Upgrades firmware on devices in a specified RF Domain or all RF Domains. Devices within a RF Domain are upgraded through the RF Domain manager. |
|---|---|
| • <RF-DOMAIN-NAME> – Upgrades devices in the RF Domain identified by the <RF-DOMAIN-NAME> keyword. |
| • <RF-DOMAIN-NAME> – Specify the RF Domain name. |
| • all – Upgrades devices across all RF Domains |
| • containing <WORD> – Filters RF Domains by their names. RF Domains with names containing the sub-string identified by the <WORD> keyword are filtered. Devices on the filtered RF Domains are upgraded. |
| • filter location <WORD> – Filters devices by their location. All devices with location matching the <WORD> keyword are upgraded. |

<table>
<thead>
<tr>
<th>&lt;DEVICE-TYPE&gt;</th>
<th>After specifying the RF Domain, select the device type. The options are: AP621, AP622, AP650, AP651, AP652, AP6522, AP6542, AP6552, AP6562, AP71XX, AP7502, AP7512, AP7522, AP7552, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000.</th>
</tr>
</thead>
<tbody>
<tr>
<td>After specifying the RF Domain and the device type, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller.</td>
<td></td>
</tr>
</tbody>
</table>

| <MAC/HOSTNAME> | Optional. Use this option to identify specific devices for upgradation. Specify the device’s MAC address or hostname. The device should be within the specified RF Domain and of the specified device type. After identifying the devices to upgrade, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller. Note: If no MAC address or hostname is specified, all devices of the type selected are upgraded. |

| force | Optional. Select this option to force upgrade for the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time. |

| from-controller | Optional. Upgrades a device through the adopted device. If initiating an upgrade through the adopting controller, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time. |

| no-reboot (staggered-reboot) | Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted) |

| reboot-time <TIME> (staggered-reboot) | Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format. |

| staggered-reboot | This keyword is common to all of the above. Optional. Enables staggered reboot (one at a time), without network impact |
**Usage Guidelines (NOC controller adoption matrix)**

The following table displays NOC controllers and the corresponding site-level controllers supported by each:

<table>
<thead>
<tr>

rfs7000-6DCD4B#

### 3.1.21 **diff**

> Privileged Exec Mode Commands

Displays the differences between two files on a device’s file system or a particular URL.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

diff [〈FILE〉|〈URL〉] [〈FILE〉|〈URL〉]

#### Parameters
- diff [〈FILE〉|〈URL〉] [〈FILE〉|〈URL〉]

| 〈FILE〉  | The first 〈FILE〉 is the source file for the diff command. The second 〈FILE〉 is used for comparison. |
| 〈URL〉   | The first 〈URL〉 is the source file's URL. The second 〈URL〉 is the second file's URL. |

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dir {/all |/recursive |/DIR} |all-filesystems)

Parameters

- dir {/all |/recursive |/DIR} |all-filesystems)

|          | Optional. Lists all files
|----------|-------------------------|
| /all     | Optional. Lists files recursively
| /recursive | Optional. Lists files in the named file path
| <DIR>   | Optional. Lists files on all file systems

Examples

nx9500-6C8809# dir flash:/
Directory of flash:/

3.1.23 disable

Privileged Exec Mode Commands

Turns off (disables) the privileged mode command set. This command returns to the User Executable mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

disable

Parameters

None

Examples

rfs7000-37FABE#disable
rfs7000-37FABE>
3.1.24 edit

Privileged Exec Mode Commands

Edits a text file on the device’s file system

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
edit <FILE>

Parameters
- edit <FILE>

| <FILE> | Specify the name of the file to modify. |

Examples
rfs4000-229D58#edit startup-config
  GNU nano 1.2.4                File: startup-config
  ! Configuration of RFS4000 version 5.8.4.0-008D
  !
  ! version 2.5
  !
  firewall-policy default
  no ip dos tcp-sequence-past-window
  alg sip
  !
  mint-policy global-default

3.1.25 enable

Privileged Exec Mode Commands

Turns on (enables) the privileged mode command set. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

enable

Parameters

None

Examples

rfs7000-37FABE#enable
rfs7000-37FABE#
### 3.1.26 erase

**Privileged Exec Mode Commands**

Erases a device’s (wireless controller, access point, and service platform) file system. Erases the content of the specified storage device. Also erases the startup configuration to restore the device to its default.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
erase [flash:|nvram:|startup-config|usb1:|usb2:|usb3:|usb4:]
 erase [flash:|nvram:|usb1:|usb2:|usb3:|usb4:]
erase startup-config {<HOSTNAME/MAC>|on <DOMAIN-NAME> {containing <SUB-STRING>|
   exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}}
```

#### Parameters

  - **flash:** Erases everything in the device’s flash: file
  - **nvram:** Erases everything in the device’s nvram: file
  - **startup-config:** Erases the device’s startup configuration file. The startup configuration file is used to configure the device when it reboots.
  - **usb1:** Erases everything in the device’s usb1: file
    **Note:** The number of USB ports displayed varies for different device types. For example, an NX95XX has two USB ports, while an NX45XX has four USB ports.
  - **usb2:** Erases everything in the device’s usb2: file
  - **usb3:** Erases everything in the device’s usb3: file
  - **usb4:** Erases everything in the device’s usb4: file

- `erase startup-config {<HOSTNAME/MAC>|on <DOMAIN-NAME> {containing <SUB-STRING>|
  exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}}`

  - **startup-config:** Erases the startup configuration file on a specified device or devices in a specified RF Domain. The specified device(s) are reloaded after the startup configuration file is erased. Use the `<HOSTNAME/MAC>` or `on <DOMAIN-NAME>` options to identify the device or RF Domain respectively. Once executed, the configuration file, for the targeted device or for all device(s) in the targeted RF Domain, is also erased from the adopting controller’s configuration file. The are automatically reloaded once the startup configuration file has been erased.

- `<HOSTNAME/MAC>` Optional. Erases the startup configuration file on the device identified by the `<HOSTNAME/MAC>` keyword. Specify the device’s hostname or MAC address.
on <DOMAIN-NAME>
{containing <SUB-STRING>|
exclude-controllers|
exclude-rf-domain-manager|
filter <DEVICE-TYPE>}

Optional. Erases the startup configuration file on all devices or specified device(s) in a specified RF Domain

- <DOMAIN-NAME> – Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain.
  If none of the filters are used, the command is executed on all devices within the RF Domain. These filters are:
  - containing <SUB-STRING> – Optional. Executes the command on all devices containing a specified sub-string in their hostname
  - <SUB-STRING> – Specify the sub-string to match. The startup configuration file is erased on all devices whose hostname contains the sub-string specified here.
  - exclude-controllers – Optional. Executes the command on all devices excluding controllers. The startup configuration file is erased on all devices except controllers.
  - exclude-rf-domain-manager – Optional. Executes the command on all devices excluding RF Domain managers. The startup configuration file is erased on all devices except RF Domain managers.
  - filter <DEVICE-TYPE> – Optional. Executes the command on all devices of a specified type
    - <DEVICE-TYPE> – Specify the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000. The startup configuration file is erased on all devices of the type specified here. For example, if AP6521 is the device-type specified, the startup configuration file on all AP6521s, within the RF Domain, is erased.

Examples

nx4500-5CFA2B#erase ?
 flash:       Erase everything in flash:
 nvram:      Erase everything in nvram:
 startup-config   Reset configuration to factory default
 usb1:       Erase everything in usb1:
 usb2:       Erase everything in usb2:
 usb3:       Erase everything in usb3:
 usb4:       Erase everything in usb4:

nx4500-5CFA2B#

The following example shows the startup configuration file being erased on a device having hostname 'rfs6000-81701D':

rfs7000-6DCD4B#erase startup-config rfs6000-81701D

```
+---------------------------------+-----------------+------------------+
| DEVICE | STATUS   | MESSAGE          |
+---------------------------------+-----------------+------------------+
| 00-15-70-81-70-1D               | Success         | None             |
+---------------------------------+-----------------+------------------+
```
rfs7000-6DCD4B#
3.1.27 ex3500

Privileged Exec Mode Commands

Enables EX3500 switch firmware management. Use this command to perform the following operations: boot, copy, delete, and IP-related configurations.

The copy keyword provides multiple copy options. It allows you to upload or download code images or configuration files between the switch’s flash memory and an FTP/TFTP server. When you save the system code or configuration settings to a file on an FTP/TFTP server, that file can later be downloaded to the switch to restore system operation. The success of the file transfer depends on the accessibility of the FTP/TFTP server and the quality of the network connection.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

```
ex3500 [adopted|boot|copy|delete|ip]
ex3500 adopted upgrade <URL> on <EX3500-DEVICE-NAME>
ex3500 boot system <1-1> (config|opcode) <FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy [file|ftp|running-config|tftp|unit] [add-to-running-config|file|https-certificate|public-key]
ex3500 copy [ftp|tftp] [running-config|startup-config] <FTP/TFTP-SERVER-IP> <USER-NAME> <PASSWORD> <SOURCE-CONFIG-FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 copy unit file <1-1> [1|2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>
ex3500 delete [file|public-key]
ex3500 delete file [name <FILE-NAME>|unit <1-1> name <FILE-NAME>] on <EX3500-DEVICE-NAME>
ex3500 delete public-key <USER-NAME> [dsa|rsa] on <EX3500-DEVICE-NAME>
ex3500 ip ssh [crypto|save]
ex3500 ip ssh crypto host-key generates [dsa|rsa] on <EX3500-DEVICE-NAME>
```
ex3500 ip ssh crypto zeroize [dsa|rsa] on <EX3500-DEVICE-NAME>
ex3500 ip ssh save host-key on <EX3500-DEVICE-NAME>

**Parameters**

- **ex3500 adopted upgrade <URL> on <EX3500-DEVICE-NAME>**

  *Upgrades an adopted EX3500 switch*

  **Note:** After an upgrade, reboot the EX3500 switch to initiate the new image. To view an EX3500's current image version, use the `show > version > on <EX3500-DEVICE-NAME>` command.

  <URL> Specifies the location and image file name in the following format: `tftp://<IP>/[/path]/file`

  **on <EX3500-DEVICE-NAME>**

  Executes the command on a specified EX3500 switch

  - `<EX3500-DEVICE-NAME>` – Specify the EX3500 switch's hostname.

- **ex3500 boot system <1-1> (config|opcode) <FILE-NAME> on <EX3500-DEVICE-NAME>**

  *Boots a EX3500 switch using a specified configuration file*

  `<1-1>` Identifies the EX3500 unit by its ID number. Specify the EX3500 ID from 1 - 1.

  **Note:** As of now only one (1) EX3500 unit can be managed through a NOC controller.

  (config|opcode) `<FILE-NAME>`

  The following keywords are recursive:

  Specifies the image file to use for booting. The options are:

  - config – Uses the configuration file to boot the switch
  - opcode – Uses the Operation Code (opcode), which is the runtime code, to boot the switch. The opcode is like an operating system that enables the WiNG software to communicate with the EX3500 device.

  The following parameter is common to the 'config' and 'opcode' keywords:

  - `<FILE-NAME>` – Specify the configuration/runtime-code file name.

  **on <EX3500-DEVICE-NAME>**

  Reloads a specified EX3500 switch

  - `<EX3500-DEVICE-NAME>` – Specify the EX3500 switch's hostname. You can also specify its MAC address.

- **ex3500 copy file file <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>**

  *Copies a configuration file to another file*

  file file `<SOURCE-FILE-NAME>` `<DEST-FILE-NAME>`

  Copies a specified file (this is the source configuration file)

  - file – Copies the specified source file to a specified file (this is the destination configuration file)
  - `<SOURCE-FILE-NAME>` – Specify the source configuration file’s name
  - `<DEST-FILE-NAME>` – Specify the destination configuration file’s name

  When specifying the destination file name, keep in mind the following points:

  - It should not contain slashes (`/` or `/`),
  - It should not exceed 32 characters for files on the switch, or 127 characters for files on the server.

  **on <EX3500-DEVICE-NAME>**

  Copies the file to a specified EX3500 switch

  - `<EX3500-DEVICE-NAME>` – Specify the EX3500 switch’s hostname. The specified source file is copied to specified destination file on the EX3500 identified here.
### PRIVILEGED EXEC MODE COMMANDS

**ex3500 copy [ftp|tftp] add-to-running-config**

Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.

This command also allows you to add a remote system’s running configuration to the current system configuration.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add-to-running-config</td>
<td>Adds a remote system’s running configuration to the current system</td>
</tr>
<tr>
<td><strong>&lt;FTP/TFTP-SERVER-IP&gt;</strong></td>
<td>Configures the FTP or TFTP server details (depending on the option selected in the previous step), such as IP address and user credentials. This is the device running the FTP/TFTP server.</td>
</tr>
<tr>
<td><strong>&lt;USER-NAME&gt;</strong></td>
<td>If using a FTP server, specify the FTP server’s user name (should be an authorized user)</td>
</tr>
<tr>
<td><strong>&lt;PASSWORD&gt;</strong></td>
<td>Specify the password applicable for the above specified FTP server user name.</td>
</tr>
<tr>
<td><strong>&lt;SOURCE-FILE-NAME&gt;</strong></td>
<td>After specifying the server details, specify the name of the running configuration file.</td>
</tr>
<tr>
<td>on <strong>&lt;EX3500-DEVICE-NAME&gt;</strong></td>
<td>Copies the file to a specified EX3500 switch</td>
</tr>
</tbody>
</table>

**ex3500 copy [ftp|tftp] file**

Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Copies to a specified file system</td>
</tr>
<tr>
<td><strong>&lt;FTP/TFTP-SERVER-IP&gt;</strong></td>
<td>Configures the FTP or TFTP server details (depending on the option selected in the previous step), such as IP address and user credentials. This is the device running the FTP/TFTP server.</td>
</tr>
<tr>
<td><strong>&lt;USER-NAME&gt;</strong></td>
<td>If using a FTP server, specify the FTP server’s user name (should be an authorized user)</td>
</tr>
<tr>
<td><strong>&lt;PASSWORD&gt;</strong></td>
<td>Specify the password applicable for the above specified FTP server user name.</td>
</tr>
<tr>
<td>**[1</td>
<td>2]**</td>
</tr>
<tr>
<td><strong>&lt;SOURCE-FILE-NAME&gt;</strong></td>
<td>After specifying the server details, select the file type and specify the name of the source and destination file names.</td>
</tr>
<tr>
<td><strong>&lt;DEST-FILE-NAME&gt;</strong></td>
<td>Specifies the source file’s name.</td>
</tr>
<tr>
<td>on <strong>&lt;EX3500-DEVICE-NAME&gt;</strong></td>
<td>Specifies the EX3500 switch’s hostname. The specified source file is copied to specified destination file on the EX3500 identified here.</td>
</tr>
</tbody>
</table>
### ex3500 copy [ftp|tftp] https-certificate

Copies HTTPS secure site certificate from the FTP or TFTP server to the switch.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

### ex3500 copy [ftp|tftp] public-key

Copies the SSH public key from the FTP or TFTP server to the switch.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

### ex3500 copy [ftp|tftp]

Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

### ex3500 copy [ftp|tftp]

Copies the file to a specified EX3500 device.

```
on <EX3500-DEVICE-NAME>
```

- **<EX3500-DEVICE-NAME>** – Specify the EX3500 device’s hostname. The specified source file is copied to specified destination file on the EX3500 identified here.

---

### https-certificate

Copies HTTPS secure site certificate from the FTP or TFTP server to the switch.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

### public-key

Copies the SSH public key from the FTP or TFTP server to the switch.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

---

### ex3500 copy [ftp|tftp]

Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

---

### https-certificate

Copies HTTPS secure site certificate from the FTP or TFTP server to the switch.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

---

### public-key

Copies the SSH public key from the FTP or TFTP server to the switch.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

---

### ex3500 copy [ftp|tftp]

Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

---

### https-certificate

Copies HTTPS secure site certificate from the FTP or TFTP server to the switch.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

---

### public-key

Copies the SSH public key from the FTP or TFTP server to the switch.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.

---

### ex3500 copy [ftp|tftp]

Copies files from a FTP or TFTP server. This command allows you to copy the following types of files: HTTPS certificate, running configuration, startup configuration, public key, etc.

```
```

- **<FTP/TFTP-SERVER-IP>** – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- **<USER-NAME>** – If using a FTP server, specify the FTP server’s user name (should be an authorized user).
- **<PASSWORD>** – Specify the password applicable for the above specified FTP server user name.
<table>

<tr>
<td><strong>&lt;SOURCE-FILE-NAME&gt;</strong></td>
<td>Configures the source file name. You can copy the running configuration file to the startup configuration file and vice versa.</td>
</tr>
</tbody>
</table>

After identifying the FTP or TFTP server, specify the following:
- [1|2] – Configures the SSH public key type as RS or DSA
  - 1 – Configures the public key type as RSA
  - 2 – Configures the public key type as DSA
- <SOURCE-PUB-KEY-FILE-NAME> – Specifies the source public key file name
- <USER-NAME> – Specifies the public key’s user name.

Copies the public key to a specified EX3500 device
- <EX3500-DEVICE-NAME> – Specify the EX3500 device’s hostname.

Copies files from a FTP or TFTP server.
- <FTP/TFTP-SERVER-IP> – Specify the FTP or TFTP server’s IP address in the A.B.C.D format.
- <USER-NAME> – If using a FTP server, specify the FTP server’s user name (should be an authorized user)
- <PASSWORD> – Specify the password applicable for the above specified FTP server user name.

Copies the running or startup configuration file to one of the following destinations: file system, FTP server, or TFTP server
- <DEST-FILE-NAME> – Specify the destination file name. You can also copy the running configuration file to the startup configuration file and vice versa.

Copies the running or startup configuration file on to a specified EX3500 device
- <EX3500-DEVICE-NAME> – Specify the EX3500 device’s hostname.

Copies the file system from the EX3500 switch identified by the unit number
- <1-1> – Specify the unit number from 1 - 1.
  - [1|2] – Select the file type from 1 - 2.
  - 1 – Copies the selected unit’s configuration file.
  - 2 – Copies the selected unit’s opcode, which is the runtime code. The opcode is like an operating system that enables the WiNG software to communicate with the EX3500 device.

</tr>
</tbody>
</table>

**Usage Guidelines**

When using the `ex3500` command and its parameters, keep in mind the following:

- Destination file names should not:
  - Contain slashes (\ or /),
  - Exceed 32 characters for files on the switch, or 127 characters for files on the server.
- The FTP server’s default user name is set as “anonymous”.
- The Boot ROM and Loader cannot be uploaded or downloaded from the FTP/TFTP server. Follow instructions provided in the release notes for new firmware, or contact your distributor for help.
- The “Factory_Default_Config.cfg” can be used as the source to copy from, but cannot be used as the destination.
- Although the switch supports only two operation code files, the maximum number of user-defined configuration files supported is 16.

**Examples**

```plaintext
nx9500-6C8809#adopted upgrade tftp://192.168.0.99/ex3500-adopted-5.8.4.0.img on ex3524-ED5EAC

```
3.1.28 factory-reset

Privileged Exec Mode Commands

Erases startup configuration on a specified device or all devices within a specified RF Domain

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

factory-reset [<HOSTNAME/MAC>|config-all|config-device-only|on <RF-DOMAIN-NAME>]

factory-reset <HOSTNAME/MAC> {<HOSTNAME/MAC>}

factory-reset on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}

factory-reset [config-all|config-device-only] [<HOSTNAME/MAC> {<HOSTNAME/MAC>}] on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}

Parameters

- factory-reset <HOSTNAME/MAC> {<HOSTNAME/MAC>}

<table>
<thead>
<tr>
<th>factory-reset</th>
<th>Erases startup configuration and reloads device(s) based on the parameters passed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;HOSTNAME/MAC&gt;</td>
<td>Erases startup configuration and reloads the device identified by the &lt;HOSTNAME/MAC&gt; keyword. Specify the device’s hostname or MAC address.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>• &lt;HOSTNAME/MAC&gt; – Optional. You can optionally specify multiple space-separated devices.</td>
<td></td>
</tr>
</tbody>
</table>
| • factory-reset on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}

<table>
<thead>
<tr>
<th>factory-reset</th>
<th>Erases startup configuration and reloads device(s) based on the parameters passed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;RF-DOMAIN-NAME&gt; {containing &lt;SUB-STRING&gt;</td>
<td>exclude-controllers</td>
</tr>
<tr>
<td>• &lt;RF-DOMAIN-NAME&gt; – Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, the command is executed on all devices within the RF Domain. These filters are:</td>
<td></td>
</tr>
<tr>
<td>• containing &lt;SUB-STRING&gt; – Optional. Executes the command on all devices containing a specified sub-string in their hostname.</td>
<td></td>
</tr>
<tr>
<td>• &lt;SUB-STRING&gt; – Specify the sub-string to match.</td>
<td></td>
</tr>
<tr>
<td>• exclude-controllers – Optional. Executes the command on all devices excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller.</td>
<td></td>
</tr>
</tbody>
</table>

Contd..
### factory-reset

- **exclude-rf-domain-manager** – Optional. Executes the command on all devices excluding RF Domain managers. Use this option when executing the command on the NOC, site controller, or RF Domain manager.
- **filter <DEVICE-TYPE>** – Optional. Executes the command on all devices of a specified type
  - <DEVICE-TYPE> – Specify the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, V4X9000. The startup configuration is erased on all devices of the type specified here. For example, if AP6521 is the device-type specified, the command is executed on all AP6521s within the specified RF Domain.

- **<HOSTNAME/MAC>** – Erases startup configuration and reloads the device identified by the <HOSTNAME/MAC> keyword. Specify the device's hostname or MAC address.
  - <HOSTNAME/MAC> – Optional. You can optionally specify multiple space-separated devices.

- **on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}]**

- **factory-reset **Erases startup configuration and reloads device(s) based on the parameters passed

  For more information on the actions performed by this command, see Actions performed by the factory-reset command.

- **[config-all] config-device-only**

  Erases startup configuration and reloads only controller-adopted devices or the controller as well as its adopted devices
  - config-all – Erases startup configuration on the controller and all devices adopted by it
  - config-device-only – Erases startup configuration only on the devices adopted by the controller

- **<HOSTNAME/MAC> {<HOSTNAME/MAC>}**

  This parameter is common to the ‘config-all’ and ‘config-device-only’ keywords:
  - <HOSTNAME/MAC> – Erases startup configuration and reloads the device identified by the <HOSTNAME/MAC> keyword. Specify the device’s hostname or MAC address.
  - <HOSTNAME/MAC> – Optional. You can optionally specify multiple space-separated devices.

- **on <RF-DOMAIN-NAME> {containing <SUB-STRING>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}]**

  The following parameters are common to the ‘config-all’ and ‘config-device-only’ keywords:
  - on <RF-DOMAIN-NAME> – Erases startup configuration and reloads all devices or specified device(s) within a specified RF Domain
  - <RF-DOMAIN-NAME> – Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, the command is executed on all devices within the RF Domain. These filters are:
    - containing <SUB-STRING> – Optional. Executes the command on all devices containing a specified sub-string in their hostname
    - <SUB-STRING> – Specify the sub-string to match.
    - exclude-controllers – Optional. Executes the command on all devices excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller.
    - exclude-rf-domain-manager – Optional. Executes the command on all devices excluding RF Domain managers. Use this option when executing the command on the NOC, Site controller, or RF Domain manager.

Contd..
Usage Guidelines Actions performed by the factory-reset command.
The action taken by this command depends on the parameters passed.

- For the `factory-reset [<DEVICE-NAME>|on <RF-DOMAIN-NAME>]` options, the command:
  - Erases startup configuration on the target device (or) all devices in the target RF Domain.
  - Erases the device configuration entries from the controller’s configuration for the target device (or) for all the devices in the target RF Domain.
  - Reloads the target device (or) all devices in the target RF Domain.

- For the `factory-reset config-all [<DEVICE-NAME>|on <RF-DOMAIN-NAME>]` options, the command:
  - Erases startup configuration on the target device (or) all devices in the target RF Domain.
  - Erases the device configuration entries from the controller’s configuration for the target device (or) for all the devices in the target RF Domain.

- For the `factory-reset config-device-only [<DEVICE-NAME>|on <RF-DOMAIN-NAME>]` options, the command:
  - Erases startup configuration on the target device (or) all devices in the target RF Domain.

Examples

nx7500-7F3609# factory-reset config-all ap6522-5A873C
In progress ....
Erased startup-config - success 1 fail 0
Successful device deletion - total 1
nx7500-7F3609#

rfs6000-18072B# factory-reset ap650-72DBC4 ap650-72E53C
In progress ....
Erased startup-config and initiated reload - success 2 fail 0

</tbody>
</table>
-------------------------------------------------------------------------------
Total number of APs displayed: 3
```

nx7500-7F3609#
When the factory-reset command is executed on the RF Domain 'rfd1' with 'exclude-rf-domain-manager' the startup configuration:

- is erased on all non-domain-manager devices (ap7131-1180FC and ap6522-551648) within the RF Domain 'rfd1', but
- not erased on the RF Domain manager (ap8232-7F0DF8).

nx7500-7F3609# factory-reset config-device-only on rfd1 exclude-rf-domain-manager

In progress ....
Erased startup-config -
ap7131-1180FC: OK
ap6522-551648: OK

nx7500-7F3609#

nx7500-7F3609# factory-reset on rfd2
In progress ....
Erased startup-config and initiated reload -
ap650-A6566C: OK, Reload scheduled in 60 seconds...
ap4532-34505C: OK, Reload scheduled in 60 seconds...
ap650-345000: OK, Reload scheduled in 60 seconds...

Successful device deletion - total 3
nx7500-7F3609#
## 3.1.29 file-sync

### Privileged Exec Mode Commands

Syncs EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points. Use this command to configure parameters that enable syncing of PKCS#12 certificate.

When enabling file syncing, consider the following points:

- The X.509 certificate needs synchronization only if the access point’s radio2, the client-bridge radio, is configured to use EAP-TLS authentication
- Execute the command on the controller adopting the access point
- Ensure that the X.509 certificate file is installed on the controller
- If the adopting device is a site controller with layer 3 adoption to the NOC, ensure that the X.509 certificate is synced across the hierarchically managed setup – between the NOC, site-controller (the staging-controller), and the client-bridge access points.

Syncing of wireless client-bridge certificate can be automated. To automate the file syncing process, in the controller’s device/profile configuration mode, execute the following command: `file-sync [auto]count <1-20>`. For more information, see `file-sync`.

For more information on configuring an AP client-bridge, see `bridge`.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```
file-sync [cancel|load-file|wireless-bridge]

file-sync cancel wireless-bridge [DEVICE-NAME]|all|rf-domain [DOMAIN-NAME]|all]

file-sync load-file wireless-bridge <URL>

file-sync wireless-bridge [DEVICE-NAME]|all|rf-domain [DOMAIN-NAME]|all] {from-controller} {reset-radio|upload-time <TIME>}
```

### Parameters

- `file-sync cancel wireless-bridge [DEVICE-NAME]|all|rf-domain [DOMAIN-NAME]|all]`

  Cancels scheduled wireless client-bridge certificate synchronization on a specified AP, or all APs, or APs within an RF Domain
  - `DEVICE-NAME` – Cancels scheduled certificate synchronization on the AP identified by the `DEVICE-NAME` parameter. Specify the AP’s hostname or MAC address.
  - all – Cancels scheduled certificate synchronization on all APs
  - `rf-domain [DEVICE-NAME]|all` – Cancels scheduled certificate synchronization on all APs in a specified RF Domain or in all RF Domains
  - `DOMAIN-NAME` – Cancels scheduled certificate synchronization on all APs within the RF Domain identified by the `DOMAIN-NAME` parameter. Specify the RF Domain’s name.
  - all – Cancels scheduled certificate synchronization on all RF Domains
• `file-sync load-file wireless-bridge <URL>`

  **file-sync load-file wireless-bridge <URL>**

  Loads the wireless client-bridge certificate to the staging controller. Use this command to load the certificate to the controller before scheduling or initiating a certificate synchronization.

  - `<URL>` – Provide the certificate location using one of the following formats:
    - tftp://<hostname|IP>[<port>/]path/file
    - ftp://<user>:<passwd>@<hostname|IP>[<port>/]path/file
    - sftp://<user>:<passwd>@<hostname|IP>[<port>/]path/file
    - http://<hostname|IP>[<port>/]path/file
    - cf:/path/file
    - usb<n>:/path/file

  **Note:** Both IPv4 and IPv6 address types are supported.

• `file-sync wireless-bridge [DEVICE-NAME]|all|rf-domain [DOMAIN-NAME]|all] from-controller] {reset-radio|upload-time <TIME>}`

  Configures the following file-sync parameters:
  - post certificate synchronization action
  - upload time

  These file-sync options can be applied to a specified AP, all APs, or all APs within a specified RF Domain or on all RF Domains.

  - `<DEVICE-NAME>` – Applies these parameters to the AP identified by the `<DEVICE-NAME>` parameter. Specify the AP’s hostname or MAC address.
  - `all` – Applies these parameters to all APs
  - `rf-domain [DOMAIN-NAME]|all]` – Applies these parameters to all APs in a specified RF Domain or in all RF Domains
    - `<DOMAIN-NAME>` – Select to apply to APs within the RF Domain identified by the `<DOMAIN-NAME>` parameter. Specify the RF Domain’s name.
    - `all` – Select to apply these parameters to APs in all RF Domains
  - `from-controller` – Optional. Loads certificate to the APs from the adopting controller and not the RF Domain manager

  After specifying the access points to load certificate, specify the following options: reset-radio and upload-time.

  **reset-radio**

  This keyword is recursive and applicable to all of the above parameters.
  Optional. Resets the radio after file synchronization

  **upload-time <TIME>**

  This keyword is recursive and applicable to all of the above parameters.
  Optional. Schedules file upload at a specified time

  - `<TIME>` – Specify the time in the MM/DD/YYYY-HH:MM or HH:MM format. If no time is configured, the process is initiated as soon as the command is executed.

**Examples**

```
rfs7000-6DCD4B# file-sync wireless-bridge ap7131-11E6C4 upload-time 12/12/2015-12:30
```

3.1.30 format

Privileged Exec Mode Commands

Formats a device’s compact flash file system

Supported in the following platforms:
  • Wireless Controllers — RFS7000

Syntax
format cf:

Parameters

- format cf:

Examples
rfs7000-37FABE#format cf:

  Warning: This will destroy the contents of compact flash.
  Do you want to continue [y/n]? n

rfs7000-37FABE#
### 3.1.31 halt

*Privileged Exec Mode Commands*

Stops (halts) a device (access point, wireless controller, or service platform). Once halted, the system must be restarted manually.

This command stops the device immediately. No indications or notifications are provided while the device shuts down.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

`halt {force} {(on <DEVICE-NAME>))}

#### Parameters

- `halt {force} {(on <DEVICE-NAME>))

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>halt</code></td>
<td>Halts a device</td>
</tr>
<tr>
<td><code>force</code></td>
<td>Optional. Forces a device to halt ignoring in-progress operations, such as firmware upgrades, downloads, unsaved configuration changes, etc.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>The following keywords are recursive and applicable to the ‘force’ parameter:</td>
</tr>
<tr>
<td></td>
<td>• <code>on &lt;DEVICE-NAME&gt;</code> – Optional. Specifies the name of the device to be halted</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;DEVICE-NAME&gt;</code> – Enter the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Note:** If the device name is not specified, the logged device is halted.

#### Examples

```
rfst000-37FABE#halt on rfs7000-37FABE
rfs7000-37FABE#```
### 3.1.32 `join-cluster`

#### Privileged Exec Mode Commands

Adds a device (access point, wireless controller, or service platform), as cluster member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
join-cluster <IP> user <USERNAME> password <WORD> {level|mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}
```

**Parameters**

- `join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IP&gt;</code></td>
<td>Specify the cluster member’s IP address.</td>
</tr>
<tr>
<td><code>user &lt;USERNAME&gt;</code></td>
<td>Specify a user account with super user privileges on the new cluster member.</td>
</tr>
<tr>
<td><code>password &lt;WORD&gt;</code></td>
<td>Specify password for the account specified in the user parameter.</td>
</tr>
<tr>
<td>`level [1</td>
<td>2]`</td>
</tr>
<tr>
<td></td>
<td>- 1 – Configures level 1 routing</td>
</tr>
<tr>
<td></td>
<td>- 2 – Configures level 2 routing</td>
</tr>
<tr>
<td>`mode [active</td>
<td>standby]`</td>
</tr>
<tr>
<td></td>
<td>- active – Configures cluster mode as active</td>
</tr>
<tr>
<td></td>
<td>- standby – Configures cluster mode as standby</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To add a device to an existing cluster:
- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding the device to a cluster, execute the “write memory” command to ensure the configuration persists across reboots.

**Examples**

```plaintext
rfs6000-6DB5D4#join-cluster 192.168.13.16 user admin password superuser level 1
  mode standby
  ... connecting to 192.168.13.16
  ... applying cluster configuration
  ... committing the changes
  ... saving the changes
  [OK]
rfs6000-6DB5D4#
```

```plaintext
rfs6000-6DB5D4#show context
```

```plaintext

Privileged Exec Mode Commands

Establishes or brings down an L2TPv3 tunnel

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

- `l2tpv3 tunnel [〈TUNNEL-NAME〉|all]`
- `l2tpv3 tunnel 〈TUNNEL-NAME〉 [down|session|up]
  on 〈DEVICE-NAME〉`
- `l2tpv3 tunnel 〈TUNNEL-NAME〉 [down|up] {on 〈DEVICE-NAME〉}
  session 〈SESSION-NAME〉 [down|up] {on 〈DEVICE-NAME〉}
- `l2tpv3 tunnel all [down|up] {on 〈DEVICE-NAME〉}

Parameters

- `l2tpv3 tunnel 〈TUNNEL-NAME〉 [down|up] {on 〈DEVICE-NAME〉}`
  Establishes or brings down an L2TPv3 tunnel
  - `〈TUNNEL-NAME〉` — Specify the tunnel name.
  - `down` — Brings down the specified tunnel
  - `up` — Establishes the specified tunnel
  - `on 〈DEVICE-NAME〉` — Optional. Establishes or brings down a tunnel on a specified device
    - `〈DEVICE-NAME〉` — Specify the name of the AP, wireless controller, or service platform.

- `l2tpv3 tunnel 〈TUNNEL-NAME〉 session 〈SESSION-NAME〉 [down|up] {on 〈DEVICE-NAME〉}
  Establishes or brings down a session in the specified tunnel
  - `〈TUNNEL-NAME〉` — Specify the tunnel name.
  - `〈SESSION-NAME〉` — Specify the session name.
  - `down` — Brings down the specified tunnel session
  - `up` — Establishes the specified tunnel session
  - `on 〈DEVICE-NAME〉` — Optional. Establishes or brings down a tunnel session on a specified device
    - `〈DEVICE-NAME〉` — Specify the name of the AP, wireless controller, or service platform.

- `l2tpv3 tunnel all [down|up] {on 〈DEVICE-NAME〉}
  Establishes or brings down all L2TPv3 tunnels
  - `down` — Brings down all tunnels
  - `up` — Establishes all tunnels
  - `on 〈DEVICE-NAME〉` — Optional. Establishes or brings down all tunnels on a specified device
    - `〈DEVICE-NAME〉` — Specify the name of the AP, wireless controller, or service platform.
Examples

rfs7000-37FABE#l2tpv3 tunnel Tunnel1 session Tunnel1Session1 up on rfs7000-37FABE

NOTE: For more information on the L2TPv3 tunnel configuration mode and commands, see Chapter 22, L2TPV3-POLICY.
3.1.34 logging

Privileged Exec Mode Commands

Modifies message logging settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}

Parameters

- logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}

<table>
<thead>
<tr>
<th>monitor</th>
<th>Sets terminal lines logging levels. The logging severity levels can be set from 0 - 7. The system configures default settings, if no logging severity level is specified.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;0-7&gt; – Optional. Enter the logging severity level from 0 - 7. The various levels and their implications are:</td>
</tr>
<tr>
<td></td>
<td>• alerts – Optional. Immediate action needed (severity=1)</td>
</tr>
<tr>
<td></td>
<td>• critical – Optional. Critical conditions (severity=2)</td>
</tr>
<tr>
<td></td>
<td>• debugging – Optional. Debugging messages (severity=7)</td>
</tr>
<tr>
<td></td>
<td>• emergencies – Optional. System is unusable (severity=0)</td>
</tr>
<tr>
<td></td>
<td>• errors – Optional. Error conditions (severity=3)</td>
</tr>
<tr>
<td></td>
<td>• informational – Optional. Informational messages (severity=6)</td>
</tr>
<tr>
<td></td>
<td>• notifications – Optional. Normal but significant conditions (severity=5)</td>
</tr>
<tr>
<td></td>
<td>• warnings – Optional. Warning conditions (severity=4)</td>
</tr>
</tbody>
</table>

Note: Ensure that the logging module is enabled, before configuring the message logging level. To enable message logging, in the device’s configuration mode, execute the `logging > on` command. Message logging can also be enabled on a profile.

Examples

rfs4000-229D58(config-device-00-23-68-22-9D-58)#logging on

### 3.1.35 mint

**Privileged Exec Mode Commands**

Uses MiNT protocol to perform a ping and traceroute to a remote device

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
mint [ping|traceroute]
mint ping <MINT-ID> {count <1-10000>|size <1-64000>|timeout <1-10>}
mint traceroute <MINT-ID> {destination-port <1-65535>|max-hops <1-255>|source-port <1-65535}|timeout <1-255>}
```

**Parameters**

- **mint ping <MINT-ID> {count <1-10000>|size <1-64000>|timeout <1-10>**

<table>
<thead>
<tr>
<th>ping &lt;MINT-ID&gt;</th>
<th>Sends a MiNT echo message to a specified destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>count &lt;1-10000&gt;</td>
<td>Optional. Sets the pings to the MiNT destination</td>
</tr>
<tr>
<td>size &lt;1-64000&gt;</td>
<td>Optional. Sets the MiNT payload size in bytes</td>
</tr>
<tr>
<td>timeout &lt;1-10&gt;</td>
<td>Optional. Sets a response time in seconds</td>
</tr>
</tbody>
</table>

- **mint traceroute <MINT-ID> {destination-port <1-65535>|max-hops <1-255>|source-port <1-65535}|timeout <1-255>**

<table>
<thead>
<tr>
<th>traceroute &lt;MINT-ID&gt;</th>
<th>Prints the route packets trace to a device</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination-port &lt;1-65535&gt;</td>
<td>Optional. Sets the Equal-cost Multi-path (ECMP) routing destination port</td>
</tr>
<tr>
<td>max-hops &lt;1-255&gt;</td>
<td>Optional. Sets the maximum number of hops a traceroute packet traverses in the forward direction</td>
</tr>
<tr>
<td>source-port &lt;1-65535&gt;</td>
<td>Optional. Sets the ECMP source port</td>
</tr>
<tr>
<td>timeout &lt;1-255&gt;</td>
<td>Optional. Sets the minimum response time period</td>
</tr>
</tbody>
</table>
Examples

rfs4000-229D58#mint ping 68.88.0D.A7
MiNT ping 68.88.0D.A7 with 64 bytes of data.
  Response from 68.88.0D.A7: id=1 time=0.364 ms
  Response from 68.88.0D.A7: id=2 time=0.333 ms
  Response from 68.88.0D.A7: id=3 time=0.368 ms

--- 68.88.0D.A7 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 0.333/0.355/0.368 ms
rfs4000-229D58#
### Privileged Exec Mode Commands

**mkdir**

Creates a new directory in the file system

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
mkdir <DIR>
```

**Parameters**

- `mkdir <DIR>`

| <DIR> | Specify a directory name.  
|-------|--------------------------  
| **Note:** A directory, specified by the <DIR> parameter, is created within the file system.

**Examples**

```
rfs4000-229D58#dir  
Directory of flash:/.

3.37 **more**

*Privileged Exec Mode Commands*

Displays files on the device’s file system. This command navigates and displays specific files in the device’s file system. Provide the complete path to the file `more <file>`.

The `more` command also displays the startup configuration file.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`more <FILE>`

**Parameters**

- `more <FILE>`

**Examples**

```
rfs4000-229D58#more flash:/archived_logs/startup.1.log
23-38-04-06-08-14
Mar 16 05:07:15 2015: %PM-6-PROCSTART: Starting process "/usr/sbin/logd"

3.1.38 no

Privileged Exec Mode Commands

Use the no command to revert a command or a set of parameters to their default. This command is useful to turn off an enabled feature or to revert to default settings.

The no commands have their own set of parameters that can be reset. These parameters depend on the context in which the command is being used.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8532
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
no [adoption|captive-portal|cpe|crypto|debug|logging|page|raid|service|
terminal|upgrade|virtual-machine|wireless]
```

```
no adoption {on <DEVICE-OR-DOMAIN-NAME>}
```

NOTE: The no > adoption command resets the adoption state of a specified device (and all devices adopted to it) or devices within a specified RF Domain. When executed without specifying the device or RF Domain, the command resets the adoption state of the logged device and all devices, if any, adopted to it.

```
nocaptive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>] 
{on <DEVICE-OR-DOMAIN-NAME>}
```

```
nocrypto pki [server|trustpoint] 
nocrypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>} | 
on <DEVICE-NAME>}
```

```
nologging monitor
```

```
nopage
```

```
noservice [block-adopter-config-update|locator|snmp|ssm|wireless] 
noservice block-adopter-config-update 
noservice locator {on <DEVICE-NAME>}
noservice snmp sysoid wing5 
noservice ssm trace pattern {<WORD>} {(on <DEVICE-NAME>)}
noservice wireless [trace pattern {<WORD>} {(on <DEVICE-NAME>)}]
unsanctioned ap air-terminate <BSSID> {on <DOMAIN-NAME>}
noterminal [length|width]
```

```
noupgrade <PATCH-NAME> {on <DEVICE-NAME>}
```

```
nowireless client [all|<MAC>] 
nowireless client all {filter|on}
nowireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]} 
nowireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
```

The following command is available only on the RFS4000, RFS7000, NX45XX, NX65XX, and NX9000 series service platforms:

```
nocpe led cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
```
The following command is available only on the NX45XX, NX65XX, and NX9000 series service platforms:
no virtual-machine assign-usb-ports \{on <DEVICE-NAME>\}

The following commands are available only on the NX9000 series service platforms:
no raid locate

**Parameters**
- no <PARAMETERS>

| no <PARAMETERS> | Resets or reverts settings based on the parameters passed |

**Usage Guidelines**
The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**
rfs7000-37FABE# no adoption
rfs7000-37FABE#

rfs7000-37FABE# no page
rfs7000-37FABE#
3.1.39 on

Privileged Exec Mode Commands

Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

on rf-domain [<RF-DOMAIN-NAME>|all]

Parameters

- on rf-domain [<RF-DOMAIN-NAME>|all]

| on rf-domain [<RF-DOMAIN-NAME>|all] | Enters the RF Domain context based on the parameter specified |
|--------------------------------------|-------------------------------------------------------------|
|                                    | • <RF-DOMAIN-NAME> — Specify the RF Domain name. Enters the specified RF Domain context. |
|                                    | • all — Specifies all RF Domains. |

Examples

nx9500-6C8809# on rf-domain TechPubs

### 3.1.40 opendns

Privileged Exec Mode Commands

Retrieves the OpenDNS device-id from the OpenDNS site

This command integrates access points and controllers with OpenDNS. It obtains the device-id (16 character hexadecimal string) from OpenDNS. This device-id is configured under all WLANs that are to be OpenDNS enabled. When configured and enabled on a WLAN, DNS queries from all wireless clients on the WLAN are redirected to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers. These OpenDNS resolvers act as proxy DNS servers, and also provide additional features, such as Web filtering, performance improvements, etc.

#### Syntax

```
opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>
```

#### Parameters

- **opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>**
  
  **username <USERNAME>**
  
  Configures the OpenDNS user name (should be valid username registered with OpenDNS)
  
  - **<USERNAME>** – Provide the OpenDNS user name.

- **password <OPENDNS-PSWD>**
  
  Configures the password associated with the user configured in the previous step
  
  - **<OPENDNS-PSWD>** – Provide the OpenDNS password for the user.

- **label <LABEL>**
  
  Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal.
  
  - **<LABEL>** – Specify your network label.
  
  **Note:** For every unique set of username, password, and label only one device-id is returned. Apply this device-id in WLANs that are to be OpenDNS enabled. For information on configuring the device-id in the WLAN context, see *opendns*.
Usage Guidelines

Use your OpenDNS credentials to logon to the opendns.org site and use the labels, edit settings, and customize content filtering options to configure Web filtering settings.

Examples

ap7131-E6D512#opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADP8EDC6C59
ap7131-E6D512#
### 3.1.41 page

*Toggles controller paging. Enabling this command displays the CLI command output page by page, instead of running the entire output at once.*

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

page

**Parameters**

None

**Examples**

```bash
rfs7000-37FABE#page
rfs7000-37FABE#
```

3.1.42 ping

Privileged Exec Mode Commands

Sends Internet Controller Message Protocol (ICMP) echo messages to a user-specified location.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|source [<IP]|pppoe|vlan <1-4094>|wwan}]
```

Parameters
- `<IP/HOSTNAME>` Specify the destination IP address or hostname to ping. When entered without any parameters, this command prompts for an IP address or a hostname.
- `count <1-10000>` Optional. Sets the pings to the specified destination
  - `<1-10000>` – Specify a value from 1 - 10000. The default is 5.
- `dont-fragment {count|size}` Optional. Sets the dont-fragment bit in the ping packet. Packets with the dont-fragment bit specified, are not fragmented. When a packet, with the dont-fragment bit specified, exceeds the specified Maximum Transmission Unit (MTU) value, an error message is sent from the device trying to fragment it.
  - `count <1-10000>` – Sets the pings to the specified destination from 1 - 10000. The default is 5.
  - `size <1-64000>` – Sets the size of ping payload size from 1 - 64000 bytes. The default is 100 bytes.
- `size <1-64000>` Optional. Sets the ping packet's size in bytes
  - `<1-64000>` – Specify the ping payload size from 1 - 64000 bytes. The default is 100 bytes.
- `source [<IP]|pppoe|vlan <1-4094]|wwan]` Optional. Sets the source address or interface name. This is the source of the ICMP packet to the specified destination.
  - `<IP>` – Specifies the source IP address
  - `pppoe` – Selects the PPP over Ethernet interface
  - `vlan <1-4094>` – Selects the VLAN interface from 1 - 4094
  - `wwan` – Selects the wireless WAN interface
Examples

rfs7000-37FABE#ping 172.16.10.4 count 6
PING 172.16.10.4 (172.16.10.4) 100(128) bytes of data.
108 bytes from 172.16.10.4: icmp_seq=1 ttl=64 time=3.93 ms
108 bytes from 172.16.10.4: icmp_seq=2 ttl=64 time=0.367 ms
108 bytes from 172.16.10.4: icmp_seq=3 ttl=64 time=0.328 ms
108 bytes from 172.16.10.4: icmp_seq=4 ttl=64 time=0.295 ms
108 bytes from 172.16.10.4: icmp_seq=5 ttl=64 time=0.340 ms
108 bytes from 172.16.10.4: icmp_seq=6 ttl=64 time=0.371 ms
--- 172.16.10.4 ping statistics ---
6 packets transmitted, 6 received, 0% packet loss, time 5001ms
rtt min/avg/max/mdev = 0.295/0.939/3.936/1.340 ms
rfs7000-37FABE#

rfs7000-6DCD4B#ping 10.2.0.99 source 172.18.0.2
PING 10.2.0.99 (10.2.0.99) from 172.18.0.2 : 100(128) bytes of data.
108 bytes from 10.2.0.99: icmp_seq=1 ttl=63 time=1.16 ms
108 bytes from 10.2.0.99: icmp_seq=2 ttl=63 time=0.744 ms

108 bytes from 10.2.0.99: icmp_seq=4 ttl=63 time=0.662 ms
108 bytes from 10.2.0.99: icmp_seq=5 ttl=63 time=0.651 ms
--- 10.2.0.99 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3998ms
rtt min/avg/max/mdev = 0.648/0.774/1.168/0.202 ms
rfs7000-6DCD4B#
### 3.1.43 ping6

**Privileged Exec Mode Commands**

Sends ICMPv6 echo messages to a user-specified IPv6 address

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ping6 <IPv6/HOSTNAME> {<INTF-NAME>|count <1-10000>|size <1-64000>}
```

**Parameters**

- `ping <IPv6/HOSTNAME> {<INTF-NAME>|count <1-10000>|size <1-64000>}`

<table>
<thead>
<tr>
<th><code>&lt;IPv6/HOSTNAME&gt;</code></th>
<th>Specify the destination IPv6 address or hostname.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;INTF-NAME&gt;</code></td>
<td>Optional. Specify the interface name for link local/broadcast address</td>
</tr>
<tr>
<td><code>count &lt;1-10000&gt;</code></td>
<td>Optional. Sets the pings to the specified IPv6 destination</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;1-10000&gt;</code> – Specify a value from 1 - 10000. The default is 5.</td>
</tr>
<tr>
<td><code>size &lt;1-64000&gt;</code></td>
<td>Optional. Sets the IPv6 ping payload size in bytes</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;1-64000&gt;</code> – Specify the ping payload size from 1 - 64000. The default is 100 bytes.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To configure a device’s IPv6 address, in the VLAN interface configuration mode, use the `ipv6 > address` `<IPv6-ADDRESS>` command. After configuring the IPv6 address, use the `ipv6 > enable` command to enable IPv6. For more information, see `ipv6`.

**Examples**

```
rfs4000-1B3596#ping6  2001:10:10:10:10:10:10:2  count 6 size 200
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=1 ttl=64 time=0.509 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=2 ttl=64 time=0.323 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=3 ttl=64 time=0.318 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=4 ttl=64 time=0.317 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=5 ttl=64 time=0.314 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=6 ttl=64 time=0.318 ms
6 packets transmitted, 6 received, 0% packet loss, time 4999ms
rtt min/avg/max/mdev = 0.314/0.349/0.509/0.075 ms
rfs4000-1B3596#
```

3.1.44 pwd

Privileged Exec Mode Commands

Displays the full path of the present working directory, similar to the UNIX pwd command

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

pwd

Parameters

None

Examples

rfs4000-229D58#pwd
flash:/
rfs4000-229D58#

rfs4000-229D58#dir
Directory of flash:/.

rfs4000-229D58#
3.1.45 **re-elect**

*Privileged Exec Mode Commands*

Re-elects the tunnel controller (wireless controller or service platform)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>} | on <DEVICE-NAME>}
```

**Parameters**

- `re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>} | on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>re-elect tunnel-controller</th>
<th>Re-elects the tunnel controller</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;WORD&gt;</code> {on <code>&lt;DEVICE-NAME&gt;</code>}</td>
<td>Optional. Re-elects the tunnel controller on all devices whose preferred tunnel controller name matches <code>&lt;WORD&gt;</code></td>
</tr>
<tr>
<td></td>
<td>• on <code>&lt;DEVICE-NAME&gt;</code> – Optional. Re-elects the tunnel controller on a specified device</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE# re-elect tunnel-controller
OK
rfs7000-37FABE#
```
3.1.46 reload

Privalued Exec Mode Commands

Halts a device or devices and performs a warm reboot

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

reload {<DEVICE-MAC-OR-HOSTNAME>|at|cancel|force|in|on|staggered}

reload {at <TIME> <1-31> <MONTH> <1993-2035> {on <DEVICE-OR-DOMAIN-NAME>}}

reload {cancel} {on <DEVICE-OR-DOMAIN-NAME>}

reload {force} {(<DEVICE-MAC-OR-HOSTNAME>)|on <DOMAIN-NAME>|staggered}

reload {force} {on <DOMAIN-NAME> {staggered}}

reload {force} {containing <WORD>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}

reload {in <1-999>} {list|on}

reload {in <1-999>} {list {<LINE>|all}|on <DEVICE-OR-DOMAIN-NAME>}

reload {on <DOMAIN-NAME>} {containing <WORD>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}

reload {staggered} {(<DEVICE-MAC-OR-HOSTNAME>)|on <DOMAIN-NAME> {containing <WORD>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}

Parameters

- reload {}<DEVICE-MAC-OR-HOSTNAME> Initiates device(s) reload and configures associated parameters
  - The following keyword is recursive and allows you to specify multiple devices:
  - <DEVICE-MAC-OR-HOSTNAME> – Optional. Reloads a specified device(s), identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device’s hostname or MAC address.
  - Note: If no device is specified, the system reloads the logged device.

- reload {at <TIME> <1-31> <MONTH> <1993-2035> {on <DEVICE-OR-DOMAIN-NAME>}}

reload at

- <TIME> Specifies the time in the HH:MM:SS format
- <1-31> Specifies the day of the month from 1 - 31
- <MONTH> Specifies the month from Jan - Dec
### WiNG 5.8.4 CLI Reference Guide

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;1993-2035&gt;</code></td>
<td>Specifies the year from 1993 - 2035. It should be a valid 4 digit year.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</code></td>
<td>Optional. Performs reload at the scheduled time, on a specified device or all devices within a specified RF Domain</td>
</tr>
<tr>
<td>- <code>&lt;DEVICE-OR-DOMAIN-NAME&gt;</code> – Specify the name of the AP, wireless controller, service platform, or RF Domain. When a RF Domain name is provided, all devices within the specified RF Domain are reloaded at the scheduled time.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> If no device is specified, the reload is scheduled on the logged device.</td>
<td></td>
</tr>
<tr>
<td><code>reload cancel {on &lt;DEVICE-OR-DOMAIN-NAME&gt;}</code></td>
<td>Cancels pending/scheduled reloads of device(s)</td>

<td>- on <code>&lt;DOMAIN-NAME&gt;</code> – Optional. Enables reload of all devices in a RF Domain</td>
</tr>
<tr>
<td>- <code>&lt;DOMAIN-NAME&gt;</code> – Specify the name of the RF Domain. When executed, all devices within the specified RF Domain are immediately halted and a warm reboot is performed.</td>
</tr>
<tr>
<td><strong>Note:</strong> If no RF Domain is specified, the system reloads the logged device.</td>
</tr>
</tbody>
</table>
When reloading devices in a RF Domain, you can use following options to filter specific devices or device types:

- **containing <WORD>** – Optional. Filters out devices containing a specified sub-string in their hostnames.
- **<WORD>** – Optional. Provide the sub-string to match. All devices having hostnames containing the provided sub-string are filtered and forcefully reloaded.
- **exclude-controllers** – Optional. Excludes all controllers in the specified RF Domain from the reload process.
- **exclude-rf-domain-manager** – Optional. Excludes the RF Domain manager from the reload process.
- **filter <DEVICE-TYPE>** – Optional. Filters devices by the device type specified. Select the type of device to reload. All devices, of the specified type, within the specified RF Domain, are forcefully reloaded.

- **<DEVICE-TYPE>** – Select the type of device to reload. The options are: AP621, AP622, AP650, AP6511, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RF7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, VX9000, t5.

- **<DEVICE-MAC-OR-HOSTNAME>** – Optional. Performs staggered reload on specified device(s) identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device's hostname or MAC address. This is a recursive keyword that allows you to specify multiple devices. When executed, the specified device(s) are halted and a warm reboot is performed. Multiple devices are halted and rebooted one at a time without impacting network functioning.

- **<DOMAIN-NAME>** – Optional. Performs staggered reload of all devices in a RF Domain. Specify the name of the RF Domain. When executed, devices in the specified RF Domain are halted and rebooted one at a time without impacting network functioning. Use additional filter options to filter devices in the specified RF Domain.

**Note:** If no device or RF Domain is specified, the system reloads the logged device.

### Example

**reload staggered**

```plaintext
reload staggered {{<DEVICE-MAC-OR-HOSTNAME>} | on <DOMAIN-NAME> } {containing <WORD> | exclude-controllers | exclude-rf-domain-manager | filter <DEVICE-TYPE>}
```

**Use one of the following options to specify a single device, multiple devices, or a RF Domain**

- **<DEVICE-MAC-OR-HOSTNAME>** – Optional. Performs staggered reload on specified device(s) identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device’s hostname or MAC address. This is a recursive keyword that allows you to specify multiple devices. When executed, the specified device(s) are halted and a warm reboot is performed. Multiple devices are halted and rebooted one at a time without impacting network functioning.

- **<DOMAIN-NAME>** – Optional. Performs staggered reload of all devices in a RF Domain. Specify the name of the RF Domain. When executed, devices in the specified RF Domain are halted and rebooted one at a time without impacting network functioning. Use additional filter options to filter devices in the specified RF Domain.

**Note:** If no device or RF Domain is specified, the system reloads the logged device.

### Example

**reload staggered**

```plaintext
reload staggered {{<DEVICE-MAC-OR-HOSTNAME>} | on <DOMAIN-NAME> } {containing <WORD> | exclude-controllers | exclude-rf-domain-manager | filter <DEVICE-TYPE>}
```

**contd..**
### Examples

```
rfs7000-6DCD4B#reload at 12:30:00 31 Mar 2015 on rfs6000-81742D
Reload scheduled at 2015-03-31 12:30:00 UTC ...
rfs7000-6DCD4B#
```

```rfs7000-6DCD4B#reload cancel on rfs6000-81742D
Scheduled reload cancelled.
rfs7000-6DCD4B#```

The following example schedules a reload on all non-controller devices in the RF Domain 'default':

```
rfs7000-6DCD4B#reload on default exclude-controllers
ap8132-711728: OK
rfs7000-6DCD4B#```

- exclude-rf-domain-manager – Optional. Excludes the RF Domain manager from the reload process
- filter <DEVICE-TYPE> – Optional. Filters devices by the device type specified. Select the type of device. All devices, of the specified type, within the specified RF Domain, are reloaded.
- <DEVICE-TYPE> – Select the type of device to reload. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000, t5.
3.1.47 rename

Privileged Exec Mode Commands

Renames a file in the devices' file system

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

rename <OLD-FILE-NAME> <NEW-FILE-NAME>

Parameters

• rename <OLD-FILE-NAME> <NEW-FILE-NAME>

<table>
<thead>
<tr>
<th>&lt;OLD-FILE-NAME&gt;</th>
<th>Specify the file to rename.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;NEW-FILE-NAME&gt;</td>
<td>Specify the new file name.</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58#
3.1.48 rmdir

Privileged Exec Mode Commands

Deletes an existing directory from the file system (only empty directories can be removed)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
rmdir <DIR>

Parameters
- rmdir <DIR>

<table>
<thead>
<tr>
<th>rmdir &lt;DIR&gt;</th>
<th>Specifies the directory name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: The directory, specified by the &lt;DIR&gt; parameter, is removed from the file system.</td>
<td></td>
</tr>
</tbody>
</table>

rfs4000-229D58#
3.1.49 self

- Privileged Exec Mode Commands

Enters the logged device’s configuration context

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

self

Parameters

None

Examples

rfs7000-37FABE#self
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#
3.1.50 ssh

Privileged Exec Mode Commands

Opens a Secure Shell (SSH) connection between two network devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ssh <IP/HOSTNAME> <USERNAME> {<INF-NAME/LINK-LOCAL-ADD>}

Parameters

- ssh <IP/HOSTNAME> <USERNAME> {<INF-NAME/LINK-LOCAL-ADD>}

<IP/HOSTNAME>  Specify the remote system’s IP address or hostname.

<USERNAME>  Specify the name of the user requesting the SSH connection.

<INF-NAME/LINK-LOCAL-ADD>  Optional. Specify the interface’s name or link local address.

Usage Guidelines

To exit the other device’s context, use the command that is relevant to that device.

Examples

nx9500-6C8809#ssh 192.168.13.16 admin
admin@192.168.13.16’s password:
rfs6000-6DB5D4>

nx9500-6C8809#ssh 192.168.13.14 admin
The authenticity of host '192.168.13.14 (192.168.13.14)' can't be established.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '192.168.13.14' (RSA) to the list of known hosts.
admin@192.168.13.14’s password:
nx4500-5CFA8E>
3.1.51 **t5**

*Privileged Exec Mode Commands*

Executes following operations on a T5 device through the WiNG controller:

- copy, rename, and delete files on the T5 device’s file system
- write running configuration to the T5 device’s memory

The T5 switch is a means of providing cost-effective, high-speed, wall-to-wall coverage across a building. The T5 switch leverages the in-building telephone lines to extend Ethernet and Wireless LAN networks without additional expenditure on re-wiring. This setup is ideally suited for hotels, providing high-speed Wi-Fi coverage to guest rooms.

The entire setup consists of the DSL T5 switch, TW-510 Ethernet wallplates, and TW-511 wireless wallplate access points. Replace the phone jack plate in a room with the TW-511 delivers 802.11 a/b/g/n and extend wireless connectivity in that room and the neighboring rooms. These TW-511 wallplates (also referred to as the CPEs) are connected to the T5 switch over the DSL interface using a phone block.

The T5 switch is adopted and managed through a WiNG controller. The connection between the T5 and WiNG switches is over a WebSocket.

---

**NOTE:** For more information on other T5 CPE related commands, see `cpe`.

---

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

t5 [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME> | delete <FILE-NAME> | rename <SOURCE-FILE-NAME> <DEST-FILE-NAME> | write memory] {on <T5-DEVICE-NAME>}

**Parameters**

- t5 [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME> | delete <FILE-NAME> | rename <SOURCE-FILE-NAME> <DEST-FILE-NAME> | write memory] {on <T5-DEVICE-NAME>}

| **copy** <SOURCE-FILE-NAME> <DEST-FILE-NAME> | Copies file to an external server |
| --- |
| <SOURCE-FILE-NAME> – Specify the source file name. |
| <DEST-FILE-NAME> – Specify the destination file name. |
| **Note:** The content from the source file is copied to the destination file. |
| The source or destination files can be local or remote FTP or TFTP files. The source file also can be a pre-defined keyword. At least one of the files should be a local file. Use this command to copy the startup and/or running configurations to an external server. |

| **delete <FILE-NAME>** | Deletes files on the T5 device’s file system |
| --- |
| <FILE-NAME> – Specify the file name. The specified file is deleted. |

| **rename** <SOURCE-FILE-NAME> <DEST-FILE-NAME> | Renames a file on the T5 device’s file system |
| --- |
| <SOURCE-FILE-NAME> – Specify the source file name |
| <DEST-FILE-NAME> – Specify the new file name. The source file is renamed to the input provided here. |
| write memory | Writes running configuration to an adopted T5 device’s memory  
|             | • memory – Writes running configuration to the T5 device’s *non-volatile* (NV) memory. |
| **on** `<T5-DEVICE-NAME>` | Optional. Executes these operation on a specified T5 device  
|             | • `<T5-DEVICE-NAME>` – Specify the T5 device’s hostname. |

**Examples**

rfa7000-37FABE#t5 write memory on t5-ED5C2C
Success
rfa7000-37FABE#
3.1.52 telnet

Privileged Exec Mode Commands

Opens a Telnet session between two network devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

Parameters

- telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

| <IP/HOSTNAME> | Configures the remote system’s IP (IPv4 or IPv6) address or hostname. The Telnet session will be established between the connecting system and the remote system.
| <TCP-PORT> | Optional. Specify the Transmission Control Protocol (TCP) port.
| <INTF-NAME> | Optional. Specify the interface name for the link local address.

Usage Guidelines

To exit the other device’s context, use the command relevant to that device.

Examples

nx9500-6C8809#telnet 192.168.13.22
Entering character mode
Escape character is ‘^[’.

### 3.1.53 terminal

*Privileged Exec Mode Commands*

Sets the number of characters per line, and the number of lines displayed within the terminal window.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
terminal [length|width] <0-512>
```

#### Parameters

- `terminal [length|width] <0-512>`

<table>
<thead>
<tr>
<th>length &lt;0-512&gt;</th>
<th>Sets the number of lines displayed on the terminal window</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;0-512&gt; – Specify a value from 0 - 512.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>width &lt;0-512&gt;</th>
<th>Sets the width or number of characters displayed on the terminal window</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;0-512&gt; – Specify a value from 0 - 512.</td>
</tr>
</tbody>
</table>

#### Examples

```bash
rfs7000-37FABE#terminal length 150
```

```bash
rfs7000-37FABE#terminal width 215
```

```bash
rfs7000-37FABE#show terminal
Terminal Type: xterm
Length: 150   Width: 215
```

#### Related Commands

- `no` - Resets the width of the terminal window or the number of lines displayed on a terminal window.
3.1.54 time-it

Privileged Exec Mode Commands

Verifies the time taken by a particular command between request and response

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6662, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

time-it <COMMAND>

Parameters

- time-it <COMMAND>

<table>
<thead>
<tr>
<th>time-it &lt;COMMAND&gt;</th>
<th>Verifies the time taken by a particular command to execute and provide a result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;COMMAND&gt;</td>
<td>— Specify the command name.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE#time-it config terminal
Enter configuration commands, one per line. End with CNTL/Z.
That took 0.00 seconds..
rfs7000-37FABE(config)#
```
3.1.55 traceroute

Traces the route to a defined destination

Use ‘--help’ or ‘-h’ to display a complete list of parameters for the traceroute command

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
traceroute <WORD>

Parameters
- traceroute <WORD>

Examples
nx9500-6C8809#traceroute 192.168.13.16
traceroute to 192.168.13.16 (192.168.13.16), 30 hops max, 46 byte packets
  1 192.168.13.16 (192.168.13.16) 0.479 ms 0.207 ms 0.199 ms
nx9500-6C8809#
3.1.56 traceroute6

Traces the route to a specified IPv6 destination

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
traceroute6 <WORD>

Parameters
- traceroute6 <WORD>

<table>
<thead>
<tr>
<th>traceroute6 &lt;WORD&gt;</th>
<th>Traces the route to a IPv6 address or hostname</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>— Specify the IPv6 address or hostname.</td>
</tr>
</tbody>
</table>

Examples
rfs4000-1B3596#traceroute6 2001:10:10:10:10:10:10:2
1 2001:10:10:10:10:10:10:10:2 (2001:10:10:10:10:10:10:10:2)  0.622 ms  0.497 ms  0.531 ms
rfs4000-1B3596#
3.1.57 upgrade

Privileged Exec Mode Commands

Upgrades a device’s software image

Supported in the following platforms:
• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
upgrade [<FILE>|<URL>]|dhcp-vendor-options

upgrade [<FILE>|<URL>]| {background|on <DEVICE-NAME>|on <RF-DOMAIN-NAME>}

upgrade dhcp-vendor-options {<DEVICE-NAME>|on <RF-DOMAIN-NAME>}

Parameters
• upgrade [<FILE>|<URL>] {background|on <DEVICE-NAME>|on <RF-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;FILE&gt;</td>

</tr>
<tr>
<td>• &lt;RF-DOMAIN-NAME&gt; – Specify the RF Domain name. After specifying the RF Domain, optionally use the filters provided to identify specific device(s) within the RF Domain. If none of the filters are used, all devices within the RF Domain are upgraded. These filters are:</td>
<td></td>
</tr>
<tr>
<td>• containing &lt;SUB-STRING&gt; – Optional. Upgrades all devices, within the specified RF Domain, containing a specified sub-string in their hostname</td>
<td></td>
</tr>
<tr>
<td>• &lt;SUB-STRING&gt; – Specify the sub-string to match.</td>
<td></td>
</tr>
<tr>
<td>• exclude-controllers – Optional. Upgrades all devices, within the specified RF Domain, excluding controllers. Since only a NOC controller is capable of adopting other controllers, use this option when executing the command on a NOC controller.</td>
<td></td>
</tr>
<tr>
<td>• exclude-rf-domain-manager – Optional. Upgrades all devices, within the specified RF Domain, excluding RF Domain managers. Use this option when executing the command on the NOC, Site controller, or RF Domain manager.</td>
<td></td>
</tr>
<tr>
<td>• filter &lt;DEVICE-TYPE&gt; – Optional. Executes the command on all devices, within the specified RF Domain, of a specified type</td>
<td></td>
</tr>
<tr>
<td>• &lt;DEVICE-TYPE&gt; – Specify the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX5500, NX55XX, NX75XX, NX9000, NX9600, VX9000. Upgrades all devices of the type specified here. For example, if AP6521 is the device-type specified, all AP6521s within the specified RF Domain are upgraded.</td>
<td></td>
</tr>
</tbody>
</table>

### 3.1.59 watch

- **Privileged Exec Mode Commands**

  Repeats a specified CLI command at periodic intervals

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
watch <1-3600> <LINE>
```

**Parameters**

- `watch <1-3600> <LINE>`

<table>
<thead>
<tr>
<th><strong>watch &lt;1-3600&gt;</strong></th>
<th>Repeats a CLI command at a specified interval</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&lt;1-3600&gt;</strong></td>

</tbody>
</table>

**Examples**

```
rfs7000-37FABE#watch 1 show clock
rfs7000-37FABE#
```
3.1.60 exit

Privileged Exec Mode Commands

Ends the current CLI session and closes the session window

For more information, see exit.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
exit

Parameters
None

Examples
rfs7000-37FABE#exit
3.1.61 smart-cache

Privileged Exec Mode Commands

Pre-fetches cached content from the specified list of URLs

Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files, etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see smart-cache-policy.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

smart-cache pre-fetch-immediate <URL-LIST-NAME>

Parameters

- smart-cache pre-fetch-immediate <URL-LIST-NAME>

<table>
<thead>
<tr>
<th>smart-cache</th>
<th>Pre-fetches content from the specified list of URLs</th>
</tr>
</thead>
<tbody>
<tr>
<td>pre-fetch-immediate &lt;URL-LIST-NAME&gt;</td>
<td>Provide the URL list names (should be existing and configured). For more information on configuring URL lists, see url-list.</td>
</tr>
</tbody>
</table>

Examples

nx4500-5CFAB2B#smart-cache pre-fetch-immediate ?
  URL-LIST URL List to be Pre Fetched

nx4500-5CFAB2B#
3.1.62 virtual-machine

Privileged Exec Mode Commands

Installs, configures, and monitors the status of third-party virtual machines (VMs)

In addition to the WiNG VMs, the NX45XX, NX65XX, NX9500, and NX9510 series service platforms support the installation and administration of third-party VMs. However, the third-party VMs supported by these devices varies. The third-party VMs supported on NX45XX and NX65XX are:

- TEAM-URC
- TEAM-RLS
- TEAM-VoWLAN

The VM supported on NX9500 and NX9510 is:

- ADSP

Use the virtual-machine command to install the third-party VMs, and configure parameters, such as install media type and location, number of Virtual Central Processing Units (VCPUS), VM memory, VM disk, number of Virtual Network Interfaces (VIFs), and Virtual Networking Computing (VNC) port.

Installing third-party VMs saves on hardware cost and provides a unified VM management interface.

This section is organized into the following sub-sections:

- Syntax NX45XX, NX65XX
- Syntax NX9500 and NX9510

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax NX45XX, NX65XX

virtual-machine stop hard [ <VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

PRIVILEGED EXEC MODE COMMANDS 3-125
### virtual-machine uninstall [〈VM-NAME〉|〈team-urc〉|〈team-rls〉|〈team-vowlan〉] {on 〈DEVICE-NAME〉}

**Parameters** NX45XX, NX65XX

- **virtual-machine assign-usb-ports team-vowlan {on 〈DEVICE-NAME〉}**

Assigns USB ports to TEAM-VoWLAN

- **team-vowlan** – Assigns USB ports to TEAM-VoWLAN on a specified device
- **on 〈DEVICE-NAME〉** – Optional. Specify the device name.

Use the `no > virtual-machine > assign-usb-ports` command to reassign the port to WiNG.

**Note:** TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.

### virtual-machine console [〈VM-NAME〉|〈team-urc〉|〈team-rls〉|〈team-vowlan〉]

Connects to the VM’s console, based on the parameters passed. Select one of the following console options:

- **〈VM-NAME〉** – Connects to the console of the VM identified by the 〈VM-NAME〉 keyword. Specify the VM name.
- **team-urc** – Connects to the VM TEAM Unified Retail Communication’s (URC) (IP-PBX) console
- **team-rls** – Connects to the VM TEAM Radio Link Service (RLS) server’s console
- **team-vowlan** – Connects to the VM TEAM-VoWLAN’s (Voice over WLAN) console

### virtual-machine export 〈VM-NAME〉 [〈FILE〉|〈URL〉] {on 〈DEVICE-NAME〉}

Exports an existing VM image and settings. Use this command to export the VM to another NX45XX or NX65XX device in the same domain.

- **〈VM-NAME〉** – Specify the VM name.
- **〈FILE〉** – Specify the location and name of the source file (VM image). The VM image is retrieved and exported from the specified location.
- **〈URL〉** – Specify the destination location. This is the location to which the VM image is copied. Use one of the following formats to provide the destination path:
  - `ftp://<hostname|IP>[<port>]/path/file`
  - `http://<hostname|IP>[<port>]/path/file`
  - `sftp://<user>:<passwd>@<hostname|IP>[<port>]/path/file`
  - `http://<hostname|IP>[<port>]/path/file`
- **on 〈DEVICE-NAME〉** – Optional. Executes the command on a specified device or devices
- **〈DEVICE-NAME〉** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

The VM should be in a stop state during the export process. If the destination is a device, the image is copied to a predefined location (VM archive).
### PRIVILEGED EXEC MODE COMMANDS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **virtual-machine install** `<VM-NAME>` type [disk|iso disk-size `<SIZE>`|vm-archive] install-media `<FILE>|<URL>|<USB>` {autostart|memory|on|vcpus|vif-count|vnc} | Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process.  
- `<VM-NAME>` – Specify the VM name.  
- type – Specify the install-media (image) type. The options are:  
  - disk – Specifies the install media type as pre-installed OS disk image (located in the flash memory)  
  - iso disk-size `<SIZE>` – Specifies the install media type as ISO file. This is a single file, which contains the OS bootable install media.  
  - disk-size `<SIZE>` – If the install media type is ISO, specify the disk size in GB.  
  - vm-archive – Specifies the install media type as VM archive. The VM archive file is a tar.gz file consisting of a pre-installed OS disk image and an associated configuration file. The configuration is a standard libvirt VM template consisting of VM specific information.  

**Note:** After specifying the install media type, specify the location of the image. The image can be located in any of the following supported locations: FLASH, USB, or a remote location, such as http, ftp, sftp, tftp.

| **install-media** `<FILE>|<URL>|<USB>` {autostart|memory|on|vcpus|vif-count|vnc} | Specifies the install media location  
- `<FILE>` – Specifies the install-media file is located on flash, for example flash:/cache  
- `<URL>` – Specifies the install-media file is located on a remote URL. Provide the URL using one of the following formats:  
  - tftp://<hostname|IP>[:port]/path/file  
  - ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file  
  - sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file  
  - http://<hostname|IP>[:port]/path/file  
- `<USB>` – Specifies the install-media file is located on a USB. Provide the USB path and file name using the following format:  
  - usb<n>:/path/file  

After specifying the image location, you may provide the following information:  
- autostart – Optional. Specifies whether to autostart the VM on system reboot  
- ignore – Enables autostart on each system boot/reboot  
- start – Disables autostart (default setting)  
- memory – Optional. Defines the VM memory size  
  - `<512-8192>` – Specify the VM memory from 512 - 8192 MB. The default is 2048 MB.  
- on – Optional. Executes the command on a specified device  
  - `<DEVICE-NAME>` – Specify the service platform name.  
- vcpus – Optional. Specifies the number of VCPUS for this VM  
  - `<1-4>` – Specify the number of VCPUS from 1 - 4. The default setting is 4.  
- vif-count – Optional. Configures or resets the VIF number for this VM  
  - `<0-2>` – Specify the VIF number from 0 - 2. The default setting is 1. If assigning a virtual network interface for the VM, optionally specify the following parameters:  
    - vif-mac – Sets the MAC index for the virtual interfaces 1 & 2.  

Contd...
### virtual-machine install

**Syntax:**
```
virtual-machine install [team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

**Description:**
Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process. Select one of the following options:
- **team-urc** – Installs the VM TEAM-URC image
- **team-rls** – Installs the VM TEAM-RLS image
- **team-vowlan** – Installs the VM TEAM-VoWLAN image

The following keywords are common to all of the above parameters:
- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

### virtual-machine restart

**Syntax:**
```
virtual-machine restart [<VM-NAME>|hard|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

**Description:**
Restarts the VM
- **<VM-NAME>** – Restarts the VM identified by the **<VM-NAME>** keyword
- **team-urc** – Restarts the VM TEAM-URC
- **team-rls** – Restarts the VM TEAM-RLS
- **team-vowlan** – Restarts the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:
- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

The option 'hard' forces the specified VM to restart.

### Additional Options

- **vif-to-vmif** – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8. VMIFs are layer 2 interfaces on the WiNG bridge. Each custom VM can have up to a maximum of 2 virtual Ethernet interfaces. By default, these interfaces are internally connected to the Dataplane bridge through VMIF1, which is an untagged port with access VLAN 1.
- **vnc** – Enables VNC on the virtual interfaces 1 & 2
- **vnc** – Optional. Disables/enables VNC port. When enabled, provides remote access to VGA through the noVNC client.
- **disable** – Disables VNC
- **enable** – Enables VNC (default setting)
vif-count <0-2>|vif-mac <VIF-INDEX> [<MAC-INDEX>|<MAC>]|vif-to-vmif <VIF-INDEX> <VMIF-INDEX>|vnc [disable|enable] [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

Configures the VM settings
- autostart – Specifies whether to autostart the VM on system reboot
  - ignore – Enables autostart on each system reboot
  - start – Disables autostart
- memory – Defines the VM memory size
  - <512-8192> – Specify the VM memory from 512 - 8192 MB. The default is 1024 MB.
- vcpus – Specifies the number of VCPUs for this VM
  - <1-4> – Specify the number of VCPUs from 1 - 4.
- vif-count – Configures or resets the VM’s VIFs
  - <0-2> – Specify the Virtual Interface (VIF) number from 0 - 2.
- vif-mac – Configures the MAC address of the selected virtual network interface
  - <VIF-INDEX> – Select the VIF Index from 1 - 2.
  - <MAC-INDEX> – Specify the MAC index for the selected VIF from 1 - 8.
  - <MAC> – Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format.

Each VM has a maximum of two network interfaces ( indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the ‘set’ keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the dataplane (referred to as VMIF). These VMIFs are standard l2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM’s interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the vif-to-vmif command to map a VIF to a VMIF on the DP bridge.
- vif-to-vmif – Maps the virtual interface (1 or 2) to the selected VMIF interface.
  - Specify the VMIF interface index from 1 - 8.
  - <VIF-INDEX> – Selects the VIF index from 1 - 2.
  - <VMIF-INDEX> – Specify the VMIF index from 1 - 8.

WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two VM interfaces. Each VM interface can be mapped to one of the eight VMIF ports for NX4500 and NX6500 service platforms and twelve ports for NX9500 on the dataplane bridge. This mapping determines the destination for service platform routing.

By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1, by default, is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.
- vnc – Disables/enables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client.
  - disable – Disables VNC port
  - enable – Enables VNC port
After configuring the VM settings, identify the VM to apply the settings.

- `<VM-NAME>` – Applies these settings to the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Applies these settings to the VM TEAM-URC
- `team-rls` – Applies these settings to the VM TEAM-RLS
- `team-vowlan` – Applies these settings to the VM TEAM-VoWLAN
  - `on <DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

```
virtual-machine start [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

Starts the VM, based on the parameters passed. Select one of the following options:

- `<VM-NAME>` – Starts the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Starts the VM TEAM-URC
- `team-rls` – Starts the VM TEAM-RLS
- `team-vowlan` – Starts the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- `on <DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
- `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

```
virtual-machine stop [<VM-NAME>|hard|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```

Stops the VM, based on the parameters passed. Select one of the following options:

- `<VM-NAME>` – Stops the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Stops the VM TEAM-URC
- `team-rls` – Stops the VM TEAM-RLS
- `team-vowlan` – Stops the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- `on <DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
- `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

The option `hard` forces the selected VM to shutdown.
virtual-machine uninstall [<VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

Uninstalls the specified VM
- `<VM-NAME>` – Uninstalls the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Uninstalls the VM TEAM-URC
- `team-rls` – Uninstalls the VM TEAM-RLS
- `team-vowlan` – Uninstalls the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:
- `{on <DEVICE-NAME>}` – Optional. Executes the command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Note**: This command releases the VM's resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.

**Syntax NX9500 and NX9510**

- `virtual-machine console adsp`
- `virtual-machine install [adsp] {on <DEVICE-NAME>}`
- `virtual-machine restart [adsp] {on <DEVICE-NAME>}`
- `virtual-machine set disk-size <100-500> adsp {on <DEVICE-NAME>}`
- `virtual-machine set wing-memory <12288-32739>`
- `virtual-machine [start|stop] adsp {on <DEVICE-NAME>}`
- `virtual-machine uninstall adsp {on <DEVICE-NAME>}`

**Note**: On an NX95XX, you can use the install, start, stop, restart, and set commands to manage a third-party VM running on a NX45XX and NX65XX. You can also configure a third-party VM’s settings through a NX95XX series service platform.

**Parameters NX9500 and NX9510**

- `virtual-machine console adsp`

  Connects to the *Air-Defense Services Platform* (ADSP) VM’s management console. When ADSP is running on the NX9500 and NX9510 model service platforms, WiNG communicates with ADSP using a *single sign-on* (SSO) authentication mechanism. Once the user is logged in, WiNG gains access to ADSP without being prompted to login again at ADSP. However, the WiNG and ADSP databases are not synchronized. ADSP has its own user database, stored locally within its VM, which is accessed whenever a user logs directly into ADSP.

  WiNG and ADSP must be consistent in the manner events are reported up through a network hierarchy to ensure optimal interoperability and event reporting. To provide such consistency, WiNG has added support for an ADSP-like hierarchical tree. The tree resides within WiNG, and ADSP reads it from WiNG and displays the network hierarchy in its own ADSP interface. The hierarchical tree can also be used to launch ADSP modules (like Spectrum Analyzer) directly from WiNG. For more information on configuring WiNG tree-node structure, see `tree-node`. 
virtual-machine install adsp {on <DEVICE-NAME>}

Installs the ADSPVM

- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Before installing the ADSP VM, execute the upgrade command, giving the path and file name of the ADSP firmware image. This extracts the image on to the device (NX9500 or NX9510) on which the command has been executed. On successful completion of this process, execute the reload command to reboot the device. Once the device has been successfully rebooted, execute the `virtual-machine > install > adsp` command.

For example:

```
#upgrade tftp://20.1.1.60/adsp-9.1.1Jan 08 15:12:41 2016:
%DAEMON-6-INFO: lighttpd[2405]: 127.0.0.1 127.0.0.1:443 - "POST /mapi.fcgi HTTP/1.1" 200 192 "-" "-
-03-5.8.4.0-024D.img
Jan 08 15:12:51 2016: nx9500-6C874D : %DIAG-6-NEW_LED_STATE: LED state message FIRMWARE_UPGRADE_STARTED
from module led_msg
Running from partition /dev/sda8
Validating image file header
Extracting files (this may take some time).....Jan 08
15:12:53 2016: %DAEMON-6-INFO: lighttpd[2405]: 127.0.0.1
127.0.0.1:443 - "POST /mapi.fcgi HTTP/1.1" 200 923 "-" "-
```

virtual-machine restart adsp {on <DEVICE-NAME>}

Restarts the ADSP VM

- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

virtual-machine set disk-size <100-500> adsp {on <DEVICE-NAME>}

Sets the ADSP VM's disk size (in GB)

- <100-500> – Specify a value from 100 - 500 GB.
- adsp – Sets the VM as ADSP
  - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
    - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Stop the ADSP VM before executing this command.

virtual-machine set memory <512-8192> adsp {on <DEVICE-NAME>}

Modifies the ADSP VM's memory

- <512-8192> – Specify a value from 512 - 8192 MB.
- adsp – Sets the VM as ADSP
  - on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
    - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.
### virtual-machine set wing-memory `<12288-32739>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>virtual-machine set wing-memory </code>&lt;12288-32739&gt;`</td>
<td>Specifies the WiNG memory size in MB. This command is applicable only to the NX9500 and NX9510 service platforms. Use the <code>show &gt; virtual-machine-configuration</code> command to view the configured memory allocation. Use the <code>show &gt; virtual-machine-statistics</code> to view the current allocated memory allocation.</td>
</tr>
<tr>
<td>&lt;12288-32739&gt; – Specify a value from 12288 - 32739 MB. The default is 18432 MB.</td>
<td>The new memory setting takes effect only after the next boot.</td>
</tr>
</tbody>
</table>

### virtual-machine [start|stop] adsp {on `<DEVICE-NAME>`}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`virtual-machine [start</td>
<td>stop] adsp {on <code>&lt;DEVICE-NAME&gt;</code>}`</td>
</tr>
<tr>
<td>start – Starts the ADSP VM. Use this command to boot a shut down VM (in a stop state).</td>
<td></td>
</tr>
<tr>
<td>stop – Stops a running ADSP VM. Use this command to shut down a running VM.</td>
<td></td>
</tr>
<tr>
<td>on <code>&lt;DEVICE-NAME&gt;</code> – Optional. Executes the start/stop command on a specified device or devices</td>
<td></td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt; – Specify the service platform name. In case of multiple devices, list the device names separated by commas.</td>
<td></td>
</tr>
</tbody>
</table>

### virtual-machine uninstall adsp {on `<DEVICE-NAME>`}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>virtual-machine uninstall adsp {on </code>&lt;DEVICE-NAME&gt;<code>}</code></td>
<td>Uninstalls the ADSP VM.</td>
</tr>
<tr>
<td>adsp – Sets the VM as ADSP.</td>
<td></td>
</tr>
<tr>
<td>on <code>&lt;DEVICE-NAME&gt;</code> – Optional. Executes the command on a specified device or devices</td>
<td></td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt; – Specify the service platform name. In case of multiple devices, list the device names separated by commas.</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following examples show the VM installation process:

**Installation media: USB**

```
<DEVICE>#virtual-machine install `<VM-NAME>` type iso disk-size 8 install-media usb1://vms/win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable
```

**Installation media: pre-installed disk image**

```
<DEVICE> virtual-machine install `<VM-NAME>` type disk install-media flash://vms/win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on `<DEVICE-NAME>`
```

In the preceding example, the command is executed on the device identified by the `<DEVICE-NAME>` keyword. In such a scenario, the disk-size is ignored if specified. The VM has the install media as first boot device.

**Installation media: VM archive**

```
<DEVICE>#virtual-machine install type vm-archive install-media flash://vms/ `<VM-NAME>` vcpus 3
```

In the preceding example, the default configuration attached with the VM archive overrides any parameters specified.

**Exporting an installed VM:**

```
<DEVICE>#virtual-machine export `<VM-NAME>` `<URL>` on `<DEVICE-NAME>`
```
In the preceding example, the command copies the VM archive on to the URL (VM should be in stop state).

nx4500-5CFA2B# virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.
nx4500-5CFA2B#

| NOTE: Use the show > virtual-machine > [configuration|debugging|export|statistics] command to view installed VM details. |

### 3.1.63 raid

**Privileged Exec Mode Commands**

Enables *Redundant Array of Independent Disks* (RAID) management

RAID is a group of one or more independent, physical drives, referred to as an array or drive group. These physically independent drives are linked together and appear as a single storage unit or multiple virtual drives. Replacing a single, large drive system with an array, improves performance (input and output processes are faster) and increases fault tolerance within the data storage system.

In an array, the drives can be organized in different ways, resulting in different RAID types. Each RAID type is identified by a number, which determines the RAID level. The common RAID levels are 0, 00, 1, 5, 6, 50 and 60. The WiNG MegaRAID implementation supports RAID-1, which provides data mirroring, but does not support data parity. RAID-1 consists of a two-drive array, where the data is simultaneously written on both drives, ensuring total data redundancy. In case of a drive failure the information on the other drive is used to rebuild the failed drive.

An array is said to be degraded when one of its drives has failed. A degraded array continues to function and can be rebooted using the one remaining functional drive. When a drive fails, the chassis sounds an alarm (if enabled), and the CLI prompt changes to "RAID degraded". The failed drive is automatically replaced with a hot spare (provided a spare is installed). The spare is used to re-build the array.

Use this command to:

- Verify the current array status
- Start and monitor array consistency checks
- Retrieve date and time of the last consistency check
- Shut down drives before physically removing them
- Install new drives
- Assign drives as hot spares
- Identify a degraded drive
- Deactivate an alarm (triggered when a drive is removed from the array)

Supported in the following platforms:

- Service Platforms — NX7530, NX9500

**NOTE:** RAID controller drive arrays are available within NX7530 and NX9000 series service platforms (NX9000, NX9500 and NX9510 models) only. However, they can be administrated on behalf of a NX9000 profile by a different model service platform or controller. The NX9500 service platform includes a single Intel MegaRAID controller, configured to provide a single virtual drive. This virtual drive is of the RAID-1 type, and has a maximum of two physical drives. In addition to these two drives, there are three hot spares, which are used in case of a primary drive failure.

**Syntax**

```
raid [check|install|locate|remove|silence|spare]
raid [check|silence]
raid [install|locate|remove|spare] drive <0-4>
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>check</td>
<td>Starts a consistency check on the RAID array. Use the <code>show &gt; raid</code> command to view consistency check status. A consistency check verifies the data stored in the array. When regularly executed, it helps protect against data corruption, and ensures data redundancy. Consistency checks also warn of potential disk failures.</td>
</tr>
</tbody>
</table>
silence  Deactivates an alarm

**Note:** When enabled, an audible alarm is triggered when a drive in the array fails. The _silence_ command deactivates the alarm (sound).

**Note:** To enable RAID alarm, in the device configuration mode, use the _raid > alarm > enable_ command. A NX9500 profile can also have the RAID alarm feature activated. For more information on the enabling RAID alarm, see _raid_.

- raid [install|locate|remove|spare] drive <0-4>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>install &lt;0-4&gt;</td>
<td>Includes a new drive, inserted in one of the available slots, in the array. Specify the drive number.</td>
<td><strong>Note:</strong> Drives 0 and 1 are the array drives. Drives 2, 3, and 4 are the hot spare drives. You can include the new drive in a degraded array, or enable it as a hot spare. <strong>Note:</strong> If the array is in a degraded state, the re-build process is triggered and the new drive is used to repair the degraded array.</td>
</tr>
<tr>
<td>locate &lt;0-4&gt;</td>
<td>Enables LEDs to blink on a specified drive. Specify the drive number.</td>
<td><strong>Note:</strong> Blinking LEDs enable you correctly locate a drive.</td>
</tr>
<tr>
<td>remove &lt;0-4&gt;</td>
<td>Removes (shuts downs) a disk from the array, before it is physically removed from its slot. Specify the drive number containing the disk.</td>
<td><strong>Note:</strong> Use this command to also remove a hot spare.</td>
</tr>
<tr>
<td>spare &lt;0-4&gt;</td>
<td>Converts an unused drive into a hot spare. Specify the drive number.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C874D# raid install drive 0
Error: Input Error: Drive 0 is already member of array, can't be added

nx9500-6C874D#
CHAPTER 4
GLOBAL CONFIGURATION COMMANDS

This chapter summarizes the global-configuration commands in the CLI command structure.
The term global indicates characteristics or features effecting the system as a whole. Use the Global Configuration Mode to configure the system globally, or enter specific configuration modes to configure specific elements (such as interfaces or protocols). Use the configure terminal command (under PRIV EXEC) to enter the global configuration mode.

The following example describes the process of entering the global configuration mode from the PRIV EXEC mode:

<DEVICE>#configure terminal
<DEVICE>(config)#

NOTE: The system prompt changes to indicate you are now in the global configuration mode. The prompt consists of the device host name followed by (config) and a pound sign (#).

Commands entered in the global configuration mode update the running configuration file as soon as they are entered. However, these changes are not saved in the startup configuration file until a commit write memory command is issued.

<DEVICE>(config)#?
Global configuration commands:
  aaa-policy Configure a authentication/accounting/authorization policy
  aaa-tacacs-policy Configure an authentication/accounting/authorization TACACS policy
  alias Alias
  ap621 AP621 access point
  ap622 AP622 access point
  ap650 AP650 access point
  ap6511 AP6511 access point
  ap6521 AP6521 access point
  ap6522 AP6522 access point
  ap6532 AP6532 access point
  ap6562 AP6562 access point
  ap71xx AP71XX access point
  ap7502 AP7502 access point
  ap7522 AP7522 access point
  ap7532 AP7532 access point
  ap7562 AP7562 access point
  ap81xx AP81XX access point
  ap82xx AP82XX access point
ap8432  AP8432 access point
ap8533  AP8533 access point
application  Configure an application
application-policy  Configure an application policy
association-acl-policy  Configure an association acl policy
auto-provisioning-policy  Configure an auto-provisioning policy
bgp  BGP Configuration
Bonjour-gw-discovery-policy  Bonjour Gateway discovery policy
Bonjour-gw-forwarding-policy  Bonjour Gateway forwarding policy
Bonjour-gw-query-forwarding-policy  Bonjour Gateway Query forwarding policy
captive-portal  Configure a captive portal
clear  Clear
customer-identity  Client identity (DHCP Device Fingerprinting)
customer-identity-group  Client identity group (DHCP Fingerprint Database)
clonedev  Clone configuration object
cryptocmp-policy  CMP policy
customize  Customize the output of summary cli commands
database-client-policy  Configure database client policy
database-policy  Configure database policy
device  Configuration on multiple devices
device-categorization  Configure a device categorization object
dhcp-server-policy  DHCP server policy
dhcpv6-server-policy  DHCPv6 server related configuration
dns-whitelist  Configure a whitelist
event-system-policy  Configure a event system policy
ex3500  EX3500 device
ex3500-management-policy  Configure a ex3500 management policy
ex3500-gos-class-map-policy  Configure a ex3500 gos class-map policy
ex3500-gos-policy-map  Configure a ex3500 gos-policy-map
ex3524  EX3524 wireless controller
ex3548  EX3548 wireless controller
firewall-policy  Configure firewall policy
guest-management  Configure a guest management policy
help  Description of the interactive help system
host  Enter the configuration context of a device by specifying its hostname
igmp-snoop-policy  Create igmp snoop policy
inline-password-encryption  Store encryption key in the startup configuration file
ip  Internet Protocol (IP)
ipv6  Internet Protocol version 6 (IPv6)
ipv6-router-advertisement-policy  IPv6 Router Advertisement related configuration
l2tpv3  L2tpv3 tunnel protocol
mac  MAC configuration
management-policy  Configure a management policy
meshpoint  Create a new MESHPOINT or enter MESHPOINT configuration context for one or more MESHPOINTS
meshpoint-qos-policy  Configure a meshpoint quality-of-service policy
mint-policy  Configure the global mint policy
nac-list  Configure a network access control list
no  .
nsight-policy  Configure a Nsight policy
nx45xx  NX45XX integrated services platform
nx5500  NX5500 wireless controller
nx65xx  NX65XX integrated services platform
nx75xx  NX75XX wireless controller
nx9000  NX9000 wireless controller
passpoint-policy  Configure a passpoint policy
password-encryption  Encrypt passwords in configuration
profile  Profile related commands - if no parameters are given, all profiles are selected
<table>

## 4.1 Global Configuration Commands

*GLOBAL CONFIGURATION COMMANDS*

The following table summarizes Global Configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa-policy</td>
<td>Creates a AAA policy and enters its configuration mode. This policy enables administrators to define access control within the network.</td>
<td>page 4-10</td>
</tr>
<tr>
<td>aaa-tacacs-policy</td>
<td>Creates a AAA-TACACS policy and enters its configuration mode. This policy provides access control to network devices such as routers, network access servers, and other computing devices through centralized servers.</td>
<td>page 4-18</td>
</tr>
<tr>
<td>alias</td>
<td>Creates network, VLAN, service, etc. aliases</td>
<td>page 4-11</td>
</tr>
<tr>
<td>ap621</td>
<td>Adds an AP621 to the network</td>
<td>page 4-19</td>
</tr>
<tr>
<td>ap622</td>
<td>Adds an AP622 to the network</td>
<td>page 4-20</td>
</tr>
<tr>
<td>ap650</td>
<td>Adds an AP650 to the network</td>
<td>page 4-21</td>
</tr>
<tr>
<td>ap6511</td>
<td>Adds an AP6511 to the network</td>
<td>page 4-22</td>
</tr>
<tr>
<td>ap6521</td>
<td>Adds an AP6521 to the network</td>
<td>page 4-23</td>
</tr>
<tr>
<td>ap6522</td>
<td>Adds an AP6522 to the network</td>
<td>page 4-24</td>
</tr>
<tr>
<td>ap6532</td>
<td>Adds an AP6532 to the network</td>
<td>page 4-25</td>
</tr>
<tr>
<td>ap6562</td>
<td>Adds an AP6562 to the network</td>
<td>page 4-26</td>
</tr>
<tr>
<td>ap71xx</td>
<td>Adds an AP71XX to the network</td>
<td>page 4-27</td>
</tr>
<tr>
<td>ap7502</td>
<td>Adds an AP7502 to the network</td>
<td>page 4-28</td>
</tr>
<tr>
<td>ap7522</td>
<td>Adds an AP7522 to the network</td>
<td>page 4-29</td>
</tr>
<tr>
<td>ap7532</td>
<td>Adds an AP7532 to the network</td>
<td>page 4-30</td>
</tr>
<tr>
<td>ap7562</td>
<td>Adds an AP7562 to the network</td>
<td>page 4-31</td>
</tr>
<tr>
<td>ap81xx</td>
<td>Adds an AP81XX to the network</td>
<td>page 4-32</td>
</tr>
<tr>
<td>ap82xx</td>
<td>Adds an AP82XX to the network</td>
<td>page 4-33</td>
</tr>
<tr>
<td>ap8432</td>
<td>Adds an AP8432 to the network</td>
<td>page 4-34</td>
</tr>
<tr>
<td>ap8533</td>
<td>Adds an AP8533 to the network</td>
<td>page 4-35</td>
</tr>
<tr>
<td>application</td>
<td>Creates an application definition and enters its configuration mode. This command allows you to create a customized application detection definition.</td>
<td>page 4-36</td>
</tr>
<tr>
<td>application-policy</td>
<td>Creates an application policy and enters its configuration mode. This policy defines the actions executed on recognized HTTP (e.g. Facebook), enterprise (e.g. Webex) and peer-to-peer (e.g. gaming) applications or application-categories.</td>
<td>page 4-45</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>association-acl-policy</td>
<td>Creates an association ACL policy and enters its configuration mode. This policy restricts access by specifying a client MAC address or range of addresses to either include or exclude from WLAN connectivity.</td>
<td>page 4-67</td>
</tr>
<tr>
<td>auto-provisioning-policy</td>
<td>Creates an auto provisioning policy and enters its configuration mode. This policy defines the process by which an access point discovers controllers and associates with it.</td>
<td>page 4-68</td>
</tr>
<tr>
<td>bgp</td>
<td>Configures Border Gateway Protocol (BGP) settings</td>
<td>page 4-69</td>
</tr>
<tr>
<td>bonjour-gw-discovery-policy</td>
<td>Creates a Bonjour GW Discovery policy and enters its configuration mode. This policy configures the VLANs on which Bonjour services are located. This feature is supported only on the RFS7000 and AP7131 platforms.</td>
<td>page 4-71</td>
</tr>
<tr>
<td>bonjour-gw-forwarding-policy</td>
<td>Configures a Bonjour GW Forwarding policy and enters its configuration mode. This policy enables the discovery of services on VLANs not visible to the device running the Bonjour Gateway. This feature is supported only on the RFS7000 and AP7131 platforms</td>
<td>page 4-73</td>
</tr>
<tr>
<td>bonjour-gw-query-forwarding-policy</td>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character.
4.1.1 aaa-policy

Global Configuration Commands

Configures an Authentication, Accounting, and Authorization (AAA) policy. This policy configures multiple servers for authentication and authorization. Up to six servers can be configured for providing AAA services.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

aaa-policy <AAA-POLICY-NAME>

Parameters

- aaa-policy <AAA-POLICY-NAME>

Examples

rfs7000-37FABE(config)#aaa-policy test
rfs7000-37FABE(config-aaa-policy-test)#?

AAA Policy Mode commands:

- accounting Configure accounting parameters
- attribute Configure RADIUS attributes in access and accounting requests
- authentication Configure authentication parameters
- health-check Configure server health-check parameters
- mac-address-format Configure the format in which the MAC address must be filled in the Radius-Request frames
- no Negate a command or set its defaults
- proxy-attribute Configure radius attribute behavior when proxying through controller or rf-domain-manager
- server-pooling-mode Configure the method of selecting a server from the pool of configured AAA servers
- use Set setting to use

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
drop End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-aaa-policy-test)#

Related Commands

no Removes an existing AAA policy

NOTE: For more information on the AAA policy commands, see Chapter 8, AAA-POLICY.
4.1.2 alias

Global Configuration Commands

Configures network, VLAN, host, string, and network-service aliases

Aliases are objects having a unique name and content that is determined by the alias type (network, VLAN, and network-service).

A typical large enterprise network consists of multiple sites (RF Domains) having similar configuration parameters with few elements that vary, such as networks or network ranges, hosts having different IP addresses, and VLAN IDs or URLs. These elements can be defined as aliases (object oriented wireless firewalls) and used across sites by applying overrides to the object definition. Using aliases results in a configuration that is easier to understand and maintain.

Multiple instances of an alias (same type and same name) can be defined at any of the following levels: global, RF Domain, profile, or device. An alias defined globally functions as a top-level-object (TLO). Global aliases are not mandatory, and can be defined at the domain-level, or profile, or device-level only. An alias defined on a device is applicable to that device only. An alias defined on a profile applies to every device using the profile. Similarly, aliases defined at the RF Domain level apply to all devices within that domain.

Aliases defined at any given level can be overridden at any of the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

Aliases can be classified as:

- **address-range alias** – Maps a name to a range of IP addresses. An address-range alias can be utilized at different deployments. For example, if an ACL defines a pool of network addresses as 192.168.10.10 through 192.168.10.100 for an entire network, and a remote location's network range is 172.16.13.110 to 172.16.13.110, the remote location's ACL can be overridden using an alias. At the remote location, the ACL works with the 172.16.13.20-111 address range. A new ACL need not be created specifically for the remote deployment location.

- **host alias** – Maps a name to a specific host (identified by its IP address. For example, 192.168.10.23). A host alias can be utilized at different deployments. For example, if a central network DNS server is set a static IP address, and a remote location's local DNS server is defined, this host can be overridden at the remote location. At the remote location, the network is functional with a local DNS server, but uses the name set at the central network. A new host need not be created at the remote location. This simplifies creating and managing hosts and allows an administrator to better manage specific local requirements.

- **network alias** – Maps a name to a network. A network alias can be utilized at different deployments. For example, if a central network ACL defines a network as 192.168.10.0/24, and a remote location's network range is 172.16.10.0/24, the ACL can be overridden at the remote location to suit their local (but remote) requirement. At the remote location, the ACL functions with the 172.16.10.0/24 network. A new ACL need not be created specifically for the remote deployment. This simplifies ACL definition and allows an administrator to better manage specific local requirements.

- **network-group alias** – Maps a name to a single or a range of addresses of devices, hosts, and network configurations. Network configurations are complete networks in the form 192.168.10.0/24 or IP address range in the form 192.168.10.10-192.168.10.20.

  A network-group alias can contain a maximum of eight (8) host entries, eight (8) network entries, and eight (8) IP address-range entries. A maximum of 32 network-group alias entries can be created.

  A network-group alias can be used in IP firewall rules to substitute hosts, subnets, and IP address ranges.

- **network-service alias** – Maps a name to service protocols and ports to match. Both source and destination ports are configurable. For each protocol, up to 2 source port ranges and up to 2 destination port ranges can be configured. A maximum of 4 protocol entries can be configured per network-service alias. When used with an ACL, the network-service alias defines the service-specific components of the ACL rule. Overrides can be applied to the service alias, at the device level, without modifying the ACL. Application of overrides to the service alias allows an ACL to be used across sites.
Use a network-service alias to associate more than one IP address to a network interface, providing multiple connections to a network from a single IP node.

NOTE: When used with ACLs, network, network-group, and network-service aliases act as enhanced firewalls.

- **number alias** – Maps a name to a number
- **vlan alias** – Maps a name to a VLAN ID. A VLAN alias can be used at different deployments. For example, if a named VLAN is defined as 10 for the central network, and the VLAN is set at 26 at a remote location, the VLAN can be overridden at the deployment location with an alias. At the remote deployment location, the network is functional with a VLAN ID of 26 but utilizes the name defined at the centrally managed network. A new VLAN need not be created specifically for the remote deployment.
- **string alias** – Maps a name to a specific string (for example, RF Domain name). A host alias can be utilized at different deployments. For example, if the main domain at a remote location is called `loc1.domain.com` and at another deployment location it is called `loc2.domain.com`, the alias can be overridden at the remote location to suit the local (but remote) requirement. At one remote location, the alias functions with the `loc1.domain.com` domain and at the other with the `loc2.domain.com` domain.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
alias [address-range|host|network|network-group|network-service|number|string|vlan]
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
alias host <HOST-ALIAS-NAME> <HOST-IP>
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP>] [host <HOST-IP>]
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254]|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp] 
  ({<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nttp|nntp|pop3|proto|sip|smtp|sourceport|ssh|telnet|tftp|www})
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254]|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp] 
  ({<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nttp|nntp|pop3|proto|sip|smtp|sourceport <1-65535>|<WORD>|ssh|telnet|tftp|www})
alias number <NUMBER-ALIAS-NAME> <0-4294967295>
alias string <STRING-ALIAS-NAME> <LINE>
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

**Parameters**

- `alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>`
  - Creates a address range alias, defining a range of IP addresses
  - `<ADDRESS-RANGE-ALIAS-NAME>` – Specify the address range alias name.
    - **Note:** Alias name should begin with `$`.  

---

**NOTE:**
When used with ACLs, network, network-group, and network-service aliases act as enhanced firewalls.

rfs4000-229D58(config)#
```

Example 1:

```
rfs4000-229D58(config)#alias network-group $test host 192.168.1.10 192.168.1.11
rfs4000-229D58(config)#alias network-group $test network 192.168.2.0/24 192.168.3.0/24
rfs4000-229D58(config)#alias network-group $test address-range 192.168.4.10 to 192.168.4.20
```

In the preceding example, the network-group alias '$test' includes hosts 192.168.1.10 and 192.168.1.11, networks 192.168.2.0/24 and 192.168.3.0/24 and address-range 192.168.4.10 to 192.168.4.20.
Example 2:
rfs4000-229D58(config)#alias network-service $kerberos proto tcp 749 750 80 proto tcp sourceport 20 proto udp 68 sourceport 67
rfs4000-229D58(config)#commit

In the preceding example, the network-service alias ‘$kerberos’ is configured to allow following traffic:

- TCP traffic to destination ports 749, 750, and 80
- TCP traffic from source port 20
- UDP traffic to destination port 68 and from source port 67

rfs4000-229D58(config)#alias string $DOMAIN test.example_company.com

4.1.3 aaa-tacacs-policy

Global Configuration Commands

Configures AAA Terminal Access Controller Access-Control System (TACACS) policy. TACACS is CISCO protocol that provides access control to network devices such as routers, network access servers, and other computing devices through one or more centralized servers. A TACACS Authentication server should be configured when the server preference is authenticated server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>

Parameters

- aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>

Examples

rfs7000-37FABE(config)#aaa-tacacs-policy testpolicy
rfs7000-37FABE(config-aaa-tacacs-policy-testpolicy)#?
AAA TACACS Policy Mode commands:
accounting Configure accounting parameters
authentication Configure authentication parameters
authorization Configure authorization parameters
no Negate a command or set its defaults
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-aaa-tacacs-policy-testpolicy)#

Related Commands

no Removes an existing AAA TACACS policy

NOTE: For more information on the AAA-TACACS policy commands, see Chapter 25, AAA-TACACS-POLICY.
4.1.4 ap621

Global Configuration Commands

Adds an AP621 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ap621 <MAC>

Parameters

- <MAC> Specify the AP621’s MAC address.

Examples

rfs7000-37FABE(config)#ap621 5C-0E-8B-E3-C3-56
rfs7000-37FABE(config-device-5C-0E-8B-E3-C3-56)#show context
ap621 5C-0E-8B-E3-C3-56
  use profile default-ap621
  use rf-domain default
  hostname ap621-E3C356
rfs7000-37FABE(config-device-5C-0E-8B-E3-C3-56)#

rfs7000-37FABE(config)#show wireless ap configured

rfs7000-37FABE(config)#

Related Commands

no Removes an AP621 from the network
4.1.5 ap622

Global Configuration Commands

Adds an AP622 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
ap622 <MAC>
```

Parameters

- `<MAC>` Specify the AP622’s MAC address.

Examples

```
rfs7000-37FABE(config)#ap622 B4-C7-99-43-C3-DC
rfs7000-37FABE(config-device-B4-C7-99-43-C3-DC)#show context

**Related Commands**

- `no` Removes an AP6562 from the network
4.1.12 ap71xx

Global Configuration Commands

Adds an AP71XX series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
ap71xx <MAC>

Parameters
- ap71xx <MAC>

Examples
nx4500-5CFA2B(config)#ap71xx 00-23-68-11-E6-C4
nx4500-5CFA2B(config-device-00-23-68-11-E6-C4)#show context

4.1.21 application

Global Configuration Commands

The following table lists the commands that enable you to enter the Application definition configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>application</td>
<td>Creates a new application definition and enters its configuration mode. This command allows you to create a customized application detection definition.</td>
<td>page 4-37</td>
</tr>
<tr>
<td>application-config-mode commands</td>
<td>Summarizes application definition configuration mode commands.</td>
<td>page 4-39</td>
</tr>
</tbody>
</table>
4.1.21.1 application

Creates a new application definition and enters its configuration mode. This command allows you to create a customized application recognition definition.

The WiNG software uses Protocol and Application Classification Engine (PACE), a third-party Deep Packet Inspection (DPI) engine from IPOQUE, to enable application recognition. When enabled, the PACE evaluation package inspects network traffic to determine the application/protocol type. It can detect common HTTP-based applications (for example, Youtube and Facebook), enterprise-based applications (for example, Lync and Webex), and peer-to-peer applications (for example Facetime and Bittorrent) in the network’s traffic. PACE uses a range of DPI technologies to identify approximately 700 built-in applications that are grouped into twenty two (22) application categories. You can use this command to add applications not included in the PACE package.

Application recognition can be used as a filter to classify packets based on their application/protocol type. Once classified, an action is applied, such as deny, allow, mark, or rate-limit on the packet. These actions are defined in an application policy. Therefore, an application policy, like an Access Control List (ACL), is a set of rules that control traffic within the managed network. The match criteria, used by the application policy, are the built-in PACE app-categories and/or the customized applications configured here.

**NOTE:** The PACE DPI engine has to be enabled to trigger application recognition. To enable DPI, in the device or profile configuration mode, execute the dpi command. To enable customized application detection, in the device/profile configuration mode execute the dpi > custom-app <APPLICATION-NAME> command. For more information, see dpi.

**NOTE:** To enable application recognition based traffic control, apply this application or PACE app-categories to an application policy, and use the policy with the RADIUS user authentication process, user role, WLAN, or bridge VLAN. For more information, see application-policy.

Supported in the following platforms:
- Access Points — AP7522, AP7532, AP7562
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

application <APPLICATION-NAME>

**Parameters**

- application <APPLICATION-NAME>

<table>
<thead>
<tr>
<th><strong>application &lt;APPLICATION-NAME&gt;</strong></th>
<th>Creates a new application definition and enters its configuration mode</th>
</tr>

<tr>
<td>&lt;NETWORK-SERVICE-ALIAS-NAME&gt;</td>
<td>• &lt;NETWORK-SERVICE-ALIAS-NAME&gt; – Specify the network-service alias name (should be existing and configured). The network-service alias should specify the protocols and ports to match.</td>
</tr>
<tr>
<td>url-list</td>
<td>Associates a URL list with this application definition</td>
</tr>
<tr>
<td>&lt;URL-LIST-NAME&gt;</td>
<td>• &lt;URL-LIST-NAME&gt; – Specify the URL list name (should be existing and configured). The URL list should specify the HTTP URL host names to match.</td>
</tr>
</tbody>
</table>

Examples

nx9500-6C8809(config-application-Bing)#use url-list Bing

nx9500-6C8809(config-application-Bing)#show context application Bing
description "Bing is Microsoft's web search engine"
app-category streaming
use url-list Bing
https server-cert common-name exact bing.com
nx9500-6C8809(config-application-Bing)#

Related Commands
- no
  Removes the network-service alias or the URL list associated with this application definition
4.1.21.2.5 no

* application-config-mode commands

Removes or resets this application definition’s configured settings
Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

- no [app-category|description|https|use]
- no [app-category|description]
- no https server-cert common-name [contains|ends-with] <WORD>
- no use [network-service <NETWORK-SERVICE-ALIAS-NAME>|url-list <URL-LIST-NAME>]

**Parameters**

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes or resets this application definition’s configured settings based on the parameters passed</th>
</tr>
</thead>
</table>

**Examples**

The following example displays the application definition ‘Bing’ parameters before the ‘no’ commands are executed:

```
nx9500-6C8809(config-application-Bing)#show context
application Bing
description "Bing is Microsoft's web search engine"
app-category streaming
use url-list Bing
https server-cert common-name exact bing.com
```

```
nx9500-6C8809(config-application-Bing)#no description
```

```
nx9500-6C8809(config-application-Bing)#no https server-cert common-name exact bing.com
```

The following example displays the application definition ‘Bing’ parameters before the ‘no’ commands are executed:

```
nx9500-6C8809(config-application-Bing)#show context
application Bing
app-category streaming
use url-list Bing
```

```
nx9500-6C8809(config-application-Bing)#
```
4.1.22 application-policy

The following table lists the commands that enable you to enter the Application policy configuration mode:

Table 4.4 Application-Policy Config Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>application-policy</td>
<td>Creates an application policy and enters its configuration mode</td>
<td>page 4-46</td>
</tr>
<tr>
<td>application-policy-mode commands</td>
<td>Summarizes the application policy configuration mode commands</td>
<td>page 4-48</td>
</tr>
</tbody>
</table>
4.1.22.1 application-policy

Create an application policy and enters its configuration mode.

An application policy defines actions to be executed on recognized HTTP (Facebook), enterprise (Webex) and peer-to-peer (gaming) applications or application categories. These rules are numbered and are applied to each packet sequentially in increasing order of their precedence number. Once a match is made, the packet is either forwarded, dropped, marked, or rate limited depending on the action specified in that rule.

Application recognition is the key to application-based traffic control and prioritization within a managed network. The WiNG software uses PACE, a third-party DPI engine from IPOQUE, to enable application recognition. When enabled, PACE uses various DPI technologies to identify a range of applications that include Web-based and other difficult-to-classify protocols utilizing dynamic TCP/UDP port assignments. When an application is recognized and classified, a pre-defined application policy invokes appropriate action for that specific application. PACE provides a default database of application definitions (approximately 700 canned application signatures). In addition, to these, there is a provision to add new customized application definitions. You can also customize the default, canned application definitions.

Once created and configured, apply the application policy to the following levels within the network to enforce application assurance:

- RADIUS CoA usage – In the device/profile configuration mode, use the `application-policy > radius > <APPLICATION-POLICY-NAME>` command to apply the policy to every user successfully authenticated by the RADIUS server.
- User role – In the role-policy-user-role configuration mode, use the `use > application-policy <APPLICATION-POLICY-NAME>` command to apply the policy to all users assigned to the role.
- WLAN – In the WLAN configuration mode, use the `use > application-policy <APPLICATION-POLICY-NAME>` command to apply the policy to all users accessing the WLAN.
- Bridge VLAN – In the bridge VLAN configuration mode, use the `use > application-policy <APPLICATION-POLICY-NAME>` command to apply the policy for the traffic corresponding to the bridged VLAN.

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`application-policy <APPLICATION-POLICY-NAME>`

Parameters

- `application-policy <APPLICATION-POLICY-NAME>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>application-policy &lt;APPLICATION-POLICY-NAME&gt;</code></td>
<td>Specify the application policy name. If an application policy with the specified name does not exist, it is created. The name should not exceed 32 characters in length.</td>
</tr>
</tbody>
</table>
Examples

nx9500-6C8809(config)#application-policy TestAppliPolicy
nx9500-6C8809(config-app-policy-TestAppliPolicy)#?

Application Policy Mode commands:
- allow: Allow packets
- deny: Deny packets
- description: Application policy description
- enforcement-time: Configure policy enforcement based on time
- logging: Application recognition logging
- mark: Mark packets
- no: Negate a command or set its defaults
- rate-limit: Rate-limit packets
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

<td>page 4-65</td>
</tr>
</tbody>
</table>
### 4.1.22.2.1 allow

**application-policy-mode commands**

Creates an allow rule and configures the match criteria based on which packets are filtered and the allow access action applied.

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

**Parameters**

- **allow [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]**
  - Uses application category as the match criteria
    - `<APP-CATEGORY-NAME>` – Specify the application category. The options are:
      - antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote\_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet’s app-category is matched with the value specified here. In case of a match, the system forwards the packet or else drops it.
    - `all` – The system forwards all packets irrespective of the application category.

- **application <APPLICATION-NAME>**
  - Uses application name as the match criteria
    - `<APPLICATION-NAME>` – Specify the application name. Each packet’s application is matched with the application name specified here. In case of a match, the system forwards the packet.

**Note:** The WiNG database provides approximately 381 canned applications. In addition to these, the database also includes custom-made applications. These are application definitions created using the `application` command.

- **schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)**
  - Schedules an enforcement time for this allow rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time.
    - `schedule <SCHEDULE-POLICY-NAME>` – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced at the same time (defined by the `application-policy > enforcement-time` command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy’s enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as ‘all’).
    - `<SCHEDULE-POLICY-NAME>` – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule.

**Note:** In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see `enforcement-time`. 
Examples

The following examples show two allow rules, allowing access to all packets belonging to the application category 'business' and the application 'Bing':

```
nx9500-6C8809(config-app-policy-Bing)#allow application Bing [TAB]
Bing BitTorrent BitTorrent_encrypted
BitTorrent_plain BitTorrent_uTP BitTorrent_uTP_encrypted
```

**Note:** Bing is not one of the WiNG built-in database applications. It is a customized application created using the `application` command.

```
nx9500-6C8809(config-app-policy-Bing)#allow application Bing precedence 1
```

```
nx9500-6C8809(config-app-policy-Bing)#allow app-category [TAB]
all antivirus\ update audio
business conference custom
database filetransfer gaming
generic im mail
mobile network\ management other
p2p remote_control social\ networking
standard streaming tunnel
video voip web
```

**Note:** Bing is not one of the WiNG built-in database applications. It is a customized application created using the `application` command.

```
nx9500-6C8809(config-app-policy-Bing)#allow app-category business precedence 2
```

```
nx9500-6C8809(config-app-policy-Bing)#show context application-policy Bing
allow application Bing precedence 1
allow app-category business precedence 2
```

**Note:** Bing is not one of the WiNG built-in database applications. It is a customized application created using the `application` command.

```
nx9500-6C8809(config-app-policy-Bing)#allow application Bing precedence 1
```

```
nx9500-6C8809(config-app-policy-Bing)#deny app-category streaming precedence 2
```

The following configuration is incorrect:

```
nx9500-6C8809(config-app-policy-Bing)#deny app-category streaming precedence 1
```

```
nx9500-6C8809(config-app-policy-Bing)#allow application Bing precedence 2
```

Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent allow rule.

**Note:** The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.
The following example shows an application policy 'SocialNet' having an allow rule with an associated schedule policy named 'Faceook':

```
nx9500-6C8809(config-app-policy-SocialNet)#allow application facebook schedule Facebook precedence 1
```

```
nx9500-6C8809(config-app-policy-SocialNet)#show context
application-policy SocialNet
  description "This application policy relates to Social Networking sites."
  allow application facebook schedule Facebook precedence 1
nx9500-6C8809(config-app-policy-SocialNet)#
```

The schedule policy 'FaceBook' configuration as follows. As per this policy, the above allow rule will apply to all FaceBook packets every Friday between 13:00 and 18:00 hours.

```
nx9500-6C8809(config-schedule-policy-FaceBook)#show context
schedule-policy FaceBook
  description "Allows FaceBook traffic on Fridays."
  time-rule days friday start-time 13:00 end-time 18:00
nx9500-6C8809(config-schedule-policy-FaceBook)#
```

**Related Commands**

<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes this allow rule from the application policy</td>
</tr>
</tbody>
</table>
### 4.1.22.2.2 deny

**application-policy-mode commands**

Creates a deny rule and configures the match criteria based on which packets are filtered and the deny access action applied.

**Syntax**

```plaintext
deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

**Parameters**

- `deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]` creates a deny rule and configures the match criteria. The options are `app-category` and `application`.
  - `app-category` specifies the application category as the match criteria. The options are:
    - `<APP-CATEGORY-NAME>` – Specifies the application category name. The options are: antivirus\update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\management, other, p2p, remote\control, social\networking, standard, streaming, tunnel, video, voip, and web. Each packet’s app-category is matched with the value specified here. In case of a match, the system drops the packet.
    - `all` – The system drops all packets irrespective of the application category.
  - `application` specifies the application name as the match criteria. The options are:
    - `<APPLICATION-NAME>` – Specifies the application name. Each packet’s application is matched with the application name specified here. In case of a match, the system drops the packet.

- `schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)` associates a schedule policy with the rule. It is used to specify the enforcement time for this deny rule by associating a schedule policy with it.
  - `<SCHEDULE-POLICY-NAME>` specifies the policy name (should be existing and configured).

**Note:** There are approximately some 381 canned applications in the database. In addition to these, the database displays custom-made applications also. These are application definitions created using the `application` command.
Examples

The following example shows one deny rule, denying access to all packets belonging to the application category 'social\ networking':

```
x9500-6C8809(config-app-policy-Bing)#den
```
nx9500-6C8809(config-app-policy-SocialNet)#show context
application-policy SocialNet
description "This application policy relates to Social Networking sites."
allow application facebook schedule FaceBook precedence 1
deny app-category "social networking" schedule DenyS-N precedence 2
nx9500-6C8809(config-app-policy-SocialNet)#

**Related Commands**

</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes this deny rule from the application policy</td>
</tr>
</tbody>
</table>
4.1.22.2.3 **description**

*application-policy-mode commands*

Configures a brief description for this application policy that enables you to differentiate it from other application policies.

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

description <LINE>

**Parameters**

- description <LINE>

<table>
<thead>
<tr>
<th>description &lt;LINE&gt;</th>
<th>Configures this application policy’s description</th>
</tr>
</thead>
<tbody>
<tr>
<td>- &lt;LINE&gt;</td>
<td>- Specify a brief description not exceeding 80 characters in length.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-app-policy-Bing)#description "This application policy allows Bing search engine packets"
nx9500-6C8809(config-app-policy-Bing)#show context application-policy Bing
description "This application policy allows Bing search engine packets"
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
nx9500-6C8809(config-app-policy-Bing)#
```

**Related Commands**

- **no** Removes this application policy’s description
4.1.22.2.4 enforcement-time

> application-policy-mode commands

Configures an enforcement time period in days and hours for this application policy. The enforcement time is applicable only to those rules, within the application policy, that do not have a schedule policy associated. By default an application policy is enforced on all days.

**NOTE:** Schedule policies are a means of enforcing allow/deny/mark/rate-limit rules at different time periods. If no schedule policy is applied, all rules within an application policy are enforced at the time specified using this enforcement-time command. For more information on configuring a schedule policy, see schedule-policy.

---

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>
```

**Parameters**

- **enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>}**

---

<table>
<thead>
<tr>
<th>enforcement-time days</th>
<th>Enforces this application policy on only the days specified here</th>
</tr>
</thead>
<tbody>
<tr>
<td>• sunday –</td>
<td>Enforces the policy only on Sundays</td>

<tbody>
<tr>
<td>no</td>
<td>Removes this application policy's enforcement period</td>
</tr>
</tbody>
</table>
4.1.22.2.5 logging

*application-policy-mode commands*

Enables logging of application recognition hits made by the PACE DPI engine. It also sets the logging level.

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
logging [level|on]
logging on
logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings]
```

**Parameters**

- **logging on**
  - Enables logging of application recognition hits made by the PACE DPI engine. This option is disabled by default.
  
- **logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings]**
  - Sets the logging level for application recognition hits made by the PACE DPI engine. This option is disabled by default.
    - `<0-7>` – Sets the message logging severity level on a scale of 0 - 7
    - `emergencies` – Severity level 0: System is unusable
    - `alerts` – Severity level 1: Requires immediate action
    - `critical` – Severity level 2: Critical conditions
    - `errors` – Severity level 3: Error conditions
    - `warnings` – Severity level 4: Warning conditions
    - `notifications` – Severity level 5: Normal but significant conditions (this is the default setting)
    - `informational` – Severity level 6: Informational messages
    - `debugging` – Severity level 7: Debugging messages

**Examples**

```
nx9500-6C8809(config-app-policy-Bing)#logging level critical
nx9500-6C8809(config-app-policy-Bing)#show context application-policy Bing
description "This application policy allows Bing search engine packets"
  enforcement-time days weekdays start-time 12:30 end-time 20:00
  allow application Bing precedence 1
  allow app-category business precedence 2
  deny app-category "social networking" precedence 3
  logging level critical
nx9500-6C8809(config-app-policy-Bing)#
```

**Related Commands**

```
no
```

- Resets the logging level to default (notifications). And the `no > logging > on` command disables DPI logging.
### 4.1.22.2.6 mark

<table>
<thead>
<tr>
<th><strong>application-policy-mode commands</strong></th>
</tr>
</thead>
</table>

Creates a mark rule and configures the match criteria based on which packets are marked

Marks packets, matching a specified set of application categories or applications/protocols, with 802.1p priority level or *Differentiated Services Code Point (DSCP) type of service* (ToS) code. Marking packets is a means of identifying them for specific actions, and is used to provide different levels of service to different traffic types.

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX7500, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
[8021p <0-7]|dscp <0-63> schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)
```

#### Parameters

- **mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]
  [8021p <0-7]|dscp <0-63> schedule <SCHEDULE-POLICY-NAME> (precedence <1-256>)**

<table>
<thead>
<tr>
<th><strong>mark</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Creates a mark rule and configures the match criteria. When applied, the rule marks packets, matching the criteria configured here, with 802.1p priority value or DSCP code. The match criteria options are: app-category and application.</td>
</tr>
</tbody>
</table>

| **app-category [<APP-CATEGORY-NAME>|all]** |
|------------------------------------------|
| Uses application category as the match criteria |
| - `<APP-CATEGORY-NAME>` – Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet’s app-category is matched with the value specified here. In case of a match, the system marks the packet. |
| - all – The system marks all packets irrespective of the application category. |

<table>
<thead>
<tr>
<th><strong>application &lt;APPLICATION-NAME&gt;</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Uses application name as the match criteria</td>
</tr>
<tr>
<td>- <code>&lt;APPLICATION-NAME&gt;</code> – Specify the application name. Each packet’s application is matched with the application name specified here. In case of a match, the system marks the packet.</td>
</tr>
</tbody>
</table>

**Note:** The WING database provides approximately 381 canned applications. In addition to these, the database includes custom-made applications. These are application definitions created using the `application` command.

<table>
<thead>
<tr>
<th><strong>8021p &lt;0-7&gt;</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Marks packets matching the specified criteria with 802.1p priority value</td>
</tr>
<tr>
<td>- <code>&lt;0-7&gt;</code> – Specify a value from 0 - 7.</td>
</tr>
</tbody>
</table>

**Note:** The IEEE 802.1p signaling standard enables marking of layer 2 network traffic. Layer 2 network devices (such as switches), using 802.1p standards, group traffic into classes based on their 802.1p priority value, which is appended to the packet’s MAC header. In case of traffic congestion, packets with higher priority get precedence over lower priority packets and are forwarded first.

<table>
<thead>
<tr>
<th><strong>dscp &lt;0-63&gt;</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Marks packets matching the specified criteria with DSCP ToS code</td>
</tr>
<tr>
<td>- <code>&lt;0-63&gt;</code> – Specify a value from 0 - 63.</td>
</tr>
</tbody>
</table>

**Note:** The DSCP protocol marks layer 3 network traffic. Layer 3 network devices (such as routers) using DSCP, mark each layer 3 packet with a six-bit DSCP code, which is appended to the packet’s IP header. Each DSCP code is assigned a corresponding level of service, enabling packet prioritization.
**Examples**

nx9500-6C8809(config-app-policy-Bing)#mark app-category video dscp 9 precedence 4

nx9500-6C8809(config-app-policy-Bing)#mark application facetime dscp 10 precedence 5

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
logging level critical
nx9500-6C8809(config-app-policy-Bing)#

**schedule**

<table>
<thead>
<tr>
<th>&lt;SCHEDULE-POLICY-NAME&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedules an enforcement time for this mark rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time.</td>
</tr>
<tr>
<td>• schedule &lt;SCHEDULE-POLICY-NAME&gt; – Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced at the same time (defined by the <code>application-policy &gt; enforcement-time</code> command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy’s enforcement time. In other words the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as ‘all’).</td>
</tr>
<tr>
<td>• &lt;SCHEDULE-POLICY-NAME&gt; – Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule.</td>
</tr>
</tbody>
</table>

**precedence**

| <1-256> |
| Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule. |
| Let us consider application `youtube` belonging to app-category `streaming`. The action required is: Allow `youtube` packets and deny all other applications belonging to app-category `streaming`. The rules can be defined as: 
  #allow application youtube precedence 1
  #deny app-category streaming precedence 2
| The following configuration is incorrect: 
  #deny app-category streaming precedence 1
  #allow application youtube precedence 2
| Once the deny app-category streaming precedence 1 rule is hit, all streaming packets, including `youtube`, are dropped. Consequently, there are no packets left to apply the subsequent allow rule. |
| Note: The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type. |

</tr>
</tbody>
</table>
4.22.2.7 rate-limit

> application-policy-mode commands

Creates a rate-limit rule and configures the match criteria.

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

\[
\text{rate-limit \ [app-category \ [<\text{APP-CATEGORY-NAME}|\text{all}]|application \ <\text{APPLICATION-NAME}>\] (\ [egress|ingress]\) rate \ <50-1000000> max-burst-size \ <2-1024> \ schedule \ <\text{SCHEDULE-POLICY-NAME}> \ (precedence \ <1-256>)}
\]

Parameters

- **rate-limit** [app-category [\ <\text{APP-CATEGORY-NAME}|\text{all}]|application \ <\text{APPLICATION-NAME}>\] (\ [egress|ingress]\) rate \ <50-1000000> max-burst-size \ <2-1024> \ schedule \ <\text{SCHEDULE-POLICY-NAME}> \ (precedence \ <1-256>)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>rate-limit</strong></td>
<td>Creates a rate-limit rule and configures the match criteria. When applied, the rule applies a rate-limit to packets that match the criteria configured here. These packets could be incoming, outgoing, or both. The match criteria options are: app-category and application.</td>
</tr>
<tr>
<td><strong>app-category</strong> [\ &lt;\text{APP-CATEGORY-NAME}</td>
<td>\text{all}]</td>
</tr>
<tr>
<td><strong>application</strong> &lt;\text{APPLICATION-NAME}&gt;</td>
<td>Uses application name as the match criteria.\n- \ &lt;\text{APPLICATION-NAME}&gt; – Specify the application name. Each packet’s application is matched with the application name specified here. In case of a match, the system rate-limits the packet.</td>
</tr>
<tr>
<td>\ [egress</td>
<td>ingress]\</td>
</tr>
<tr>
<td><strong>rate</strong> &lt;50-1000000&gt;</td>
<td>The following parameters are common to the ‘egress’ and ‘ingress’ keywords:\n- \ rate – Configures the rate limit, in Kbps, for both incoming and outgoing packets\n  \ - \ &lt;50-1000000&gt; – Specify the rate limit from 50 - 1000000 Kbps.</td>
</tr>
<tr>
<td><strong>max-burst-size</strong></td>
<td>The following parameters are common to the ‘egress’ and ‘ingress’ keywords:\n- \ max-burst-size – Configures the maximum burst size, in Kbytes, for both incoming and outgoing packets\n  \ - \ &lt;2-1024&gt; – Specify the maximum burst size from 2 - 1024 Kbytes.</td>
</tr>
</tbody>
</table>
Schedule a specific enforcement time for this rate-limit rule by associating a schedule policy with it. Use this parameter to apply rule-specific enforcement time.

- `schedule <SCHEDULE-POLICY-NAME>`: Associates a schedule policy with the rule. When associated, the rule is enforced only on the days and time configured in the schedule policy. Without the association of a schedule policy, all rules within an application policy are enforced at the same time (defined by the `application-policy > enforcement-time` command). If scheduling a rule, ensure that the time configured in the schedule policy is a subset of the application policy’s enforcement time. In other words, the application policy should be active when the rule is being enforced. For example, if the application policy is enforced on Mondays from 10:00 to 22:00 hours and the schedule policy time-rule is set for Fridays, then this rule will never be hit. When enforcing rules at different times, the best practice would be to keep the application policy active at all time (i.e., retain the default enforcement-time setting as ‘all’).

- `<SCHEDULE-POLICY-NAME>`: Specify the policy name (should be existing and configured). After applying a schedule policy, specify a precedence for the rule.

**Note:** In case of no schedule policy being applied, the rule is enforced as per the enforcement-time configured in the application policy. For more information, see `enforcement-time`.

Assigns a precedence value for this rate-limit rule. Assigns a precedence value between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.

**Let us consider application youtube belonging to app-category streaming.**

The action required is: Allow `youtube` packets and deny all other applications belonging to app-category `streaming`.

The rules can be defined as:

```plaintext
#allow application youtube precedence 1
#deny app-category streaming precedence 2
```

The following configuration is incorrect:

```plaintext
#deny app-category streaming precedence 1
#allow application youtube precedence 2
```

Once the `deny` app-category streaming precedence 1 rule is hit, all streaming packets, including `youtube`, are dropped. Consequently, there are no packets left to apply the subsequent `allow` rule.

**Note:** The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.
Examples

```bash
nx9500-6C8809(config-app-policy-Bing)#rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6
```

```bash
nx9500-6C8809(config-app-policy-Bing)#show context application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6
logging level critical
```

```bash
nx9500-6C8809(config-app-policy-Bing)#
```

description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
mark app-category video dscp 9 precedence 4
mark application facetime dscp 10 precedence 5
rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6
logging level critical
nx9500-6C8809(config-app-policy-Bing)#
```
4.1.23 association-acl-policy

Global Configuration Commands

Configures an association ACL policy. This policy defines a list of devices allowed or denied access to the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>

Parameters

- association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>

Examples

rfs7000-37FABE(config)#association-acl-policy test
rfs7000-37FABE(config-assoc-acl-test)#?

Association ACL Mode commands:
- deny Specify MAC addresses to be denied
- no Negate a command or set its defaults
- permit Specify MAC addresses to be permitted
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-assoc-acl-test)#

Related Commands

| no | Resets values or disables commands |

NOTE: For more information on the association-acl-policy, see Chapter 10, ASSOCIATION-ACL-POLICY.
4.1.24 auto-provisioning-policy

Global Configuration Commands

Configures an auto provisioning policy. This policy configures the automatic provisioning of device adoption. The policy configures how an AP is adopted based on its type.

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>

Parameters

- auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>

Examples

rfs7000-37FABE(config)#auto-provisioning-policy test
rfs7000-37FABE(config-auto-provisioning-policy-test)#?

Auto-Provisioning Policy Mode commands:

adopt Add rule for device adoption
default-adoption Adopt devices even when no matching rules are found.
Assign default profile and default rf-domain
deny Add rule to deny device adoption
evaluate-always Set the flag to evaluate the policy everytime, regardless of previous adoption status
no Negate a command or set its defaults
redirect Add rule to redirect device adoption
upgrade Add rule for device upgrade
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
derald End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-auto-provisioning-policy-test)#

Related Commands

no Removes an existing Auto Provisioning policy

NOTE: For more information on the association-acl-policy, see Chapter 9, AUTO-PROVISIONING-POLICY.
4.1.25 bgp

Global Configuration Commands

Configures Border Gateway Protocol (BGP) settings

BGP is an inter-ISP routing protocol which establishes routing between Internet Service Providers (ISPs). ISPs use BGP to exchange routing and reachability information between Autonomous Systems (AS) on the Internet. BGP makes routing decisions based on paths, network policies and/or rules configured by network administrators. The primary role of a BGP system is to exchange network reachability information with other BGP peers. This information includes information on AS that the reachability information traverses. This information is sufficient to create a graph of AS connectivity from which routing decisions can be created and rules enforced.

An AS is a set of routers under the same administration that use Interior Gateway Protocol (IGP) and common metrics to define how to route packets within the AS. AS uses inter-AS routing to route packets to other ASs. For an external AS, an AS appears to have a single coherent interior routing plan and presents a consistent picture of the destinations reachable through it.

Routing information exchanged through BGP supports only destination based forwarding (it assumes a router forwards packets based on the destination address carried in the IP header of the packet).

BGP uses TCP as its transport protocol. This eliminates the need to implement explicit update fragmentation, retransmission, acknowledgment, and sequencing. BGP listens on TCP port 179. The error notification mechanism used in BGP assumes that TCP supports a graceful close (all outstanding data is delivered before the connection is closed).

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>

Parameters

- bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>

<table>

NOTE: For more information on configuring BGP Top-Level Objects (TLOs), see Chapter 28, BORDER GATEWAY PROTOCOL.
4.1.26 bonjour-gw-discovery-policy

Bonjour is Apple's zero-configuration networking (Zeroconf) implementation. Zeroconf is a group of technologies that include service discovery, address assignment and hostname resolution. Bonjour locates the devices (printers, computers, etc.) and services these computers provide over a local network.

Bonjour provides a method to discover services on a local area network (LAN). Bonjour allows users to set up a network without any configuration. Services such as printers, scanners and file-sharing servers can be found using Bonjour. Bonjour only works within a single broadcast domain. However, with a special DNS configuration, it can be extended to find services across broadcast domains.

This command configures a Bonjour GW Discovery policy. The policy defines a list of services clients can discover across subnets. A maximum of 8 (eight) policies can be created on access points, wireless controllers, or service platforms.

When configured and applied, this feature enables discovery of Bonjour services on local and/or tunneled VLANs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
bonjour-gw-discovery-policy <POLICY-NAME>
```

Parameters

- `bonjour-gw-discovery-policy <POLICY-NAME>`

| <POLICY-NAME> | Specify the Bonjour GW Discovery policy name. If the policy does not exist, it is created. In the Bonjour GW Discovery policy configuration mode, use the allow-service keyword to configure the services that the Bonjour gateway is allowed to discover. A maximum of 16 (sixteen) service rules can be created. Optionally, you can restrict this facility for users on specific VLANs. To do so, specify the VLAN IDs.  
  
  **Note:** Execute the `bonjour-gw-forwarding-policy` command to enable forwarding of Bonjour service responses across VLANs.  
  
  **Note:** To associate a Bonjour GW Discovery policy with a WLAN, in the WLAN configure mode, execute the following command:  
  
  `use > bonjour-gw-discovery-policy > <POLICY-NAME>` For more information, see `use`.  
  
  **Note:** To associate a Bonjour GW Discovery policy with a VLAN, in the interface VLAN configure mode, execute the following command:  
  
  `use > bonjour-gw-discovery-policy > <POLICY-NAME>` For more information, see `use`.  
  
  **Note:** To associate a Bonjour GW Discovery policy with a user role, in the role-policy - user-role config mode, execute the following command:  
  
  `use > bonjour-gw-discovery-policy > <POLICY-NAME>` For more information, see `use`.  

|
Examples

rfs7000-37FABE(config)#bonjour-gw-discovery-policy TestPolicy
rfs7000-37FABE(config-bonjour-gw-discovery-policy-TestPolicy)#?

commands:
- allow-service: Allow Bonjour Service on local or tunneled vlan, Optionally VLAN IDs can be given so service will be discovered for those vlan only
- no: Negate a command or set its defaults
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

rfs7000-37FABE(config-bonjour-gw-discovery-policy-TestPolicy)#

Related Commands

| no | Removes an existing Bonjour GW Discovery policy |
4.1.27 bonjour-gw-forwarding-policy

Global Configuration Commands

Configures a Bonjour GW Forwarding policy. When configured and applied on the controller, the policy defines the service VLANs (the VLANs on which Bonjour services are running) and client VLANs where clients are present. All Bonjour responses from service VLANs are forwarded to client VLANs. A maximum of 2 (two) policies can be created on a wireless controller or service platform. And only 1 (one) policy can be created on an access point.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

bonjour-gw-forwarding-policy <POLICY-NAME>

Parameters

- bonjour-gw-forwarding-policy <POLICY-NAME>

<table>
<thead>
<tr>
<th>&lt;POLICY-NAME&gt;</th>
<th>Specify the Bonjour GW Forwarding policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note:</td>
<td>To receive Bonjour service responses from specific VLANs, specify the VLAN IDs. In the Bonjour GW Forwarding policy configuration mode, provide a list of VLAN IDs from which Bonjour responses can be received (format: 10-20, 25, 30-35). And then specify the list of client VLANs that can access Bonjour services.</td>
</tr>
<tr>
<td>Note:</td>
<td>Execute the bonjour-gw-discovery-policy command to define the Bonjour services allowed on local and tunneled VLANs.</td>
</tr>
<tr>
<td>Note:</td>
<td>To associate a Bonjour GW Forwarding policy with a device or profile, in the profile/device configuration mode, execute the use &gt; bonjour-gw-forwarding-policy &gt; &lt;POLICY-NAME&gt; command. For more information, see use.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config)#bonjour-gw-forwarding-policy TestPolicy
rfs7000-37FABE(config-bonjour-gw-forwarding-policy-TestPolicy)#?

commands:

<table>
<thead>
<tr>
<th>forward-bonjour-response</th>
<th>Forwards bonjour service response across vlans</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Negate a command or set its defaults</td>
</tr>
<tr>
<td>clrscr</td>
<td>Clears the display screen</td>
</tr>
<tr>
<td>commit</td>
<td>Commit all changes made in this session</td>
</tr>
<tr>
<td>do</td>
<td>Run commands from Exec mode</td>
</tr>

rfs7000-37FABE(config-bonjour-gw-forwarding-policy-TestPolicy)#

Related Commands

no | Removes an existing Bonjour GW Forwarding policy
4.1.28 bonjour-gw-query-forwarding-policy

Global Configuration Commands

Configures a Bonjour GW Query Forwarding policy and enters its configuration mode. When created and applied, this policy enables forwarding of Bonjour queries across VLANs.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`bonjour-gw-query-forwarding-policy <POLICY-NAME>`

Parameters

- `bonjour-gw-query-forwarding-policy <POLICY-NAME>`

| <POLICY-NAME> | Specify the Bonjour GW Query Forwarding policy name. If the policy does not exist, it is created.
|---------------|--------------------------------------------------|
| Note: In the Bonjour GW Query Forwarding policy configuration mode, specify the ‘from’ and ‘to’ VLAN(s). The `from-vlans` option configures the VLAN(s) that are the source of the Bonjour queries. The `to-vlans` option configures the destination VLAN(s) that can access the Bonjour queries.
| Note: To associate a Bonjour GW Query Forwarding policy with a device or profile, in the profile/device configuration mode, execute the `use > bonjour-gw-query-forwarding-policy > <POLICY-NAME>` command. For more information, see `use`.

Examples

```
rs7000-37FABE(config)#bonjour-gw-query-forwarding-policy TestPolicy
rs7000-37FABE(config-bonjour-gw-query-forwarding-policy-test)#?
(config-bonjour-gw-query-forwarding-policy) commands:
  forward-bonjour-query  Forwards bonjour query across vlans
  no                     Negate a command or set its defaults
clrscr                  Clears the display screen
commit                  Commit all changes made in this session
do                      Run commands from Exec mode
end                     End current mode and change to EXEC mode
exit                    End current mode and down to previous mode
help                    Description of the interactive help system
revert                  Revert changes
service                 Service Commands
show                    Show running system information
write                   Write running configuration to memory or terminal
```

4.1.29 captive portal

> Global Configuration Commands

A captive portal provides secure guest access and authentication services within the network. The following table lists the commands available to enter the captive portal configuration mode:

**Table 4.6 Captive-Portal Config Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal</td>
<td>Creates a new captive portal and enters its configuration mode</td>
<td>page 4-76</td>

<td>Summarizes captive portal configuration commands</td>
<td>page 4-78</td>
</tr>
</tbody>
</table>
4.1.29.1 captive-portal

A captive portal provides secure access using a standard Web browser. Captive portals provide authenticated access by capturing and re-directing a wireless user's Web browser session to a captive portal login page where the user must enter valid credentials to access to the wireless network. Once logged into the captive portal, additional Acknowledgment, Agreement, Welcome, No Service, and Fail pages provide the administrator options to customize the screen flow and user appearance.

Captive portals are recommended for providing guests or visitors authenticated access to network resources when 802.1X EAP is not a viable option. Captive portal authentication does not provide end-user data encryption, but it can be used with static WEP, WPA-PSK or WPA2-PSK encryption.

Authentication for captive portal access requests is performed using a username and password pair, authenticated by an integrated RADIUS server. Authentication for private network access is conducted either locally on the requesting wireless client, or centrally at a datacenter.

Captive portals use a Web provisioning tool to create guest user accounts directly on the controller, service platform, or access point. The connection medium defined for the Web connection is either HTTP or HTTPS. Both HTTP and HTTPS use a request and response procedure to disseminate information to and from requesting wireless clients.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

captive-portal <CAPTIVE-PORTAL-NAME>

Parameters

- captive-portal <CAPTIVE-PORTAL-NAME>

Examples

rfs7000-37FABE(config)#captive-portal test
rfs7000-37FABE(config-captive-portal-test)#?

Captive Portal Mode commands:

- access-time 
  Allowed access time for the client. Used when there is no session time in radius response
- access-type 
  Access type of this captive portal
- accounting 
  Configure how accounting records are created for this captive portal policy
- bypass 
  Bypass captive portal
- connection-mode 
  Connection mode for this captive portal
- custom-auth 
  Custom user information
- data-limit 
  Enforce data limit for clients
- inactivity-timeout
  Inactivity timeout in seconds. If a frame is not received from client for this amount of time, then current session will be removed
- ipv6 
  Internet Protocol version 6 (IPv6)
- localization 
  Configure the FQDN address to get the localization parameters for the client
- logout-fqdn 
  Configure the FQDN address to logout the session from client
- no 
  Negate a command or set its defaults
- oauth 
  OAuth 2.0 authentication configuration
- post-authentication-vlan 
  Configure post authentication vlan for captive portal users
radius-vlan-assignment  
Enable radius vlan assignment for captive portal users
redirection  
Configure connection redirection parameters
report-loyalty-application  
Report customer loyalty application presence in clients
server  
Configure captive portal server parameters
simultaneous-users  
Particular username can only be used by a certain number of MAC addresses at a time
terms-agreement  
User needs to agree for terms and conditions
use  
Set setting to use
webpage  
Configure captive portal webpage parameters
webpage-auto-upload  
Enable automatic upload of internal and advanced webpages
webpage-location  
The location of the webpages to be used for authentication. These pages can either be hosted on the system or on an external web server.
welcome-back  
Welcome back page settings
clrscr  
Cleans the display screen
commit  
Commit all changes made in this session
do  
Run commands from Exec mode
end  
End current mode and change to EXEC mode
exit  
End current mode and down to previous mode
help  
Description of the interactive help system
revert  
Revert changes
service  
Service Commands
show  
Show running system information
write  
Write running configuration to memory or terminal

rfs7000-37FABE(config-captive-portal-test)#

</tbody>
</table>
4.29.2.1 access-time

* captive-portal-mode commands

Defines the permitted access time for a client. It is used when no session time is defined in the RADIUS response.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

access-time <10-10080>

Parameters

- access-time <10-10080>

<table>
<thead>
<tr>
<th>access-time &lt;10-10080&gt;</th>
<th>Defines the duration wireless clients are allowed access to the Internet using this captive portal policy</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;10-10080&gt; – Specify a value from 10 - 10080 minutes. The default is 1440 minutes.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-captive-portal-test)#access-time 35
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
running captive-portal test
access-time 35
rfs7000-37FABE(config-captive-portal-test)#

Related Commands

- no
  - Reverts to the default permitted access time (1440 minutes)
### 4.1.29.2.2 access-type

* ◆ captive-portal-mode commands

Defines the captive portal’s access type. The authentication scheme configured here is applied to wireless clients using this captive portal.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
access-type [custom-auth-radius|logging|no-auth|radius|registration]
```

#### Parameters

- **access-type [custom-auth-radius|logging|no-auth|radius|registration]**

#### Examples

```
rfs7000-37FABE(config-captive-portal-test)#access-type logging
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal-test
  access-type logging
  access-time 35
rfs7000-37FABE(config-captive-portal-test)#
```

#### Related Commands

- **no**

  Removes the captive portal access type or reverts to default (radius)
4.1.29.2.3 accounting

- captive-portal-mode commands

Enables support for accounting messages for this captive portal

When enabled, accounting for clients entering and exiting the captive portal is initiated. Accounting is the method of collecting and sending security server information for billing, auditing, and reporting user data. This data includes information, such as start and stop times, executed commands (such as PPP), number of packets and number of bytes transmitted, etc. Accounting enables tracking of captive portal services consumed by clients.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

accounting [radius|syslog]

accounting radius

accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}

Parameters

- accounting radius

  radius
  Enables support for RADIUS accounting messages. When enabled, this option uses an external RADIUS resource for AAA accounting. This option is disabled by default.

- accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}

  syslog
  Enables support for syslog accounting messages. When enabled, data relating to wireless client usage of remote access services is logged on the specified external syslog resource. This information assists in differentiating between local and remote users. Remote user information can be archived to an external location for periodic network and user administration. This option is disabled by default.
  - host <IP/HOSTNAME> – Specifies the destination where accounting messages are sent. Specify the destination’s IP address or hostname.

  port <1-65535>
  Optional. Specifies the syslog server’s listener port
  - <1-65535> – Specify the UDP port from 1-65535. The default is 514.

  proxy-mode [none|through-controller|through-rf-domain-manager]
  Optional. Specifies the mode of proxying the syslog server
  - none – Accounting messages are sent directly to the syslog server
  - through-controller – Accounting messages are sent through the controller configuring the device
  - through-rf-domain-manager – Accounting messages are sent through the local RF Domain manager
Examples

rfs7000-37FABE(config-captive-portal-test)#accounting syslog host 172.16.10.13 port 1

rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
  access-type logging
  access-time 35
  accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#

Related Commands

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables accounting records for this captive portal</td>
</tr>
</tbody>
</table>
4.1.29.2.4 bypass

<table>
<thead>
<tr>
<th>captive-portal-mode commands</th>
</tr>
</thead>
</table>

Enables bypassing of captive portal detection requests from wireless clients.

Certain devices, such as Apple IOS devices send Captive Network Assistant (CNA) requests to detect existence of captive portals. When enabled, the bypass option does not allow CNA requests to be redirected to the captive portal pages.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

bypass captive-portal-detection

Parameters

- bypass captive-portal-detection

<table>
<thead>
<tr>
<th>bypass captive-portal-detection</th>
<th>Bypasses captive portal detection requests</th>
</tr>
</thead>
</table>

Examples

rfs4000-229D58(config-captive-portal-test)#bypass captive-portal-detection

rfs4000-229D58(config-captive-portal-test)#show context captive-portal test

  bypass captive-portal-detection

rfs4000-229D58(config-captive-portal-test)#

Related Commands

| no | Disables bypassing of captive portal detection requests |
4.1.29.2.5 connection-mode

Configures a captive portal’s mode of connection to the Web server. HTTP uses plain unsecured connection for user requests. HTTPS uses an encrypted connection to support user requests.

Both HTTP and HTTPS use the same Uniform Resource Identifier (URI), so controller and client resources can be identified. However, the use of HTTPS is recommended, as it affords controller and client transmissions some measure of data protection HTTP cannot provide.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
connection-mode [http|https]

Parameters
- connection-mode [http|https]

- http
  Sets HTTP as the default connection mode. This is the default setting.

- https
  Sets HTTPS as the default connection mode

Examples
rfs7000-37FABE(config-captive-portal-test)#connection-mode https
rfs7000-37FABE(config-captive-portal-test)#show context
  captive-portal test
  access-type logging
  access-time 35
  connection-mode https
  accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#

Related Commands
- no
  Removes this captive portal’s connection mode
4.1.29.2.6 custom-auth

Configures custom user information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

custom-auth info <LINE>

Parameters

- custom-auth info <LINE>

| info <LINE> | Configures information used for RADIUS lookup when custom-auth RADIUS access type is configured
|            | • <LINE> – Guest data needs to be provided. Specify the name, e-mail address, and telephone number of the user.

Examples

rfs7000-37FABE(config-captive-portal-test)#custom-auth info bob bob@examplecompany.com
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
        access-type logging
        access-time 35
        custom-auth info bob bob@examplecompany.com
        connection-mode https
        accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#

Related Commands

- **no** | Removes custom user information configured with this captive portal
4.1.29.2.7 **data-limit**

*caption-portal-mode commands*

Enforces data transfer limits on captive portal clients. This feature enables the tracking and logging of user usage. Users exceeding the allowed bandwidth are restricted from the captive portal.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
data-limit <1-102400> {action [log-and-disconnect|log-only]}
```

**Parameters**

- **data-limit <1-102400> {action [log-and-disconnect|log-only]}**

<table>
<thead>
<tr>
<th>data-limit &lt;1-102400&gt;</th>
<th>Sets a captive portal client's data transfer limit in megabytes. This limit is applicable for both upstream and downstream data transfer.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-102400</td>
<td>Specify a value from 1 - 102400 MB.</td>
</tr>
</tbody>
</table>

- **action [log-and-disconnect|log-only]**

  | Optional. Specifies the action taken when a client exceeds the configured data limit. The options are: |
  | log-and-disconnect – Logs a record and disconnects the client                                                   |
  | log-only – Only a log is generated and the client remains connected to the captive portal. This is the default setting. |

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#data-limit 200 action log-and-disconnect
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
data-limit 200 action log-and-disconnect
rfs7000-37FABE(config-captive-portal-test)#
```

**Related Commands**

- **no** Removes data limit enforcement for captive portal clients
4.1.29.2.8 inactivity-timeout

* [captive-portal-mode commands](#)

Defines an inactivity timeout in seconds. If a frame is not received from a client for the specified interval the current session is terminated.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

inactivity-timeout <60-86400>

**Parameters**

- inactivity-timeout <60-86400>

<table>
<thead>
<tr>
<th>&lt;60-86400&gt;</th>
<th>Defines the timeout interval after which a captive portal session is automatically terminated</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;60-86400&gt;</td>
<td>- Specify a value from 60 - 86400 seconds. The default is 10 minutes or 600 seconds.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-captive-portal-test)#inactivity-timeout 750

rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
  access-type logging
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  inactivity-timeout 750
  accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#

**Related Commands**

| no | Removes the client inactivity interval configured with this captive portal |
4.1.29.2.9  ipv6

> captive-portal-mode commands

Configures the internal captive portal server’s (running on the centralized mode) IPv6 address. If using centralized server mode, use this option to define the controller, service platform, or access point resource’s (hosting the captive portal) IPv6 address. For information on configuring the server mode, see server.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ipv6 server host <IPv6>

Parameters

- ipv6 server host <IPv6>

<table>
<thead>
<tr>
<th>ipv6 server host &lt;IPv6&gt;</th>
<th>Configures the IPv6 address of the internal captive portal server</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IPv6&gt;</td>
<td>&lt;IPv6&gt; – Specify the captive portal server’s global IPv6 address.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-6DCD4B(config-captive-portal-test2)#show context captive-portal test2
  access-type OAuth
  OAuth client-id Google TechPubs.printer.google.com
rfs7000-6DCD4B(config-captive-portal-test2)#

Related Commands

no

| no | Removes the captive portal server’s IPv6 address |
4.1.29.2.10 localization

captive-portal-mode commands

Configures an FQDN address string that enables the client to receive localization parameters. Use this option to add a URL to trigger a one-time redirect on demand. The defined URL is triggered from a mobile application to derive location information from the wireless network so an application can be localized to a particular store or region.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8532
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
localization [fqdn <WORD>|response <WORD>]
```

**Parameters**

- **localization [fqdn <WORD>|response <WORD>]**
  - Configures an FQDN address string that enables the client to receive localization parameters. This command also allows the configuration of a response message.

  - **fqdn <WORD>**
    - Configures the FQDN address string, which is used to obtain localization parameters for the captive portal's client.
    - `<WORD>` – Specify the FQDN address string. For example, local.guestaccess.com

  - **response <WORD>**
    - Configures a message, which is sent back to the client in response to the client's localization HTTP requests.
    - `<WORD>` – Specify the response message (should not exceed 512 characters in length). The following built-in query tags can be included in the response message:
      - `WING_TAG_CLIENT_IP` - Captive portal client IPv4 address
      - `WING_TAG_CLIENT_MAC` - Captive portal client MAC address
      - `WING_TAG_WLAN_SSID` - Captive portal client WLAN ssid
      - `WING_TAG_AP_MAC` - Captive portal client AP MAC address
      - `WING_TAG_AP_NAME` - Captive portal client AP Name
      - `WING_TAG_RF_DOMAIN` - Captive portal client RF Domain
      - `WING_TAG_USERNAME` - Captive portal authentication username
      - `WING_TAG_USERTYPE` - Captive portal usertype
    - Example:
      ```
      <local><site>WING_TAG_RF_DOMAIN</site><ap>WING_TAG_AP_NAME</ap></local>
      ```

**Examples**

```
nx4500-5CFA2B(config-captive-portal-test)#localization fqdn local.guestaccess.com

nx4500-5CFA2B(config-captive-portal-test)#localization response <local><site>SJZebra</site><ap>ap8132-74B45C</ap><user>Bob</user></local>

nx4500-5CFA2B(config-captive-portal-test)#show context include-factory | include localization

localization fqdn local.guestaccess.com
localization response <local><site>SJZebra</site><ap>ap8132-74B45C</ap><user>Bob</user></local>
```

```

| no <PARAMETERS> | Removes or resets this captive portal's settings, based on the parameters passed. |

Examples

The following example shows the captive portal 'test' settings before the 'no' commands are executed:

rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-type logging
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  inactivity-timeout 750
  accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#

rfs7000-37FABE(config-captive-portal-test)#no accounting syslog
rfs7000-37FABE(config-captive-portal-test)#no access-type

The following example shows the captive portal 'test' settings after the 'no' commands are executed:

rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  inactivity-timeout 750
rfs7000-37FABE(config-captive-portal-test)#
4.1.29.2.13 oauth

.oauth {client-id [facebook|google] <WORD>}

Parameters
- oauth {client-id [facebook|google] <WORD>}

Example
rfs7000-6DCD4B(config-captive-portal-test2)#OAuth client-id Google TechPubs.printer.google.com
rfs7000-6DCD4B(config-captive-portal-test2)#show context captive-portal test2

Related Commands
- no

Removes all OAuth client identities configured for this captive portal
4.2.9.2.14 post-authentication-vlan

Captive-portal-mode commands

Configures the VLAN that is assigned to this captive portal’s users upon successful authentication.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]

Parameters
- post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]

| post-authentication-vlan [<1-4096>|<VLAN-ALIAS>] | Configures the post authentication VLAN. The VLAN specified here is assigned to this captive portal’s users after they have authenticated and logged on to the network. Provide the VLAN ID, or use an existing VLAN alias to identify the post authentication VLAN.
| | • <1-4096> – Specify the VLAN’s number from 1 - 4096.
| | • <VLAN-ALIAS> – Specify the VLAN alias (should be existing and configured).
| | Note: VLAN alias names begin with a ‘$’.

Examples
rfs4000-229D58(config-captive-portal-test)#post-authentication-vlan 1
rfs4000-229D58(config-captive-portal-test)#show context captive-portal test

| post-authentication-vlan 1 |
| rfs4000-229D58(config-captive-portal-test)# |

Related Commands
- no
  Removes the post authentication RADIUS VLAN assigned to this captive portal’s users

- radius-vlan-assignment
  Enables assignment of a RADIUS VLAN for this captive portal
4.1.29.2.15  \texttt{radius-vlan-assignment}

- \textit{captive-portal-mode commands}

Enables assignment of a RADIUS VLAN for this captive portal.

When enabled, if the RADIUS server as part of the authentication process returns a client's VLAN-ID in a RADIUS access-accept packet, all client traffic is forwarded on the post authentication VLAN. If disabled, the RADIUS server's VLAN assignment is ignored and the VLAN configuration defined within the WLAN configuration is used instead. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

\textbf{Syntax}
\begin{verbatim}
radius-vlan-assignment
\end{verbatim}

\textbf{Parameters}
None

\textbf{Examples}
\begin{verbatim}
rfs4000-229D58(config-captive-portal-test)#radius-vlan-assignment
rfs4000-229D58(config-captive-portal-test)#show context captive-portal test

4.1.29.2.16 redirection

**captive-portal-mode commands**

Configures a list of destination ports (separated by commas, or using a dash for a range) that are taken into consideration when redirecting client connections

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

redirection ports <LIST-OF-PORTS>

**Parameters**

- redirection ports <LIST-OF-PORTS>

<table>
<thead>
<tr>
<th>ports &lt;LIST-OF-PORTS&gt;</th>
<th>Configures destination ports considered for redirecting client connection</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> A maximum of 16 ports can be specified in a comma-separated list. Standard ports 80 and 443 are always considered for client connections regardless of what's entered by the administrator.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs4000-229D58(config-captive-portal-test)#redirection ports 1,2,3
rfs4000-229D58(config-captive-portal-test)#show context captive-portal test redirection ports 1-3
rfs4000-229D58(config-captive-portal-test)#
```

**Related Commands**

- **no** Disables redirection of client connection
4.1.29.2.17  report-loyalty-application

> captive-portal-mode commands

Enables detection of captive portal client’s usage of a selected (preferred) loyalty application

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

report-loyalty-application {custom-app <APPLICATION-NAME>}

Parameters

- report-loyalty-application {custom-app <APPLICATION-NAME>}

report-loyalty-application {custom-app <APPLICATION-NAME>}

Reports a captive portal client’s loyalty application presence and stores this information in the captive portal’s user database. The client’s loyalty application detection occurs on the access point to which the client is associated. Retail administrators can use this information to assess whether patrons’ loyalty application usage is as per expectation within specific retail environments. This option is disabled by default.

- custom-app <APPLICATION-NAME> – Optional. Uses a custom application definition as match criteria.
- <APPLICATION-NAME> – Specify the custom application name (should be existing and configured). Ensure that the application specified is available and configured. If not, create an application definition. For more information, see application.

Note: If no custom application definition is specified, the system uses localization to detect application presence.

Examples

nx9500-6C8809(config-captive-portal-test)#report-loyalty-application custom-app AntiVirus

nx9500-6C8809(config-captive-portal-test)#show context include-factory | include report-loyalty-application

report-loyalty-application custom-app AntiVirus

nx9500-6C8809(config-captive-portal-test)#

Related Commands

no

Disables detection of customer-loyalty application presence
4.1.29.2.18 server

>captive-portal-mode commands

Configures captive portal server parameters, such as the hostname, IP address, and mode of operation. This is the server validating guest user permissions.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

server [host|mode]
server host <IP/HOSTNAME>
server mode [centralized|centralized-controller {hosting-vlan-interface <0-4096>}| self]

Parameters

- server host <IP/HOSTNAME>
  
  Configures the internal captive portal authentication server (wireless controller, access point, service platform)
  
  <IP/HOSTNAME> – Specify the IPv4/IPv6 address or hostname of the captive portal server.
  
  Note: For centralized-controller mode, the server host should be a virtual hostname and not an IP address.

- server mode [centralized|centralized-controller {hosting-vlan-interface <0-4096>}| self]

  Configures the captive portal server mode. This parameter identifies the devices that will capture and redirect a wireless user’s Web browser session to a landing page where the user has to provide login credentials in order to access the associated WLAN. The WiNG captive portal implementation is very flexible and allows the captive portal services to reside anywhere within the WiNG managed network. For example, the capture and redirection can be performed directly by the access points at the edge of the network, centrally on the controllers or service platforms managing the access points, or on dedicated wireless controller deployed within an isolated network.

  centralized
  
  Considers the configured server’s hostname or IP address as the centralized captive portal server. When selected, capture and redirection is provided by a designated controller/service platform on the network defined using an IPv4/IPv6 address or hostname. The controller/service platform can either be managing the dependent/independent access points or be a dedicated device deployed over the intermediate network.

  centralized-controller {hosting-vlan-interface <0-4096>}</n
  Considers the configured server’s virtual hostname as the centralized captive portal server. When selected, capture and redirection is provided by a cluster of controllers/service platforms that are managing the dependent/independent access points using a virtual hostname.
  
  hosting-vlan-interface – Optional. Configures the VLAN where the client can reach the wireless controller (server). This option is available only for the centralized-controller mode.
  
  <0-4096> – Specify the VLAN number (0 implies the controller is available on the client’s VLAN).
### Examples

```
rfs7000-37FABE(config-captive-portal-test)#server host 172.16.10.9
rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  inactivity-timeout 750
  server host 172.16.10.9
rfs7000-37FABE(config-captive-portal-test)#
```

- **captive-portal-mode commands**

Enforces the user to agree to terms and conditions (included in the login page) for captive portal access. This feature is disabled by default.

When enabled, the system enforces a previously registered user to re-confirm the terms of agreement, on successive log ins, only if the interval between the last log out and the current log in exceeds the `agreement-refresh` timeout configured in the WLAN context. For more information on configuring the agreement-refresh timeout value, see registration.

For example:

If the agreement-refresh timeout is set at 20 minutes, the following two possibilities can arise:

- The interval between logging out and re-logging **exceeds** 20 minutes - in which case the user is served the Terms of Agreement page on successful authentication.
- The interval between logging out and re-logging is **less than** 20 minutes - in which case the user is provided direct Internet access.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

**Syntax**

```
terms-agreement
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#terms-agreement

rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  inactivity-timeout 750
  server host 172.16.10.9
  simultaneous-users 5
  terms-agreement

rfs7000-37FABE(config-captive-portal-test)#
```

4.1.29.2.21 use

`captive-portal-mode commands`

Configures a AAA policy and DNS whitelist with this captive portal policy. AAA policies are used to configure authentication and accounting servers for this captive portal. DNS whitelists restrict users to a set of configurable domains on the Internet.

For more information on AAA policies, see `AAA-POLICY`.

For more information on DNS whitelists, see `dns-whitelist`.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]`

**Parameters**

- `use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]`

| aaa-policy `<AAA-POLICY-NAME>` | Configures a AAA policy with this captive portal. AAA policies validate user credentials and provide captive portal access to the network.
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;AAA-POLICY-NAME&gt;</code> – Specify the AAA policy name.</td>
</tr>
</tbody>
</table>

| dns-whitelist `<DNS-WHITELIST-NAME>` | Configures a DNS whitelist to use with this captive portal. DNS whitelists restrict captive portal access.
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;DNS-WHITELIST-NAME&gt;</code> – Specify the DNS whitelist name.</td>
</tr>
</tbody>
</table>

**Note:** To effectively host captive portal pages on an external Web server, the IP address of the destination Web server(s) should be added to the DNS whitelist.

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#use aaa-policy test
rfs7000-37FABE(config-captive-portal-test)#use dns-whitelist test
rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-time 35
  custom-auth info bob bobs@examplecompany.com
  connection-mode https
  inactivity-timeout 750
  server host 172.16.10.9
  simultaneous-users 5
  terms-agreement
  use aaa-policy test
  use dns-whitelist test
rfs7000-37FABE(config-captive-portal-test)#
```

4.1.29.2.22 webpage

- *captive-portal-mode commands*

Use this command to define the appearance and flow of Web pages requesting clients encounter when accessing a controller, service platform, or access point managed captive portal. Define whether the Web pages are maintained locally or externally to the managing device as well as messages displayed requesting clients.

Configures Web pages displayed when interacting with a captive portal. These pages are:

- acknowledgment – This page displays details for the user to acknowledge
- agreement – This page displays “Terms and Conditions” that a user accepts before allowed access to the captive portal.
- fail – This page is displayed when the user is not authenticated.
- login – This page is displayed when the user connects to the captive portal. It fetches login credentials from the user.
- no-service – This page is displayed when a captive portal user is unable to access the captive portal due to unavailability of critical services.
- registration – This page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database.
- welcome – This page is displayed to welcome an authenticated user to the captive portal.

These Web pages, which interact with captive portal users, can be located either on the controller or an external location.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```text
webpage [external|internal]
webpage external [acknowledgment|agreement|fail|login {post}|no-service|registration|welcome] <URL>
webpage internal [acknowledgment|agreement|fail|login|no-service|org-name|org-signature|registration|welcome]
  [description|footer|header|title] <CONTENT>
webpage internal [acknowledgment|agreement|fail|login|no-service|registration|welcome]
  [body-background-color|body-font-color|org-background-color|org-font-color] <WORD>
webpage internal [acknowledgment|agreement|fail|login|no-service|registration|welcome]
  [main-logo use-as-banner|small-logo] <URL>
webpage internal registration field [age-range|city|country|custom|disclaimer|dob|email|gender|member|mobile|name|optout|street|via-email|via-sms|zip] type [checkbox|date|dropdown-menu|e-address|number|radio-button|text] enable {label <LINE>|mandatory|title <LINE>|placeholder <LINE>}
webpage internal welcome use-external-success-url
webpage internal [org-name|org-signature] <LINE>
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>webpage external</td>
<td>Indicates Web pages being served are hosted on an external (to the captive portal) server resource.</td>
</tr>
<tr>
<td>acknowledgment</td>
<td>Indicates the page is displayed for user acknowledgment of details. Users are redirected to this page to acknowledge information provided.</td>
</tr>
<tr>
<td>agreement</td>
<td>Indicates the page is displayed for “Terms &amp; Conditions”. The agreement page provides conditions that must be agreed to before captive portal access is permitted.</td>
</tr>
<tr>
<td>fail</td>
<td>Indicates the page is displayed for login failure. The fail page asserts authentication attempt has failed, the user is not allowed to access the Internet (using this captive portal) and must provide the correct login information again to access the Internet.</td>
</tr>
</tbody>
</table>
| login {post}    | Indicates the page is displayed for getting user credentials. This page is displayed by default.  
  - post – Optional. Redirects users to post externally during authentication.  
  The login page prompts the user for a username and password to access the captive portal and proceed to either the agreement page (if used) or the welcome page. |
| no-service      | Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The no-service page asserts the captive portal service is temporarily unavailable due to technical reasons. Once the services become available, the captive portal user is automatically connected back to the services available through the captive portal. The possible scenarios are:  
  - The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated  
  - The external captive portal server is not reachable  
  - The connectivity between the adopted AP and controller is lost  
  - The external DHCP server is not reachable  
  To provide this service, enable the following:  
  - External captive portal server monitoring  
  - AAA server monitoring. This enables detection of RADIUS server failure.  
  - External DHCP server monitoring  
  **Note:** For more information on enabling these critical resource monitoring, see service. |
| registration    | Indicates the page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register. |
| welcome         | Indicates the page is displayed after a user has been successfully authenticated. The welcome page asserts a user has logged in successfully and can access the captive portal. |
This parameter is common to all of the above mentioned Web pages, and specifies the Web page URL. The Web page is retrieved and served from the specified external location.

The URL can include following query tags:
- 'WING_TAG_CLIENT_IP' - Captive portal client IPv4 address
- 'WING_TAG_CLIENT_MAC' - Captive portal client MAC address
- 'WING_TAG_WLAN_SSID' - Captive portal client WLAN ssid
- 'WING_TAG_AP_MAC' - Captive portal client AP MAC address
- 'WING_TAG_AP_NAME' - Captive portal client AP Name
- 'WING_TAG_RF_DOMAIN' - Captive portal client RF Domain
- 'WING_TAG_CP_SERVER' - Captive portal server address
- 'WING_TAG_USERNAME' - Captive portal authentication username

Example:

Use '&' or '?' character to separate field-value pair.

**Note:** Enter ‘ctrl-v’ followed by ‘?’ to configure query string.

GLOBAL CONFIGURATION COMMANDS

| main-logo | The following keyword is common to all of the above internal Web page options:  
| use-as-banner | • main-logo – Indicates the main logo displayed in the header of each Web page  
| | • use-as-banner – Uses the image, specified here, as the Web page banner, in place of the logo and organization name  
| small-logo | The following keyword is common to all of the above internal Web page options:  
| | • small-logo – Indicates the logo image displayed in the footer of each Web page, and constitutes the organization's signature  
| <URL> | This parameter is common to the 'main-logo' and 'small-logo' keywords and provides the complete URL from where the main-logo and small-logo files are loaded and subsequently cached on the system.  
| | • <URL> – Specify the location and name of the main-logo and the small-logo image files.  

- webpage internal registration field [age-range|city|country|custom|disclaimer|dob|email|gender|member|mobile|name|optout|street|via-email|via-sms|zip] type [checkbox|date|dropdown-menu|e-address|number|radio-button|text] enable {label <LINE>|mandatory|title <LINE>|placeholder <LINE>}

| internal | Indicates the Web pages are hosted on an internal server resource  
| registration | Allows you to customize the user registration page. Select this option if the captive-portal's access-type is set to registration. Use the field and type options to define the input fields (for example, age-range, city, email, etc.) and the field type (for example, text, checkbox, dropdown-menu, radio-button, etc.)  
| | Note: Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register.  
| | If the registration Web page is not customized, the built-in, default registration page is displayed to the client.  
| field [age-range|city|country|custom <WORD>|disclaimer[]] | Configures the captive portal's registration page fields  
| | Following are the available fields and the field type for each:  
| | • age-range – Creates the age-range input field (enabled by default and included in the built-in registration page)  
| | • dropdown-menu – Configures the age-range field as a drop-down menu  
| | • radio-button – Configures the age-range field as a radio button menu  
| | • city – Creates the postal address: city name input field (enabled by default and included in the built-in registration page)  
| | • text – Configures the city field as only alpha-numeric and special characters input field  
| | • country – Creates the postal address: country name input field (disabled by default)  
| | • text – Configures the country field as only alpha-numeric and special characters input field  
| | • custom <WORD> – Creates a customized field (as per your requirement). Use the ‘custom’ option to create a field not included in the built-in list.  
| | • <WORD> – Provide a name for the field. On the registration page, the field is displayed under the name specified here.  
| | • checkbox – Configures client’s disclaimer-confirmation input field (disabled by default)  
| | • checkbox – Configures the disclaimer field as a check box  

Contd..
field [dob|email|gender|member|mobile|name|optout|street|via-email|via-sms|zip]

- dob – Creates the client’s *date of birth* (DoB) input field (disabled by default)
  - date – Configures the DoB field as only date-format input field
  - dropdown-menu – Configures the DoB field as a drop-down menu
  - text – Configures the DoB field as only alpha-numeric and special characters input field
- email – Creates the e-mail address input field (enabled by default and included in the built-in registration page)
  - e-address – Configures the e-mail field as only e-mail address format input field
- gender – Creates client’s gender input field (disabled by default)
  - dropdown-menu – Configures the gender field as a drop-down menu
  - radio-button – Configures the gender field as a radio button menu
- member – Creates client’s loyalty or captive-portal membership card number input field (disabled by default)
  - number – Configures the member field as only-numeric characters input field
  - text – Configures the member field as only alpha-numeric and special characters input field
- mobile – Creates the mobile number input field (enabled by default and included in the built-in registration page)
  - number – Configures the mobile field as only-numeric characters input field
  - text – Configures the mobile field as only alpha-numeric and special characters input field
- name – Creates the client name input field (enabled by default and included in the built-in registration page)
  - text – Configures the name field as only alpha-numeric and special characters input field
- optout – Creates an input field that enables clients to opt out from registering
  - checkbox – Configures the optout field as a check box
- street – Creates the *postal address: street name/number* input field (enabled by default and included in the built-in registration page)
  - text – Configures the street field as only alpha-numeric and special characters input field
- via-email – Creates the client’s preferred mode of communication as e-mail input field (enabled by default and included in the built-in registration page)
  - checkbox – Configures the via-email field as a check box
- via-sms – Creates the client’s preferred mode of communication as SMS input field (enabled by default and included in the built-in registration page)
  - checkbox – Configures the via-sms field as a check box
- zip – Creates the *postal address: zip* input field (enabled by default and included in the built-in registration page)
  - number – Configures the zip field as only-numeric characters input field
  - text – Configures the zip field as only alpha-numeric and special characters input field
After specifying the field, configure the field type. The options displayed depend on the field selected in the previous step. These options are: checkbox, date, dropdown-menu, e-address, number, radio-button, and text.

- **checkbox** – Configures the field as a check box
- **date** – Configures the field as only date-format input field
- **dropdown-menu** – Configures the field as a drop-down menu
- **e-address** – Configures the field as an e-mail address input field
- **number** – Configures the field as only-numeric characters input field
- **radio-button** – Configures the field as a radio button
- **text** – Configures the field as only alpha-numeric and special characters input field

**Note:** Some of the fields can have more than one field type options. For example, the field ‘zip’ can either be a numerical field or a text. Select the one best suited for your captive-portal.

Enables the field. When enabled, the field is displayed on the registration page. After enabling the field, optionally configure the following parameters:

- **label** <LINE> – Optional. Configures the field’s label
- **mandatory** – Optional. Makes the field mandatory
- **title** – Optional. Configures the comma-separated list of items to include in the drop-down menu.
- **placeholder** <LINE> – Optional. Configures a string, not exceeding 300 characters, that is displayed within the field. If not configured, the field remains blank.

4.1.29.23 webpage-auto-upload

* captive-portal-mode commands

Enables automatic upload of advanced Web pages to requesting clients on association. Enable this option if the webpage-location is selected as advanced. For more information, see `webpage-location`.

If this feature is enabled, access points shall request for Web pages from the controller during adoption. If the controller has a different set of Web pages, than the ones existing on the access points, the controller shall distribute the Web pages uploaded on it to the access points.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`webpage-auto-upload`

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#webpage-auto-upload
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test webpage-auto-upload logout-fqdn logout.testuser.com
```

4.1.29.2.24 webpage-location

```markdown
**captive-portal-mode commands**

Specifies the location of the Web pages used for authentication. These pages can either be hosted on the system or on an external Web server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
```

**Syntax**

```bash
webpage-location [advanced|external|internal]
```

**Parameters**

- `webpage-location [advanced|external|internal]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advanced</td>
<td>Uses Web pages for login, welcome, failure, and terms created and stored on the controller. Select <strong>advanced</strong> to use a custom-developed directory full of Web page content that can be copied in and out of the controller, service platform, or access point. If selecting advanced, enable the <code>webpage-auto-upload</code> option to automatically launch the advanced pages to requesting clients upon association. For more information, see <code>webpage-auto-upload</code>.</td>
</tr>
<tr>
<td>external</td>
<td>Uses Web pages for login, welcome, failure, and terms located on an external server. Provide the URL for each of these pages.</td>
</tr>
<tr>
<td>internal</td>
<td>Uses Web pages for login, welcome, and failure that are automatically generated</td>
</tr>
</tbody>
</table>

**Examples**

```bash
rfs7000-37FABE(config-captive-portal-test)#webpage-location external

rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
  access-time 35
  connection-mode https
  inactivity-timeout 750
  server host 172.16.10.9
  simultaneous-users 5
  terms-agreement webpage-location external
  use aaa-policy test

rfs7000-37FABE(config-captive-portal-test)#
```

### 4.1.29.2.25 welcome-back

#### captive-portal-mode commands

Enables the provision of direct Internet access to once-registered, captive-portal guest users on subsequent log-ins. When enabled, a previously registered captive-portal guest user, on subsequent logins, is served the Acknowledgement page only if:

- The `agreement-refresh` option is enabled for device-based (device and device-OTP) registration, and
- The interval between logout and login is **lesser** than the `agreement-refresh` timeout configured in the WLAN context. If this interval exceeds the agreement-refresh timeout, the user is served the Agreement page. For more information on configuring the agreement-refresh timeout value, see registration.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
welcome-back pass-through
```

#### Parameters

- `welcome-back pass-through`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>welcome-back pass-through</td>
<td>Enables display of the Acknowledgement page to an already registered user on subsequent captive-portal log-ins, provided the interval between logout and login is lesser than the <code>agreement-refresh</code> timeout</td>
</tr>
<tr>
<td>pass-through</td>
<td>Provides user direct Internet access, from the Welcome-back page, without any user action</td>
</tr>
</tbody>
</table>

#### Examples

```bash
nx9500-6C8809(config-captive-portal-test)#show context captive-portal test
welcome-back pass-through
webpage internal registration field city type text enable label "City" placeholder "Enter City"
webpage internal registration field street type text enable label "Address" placeholder "123 Any Street"
webpage internal registration field name type text enable label "Full Name" placeholder "Enter First Name, Last Name"
webpage internal registration field zip type number enable label "Zip" placeholder "Zip"
webpage internal registration field via-sms type checkbox enable title "SMS Preferred"
webpage internal registration field mobile type number enable label "Mobile" placeholder "Mobile Number with Country code"
webpage internal registration field age-range type dropdown-menu enable label "Age Range" title "Age Range"
webpage internal registration field email type e-address enable mandatory label "Email" placeholder "you@domain.com"
webpage internal registration field via-email type checkbox enable title "Email Preferred"
```

</table>
This section provides the configurations required to enable device registration with dynamic VLAN assignment in a multi-vendor environment.

1. Create vendor-specific RADIUS user groups, and assign an allowed VLAN to each group, as shown in the following examples:
   ```
nx9500-6C8809(config)#radius-group Apple
   nx9500-6C8809(config-radius-group-Apple)#policy vlan 200
   nx9500-6C8809(config)#radius-group Samsung
   nx9500-6C8809(config-radius-group-Samsung)#policy vlan 100
   nx9500-6C8809(config)#radius-group Devices
   nx9500-6C8809(config-radius-group-Devices)#policy vlan 1
   ```
   Note, if necessary, configure the session-time for each of the above configured RADIUS group. This is the duration for which a RADIUS group client’s session remains active after successful authentication. Upon expiration, the RADIUS session is terminated. Use the `policy > session-time > <5-144000>` command to specify the session-time.

2. Create a RADIUS user pool, add users to the pool, and assign the users to the vendor-specific user groups: as shown in the following examples:
   ```
nx9500-6C8809(config)#radius-user-pool-policy Vendor-Devices
   nx9500-6C8809(config-radius-user-pool-Vendor-Devices)#user Samsung password 0 samsung group Samsung
   nx9500-6C8809(config-radius-user-pool-Vendor-Devices)#user test password 0 test123 group Apple
   ```

3. Create a RADIUS server policy, and associate the RADIUS groups and user pool created in steps 1 and 2 respectively, as shown in the following examples:
   ```
nx9500-6C8809(config)#radius-server-policy Guest-Radius
   nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-user-pool-policy Vendor-Devices
   nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-group Samsung
   nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-group Sony
   nx9500-6C8809(config-radius-server-policy-Guest-Radius)#use radius-group Apple
   ```

4. Create AAA Policy pointing to to the controller (Controller)
   ```
nx9500-6C8809(config)#aaa-policy OnBoard-NX
   nx9500-6C8809(config-aaa-policy-OnBoard-NX)#authentication server 1 controller
   nx9500-6C8809(config-aaa-policy-OnBoard-NX)#show context
   aaa-policy OnBoard-NX
   authentication server 1 onboard self
   nx9500-6C8809(config-aaa-policy-OnBoard-NX)#
   ```

5. Create a captive-portal, and point to the captive-portal’s server, enable RADIUS VLAN assignment, and associate the AAA policy, as shown in the following examples:
   ```
nx9500-6C8809(config)#captive-portal DeviceRegistration
   nx9500-6C8809(config-captive-portal-DeviceRegistration)#server host captive.zebranoc.com
   nx9500-6C8809(config-captive-portal-DeviceRegistration)#radius-vlan-assignment
   nx9500-6C8809(config-captive-portal-DeviceRegistration)#use aaa-policy OnBoard-NX
   nx9500-6C8809(config-captive-portal-DeviceRegistration)#access-type radius
   ```

6. Configure a WLAN and enable RADIUS VLAN assignment, as shown in the following examples:
nx9500-6C8809(config)#wlan CP-OnBoarding
nx9500-6C8809(config-wlan-CP-OnBoarding)#ssid CP-OnBoarding
nx9500-6C8809(config-wlan-CP-OnBoarding)#radius vlan-assignment
nx9500-6C8809(config-wlan-CP-OnBoarding)#use aaa-policy OnBoard-NX
nx9500-6C8809(config-wlan-CP-OnBoarding)#use captive-portal DeviceRegistration
nx9500-6C8809(config-wlan-CP-OnBoarding)#captive-portal-enforcement fall-back
nx9500-6C8809(config-wlan-CP-OnBoarding)#registration device group-name Devices expiry-time 4320
nx9500-6C8809(config-wlan-CP-OnBoarding)#authentication-type mac

7. Create an access point profile, associate the RADIUS server policy, captive-portal policy to it, and also assign
the WLAN to the AP radio, as shown in the following examples:

nx9500-6C8809(config-profile-SITE-10)#use radius-server-policy Guest-Radius
nx9500-6C8809(config-profile-SITE-10)#use captive-portal server DeviceRegistration
nx9500-6C8809(config-profile-SITE-10-if-radio2)#wlan CP-OnBoarding bss 1 primary
nx9500-6C8809(config-profile-SITE-10-if-ge1)#switchport mode trunk
nx9500-6C8809(config-profile-SITE-10-if-ge1)#switchport trunk native vlan 90
nx9500-6C8809(config-profile-SITE-10-if-ge1)#switchport trunk allowed vlan 1,90,1000-1002
nx9500-6C8809(config-profile-SITE-10-if-ge1)#no switchport trunk native tagged

8. Use the access point profile in the access point's device context.

configuring WeChat Wi-Fi hotspot support in WiNG captive portal

WeChat is a popular messaging app used in China with more than 500 million installations. WeChat’s WiFi hotspot solution allows businesses to provide internet access to their customers. The WiNG captive portal can be configured to incorporate the WeChat WiFi hotspot, so that WeChat users, on their first connect to a WiNG access point, can automatically authenticate with the WeChat server through an intermediate server.

This section provides the configurations required to be made on the WiNG portal to enable WeChat Wi-Fi hotspot.

Configure the following parameters:

1. Create an AAA policy re-directing the WiNG captive portal user to WeChat’s AAA server for authentication, as shown in the following example:

```
x9500-6C8809(config)#aaa-policy cloud2
nx9500-6C8809(config-aaa-policy-cloud2)#authentication server 1 host cloud2.synchroweb.com secret 0 firmware
nx9500-6C8809(config-aaa-policy-cloud2)#show context
```

Note, Synchroweb is an independent software vendor (ISV), whose third-party software is being as the intermediate server. The AAA server and RADIUS accounting server configured in AAA policy must be as per the specification provided by the ISV.

2. Create a DNS whitelist, whitelisting WeChat’s server name in order to initiate RADIUS authentication. The “qq.com” domain name is where WeChat server can be reached.

```
x9500-6C8809(config)#dns-whitelist wxWL
nx9500-6C8809(config-dns-whitelist-wxWL)#permit cloud2.synchroweb.com
nx9500-6C8809(config-dns-whitelist-wxWL)#permit qq.com suffix
nx9500-6C8809(config-dns-whitelist-wxWL)#show context
dns-whitelist wxWL
  permit qq.com suffix
  permit cloud2.synchroweb.com
```

3. Create a captive portal and associate the AAA policy and DNS whitelist created in steps 1 & 2, as shown in the following example:

```
x9500-6C8809(config)#captive-portal wxCP
nx9500-6C8809(config-captive-portal-wxCP)#use aaa-policy cloud2
nx9500-6C8809(config-captive-portal-wxCP)#use dns-whitelist wxWL
```

4. Configure the following captive portal parameters:

```
x9500-6C8809(config)#captive-portal wxCP
nx9500-6C8809(config-captive-portal-wxCP)#access-time 10
nx9500-6C8809(config-captive-portal-wxCP)#server host guest.zebra.com
nx9500-6C8809(config-captive-portal-wxCP)#webpage-location external
nx9500-6C8809(config-captive-portal-wxCP)#webpage external login http://cloud2.synchroweb.com/wechat.nx/index.phpc=WING_TAG_CLIENT_MAC
nx9500-6C8809(config-captive-portal-wxCP)#show context
captive-portal wxCP
  access-time 10
  server host guest.zebra.com
  webpage-location external
  webpage external login http://cloud2.synchroweb.com/wechat.nx/index.phpc=WING_TAG_CLIENT_MAC
```

```
x9500-6C8809(config-captive-portal-wxCP)#show context
captive-portal wxCP
  access-time 10
  server host guest.zebra.com
  webpage-location external
  webpage external login http://cloud2.synchroweb.com/wechat.nx/index.phpc=WING_TAG_CLIENT_MAC
```

```
x9500-6C8809(config-captive-portal-wxCP)#use aaa-policy cloud2
```

```
x9500-6C8809(config-captive-portal-wxCP)#use dns-whitelist wxWL
```

Note, the login URL configured here must be as per the specifications provided by the ISV.

Note, the access-type remains unchanged (i.e radius, which is the default setting). The access-time is set to a minimum value (10 minutes in this example) in order to avoid the default value of 24 hours being applied, in case the RADIUS response does not contain the session-timeout attribute.

5. Create a WLAN and associate the captive portal created in step 3:

```
ng9500-6C8809(config-wlan-wxOpen)#use captive-portal wxCP
ng9500-6C8809(config-wlan-wxOpen)#captive-portal-enforcement
ng9500-6C8809(config-wlan-wxOpen)#show context
wlan wxOpen
ssid wxOpen
vlan 200
bridging-mode local
encryption-type none
authentication-type none
use captive-portal wxCP
```

Note, the modes of authentication and encryption remain unchanged (i.e none, which is the default setting for both parameters). Ensure captive-portal-enforcement is enabled on the WLAN.

4.1.31 client-identity

- **Global Configuration Commands**

With an increase in *Bring Your Own Device* (BYOD) corporate networks, there is a parallel increase in the number of possible attack scenarios within the network. BYOD devices are inherently unsafe, as the organization’s security mechanisms do not extend to these personal devices deployed in the corporate wireless network. Organizations can protect their network by limiting how and what these BYODs can access on and through the corporate network.

Device fingerprinting assists administrators by controlling how BYOD devices access a corporate wireless domain. Device fingerprinting uses DHCP options sent by the client in request or discover packets to derive a unique signature specific to device class. For example, Apple devices have a different signature from Android devices. The signature is used to classify the devices and assign permissions and restrictions on each device class.

The following table summarizes the commands available for creating and configuring a set of new client identity parameters:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-identity</td>
<td>Creates a new client identity and enters its configuration mode</td>
<td>page 4-122</td>
</tr>
<tr>
<td>client-identity-mode</td>
<td>Invokes the client identity policy configuration mode commands</td>
<td>page 4-124</td>
</tr>
<tr>
<td>client-identity-group</td>
<td>Creates a new client identity group and enters its configuration mode</td>
<td>page 4-129</td>
</tr>
</tbody>
</table>
4.1.31.1 client-identity

- client-identity

Creates a new client identity and enters its configuration mode. Client identity is a set of unique fingerprints used to identify a class of devices. This information is used to configure permissions and access rules for the identified class of devices in the network. The client-identity feature enables device fingerprinting.

Device fingerprinting is a technique of collecting, analyzing, and identifying traffic patterns originating from remote computing devices. When enabled, device fingerprinting helps to identify a wireless client’s device type. There are two methods of fingerprinting devices: Active and Passive.

Active fingerprinting is based on the fact that traffic patterns vary with varying device types. It involves the sending of requests (HTTP, etc.) to devices (clients) and analyzing their response to determine the device type. For example, an invalid request is sent to a device, and its error response is analyzed to identify the device type. Since active device fingerprinting involves sending of packets, the probability of the network getting flooded is very high, especially when many devices are being fingerprinted simultaneously.

Passive fingerprinting involves monitoring of devices to check for known traffic patterns specific to devices based on the protocol, driver implementation, etc. This method accurately classifies a client’s TCP/IP configuration, OS fingerprints, wireless settings etc. No packets are sent to the device. Some of the commonly used protocols for passive device fingerprinting are, TCP, DHCP, HTTP, etc.

This feature implements DHCP device fingerprinting, which relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
client-identity <CLIENT-IDENTITY-NAME>

Parameters
- client-identity <CLIENT-IDENTITY-NAME>

<table>
<thead>
<tr>
<th>client-identity &lt;CLIENT-IDENTITY-NAME&gt;</th>
<th>Creates a new client identity policy and enters its configuration mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;CLIENT-IDENTITY-NAME&gt;</td>
<td>Specify a client identity policy name. If the client identity policy does not exist, it is created.</td>
</tr>
</tbody>
</table>

Usage Guidelines
The following points should be considered when configuring the client identity (device fingerprinting) feature:

1. Ensure that DHCP is enforced on the WLANs. For more information on enforcing DHCP on WLANs, see enforce-dhcp.

2. Successful identification of different device types depends on the uniqueness of the configured fingerprints. DHCP fingerprinting identifies clients based on the patterns (fingerprints) in the DHCP discover and request messages sent by clients. If different operating systems have the same fingerprints, it will be difficult to identify the device type.

3. When associating client identities with a role policy, ensure that the profile/device, under which the role policy is being used, also has an associated client identity group (containing all the client identities used by the role policy).
Examples

rfs4000-229D58(config)#client-identity test
rfs4000-229D58(config-client-identity-test)#?
Client Identity Mode commands:
dhcp                     Add a DHCP option based match criteria
dhcp-match-message-type  Specify DHCP message type to match
no                       Negate a command or set its defaults
clrscr                   Clears the display screen
commit                   Commit all changes made in this session
do                       Run commands from Exec mode
end                      End current mode and change to EXEC mode
exit                     End current mode and down to previous mode
help                     Description of the interactive help system
revert                   Revert changes
service                  Service Commands
show                     Show running system information
write                    Write running configuration to memory or terminal

rfs4000-229D58(config-client-identity-test)#
4.1.31.2 client-identity-mode commands

The following table summarizes client identity configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp</td>
<td>Configures the DHCP option match criteria for device fingerprinting</td>
<td>page 4-125</td>
</tr>
<tr>
<td>dhcp-match-message-type</td>
<td>Configures the DHCP message type for device fingerprinting</td>
<td>page 4-127</td>
</tr>
<tr>
<td>no</td>
<td>Removes the DHCP option (used for client identification) configurations</td>
<td>page 4-128</td>
</tr>
</tbody>
</table>
4.1.31.2.1 dhcp

**client-identity-mode commands**

Configures the DHCP option match criteria (signature) for the discover and request message types received from wireless clients.

When accessing a network, DHCP discover and request messages are passed between wireless clients and the DHCP server. These messages contain DHCP options and option values that differ from device to device and are based on the DHCP implementation in the device’s *operating system* (OS). Options and option values contained in a client’s messages are parsed and compared against the configured DHCP option values to identify the device. Once a device type is identified, the wireless client database is updated with the discovered device type.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
dhcp <1-16> message-type [discover|request] [option|option-codes]
dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes]
    [contains|exact|starts-with] [ascii|hexstring] <WORD>
```

**Parameters**

- `dhcp <1-16>` Adds a DHCP option match criteria signature
  - `<1-16>` – Specify an index for this DHCP match criteria from 1 - 16.
  - **Note:** A maximum of 16 match criteria can be configured.

- `message-type [discover|request]` Specifies the message type to which this DHCP match criteria is applicable
  - `discover` – Applies this match criteria to DHCP discover messages only. Indicates that the fingerprint is only checked with any DHCP discover messages received from any device.
  - `request` – Applies this match criteria to DHCP request messages only. Indicates that the fingerprint is only checked with any DHCP request messages received from any device.
  - **Note:** It is recommended to configure client-identity with request messages, because clients rarely send discover messages.
  - **Note:** If the message type is not specified, the fingerprint is checked with all message types (DHCP request and DHCP discover).

- `option <1-254>` The following keywords are common to the ‘discover’ and ‘request’ message types:
  - `option` – Configures a DHCP option value, which is used as the match criteria
  - `<1-254>` – Configures a code for this DHCP option from 1 - 254 (except option 53)

- `option-codes` The following keyword is common to the ‘discover’ and ‘request’ message types:
  - `option-codes` – Matches criteria based on the DHCP option codes contained in the client’s discover/request messages
  - **Note:** Devices pass options in their DHCP discover/request messages as option codes, option types, and option value sets. These option codes are extracted and matched against the configured DHCP option codes and a fingerprint is derived. This derived fingerprint is used to identify the device.
Usage Guidelines
The following DHCP options are useful for identifying different device types:

1. **Option 55**: Used by a DHCP client to request values for specific configuration parameters. It is a list of DHCP option codes and can be in the client’s order of preference.
2. **Client configured list of DHCP options** (all options parsed into a hex string).
3. **Option 60**: Vendor class identifier. Used to identify the vendor and functionality of a DHCP client (some devices do not set the value of this field).

Though it is possible to use any option to configure a device fingerprint, the use of a combination of one or more of the preceding options to define a device is recommended.

Examples

```bash
rfs4000-229D58(config-client-identity-test)#dhcp 1 message-type request option 60 exact ascii MSFT\5.0
rfs4000-229D58(config-client-identity-test)#dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
```

```bash
rfs4000-229D58(config-client-identity-test)#show context client-identity test
dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT5.0
```

Related Commands

| no | Removes a DHCP option signature (match criteria) |
4.31.2.2  dhcp-match-message-type

client-identity-mode commands

Configures the DHCP message type to match

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dhcp-match-message-type [all|any|discover|request]

Parameters

- dhcp-match-message-type [all|any|discover|request]

| dhcp-match-message-type [all|any|discover|request] | Specifies the DHCP message type to consider for matching |
|-----------------------------------------------------|--------------------------------------------------------|
| • all – Matches all message types: discover and request. Indicates that the fingerprint is checked with both the DHCP request and the DHCP discover message. |
| • any – Matches any message type: discover or request. Indicates that the fingerprint is checked with either the DHCP request or the DHCP discover message. |
| • discover – Matches discover messages only. Client matches the client identity only if the discover message sent by the client matches. Values configured for request messages are ignored. |
| • request – Matches request messages only. Client matches the client identity only if the request message sent by the client matches. Values configured for discover messages are ignored. |

Examples

rfs4000-229D58(config-client-identity-test)#dhcp-match-message-type all

rfs4000-229D58(config-client-identity-test)#show context
client-identity test
dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT5.0
dhcp-match-message-type all
rfs4000-229D58(config-client-identity-test)#

Related Commands

| no | Removes the DHCP message type to match |
4.1.31.2.3 no

Removes the DHCP options match criteria configurations

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [dhcp <1-16>|dhcp-match-message-type]

Parameters

- no [dhcp <1-16>|dhcp-match-message-type]

| dhcp <1-16> | Removes the DHCP option match criteria rule identified by the <1-16> keyword
| dhcp-match-message-type | Removes the DHCP message type to match

Examples

The following example shows the client identity ‘test’ settings before the ‘no’ commands are executed:

```
rfs4000-229D58(config-client-identity-test)#show context
client-identity test
dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT5.0
dhcp-match-message-type all
rfs4000-229D58(config-client-identity-test)#
```

The following example shows the client identity ‘test’ settings after the ‘no’ commands are executed:

```
rfs4000-229D58(config-client-identity-test)#no dhcp 2
rfs4000-229D58(config-client-identity-test)#no dhcp-match-message-type
rfs4000-229D58(config-client-identity-test)#show context
client-identity test
dhcp 1 message-type request option 60 exact ascii MSFT5.0
rfs4000-229D58(config-client-identity-test)#
```

</tr>
</tbody>
</table>
4.1.32.1 client-identity-group

- **client-identity-group**

  Configures a new client identity group

  A client identity group is a collection of client identities. Each client identity included in a client identity group is set a priority value that indicates the priority for that identity when device fingerprinting.

  Device Fingerprinting relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

  A client identity group can be attached to a profile or device, enabling device fingerprinting on them.

  Supported in the following platforms:
  
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
client-identity-group <CLIENT-IDENTITY-GROUP-NAME>
```

**Parameters**

- **client-identity-group <CLIENT-IDENTITY-GROUP-NAME>**

| client-identity-group <CLIENT-IDENTITY-GROUP-NAME> | Creates a new client identity group and enters its configuration mode
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;CLIENT-IDENTITY-GROUP-NAME&gt;</td>
<td>Specify a client identity group name. If the group does not exist, it is created.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config)#client-identity-group test
rfs4000-229D58(config-client-identity-group-test)#
```

Client Identity group Mode commands:

- **client-identity** Client identity (DHCP Device Fingerprinting)
- **no** Negate a command or set its defaults
- **clrscr** Clears the display screen
- **commit** Commit all changes made in this session
- **do** Run commands from Exec mode
- **end** End current mode and change to EXEC mode
- **exit** End current mode and down to previous mode
- **help** Description of the interactive help system
- **revert** Revert changes
- **service** Service Commands
- **show** Show running system information
- **write** Write running configuration to memory or terminal

```
rfs4000-229D58(config-client-identity-group-test)#
```
4.1.32.2 client-identity-group-mode commands

The following table summarizes client identity group configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-identity</td>
<td>Associates an existing and configured client identity (device fingerprint) with this client identity group</td>
<td>page 4-132</td>
</tr>
<tr>
<td>no</td>
<td>Removes the client identity associated with this client identity group</td>
<td>page 4-128</td>
</tr>
</tbody>
</table>
4.1.32.2.1 client-identity

**client-identity-group-mode commands**

Associates an existing and configured client identity (device fingerprint) with this client identity group

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>

**Parameters**
- **client-identity** <CLIENT-IDENTITY-NAME> precedence <1-10000>

<table>
<thead>
<tr>
<th>client-identity &lt;CLIENT-IDENTITY-NAME&gt;</th>
<th>Associates a client identity with this group</th>
</tr>
</thead>
<tbody>
<tr>
<td>precedence &lt;1-10000&gt;</td>
<td>Determines the order in which client identity is used.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The client identity rule is applied based on its precedence value. Lower the value, higher is the precedence. Therefore, a client identity with precedence 5 gets precedence over a client identity having precedence 20.</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows two client identities created and configured:

```
rfs4000-229D58(config)#show context
!
! Configuration of RFS4000 version 5.8.4.0-004D
!
! version 2.5

4.1.33 clone

Global Configuration Commands

Creates a replica of an existing object or device. The configuration of the new object or device is an exact copy of the existing object or device configuration. Use this command to copy existing configurations and then modifying only the required parameters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

clone [TLO|device]

clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>

clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>

Parameters

- clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>
  - TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>
    - Creates a new TLO by cloning an existing top-level object. The new object has the same configuration as the cloned object.
    - <EXISTING-OBJECT-NAME> – Specify the existing object’s (to be cloned) name
    - <NEW-OBJECT-NAME> – Provide the new object’s name.
    - Note: Enter clone and press Tab to list objects available for cloning.

- clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>
  - device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>
    - Configures a new device based on an existing device configuration
    - <EXISTING-DEVICE-MAC/NAME> – Specify the existing device’s name or MAC address (the device to be cloned)
    - <NEW-DEVICE-MAC> – Provide the new device’s MAC address.
    - Note: Enter clone > device and press Tab to list devices available for cloning.

Examples

nx9500-6C8809(config)#clone rf_domain TechPubs Cloned_TechPubs2
nx9500-6C8809(config)#show context

nx9500-6C8809(config)#
4.1.34 crypto-cmp-policy

- **Global Configuration Commands**

  Creates a crypto Certificate Management Protocol (CMP) policy and enters its configuration mode

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP91XX, AP92XX, AP8432, AP8533
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>
```

**Parameters**

- `crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>`

**Examples**

```
nx9500-6C8809(config)#crypto-cmp-policy CMP
nx9500-6C8809(config-cmp-policy-CMP)#?
```

**CMP Policy Mode commands:**

- `ca-server` CMP CA Server configuration commands
- `cert-key-size` Set key size for certificate request
- `cert-renewal-timeout` Trigger a cert renewal request on timeout
- `cross-cert-validate` Validate cross-cert using factory-cert
- `no` Negate a command or set its defaults
- `subjectAltName` Configure subjectAltName value
- `trustpoint` Trustpoint for CMP
- `use` Set setting to use

```
clrscr
commit
do
end
exit
help
revert
service
show
write
```

```

4.1.35 customize

Global Configuration Commands

Customizes the output of the summary CLI commands. Use this command to define the data displayed as a result of various show commands.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

customize [cdp-lldp-info-column-width|hostname-column-width] <1-64>
customize show-adoption-status (adopted-by, ap-name <1-64>, cdp-lldp-info, config-status, last-adoption, msgs, uptime, version)
customize show-wireless-client (ap-name <1-64>, auth, client-identity <1-32>, bss, enc, hostname <1-64>, ip, last-active, location <1-64>, mac, radio-alias <3-67>, radio-id, radio-type, role <1-32>, state, username <1-64>, vendor, vlan, wlan)
customize show-wireless-client-stats (hostname <1-64>, mac, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)
customize show-wireless-client-stats-rf (average-retry-number, error-rate, hostname <1-64>, mac, noise, q-index, rx-rate, signal, snr, tx-rate)
customize show-wireless-meshpoint-accelerated-multicast (ap-hostname, group-addr, mesh-name, neighbor-hostname, neighbor-ifid, radio-alias, radio-id, radio-mac, subscriptions)
customize show-wireless-meshpoint (ap-mac, cfg-as-root, hops, hostname <1-64>, interface-ids, is-root, mesh-name <1-64>, mpid, next-hop-hostname <1-64>, next-hop-ifid, next-hop-use-time, path-metric, root-bound-time, root-hostname <1-64>, root-mpid)
customize show-wireless-meshpoint-neighbor-stats (ap-hostname <1-64>, neighbor-hostname <1-64>, neighbor-ifid, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)
customize show-wireless-meshpoint-neighbor-stats-rf (ap-hostname <1-64>, average-retry-number, error-rate, neighbor-hostname <1-64>, neighbor-ifid, noise, q-index, rx-rate, signal, snr, t-index, tx-rate)
customize show-wireless-mint-client (client-alias <1-64>, client-bss, portal-alias <1-64>, portal-bss, up-time)
customize show-wireless-mint-client-stats (client-alias <1-64>, portal-alias <1-64>, portal-bss, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)
customize show-wireless-mint-client-stats-rf (average-retry-number, client-alias <1-64>, error-rate, noise, portal-alias <1-64>, portal-bss, q-index, rx-rate, signal, snr, tx-rate)
customize show-wireless-mint-portal (client-alias <1-64>, client-bss, portal-alias <1-64>, portal-bss, up-time)

customize show-wireless-mint-portal-stats (client-alias <1-64>, client-bss, portal-alias <1-64>, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)

customize show-wireless-mint-portal-stats-rf (average-retry-number, client-alias <1-64>, client-bss, error-rate, noise, portal-alias <1-64>, q-index, rx-rate, signal, snr, tx-rate)

customize show-wireless-radio (adopt-to, ap-name <1-64>, channel, location <1-64>, num-clients, power, radio-alias <3-67>, radio-id, radio-mac, rf-mode, state)

customize show-wireless-radio-stats (radio-alias <3-67>, radio-id, radio-mac, rx-bytes, rx-errors, rx-packets, rx-throughput, tx-bytes, tx-dropped, tx-packets, tx-throughput)

customize show-wireless-radio-stats-rf (average-retry-number, error-rate, noise, q-index, radio-alias <3-67>, radio-id, radio-mac, rx-rate, signal, snr, t-index, tx-rate)

**Parameters**

- customize [cdp-lldp-info-column-width|hostname-column-width] <1-64>
  
  hostname-column-width <1-64>  |  Configures default width of the hostname column in all show command outputs  
  • <1-64> – Sets the hostname column width from 1 - 64 characters  

  cdp-lldp-info-column-width <1-64>  |  Configures the column width in the `show > cdp/lldp > [neighbor|report]` command output  
  • <1-64> – Sets the column width from 1 - 64 characters  

- customize show-adoption-status (adopted-by, ap-name <1-64>, cdp-lldp-info, config-status, last-adoption, msgs, uptime, version)

  show-adoption-status  |  Configures the information displayed in the `show > adoption > status` command output. Select the columns (information) displayed from the following options: adopted-by, ap-name, cdp-lldp-info, config-status, last-adoption, msgs, uptime, and version. These are recursive parameters and you can select multiple options at a time.  
  **Note:** The columns displayed by default are: Device-Name, Version, Config-Status, MSGS, Adopted-By, Last-Adoption, and Uptime.  
  **Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- customize show-wireless-client (ap-name <1-64>, auth, client-identity <1-32>, bss, enc, hostname <1-64>, ip, last-active, location <1-64>, mac, radio-alias <3-67>, radio-id, radio-type, role <1-32>, state, username <1-64>, vendor, vlan, wlan)

  show-wireless-client  |  Customizes the `show > wireless > client` command output  
  **Note:** The columns displayed by default are: MAC, IPv4, Vendor, Radio-ID, WLAN, VLAN, and State.  

  ap-name <1-64>  |  Includes the ap-name column, which displays the name of the AP with which this client associates  
  • <1-64> – Sets the ap-name column width from 1 - 64 characters  

  auth  |  Includes the auth column, which displays the authorization protocol used by the wireless client  

  client-identity <1-32>  |  Includes the client-identity (device type) column, which displays details gathered from DHCP device fingerprinting feature (when enabled). For more information, see `client-identity`.  
  • <1-32> – Sets the client-identity column width from 1 - 32 characters
<table>

- customize show-wireless-client-stats-rf (average-retry-number, error-rate, host-name <1-64>, mac, noise, q-index, rx-rate, signal, snr, tx-rate)

- show-wireless-client-stats-rf Customizes the show > wireless > client > statistics > rf command output

**Note:** The columns displayed by default are: MAC, Signal (dBm), Noise (dBm), SNR (dB), TX Rate (Mbps), Retry Avg, Errors (pps), and Q-Index (%).

- average-retry-number Includes the average-retry-number column, which displays the average number of retransmissions made per packet

- error-rate Includes the error-rate column, which displays the rate of error for the wireless client

- hostname <1-64> Includes the hostname column, which displays the wireless client’s hostname
  - <1-64> – Sets the hostname column width from 1 - 64 characters

- mac Includes the MAC column, which displays the wireless client’s MAC address

- noise Includes the noise column, which displays the noise (in dBm) as detected by the wireless client

- q-index Includes the q-index column, which displays the RF quality index
  - **Note:** Higher values indicate better RF quality.

- rx-rate Includes the rx-rate column, which displays the receive rate at the particular wireless client

- signal Includes the signal column, which displays the signal strength (in dBm) at the particular wireless client

- snr Includes the snr column, which displays the signal to noise (SNR) ratio (in dB) at the particular wireless client

- tx-rate Includes the tx-rate column, which displays the packet transmission rate at the particular wireless client
- customize show-wireless-meshpoint-accelerated-multicast (ap-hostname, group-addr, mesh-name, neighbor-hostname, neighbor-ifid, radio-alias, radio-id, radio-mac, subscriptions)

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show-wireless-meshpoint-accelerated-multicast</td>
<td>Configures the information displayed in the show &gt; wireless &gt; meshpoint &gt; accelerated multicast command output. Select the columns (information) displayed from the following options: ap-hostname, group-addr, mesh-name, neighbor-hostname, neighbor-ifid, radio-alias, radio-id, radio-mac, subscriptions. These are recursive parameters and you can select multiple options at a time. <strong>Note:</strong> The columns displayed by default are: Mesh, Radio, Neighbor-IFID, Neighbor-Hostname, Group-MAC, and Subscriptions.</td>
</tr>

**show-wireless-mint-portal**  
Configures the information displayed in the `show > wireless > mint > portal` command output. Select the columns (information) displayed from the following options: client-alias, client-bss, portal-alias, portal-bss, and up-time. These are recursive parameters and you can select multiple options at a time.  
**Note:** The columns displayed by default are: Client, Client-Radio-MAC, Portal, Portal-Radio-MAC, and Up-Time.  
**Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- **Customize show-wireless-mint-portal-stats** *(client-alias <1-64>, client-bss, portal-alias <1-64>, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)*

**show-wireless-mint-portal-stats**  
Configures the information displayed in the `show > wireless > mint > portal > statistics` command output. Select the columns (information) displayed from the following options: client-alias, client-bss, portal-alias, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput. These are recursive parameters and you can select multiple options at a time.  
**Note:** The columns displayed by default are: Client, Client-Radio-MAC, Portal, Tx bytes, Rx bytes, TX pkts, RX pkts, TX (bps), Rx (bps), T-Index (%), and Dropped pkts.  
**Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- **Customize show-wireless-mint-portal-stats-rf** *(average-retry-number, client-alias <1-64>, client-bss, error-rate, noise, portal-alias <1-64>, q-index, rx-rate, signal, snr, tx-rate)*

**show-wireless-mint-portal-stats-rf**  
Configures the information displayed in the `show > wireless > mint > portal > statistics > rf` command output. Select the columns (information) displayed from the following options: average-retry-number, client-alias, client-bss, error-rate, noise, portal-alias, q-index, rx-rate, signal, snr, tx-rate. These are recursive parameters and you can select multiple options at a time.  
**Note:** The columns displayed by default are: Client, Client-Radio-MAC, Portal, Signal (dBm), Noise (dBm), SNR (dB), Tx-Rate (Mbps), Rx-rate (Mbps), Retry Avg, Errors (pps), and Q-Index (%).  
**Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- **Customize show-wireless-radio** *(adopt-to, ap-name <1-64>, channel, location <1-64>, num-clients, power, radio-alias <3-67>, radio-id, radio-mac, rf-mode, state)*

**show-wireless-radio**  
Customizes the show wireless radio command output  
**adopt-to**  
Includes the adopt-to column, which displays information about the wireless controller adopting this AP  
**ap-name <1-64>**  
Includes the ap-name column, which displays information about the AP this radio belongs  
• <1-64> – Sets the ap-name column width from 1 - 64 characters  
**channel**  
Includes the channel column, which displays information about the configured and current channel for this radio
| Location <1-64> | Includes the location column, which displays the location of the AP this radio belongs to.  
  • <1-64> – Sets the location column width from 1 - 64 characters |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Num-Clients</td>
<td>Includes the num-clients column, which displays the number of clients associated with this radio</td>
</tr>
<tr>
<td>Power</td>
<td>Includes the power column, which displays the radio’s configured and current transmit power.</td>
</tr>
</tbody>
</table>
| Radio-Alias <3-67> | Includes the radio-alias column, which displays the radio’s alias (combination of AP’s hostname and radio interface number in the “HOSTNAME:RX” format).  
  • <3-67> – Sets the radio-alias column width from 3 - 67 characters |
| Radio-ID        | Includes the radio-id column, which displays the radio’s ID (combination of AP’s MAC address and radio interface number in the “AA-BB-CC-DD-EE-FF:RX” format). |
| Radio-Mac       | Includes the radio-mac column, which displays the radio’s base MAC address. |
| Rf-Mode         | Includes the rf-mode column, which displays the radio’s operating mode. The radio mode can be 2.4 GHz, 5.0 GHz, or sensor. |
| State           | Includes the state column, which displays the radio’s current operational state. |

- `customise show-wireless-radio-stats (radio-alias <3-67>, radio-id, radio-mac, rx-bytes, rx-errors, rx-packets, rx-throughput, tx-bytes, tx-dropped, tx-packets, tx-throughput)`

<table>
<thead>
<tr>

</table>
| Radio-Alias <3-67>        | Includes the radio-alias column, which displays the radio’s alias (combination of AP’s hostname and radio interface number in the “HOSTNAME:RX” format).  
  • <3-67> – Sets the radio-alias column width from 3 - 67 characters |
| Radio-ID                  | Includes the radio-id column, which displays the radio’s ID (combination of AP’s MAC address and radio interface number in the “AA-BB-CC-DD-EE-FF:RX” format). |
| Radio-Mac                 | Includes the radio-mac column, which displays the radio’s base MAC address. |
| Rx-Bytes                  | Includes the rx-bytes column, which displays the total number of bytes received by the radio. |
| Rx-Errors                 | Includes the rx-error column, which displays the total number of errors received by the radio. |
| Rx-Packets                | Includes the rx-packets column, which displays the total number of packets received by the radio. |
| Rx-Throughput             | Includes the rx-throughput column, which displays the receive throughput at the radio. |
| Tx-Bytes                  | Includes the tx-bytes column, which displays the total number of bytes transmitted by the radio. |
| Tx-Dropped                | Includes the tx-dropped column, which displays the total number of packets dropped by the radio. |
| Tx-Packets                | Includes the tx-packets column, which displays the total number of packets transmitted by the radio. |
| Tx-Throughput             | Includes the tx-throughput column, which displays the transmission throughput at the radio. |
GLOBAL CONFIGURATION COMMANDS 4-147

- customize show-wireless-radio-stats-rf (average-retry-number, error-rate, noise, q-index, radio-alias <3-67>, radio-id, radio-mac, rx-rate, signal, snr, t-index, tx-rate)

<td></td>
<td></td>
</tr>
</tbody>
</table>
4.1.36.1 database-client-policy

`database-client-policy` creates a database client policy and enters its configuration mode. The database client policy configures the IP address or hostname of the VX9000 hosting the MongoDB.

The WiNG software supports a split Mongo/NSight environment that provides a more scalable and cost-effective guest management solution, wherein the MongoDB and the NSight server are hosted on separate VX9000 virtual machines (VMs). In such an environment, the database client policy is created and used on the NSight VM to enable the NSight VM identify the VM hosting the MongoDB.

There are two, split Mongo/application deployment scenarios: a non-replica set deployment and a replica set deployment.

The non-replica set deployment consists of two VMs, one hosting the MongoDB and the other hosting the NSight server.

The replica set deployment consists of four VMs deployed across two locations on different subnets - data center 1 and data center 2. Each data center has two VMs, one hosting the MongoDB, while the other hosting the NSight server. Following is an example of the data center 1 & 2 setup:

Data center 1: Mongo-VM1 and NSight-VM1 use 192.168.1.0/24
Data center 2: Mongo-VM2 and NSight-VM2 use 192.168.2.0/24

A third location with one VM hosting a full version of the database is setup to function as the arbiter.

In both these scenarios, the MongoDB VM should be configured with a disk space large enough to support customer’s database requirements. Further, each MongoDB VM must use a database policy enabling the MongoDB daemon.

---

**NOTE:** On the NX95XX model service platforms, the Mongo daemon is enabled by default.

---

Supported in the following platforms:
- Service Platforms — VX9000

**Syntax**

`database-client-policy <DATABASE-CLIENT-POLICY-NAME>`

**Parameters**

- `database-client-policy <DATABASE-CLIENT-POLICY-NAME>`

**Examples**

```
vx9000-34B78B(config)#database-client-policy DBClientPolicy
vx9000-34B78B(config-database-client-policy-DBClientPolicy)#?
```

**Database Client Policy Mode commands:**

- `database-server` Add database server
- `no` Negate a command or set its defaults
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal
To setup a split Mongo/NSight environment,

1. On the VX9000, hosting the Mongo database, use a database policy enabling the Mongo daemon.

2. On the VX9000, hosting the NSight server, create the database client policy, and configure the MongoDB server's IP address or hostname. This is the VX9000 on which the Mongo daemon is enabled.

3. Use this database client policy in the NSight server VM's device context.

<td></td>
<td></td>
</tr>
</tbody>
</table>
4.1.37.1 database-policy

database-policy

Creates a database policy and enters its configuration mode. A database policy enables the deployment of a replica set from a single MongoDB instance. A replica set in MongoDB is a group of devices (replica-set members) running the mongod instances that maintain the same data set. Replica sets provide redundancy and high availability and are the basis for all production deployments.

A replica set usually consists of: an arbiter, a primary member, and one or more secondary members. The primary member and the secondary member(s) maintain replicas of the data set. All real-time, client-write operations are accepted by the primary member only and are recorded in the primary member’s operations log (oplog). The secondary member(s) asynchronously replicate the primary member’s oplog in order to maintain a data set identical to that of the primary member. In case of the primary member’s unavailability, one of the secondary member is elected as the primary member. The arbiter, on the other hand, does not maintain a data set and is added to the replica set to facilitate the election of the fall-back primary member. It provides that one extra vote required in the election of the primary member.

For the fall-back primary-member election to succeed, at least one member and the arbiter should up and running and mutually reachable. If, for example, in a three-member replica set the primary goes down but the secondary and the arbiter are up and mutually reachable, the secondary member is designated as the primary member and begins to accept write operations. But, if the arbiter is down, or if the arbiter and the secondary are unable to communicate with each other, the secondary member’s status remains unchanged.

Before deploying a replica set, ensure that each of the device identified to be a replica-set member:

- has MongoDB installed, and
- is able to communicate with every other member in the set.

Having installed MongoDB and established connectivity,

- Create a database policy (with identical replica-set configuration) on each of the member device, and
- Use the database policy in the member device’s configuration mode.

These member devices elect a primary member, which begins accepting client-write operations. Remaining devices in the replica-set, with the exception of the arbiter, are designated as secondary members.

**NOTE:** In a replica-set, the primary and secondary members can be deployed only on an NX95XX series service platform or a VX9000. However, the arbiter can be an NX5500, NX75XX, and NX9XXX series service platforms. For more information on using the database policy in the NX95XX device, see use.

Supported in the following platforms:

- Service Platforms — NX9000, NX9500, NX9510, VX9000

**Syntax**

database-policy <DATABASE-POLICY-NAME>

**Parameters**

- database-policy <DATABASE-POLICY-NAME>

| database-policy <DATABASE-POLICY-NAME> | Specify the database policy name. If the policy does not exist, it is created. |
**Examples**

nx9500-6C8809(config-database-policy-test)#?

Database Policy Mode commands:

- no          Negate a command or set its defaults
- replica-set Replica Set
- shutdown    Disable database server

- clrscr      Clears the display screen
- commit      Commit all changes made in this session
- do          Run commands from Exec mode
- end         End current mode and change to EXEC mode
- exit        End current mode and down to previous mode
- help        Description of the interactive help system
- revert      Revert changes
- service     Service Commands
- show        Show running system information
- write       Write running configuration to memory or terminal

nx9500-6C8809(config-database-policy-test)#

</tbody>
</table>
4.1.37.2.1 replica-set

database-policy-mode commands

Adds a member (hosting mongod instance) to a MongoDB replica set. A replica set in MongoDB is a group of devices running the mongod instances that maintain the same data set. Replica sets provide redundancy and high availability, and are the basis for all production deployments.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600, VX9000, NX7500, NX5500

Syntax

replica-set member [IP|FQDN] {arbiter|priority <0-255>}

Parameters
- replica-set member [IP|FQDN] {arbiter|priority <0-255>}

Examples

nx9500-6C8809(config-database-policy-test)#replica-set member 192.168.13.14 arbiter
nx9500-6C8809(config-database-policy-test)#replica-set member 192.168.13.16 priority 1
nx9500-6C8809(config-database-policy-test)#replica-set member 192.168.13.12 priority 2
nx9500-6C8809(config-database-policy-test)#show context database-policy test
  replica-set member 192.168.13.12 priority 2
  replica-set member 192.168.13.14 arbiter
  replica-set member 192.168.13.16 priority 1
nx9500-6C8809(config-database-policy-test)#

Related Commands

no

Removes a member from the MongoDB replica set
4.1.37.2.2 shutdown

Shuts down the MongoDB database server (i.e. stops the Mongo daemon). The factory default is set as `no shutdown`.

**Syntax**

```
shutdown
```

**Parameters**

None

**Examples**

```
nx9500-6C8809(config-database-policy-test)#shutdown

nx9500-6C8809(config-database-policy-test)#show context database-policy test
  shutdown

nx9500-6C8809(config-database-policy-test)#
```

**Related Commands**

`no` Enables the MongoDB database server (starts the Mongo daemon)
4.1.37.2.3  no

    database-policy-mode commands

Removes or reverts to default values the MongoDB database policy settings

Supported in the following platforms:

- Service Platforms — NX9000, NX9500, NX9510, NX9600, VX9000, NX7500, NX5500

Syntax

no [replica-set|shutdown]

no replica-set member [<IP>|<FQDN>]

no shutdown

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes a member from the MongoDB replica set, or brings up a MongoDB server that has been shut down |

Examples

The following example shows a three-member replica set:

nx9500-6C8809(config-database-policy-test)#show context
database-policy test
    replica-set member 192.168.13.12 priority 2
    replica-set member 192.168.13.14 arbiter
    replica-set member 192.168.13.16 priority 1

nx9500-6C8809(config-database-policy-test)#

In the following example the arbiter is being removed, leaving the replica set with only two members:

nx9500-6C8809(config-database-policy-test)#no replica-set member 192.168.13.14

nx9500-6C8809(config-database-policy-test)#show context
database-policy test
    replica-set member 192.168.13.12 priority 2
    replica-set member 192.168.13.16 priority 1

nx9500-6C8809(config-database-policy-test)#

Since a replica set must have at least three members, another member must be added to this replica set. This member may or may not be an arbiter.

nx9500-6C8809(config-database-policy-test)#replica-set member 192.168.13.8 priority 3

nx9500-6C8809(config-database-policy-test)#show context
database-policy test
    replica-set member 192.168.13.12 priority 2
    replica-set member 192.168.13.16 priority 1
    replica-set member 192.168.13.8 priority 3

nx9500-6C8809(config-database-policy-test)#
4.1.38 device

Global Configuration Commands

Enables simultaneous configuration of multiple devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

device {containing|filter}

device {containing <STRING>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|ex3524|ex3548|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|t5|vx9000]}

device {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|ex3524|ex3548|rfs4000|rfs6000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|t5|vx9000]}

Parameters

- device {containing <STRING>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|ex3524|ex3548|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|t5|vx9000]}

device

Enters a device’s configuration mode. Use this command to simultaneously configure devices having similar configuration.

containing

Optional. Configures the string to search for in the device’s hostname. All devices having hostnames containing the string specified here are filtered, and can be configured simultaneously.

- <STRING> – Specify the string to search for in the device’s hostname.

filter type

Optional. Filters out a specific device type. After specifying the hostname string, select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, EX3524, EX3548, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, t5, and VX9000 (V-WLC).

Note: The t5 option is applicable only on the RFS7000, NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, and NX9600 platforms.

Note: The VX9000 option is applicable only to the NX9000, NX9500, NX9510, and NX9600 platforms.

- device {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|ex3524|ex3548|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|t5|vx9000]}

device

Configures a basic device profile

filter type

Optional. Filters out a specific device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, EX3524, EX3548, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, t5, and VX9000 (V-WLC).

Contd..
**Examples**

```
rfs7000-6DCD4B(config)#device filter type ap81xx
rfs7000-6DCD4B(config-device-{'type': 'ap81xx'})#
```

**Note:** The t5 option is applicable only on the RFS7000, NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, and NX9600 platforms.

**Note:** The VX9000 option is applicable only to the NX9000, NX9500, NX9510, and NX9600 platforms.
### 4.1.39 `device-categorization`

*Global Configuration Commands*

Categorizes devices as sanctioned or neighboring. Categorization of devices enables quick identification and blocking of unsanctioned devices in the network.

The following table summarizes the device categorization mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>device-categorization</code></td>
<td>Creates a device categorization list and enters its configuration mode</td>
<td>page 4-165</td>
</tr>
<tr>
<td><code>device-categorization-mode</code></td>
<td>Summarizes device categorization list configuration mode commands</td>
<td>page 4-166</td>
</tr>
</tbody>
</table>
4.1.39.1 **device-categorization**

`device-categorization`

Configures a device categorization list

Proper classification and categorization of devices (access points, clients, etc.) helps suppress unnecessary unauthorized access point alarms, allowing network administrators to focus on alarms on devices actually behaving in a suspicious manner. An intruder with a device erroneously authorized could potentially perform activities that harm your organization.

Authorized access points and clients are generally known to you and conform with your organization’s security policies. Unauthorized devices are those detected as interoperating within the network, but are not approved. These devices should be filtered to avoid jeopardizing the data within a managed network. Use this command to apply the neighboring and sanctioned (approved) filters on peer devices operating within a wireless controller or access point’s radio coverage area. Detected client MAC addresses can also be filtered based on their classification.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9600

**Syntax**

```
device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>
```

**Parameters**

- `device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>`

**Examples**

```
rfs7000-37FABE(config)#device-categorization rfs7000
rfs7000-37FABE(config-device-categorization-rfs7000)#?
```

Device Category Mode commands:

- `mark-device` Add a device
- `no` Negate a command or set its defaults
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-device-categorization-rfs7000)#
```

**Related Commands**

- `no` Removes an existing device categorization list
## device-categorization-mode commands

The following table summarizes device categorization configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>mark-device</td>
<td>Adds a device to the device categorization list</td>
<td>page 4-167</td>

<tr>
<td>no</td>
<td>Removes a device from the device categorization list</td>
<td>page 4-168</td>
</tr>
</tbody>
</table>
4.1.39.2.1 mark-device

Adds a device to the device categorization list as sanctioned or neighboring. Devices are further classified as AP or client.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
mark-device <1-1000> [sanctioned|neighboring] [ap|client]
mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}

Parameters
- mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
- mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}

Examples
rfs7000-37FABE(config-device-categorization-rfs7000)#mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#show context
device-categorization rfs7000
mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#

Related Commands
- no
  Removes an entry from the device categorization list
4.1.39.2.2 no

Removes a device from the device categorization list

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no mark-device <1-1000> [neighboring|sanctioned] [ap|client] {mac <MAC>}
no mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}
no mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}

Parameters
- no <PARAMETERS>

Examples

The following example shows the device categorization list 'rfs7000' settings before the 'no' command is executed:

```
rfs7000-37FABE(config-device-categorization-rfs7000)#show context
device-categorization rfs7000
  mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#
```

The following example shows the device categorization list 'rfs7000' settings after the 'no' command is executed:

```
rfs7000-37FABE(config-device-categorization-rfs7000)#no mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#
```

Related Commands

- mark-device
  Adds a device to a list of sanctioned or neighboring devices
4.1.40 dhcp-server-policy

Configures DHCPv4 server policy parameters, such as class, address range, and options. A new policy is created if it does not exist.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dhcp-server-policy <DHCP-SERVER-POLICY-NAME>

Parameters

- dhcp-server-policy <DHCP-SERVER-POLICY-NAME>

Examples

rfs7000-37FABE(config)#dhcp-server-policy test
rfs7000-37FABE(config-dhcp-policy-test)#?

DHCP policy Mode commands:

- bootp: BOOTP specific configuration
- dhcp-class: Configure DHCP class (for address allocation using DHCP user-class options)
- dhcp-pool: Configure DHCP server address pool
- dhcp-server: Activating dhcp server based on criteria
- no: Negate a command or set its defaults
- option: Define DHCP server option
- ping: Specify ping parameters used by DHCP Server

rfs7000-37FABE(config-dhcp-policy-test)#

</tbody>
</table>

NOTE: For more information on DHCP policy, see Chapter 12, DHCP-SERVER-POLICY.
Global Configuration Commands

4.1.41 dhcpv6-server-policy

Creates a DHCPv6 server policy and enters its configuration mode

DHCPv6 is a networking protocol for configuring IPv6 hosts with IP addresses, IP prefixes, or other configuration attributes required on an IPv6 network.

DHCPv6 servers pass IPv6 network addresses to IPv6 clients. The DHCPv6 address assignment feature manages non-duplicate addresses in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple pools. Additional options, such as the default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface or on multiple interfaces, or the server can automatically find the appropriate pool.

When configured and applied to a device, the DHCPv6 server policy enables the device to function as a stateless DHCPv6 server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>

Parameters
- dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>

Examples

rfs7000-6DCD4B(config)#dhcpv6-server-policy test
rfs7000-6DCD4B(config-dhcpv6-server-policy-test)#?

DHCPv6 server policy Mode commands:
- dhcpv6-pool Configure DHCPv6 server address pool
- no Negate a command or set its defaults
- option Define DHCPv6 server option
- restrict-vendor-options Restrict vendor specific options to be sent in server reply
- server-preference Server preference value sent in the reply, by the server to client
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

Related Commands

no Removes an existing DHCPv6 server policy
NOTE: For more information on DHCP policy, see Chapter 12, DHCP-SERVER-POLICY.
4.1.42 dns-whitelist

- Global Configuration Commands

Configures a DNS whitelist. A DNS whitelist is a list of domains allowed access to the network.

The following table lists DNS Whitelist configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>dns-whitelist</td>
<td>Creates a DNS whitelist and enters its configuration mode</td>
<td>page 4-173</td>
</tr>
<tr>
<td>dns-whitelist-mode</td>
<td>Summarizes DNS whitelist configuration mode commands</td>
<td>page 4-174</td>
</tr>
</tbody>
</table>

Table 4.18 DNS-Whitelist Config Commands
4.1.42.1 dns-whitelist

```
4.1.42.1 dns-whitelist

Configures a DNS whitelist. A DNS whitelist is a list of allowed DNS destination IP addresses pre-approved to access a controller, service platform, or access point managed captive portal.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dns-whitelist <DNS-WHITELIST-NAME>

Parameters
- dns-whitelist <DNS-WHITELIST-NAME>

Examples

rfs7000-37FABE(config)#dns-whitelist test
rfs7000-37FABE(config-dns-whitelist-test)#?

DNS Whitelist Mode commands:
no Negate a command or set its defaults
permit Match a host
clrscr Clears the display screen
commit Commit all changes made in this session
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-dns-whitelist-test)#

Related Commands

no Removes an existing DNS Whitelist
```
4.1.42.2 dns-whitelist-mode commands

The following table summarizes DNS Whitelist configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>permit</td>
<td>Permits a host, existing on a DNS whitelist, access to the network or captive portal</td>
<td>page 4-175</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts to default</td>
<td>page 4-176</td>
</tr>
</tbody>
</table>
4.1.42.2.1 permit

A whitelist is a list of host names and IP addresses permitted access to the network or captive portal. This command adds a host or destination IP address to the DNS whitelist.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
permit <IPv4/IPv6/HOSTNAME> {suffix}

Parameters
- permit <IPv4/IPv6/HOSTNAME> {suffix}

<table>
<thead>
<tr>
<th>&lt;IPv4/IPv6/HOSTNAME&gt;</th>
<th>Adds a device to the DNS whitelist</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;IPv4/IPv6/HOSTNAME&gt; – Provide a hostname or numerical IPv4 or IPv6 address for each destination IP address or host included in the whitelist.</td>
</tr>
</tbody>
</table>

Note: A maximum of 256 entries can be made.

suffix
- suffix

Optional. Matches any hostname or domain name including the specified name as suffix

Examples
rfs7000-37FABE(config-dns-whitelist-test)#permit example_company.com suffix

rfs7000-37FABE(config-dns-whitelist-test)#show context dns-whitelist test
permit example_company.com suffix
rfs7000-37FABE(config-dns-whitelist-test)#

Related Commands
- **no** | Removes a DNS whitelist entry |
4.1.42.2.2 no

**dns-whitelist-mode commands**

Removes a specified host or IP address from the DNS whitelist, and prevents it from accessing network resources

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

no permit <IPv4/IPv6/HOSTNAME>

**Parameters**
- no permit <IPv4/IPv6/HOSTNAME>

<table>
<thead>
<tr>
<th>&lt;IPv4/IPv6/HOSTNAME&gt;</th>
<th>Removes a device from the DNS whitelist (identifies the device by its IP address or hostname)</th>
</tr>
</thead>
</table>

**Examples**

rfs7000-37FABE(config-dns-whitelist-test)#show context
dns-whitelist test
permit example_company.com suffix
rfs7000-37FABE(config-dns-whitelist-test)#

rfs7000-37FABE(config-dns-whitelist-test)#no permit example_company.com

rfs7000-37FABE(config-dns-whitelist-test)#show context
dns-whitelist test
rfs7000-37FABE(config-dns-whitelist-test)#

**Related Commands**

| permit | Adds a device to the DNS whitelist |
4.1.43 end

Global Configuration Commands

Ends and exits the current mode and moves to the PRIV EXEC mode.
The prompt changes to the PRIV EXEC mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
end

Parameters
None

Examples
rfs7000-37FABE(config)#end
rfs7000-37FABE#
4.1.44 **event-system-policy**

*Global Configuration Commands*

The following table lists event system configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>event-system-policy</code></td>
<td>Creates an event system policy and enters its configuration mode</td>
<td>page 4-179</td>
</tr>
<tr>
<td><code>event-system-policy-mode commands</code></td>
<td>Summarizes event system policy configuration mode commands</td>
<td>page 4-180</td>
</tr>
</tbody>
</table>
4.1.44.1 event-system-policy

- event-system-policy

Configures a system wide events handling policy

Event system policies enable administrators to create notification mechanisms using one, some, or all of the SNMP, syslog, controller forwarding, or email notification options available to the controller or service platform. Each listed event can have customized notification settings defined and saved as part of an event policy. Thus, policies can be configured and administrated in respect to specific sets of client association, authentication or encryption, and performance events. Once policies are defined, they can be mapped to device profiles strategically as the likelihood of an event applies to particular devices.

To view an existing event system policy configuration details, use the `show > event-system-policy` command.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`event-system-policy <EVENT-SYSTEM-POLICY-NAME>`

Parameters

- `event-system-policy <EVENT-SYSTEM-POLICY-NAME>`

<table>
<thead>
<tr>
<th>&lt;EVENT-SYSTEM-POLICY-NAME&gt;</th>
<th>Specify the event system policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
</table>

Examples

```
rfs7000-37FABE(config)#event-system-policy event-testpolicy
rfs7000-37FABE(config-event-system-policy-event-testpolicy)#?
```

Event System Policy Mode commands:

- `event` Configure an event
- `no` Negate a command or set its defaults
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-event-system-policy-event-testpolicy)#
```

Related Commands

- `no` Removes an event system policy
4.144.2 event-system-policy-mode commands

The following table summarizes event system policy configuration mode commands:

Table 4.21 Event-System-Policy Mode Commands

<table>
<thead>
<tr>

</table>
4.1.44.2.1 event

event-system-policy-mode commands

Configures an event and sets the action performed when the event happens

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

event <EVENT-TYPE> <EVENT-NAME> (email,forward-to-switch,snmp,syslog) [default|on|off]

The event types are:

```
rfs7000-37FABE(config-event-system-policy-testpolicy)#event ?
aaa             AAA/Radius module
adapt           Adaptsivity Module
adopt-service   Adoption Service
adv-wips        Adv-wips module
ap              Access Point module
captive-portal Captive Portal
cdp             Cisco Discovery Protocol
certmgr         Certificate Manager (Not valid for NCAP/MCN)
cfgd            Cfgd module
cluster         Cluster module
crm             Critical Resource Monitoring
database        Database Services
device          Device module
dhcpsvr         DHCP Configuration Daemon
diag            Diag module
dot11           802.11 management module
dot1x           802.1X Authentication
fwu             Firmware update module
isdn            Isdn module
l2gre           Layer 2 GRE Tunnel
l2tpv3          Layer 2 Tunneling Protocol Version 3
licmgr          License module
lldp            Link Layer Discovery Protocol
mgmt            Management Services
nsm             Network Services Module
pm              Process-monitor module
radconf         Radius Configuration Daemon
rasst           Roaming-Assist module
radio           Radio module
smtpnot         Smtpnot module
system          System module
test            Test module
vrrp            Virtual Router Redundancy Protocol
webf            Webf module
wips            Wireless IPS module
```

rfs7000-37FABE(config-event-system-policy-testpolicy)#

NOTE: The parameter values for <EVENT-TYPE> and <EVENT-NAME> are summarized in the table under the Parameters section.
## Parameters

- **event** `<EVENT-TYPE> <EVENT-NAME>` (email, forward-to-switch, snmp, syslog) [default|on|off]

<table>
<thead>
<tr>
<th><code>&lt;event-type&gt;</code></th>
<th><code>&lt;event-name&gt;</code></th>
</tr>
</thead>
</table>
| **aaa**        | Enables and configures the logging of authentication, authorization, and accounting related event messages  
  - radius-discon-msg – RADIUS disconnection message  
  - radius-session-expired – RADIUS session expired message  
  - radius-session-not-started – RADIUS session not started message  
  - radius-vlan-update – RADIUS VLAN update message |
| **adapt**      | Enables and configures the logging of adaptivity module related events  
  - adaptivity-change – Event adaptivity change message  
  - adaptivity-rehome – Event adaptivity rehome message |
| **adopt-services** | Enables and configures the logging of adopted services related events |
| **adv-wips**   | Enables and configures the logging of advanced WIPS related events |
| **ap**         | Enables and configures the logging of AP related event messages  
  - adopted – Event AP adopted message  
  - adopted-to-controller – Event AP adopted to wireless controller message  
  - ap-adopted – Event access port adopted message  
  - ap-autoup-done – Event AP autoup done message  
  - ap-autoup-fail – Event AP autoup fail message  
  - ap-autoup-needed – Event AP autoup needed message  
  - ap-autoup-no-need – Event AP autoup not needed message  
  - ap-autoup-reboot – Event AP autoup reboot message  
  - ap-autoup-timeout – Event AP autoup timeout message  
  - ap-autoup-ver – Event AP autoup version message  
  - ap-reset-detected – Event access port reset detected message  
  - ap-reset-request – Event access port user requested reset message  
  - ap-timeout – Event access port timed out message  
  - ap-unadopted – Event access port unadopted message  
  - image-parse-failure – Event image parse failure message  
  - legacy-auto-update – Event legacy auto update message  
  - no-image-file – Event no image file message  
  - offline – Event AP detected as offline  
  - online – Event offline AP detected as online  
  - reset – Event reset message  
  - sw-conn-lost – Event software connection lost message  
  - unadopted – Event unadopted message |
| **captive-portal** | Enables and configures the logging of captive portal (hotspot) related event messages  
  - allow-access – Event client allowed access message  
  - auth-failed – Event authentication failed message  
  - auth-success – Event authentication success message  
  - client-disconnect – Event client disconnected message |

</table>
4.1.45.1 ex3500

> ex3500

Creates an EX3500 time range list and enters its configuration mode

An EX3500 time range list consists of a set of periodic and absolute time range rules. Periodic time ranges recur periodically at specified time periods, such as daily, weekly, weekends, weekdays, and on specific week days, for example on every successive Mondays. Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period (the starting and ending days and time are fixed).

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four Small Form Factor Pluggable (SFP) transceiver slots for fiber connectivity. The EX3500 series switch can adopt to a WiNG NOC controller and be managed by it. The EX3500 time range values configured here are used in EX3500 MAC ACL firewall rules that filter an EX3500’s incoming and outgoing traffic. For more information on creating EX3500 MAC ACL rules, see ex3500 and access-group.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax
ex3500 time-range <TIME-RANGE-NAME>

Parameters
- ex3500 time-range <TIME-RANGE-NAME>

Examples
nx9500-6C8809(config)#ex3500 time-range EX3500_TimeRange_02
nx9500-6C8809(config-ex3500-time-range-EX3500_TimeRange_02)#?

EX3500 Time Range Configuration commands:
  absolute  Absolute time and date
  no        Negate a command or set its defaults
  periodic  Periodic time and date
  clrscr    Clears the display screen
  commit    Commit all changes made in this session
  do        Run commands from Exec mode
  end       End current mode and change to EXEC mode
  exit      End current mode and down to previous mode
  help      Description of the interactive help system
  revert    Revert changes
  service   Service Commands
  show      Show running system information
  write     Write running configuration to memory or terminal

nx9500-6C8809(config-ex3500-time-range-EX3500_TimeRange_02)#

Related Commands

</tbody>
</table>
4.1.45.2.1 absolute

*ex3500-time-range-config-mode* commands

Configures an absolute time range rule for this EX3500 time range list

Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037> {end <0-23> <0-59> <1-31> <MONTH> <2013-2037>}
```

**Parameters**

- `absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037> {end <0-23> <0-59> <1-31> <MONTH> <2013-2037>}`

<table>
<thead>
<tr>
<th>absolute</th>
<th>Configures an absolute time range rule settings</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>start &lt;0-23&gt; &lt;0-59&gt; &lt;1-31&gt; &lt;MONTH&gt; &lt;2013-2037&gt;</code></td>
<td>Configures the start day and time settings</td>
</tr>
<tr>
<td><code>end &lt;0-23&gt; &lt;0-59&gt; &lt;1-31&gt; &lt;MONTH&gt; &lt;2013-2037&gt;</code></td>
<td>Optional. Configures the end day and time settings</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#absolute start 1 0 1 june 2015 end 1 0 30 june 2016
```

```
nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#show context ex3500 time-range EX3500-TimeRange-01
  absolute start 1 0 1 june 2015 end 1 0 30 june 2016
```

```
nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#
```

**Related Commands**

- `no` Removes this absolute time range rule from the EX3500 time range list
4.1.45.2.2 periodic

`ex3500-time-range-config-mode commands`

Configures a periodic time range rule for this EX3500 time range list.

Periodic time ranges are configured to recur based on periodicity such as daily, weekly, weekends, weekdays, and on specific week days, such as on every successive Sunday.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
periodic [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend] <0-23> <0-59> to [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend] <0-23> <0-59> rule-precedence <1-7>
```

**Parameters**

- **periodic**
  - [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend] Configures this periodic time range’s start day. The options are:
    - daily
    - friday
    - monday
    - saturday
    - sunday
    - thursday
    - tuesday
    - wednesday
    - weekdays
    - weekend
  - <0-23> <0-59> After specifying the start day, specify the start time in hours (24 hours format) and minutes.
    - <0-23> – Specify the start time from 0 - 23 hours.
    - <0-59> – Specify the start time from 0 - 59 minutes.

  For example, if the values provided are 12 hours and 30 minutes, the start time is 12:30 A.M on the specified day.

- **to**
  - [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend]
  - Configures this periodic time range’s end day. This is the day when the time range ends.
    - The options available changes depending on the **start day** configured. The options are:
      - <0-23> <0-59> – Select this option to end the time range on the same day as it starts.
      - daily – Select this option if the time range starts and ends every day at a specified time
      - friday – Select this option if the time range ends on Fridays
      - monday – Select this option if the time range ends on Mondays
      - saturday – Select this option if the time range ends on Saturdays
      - sunday – Select this option if the time range ends on Sundays
```

Contd..
Examples

nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#periodic daily 1 10 to daily 23 10 rule-precedence 1

nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#show context ex3500 time-range EX3500-TimeRange-01
  periodic daily 1 10 to daily 23 10 rule-precedence 1
  absolute start 1 0 1 june 2015 end 1 0 30 june 2016

4.1.46.1 ex3500-management-policy

ex3500-management-policy

Creates an EX3500 management policy and enters its configuration mode. Once configured and applied on a
EX3500 switch, the management policy controls access to the switch from management stations using SNMP.
The EX3500 management policy is either applied:

- Individually on an adopted EX3500 series switch (in the device configuration mode), or
- To a EX3524 and/or EX3548 profile, which is then applied to an adopted EX3500 series switch.

EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-
BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the
IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent
that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP
Web agent and CLI, which in spite of being different from that of the WiNG operating system provides WiNG
controllers PoE and port management resources.

Going forward NX9500, NX7500, NX6500, NX4500 WiNG managed series service platforms and WiNG VMs can
discover, adopt, and partially manage EX3500 series Ethernet switches without modifying the proprietary
operating system running the EX3500 switches. The WiNG service platforms utilize standardized WiNG interfaces
to push configuration files to the EX3500 switches, and maintain a translation layer, understood by the EX3500
switch, for statistics retrieval.

WiNG can partially manage an EX3500 without using DHCP option 193, provided the EX3500 is directly
configured to specify the IPv4 addresses of potential WiNG adopters. To identify the potential WiNG adopter, in
the EX3500’s device configuration mode specify the adopter’s IPv4 address using the
controller > host > <IP-ADDRESS> command. WiNG service platforms leave the proprietary operating system
running the EX3500 switches unmodified, and partially manage them utilizing standardized WiNG interfaces.
WiNG service platforms use a translation layer to communicate with the EX3500.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX9500

Syntax

ex3500-management-policy <POLICY-NAME>

Parameters

- ex3500-management-policy <POLICY-NAME>

Examples

nx9500-6C8809(config)#ex3500-management-policy test
nx9500-6C8809(config-ex3500-management-policy-test)#?

4.146.2.1 enable

> ex3500-management-policy config commands

Configures an executive password for this EX3500 management policy

Each EX3500 management policy can have a unique executive password with its own privilege level assigned. Utilize these passwords as specific EX3500 management sessions require priority over others.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

`enable password [0|7|level]
`enable password [0|7] <PASSWORD>
`enable password level <0-15> [0 <PASSWORD>|7 <PASSWORD>]

Parameters

- `enable password [0|7] <PASSWORD>`
  - Creates a new executive password for this EX3500 management policy. The password could be in clear text or encrypted
  - 0 – Configures a clear text password using ASCII characters (should be 1 - 32 characters long)
  - 7 – Configures an encrypted password using HEX characters (should be 32 characters long)
  - `<PASSWORD>` – Specify the password.

- `enable password level <0-15> [0 <PASSWORD>|7 <PASSWORD>]`
  - Creates a new executive password for this EX3500 management policy and sets its privilege level
  - `<0-15>` – Specify the privilege level for this executive password from 0 - 15. Lower values have higher priority, to slot and prioritize executive passwords and EX3500 management sessions.
  - `<PASSWORD>` – Specify the password.

Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#enable password level 3 7
1234567890123456789012345678901234567890123456789012345678901234567
```

```
nx9500-6C8809(config-ex3500-management-policy-test)#show context ex3500-management-policy-test
  enable password level 3 7 12345678901234567890123456789012345678901234567
  snmp-server notify-filter 1 remote 127.0.0.1
```

```
nx9500-6C8809(config-ex3500-management-policy-test)#
```

Related Commands

`no`
- Removes an executive password from this EX3500 management policy
# http

> **ex3500-management-policy config commands**

Configures the HTTP server settings used to authenticate HTTP connection to a EX3500 switch. Management access to an EX3500 switch can be enabled/disabled as required using separate interfaces and protocols (HTTP, SSH). Disabling un-used and insecure interfaces and unused management services can dramatically reduce an attack footprint and free resources within an EX3500 management policy.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

## Syntax

```
http [port <1-65535>|secure-port <1-65535>|secure-server|server]
```

## Parameters

- **http [port <1-65535>|secure-port <1-65535>|secure-server|server**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>http port &lt;1-65535&gt;</td>
<td>Configures the HTTP port number. This is the port used to connect to the HTTP server.</td>
</tr>
<tr>
<td>secure-port &lt;1-65535&gt;</td>
<td>Enables secure HTTP connection over a designated secure port. Ensure that the HTTP secure server is enabled before specifying the secure-server port.</td>
</tr>
<tr>
<td>secure-server</td>
<td>Enables HTTP secure server. This option is disabled by default.</td>
</tr>
<tr>
<td>server</td>
<td>Enables HTTP server. This option is enabled by default. Consequently, HTTP management access is allowed by default.</td>
</tr>
</tbody>
</table>

## Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#http secure-server
```

```
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
http secure-server
enable password level 3 7 123456789012030405060708092991
snmp-server notify-filter 1 remote 127.0.0.1
```

## Related Commands

- **no**

  Reverts to default HTTP server settings (HTTP server enabled, HTTP port 80)
4.1.46.2.3 memory

`ex3500-management-policy config commands`

Configures the EX3500’s memory utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the memory utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500’s memory and CPU utilization’s upper and lower thresholds, you can avoid over utilization of the EX3500’s processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

Supported in the following platforms:
  - Wireless Controller — RFS7000
  - Service Platforms — NX7500, NX9500

**Syntax**

```
memory [falling-threshold|rising-threshold] <1-100>
```

**Parameters**

- `memory [falling-threshold|rising-threshold] <1-100>`

<table>
<thead>
<tr>
<th>memory</th>
<th>Configures the EX3500’s memory utilization rising and falling threshold values. The system generates a notification when either of these limits is exceeded.</th>
</tr>
</thead>
</table>
| falling-threshold `<1-100>` | Configures the falling threshold for the EX3500 memory utilization  
  • `<1-100>` – Specify the falling threshold as a percentage from 1 - 100. The default is 70%. |
| rising-threshold `<1-100>` | Configures the rising threshold for the EX3500’s memory utilization  
  • `<1-100>` – Specify the rising threshold as a percentage from 1 - 100. The default is 90%. |

**Examples**

```
nx9500-6C8809(config-ex3500-management-policy-test)#memory falling-threshold 50
nx9500-6C8809(config-ex3500-management-policy-test)#memory rising-threshold 95
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
  http secure-server
  enable password level 3 7 12345678901020304050607080929291
  snmp-server notify-filter 1 remote 127.0.0.1
  memory falling-threshold 50
  memory rising-threshold 95
nx9500-6C8809(config-ex3500-management-policy-test)#
```

**Related Commands**

```
no
```

Reverts the memory utilization’s falling-threshold and/or rising threshold to 70% and 90% respectively
4.1.46.2.4 process-cpu

ex3500-management-policy config commands

Configures the EX3500’s CPU (processor) utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the CPU utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500’s memory and CPU utilization’s upper and lower thresholds, you can avoid over utilization of the EX3500’s processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax
process-cpu [falling-threshold|rising-threshold] <1-100>

Parameters
- process-cpu [falling-threshold|rising-threshold] <1-100>

| process-cpu | Configures the EX3500’s CPU utilization rising and falling threshold values. The system generates a notification when either of these limits is exceeded. |
| falling-threshold | Configures the falling threshold for the EX3500’s CPU utilization |
| <1-100> | • <1-100> – Specify the falling threshold as a percentage from 1 - 100. The default is 70%. |
| rising-threshold | Configures the rising threshold for the EX3500’s CPU utilization |
| <1-100> | • <1-100> – Specify the rising threshold as a percentage from 1 - 100. The default is 90%. |

Examples
nx9500-6C8809(config-ex3500-management-policy-test)#process-cpu falling-threshold 60
nx9500-6C8809(config-ex3500-management-policy-test)#process-cpu rising-threshold 80
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
http secure-server
enable password level 3 7 12345678901020304050607080929291
snmp-server notify-filter 1 remote 127.0.0.1
memory falling-threshold 50
memory rising-threshold 95
process-cpu falling-threshold 60
process-cpu rising-threshold 80
nx9500-6C8809(config-ex3500-management-policy-test)#

Related Commands

| no | Reverts the CPU utilization’s falling-threshold and/or rising threshold to 70% and 90% respectively |
4.146.2.5  snmp-server

Configures Simple Network Management Protocol (SNMP) server settings. Once configured and applied on a
EX3500 switch, the management policy controls access to the switch from management stations using SNMP.
SNMP is an application layer protocol that facilitates the exchange of management information between the
management stations and a managed EX3500 switch. SNMP-enabled devices listen on port 162 (by default) for
SNMP packets from the management server. SNMP uses read-only and read-write community strings as an
authentication mechanism to monitor and configure supported devices. The read-only community string is used to
gather statistics and configuration parameters from a supported wireless device. The read-write community string
is used by a management server to set device parameters. SNMP is generally used to monitor a system’s
performance and other parameters.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
snmp-server {community|contact|enable|engine-id|group|host|location|notify-filter|
user|view}
```

```
snmp-server {community <STRING> {ro|rw}}
```

```
snmp-server {contact <NAME>}
```

```
snmp-server {enable traps {authentication|link-up-down}}
```

```
snmp-server {engine-id [local <WORD>|remote <IP> <WORD>]}
```

```
snmp-server {group <GROUP-NAME> [v1|v2c|v3 [auth|noauth|priv]] {notify <WORD>|read <WORD>|write <WORD>}}
```

```
snmp-server {host <IP> [<STRING>|inform]}
```

```
{udp-port <1-65535>}
```

```
snmp-server {host <IP> inform [retry <0-255>|timeout <0-2147483647>] <STRING>
version [v2c|v3 [auth|noauth|priv]] {udp-port <1-65535>}}
```

```
snmp-server {location <WORD>}
```

```
snmp-server {notify-filter <WORD> remote <IP>}
```

```
{udp-port <1-65535>}
```

```
snmp-server {user <USER-NAME> <GROUP-NAME> [remote-host<v1|v2c|v3]}
```

```
{udp-port <1-65535>}
```

```
snmp-server {user <USER-NAME> <GROUP-NAME> remote-host <IP> v3 [auth|encrypted auth]
[md5|sha] <WORD> {priv [3des|aes128|aes192|aes256|des56] <WORD>}}
```

```
snmp-server {user <USER-NAME> <GROUP-NAME> [v1|v2c|v3]}
```

```
```

```
snmp-server {view <VIEW-NAME> <OID-TREE-STRING> [excluded|included]}
```

Parameters
- snmp-server {community <STRING> {ro|rw}}

| snmp-server community <STRING> {ro|rw} | Configures SNMP-server related settings |
|----------------------------------------|----------------------------------------|
| • community – Optional. Configures an SNMP community access string used to authorize management access by clients using SNMP v1, v2c, or v3 |
| • <STRING> – Specify the SNMP community access string (should not exceed 32 characters). | Contd.. |
After specifying the string, optionally specify the access type associated with it.

- **ro** – Optional. Provides read-only access with this SNMP community string. Allows authorized clients to only retrieve *Management Information Base* (MIB) objects. This is the default setting.
- **rw** – Optional. Provides read-write access with this SNMP community string. Allows authorized clients to retrieve as well as modify MIB objects.

**Note:** You can configure a maximum of five (5) community strings per EX3500 management policy.

- **snmp-server contact** `<NAME>`

   Configures SNMP-server related settings
   - contact – Optional. Configures the system’s contact information
     - `<NAME>` – Specify the contact person’s name (should not exceed 255 characters).

- **snmp-server enable traps** `{authentication|link-up-down}`

   Configures SNMP-server related settings
   - enable traps – Optional. Enables the EX3500 switch to send following SNMP traps or notifications:
     - authentication – Optional. Enables SNMP authentication trap. This option is disabled by default.
     - link-up-down – Optional. Enables SNMP link up and link down traps. This option is disabled by default.

   **Note:** If the command is executed without either of the above mentioned trap options, the system enables both authentication and link-up-down traps.

   **Note:** If enabling SNMP traps, use the `snmp-server > host` command to specify the host(s) receiving the SNMP notifications.

- **snmp-server engine-id** `{local <WORD>|remote <IP> <WORD>}`

   Configures SNMP-server related settings
   - engine-id – Optional. Configures an identification string for the SNMPv3 engine. The SNMP engine is an independent SNMP agent residing either on the logged switch or on a remote device. It prevents message replay, delay, and redirection. In SNMPv3, the engine ID in combination with user passwords generates the security keys that is used for SNMPv3 packet authentication and encryption.
     - local – Configures the SNMP engine on the logged switch
       - `<WORD>` – Specify the hexadecimal engine ID string identifying the SNMP engine (should be 9 - 64 characters in length).
     - remote `<IP>` `<WORD>` – Configures a remote device as the SNMP engine
       - `<IP>` – Specify the remote device’s IP address.
       - `<WORD>` – Specify the hexadecimal engine ID string identifying the SNMP engine (should be 9 - 64 characters in length).

   Configure the remote engine ID when using SNMPv3 informs. The remote ID configured here is used to generate the security digest for authentication and encryption of packets exchanged between the switch and the remote host user. SNMP passwords are localized using the engine ID of the authoritative agent. For informs, the authoritative SNMP agent is the remote agent. You therefore need to configure the remote agent’s SNMP engine ID before you can send proxy requests or informs to it.
```
- **snmp-server** {group <GROUP-NAME> [v1|v2c|v3 [auth|noauth|priv]] {notify <WORD>|read <WORD>|write <WORD>}}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **snmp-server group** <GROUP-NAME> | Configures SNMP-server related settings
  - **group** – Optional. Configures an SNMP user group, mapping SNMP users to SNMP views
    - **<GROUP-NAME>** – Specify the SNMP group name (should not exceed 32 characters).
  - **[v1|v2c|v3 [auth|noauth|priv]]**
    - Configures the SNMP version used for authentication by this user group
      - **v1** – Configures the SNMP version as v1.
      - **v2c** – Configures SNMP version as v2c.
      - **v3** – Configures the SNMP version as v3. If using SNMP v3, specify the authentication and encryption levels.
        - **auth** – Uses SNMP v3 with authentication and no privacy.
        - **noauth** – Uses SNMP v3 with no authentication and no privacy.
        - **priv** – Uses SNMP v3 with authentication and privacy.
| **notify <WORD>** | Optional. Configures the notification view string
  - **<WORD>** – Specify the string (should not exceed 32 characters).
| **read <WORD>** | Optional. Configures the read view string
  - **<WORD>** – Specify the string (should not exceed 32 characters).
| **write <WORD>** | Optional. Configures the write view string
  - **<WORD>** – Specify the string (should not exceed 32 characters).

- **snmp-server** {host <IP> <STRING> version [v1|v2c|v3 [auth|noauth|priv]]} {udp-port <1-65535>}}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **snmp-server host** <IP> | Configures SNMP-server related settings
  - **host** – Optional. Configures the host(s) receiving the SNMP notifications. At least one SNMP server host should be configured in order to configure the switch to send notifications.
    - **<IP>** – Specify the SNMP host’s IP address.
**Note**: You can configure a maximum of five (5) SNMP trap recipients per EX3500 management policy.
**Note**: Ensure that SNMP trap notification is enabled.
| **<STRING>** | Configures the SNMP community string. You can configure the SNMP community string here, or else use the string configured using the **snmp-server > community <STRING> > [ro|rw]** command. It is recommended that you configure the SNMP community string prior to configuring the SNMP host.
  - **<STRING>** – Specify the community string. The string configured here is sent in the SNMP traps to the SNMPv1 or SNMPv2c hosts.
| **version [v1|v2c|v3 [auth|noauth|priv]]** | Configures the SNMP version used
  - **v1** – Configures the SNMP version as 1. This is the default setting.
  - **v2c** – Configures SNMP version as 2c.
  - **v3** – Configures the SNMP version as 3. If using SNMPv3, specify the authentication and encryption levels.
    - **auth** – Uses SNMP v3 with authentication and no privacy.
    - **noauth** – Uses SNMP v3 with no authentication and no privacy.
    - **priv** – Uses SNMP v3 with authentication and privacy. |

  **Note:** Ensure that SNMP trap notification is enabled.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `inform [retry <0-255>|timeout <0-2147483647>]<STRING>` | Enables sending of SNMP notifications as inform messages, and configures inform message settings.
  - retry <0-255> – Configures the maximum number attempts made to re-send an inform message in case the specified SNMP host does not acknowledge receipt.
  - timeout <0-2147483647> – Configures the interval, in seconds, to wait for an acknowledgment from the SNMP host before re-sending an inform message
  - <STRING> – Specify the community string. The string configured here is sent in the SNMP inform messages to the SNMPv2c or SNMPv3 hosts.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `udp-port <1-65535>` | Optional. After specifying the SNMP version, optionally specify the host UDP port
  - <1-65535> – Specify the UDP port. The default is 162.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `snmp-server {location <WORD>}` | Configures SNMP-server related settings
  - location – Optional. Configures the EX3500’s location string
  - <WORD> – Specify the location (should not exceed 255 characters).
### snmp-server {notify-filter <WORD> remote <IP>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notify-filter</td>
<td>Optional. Modifies the SNMP server’s notify filter.</td>
</tr>
<tr>
<td>remote</td>

</tr>
</tbody>
</table>
### Global Configuration Commands

- **snmp-server {user <USER-NAME> <GROUP-NAME> [v1|v2c|v3]}

  Configures SNMP-server related settings
  - user – Optional. Configures the name of the SNMP user (connecting to the SNMP agent) and adds the user to an existing SNMP group. It also specifies the SNMP version type used. In case of SNMPv3, this command also configures the authentication type used and the enables encryption.
  - <USER-NAME> – Specify the user’s name (should not exceed 32 characters).
  - <GROUP-NAME> – Specify the SNMP group name to which this user is assigned.
  - [v1|v2c|v3] – After specifying the group name, specify the SNMP version used.

  **Note:** If using SNMP version 3, optionally specify the authentication type and the corresponding authentication password used. Please see previous table for SNMPv3 authentication and encryption configuration details.

- **snmp-server {view <VIEW-NAME> <OID-TREE-STRING> [excluded|included]}

  Configures SNMP-server related settings
  - view – Optional. Creates an SNMP view. SNMP views are used to control user access to the MIB.
  - <VIEW-NAME> – Provide a name for this SNMP view (should not exceed 32 characters).
  - <OID-TREE-STRING> [excluded|included] – Configures the object identifier (OID) of a branch within the MIB tree

  **Example**

  nx9500-6C8809(config-ex3500-management-policy-test)#snmp-server enable traps
  nx9500-6C8809(config-ex3500-management-policy-test)#snmp-server host 192.168.13.10 snmpteststring version 1 udp-port 170

### 4.1.46.2.6 ssh

#### ex3500-management-policy config commands

Configures the SSH server settings used to authenticate Secure Shell (SSH) connection to a EX3500 switch.

Management access to an EX3500 switch can be enabled/disabled as required using separate interfaces and protocols (HTTP, SSH). Disabling un-used and insecure interfaces and unused management services can dramatically reduce an attack footprint and free resources within an EX3500 management policy.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

#### Syntax

```bash
ssh [authentication-retries <1-5>|server|server-key size <512-1024>|timeout <1-120>]
```

#### Parameters

- `ssh [authentication-retries <1-5>|server|server-key size <512-1024]|timeout <1-120>]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ssh</code></td>
<td>Enables SSH management access to an EX3500 switch. This option is disabled by default. Use this command to configure SSH access settings.</td>
</tr>
</tbody>
</table>
| `authentication-retries <1-5>` | Configures the maximum number of retries made to connect to the SSH server resource.  
  - `<1-5>` – Specify a value from 1 - 5. The default setting is 3. |
| `server`    | Enables SSH server connection                                                |
| `server-key size <512-1024>` | Configures the SSH server key size.  
  - `<512-1024>` – Specify the SSH server key from 512 - 1,024. The default length is 768. |
| `timeout <1-120>` | Configures the SSH server resource inactivity timeout value in seconds. When the specified time is exceeded, the SSH server resource becomes unreachable and must be re-authenticated.  
  - `<1-120>` – Specify a value from 1 120 seconds. The default is 120 seconds. |

#### Examples

```bash
nx9500-6C8809(config-ex3500-management-policy-test)#ssh authentication-retries 4
nx9500-6C8809(config-ex3500-management-policy-test)#ssh timeout 90
nx9500-6C8809(config-ex3500-management-policy-test)#ssh server-key size 600

4.1.46.2.7 **username**

Use the `username` command in the configuration mode to configure a user for the EX3500 switch.

**Syntax**

```
username <USER-NAME> [access-level <0-15>|nopassword|password [0|7] <PASSWORD>]
```

**Parameters**

- **username**: Configures the TACACS server port username.
  - `<USER-NAME>`: Specify the user name (should not exceed 32 characters).

- **access-level**: Configures the access level for this user. This value determines the access priority of each user requesting access and interoperability with EX3500 switch.
  - `<0-15>`: Specify the access level from 0 - 15. The default is 0.

- **nopassword**: Allows user to login without a password.

- **password [0|7]** `<PASSWORD>`: Configures the password for this user.
  - `0`: Configures a plain text password.
  - `7`: Configures an encrypted password (should be 32 characters in length).
  - `<PASSWORD>`: Specify the password.

**Examples**

```
nx9500-6C8809(config-ex3500-management-policy-test)#username user1 access-level 5
nx9500-6C8809(config-ex3500-management-policy-test)#username user1 password 0 user1@1234
```

**Related Commands**

</tbody>
</table>
4.1.47.1 ex3500-qos-class-map-policy

Creates a EX3500 Quality of Service (QoS) class map policy and enters its configuration mode.

A QoS class map policy contains a set of Differentiated Services (DiffServ) classification criteria that are used to classify incoming traffic into different categories and provide differentiated service based on this classification. Each policy defines a set match criteria rules that use objects, such as access lists, IP precedence or DSCP values, and VLANs. When configured and applied, the policy classifies traffic based on layer 2, layer 3, or layer 4 information contained in each incoming packet.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
ex3500-qos-class-map-policy <POLICY-NAME>
```

Parameters

- `ex3500-qos-class-map-policy <POLICY-NAME>`

Examples

```
nx9500-6C8809(config)#ex3500-qos-class-map-policy dscp
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#?
```

EX3500_Qos_class_map Mode commands:

- `description` Class-map description
- `match` Defines the match criteria to classify traffic
- `no` Negate a command or set its defaults
- `rename` Redefines the name of class-map
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

Related Commands

### 4.1.47.2.1 description

> **ex3500-qos-class-map-policy config commands**

Configures this EX3500 QoS class map policy’s description

**Supported in the following platforms:**
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

description <LINE>

**Parameters**
- description <LINE>

| description <LINE> | Configures this EX3500 QoS class map policy’s description
|-------------------|-----------------------------------------------------------------------------------------------------------------
| • <LINE>          | – Enter a description that allows to you differentiate it from other policies with similar configuration (should not exceed 64 characters) |

**Examples**

nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#description "Matches packets marked for DSCP service 3"

nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context ex3500-qos-class-map-policy dscp

**Related Commands**

| no               | Removes this EX3500 QoS class map policy’s description |
4.1.47.2.2 match

- **ex3500-qos-class-map-policy config commands**

Configures match criteria rules used to classify traffic

Access lists, IP precedence, DSCP values, or VLANs are commonly used to classify traffic. Access lists select traffic based on layer 2, layer 3, or layer 4 information contained in each packet.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
match [access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl] <ACL-NAME>|cos <0-7]|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]
```

**Parameters**

- **match [access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl] <ACL-NAME>|cos <0-7]|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]**
  - **match** Configures the match criteria. The options are: access-list, cos, ip, ipv6, vlan
  - **Note:** Incoming packets matching the specified criteria are included in this QoS class map.

- **access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl] <ACL-NAME>**
  - Uses access lists to provide the match criteria. You can use any one the following ACL types to classify traffic:
    - ex3500-ext-access-list – Uses an IPv4 EX3500 extended ACL
    - ex3500-std-access-list – Uses an IPv4 EX3500 standard ACL
    - mac-acl – Uses a MAC EX3500 ACL
  - The following keyword is common to all of the above ACL types:
    - `<ACL-NAME>` – Specify the ACL name (should be existing and configured).

- **cos <0-7>**
  - Configures the class of service (CoS) value used to apply user priority. CoS is a form of QoS applicable only to layer 2 Ethernet frames. It uses 3-bits (8 values) of the 802.1Q tag to differentiate and shape network traffic.
  - `<0-7>` – Specify the CoS value from 0 - 7.
  - Following are the 8 traffic classes based on the CoS value:
    - 000 (0) - Routine
    - 001 (1) - Priority
    - 010 (2) - Immediate
    - 011 (3) - Flash
    - 100 (4) - Flash Override
    - 101 (5) - Critical
    - 110 (6) - Internetwork Control
    - 111 (7) - Network Control

- **ip [dscp <0-63>|precedence <0-7>]**
  - Configures the IPv4 DSCP value to match and/or the IP precedence value to match.
  - `<0-63>` – Specify the DSCP value from 0 - 63. Use this option to specify the type of service (ToS) field values included in the IP header. The ToS field exists between the header length and the total length fields. The DSCP constitutes the first 6 bits of the ToS field.
  - **Contd...**
Usage Guidelines
When configuring match entries, take into consideration the following points:

- Deny rules included in an ACL (associated with a EX3500 QoS class map policy) are ignored whenever an incoming packet matches the ACL.
- A class map policy cannot include both IP ACL or IP precedence rule and a VLAN rule.
- A class map policy containing a MAC ACL or VLAN rule cannot include either an IP ACL or a IP precedence rule.
- A class map policy can include a maximum of 16 match entries.

Examples

```plaintext
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#match ip dscp 3
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context ex3500-qos-class-map-policy dscp
description "Matches packets marked for DSCP service 3"
match ip dscp 3
```

Related Commands

- `no`  Removes match criteria rules configured for this EX3500 QoS class map policy
4.1.47.2.3 rename

*ex3500-qos-class-map-policy config commands*

Renames an existing EX3500 QoS class map policy

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

`rename <EX3500-QOS-CLASS-MAP-POLICY-NAME> <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME>`

**Parameters**

- `rename <EX3500-QOS-CLASS-MAP-POLICY-NAME> <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME>`

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
</table>
| `rename <EX3500-QOS-CLASS-MAP-POLICY-NAME> <NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME>` | Renames an existing EX3500 QoS class map  
| | • `<EX3500-QOS-CLASS-MAP-POLICY-NAME>` – Enter the EX3500 QoS class map’s current name.  
| | • `<NEW-EX3500-QOS-CLASS-MAP-POLICY-NAME>` – Enter the new name. |

**Examples**

```bash
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#rename [TAB]
dscp test test2
```

```bash
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

4.1.47.2.4 no

**ex3500-qos-class-map-policy config commands**

Removes this EX3500 QoS class map policy’s description and match criteria

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```markdown
no [description|match]
no description
no match [access-list [ex3500-ext-access-list|ex3500-std-access-list|mac-acl] <ACL-NAME>|cos <0-7>|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]
```

**Parameters**
- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes the EX3500 QoS class map policy’s settings based on the parameters passed</th>
</tr>
</thead>
</table>

**Examples**

The following example shows the EX3500 QoS class map policy 'test' settings before the 'no' command are executed:

```plaintext
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy dscp
  description "Matches packets marked for DSCP service 3"
  match ip dscp 3
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

```plaintext
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#no description
```

```plaintext
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#no match ip dscp
```

The following example shows the EX3500 QoS class map policy 'test' settings after the 'no' command are executed:

```plaintext
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy test
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```
The following table lists EX3500 QoS policy map configuration mode commands:

<table>

<td>page 4-228</td>
</tr>
</tbody>
</table>
4.1.48.1 **ex3500-qos-policy-map**

*ex3500-qos-policy-map*

Creates an EX3500 policy map and enters its configuration mode.

An EX3500 policy map contains one or more EX3500 QoS class maps traffic classifications (existing and configured) and can be attached to multiple interfaces. Creates an EX3500 policy map, and then use the class parameter to configure policies for traffic that matches the criteria defined in the EX3500 QoS class map policy. For more information, see `match`.

**Supported in the following platforms:**
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>
```

**Parameters**

- `ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>`

| `<EX3500-QOS-POLICY-MAP-NAME>` | Specify the EX3500 policy map's name |

**Examples**

```
nx9500-6C8809(config)#ex3500-qos-policy-map testPolicyMap
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap)#?
```

**EX3500_Qos_policy_map Mode commands:**

```

4.1.48.2.1 class

> ex3500-qos-policy-map config commands

Creates a policy map class and enters its configuration mode. The policy map class is a traffic classification upon which a policy can act.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

class <EX3500-QoS-CLASS-MAP-POLICY-NAME>

**Parameters**
- class <EX3500-QoS-CLASS-MAP-POLICY-NAME>

**Examples**

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap)#class dscp
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#?
commands:
  no Negate a command or set its defaults
  police Defines a policer for classified traffic

4.148.2.3 police

Configures an enforcer for classified traffic

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

police [flow|srtcm-color-aware|srtcm-color-blind|trtcm-color-aware|trtcm-color-blind]

police flow <0-1000000> <0-16000000> conform-action transmit violate-action [<0-63>|drop]

police [srtcm-color-aware|srtcm-color-blind] <0-1000000> <0-16000000> <0-16000000>
conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]

Parameters
- police flow <0-1000000> <0-16000000> conform-action transmit violate-action [<0-63>|drop]

### Parameters

<table>
<thead>
<tr>
<th>police</th>
<th>Configures an enforcer for classified traffic</th>
</tr>
</thead>
</table>
| flow <0-1000000> <0-16000000> | Configures an enforcer for classified traffic based on the metered flow rate
- <0-1000000> – Configures the committed information rate (CIR) from 0 -1000000 kilobits per second.
- <0-16000000> – Configures the committed burst size (BC) from 0 - 16000000 bytes.

Policing is based on a token bucket, where bucket depth (i.e., the maximum burst before the bucket overflows) is specified by the committed-burst field, and the average rate tokens are added to the bucket is specified by the committed-rate option. Note that the token bucket functions similar to that described in RFC 2697 and RFC 2698.

The behavior of the meter is specified in terms of one token bucket (C), the rate at which the tokens are incremented CIR and the maximum size of the token bucket BC.

The token bucket C is initially full, that is, the token count Tc(0) = BC. Thereafter, the token count Tc is updated CIR times per second as follows:

- If Tc is less than BC, Tc is incremented by one, else
- Tc is not incremented.

When a packet of size B bytes arrives at time t, the following happens:

- If Tc(t)-B ≥ 0, the packet is green and Tc is decremented by B down to the minimum value of 0, else
- The packet is red and Tc is not decremented.

| conform-action transmit | Configures the action applied when packets fall within the specified CIR and BC limits
- transmit – Transmits packets falling within the specified CIR and BC limits. This is subject to there being enough tokens to service the packet, in which case the packet is set green.

| violate-action [<0-63>|drop] | Configures the action applied when packets violate the specified CIR and BC limits
- <0-63> – Applies a new DSCP value. Select the DSCP value from 0 - 63.
- drops – Drops packets violating the specified CIR and BC limits |
### police [srtcm-color-aware|srtcm-color-blind] <0-1000000> <0-16000000> <0-16000000> conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]

<table>
<thead>
<tr>
<th>police</th>
<th>Configures an enforcer for classified traffic</th>
</tr>
</thead>
</table>
| [srtcm-color-aware|srtcm-color-blind] <0-1000000> | Configures an enforcer for classified traffic based on *single rate three color meter* (srTCM) mode. The srTCM as defined in RFC 2697 meters a traffic stream and processes its packets according to three traffic parameters — *Committed Information Rate* (CIR), *Committed Burst Size* (BC), and *Excess Burst Size* (BE).
| <0-16000000> | • srtc-color-blind - Single rate three color meter in color-blind mode
| <0-16000000> | • srtc-color-aware - Single rate three color meter in color-aware mode
| | The meter operates in one of two modes. In the color-blind mode, the meter assumes that the packet stream is uncolored. In color-aware mode the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The marker (re)colors an IP packet according to the results of the meter. The color is coded in the DS field [RFC 2474] of the packet.
| | • <0-1000000> – Configures the CIR from 0 -1000000 kilobits per second.
| | • <0-16000000> – Configures the BC from 0 - 1600000 bytes.
| | • <0-16000000> – Configures the BE from 0 - 1600000 bytes.
| | The behavior of the meter is specified in terms of its mode and two token buckets, C and E, which both share the common rate CIR. The maximum size of the token bucket C is BC and the maximum size of the token bucket E is BE.
| | The token buckets C and E are initially full, that is, the token count Tc(0) = BC and the token count Te(0) = BE. Thereafter, the token counts Tc and Te are updated CIR times per second as follows:
| | • If Tc is less than BC, Tc is incremented by one, else
| | • If Te is less then BE, Te is incremented by one, else
| | • neither Tc nor Te is incremented.
| | When a packet of size B bytes arrives at time t, the following happens if srTCM is configured to operate in color-blind mode:
| | • If Tc(t)-B > OR = 0, the packet is green and Tc is decremented by B down to the minimum value of 0, else
| | • If Te(t)-B > OR = 0, the packets is yellow and Te is decremented by B down to the minimum value of 0,
| | • else the packet is red and neither Tc nor Te is decremented.
| | When a packet of size B bytes arrives at time t, the following happens if srTCM is configured to operate in color-aware mode:
| | • If the packet has been precolored as green and Tc(t)-B ? 0, the packet is green and Tc is decremented by B down to the minimum value of 0, else
| | • If the packet has been pre-colored as yellow or green and if
| | • Te(t)-B > OR = 0, the packets is yellow and Te is decremented by B down to the minimum value of 0, else the packet is red and neither Tc nor Te is decremented.
| | The metering policy guarantees a deterministic behavior where the volume of green packets is never smaller than what has been determined by the CIR and BC, that is, tokens of a given color are always spent on packets of that color. Refer to RFC 2697 for more information on other aspects of srTCM.
| conform-action transmit | Configures the action applied when packet rates fall within the specified CIR and BC limits
| | • transmit – Transmits packets falling within the specified CIR and BC limits
### police

*police [trtcm-color-aware|trtcm-color-blind] <0-1000000> <0-16000000> <0-1000000> <0-16000000> conform-action transmit exceed-action [<0-63>|drop]*

**police** Configures an enforcer for classified traffic

- **[trtcm-color-aware|trtcm-color-blind]** - Two rate three color meter in color-blind mode
- **<0-1000000>** - Configures the CIR from 0 - 1000000 kilobits per second
- **<0-16000000>** - Configures the BC from 0 - 1600000 bytes.
- **<0-1000000>** - Configures the PIR from 0 - 1000000 kilobits per second
- **<0-16000000>** - Configures the BP from 0 - 1600000 bytes

The meter operates in one of two modes. In the color-blind mode, the meter assumes that the packet stream is uncolored. In color-aware mode the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The marker (re)colors an IP packet according to the results of the meter. The color is coded in the DS field [RFC 2474] of the packet.

The behavior of the meter is specified in terms of its mode and two token buckets, P and C, which are based on the rates PIR and CIR, respectively. The maximum size of the token bucket P is BP and the maximum size of the token bucket C is BC.

The token buckets P and C are initially (at time 0) full, that is, the token count Tp(0) = BP and the token count Tc(0) = BC. Thereafter, the token count Tp is incremented by one PIR times per second up to BP and the token count Tc is incremented by one CIR times per second up to BC.

When a packet of size B bytes arrives at time t, the following happens if trTCM is configured to operate in color-blind mode:

- If Tp(t)-B ≤ 0, the packet is red, else
- If Tc(t)-B ≤ 0, the packet is yellow and Tp is decremented by B, else
- The packet is green and both Tp and Tc are decremented by B.

Contd..
When a packet of size B bytes arrives at time t, the following happens if trTCM is configured to operate in color-aware mode:

- If the packet has been pre-colored as red or if TP(t) - B < 0, the packet is red, else
- If the packet has been pre-colored as yellow or if TC(t) - B < 0, the packet is yellow and TP is decremented by B, else
- The packet is green and both TP and TC are decremented by B.

The trTCM can be used to mark an IP packet stream in a service, where different, decreasing levels of assurances (either absolute or relative) are given to packets which are green, yellow, or red. Refer to RFC 2698 for more information on other aspects of trTCM.

| conform-action | Configures the action applied when packet rates fall within the specified CIR and BP limits
| transmit | transmit – Transmits packets falling within the specified CIR and BC limits
| exceed-action | Configures the action applied when packet rates exceed the specified CIR limit, but are within the specified PIR limit
| [<0-63>|drop] | <0-63> – Applies a new DSCP value. Select the DSCP value from 0 - 63. drops – Drops packets exceeding the specified CIR and BC limit
| violate-action | Configures the action applied when packet rates exceed the specified PIR limit
| [<0-63>|drop] | <0-63> – Applies a new DSCP value. Select the DSCP value from 0 - 63. drops – Drops packets exceeding the specified BE limit

Usage Guidelines
When configuring the traffic class enforcer parameters, take into consideration the following factors:

1. You can configure up to 200 enforcers/policers (i.e., class maps) for ingress ports.
2. The committed-rate cannot exceed the configured interface speed, and the committed-burst cannot exceed 16 Mbytes.

Examples
The following example uses the police trtcn-color-blind command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#police trtcn-color-blind 100000 4000 100000 6000 conform-action transmit exceed-action 0 violate-action drop
```

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#show context class dscp
police trtcn-color-blind 100000 4000 100000 6000 conform-action transmit exceed-action 0 violate-action drop	nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#
```

Related Commands

```
no
```
Removes the traffic enforcer settings
4.1.48.2.4 set

Sets class of service (CoS) value, per-hop behavior (PHB) value, and IP DSCP value in matching packets

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```set [cos <0-7>|ip dscp <0-63>|phb <0-7>]
```

**Parameters**

- `set [cos <0-7>|ip dscp <0-63>|phb <0-7>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cos &lt;0-7&gt;</code></td>
<td>Configures the CoS value for a matching packet (as specified by the match command) in the packet's VLAN tag&lt;br&gt;• <code>&lt;0-7&gt;</code> – Specify a value from 0 - 7. The CoS is modified to the value specified here.</td>
</tr>
<tr>
<td><code>ip dscp &lt;0-63&gt;</code></td>
<td>Modifies the IP DSCP value in a matching packet (as specified by the match command)&lt;br&gt;• <code>&lt;0-63&gt;</code> – Specify a value from 0 - 63. The DSCP value is modified to the value specified here.</td>
</tr>
<tr>
<td><code>phb &lt;0-7&gt;</code></td>
<td>Configures a PHB value for a matching packets&lt;br&gt;• <code>&lt;0-7&gt;</code> – Specify a value from 0 - 7.&lt;br&gt;<strong>Note:</strong> The PHB label is composed of five bits, three bits for per-hop behavior, and two bits for the color scheme used to control queue congestion. A packet is marked green, yellow, or red as per the following:&lt;br&gt;• green if it does not exceed the CIR and BC limits&lt;br&gt;• yellow if it exceeds the CIR and BC limits, but not the BE limit, and&lt;br&gt;• red otherwise.</td>
</tr>
</tbody>
</table>

**Examples**

The following example uses the `set > phb` command to classify the service that incoming packets will receive, and then uses the `police > trtcм-color-blind` command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000 bytes, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

```bash
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)#set phb 3
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)#police trtcм-color-blind 100000 4000 1000000 6000 conform-action transmit exceed-action 0 violate-action drop
```

The following example uses the `set > ip dscp` command to classify the service that incoming packets will receive, and then uses the `police > flow` command to limit the average bandwidth to 100,000 Kbps, the burst rate to 4000 bytes, and configure the response to drop any violating packets:

```bash
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#set ip dscp 3
```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#police
flow 100000 4000 conform-action transmit violate-action drop

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#show context
  class dscp
  set ip dscp 3
  police flow 100000 4000 conform-action transmit violate-action drop
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#

nx9500-6C8809(config-ex3500-qos-policy-map-test)#no class test

The following example shows the EX3500 QoS policy map 'test' settings after the 'no' command are executed:

```
x9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
```

nx9500-6C8809(config-ex3500-qos-policy-map-test)#
4.1.49 ex3524

- **Global Configuration Commands**

  Adds a EX3524 switch to the network

  The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four Small Form Factor Pluggable (SFP) transceiver slots for fiber connectivity.

  To enable layer 3 adoption of the logged EX3524 switch to a NOC controller, navigate to the EX3524 switch’s device configuration mode and execute the following command: `controller > host > <IP/HOSTNAME>`.

  EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP Web agent and CLI, which in spite of being different from that of the WiNG operating system provides WiNG controllers PoE and port management resources.

  Going forward NX9500, NX7500, NX6500, NX4500 WiNG managed series service platforms and WiNG VMs can discover, adopt, and partially manage EX3500 series Ethernet switches without modifying the proprietary operating system running the EX3500 switches. The WiNG service platforms utilize standardized WiNG interfaces to push configuration files to the EX3500 switches, and maintain a translation layer, understood by the EX3500 switch, for statistics retrieval.

  Supported in the following platforms:
  - Wireless Controller — RFS7000
  - Service Platforms — NX7500, NX9500

**Syntax**

```
ex3524 <DEVICE-EX3524-MAC>
```

**Parameters**

- `<DEVICE-EX3524-MAC>` Specifies the MAC address of a EX3524 switch

**Examples**

```
nx9500-6C8809(config)#ex3524 A1-C4-33-6D-66-07

nx9500-6C8809(config-device-A1-C4-33-6D-66-07)#?
```

EX35xx Device Mode commands:

- `hostname` Set system's network name
- `interface` Select an interface to configure
- `ip` Internet Protocol (IP)
- `no` Negate a command or set its defaults
- `power` EX3500 Power over Ethernet Command
- `remove-override` Remove configuration item override from the device (so profile value takes effect)
- `upgrade` Configures upgrade option for ex3500 system
- `use` Set setting to use
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

**Global Configuration Commands**

Adds a EX3548 switch to the network

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```plaintext
ex3548 <DEVICE-EX3548-MAC>
```

**Parameters**

- `ex3548 <DEVICE-EX3548-MAC>`

**Examples**

```plaintext
nx9500-6C8809(config)#ex3548 22-65-78-09-12-35
nx9500-6C8809(config-device-22-65-78-09-12-35)#?
```

**EX35xx Device Mode commands:**

- `hostname` Set system's network name
- `interface` Select an interface to configure
- `ip` Internet Protocol (IP)
- `no` Negate a command or set its defaults
- `power` EX3500 Power over Ethernet Command
- `remove-override` Remove configuration item override from the device (so profile value takes effect)
- `upgrade` Configures upgrade option for ex3500 system
- `use` Set setting to use
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```plaintext
nx9500-6C8809(config-device-22-65-78-09-12-35)#
```

**Related Commands**

| `no` | Removes a EX3548 switch from the network |
4.1.51 firewall-policy

Global Configuration Commands

Configures a firewall policy. This policy defines a set of rules for managing network traffic and prevents unauthorized access to the network behind the firewall.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`firewall-policy <FIREWALL-POLICY-NAME>`

Parameters

- `firewall-policy <FIREWALL-POLICY-NAME>`

<table>
<thead>
<tr>
<th>&lt;FIREWALL-POLICY-NAME&gt;</th>
<th>Specify the firewall policy name. If a firewall policy does not exist, it is created.</th>
</tr>
</thead>
</table>

Examples

```
rfs7000-37FABE(config)#firewall-policy test
rfs7000-37FABE(config-fw-policy-test)##
```

Firewall policy Mode commands:

- `acl-logging` Log on flow creating traffic
- `alg` Enable ALG
- `clamp` Clamp value
- `dhcp-offer-convert` Enable conversion of broadcast dhcp offers to unicast
- `dns-snoop` DNS Snooping
- `firewall` Wireless firewall
- `flow` Firewall flow
- `ip` Internet Protocol (IP)
- `ip-mac` Action based on ip-mac table
- `ipv6` Internet Protocol version 6 (IPv6)
- `ipv6-mac` Action based on ipv6-mac table
- `logging` Firewall enhanced logging
- `no` Negate a command or set its defaults
- `proxy-arp` Enable generation of ARP responses on behalf of another device
- `proxy-nd` Enable generation of ND responses (for IPv6) on behalf of another device
- `stateful-packet-inspection-l2` Enable stateful packet inspection in layer2 firewall
- `storm-control` Storm-control
- `virtual-defragmentation` Enable virtual defragmentation for IPv4 packets (recommended for proper functioning of firewall)

**NOTE:** For more information on Firewall policy, see *Chapter 13, FIREWALL-POLICY.*
4.1.52 global-association-list

Global Configuration Commands

Configures a global list of client MAC addresses. Based on the deny or permit rules specified, clients are either allowed or denied access to the managed network.

The global association list serves the same purpose as an Association Access Control List (ACL). However, the Association ACL allows a limited number of entries, a few thousand only, and does not suffice the requirements of a large deployment. This gap is filled by a global association list, which is much larger (with tens of thousands of entries). Both lists co-exist in the system. When an access request comes in, the association ACL is looked up first and if the requesting MAC address is listed in one of the deny ACLs, the association is denied. But, if the requesting client is permitted access, or if in case none of the ACLs list the client’s MAC address, the global association ACL is checked. Once authenticated, the client’s credentials are cached on the access point, and subsequent requests are not referenced to the controller. An entry in an APs credential cache means a pass in the global association list.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

global-association-list <GLOBAL-ASSOC-LIST-NAME>

Parameters

- global-association-list <GLOBAL-ASSOC-LIST-NAME>

| <GLOBAL-ASSOC-LIST-NAME> | Specify the global association list name. If a list with the same name does not exist, it is created.
| Note: Map this global association list to a device (controller) or a controller profile. Once associated, the controller applies this association list to requests received from all adopted APs. For more information, see use.
| Note: The global association list can also be mapped to a WLAN. The usage of global access lists is controlled on a per-WLAN basis. For more information, see association-list.

Examples

rfs4000-229D58(config)#global-association-list my-clients
rfs4000-229D58(config)#global-association-list my-clients#

Global Association List Mode commands:

default-action | Configure the default action when the client MAC does not match any rule
deny | Specify MAC addresses to be denied
no | Negate a command or set its defaults
permit | Specify MAC addresses to be permitted
clrscr | Clears the display screen
commit | Commit all changes made in this session
do | Run commands from Exec mode
end | End current mode and change to EXEC mode
exit | End current mode and down to previous mode
help | Description of the interactive help system
revert | Revert changes
service | Service Commands
show | Show running system information
write | Write running configuration to memory or terminal

<td></td>
</tr>
</tbody>
</table>
4.1.53.1 guest-management

Configures a guest management policy that redirects guest users to a registration portal upon association to a captive portal SSID. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) where previously, not-registered guest users can register. The internally hosted captive portal registration page can be customized based on business requirements. For more information, see webpage.

Use the guest management policy commands to configure parameters, such as E-mail host and SMS gateway along with the credentials required for sending pass code to guest via e-mail and SMS. You can configure up to 32 different guest management policies. Each guest management policy allows you to configure the SMS gateway, SMS message body, E-mail SMTP server, E-mail subject contents, and E-mail message body. Although, at any point-in-time, multiple guest management policies may exist, only one guest management policy can be active per device.

Guest registration is supported only on the NX9000 and NX7500 series service platforms as an adopting controller. But the number of user identity entries supported on each varies. It is 2 million and 1 million user identity entries for the NX9000 and NX7500 model service platforms respectively. Guest management and registration is not supported on any of the other WiNG supported platforms.

Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

guest-management <POLICY-NAME>

**Parameters**

- guest-management <POLICY-NAME>

**Examples**

```
nx9500-6C8809(config)#guest-management guest
nx9500-6C8809(config-guest-management-guest)#?
```

Guest Management Mode commands:

- `email` Email guest-notification configuration
- `guest-database-backup` Configure guest-database-backup parameters
- `no` Negate a command or set its defaults
- `sms` SMS guest-notification configuration
- `sms-over-smtp` Sms-over-smtp configuration to email sms gateway address
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
nx9500-6C8809(config-guest-management-guest)#
```

**Related Commands**

- `no` Removes an existing guest management policy

### email

**guest-management-policy-mode commands**

Configures guest user e-mail notification settings

Guest users can register themselves with their e-mail credentials as a primary key for authentication. The captive portal system provides the pass code for their registration. Guest users need to use their registered e-mail, mobile, or member ID and the received pass code for further login to the captive portal.

Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
email [host|message|subject]

email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>
  security [none|ssl|starttls] username <USER-NAME> password <PASSWORD>

email message <LINE>

email subject <LINE>
```

**Parameters**

- **email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>]**
  - `sender <EMAIL-ADDRESS>`
    - Configures the SMTP server resource’s IPv4 address or hostname used for guest management email traffic, guest user credential validation, and pass code reception. Optionally you can use an existing host alias to identify the SMTP server resource.
    - `<IP/HOSTNAME>` – Specify the SMTP server resource’s IP address or hostname.
    - `<HOST-ALIAS-NAME>` – Specify the host alias name (should be existing and configured). Consider providing the host as an alias. A host alias is a configuration item that maps the alias to a hostname. Once created, it can be used across different configuration modes. Where ever used the alias is replaced by the associated hostname.

- **sender <EMAIL-ADDRESS>**
  - Configures the sender’s e-mail address. The sender here is the guest user receiving the pass code. Guest users require this pass code for registering their guest e-mail credentials.
    - `<EMAIL-ADDRESS>` – Specify the e-mail address (should not exceed 100 characters).

- **security [none|ssl|starttls]**
  - Configures the encryption protocol used by the SMTP server when communicating the pass code
    - `none` – No encryption used. Use if no additional user authentication is needed beyond the required username and password combination.
    - `SSL` – Uses SSL encryption. This is the default setting.
    - `STARTTLS` – Uses STARTTLS encryption

- **username <USER-NAME>**
  - Configures a username unique to this SMS guest management configuration. After configuring the username, specify the associated password. Ensure that the password is correctly provided to receive the pass code required for registering guest user credentials with SMS.
    - `<USER-NAME>` – Specify the username (should not exceed 100 characters).

- **password <PASSWORD>**
  - Configures the password associated with the specified SMTP user name
    - `<PASSWORD>` – Specify the password (should not exceed 63 characters).
### email message <LINE>

### 4.1.53.2.2 guest-database-backup

- **guest-management-policy-mode commands**

Enables periodic backup of a captive portal’s guest registration user database. This option is enabled by default.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
guest-database-backup enable {<TIME>}
```

**Parameters**

- `guest-database-backup enable {<TIME>}`

<table>
<thead>
<tr>
<th>guest-database-backup enable &lt;TIME&gt;</th>
<th>Enables periodic backup of a captive portal’s guest registration user database. This command also allows you to configure the time at which the system starts backing up the database. The default backup-start time is ‘00:00’ (midnight every day).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;TIME&gt; – Optional. Resets the periodic database backup-start time to a user-defined value in the HH;MM format. When specified, the system starts periodic backup of the database, every day, at the specified time.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-guest-management-test)#guest-database-backup enable 12:30
vnx9500-6C8809(config-guest-management-test)#show context
  guest-management test
  guest-database-backup enable 12:30
  nx9500-6C8809(config-guest-management-test)#
```

**Related Commands**

| no | Disables periodic backup of a captive portal’s guest registration user database |
4.1.53.2.3 sms

*guest-management-policy-mode commands*

Configures guest user SMS notification settings

SMS enables guest users to register themselves with their e-mail or mobile device ID as the primary key for authentication. The captive portal provides the pass code for registration. Guest users use their registered e-mail or mobile device ID and the received pass code for future login to the captive portal.

**NOTE:** When using SMS, ensure that the WLAN’s mode of authentication is set to *none* and the mode of registration is set to *user*. In other words, captive portal authentication must always enforce guest registration.

SMS is similar to MAC address-based self registration, but in addition the captive portal sends an SMS message, containing an access code, to the user’s mobile phone number provided at the time of registration. The captive portal verifies the code, returns the *Welcome* page and provides access. This allows the administrator to verify the phone number provided and can be traced back to a specific individual should the need arise.

The default gateway used with SMS is *Clickatell*. A pass code can be sent with SMS to the guest user directly using Clickatell, or the pass code can be sent via e-mail to the SMS Clickatell gateway server, and Clickatell sends the pass code SMS to the guest user.

Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
sms [host|message]

sms host clickatell username <USER-NAME> password <PASSWORD> api-id <ID> 
  user-agent <PYCLICKATELL> {source-number <WORD>}

sms message <LINE>
```

**Parameters**

- `sms host clickatell username <USER-NAME> password <PASSWORD> api-id <ID> user-agent <PYCLICKATELL> {source-number <WORD>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sms</td>
<td>Configures guest user SMS notification settings</td>
</tr>
<tr>
<td>host clickatell</td>
<td>By default, <em>clickatell</em> is the host SMS gateway server resource. Upon receiving the pass code e-mail, the SMS gateway sends the actual notification pass code SMS to the guest user.</td>
</tr>
<tr>
<td>username &lt;USER-NAME&gt;</td>
<td>Configures a username unique to this SMS guest management configuration. After configuring the username, specify the associated password. Ensure that the password is correctly provided to receive the pass code required for registering guest user credentials with SMS.</td>
</tr>
<tr>
<td>password &lt;PASSWORD&gt;</td>
<td>Configures the password associated with the specified username</td>
</tr>
<tr>
<td>api-id &lt;ID&gt;</td>
<td>Set a 32 character maximum API ID</td>
</tr>
<tr>
<td>user-agent &lt;PYCLICKATELL&gt;</td>
<td>Since the SMS service provider by default is Clickatell, set the user agent name to <em>pyclickatell</em>. The user-agent value ensures the Clickatell SMS gateway server and its related credentials, needed for sending the pass code to guest users, are configured.</td>
</tr>
</tbody>
</table>
### source-number <WORD>
Optional. Configures the long-address or the from-number associated with this Clickatell user account
- <WORD> – Specify the source number (should not exceed 32 characters).

---

### sms message <LINE>

**Examples**

nx9500-6C8809(config-guest-management-test)#sms host clickatell username guest1 password guest1@123 api-id test user-agent pyclickatell

nx9500-6C8809(config-guest-management-test)#sms message Dear guest1, Your passcode for internet access is GM-guest1

nx9500-6C8809(config-guest-management-test)#show context
guest-management test
  email host 192.168.13.10 sender bob@zebra.com security ssl username guest1 password guest1@123
  sms host clickatell username guest1 password guest1@123 api-id test user-agent pyclickatell
  sms message Dear guest1, Your passcode for internet access is GM-guest1

**Related Commands**

**no** Removes the SMS settings used to send SMS to the guest user

- **SMS** Configures guest user SMS notification content
  - **message <LINE>** Configures the content of the SMS sent to the guest user notifying the pass code (should not exceed 1024 characters)
    - <LINE> – Specify the message content. When entering the message, use the following tags:
      - GM-NAME – for the guest user’s name
      - GM_PASSCODE – for the pass code
      - For example: Dear GM_NAME, your internet access pass code is GM_PASSCODE.
4.1.53.2.4 sms-over-smtp

Configures an e-mail host server (for example: smtp.gmail.com) along with sender related credentials and the recipient gateway e-mail address to which the message is E-mailed. The gateway server converts the e-mail into SMS and sends the message to the guest users’s mobile device.

When sending an e-mail, the e-mail client interacts with a SMTP server to handle the content transmission. The SMTP server on the host may have conversations with other SMTP servers to deliver the e-mail.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
sms-over-smtp [host|message|subject]
sms-over-smtp  host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>
  security [none|ssl|starttls] username <USER-NAME> password <PASSWORD> recipient <EMAIL-ADDRESS>
sms-over-smtp  message <LINE>
sms-over-smtp  subject <LINE>
```

Parameters

- `sms-over-smtp host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>]` sender `<EMAIL-ADDRESS>`
  - Configures the SMS gateway server resource’s IPv4 address or hostname used for guest management SMS over SMTP traffic, guest user credential validation and pass code reception. Optionally you can use an existing host alias to identify the SMS gateway server resource.
  - `<IP/HOSTNAME>` – Specify the SMTP gateway server resource’s IP address or hostname.
  - `<HOST-ALIAS-NAME>` – Specify the host alias name (should existing and configured). Consider providing the host as an alias. A host alias is a configuration item that maps the alias to a hostname. Once created, it can be used across different configuration modes. Where ever used the alias is replaced by the associated hostname.

- `sender `<EMAIL-ADDRESS>`
  - Configures the sender’s e-mail address. The sender here is the guest user receiving the pass code. Guest users require this pass code for registering their guest e-mail credentials using SMTP.
  - `<EMAIL-ADDRESS>` – Specify the e-mail address (should not exceed 64 characters).

- `security [none|ssl|starttls] username <USER-NAME> password <PASSWORD> recipient <EMAIL-ADDRESS>`
  - Configures the encryption protocol used by the SMTP server when communicating the pass code
  - `none` – No encryption used. Use if no additional user authentication is needed beyond the required username and password combination.
  - `SSL` – Uses SSL encryption. This is the default setting.
  - `STARTTLS` – Uses STARTTLS encryption
### username

**<USER-NAME>**

Configures a username unique to this SMTP guest management configuration. After configuring the username, specify the associated password. Ensure that the correct password is provided to receive the pass code required for registering guest user credentials with SMTP.

- `<USER-NAME>` – Specify the username (should not exceed 64 characters).

### password

**<PASSWORD>**

Configures the password associated with the specified SMTP user name.

- `<PASSWORD>` – Specify the password (should not exceed 64 characters).

### recipient

**<EMAIL-ADDRESS>**

Configures the e-mail recipient's e-mail address.

- `<EMAIL-ADDRESS>` – Specify the recipient's e-mail address (should not exceed 64 characters in length).

### sms-over-smtp message

**<LINE>**

Configures guest user SMS over SMTP notification message content

- `<LINE>` – Specify the message content. When entering the message, use the following tags:
  - GM-NAME – for the guest user's name
  - GM_PASSCODE – for the pass code
  - CR-NL – to enter a new line
  - For example: Dear GM_NAME, your internet access pass code is GM_PASSCODE. CR-NL Use this access code for internet access.

### sms-over-smtp subject

**<LINE>**

Configures guest user e-mail notification subject line content

- `<LINE>` – Specify the subject line content. When entering the subject line, use the following tag:
  - GM-NAME – for the guest user's name
  - For example: GM_NAME, your internet access code

### Examples

nx9500-6C8809(config-guest-management-test3)#sms-over-smtp host test sender bob@zebra.com security ssl username bob password bob@123 recipient bob@zebra.com

nx9500-6C8809(config-guest-management-test3)#show context guest-management test3
  sms-over-smtp host test sender bob@zebra.com security ssl username bob password bob@123 recipient bob@zebra.com

nx9500-6C8809(config-guest-management-test3)#

### Related Commands

no

Removes the SMS over SMTP settings used to send SMS to the guest user.

nx9500-6C8809(config-guest-management-test3)#
4.1.54 host

- **Global Configuration Commands**

Enters the configuration context of a remote device using its hostname

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
host <DEVICE-NAME>
```

**Parameters**

- `host <DEVICE-NAME>`

<table>
<thead>
<tr>
<th>&lt;DEVICE-NAME&gt;</th>
<th>Specify the device’s hostname. All discovered devices are displayed when ‘Tab’ is pressed to auto complete this command.</th>
</tr>
</thead>
</table>

**Examples**

```
rf4000-229D58 (config)#host rf4000-229D58
rf4000-229D58 (config-device-00-23-68-22-9D-58)#
```
4.1.55 **inline-password-encryption**

*Global Configuration Commands*

Stores the encryption key in the startup configuration file.

By default, the encryption key is not stored in the startup-config file. Use the `inline-password-encryption` command to move the encrypted key to the startup-config file. This command uses the master key to encrypt the password, then moves it to the startup-config file.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6522, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
inline-password-encryption
```

**Parameters**

None

**Usage Guidelines**

When the configuration file is imported to a different device, it first decrypts the encryption key using the default key and then decrypts the rest of the configuration using the administrator configured encryption key.

**Examples**

```plaintext
rfs7000-37FABE(config)#password-encryption secret 2 12345678
```

```plaintext
rfs7000-37FABE(config)#commit write memory
```

This command uses the specified password for encryption key and stores it outside of startup-config.

```plaintext
rfs7000-37FABE(config)#inline-password-encryption
```

This command moves the same password to the startup-config and encrypts it with the master key.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables storing of the encryption key in the startup configuration file</td>
</tr>
<tr>
<td>password-encryption</td>
<td>Enables password encryption</td>
</tr>
</tbody>
</table>
4.1.56 ip

**Global Configuration Commands**

Creates a IP access control list (ACL) and/or a SNMP IP ACL

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ip [access-list|snmp-access-list]
ip access-list <IP-ACL-NAME>
ip snmp-access-list <IP-SNMP-ACL-NAME>
```

**Parameters**

- **ip access-list <IP-ACL-NAME>**
  - **access-list**
    - <IP-ACL-NAME> — Creates an IP ACL and enters its configuration mode
      - <IP-ACL-NAME> — Specify the ACL name. If the access list does not exist, it is created.

- **ip snmp-access-list <IP-SNMP-ACL-NAME>**
  - **snmp-access-list**
    - <IP-SNMP-ACL-NAME> — Creates a SNMP IP ACL and enters its configuration mode. An SNMP IP ACL is an access control mechanism that uses a combination of IP ACL and SNMP community string.
      - SNMP performs network management functions using a data structure called a *Management Information Base* (MIB). SNMP is widely implemented but not very secure, since it uses only text community strings for accessing controller or service platform configuration files.
      - Use SNMP ACLs (firewalls) to help reduce SNMP’s vulnerabilities, as SNMP traffic can be easily exploited to produce a *denial of service* (DoS).
        - <IP-SNMP-ACL-NAME> — Specify the SNMP IP ACL name. If the access list does not exist, it is created. After creating the SNMP ACL, define the deny/permit rules based on the network and/or host IP addresses. Once created and configured, link this SNMP IP ACL with a SNMP community string.
          - **Note:** To link the SNMP community string with the SNMP IP ACL, in the management-policy-config-mode, use the following command: `snmp-server > community <COMMUNITY-STRING> > [ro|rw] > ip-snmp-access-list <IP-SNMP-ACL-NAME>`. 

Examples
rfs7000-37FABE(config)#ip access-list test
rfs7000-37FABE(config-ip-acl-test)#?

ACL Configuration commands:
 deny     Specify packets to reject
 disable  Disable rule if not needed
 no       Negate a command or set its defaults
 permit   Specify packets to forward
 clrscr   Clears the display screen
 commit   Commit all changes made in this session
 end      End current mode and change to EXEC mode
 exit     End current mode and down to previous mode
 help     Description of the interactive help system
 revert   Revert changes
 service  Service Commands
 show     Show running system information
 write    Write running configuration to memory or terminal

rfs7000-37FABE(config-ip-acl-test)#

rfs7000-37FABE(config)#ip snmp-access-list SNMPAcl
rfs7000-37FABE(config-ip-snmp-acl-SNMPAcl)#?

SNMP ACL Configuration commands:
 deny     Specify packets to reject
 no       Negate a command or set its defaults
 permit   Specify packets to forward
 clrscr   Clears the display screen
 commit   Commit all changes made in this session
 do       Run commands from Exec mode
 end      End current mode and change to EXEC mode
 exit     End current mode and down to previous mode
 help     Description of the interactive help system
 revert   Revert changes
 service  Service Commands
 show     Show running system information
 write    Write running configuration to memory or terminal

rfs7000-37FABE(config-ip-snmp-acl-SNMPAcl)#

Related Commands

no Removes an IP access control list

NOTE: For more information on access control lists, see Chapter 11, ACCESS-LIST.
### Global Configuration Commands

Creates an IPv6 ACL

An IPv6 ACL defines a set of rules that filter IPv6 packets flowing through a port or interface. Each rule specifies the action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
ipv6 access-list <IPv6-ACL-NAME>
```  

#### Parameters

- `ipv6 access-list <IPv6-ACL-NAME>`

#### Examples

```
rfs4000-229D58(config)#ipv6 access-list IPv6ACLTest
rfs4000-229D58(config-ipv6-acl-IPv6ACLTest)#?
```

IPv6 Access Control Mode commands:

- `deny` Specify packets to reject
- `no` Negate a command or set its defaults
- `permit` Specify packets to forward
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs4000-229D58(config-ipv6-acl-IPv6ACLTest)#
```

#### Related Commands

**NOTE:** For more information on access control lists, see *Chapter 11, ACCESS-LIST.*
4.1.58 ipv6-router-advertisement-policy

The following table lists the IPv6 router advertisement (RA) policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6-router-advertisement-policy</td>
<td>Creates a new IPv6 RA policy and enters its configuration mode</td>
<td>page 4-264</td>
</tr>
<tr>
<td>ipv6-router-advertisement-policy-mode commands</td>
<td>Summarizes the IPv6 RA policy configuration mode commands</td>
<td>page 4-266</td>
</tr>
</tbody>
</table>
4.1.58.1 ipv6-router-advertisement-policy

- ipv6-router-advertisement-policy

Creates an IPv6 RA policy and enters its configuration mode.

An IPv6 router policy allows routers to advertise their presence in response to solicitation messages. After receiving a neighbor solicitation message, the destination node sends an advertisement message, which includes the link layer address of the source node. After receiving the advertisement, the destination device replies with a neighbor advertisement message on the local link. After the source receives the advertisement it can communicate with other devices.

Advertisement messages are also sent to indicate a change in link layer address for a node on the local link. With such a change, the multicast address becomes the destination address for advertisement messages.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ipv6-router-advertisement-policy <POLICY-NAME>

Parameters

- ipv6-router-advertisement-policy <POLICY-NAME>

Examples

rfs4000-229D58(config)#ipv6-router-advertisement-policy test
rfs4000-229D58(config-ipv6-radv-policy-test)#?

IPv6 Router Advertisement Policy Mode commands:

- advertise: Option to advertise in router advertisement
- assist-neighbor-discovery: Send the Source Link Layer address option in Router Advertisement to assist in neighbor discovery
- check-ra-consistency: Check if the parameters advertised by other routers on the link are in conflict with those configured on this router. Conflicts are logged.
- dns-server: DNS Server
- domain-name: Configure domain-name
- managed-config-flag: Set the managed-address-configuration flag in Router Advertisements. When set, it indicates that the addresses are available via DHCPv6
- nd-reachable-time: Time that a node assumes a neighbor is reachable after having received a reachability confirmation
- no: Negate a command or set its defaults
- ns-interval: Time between retransmitted Neighbor Solicitation messages
- other-config-flag: Set the other-configuration flag in Router Advertisements. When set, it indicates that other configuration information is available via DHCPv6.
- ra: Router Advertisements
- router-lifetime: Lifetime associated with the default router
- route-preference: Preference of this router over other routers
- unicast-solicited-advertisement: Unicast the solicited Router Advertisements
clrscr                  Clears the display screen
commit                 Commit all changes made in this session
do                     Run commands from Exec mode
end                     End current mode and change to EXEC mode
exit                    End current mode and down to previous mode
help                    Description of the interactive help system
revert                  Revert changes
service                 Service Commands
show                    Show running system information
write                   Write running configuration to memory or terminal

*Table 4.34 IPv6-Router-Advertisement-Policy-Config-Mode Commands*
4.1.58.2.1 advertise

IPv6-router-advertisement-policy-mode commands

Enables advertisement of IPv6 MTU and hop-count value in RAs

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

advertise [hop-limit|mtu]

Parameters

- advertise [hop-limit|mtu]

| advertise [hop-limit|mtu] | Enables advertisement of IPv6 MTU and hop-count value in RAs. Both these features are disabled by default. |
|-------------------------|--------------------------------------------------------------------------------------------------|

Examples

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#advertise hop-limit

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#advertise mtu

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
advertisemt
advertise hop-limit
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

- no | Disables advertisement of IPv6 MTU and hop-count value in RAs |
4.1.58.2.2 assist-neighbor-discovery

- **ipv6-router-advertisement-policy-mode commands**

  Enables advertisement of the source link layer address in RAs to facilitate neighbor discovery. This feature is enabled by default.

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
assist-neighbor-discovery
```

**Parameters**

None

**Examples**

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#assist-neighbor-discovery

4.1.58.2.3 check-ra-consistency

Enables checking of consistency in RA values advertised by this router with those advertised by other routers, if any, on the same link. If the values advertised are inconsistent, a conflict is logged.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
check-ra-consistency

Parameters
None

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#check-ra-consistency
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test
   advertise mtu
   advertise hop-limit
   check-ra-consistency
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

| no | Enables comparison of interface-specific parameters advertised by other routers, within the link, with those advertised with this router |
4.1.58.2.4 dns-server

ipv6-router-advertisement-policy-mode commands

Configures the DNS server’s IPv6 address and lifetime. The configured values are advertised in RAs.

Supported in the following platforms:
• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}

Parameters
• dns-server <IPv6> {lifetime [<4-3600>|expired|infinite]}

| dns-server <IPv6> | Configures the DNS server’s IPv6 address
| lifetime [<4-3600>|expired|infinite] | Enables the use of a DNS server to resolve host names to IPv6 addresses. When an IPv6 host is configured with the address of a DNS server, the host sends DNS name queries to the server for resolution.
| lifetime [<4-3600>|expired|infinite] | • <IPv6> – Specify the DNS server’s address. This address is advertised in RAs. A maximum of four (4) entries can be made per policy.
| lifetime [<4-3600>|expired|infinite] | Optional. Configures the DNS server’s (identified by the <IPv6> parameter) lifetime
| lifetime [<4-3600>|expired|infinite] | • <4-3600> – Configures a lifetime in seconds. Specify a value form 4 - 3600 seconds. The default is 600 seconds.
| lifetime [<4-3600>|expired|infinite] | • expired – Advertises that this DNS server’s lifetime has expired and should not be used
| lifetime [<4-3600>|expired|infinite] | • infinite – Advertises that this DNS server’s lifetime is infinite

Examples

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#dns-server 2002::2 lifetime 3000

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test
advertise mtu
advertise hop-limit
check-ra-consistency
dns-server 2002::2 lifetime 3000
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

no | Removes the DNS server settings advertised in RAs. Once removed these values are not advertised in RAs.
**4.1.58.2.5 domain-name**

- *ipv6-router-advertisement-policy-mode commands*

Configures the Domain name search label advertised in RAs

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

domain-name <WORD> {lifetime [<4-3600> | expired | infinite]}

**Parameters**
- domain-name <WORD> {lifetime [<4-3600> | expired | infinite]}

| domain-name <WORD> | Configures the Domain name search label advertised in RAs Enter a fully qualified domain name (FQDN), which is an unambiguous domain name available in a router advertisement resource. To distinguish an FQDN from a regular domain name, a trailing period is added. For example, somehost.example.com.
- <WORD> – Specify the Domain name search label. A maximum of four (4) entries can be made per policy.

| lifetime [<4-3600> | expired | infinite] | Optional. Configures the Domain name search label's lifetime
- <4-3600> – Configures a lifetime in seconds. Specify a value form 4 - 3600 seconds. The default is 600 seconds.
- expired – Advertises that this Domain name search label's lifetime has expired and should not be used
- infinite – Advertises that this Domain name search label's lifetime is infinite

**Examples**
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#domain-name TechPubs lifetime infinite

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test advertise mtu advertise hop-limit check-ra-consistency dns-server 2002::2 lifetime 3000 domain-name TechPubs lifetime infinite

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

**Related Commands**

| no | Removes the Domain name settings advertised in RAs. Once removed these values are not advertised in RAs. |
4.1.58.2.6 managed-config-flag

Sets the managed address configuration flag in RAs. When set, it indicates that IPv6 addresses are available through DHCPv6. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
managed-config-flag

Parameters
None

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#managed-config-flag

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
  managed-config-flag
  advertise mtu
  advertise hop-limit
  check-ra-consistency

### 4.1.58.2.7 nd-reachable-time

*ipv6-router-advertisement-policy-mode commands*

Enables advertisement of neighbor discovery reachable time in RAs. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
nd-reachable-time [<5000-3600000>|global]
```

**Parameters**

- `nd-reachable-time [<5000-3600000]|global]`

| nd-reachable-time [<5000-3600000]|global] | Configures the interval, in milliseconds, that a node assumes a neighbor is reachable after receiving a reachability confirmation from the neighbor. Therefore, a neighbor is reachable, after being discovered, for a period specified here. This value is advertised in RAs. Use one of the following options:
| | • `<5000-3600000>` – Configures an interface-specific value. Specify a value from 5000 - 3600000 milliseconds. The default is 5000 milliseconds.
| | • `global` – Advertises the neighbor reachable time configured for the system. This is the value configured at the device configuration mode. For more information, see `ipv6`.

**Examples**

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#nd-reachable-time 6000
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test
 managed-config-flag
  nd-reachable-time 6000
 advertise mtu
 advertise hop-limit
 check-ra-consistency
 dns-server 2002::2 lifetime 3000
domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```

**Related Commands**

- `no` Disables advertisement of neighbor reachable time in RAs
4.1.58.2.8 no

ipv6-router-advertisement-policy-mode commands

Removes or reverts router advertisement policy settings. Use the no command to remove or revert the interface-specific parameters that are advertised by link router.

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

Parameters

• no <PARAMETERS>

Examples

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test

4.1.58.2.9 ns-interval

ipv6-router-advertisement-policy-mode commands

Configures the neighbor solicitation (NS) retransmit timer value advertised in RAs. This is the interval between two successive NS messages. When specified, it enables the sending of the specified value in RAs. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
ns-interval [<1000-3600000>|global]

Parameters
- ns-interval [<1000-3600000>|global]

| ns-interval [<1000-3600000>|global] | Configures the NS interval advertised in RAs. Use one of the following options:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>[&lt;1000-3600000&gt;] – Specify a value from 1000 - 3600000 milliseconds. The default is 1000 milliseconds.</td>
<td></td>
</tr>
<tr>
<td>global – Advertises the NS interval configured for the system. This is configured on the device in the device configuration mode. For more information, see ipv6.</td>
<td></td>
</tr>
</tbody>
</table>

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#ns-interval 3000

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test

check-ra-consistency
dns-server 2002::2 lifetime 3000
domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands
- no Disables advertisement of NS interval in RAs
4.1.58.2.10 other-config-flag

Sets the other-configuration flag in RAs. When set, it indicates that other configuration details, such as DNS-related information, are available through DHCPv6. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

4.1.58.2.11 ra

`ipv6-router-advertisement-policy-mode commands`

Configures RA related parameters, such as the interval between two unsolicited successive RAs. It also allows suppression of RAs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**
```
ra [interval <3-1800>|suppress]
```

**Parameters**
- `ra [interval <3-1800>|suppress]`

| interval <3-1800> | Configures the interval, in seconds, between two unsolicited successive RAs
|                  | • `<3-1800>` – Specify a value from 3 - 1800 seconds. The default is 300 seconds.
|                  | **Note:** The router-lifetime should be at least three times the specified router interval.

| suppress | Enables the suppression of RAs. When enabled, the transmission of RAs in IPv6 packets is suppressed. This option is disabled by default. The `no > ra > suppress` command enables the sending of RAs.

**Examples**
```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#ra interval 200
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#ra suppress
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy_test
  ra suppress
  ra interval 200
  managed-config-flag
  nd-reachable-time global
  advertise mtu
  advertise hop-limit
  check-ra-consistency
  dns-server 2002::2 lifetime 3000
  domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```

**Related Commands**
```
no
```
| no | Removes the RA interval, and enables the sending of RAs |
4.1.58.2.12 router-lifetime

**ipv6-router-advertisement-policy-mode commands**

Configures the default router’s lifetime, in seconds, advertised in RAs

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`router-lifetime <0-9000>`

**Parameters**
- `router-lifetime <0-9000>`

<table>
<thead>
<tr>
<th>router-lifetime</th>
<th>Configures the default router’s lifetime</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;0-9000&gt;</td>
<td>- <code>&lt;0-9000&gt;</code> – Specify a value from 0 - 9000 seconds. The default value is 1500 seconds.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: A value of “0” indicates that this router is not the default router.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#router-lifetime 2000

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test ra suppress ra interval 200 managed-config-flag nd-reachable-time global router-lifetime 2000 advertise mtu advertise hop-limit check-ra-consistency dns-server 2002::2 lifetime 3000 domain-name TechPubs lifetime infinite rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

**Related Commands**

| no | Removes the default router’s lifetime |
4.1.58.2.13 router-preference

*ripv6-router-advertisement-policy-mode commands*

Configures the router preference field value advertised in RAs. The options are high, medium, and low. This value is used to prioritize and select the default router when multiple routers are discovered.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
router-preference [high|medium|low]
```

**Parameters**

- `router-preference [high|medium|low]`

---

**Examples**

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#router-preference high
```

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test
  ra suppress
  ra interval 200
  managed-config-flag
  nd-reachable-time global

```
4.1.58.2.14 unicast-solicited-advertisement

Enables unicasting of solicited RAs. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
unicast-solicited-advertisement

Parameters
None

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#unicast-solicited-advertisement
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

no | Disables unicasting of solicited RAs
### 4.1.59 l2tpv3

**Global Configuration Commands**

Configures a Layer 2 Tunnel Protocol Version 3 (L2TPv3) tunnel policy, used to create one or more L2TPv3 tunnels. The L2TPv3 policy defines the control and encapsulation protocols needed for tunneling layer 2 frames between two IP nodes. This policy enables creation of L2TPv3 tunnels for transporting Ethernet frames between bridge VLANs and physical GE ports. L2TPv3 tunnels can be created between any vendor devices supporting L2TPv3 protocol.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
l2tpv3 policy <L2TPV3-POLICY-NAME>
```

**Parameters**

- `l2tpv3 policy <L2TPV3-POLICY-NAME>`

<table>
<thead>
<tr>
<th>l2tpv3 policy &lt;L2TPV3-POLICY-NAME&gt;</th>
<th>Configures an L2TPv3 tunnel policy</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;L2TPV3-POLICY-NAME&gt;</code> — Specify a policy name. The policy is created if it does not exist. To modify an existing L2TPv3, specify its name.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FAEE(config)#l2tpv3 policy L2TPV3Policy1
rfs7000-37FAEE(config-l2tpv3-policy-L2TPV3Policy1)#?
L2tpv3 Policy Mode commands:
  cookie-size   Size of the cookie field present in each l2tpv3 data message
  failover-delay Time interval for re-establishing the tunnel after the failover (RF-Domain manager/VRRP-master/Cluster-master failover)
  force-l2-path-recovery Enables force learning of servers, gateways etc., behind the l2tpv3 tunnel when the tunnel is established
  hello-interval Configure the time interval (in seconds) between l2tpv3 Hello keep-alive messages exchanged in l2tpv3 control connection
  no             Negate a command or set its defaults
  reconnect-attempts Maximum number of attempts to reestablish the tunnel.
  reconnect-interval Time interval between the successive attempts to reestablish the l2tpv3 tunnel
  retry-attempts Configure the maximum number of retransmissions for signaling message
  retry-interval Time interval (in seconds) before the initiating a retransmission of any l2tpv3 signaling message
  rx-window-size Number of signaling messages that can be received without sending the acknowledgement
  tx-window-size Number of signaling messages that can be sent without receiving the acknowledgement
  clrscr         Clears the display screen
  commit         Commit all changes made in this session
  end            End current mode and change to EXEC mode
  exit           End current mode and down to previous mode
  help           Description of the interactive help system
  revert         Revert changes
  service        Service Commands
  show           Show running system information
```
**write**

Write running configuration to memory or terminal

rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

Global Configuration Commands

Configures a MAC ACLs

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

mac access-list <MAC-ACL-NAME>

Parameters
- mac access-list <MAC-ACL-NAME>

Examples

rfs7000-37FABE(config)#mac access-list test
rfs7000-37FABE(config-mac-acl-test)#?
MAC Extended ACL Configuration commands:
  deny Specify packets to reject
  disable Disable rule if not needed
  no Negate a command or set its defaults
  permit Specify packets to forward
  clrscr Clears the display screen
  commit Commit all changes made in this session
  end End current mode and change to EXEC mode
  exit End current mode and down to previous mode
  help Description of the interactive help system
  revert Revert changes
  service Service Commands
  show Show running system information
  write Write running configuration to memory or terminal

rfs7000-37FABE(config-mac-acl-test)#

Related Commands

no Removes a MAC access control list

NOTE: For more information on MAC access control lists, see Chapter 11, ACCESS-LIST.
4.1.61 management-policy

**Global Configuration Commands**

Configures a management policy. Management policies include services that run on a device, welcome messages, banners, etc.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

management-policy <MANAGEMENT-POLICY-NAME>

**Parameters**

- management-policy <MANAGEMENT-POLICY-NAME>

| MANAGEMENT-POLICY-NAME | Specify the management policy name. If the policy does not exist, it is created. |

**Examples**

 DEVICE(config)#management-policy test
 DEVICE(config-management-policy-test)#?
 Management Mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa-login</td>

</table>

**Related Commands**

- no: Removes an existing management policy
NOTE: For more information on Management policy configuration, see Chapter 15, MANAGEMENT-POLICY.
4.1.62 meshpoint

Global Configuration Commands

Creates a new meshpoint and enters its configuration mode. Use this command to select and configure existing meshpoints.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

meshpoint [MESHPOINT-NAME]|containing <WORD>

Parameters

- meshpoint [MESHPOINT-NAME]|containing <WORD>

Examples

rfs7000-37FABE(config)#meshpoint TestMeshpoint
rfs7000-37FABE(config-meshpoint-TestMeshpoint)#?

Mesh Point Mode commands:

- allowed-vlans Set the allowed VLANs
- beacon-format The beacon format of this meshpoint
- control-vlan VLAN for meshpoint control traffic
- data-rates Specify the 802.11 rates to be supported on this meshpoint
- description Configure a description of the usage of this meshpoint
- force Force suboptimal paths
- meshid Configure the Service Set Identifier for this meshpoint
- neighbor Configure neighbor specific parameters
- no Negate a command or set its defaults
- root Set this meshpoint as root
- security-mode The security mode of this meshpoint
- shutdown Shutdown this meshpoint
- use Set setting to use
- wpa2 Modify ccmp wpa2 related parameters
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-meshpoint-TestMeshpoint)#

Related Commands

- no Removes an existing meshpoint
NOTE: For more information on Meshpoint configuration, see Chapter 26, MESHPOINT.
4.1.63 meshpoint-qos-policy

Global Configuration Commands

Configures a set of parameters that defines the meshpoint quality of service (QoS) policy

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>

Parameters

- meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>

Examples

rfs7000-37FABE(config)#meshpoint-qos-policy TestMeshpointQoS
rfs7000-37FABE(config-meshpoint-qos-TestMeshpointQoS)#?
Mesh Point QoS Mode commands:
accelerated-multicast  Configure accelerated multicast streams address and forwarding QoS classification
no                     Negate a command or set its defaults
rate-limit             Configure traffic rate-limiting parameters on a per-meshpoint/per-neighbor basis
clrscr                 Clears the display screen
commit                 Commit all changes made in this session
do                     Run commands from Exec mode
end                    End current mode and change to EXEC mode
exit                   End current mode and down to previous mode
help                   Description of the interactive help system
revert                 Revert changes
service                Service Commands
show                   Show running system information
write                  Write running configuration to memory or terminal

rfs7000-37FABE(config-meshpoint-qos-TestMeshpointQoS)#

Related Commands

no                      Removes an existing meshpoint QoS policy

NOTE: For more information on Meshpoint QoS policy configuration, see Chapter 26, MESHPOINT.
4.1.64 mint-policy

Global Configuration Commands

Configures the global MiNT policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

mint-policy global-default

Parameters

- mint-policy global-default

| global-default | Configures the global default MiNT policy |

Examples

rfs7000-37FABE(config)#mint-policy global-default
rfs7000-37FABE(config-mint-policy-global-default)#?

Mint Policy Mode commands:

- level Mint routing level
- mtu Configure the global Mint MTU
- no Negate a command or set its defaults
- router Mint router
- udp Configure mint UDP/IP encapsulation
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-mint-policy-global-default)#

Related Commands

- no Removes an existing MiNT policy

NOTE: For more information on MiNT policy configuration, see Chapter 14, MINT-POLICY.
4.1.65 **nac-list**

*Global Configuration Commands*

A *Network Access Control* (NAC) policy configures a list of devices that can access a network based on their MAC addresses.

The following table lists NAC list configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>nac-list</td>
<td>Creates a NAC list and enters its configuration mode</td>
<td>page 4-291</td>
</tr>
<tr>
<td>nac-list-mode</td>
<td>Summarizes NAC list configuration mode commands</td>
<td>page 4-292</td>
</tr>
</tbody>
</table>
4.1.65.1 nac-list

nac-list

Configures a NAC list that manages access to the network

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

nac-list <NAC-LIST-NAME>

Parameters

- nac-list <NAC-LIST-NAME>

Examples

rfs7000-37FABE(config)#nac-list test
rfs7000-37FABE(config-nac-list-test)#?
NAC List Mode commands:
  exclude Specify MAC addresses to be excluded from the NAC enforcement list
  include Specify MAC addresses to be included in the NAC enforcement list
  no Negate a command or set its defaults
  clrscr Clears the display screen
  commit Commit all changes made in this session
  do Run commands from Exec mode
  end End current mode and change to EXEC mode
  exit End current mode and down to previous mode
  help Description of the interactive help system
  revert Revert changes
  service Service Commands
  show Show running system information
  write Write running configuration to memory or terminal

rfs7000-37FABE(config-nac-list-test)#

Related Commands

no Removes a NAC list
4.1.65.2 nac-list-mode commands

The following table summarizes NAC list configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude</td>
<td>Specifies the MAC addresses excluded from the NAC enforcement list</td>
<td>page 4-293</td>
</tr>
<tr>
<td>include</td>
<td>Specifies the MAC addresses included in the NAC enforcement list</td>
<td>page 4-294</td>
</tr>
<tr>
<td>no</td>
<td>Cancels an exclude or include NAC list rule</td>
<td>page 4-295</td>
</tr>
</tbody>
</table>
4.1.65.2.1 exclude

`nac-list-mode commands`

Specifies the MAC addresses excluded from the NAC enforcement list

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`exclude <START-MAC> [<END-MAC> precedence <1-1000>|preference <1-1000>]`

Parameters

- `exclude <START-MAC> [<END-MAC> precedence <1-1000>|preference <1-1000>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;START-MAC&gt;</code></td>
<td>Specifies a range of MAC addresses or a single MAC address to exclude from the NAC enforcement list</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;START-MAC&gt;</code> – Specify the first MAC address in the range.</td>
</tr>
<tr>
<td><code>&lt;END-MAC&gt;</code></td>
<td>Specifies the last MAC address in the range (optional if a single MAC is added to the list)</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;END-MAC&gt;</code> – Specify the last MAC address in the range.</td>
</tr>
<tr>
<td>precedence <code>&lt;1-1000&gt;</code></td>
<td>Sets the rule precedence. Exclude entries are checked in the order of their rule precedence.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;1-1000&gt;</code> – Specify a value from 1 - 1000.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-nac-list-test)#exclude 00-40-96-B0-BA-2A precedence 1
rfs7000-37FABE(config-nac-list-test)#show context nac-list test
  exclude 00-40-96-B0-BA-2A 00-40-96-B0-BA-2A precedence 1
rfs7000-37FABE(config-nac-list-test)#
```
4.1.65.2.2 include

nac-list-mode commands

Specifies the MAC addresses included in the NAC enforcement list

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

include <START-MAC> [ <END-MAC> precedence <1-1000> ]

Parameters

- include <START-MAC> [ <END-MAC> precedence <1-1000> ]

<table>
<thead>
<tr>
<th>&lt;START-MAC&gt;</th>
<th>Specifies a range of MAC addresses or a single MAC address to include in the NAC enforcement list</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;START-MAC&gt; – Specify the first MAC address in the range.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Use this parameter to specify a single MAC address.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&lt;END-MAC&gt;</th>
<th>Specifies the last MAC address in the range (optional if a single MAC is added to the list)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;END-MAC&gt; – Specify the last MAC address in the range.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>precedence &lt;1-1000&gt;</th>
<th>Sets the rule precedence. Include entries are checked in the order of their rule precedence.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-1000&gt; – Specify a value from 1 - 1000.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-nac-list-test)#include 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#show context nac-list test
  exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
  include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#
4.1.65.2.3 no

nac-list-mode commands

Cancels an exclude or include NAC list rule

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [exclude|include]

no [exclude|include] <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes or reverts this NAC list's settings based on the parameters passed |

Examples
The following example shows the NAC list ‘test’ settings before the ‘no’ command is executed:

rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#

rfs7000-37FABE(config-nac-list-test)#no exclude 00-40-96-B0-BA-2A precedence 1

The following example shows the NAC list ‘test’ settings after the ‘no’ command is executed:

rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#

Related Commands

| exclude | Specifies MAC addresses excluded from the NAC enforcement list |
| include | Specifies MAC addresses included in the NAC enforcement list |
4.1.66 `no`

- **Global Configuration Commands**

Negates a command, or reverts configured settings to their default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

event-system-policy                 Delete a event system policy
ex3500                              EX3500 device
ex3500-management-policy            Delete a ex3500 management policy
ex3500-qos-class-map-policy         Delete a ex3500 qos class-map policy
ex3500-qos-policy-map               Delete a ex3500 qos policy-map
ex3524                              Delete an EX3524 wireless controller
ex3548                              Delete an EX3548 wireless controller
firewall-policy                     Configure firewall policy
global-association-list            Delete a global association list
guest-management                   Delete a guest management policy
igmp-snoop-policy                   Remove device onboard igmp snoop policy
inline-password-encryption          Disable storing encryption key in the startup configuration file
ip                                   Internet Protocol (IP)
ipv6                                 Internet Protocol version 6 (IPv6)
ipv6-router-advertisement-policy    IPv6 Router Advertisement related configuration
l2tpv3                               Negate a command or set its defaults
mac                                  MAC configuration
management-policy                   Delete a management policy
meshpoint                           Delete a meshpoint object
meshpoint-qos-policy                 Delete a mesh point QoS configuration policy
nac-list                             Delete an network access control list
nsight-policy                       Delete a nsight policy
nx45xx                              Delete an NX45XX integrated services platform
nx5500                              Delete an NX5500 wireless controller
nx65xx                              Delete an NX65XX integrated services platform
nx75xx                              Delete an NX75XX wireless controller
nx9000                              Delete an NX9000 wireless controller
passpoint-policy                    Delete a passpoint configuration policy
password-encryption                 Disable password encryption in configuration
profile                             Delete a profile and all its associated configuration
radio-qos-policy                    Delete a radio QoS configuration policy
radius-group                        Local radius server group configuration
radius-server-policy                Remove device onboard radius policy
radius-user-pool-policy Configure Radius User Pool
rf-domain Delete one or more RF-domains and all their associated configurations
rfs4000 Delete an RFS4000 wireless controller
rfs6000 Delete an RFS6000 wireless controller
rfs7000 Delete an RFS7000 wireless controller
roaming-assist-policy Delete a roaming-assist policy
role-policy Role based firewall policy
route-map Dynamic routing route map Configuration
rtl-server-policy Policy Based Routing Configuration
schedule-policy Delete a schedule policy
sensor-policy Delete a sensor policy
smart-cache-policy Delete a content caching
smart-rf-policy Delete a smart-rf-policy
t5 Delete an T5 wireless controller
url-filter Delete a url filter
url-list Delete a URL list
vx9000 Delete an VX9000 wireless controller
web-filter-policy Delete a web filter policy
wips-policy Delete a wips policy
wlan Delete a wlan object
wlan-qos-policy Delete a wireless lan QoS configuration policy

service Service Commands

<DEVICE>(config)#
4.1.67 nsight-policy

- **Global Configuration Commands**

The following table lists NSight policy configuration mode commands:

<table>
<thead>
<tr>

</tbody>
</table>
4.1.67.1 nsight-policy

Creates an NSight policy and enters its configuration mode

The NSight policy is an advance management, analytics, reporting, and troubleshooting tool, which when created and applied at the RF Domain level allows the RF Domain manager to send statistics (polled from devices within the RF Domain) to the NOC. The NOC, when enabled as the NSight server, stores this data in a locally or externally hosted MongoDB database. This large, complex data are collated and presented on the NOC’s GUI in visual forms that are easy to understand and manage. For large networks, enabling NSight removes the inadequacies of the existing data collection, presentation, and analytics framework.

Zebra NSight is an advanced network visibility, service assurance, and analytics platform that is fast and easy to use. NSight is a powerful feature-rich management module addition to the existing WiNG 5.8 (or later) platform. It simplifies network monitoring, troubleshooting and reporting and enables the creation of customized role-based dashboards. It also provides assistance in projecting any extensions necessary to accommodate increased network client or throughput demands. NSight also provides a unique multi-dimensional monitoring and reporting capability based on time, network analytics and user role.

Major NSight features include:

- **Network statistic and event visualization** - Simplified and unified network views based on defined user roles
- **Custom dashboards** - Live network health information in real-time to optimally assist network administrators
- **Live troubleshooting tools** - Packet capture, wireless debug logs, TCP/IP ping and traceroute
- **Interactive floor maps with timeline views** - Visualize and identify potential issues and problems areas
- **Real-time trend analysis** - Simplify network growth planning
- **Exceptionally responsive interface** - Any information the admin needs is three, or less, clicks away

The WiNG NSight implementation consists of the following components:

- An NSight server hosted on the NOC
- A MongoDB database hosted on the NOC. This database consists of AP statistics gathered by RF Domain managers.
- An NSight UI application running on the NOC
- An NSight client hosted on the RF Domain manager. This is the SSM statistics module that periodically gathers statistics from adopted APs and forwards to the NSight server.

---

**NOTE:** NSight is a licensed option. To enable the NSight, navigate to the NSight server’s device configuration mode and apply the NSight license.

---

To enable NSight, follow the steps given below:

1. Create an NSight policy to enable the NSight server.

   - `nx9500-6C8809(config-nsight-policy-nsight-for-noc)#enable`
   - `nx9500-6C8809(config-nsight-policy-nsight-for-noc)#nsight-server`
   - `nx9500-6C8809(config-nsight-policy-nsight-for-noc)#show context`
   - `nsight-policy nsight-for-noc`
   - `nsight-server`
   - `nx9500-6C8809(config-nsight-policy-nsight-for-noc)#`

2. Apply the policy configured in step 1 to the NOC. This enables the NOC to recognize itself as the NSight server.

   - `nx9500-6C8809(config)#self`
   - `nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#use nsight-policy nsight-for-noc`

3. Create another NSight policy pointing to the NSight server host.

   - `nx9500-6C8809(config-nsight-policy-nsight-for-rfdm)#enable`
nx9500-6C8809 (config-nsight-policy-nsight-for-rfdm)#server host 192.168.13.13
nx9500-6C8809 (config-nsight-policy-nsight-for-rfdm)#show context
nsight-policy nsight-for-rfdm
   server host 192.168.13.13 https
nx9500-6C8809 (config-nsight-policy-nsight-for-rfdm)#

4. Apply the policy configured in step 3 to the RF Domain. This enables the domain manager to collect statistics from the access points and send to the NOC serving as the NSight server.

nx9500-6C8809 (config)#rf-domain TechPubs
nx9500-6C8809 (config-rf-domain-TechPubs)#use nsight-policy nsight-for-rfdm
nx9500-6C8809 (config-rf-domain-TechPubs)#show context
rf-domain TechPubs
   location SanJose
   timezone America/Los_Angeles
   country-code us
   use nsight-policy nsight-for-rfdm
nx9500-6C8809 (config-rf-domain-TechPubs)#

NOTE: Once the NSight server is up and running, and the RF Domains also have the NSight server host configured, on the NSight server’s device configuration mode, configure the data-update interval related parameters. For more information, see nsight.

The NOC stores the statistical data, received from RF Domain managers, in the MongoDB database. This data contains following information:

- Operating parameters of devices – Fixed information of devices, such as IP addresses, wired interface status, radio operating parameters (channel, power, etc.)
- SMART RF neighbor information – SMART RF neighbors’ data for every radio. This data is used to generate and display heat-maps on floor map. Any changes in the SMART RF data is reported to the MART server and stored in the database.
- Rogue AP information – Rogue AP list and rogue AP status. Any changes in the rouge AP list or status is reported to the MART server and stored in the database.
- Wireless client list – Details of wireless clients within the RF Domain
- Wireless access point statistics – Statistics of all the APs in the RF Domain. AP statistics includes details, such as number of bytes transferred since the last reporting interval, number of TX retries, signal-noise-ratio (SNR), noise, RF quality index, client count, etc.
- Wireless client statistics – Statistics of all the wireless clients in the RF Domain. Wireless client statistics includes details, such as number of bytes transferred from last reporting interval, number of TX retries, SNR, RF quality index, etc.
- Wired interface statistics – Statistics of wired interfaces of all APs. It includes details, such as interface status, number of bytes transferred from last reporting interval, etc.
- Event history – Event details for all APs adopted by the NOC. These are events received by the Cfgd every 30 seconds and sent to the MART server. Each event consists of the RF Domain name, wireless client MAC if applicable, AP MAC, event mnemonic, event timestamp, and the event string itself.

Apart from the above mentioned data, the MongoDB database contains information that is reported to the NSight server by the Cfgd running on the NOC. These are:

- Device information – Information of all devices (APs and controllers) within the network, such as hostname, device type, firmware version, location, geo-coordinates, etc. This information is collected and reported by the Cfgd running on the NOC.
• Configuration elements, such as RF Domains, RF Domain location hierarchy, WLANs.

**NOTE:** All network devices (APs and controllers) should be upgraded to the latest WiNG build for NSight and MongoDB implementation.

Supported in the following platforms:
• Service Platforms — NX7500, NX9500, NX9510, NX9600, VX9000

**Syntax**

nsight-policy <NSIGHT-POLICY-NAME>

**Parameters**

• nsight-policy <NSIGHT-POLICY-NAME>

| <NSIGHT-POLICY-NAME> | Specify the NSight policy name. If the policy does not exist, it is created. |

**Examples**

nx9500-6C8809(config)#nsight-policy test
nx9500-6C8809(config-nsight-policy-test)#?

Nsight Policy Mode commands:
  enable              Enable this Nsight policy
  event-history-size  Size of the event history collection
  history-ttl         Time to live for historical data
  no                  Negate a command or set its defaults
  nsight-server       Enable Nsight server functionality
  server              Configure Nsight server
  clrscr              Clears the display screen
  commit              Commit all changes made in this session
  end                 End current mode and change to EXEC mode
  exit                End current mode and down to previous mode
  help                Description of the interactive help system
  revert              Revert changes
  service             Service Commands
  show                Show running system information
  write               Write running configuration to memory or terminal

nx9500-6C8809(config-nsight-policy-test)#

**Related Commands**

| no | Removes an existing NSight policy |
4.1.67.2 nsight-policy commands

The following table summarizes NSight policy configuration mode commands:

</tr>
</tbody>
</table>
4.1.67.2.1 enable

*nsight-policy commands*

Enables this NSight policy. The default setting is enabled.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

`enable`

**Parameters**

None

**Examples**

```
nx9510-6C8A5C(config-nsight-policy-test2)#enable
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables this NSight policy</td>
</tr>
</tbody>
</table>
4.1.67.2.2  event-history-size

*nsight-policy commands*

Converts and sizes the NSight event history collection to a capped collection. The conversion occurs when upgrading. Use this command to define the NSight event history collection’s size and prevent its unbounded growth. Note, resizing the collection results in the collection contents being dropped.

Supported in the following platforms:

- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

`event-history-size [high|low|medium]`

Parameters

- `event-history-size [high|low|medium]`

| event-history-size [high|low|medium] | Defines the size of the NSight event history collection. The options are:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>high</td>
<td>high – Sets the size at approximately 10 M events</td>
</tr>
<tr>
<td>low</td>
<td>low – Sets the size at approximately 500 K events. This is the default setting.</td>
</tr>
<tr>
<td>medium</td>
<td>medium – Sets the size at approximately 5 M events</td>
</tr>
</tbody>
</table>

Examples

nx9500-6C8809(config-nsight-policy-test)#event-history-size medium

nx9500-6C8809(config-nsight-policy-test)#show context
nsight-policy test
  event-history-size medium
nx9500-6C8809(config-nsight-policy-test)#

Related Commands

- `no`  
  Reverts the NSight event history collection size to default (5 M)
### 4.1.67.2.3 history-ttl

*nsight-policy commands*

Configures the *time-to-live* (TTL), in days, for historical data related to clients, devices, and guest users. This is the duration for which clients, devices, or guest user related data is retained in the NSight database.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

```
history-ttl [clients|devices|guest-clients]
```

```
history-ttl [clients|devices] <1-3650>
```

```
history-ttl guest-clients <8-48>
```

**Parameters**

- `history-ttl [clients|devices] <1-3650>`
- `history-ttl guest-clients <8-48>`

**Examples**

```
nx9500-6C8809(config-nsight-policy-test)# history-ttl clients 250
```

```
nx9500-6C8809(config-nsight-policy-test)# show context nsight-policy test
```

```
  history-ttl clients 250
```

```
nx9500-6C8809(config-nsight-policy-test)#
```

**Related Commands**

- `no` — Reverts the NSight clients or devices TTL duration to default (180 days)
### 4.1.67.2.4 nsight-server

#### nsight-policy commands

Enables NSight server functionality and configures the SMTP report delivery settings. When applied to a device (NOC), this policy enables the device to recognize itself as the NSight server.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

```
nsight-server {smtp-report-delivery|standalone}
```

```
nsight-server {smtp-report-delivery host <WORD> sender <EMAIL-ADD> [port <1-65535>]
security [none|ssl|starttls]|username <USER-NAME> password [0|2|<WORD>]
}
```

```
nsight-server {standalone}
```

**Parameters**

- **nsight-server {smtp-report-delivery host <WORD> sender <EMAIL-ADD> [port <1-65535>]
security [none|ssl|starttls]|username <USER-NAME> password [0|2|<WORD>]}**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsight-server</td>
<td>Enables NSight server functionality on the host using this NSight policy</td>
</tr>
</tbody>
</table>
| smtp-report-delivery host <WORD> | Optional. Configures SMTP report delivery settings  
  - host <WORD> – Configures the SMTP server host  
  - <WORD> – Specify the SMTP server host’s IP address or hostname. |
| sender <EMAIL-ADD> | Optional. Configures the SMTP sender’s e-mail address  
  - <EMAIL-ADD> – Specify the sender’s e-mail address. |
| port <1-65535> | Optional. Configures the SMTP server port  
  - <1-65535> – Specify the port from 1 - 65535. |
| security [none|ssl|starttls] | Optional. Configures the encryption protocol used by the SMTP server. The options are:  
  - none – Uses no encryption  
  - ssl – Uses SSL encryption  
  - starttls – Uses STARTTLS encryption |
| username <USER-NAME> password [0|2|<WORD>] | Optional. Configures the SMTP username  
  - <USER-NAME> Specify the user name  
  - password [0|2|<WORD>] – Configures the password associated with the above configured user  
    - 0 – Configures a clear text password  
    - 2 – Configures an encrypted password  
    - <WORD> – Enter the password. |
| nsight-server {standalone} | Enables NSight server functionality on the host using this NSight policy |
| standalone | Optional. Configures NSight server as standalone |
Examples
nx9510-6C8A5C(config-nsight-policy-test2)#nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
  nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#

server

nsight-policy commands

Configures the NSight server host. This configuration is used by the NSight client to identify the NSight server host. Supported in the following platforms:

- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}

Parameters

- server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}

| server host [<IP>|<HOSTNAME>|<X:X::X:X>] | Configures the NSight server host's address. Use one of the following options to identify the NSight server host:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;IP&gt; – Configures the NSight server's IPv4 address</td>
<td></td>
</tr>
<tr>
<td>• &lt;HOSTNAME&gt; – Configures the NSight server's hostname</td>
<td></td>
</tr>
<tr>
<td>• &lt;X:X::X:X&gt; – Configures the NSight server's IPv6 address</td>
<td></td>
</tr>
</tbody>
</table>
| {http|https} | Optional. Configures the protocol used to communicate with the NSight server:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• http – Optional. Uses HTTP to communicate</td>
<td></td>
</tr>
<tr>
<td>• https – Optional. Uses HTTPS to communicate (this is the default setting)</td>
<td></td>
</tr>
</tbody>
</table>

Examples

nx9510-6C8A5C(config-nsight-policy-test2)#server host 172.22.0.153 http

nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
server host 172.22.0.153 http
nsight-server

nx9510-6C8A5C(config-nsight-policy-test2)#

Related Commands

- **no** | Removes NSight server host settings from this NSight policy
4.1.67.2.6 no

nsight-policy commands

Removes NSight policy settings

Supported in the following platforms:
   • Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

no [enable|event-history-size|history-ttl [clients|devices|guest-clients]|nsight-server {smtp-report-delivery}|server host [<IP>|<HOSTNAME>|<X::X::X::X>]]

Parameters

• no <PARAMETERS>

no <PARAMETERS> Removes NSight policy settings based on the parameters passed

Examples

The following example shows the NSight policy ‘test2’ settings before the ‘no’ command is executed:

```
nx9510-6C8A5C(config-nsight-policy-test2)#show context nsight-policy test2
  server host 172.22.0.153 http
  nsight-server
```

```
nx9510-6C8A5C(config-nsight-policy-test2)#no server host 172.22.0.153
```

The following example shows the NSight policy ‘test2’ settings after the ‘no’ command is executed:

```
nx9500-6C8809(config-nsight-policy-test2)#show context nsight-policy test2
  nsight-server
```

```
nx9510-6C8A5C(config-nsight-policy-test2)#
```
4.1.68 passpoint-policy

Global Configuration Commands

Creates a new passpoint policy and enters its configuration mode

The passpoint policy implements the Hotspot 2.0 Wi-Fi Alliance standard, enabling interoperability between clients, infrastructure, and operators. It makes a portion of the IEEE 802.11u standard mandatory and adds Hotspot 2.0 extensions that allow clients to query a network before actually attempting to join it.

The passpoint policy allows a single or set of Hotspot 2.0 configurations to be global and referenced by the devices that use it. It is mapped to a WLAN. However, only primary WLANs on a BSSID will have their passpoint policy configuration used.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

passpoint-policy <POLICY-NAME>

Parameters

- passpoint-policy <POLICY-NAME>

Examples

rfs4000-229D58(config)#passpoint-policy test
rfs4000-229D58(config-passpoint-policy-test)#?
Passpoint Policy Mode commands:
3gpp                   Configure a 3gpp plmn (public land mobile network) id
access-network-type    Set the access network type for the passpoint
connection-capability  Configure the connection capability for the passpoint
domain-name            Add a domain-name for the passpoint
hessid                 Set a homogeneous ESSID value for the passpoint
internet               Advertise the passpoint having internet access
ip-address-type        Configure the advertised ip-address-type
nai-realm              Configure a NAI realm for the passpoint
net-auth-type          Add a network authentication type to the passpoint
no                     Negate a command or set its defaults
operator               Add configuration related to the operator of the passpoint
osu                    Online signup
roam-consortium        Add a roam consortium for the passpoint
venue                  Set the venue parameters of the passpoint
wan-metrics            Set the wan-metrics of the passpoint
clrscr                 Clears the display screen
commit                 Commit all changes made in this session
do                     Run commands from Exec mode
end                     End current mode and change to EXEC mode
exit                    End current mode and down to previous mode
help                    Description of the interactive help system
revert                  Revert changes
service                 Service Commands
show                    Show running system information
write                   Write running configuration to memory or terminal
rfs4000-229D58(config-passpoint-policy-test)#
### Related Commands

</table>

**NOTE:** For more information on passpoint policy, see Chapter 27, PASSPOINT POLICY.
## 4.1.69 password-encryption

### Global Configuration Commands

Enables password encryption

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
password-encryption secret 2 <LINE>
```

**Parameters**

- `secret 2 <LINE>`
  
  Encrypts passwords with a secret phrase
  
  - 2 – Specifies the encryption type as either SHA256 or AES256
  
  - `<LINE>` – Specify the encryption passphrase.

**Examples**

```
rfs7000-37FABE(config)#password-encryption secret 2 example_company
```

**Related Commands**

- `no` Disables password encryption
4.1.70 profile

Global Configuration Commands

Configures profile related commands. If no parameters are given, all profiles are selected.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|
ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|containing|filter|rfs4000|rfs6000|
   rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}
```

```
profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|
ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|containing|filter<rfs4000|rfs6000|
rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600} <DEVICE-PROFILE-NAME>
```

```
profile {containing <DEVICE-PROFILE-NAME>} {filter type [ap621|ap622|ap650|ap6511|
ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|
rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}
```

Parameters

- profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|
ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|rfs4000|rfs6000|rfs7000|nx45xx|
   nx5500|nx65xx|nx75xx|nx9000|nx9600} <DEVICE-PROFILE-NAME>

profile <DEVICE-TYPE> <DEVICE-PROFILE-NAME>

Configures device profile commands. If no device profile is specified, the system configures all device profiles.

- <DEVICE-TYPE> – Select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, and NX9600. After specifying the device type, specify the profile name.
- <DEVICE-PROFILE-NAME> – Specify the profile name.

Note: Select 'anyap' to configure a profile applicable to any access point.

Note: The NX9600 profile option is only available on an NX9600 device.

- profile {containing <DEVICE-PROFILE-NAME>} {filter type [ap621|ap622|ap650|ap6511|
ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|
rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}

profile containing <DEVICE-PROFILE-NAME>

Optional. Configures profiles that contain a specified sub-string in the hostname

- <DEVICE-PROFILE-NAME> – Specify a substring in the profile name to filter profiles.
<table>
<thead>
<tr>
<th>filter type</th>
<th>Optional. An additional filter used to configure a specific type of device profile. If no device type is specified, the system configures all device profiles.</th>
</tr>
</thead>
<tbody>
<tr>
<td>• type – Filters profiles by the device type. Select a device type from the following options: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, and NX9600.</td>
<td></td>
</tr>
<tr>
<td>Note: The NX9600 profile option is only available on an NX9600 device.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>profile</th>
<th>Configures device profile commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter type</td>
<td>Optional. An additional filter used to configure a specific type of device profile. If no device type is specified, the system configures all device profiles.</td>
</tr>
<tr>
<td>• type – Filters profiles by the device type. Select a device type from the following options: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, and NX9600.</td>
<td></td>
</tr>
<tr>
<td>Note: The NX9600 profile option is only available on an NX9600 device.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#?
```

Profile Mode commands:

- **adopter-auto-provisioning-policy-lookup** Use centralized auto-provisioning policy when adopted by another controller
- **adoption** Adoption configuration
- **alias** Alias
- **application-policy** Application Policy configuration
- **area** Set name of area where the system is located
- **arp** Address Resolution Protocol (ARP)
- **auto-learn** Auto learning
- **autogen-uniqueid** Autogenerate a unique id
- **autostart** Autostart settings
- **bluetooth-detection** Detect Bluetooth devices using the Bluetooth USB module - there will be interference on 2.4 Ghz radio in wlan mode
- **bridge** Ethernet bridge
- **captive-portal** Captive portal
- **cdp** Cisco Discovery Protocol
- **cluster** Cluster configuration
- **configuration-persistence** Enable persistence of configuration across reloads (startup config file)
- **controller** WLAN controller configuration
- **critical-resource** Critical Resource
- **crypto** Encryption related commands
- **database** Database command
- **device-upgrade** Device firmware upgrade
- **dot1x** 802.1X
- **dpi** Enable Deep-Packet-Inspection (Application Assurance)
- **dscp-mapping** Configure IP DSCP to 802.1p priority mapping for untagged frames
- **email-notification** Email notification configuration
traffic-class-mapping Configure IPv6 traffic class to 802.1p priority mapping for untagged frames
traffic-shape Traffic shaping
tunnel-controller Tunnel Controller group this controller belongs to
trustpoint Assign a trustpoint to a service
use Set setting to use
vrrp VRRP configuration
vrrp-state-check Publish interface via OSPF/BGP only if the interface VRRP state is not BACKUP
wep-shared-key-auth Enable support for 802.11 WEP shared key authentication
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
write Write running configuration to memory or terminal

<DEVICE>(config-profile-<PROFILE-NAME>)#

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td><strong>no</strong></td>
</tr>
</tbody>
</table>

**NOTE:** For more information on profiles and how to configure profiles, see Chapter 7, **PROFILES**.
4.1.71 radio-qos-policy

Global Configuration Commands

Configures a radio quality-of-service (QoS) policy

Supported in the following platforms:
  - Wireless Controllers — RFS4011

Syntax

radio-qos-policy <RADIO-QOS-POLICY-NAME>

Parameters

- radio-qos-policy <RADIO-QOS-POLICY-NAME>

Examples

rfs7000-37FABE(config)#radio-qos-policy test
rfs7000-37FABE(config-radio-qos-test)#

Radio QoS Mode commands:

- accelerated-multicast Configure multicast streams for acceleration
- admission-control Configure admission-control on this radio for one or more access categories
- no Negate a command or set its defaults
- smart-aggregation Configure smart aggregation parameters
- wmm Configure 802.11e/Wireless MultiMedia parameters

clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-radio-qos-test)#

Related Commands

no Removes an existing Radio QoS policy

NOTE: For more information on radio qos policy, see Chapter 17, RADIO-QOS-POLICY.
4.1.72 radius-group

Global Configuration Commands

Configures RADIUS user group parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

radius-group <RADIUS-GROUP-NAME>

Parameters

- radius-group <RADIUS-GROUP-NAME>

Examples

rfs7000-37FABE(config)#radius-group testgroup
rfs7000-37FABE(config-radius-group-testgroup)#?

Radius user group configuration commands:

- guest Make this group a Guest group
- no Negate a command or set its defaults
- policy Radius group access policy configuration
- rate-limit Set rate limit for group
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-radius-group-testgroup)#

Related Commands

- no Removes an existing RADIUS group

NOTE: For more information on RADIUS user group commands, see Chapter 16, RADIUS-POLICY.
4.1.73 **radius-server-policy**

Global Configuration Commands

Creates an onboard device RADIUS policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
radius-server-policy <RADIUS-SERVER-POLICY-NAME>
```

Parameters

- `radius-server-policy <RADIUS-SERVER-POLICY-NAME>`

Examples

```plaintext
rfs7000-37FABE(config)#radius-server-policy testpolicy
rfs7000-37FABE(config-radius-server-policy-testpolicy)#
```

Radius Configuration commands:

- `authentication` Radius authentication
- `bypass` Bypass Certificate Revocation List (CRL) check
- `chase-referral` Enable chasing referrals from LDAP server
- `crl-check` Enable Certificate Revocation List (CRL) check
- `ldap-agent` LDAP Agent configuration parameters
- `ldap-group-verification` Enable LDAP Group Verification setting
- `ldap-server` LDAP server parameters
- `local` RADIUS local realm
- `num` RADIUS client
- `no` Negate a command or set its defaults
- `proxy` RADIUS proxy server
- `session-resumption` Enable session resumption/fast reauthentication by using cached attributes
- `termination` Enable Eap termination for proxy requests
- `use` Set setting to use

```plaintext
clrscr
commit
do
end
exit
help
revert
service
show
write
```

```plaintext
rfs7000-37FABE(config-radius-server-policy-testpolicy)#
```

Related Commands

- `no` Removes an existing RADIUS server policy

**NOTE:** For more information on RADIUS server policy commands, see Chapter 16, RADIUS-POLICY.
4.1.74 radius-user-pool-policy

Global Configuration Commands

Configures a RADIUS user pool

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

radius-user-pool-policy <RADIUS-USER-POOL-POLICY-NAME>

Parameters

- radius-user-pool-policy <RADIUS-USER-POOL-POLICY-NAME>

Examples

rfs7000-37FABE(config)#radius-user-pool-policy testpool
rfs7000-37FABE(config-radius-user-pool-testpool)#?

Radius User Pool Mode commands:
  duration  Set a guest user’s access duration
  no        Negate a command or set its defaults
  user      Radius user configuration

  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal

rfs7000-37FABE(config-radius-user-pool-testpool)#

Related Commands

| no | Removes an existing RADIUS user pool |

NOTE: For more information on RADIUS user group commands, see Chapter 16, RADIUS-POLICY.
### 4.1.75 `rename`

Global Configuration Commands

Renames and existing TLO

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP91XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
rename tlo <TLO-NAME>
```

**Parameters**

- `rename tlo <TLO-NAME> <NEW-TLO-NAME>`

<table>
<thead>
<tr>
<th><code>rename tlo &lt;TLO-NAME&gt; &lt;NEW-TLO-NAME&gt;</code></th>
<th>Renames an existing TLO object</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;TLO-NAME&gt;</code> – Specify the TLO’s name. This is the TLO that is to be renamed.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;NEW-TLO-NAME&gt;</code> – Specify the new name for this TLO</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows the top level objects available for renaming:

Enter `rename` and press **Tab** to list top level objects available for renaming.

```
rfs4000-229D58(config)#rename [TAB]
aaa_policy
address_range_alias
auto_provisioning_policy
bonjour_gw_forwarding_policy
bridging_policy
centro_policy
client_identity_group
crypto_cmp_policy
dhcp_server_policy
dns_whitelist
firewall_policy
host_alias
ip_snmp_acl
ipv6_radv_policy
mac_acl
meshpoint
mint_policy
mac_list
network_group_alias
passpoint_policy
radio_qos
radius_server_policy
rf_domain
roaming_assist_policy
routing_policy
smart_rf_policy
subscriber_policy
url_list
wips_policy
wlan_qos
device
```

```
rfs4000-229D58(config)#
```
The following examples first clones the existing IP access list BROADCAST-MULTICAST-CONTROL, and then renames the cloned IP access list:

```
rfs4000-229D58(config)#show context
!
! Configuration of RFS4000 version 5.8.4.0-004D
!
!
version 2.5

<tr>
<td>rf-domain-mode commands</td>
<td>Invokes RF Domain configuration mode commands</td>
<td>page 4-330</td>
</tr>
</tbody>
</table>
4.1.76.1 rf-domain

rf-domain

Creates an RF Domain or enters the RF Domain configuration context for one or more RF Domains. If the RF Domain does not exist, it is created.

The configuration of controllers (wireless controllers, service platforms, and access points) comprises of RF Domains that define regulatory, location, and other relevant policies. At least one default RF Domain is assigned to each controller.

RF Domains allow administrators to assign configuration data to multiple devices deployed in a common coverage area, such as in a floor, building, or site. Each RF Domain contains policies that set the Smart RF or WIPS configuration.

RF Domains also enable administrators to override WLAN SSID name and VLAN assignments. This enables the deployment of a global WLAN across multiple sites and unique SSID name or VLAN assignments to groups of access points servicing the global WLAN. This WLAN override eliminates the need to define and manage a large number of individual WLANs and profiles.

A controller’s configuration contains:

- A default RF Domain - Each controller utilizes a default RF Domain. Access Points are assigned to this default RF Domain as they are discovered by the controller. A default RF Domain can be used for single-site and multi-site deployments.
  - Single-site deployment – The default RF Domain can be used for single site deployments, where regional, regulatory, and RF policies are common between devices.
  - Multi-site deployment – A default RF Domain can omit configuration parameters to prohibit regulatory configuration from automatically being inherited by devices as they are discovered. This is desirable in multi-site deployments with devices spanning multiple countries. Omitting specific configuration parameters eliminates the risk of an incorrect country code from being automatically assigned to a device.

- A user-defined RF Domain - Created by administrators. A user-defined RF Domain can be assigned to multiple devices manually or automatically.
  - Manually assigned – Use the CLI or UI to manually assign a user-defined RF Domain to controllers and service platforms.
  - Automatically assigned – Use a AP provisioning policy to automatically assign specific RF Domains to access points based on the access point’s model, serial number, VLAN, DHCP option, and IP address or MAC address. Automatic RF Domain assignments are useful in large deployments, as they enable plug-n-play access point deployments by automatically applying RF Domains to remote access points. For more information on auto provisioning policy, see Chapter 9, AUTO-PROVISIONING-POLICY.

Configure and deploy user-defined RF Domains for single or multiple sites where devices require unique regulatory and regional configurations, or unique Smart RF and WIPS policies. User-defined RF Domains can be used to:

- Assign unique Smart RF or WIPS policies to access points deployed on different floors or buildings within a site.
- Assign unique regional or regulatory configurations to devices deployed in different states or countries.
- Assign unique WLAN SSIDs and/or VLAN IDs to sites assigned a common WLAN without having to define individual WLANs for each site.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
**Syntax**

rf-domain {<RF-DOMAIN-NAME>|containing <RF-DOMAIN-NAME>}

**Parameters**

- rf-domain {<RF-DOMAIN-NAME>|containing <RF-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>rf-domain</th>
<th>Creates a new RF Domain or enters its configuration context</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;RF-DOMAIN-NAME&gt;</td>
<td>Optional. Specify the RF Domain name (should not exceed 32 characters and should represent the intended purpose). Once created, the name cannot be edited.</td>
</tr>
<tr>
<td>containing &lt;RF-DOMAIN-NAME&gt;</td>
<td>Optional. Identifies an existing RF Domain that contains a specified sub-string in the domain name</td>
</tr>
</tbody>
</table>

- <RF-DOMAIN-NAME> – Specify a sub-string of the RF Domain name.

**Examples**

rfs7000-37FABE(config)#rf-domain rfs7000
rfs7000-37FABE(config-rf-domain-rfs7000)#?

RF Domain Mode commands:

- adoption-mode Configure the adoption mode for the access-points in this RF-Domain
- alias Alias
- channel-list Configure channel list to be advertised to wireless clients
- contact Configure the contact
- control-vlan VLAN for control traffic on this RF Domain
- controller-managed RF Domain manager for this domain will be an adopting controller
- country-code Configure the country of operation
- layout Configure layout
- location Configure the location
- mac-name Configure MAC address to name mappings
- no Negate a command or set its defaults
- override-smartrf Configured RF Domain level overrides for smart-rf
- override-wlan Configured RF Domain level overrides for wlan
- sensor-server AirDefense sensor server configuration
- stats Configure the stats related setting
- timezone Configure the timezone
- tree-node Configure tree node under which this rf-domain appears
- use Set setting to use
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-rf-domain-rfs7000)#

nxa9500-6C8809(config-rf-domain-test)#?

RF Domain Mode commands:

- adoption-mode Configure the adoption mode for the access-points in this RF-Domain
- alias Alias
- channel-list Configure channel list to be advertised to wireless clients
- contact Configure the contact
- control-vlan VLAN for control traffic on this RF Domain
- controller-managed RF Domain manager for this domain will be an adopting controller
- country-code Configure the country of operation
- layout Configure layout
- location Configure the location

4.1.76.2 rf-domain-mode commands

This section describes the default commands under RF Domain.

The following table summarizes RF Domain configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>adoption-mode</td>
<td>Configures the mode of adoption of access points in the selected RF Domain</td>
<td>page 4-331</td>
</tr>
<tr>
<td>alias</td>
<td>Configures network, VLAN, and service aliases at the RF Domain level</td>
<td>page 4-333</td>
</tr>
<tr>
<td>channel-list</td>
<td>Configures the channel list advertised by radios</td>
<td>page 4-339</td>
</tr>
<tr>
<td>contact</td>
<td>Configures network administrator’s contact information (needed in case of any problems impacting the RF Domain)</td>
<td>page 4-340</td>
</tr>
<tr>
<td>control-vlan</td>
<td>Configures VLAN for traffic control on a RF Domain</td>
<td>page 4-341</td>
</tr>
<tr>
<td>controller-managed</td>
<td>Configures the adopting controller or service platform as this RF Domain’s manager</td>
<td>page 4-342</td>
</tr>
<tr>
<td>country-code</td>
<td>Configures the country of operation</td>
<td>page 4-343</td>
</tr>
<tr>
<td>layout</td>
<td>Configures layout information</td>
<td>page 4-344</td>
</tr>
<tr>
<td>location</td>
<td>Configures the physical location of a RF Domain</td>
<td>page 4-346</td>
</tr>
<tr>
<td>mac-name</td>
<td>Maps MAC addresses to names</td>
<td>page 4-347</td>
</tr>
<tr>
<td>mpact-server</td>
<td>Configures an MPact server on the selected RF Domain. This command is supported only on the NX95XX series service platforms.</td>
<td>page 4-348</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts configured settings to their default</td>
<td>page 4-349</td>
</tr>
<tr>
<td>override-smart-rf</td>
<td>Configures RF Domain level overrides for Smart RF</td>
<td>page 4-351</td>
</tr>
<tr>
<td>override-wlan</td>
<td>Configures RF Domain level overrides for a WLAN</td>
<td>page 4-352</td>
</tr>
<tr>
<td>sensor-server</td>
<td>Configures an AirDefense sensor server on this RF Domain</td>
<td>page 4-354</td>
</tr>
<tr>
<td>stats</td>
<td>Configures stats related settings on this RF Domain. These settings define how RF Domain statistics are updated.</td>
<td>page 4-356</td>
</tr>
<tr>
<td>timezone</td>
<td>Configures a RF Domain’s geographic time zone</td>
<td>page 4-357</td>
</tr>
<tr>
<td>tree-node</td>
<td>Configures the hierarchical (tree-node) structure under which this RF Domain appears</td>
<td>page 4-358</td>
</tr>
<tr>
<td>use</td>
<td>Enables the use of a specified Smart RF and/or WIPS policy</td>
<td>page 4-360</td>
</tr>
</tbody>
</table>
4.1.76.2.1 adoption-mode

rf-domain-mode commands

Configures the mode of adoption of access points in the selected RF Domain

By default, controllers or virtual controllers (VCs) on being powered-up automatically move to the Controller/VC mode and do not attempt adoption to the CLOUD or local controller. On the other hand, a non-vc access point (AP), on being powered-up for the first time, starts the following auto-discovery process:

1. Moves to MLCP_DISCOVERY state and tries to discover a local controller. If a local controller is found, it
   a. adopts to the controller, and
   b. marks itself as “local-controller” adopted, and
   c. moves to the MLCP_MODE
2. If a local controller is not found, the AP switches to the CLOUD_DISCOVERY state, and tries connecting to the Cloud. If the AP succeeds in connecting to the cloud, it
   a. marks itself as “cloud-adopted”, and
   b. moves to the CLOUD_MODE.
3. If the AP fails to adopt either to a local controller or the Cloud, it switches between MLCP_DISCOVERY and CLOUD_DISCOVERY states until adopted.
4. Once adopted, an AP’s adoption mode does not change unless,
   a. It is changed from the controller’s CLI (using the adoption-mode command) or from the Cloud dashboard, or
   b. If the AP is reverted to factory settings, in which case the AP starts the auto-discovery process on bootup.

Supported in the following platforms:

- Access Points – AP7502, AP7522, AP7532, AP7562
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

adoption-mode [cloud|controller]

Parameters

- adoption-mode [cloud|controller]

adoption-mode [cloud|controller] Configures the mode of adoption of access points in the selected RF Domain as ‘cloud’ or ‘controller’

- cloud – Sets the mode of adoption as cloud. Note, APs with the controller host configuration specified are marked as local-controller APs and never try adopting to the CLOUD.
- controller – Sets the mode of adoption as controller. This is the default setting.

Note: Use this command to migrate all access points, within the RF Domain, from the controller to the cloud or vice versa. Also, use it to prevent cloud-enabled APs (AP7502, AP7522, AP7532, AP7562), deployed at an enterprise customer site, from adopting to the Cloud and exposing AP details.

Examples

nx9500-6C8809(config-rf-domain-test)#adoption-mode cloud

nx9500-6C8809(config-rf-domain-test)#show context
rf-domain test
adoption-mode cloud
no country-code
nx9500-6C8809(config-rf-domain-test20)#

</tr>
</tbody>
</table>
### 4.1.76.2.2 alias

#### rf-domain-mode commands

Configures network, VLAN, host, string, and network-service aliases at the RF Domain level.

This command also allows you to associate existing aliases, created in the global configuration mode, and apply overrides to customize for use at the domain level.

For information on aliases, see `alias`.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
alias [address-range|host|network|network-group|network-service|number|string|vlan]

alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

alias host <HOST-ALIAS-NAME> <HOST-IP>

alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP>]

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [0-254]|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp]

alias number <NUMBER-ALIAS-NAME> <0-4294967295>

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [0-254]|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp]

alias string <STRING-ALIAS-NAME> <LINE>

alias vlan <VLAN-ALIAS-NAME> <1-4094>
```

**Parameters**

- **address-range** 
  - `<ADDRESS-RANGE-ALIAS-NAME>`
  - `<STARTING-IP>` to `<ENDING-IP>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;ADDRESS-RANGE-ALIAS-NAME&gt;</code></td>
<td>Creates a new address-range alias for this RF Domain. Or associates an existing address-range alias with this RF Domain. An address-range alias maps a name to a range of IP addresses.</td>
</tr>
<tr>
<td><code>&lt;STARTING-IP&gt;</code> to <code>&lt;ENDING-IP&gt;</code></td>
<td>Associates a range of IP addresses with this address range alias</td>
</tr>
<tr>
<td>Note</td>
<td>Alias name should begin with <code>$</code>.</td>
</tr>
</tbody>
</table>

Note: If using an existing address-range alias, you can apply overrides to the alias at the RF Domain level.
### alias host <HOST-ALIAS-NAME> <HOST-IP>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host &lt;HOST-ALIAS-NAME&gt;</td>
<td>Creates a host alias for this RF Domain. Or associates an existing host alias with this RF Domain. A host alias maps a name to a single network host.</td>
</tr>
<tr>
<td></td>
<td>• &lt;HOST-ALIAS-NAME&gt; – Specify the host alias name.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Alias name should begin with <code>$</code>.</td>
</tr>
<tr>
<td>&lt;HOST-IP&gt;</td>
<td>Associates the network host’s IP address with this host alias</td>
</tr>
<tr>
<td></td>
<td>• &lt;HOST-IP&gt; – Specify the network host’s IP address.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If using an existing host alias, you can apply overrides to the alias at the RF Domain level.</td>
</tr>
</tbody>
</table>

### alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>network &lt;NETWORK-ALIAS-NAME&gt;</td>
<td>Creates a network alias for this RF Domain. Or associates an existing network alias with this RF Domain. A network alias maps a name to a single network address.</td>
</tr>
<tr>
<td></td>
<td>• &lt;NETWORK-ALIAS-NAME&gt; – Specify the network alias name.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Alias name should begin with <code>$</code>.</td>
</tr>
<tr>
<td>&lt;NETWORK-ADDRESS/MASK&gt;</td>
<td>Associates a single network with this network alias</td>
</tr>
<tr>
<td></td>
<td>• &lt;NETWORK-ADDRESS/MASK&gt; – Specify the network’s address and mask.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If using an existing network alias, you can apply overrides to the alias at the RF Domain level.</td>
</tr>
</tbody>
</table>

### alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP> {<STARTING-IP> to <ENDING-IP>}|host <HOST-IP> {<HOST-IP>}|network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>network-group &lt;NETWORK-GROUP-ALIAS-NAME&gt;</td>
<td>Creates a network-group alias for this RF Domain. Or associates an existing network-group alias with this RF Domain.</td>
</tr>
<tr>
<td></td>
<td>• &lt;NETWORK-GROUP-ALIAS-NAME&gt; – Specify the network-group alias name.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Alias name should begin with <code>$</code>.</td>
</tr>
<tr>
<td></td>
<td>After specifying the name, specify the following: a range of IP addresses, host addresses, or a range of network addresses.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If using an existing network-group alias, you can apply overrides to the alias at the RF Domain level.</td>
</tr>
</tbody>
</table>

### address-range <STARTING-IP> to <ENDING-IP> {<STARTING-IP> to <ENDING-IP>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Associates a range of IP addresses with this network-group alias</td>
</tr>
<tr>
<td></td>
<td>• &lt;STARTING-IP&gt; – Specify the first IP address in the range.</td>
</tr>
<tr>
<td></td>
<td>• to &lt;ENDING-IP&gt; – Specify the last IP address in the range.</td>
</tr>
<tr>
<td></td>
<td>• &lt;STARTING-IP&gt; to &lt;ENDING-IP&gt; – Optional. Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured.</td>
</tr>
</tbody>
</table>

### host <HOST-IP> {<HOST-IP>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Associates a single or multiple hosts with this network-group alias</td>
</tr>
<tr>
<td></td>
<td>• &lt;HOST-IP&gt; – Specify the hosts’ IP address.</td>
</tr>
<tr>
<td></td>
<td>• &lt;HOST-IP&gt; – Optional. Specifies more than one host. A maximum of eight (8) hosts can be configured.</td>
</tr>
</tbody>
</table>

### network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Associates a single or multiple networks with this network-group alias</td>
</tr>
<tr>
<td></td>
<td>• &lt;NETWORK-ADDRESS/MASK&gt; – Specify the network’s address and mask.</td>
</tr>
<tr>
<td></td>
<td>• &lt;NETWORK-ADDRESS/MASK&gt; – Optional. Specifies more than one network. A maximum of eight (8) networks can be configured.</td>
</tr>
</tbody>
</table>

**Create a network-service alias for this RF Domain.** Or associates an existing network-service alias with this RF Domain. A network-service alias maps a name to network services and the corresponding source and destination software ports.

- `<NETWORK-SERVICE-ALIAS-NAME>` – Specify a network-service alias name.

**Note:** Alias name should begin with `$`.  
**Note:** If using an existing network-service alias, you can apply overrides to the alias at the RF Domain level.

**proto [<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp]**

Use one of the following options to associate an Internet protocol with this network-service alias:

- `<0-254>` – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the *Protocol* field of the IPv4 header and the *Next Header* field of IPv6 header. For example, the User Datagram Protocol's (UDP) designated number is 17.
- `<WORD>` – Identifies the protocol by its name. Specify the protocol name.
  - `gre` – Selects *Generic Routing Encapsulation* (GRE). The protocol number is 47.
  - `ospf` – Selects *Open Shortest Path First* (OSPF). The protocol number is 89.
  - `vrrp` – Selects *Virtual Router Redundancy Protocol* (VRRP). The protocol number is 112.

**{(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|ntp|ntp|poll|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|tftp|www})**

After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports.

- `<1-65535>` – Optional. Configures a destination port number from 1 - 65535
- `<WORD>` – Optional. Identifies the destination port by the service name provided. For example, the *secure shell* (SSH) service uses TCP port 22.
  - `bgp` – Optional. Configures the default *Border Gateway Protocol* (BGP) services port (179)
  - `dns` – Optional. Configures the default *Domain Name System* (DNS) services port (53)
  - `ftp` – Optional. Configures the default *File Transfer Protocol* (FTP) control services port (21)
  - `ftp-data` – Optional. Configures the default FTP data services port (20)
  - `gopher` – Optional. Configures the default gopher services port (70)
  - `https` – Optional. Configures the default HTTPS services port (443)
  - `ntp` – Optional. Configures the default Newsgroup (NNTP) services port (119)

Contd..
### alias number <NUMBER-ALIAS-NAME> <0-4294967295>

**Description:** Creates a new number alias or applies an existing number, identified by the <NUMBER-ALIAS-NAME> keyword.

- `<NUMBER-ALIAS-NAME>` – Specify the number alias name.
- `<0-4294967295>` – Specify the number, from 0 - 4294967295, assigned to the number alias created.

**Note:** Number aliases map a name to a numeric value. For example, `alias number $NUMBER 100`.
- The number alias name is: $NUMBER
- The value assigned is: 100
- The value referenced by alias $NUMBER, wherever used, is 100.

### alias string <STRING-ALIAS-NAME> <LINE>

**Description:** Creates a string alias for this RF Domain. Or associates an existing string alias with this RF Domain. String aliases map a name to an arbitrary string value. For example, `alias string $DOMAIN test.example_company.com`.

- `<STRING-ALIAS-NAME>` – Specify the string alias name.
- `<LINE>` – Specify the string value.

**Note:** Alias name should begin with `$`.
**Note:** If using an existing string alias, you can apply overrides to the alias at the RF Domain level.

### alias vlan <VLAN-ALIAS-NAME> <1-4094>

**Description:** Creates a VLAN alias for this RF Domain. Or associates an existing VLAN alias with this RF Domain. A VLAN alias maps a name to a VLAN ID.

- `<VLAN-ALIAS-NAME>` – Specify the VLAN alias name.

**Note:** Alias name should begin with `$`.
GLOBAL CONFIGURATION COMMANDS 4-337

<table>
<thead>
<tr>
<th>Example</th>
<th>Maps the VLAN alias to a VLAN ID</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;1-4094&gt;</code></td>
<td>- Specify the VLAN ID from 1 - 4094.</td>
</tr>
<tr>
<td><strong>Note:</strong> If using an existing VLAN alias, you can apply overrides to the alias at the RF Domain level.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config)#show context
  ! Configuration of RFS4000 version 5.8.4.0-004D
  !
  version 2.5
  !
  alias network-group $TestNetGrpAlias network 192.168.13.0/24 192.168.16.0/24
  alias network-group $TestNetGrpAlias address-range 192.168.13.7 to 192.168.13.16 192.168.13.20 to 192.168.13.25
  !
  alias network $TestNetworkAlias 192.168.13.0/24
  !
  alias host $TestHostAlias 192.168.13.10
  !
  alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
  !
  alias network-service $NetworkServAlias proto udp
  !
  alias network-service $kerberos proto tcp 749 750 80
  alias network-service $kerberos proto udp 68 sourceport 67
  !
  alias vlan $TestVLANAlias 1
  --More--
  rfs4000-229D58(config)#
```

In the following examples, the global aliases `$kerberos` and `$TestVLANAlias` are associated with the RF Domain 'test' and overrides applied:

```
rfs4000-229D58(config-rf-domain-test)#alias network-service $kerberos proto tcp 749 750 80
rfs4000-229D58(config-rf-domain-test)#alias vlan $TestVLANAlias 10
```

```
rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
  no country-code
  alias network-service $kerberos proto tcp 749 750 80
  alias vlan $TestVLANAlias 10
rfs4000-229D58(config-rf-domain-test)#
```

```
x9500-6C8809(config-rf-domain-test)#alias string $test example_company.com
```

```
x9500-6C8809(config-rf-domain-test)#show context
rf-domain test
  no country-code
  alias string $test example_company.com
x9500-6C8809(config-rf-domain-test)#
```

**Example 1:**

In the following examples, the network-group alias `$test` is configured to include hosts 192.168.1.10 and 192.168.1.11, networks 192.168.2.0/24 and 192.168.3.0/24 and address-range 192.168.4.10 to 192.168.4.20.

```
rfs4000-229D58(config)#alias network-group $test host 192.168.1.10 192.168.1.11
rfs4000-229D58(config)#alias network-group $test network 192.168.2.0/24 192.168.3.0/24
rfs4000-229D58(config)#alias network-group $test address-range 192.168.4.10 to 192.168.4.20
```
Associate this network-group alias \'$test\' to the RF Domain \'test\' and override the \'host\' element of the alias.

```
n-rfs4000-229D58(config-rf-domain-test)#alias network-group \$test host 192.168.10.10
n-rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
  no country-code
  alias network-service $kerberos proto tcp 749 750 80
    alias network-group $test host 192.168.10.10
    alias network-group $test network 192.168.2.0/24 192.168.3.0/24
    alias network-group $test address-range 192.168.4.10 to 192.168.4.20
  alias vlan $TestVLANAlias 10
n-rfs4000-229D58(config-rf-domain-test)#
```

In the preceding example, the \'host\' element of the network-group alias \'$test\' has been overridden. But the \'network\' and \'address-range\' elements have been retained as is.

4.1.76.2.3 channel-list

rf-domain-mode commands

Configures the channel list advertised by radios. This command also enables a dynamic update of a channel list. Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

channel-list [2.4GHz|5GHz|dynamic]

channel-list dynamic

channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

Parameters

- channel-list dynamic

  - dynamic Enables a dynamic update of a channel list

  - channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

2.4GHz

<CHANNEL-LIST>

Configures the channel list advertised by radios operating in the 2.4 GHz mode

  • <CHANNEL-LIST> – Specify the list of channels separated by commas or hyphens.

5GHz

<CHANNEL-LIST>

Configures the channel list advertised by radios operating in the 5.0 GHz mode

  • <CHANNEL-LIST> – Specify the list of channels separated by commas or hyphens.

Examples

rfs7000-37FABE(config-rf-domain-default)#channel-list 2.4GHz 1-10

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  no country-code
channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
rfs7000-37FABE(config-rf-domain-default)#

Related Commands

- no Removes the list of channels configured on the selected RF Domain for 2.4 GHz and 5.0 GHz bands. Also disables dynamic update of a channel list.
4.1.76.2.4 contact

rf-domain-mode commands

Configures the network administrator’s contact details. The network administrator is responsible for addressing problems impacting the network.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
contact <WORD>

Parameters

- contact <WORD>

Examples
rfs7000-37FABE(config-rf-domain-default)#contact Bob+14082778691

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
rfs7000-37FABE(config-rf-domain-default)#

Related Commands

- no
  Removes a network administrator’s contact details
### 4.1.76.2.5 control-vlan

*rf-domain-mode commands*

Configures the VLAN designated for traffic control in this RF Domain

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
control-vlan <1-4094>
```

**Parameters**

- `control-vlan <1-4094>`

  | `<1-4094>` | Specify the VLAN ID from 1 - 4094. The default is 1. |

**Examples**

```
rfs7000-37FABE(config-rf-domain-default)#control-vlan 1
```

```
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  show context
  contact Bob+14082778691
  no country-code
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
  control-vlan 1
```  

**Related Commands**

- `no` Disables the VLAN designated for controlling RF Domain traffic
4.1.76.2.6 controller-managed

rf-domain-mode commands

Configures the adopting controller (wireless controller, access point, or service platform) as this RF Domain’s manager. In other words, the RF Domain is controller managed, and the managing controller is the device managing the RF Domain.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

controller-managed

Parameters

None

Examples

rfs4000-229D58(config-rf-domain-test)#controller-managed
rfs4000-229D58(config-rf-domain-test)#commit

rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
  country-code in
controller-managed
  network-alias techPubs host 192.168.13.8
  network-alias techPubs address-range 192.168.13.10 to 192.168.13.15
  service-alias testing index 10 proto 9 destination-port range 21 21

rfs4000-229D58(config-rf-domain-test)#af

Related Commands

no

Removes the adopting controller or service platform as this RF Domain’s manager
4.1.76.2.7 country-code

rf-domain-mode commands

Configures a RF Domain’s country of operation. Since device channels transmit in specific channels unique to the country of operation, it is essential to configure the country code correctly or risk using illegal operation.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

country-code <WORD>

Parameters

- country-code <WORD>

Examples

rfs7000-37FABE(config-rf-domain-default)#country-code us

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
contact Bob+14082778691
country-code us
channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
control-vlan 1
rfs7000-37FABE(config-rf-domain-default)#

Related Commands

- no

Removes the country of operation configured on a RF Domain
4.1.76.2.8 layout

rf-domain-mode commands

Configures the RF Domain layout in terms of area, floor, and location on a map. It allows users to place APs across the deployment map. A maximum of 256 layouts is permitted.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
layout [area|description|floor|map-location] {area|description|floor|map-location}

layout [area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME>{<1-4094>}]|map-location <URL> units [feet|meters]{area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME>{<1-4094>}|map-location <URL> units [feet|meters]}
```

Parameters

- **layout [area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME>{<1-4094>}]|map-location <URL> units [feet|meters]{area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME>{<1-4094>}|map-location <URL> units [feet|meters]}

4.1.76.2.9 location

rf-domain-mode commands

Configures the RF Domain’s physical location. The location could be as specific as the building name or floor number. Or it could be generic and include an entire site. The location defines the physical area where a set of devices with common configurations are deployed and managed by a RF Domain policy.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

location <WORD>

Parameters

- location <WORD>

Examples

rfs7000-37FABE(config-rf-domain-default)#location SanJose

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default

4.1.76.2.10 mac-name

rf-domain-mode commands

Configures a relevant name for each MAC address. Use this command to associate client names to specific connected client MAC addresses for improved client management.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
mac-name <MAC> <NAME>

Parameters
- mac-name <MAC> <NAME>

<table>
<thead>
<tr>
<th>mac-name &lt;MAC&gt; &lt;NAME&gt;</th>
<th>Assigns a user-friendly name to this RF Domain’s member access point’s connected client to assist in its easy recognition</th>

Related Commands

no | Removes the MAC address to name mapping
4.1.76.2.11 mpact-server

rf-domain-mode commands

Configures an MPact server on the selected RF Domain

Within an MPact Appliance architecture, sensors scan for RSSI data at an administrator-defined interval and send to a dedicated MPact server resource, as opposed to an ADSP server. Use this command to configure the MPact server related parameters.

Supported in the following platforms:
  • Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

mpact-server <1-3> ip <IP/HOSTNAME> \{port \[443|\<1-65535\>\]

Parameters

- mpact-server <1-3> ip <IP/HOSTNAME> \{port \[443|\<1-65535\>\]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| mpact-server <1-3> | Configures the MPact server parameters  
  • <1-3> – Select the server ID from 1 - 3. The server with the lowest defined ID is reached first. The default is 1. |
| ip | Configures the (non-DNS) IPv4 address of the MPact server  
  • <IP/HOSTNAME> – Specify the server’s IPv4 address/hostname. This is the IP address of the MPact server designated to receive RSSI scan data from a WiNG dedicated sensor. |
| port [443\<1-65535\>] | Optional. Configures the port where the MPact server is reachable. The options are:  
  • 443 – Configures port 443, the default port used by the MPact server. This is the default setting.  
  • <1-65535> – Specify a port for the MPact server port from 1 - 65535. |

Examples

nx9500-6C8809(config-rf-domain-test)#mpact-server 1 ip 192.168.13.20 port 200

nx9500-6C8809(config-rf-domain-test)#show context
rf-domain test
no country-code
mpact-server 1 ip 192.168.13.20 port 200
nx9500-6C8809(config-rf-domain-test)#

Related Commands

- no Removes the MPact server configurations
4.1.76.2.12 no

rf-domain-mode commands

Negates a command or reverts configured settings to their default. When used in the config RF Domain mode, the no command negates or reverts RF Domain settings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [adoption-mode|alias|channel-list|contact|control-vlan|controller-managed|

no use [database-policy|license|nsight-policy|smart-rf-policy|wips-policy]

Parameters
- no <PARAMETERS>

no <PARAMETERS> Removes or reverts this RF Domain’s settings based on the parameters passed

Examples

The following example shows the default RF Domain settings before the ‘no’ commands are executed:

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  location SanJose
  contact Bob+14082778691
  country-code us
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
  mac-name 11-22-33-44-55-66 TestDevice
  layout area Ecospace floor Floor1 map-location www.firstfloor.com units meters
  control-vlan 1
rfs7000-37FABE(config-rf-domain-default)#

rfs7000-37FABE(config-rf-domain-default)#no channel-list 2.4GHz 1-10
rfs7000-37FABE(config-rf-domain-default)#no mac-name 11-22-33-44-55-66
rfs7000-37FABE(config-rf-domain-default)#no location
rfs7000-37FABE(config-rf-domain-default)#no control-vlan
The following example shows the default RF Domain settings after the ‘no’ commands are executed:

rfs7000-37FABE(config-rf-domain-default)#show context
  rf-domain default
  contact Bob+1408277691
  country-code us
  layout area Ecospace floor Floor1 map-location www.firstfloor.com units meters
rfs7000-37FABE(config-rf-domain-default)#
4.1.76.2.13 override-smart-rf

rf-domain-mode commands

Enables dynamic channel switching for Smart RF radios. This command allows you to configure an override list of channels that Smart RF can use for channel compensations on 2.4 GHz and 5.0 GHz radios.

When a radio fails or is faulty, a Smart RF policy provides automatic recovery by instructing neighboring access points to increase their transmit power to compensate for the coverage loss. Once correct access point placement has been established, Smart-RF can optionally be leveraged for automatic detector radio selection. Smart-RF uses detector radios to monitor RF events and can ensure availability of adequate detector coverage.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
override-smart-rf channel-list [2.4GHz|5GHZ] <CHANNEL-LIST>

Parameters

- override-smart-rf channel-list [2.4GHz|5GHZ] <CHANNEL-LIST>

Related Commands

- **no** Removes the override-smartrf list of channels configured for 2.4 GHz and 5.0 GHz radios
4.1.76.2.14 override-wlan

- rf-domain-mode commands

Configures RF Domain level overrides for a WLAN

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

overrides-wlan <WLAN-NAME> [shutdown|ssid|vlan-pool|wep128|wpa-wpa2-psk]
overrides-wlan <WLAN-NAME> [shutdown|ssid <SSID>|vlan-pool <1-4094> {limit <0-8192>}] 
overrides-wlan <WLAN-NAME> wpa-wpa2-psk [0 <WORD>|2 <WORD>]
overrides-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>]|transmit-key <1-4>]

Parameters

- overrides-wlan <WLAN-NAME> [shutdown|ssid <SSID>|vlan-pool <1-4094> {limit <0-8192>}] 

| <WLAN-NAME> | Configures the WLAN name
|             | If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN's coverage area. After creating the WLAN, configure its override parameters.

| shutdown | Shuts down WLAN operation on all mapped radios

| ssid <SSID> | Configures a override SSID associated with this WLAN
|            | • <SSID> – Specify the SSID (should not exceed 32 characters in length).
|            | Each WLAN provides associated wireless clients with a SSID. This has limitations, because it requires wireless clients to associate with different SSIDs to obtain QoS and security policies. However, a WiNG-managed RF Domain can have WLANs assigned and advertise a single SSID, and yet allow users to inherit different QoS or security policies.

| vlan-pool <1-4094> {limit <0-8192>} | Configures the override VLANs available to this WLAN
|                                         | • <1-4094> – Specify the VLAN ID from 1 - 4094.
|                                         | • limit <0-8192> – Optional. Sets a limit to the number of users on this VLAN from 0 - 8192. The default is 0.
|                                         | Controllers and service platforms allow the mapping of a WLAN to more than one VLAN. Wireless clients associating with a WLAN are assigned VLANs, from the pool representative of the WLAN, in a way that ensures proper load balancing across VLANs. Clients are tracked per VLAN, and assigned to the least used/loaded VLAN. Client VLAN usage is tracked on a per-WLAN basis. The maximum allowed client limit is 8192 per VLAN.

- overrides-wlan <WLAN-NAME> wpa-wpa2-psk [0 <WORD>|2 <WORD>]

| <WLAN-NAME> | Configures the WLAN name
|             | If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN's coverage area. After creating the WLAN, configure its override parameters.
### GLOBAL CONFIGURATION COMMANDS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| wpa-wpa2-psk <PASSPHRASE> | Overrides a WLAN's existing WPA-WPA2 pre-shared key or passphrase at the RF Domain level. WPA2 is a newer 802.11i standard that provides wireless security that is stronger than Wi-Fi Protected Access (WPA) and WEP.  
  - <PASSPHRASE> – Specify a WPA-WPA2 key or passphrase. It is an alphanumeric string of 8 to 64 ASCII characters or 64 HEX characters as the primary string, which both the transmitting and receiving authenticators must share in this new override PSK. The alphanumeric string allows character spaces. The string is converted to a numeric value. This passphrase saves you the necessity of entering the 256-bit key each time keys are generated. |
| overrides-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>]|transmit-key <1-4>] | Configures the WLAN name  
  If applying RF Domain level overrides to an existing WLAN, specify its name. If creating a new WLAN, specify a name not exceeding 32 characters and representing the WLAN’s coverage area. After creating the WLAN, configure its override parameters. |
| <WLAN-NAME> | Configures a WLAN’s existing WEP128 keys at the RF Domain level (not the profile level). WEP128 uses a 104 bit key, which is concatenated with a 24-bit initialization vector (IV) to form the RC4 traffic key. WEP may be all a small-business user needs for the simple encryption of wireless data on the WLAN. However, networks that require more security are at risk from a WEP flaw. WEP is only recommended if there are client devices incapable of using higher forms of security. The existing 802.11 standard alone offers administrators no effective method to update keys. |
| key <1-4> hex | Configures the WEP128 key. A total of four keys can be configured.  
  - <1-4> – Select the key index from 1-4.  
  - hex – Configures a hexadecimal key  
    - 0 <WORD> – Configures a clear text key  
    - 2 <WORD> – Configures an encrypted key  
  The following parameter is common to both clear-text and encrypted key options:  
  - <WORD> – Specify the WEP128/Keyguard key (should not exceed 26 hexadecimal characters in length). |
| transmit-key <1-4> | Configures transmit WEP/Keyguard key settings  
  - <1-4> – Transmit the key identified by the key index specified here. Specify the index from 1-4. |

### Examples

```
rfs7000-37FABE(config-rf-domain-default)#override-wlan test vlan-pool 2 limit 20
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
  country-code us
  override-smartrf channel-list 2.4GHz 1,2,3
  override-wlan test vlan-pool 2 limit 20
  layout area Ecospace floor Floor1 map-location www.firstfloor.com units meters
rfs7000-37FABE(config-rf-domain-default)#

4.1.76.2.15 sensor-server

Configures an AirDefense sensor server on this RF Domain. Sensor servers allow network administrators to monitor and download data from multiple sensors remote locations using Ethernet TCP/IP or serial communications. This enables administrators to respond quickly to interferences and coverage problems.

The Wireless Intrusion Protection System (WIPS) protects the controller managed network, wireless clients and access point radio traffic from attacks and unauthorized access. WIPS provides tools for standards compliance and around-the-clock wireless network security in a distributed environment. WIPS allows administrators to identify and accurately locate attacks, rogue devices and network vulnerabilities in real time and permits both a wired and wireless lockdown of wireless device connections upon acknowledgement of a threat.

In addition to dedicated AirDefense sensors, an access point radio can function as a sensor and upload information to a dedicated WIPS server (external to the controller). Unique WIPS server configurations can be used by RF Domains to ensure a WIPS server configuration is available to support the unique data protection needs of individual RF Domains.

WIPS is not supported on a WLAN basis, rather sensor functionality is supported on the access point radio(s) available to each controller managed WLAN. When an access point radio is functioning as a WIPS sensor, it is able to scan in sensor mode across all legal channels within the 2.4 and 5.0 GHz bands. Sensor support requires a AirDefense WIPS Server on the network. Sensor functionality is not provided by the access point alone. The access point works in conjunction with a dedicated WIPS server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8532
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
sensor-server <1-3> ip <IP/HOSTNAME> {port [443|<1-65535>]} 
```

Parameters

- **sensor-server <1-3> ip <IP/HOSTNAME> {port [443|<1-65535>]}**

4.1.76.2.16 stats

rf-domain-mode commands

Configures stats settings that define how RF Domain statistics are updated

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

stats update-interval

stats update-interval [<5-300>|auto]

Parameters

- stats update-interval [<5-300>|auto]

<table>
<thead>
<tr>
<th>stats update-interval</th>
<th>Configures the interval at which RF Domain statistics are updated. The options are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>[&lt;5-300&gt;</td>
<td>auto]</td>
</tr>
<tr>
<td></td>
<td>• auto – The RF Domain manager automatically adjusts the update interval based on the load.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-rf-domain-default)#stats update-interval 200

rfs7000-37FABE(config-rf-domain-default)#

Related Commands

| no | Resets stats related settings |
4.1.76.2.17 timezone

rf-domain-mode commands

Configures the RF Domain’s geographic time zone. By default all WiNG devices are shipped with the time zone and time format set to Universal Time Coordinated (UTC) and 24-hour clock respectively. If the time zone is not reset, all devices within the RF Domain will display time relative to the UTC - Greenwich Time. Resetting the time zone is recommended, especially for RF Domains deployed across different geographical locations. The time zone can either be set on a specific device or on an RF Domain. When configured as RF Domain setting, it applies to all devices within the domain. For more information on configuring the time zone on a device, see timezone.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

timezone <TIMEZONE>

Parameters

- timezone <TIMEZONE>

Examples

rfs7000-37FABE(config-rf-domain-default)#timezone America/Los_Angeles

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
  timezone America/Los_Angeles
  stats update-interval 200
  country-code us
  sensor-server 2 ip 172.16.10.3
  override-smartrf channel-list 2.4GHz 1,2,3
  override-wlan test vlan-pool 2 limit 20
  layout area Ecospace floor Floor1 map-location www.firstfloor.com units meters
rfs7000-37FABE(config-rf-domain-default)#

The built-in WiNG timezones are:

nx9500-6C8809(config-rf-domain-test)#timezone <TAB>
Africa/  Asia/  Atlantic/  Australia/  CET  CST6CDT
EET  EST5EDT  Etc/  Europe/  MST7MDT  Pacific/
PST8PDT  US/  America/
nx9500-6C8809(config-rf-domain-test)#

Each of these time zones are further differentiated into sub time zones. For example, as shown in the following example:

nx9500-6C8809(config-rf-domain-test)#timezone Africa/
Africa/Cairo  Africa/Casablanca  Africa/Harare
Africa/Johannesburg  Africa/Lagos  Africa/Nairobi
nx9500-6C8809(config-rf-domain-test)#

Related Commands

no  Removes a RF Domain’s time zone
4.1.76.2.18 tree-node

rf-domain-mode commands

Configures the hierarchical (tree-node) structure under which this RF Domain is located

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

tree-node [campus|city|country|region] {(campus|city|country|region)}

Parameters
- tree-node [campus|city|country|region] {(campus|city|country|region)}

<table>
<thead>
<tr>
<th>tree-node</th>
<th>Configures the hierarchical tree structure defining the RF Domain's location. The tree node hierarchy can be configured in any order, but will always appear as: country &gt; region &gt; city &gt; campus. Further, a higher node, such as country, cannot be defined under a lower node, such as region. An RF Domain can be placed under any one of the tree nodes. But, an RF Domain at the country level may have all four nodes defined. Whereas, an RF Domain restricted to a campus, cannot have the country, city, and region nodes. Note: At least one of these four nodes must be defined. This feature is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>campus</td>
<td>Configures the campus name for this RF Domain</td>
</tr>
<tr>
<td>city</td>
<td>Configures the city for this RF Domain</td>
</tr>
<tr>
<td>country</td>
<td>Configures the country for this RF Domain</td>
</tr>
<tr>
<td>region</td>
<td>Configures the region for this RF Domain</td>
</tr>
</tbody>
</table>

Usage Guidelines

The following points need to be taken into consideration when creating the tree-node structure:
- Adding a country first is a good idea since region, city, and campus can all be added as sub-nodes in the tree structure. However, the selected country is an invalid tree node until a RF Domain is mapped.
- A city and campus can be added in the tree structure as sub-nodes under a region. An RF Domain can be mapped anywhere down the hierarchy for a region and not just directly under a country. For example, a region can have city, campus, and one RF Domain mapped.
- Only a campus can be added as a sub-node under a city. The city is an invalid tree node until a RF Domain is mapped somewhere within the directory tree.
- A campus is the last node in the hierarchy before a RF Domain, and it is not valid unless it has a RF Domain mapped.
- After creating the tree structure do a commit and save for the tree configuration to take effect and persist across reboots.
Examples
rfs4000-229D58(config-rf-domain-test)#tree-node campus EcoSpace City Bangalore country India region South

</tr>
</tbody>
</table>
### smart-rf-policy
**<SMART-RF-POLICY-NAME>**
Associates a Smart RF policy. When associated, the Smart RF policy provides automatic recovery from coverage loss (due to failed or faulty radio) by instructing neighboring access points to increase their transmit power.
Once correct access point placement has been established, Smart-RF can optionally be leveraged for automatic detector radio selection. Smart-RF uses detector radios to monitor RF events to ensure availability of adequate detector coverage.
- **<SMART-RF-POLICY-NAME>** – Specify the Smart RF policy name (should be existing and configured). For more information on configuring smart RF policy, see SMART-RF-POLICY.

### wips-policy
**<WIPS-POLICY-NAME>**
Associates a WIPS policy. A WIPS policy provides protection against wireless threats and acts as a key layer of security complementing wireless VPNs, encryption and authentication. A WIPS policy uses a dedicated sensor for actively detecting and locating rogue AP devices. After detection, WIPS uses mitigation techniques to block the devices by manual termination, air lockdown, or port suppression.
- **<WIPS-POLICY-NAME>** – Specify the WIPS policy name (should be existing and configured). For more information on configuring WIPS policy, see WIPS-POLICY.

### Examples
```
rfs7000-37FABE(config-rf-domain-default)#use smart-rf-policy Smart-RF1
rfs7000-37FABE(config-rf-domain-default)#use wips-policy WIPS1

rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
timezone America/Los_Angeles
stats update-interval 200
country-code us
  use smart-rf-policy Smart-RF1
  use wips-policy WIPS1
  sensor-server 2 ip 172.16.10.3

- **wips-policy** – Configures a WIPS policy
- **smart-rf-policy** – Configures a Smart RF policy
4.1.77 rfs6000

**Global Configuration Commands**

Adds a RFS6000 wireless controller to the network

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

rfs6000 <DEVICE-RFS6000-MAC>

**Parameters**

- rfs6000 <DEVICE-RFS6000-MAC>

| <DEVICE-RFS6000-MAC> | Specify the RFS6000's MAC address. |

**Examples**

rfs7000-37FABE(config)#rfs6000 11-20-30-40-50-61
rfs7000-37FABE(config-device-11-20-30-40-50-61)#

**Related Commands**

- **no**
  
  Removes a RFS6000 wireless controller from the network
4.1.78 rfs7000

Global Configuration Commands

Adds a RFS7000 wireless controller to the network

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

rfs7000 <DEVICE-RFS7000-MAC>

Parameters

- rfs7000 <DEVICE-RFS7000-MAC>

| <DEVICE-RFS7000-MAC> | Specify the RFS7000’s MAC address. |

Examples

rfs7000-37FABE(config)#rfs7000 12-20-30-40-50-62
rfs7000-37FABE(config-device-12-20-30-40-50-62)#

Related Commands

- no
  - Removes a RFS7000 wireless controller from the network
4.1.79 nx45xx

*Global Configuration Commands*

Adds an integrated NX45XX series service platform to the network. If a profile for service platform is not available, a new profile is created.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

---

**NOTE:** In this guide, NX4500 and NX4524 are collectively represented as a NX45XX series service platform.

**Syntax**

nx45xx <DEVICE-NX45XX-MAC>

**Parameters**

- nx45xx <DEVICE-NX45XX-MAC>

  | <DEVICE-NX45XX-MAC> | Specifies the MAC address of a NX45XX series service platform. |

**Examples**

nx9500-6C8809(config)#nx45xx B4-C7-99-5C-FA-8E
nx9500-6C8809(config-device-B4-C7-99-5C-FA-8E)#

**Related Commands**

- no | Removes a NX45XX series service platform from the network |
4.1.80 rfs4000

Global Configuration Commands

Adds an RFS4000 wireless controller to the network

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

rfs4000 <DEVICE-RFS4000-MAC>

Parameters

- rfs4000 <DEVICE-RFS4000-MAC>

<table>
<thead>
<tr>
<th>&lt;DEVICE-RFS4000-MAC&gt;</th>
<th>Specify the RFS4000’s MAC address.</th>
</tr>
</thead>
</table>

Examples

rfs7000-37FABE(config)#rfs4000 10-20-30-40-50-60
rfs7000-37FABE(config-device-10-20-30-40-50-60)#

Related Commands

- no
  Removes an RFS4000 wireless controller from the network
### 4.1.81 nx5500

**Global Configuration Commands**

Adds an integrated NX5500 series service platform to the network. If a profile for this service platform is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
nx5500 <DEVICE-NX5500-MAC>
```

**Parameters**

- `nx5500 <DEVICE-NX5500-MAC>`

<table>
<thead>
<tr>
<th>&lt;DEVICE-NX5500-MAC&gt;</th>
<th>Specifies the MAC address of a NX5500 series service platform.</th>
</tr>
</thead>
</table>

**Examples**

```
nx9500-6C8809(config)#nx5500 B4-C7-02-3C-FA-6E
nx9500-6C8809(config-device-B4-C7-02-3C-FA-6E)#
```

**Related Commands**

- `no` | Removes a NX5500 series service platform from the network |
4.1.82 nx65xx

**Global Configuration Commands**

Adds an integrated NX65XX series service platform to the network. If a profile for service platform is not available, a new profile is created.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

---

**NOTE:** In this guide, NX6500 and NX6524 are collectively represented as a NX65XX series service platform.

---

### Syntax

nx65xx <DEVICE-NX65XX-MAC>

### Parameters

- nx65xx <DEVICE-NX65XX-MAC>

### Examples

nx9500-6C8809(config)#nx65xx 00-15-70-88-9E-C4

nx9500-6C8809(config-device-00-15-70-88-9E-C4)#

### Related Commands

**no** | Removes a NX65XX series service platform from the network
4.1.83 nx75xx

Global Configuration Commands

Adds an integrated NX75XX series service platform to the network. If a profile for service platform is not available, a new profile is created.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

NOTE: In this guide, NX7500, NX7510, NX7520, and NX7530 are collectively represented as a NX75XX series service platform.

Syntax

```
nx75xx <DEVICE-NX75XX-MAC>
```

Parameters

- `nx75xx <DEVICE-NX75XX-MAC>`

Examples

```
nx9500-6C8809(config)#nx75xx B4-C9-81-6C-FA-7C
nx9500-6C8809(config-device-B4-C9-81-6C-FA-7C)#show context
nx75xx B4-C9-81-6C-FA-7C
  use profile default-nx75xx

4.1.85 roaming-assist-policy

**Global Configuration Commands**

Configures a roaming assist policy that enables access points to assist wireless clients in making roaming decisions, such as which access point to connect, etc.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

roaming-assist-policy <POLICY-NAME>

**Parameters**

- roaming-assist-policy <POLICY-NAME>

<table>
<thead>
<tr>
<th>&lt;POLICY-NAME&gt;</th>
<th>Specify the roaming assist policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
</table>

**Examples**

rfs7000-37FABE(config)#roaming-assist-policy testPolicy
rfs7000-37FABE(config-roaming-assist-policy-testPolicy)#?

Roaming Assist Mode commands:

- **action** Configure action - action is either to log / deauth
- **aggressiveness** Configure the roaming aggressiveness for a wireless client
- **detection-threshold** Configure the detection threshold - when exceeded, client monitoring starts
- **disassoc-time** Configure the disassociation time - time after which a disassociation is sent
- **handoff-count** Configure the handoff count - number of times client can exceed handoff threshold
- **handoff-threshold** Configure the handoff threshold - when exceeds an action is taken.
- **monitoring-interval** Configure the monitoring interval - interval at which client monitoring occurs
- **no** Negate a command or set its defaults
- **sampling-interval** Configure the sampling interval - interval at which client rssi values are checked
- **clrscr** Clears the display screen
- **commit** Commit all changes made in this session
- **end** End current mode and change to EXEC mode
- **exit** End current mode and down to previous mode
- **help** Description of the interactive help system
- **revert** Revert changes
- **service** Service Commands
- **show** Show running system information
- **write** Write running configuration to memory or terminal

rfs7000-37FABE(config-roaming-assist-policy-testPolicy)#

**Related Commands**

</tr>
</thead>
</table>

**NOTE:** For more information on roaming assist policy commands, see *Chapter 30, ROAMING ASSIST POLICY.*
4.1.86 role-policy

Configure a role-based firewall policy

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
role-policy <ROLE-POLICY-NAME>

Parameters
- role-policy <ROLE-POLICY-NAME>

Examples
rfs7000-37FABE(config)#role-policy role1
rfs7000-37FABE(config-role-policy-role1)#?
Role Policy Mode commands:
  default-role     Configuration for Wireless Clients not matching any role
  ldap-deadperiod Ldap dead period interval
  ldap-query      Set the ldap query mode
  ldap-server     Add a ldap server
  ldap-timeout    Ldap query timeout interval
  no              Negate a command or set its defaults
  user-role       Create a role
  clrscr          Clears the display screen
  commit          Commit all changes made in this session
  do              Run commands from Exec mode
  end             End current mode and change to EXEC mode
  exit            End current mode and down to previous mode
  help            Description of the interactive help system
  revert          Revert changes
  service         Service Commands
  show            Show running system information
  write           Write running configuration to memory or terminal
rfs7000-37FABE(config-role-policy-role1)#

Related Commands

no

Removes an existing role policy

NOTE: For more information on role policy commands, see Chapter 18, ROLE-POLICY.
4.1.87 route-map

Global Configuration Commands

Creates a dynamic BGP route map and enters its configuration mode

BGP route maps are used by network administrators to define rules controlling redistribution of routes between routers and routing processes. These route maps are also used to control and modify routing information.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax

route-map <ROUTE-MAP-NAME>

Parameters

- route-map <ROUTE-MAP-NAME>

Examples

nx9500-6C8809(config)#route-map test

nx9500-6C8809(config-dr-route-map-test)#?

Route Map Mode commands:
- deny Add a deny route map rule to deny set operations
- no Negate a command or set its defaults
- permit Add a permit route map rule to permit set operations
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

Related Commands

no Removes an existing dynamic BGP route map

NOTE: For more information on BGP route maps, see Chapter 28, BORDER GATEWAY PROTOCOL.
4.1.88 routing-policy

Global Configuration Commands

Configures a routing policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

routing-policy <ROUTING-POLICY-NAME>

Parameters

- routing-policy <ROUTING-POLICY-NAME>

Examples

rfs7000-37FABE(config)#routing-policy TestRoutingPolicy
rfs7000-37FABE(config-routing-policy-TestRoutingPolicy)#

Routing Policy Mode commands:

- apply-to-local-packets: Use Policy Based Routing for packets generated by the device
- logging: Enable logging for this Route Map
- no: Negate a command or set its defaults
- route-map: Create a Route Map
- use: Set setting to use
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

rfs7000-37FABE(config-routing-policy-TestRoutingPolicy)#

Related Commands

- no
  - Removes an existing routing policy

NOTE: For more information on routing policy commands, see Chapter 24, ROUTING-POLICY.
4.1.89 rtl-server-policy

The following table lists the Real Time Locationing (RTL) server policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>rtl-server-policy</td>
<td>Configures an RTL server policy and enters its configuration mode</td>
<td>page 4-375</td>
</tr>
<tr>
<td>rtl-server-policy-mode</td>
<td>Summarizes RTL server policy configuration mode commands</td>
<td>page 4-376</td>
</tr>
</tbody>
</table>
4.1.89.1 rtl-server-policy

**rtl-server-policy**

Creates an RTL server policy and enters its configuration mode. When configured and applied on an access point (AP7522, AP7532, AP8432, AP8533), this policy enables the sending of RSSI feeds from the access point to a third-party Euclid server. The RTL server policy provides the exact location (URL) of the Euclid server. The RSSI feeds sent are as per the sensor-policy configured and applied on the access point. Therefore, ensure that a sensor-policy, with the `rssi-interval-duration` specified, is existing, configured, and applied on the access points.

To initiate RSSI feed posts to the Euclid locationing server, use the RTL server policy on the:

- AP’s device/profile context, or
- AP’s RF Domain context.

Supported in the following platforms:

- Access Points — AP7522, AP7532, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

```
rtl-server-policy <RTL-POLICY-NAME>
```

**Parameters**

- `rtl-server-policy <RTL-POLICY-NAME>`

**Examples**

```
nx9500-6C8809(config)#rtl-server-policy test
nx9500-6C8809(config-rtl-server-policy-test)#?
```

RTL Server Policy Mode commands:

- `no` Negate a command or set its defaults
- `url` Configure the url to send the real time RSSI feed to
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
nx9500-6C8809(config-rtl-server-policy-test)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Removes an existing RTL server policy</td>
</tr>
<tr>
<td><code>use</code> (profile/device configuration mode command)</td>
<td>Documents the ‘use’ command in a device’s profile or device configuration context. Use this option to associate this RTL server policy to an access point’s profile or device.</td>
</tr>
<tr>
<td><code>use</code> (RF Domain configuration mode command)</td>
<td>Documents the ‘use’ command in the RF Domain configuration context. Use this option to associate this RTL server policy to an RF Domain. When associated, the policy is applied to all access points within the RF Domain.</td>
</tr>
</tbody>
</table>
### 4.1.89.2 rtl-server-policy-mode commands

The following table summarizes the RTL server policy configuration mode commands:

**Table 4.42** RTL-Server-Policy Mode Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Configures the third-party Euclid RTL server’s URL</td>
<td>page 4-377</td>
</tr>
<tr>
<td>no</td>
<td>Removes the Euclid RTL server’s URL configuration</td>
<td>page 4-378</td>
</tr>
</tbody>
</table>
4.1.89.2.1 url

rtl-server-policy-mode commands

Configures the third-party Euclid RTL server’s exact location. This is the URL at which the server can be reached.

Supported in the following platforms:
- Access Points — AP7522, AP7532, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax
url <URL>

Parameters
- url <URL>

<table>
<thead>
<tr>
<th>url &lt;URL&gt;</th>
<th>Configures the Euclid server’s URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;URL&gt;</td>
<td>- &lt;URL&gt; – Specify the URL.</td>
</tr>
</tbody>
</table>

Examples
nx9500-6C8809(config-rtl-server-policy-test)#url https://testrtlsever.com

nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
  url https://testrtlsever.com

nx9500-6C8809(config-rtl-server-policy-test)#

Related Commands
no
  Removes the Euclid server’s configured URL
4.1.89.2.2  no

4 rtl-server-policy-mode commands

Removes the Euclid locationing server’s URL configuration

Supported in the following platforms:
- Access Points — AP7522, AP7532, AP8432, AP8533
- Wireless Controllers — RFS4000
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax
no url

Parameters
- no url

| no url | Removes the Euclid server's URL |

Examples
The following example displays the RTL server policy ‘test’ settings before the ‘no’ command is executed:

nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
  url https://testrtlserver.com
nx9500-6C8809(config-rtl-server-policy-test)#

The following example displays the RTL server policy ‘test’ settings after the ‘no’ command is executed:

nx9500-6C8809(config-rtl-server-policy-test)#show context
rtl-server-policy test
nx9500-6C8809(config-rtl-server-policy-test)#
4.1.90 schedule-policy

The following table summarizes the config schedule policy commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule-policy</td>
<td>Creates a schedule policy and enters its configuration mode</td>
<td>page 4-380</td>
</tr>
<tr>
<td>schedule-policy-mode</td>
<td>Lists schedule policy configuration mode commands</td>
<td>page 4-381</td>
</tr>

4.1.90.1 schedule-policy

*schedule-policy*

Creates a schedule policy and enters its configuration mode. A schedule policy strategically enforces application filter policy rules during administrator assigned intervals.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
schedule-policy <SCHEDULE-POLICY-NAME>
```

**Parameters**

- `schedule-policy <SCHEDULE-POLICY-NAME>`

**Examples**

```
nx9500-6C8809(config)#schedule-policy test
nx9500-6C8809(config-schedule-policy-test)#?
```

Schedule Policy Mode commands:

- `description` Schedule policy description
- `no` Negate a command or set its defaults
- `time-rule` Configure a time rule
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
nx9500-6C8809(config-schedule-policy-test)#
```

</tbody>
</table>
4.1.90.2.1 description

* schedule-policy-mode commands

Configures a description for this schedule policy that differentiates it from other policies with similar time rule configurations.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

description <WORD>

**Parameters**
- description <WORD>

<table>
<thead>
<tr>
<th>command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description &lt;WORD&gt;</td>
<td>Configures this schedule policy’s description</td>
</tr>
<tr>
<td>&lt;WORD&gt;</td>
<td>&lt;WORD&gt; – Enter a description not exceeding 80 characters in length. The description should uniquely identify the policy from other policies with similar configuration.</td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C8809(config-schedule-policy-test)#description "Denies social networking sites on weekdays."

nx9500-6C8809(config-schedule-policy-test)#show context schedule-policy test
description "Denies social networking sites on weekdays."

4.1.90.2.2 time-rule

Configures a time rule specifying the days and optionally the start and end times. When applied to an application-policy rule, the schedule policy defines the enforcement time of the rule. For more information, see application-policy.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
time-rule days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start-time <HH:MM> [end-time <HH:MM>]}
```

Parameters

<table>
<thead>
<tr>
<th>days</th>
<th>Specifies the days on which the time rule is applicable</th>
</tr>
</thead>
<tbody>
<tr>
<td>[sunday</td>
<td>monday</td>
</tr>
<tr>
<td></td>
<td>• monday – Applicable on Mondays only</td>
</tr>
<tr>
<td></td>
<td>• tuesday – Applicable on Tuesdays only</td>
</tr>
<tr>
<td></td>
<td>• wednesday – Applicable on Wednesdays only</td>
</tr>
<tr>
<td></td>
<td>• thursday – Applicable on Thursdays only</td>
</tr>
<tr>
<td></td>
<td>• friday – Applicable on Fridays only</td>
</tr>
<tr>
<td></td>
<td>• saturday – Applicable on Saturdays only</td>
</tr>
<tr>

<tr>
<td></td>
<td>• weekdays – Applicable on weekdays only</td>
</tr>
<tr>
<td></td>
<td>• all – Applicable on all days</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>start-time <a href="">HH:MM</a> [end-time <a href="">HH:MM</a>]</th>
<th>After specifying the days of enforcement, specify the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• start-time – Optional. Specifies the enforcement start time</td>
</tr>
<tr>
<td></td>
<td>• <a href="">HH:MM</a> – Specify the start time in hours and minutes in the HH:MM format.</td>
</tr>
<tr>
<td></td>
<td>If no start time is specified, the time rule is enforced, on the specified days, at all time.</td>
</tr>
<tr>
<td></td>
<td>• end-time – Specifies the enforcement end time</td>
</tr>
<tr>
<td></td>
<td>• <a href="">HH:MM</a> – Specify the time in hours and minutes in the HH:MM format.</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809(config-schedule-policy-test)#time-rule days weekdays start-time 10:00 end-time 23:30
```

```
nx9500-6C8809(config-schedule-policy-test)#show context
```

description "Denies social networking sites on weekdays."

time-rule days weekdays start-time 10:00 end-time 23:30

```
nx9500-6C8809(config-schedule-policy-test)#
```

Related Commands

| no | Removes the time-rule from the schedule policy |
4.1.90.2.3 no

*schedule-policy-mode commands*

Removes the selected schedule policy’s settings

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

no [description|time-rule]

no description

no time-rule days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays]

**Parameters**

- no <PARAMETERS>

  
  no <PARAMETERS> Removes the schedule policy’s settings based on the parameters passed

**Examples**

The following example displays the schedule policy ‘test’ settings before the ‘no’ commands have been executed:

nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
description "Denies social networking sites on weekdays."
time-rule days weekdays start-time 10:00 end-time 23:30
nx9500-6C8809(config-schedule-policy-test)#

The following example displays the schedule policy ‘test’ settings after the ‘no’ commands have been executed:

nx9500-6C8809(config-schedule-policy-test)#no description
nx9500-6C8809(config-schedule-policy-test)#no time-rule days weekdays

nx9500-6C8809(config-schedule-policy-test)#show context
schedule-policy test
nx9500-6C8809(config-schedule-policy-test)#
4.1.91 **self**

> **Global Configuration Commands**

Displays the logged device’s configuration context

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
self
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config)#self
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#
```
4.1.92 sensor-policy

*Global Configuration Commands*

The following table summarizes the config sensor policy commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensor-policy</td>
<td>Creates a sensor policy and enters its configuration mode</td>

</tr>
</tbody>
</table>
### 4.1.92.1 sensor-policy

A sensor policy is created and enters its configuration mode. When created and used on WiNG devices, this policy enables controllers and access points to function as sensors. Within the MPact architecture, these sensors scan for RSSI data at specified intervals, and forward the gathered RSSI data to a dedicated MPact server. The MPact server calculates the location of Wi-Fi devices on the basis of the data received.

Use this command to configure a policy defining the mode of scanning, the channels to scan (in case scan-mode is set to custom-scan), and the RSSI interval. For the sensor policy to take effect, use the policy either in the access point's RF Domain context or in the access point's device context.

**Syntax**

```plaintext
sensor-policy <SENSOR-POLICY-NAME>
```

**Parameters**

- `sensor-policy <SENSOR-POLICY-NAME>`

**Usage Guidelines**

Access point radios, functioning as sensors, along with AirDefense WIPS servers protect networks from attacks and unauthorized access. These access point sensors scan legal channels and (based on a WIPS policy settings) identify events potential threats to the managed network. These events are reported to the AirDefense WIPS server, which determines the action taken.

In addition to WIPS support, sensor functionality has now been added for Zebra’s MPact locationing system. The MPact system for Wi-Fi locationing includes WiNG controllers and access points functioning as sensors. Within the MPact architecture, sensors scan for RSSI data on an administrator-defined interval and send to a dedicated MPact server resource, as opposed to an ADSP server. The MPact server collects the RSSI data from WiNG sensor devices, and calculates the location of Wi-Fi devices. With the introduction of the MPact platform, the data collected by access point radios, functioning as sensors, is also used by the MPact server to provide real-time locationing services.
Examples
nx9500-6C8809(config)#sensor-policy test
nx9500-6C8809(config-sensor-policy-test)#?

Sensor Policy Mode commands:
- custom-scan: Channel configuration in Custom Scan channels
- no: Negate a command or set its defaults
- rssi-interval-duration: Configure the periodicity of sending RSSI info from sensor to server
- scan-mode: Configure the Scan mode
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

Related Commands

no | Removes an existing sensor policy
4.1.92.2 sensor-policy-mode commands

</tr>
<tr>
<td>no</td>
<td>Removes or reverts to default a sensor policy’s settings</td>
<td>page 4-394</td>
</tr>
</tbody>
</table>
### 4.1.92.2.1 custom-scan

#### sensor-policy-mode commands

Configures the channel scanning settings when the `scan-mode` is set to `custom-scan`

#### NOTE:
If the mode of scanning is set to Custom-Scan, use this command to configure the channels to be scanned. To set the mode of scanning to custom-scan, use the `scan-mode > Custom-Scan` command. For more information, see `scan-mode`.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
custom-scan channel-frequency <CHANNEL-FREQUENCY> width [20MHz|40MHz-Both|40MHz-Lower|40MHz-Upper|80MHz] scan-weight <SCAN-WEIGHT>
```

#### Parameters
- `custom-scan channel-frequency <CHANNEL-FREQUENCY> width [20MHz|40MHz-Both|40MHz-Lower|40MHz-Upper|80MHz] scan-weight <SCAN-WEIGHT>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel-frequency</td>
<td>Configures the custom-scan channel frequency, channel width, and scan weight</td>
</tr>
</tbody>
</table>
| <CHANNEL-FREQUENCY> | Specifies the channel frequency. A list of unique channels in the 2.4, 4.9, 5 and 6 GHz band can be collectively or individually enabled for customized channel scans and RSSI reporting.  
  - `<CHANNEL-FREQUENCY>` – Specify a single or multiple, ‘comma-separated’ channel frequencies. |
| width [20MHz|40MHz-Both|40MHz-Lower|40MHz-Upper|80MHz] | Configures the channel width. When custom channels are selected for RSSI scans, each selected channel can have its own width defined. Numerous channels have their width fixed at 20MHz, 802.11a radios support 20 and 40 MHz channel widths.  
  - 20MHz – Selects the channel width as 20 Mhz  
  - 40Mhz-Both – Selects the channel width as 40Mhz-Both  
  - 40Mhz-Lowr – Selects the channel width as 40Mhz-Lower  
  - 40Mhz-Upper – Selects the channel width as 40Mhz-Upper  
  - 80Mhz – Selects the channel width as 80Mhz |
| scan-weight <SCAN-WEIGHT> | Configures the scan-weight (scanning duration) for each of the selected channels. Each selected channel can have its weight prioritized in respect to the amount of time a scan is permitted within the defined RSSI scan interval.  
  - `<SCAN-WEIGHT>` – Specify the scan weightage given to each selected channel. |

#### Examples

```
nx9500-6C8809(config-sensor-policy-test)#custom-scan channel-frequency 2412 width 20MHz scan-weight 1000

nx9500-6C8809(config-sensor-policy-test)#custom-scan channel-frequency 2417 width 20MHz scan-weight 1000

nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
  scan-mode Custom-Scan
  custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
  custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
  nx9500-6C8809(config-sensor-policy-test)#
```
Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Removes channels from the channels-to-scan list in case of scan-mode being set to Custom-Scan</td>
</tr>
</tbody>
</table>
### 4.1.92.2.2 rssi-interval-duration

**sensor-policy-mode commands**

Configures the interval, in seconds, at which dedicated sensors (access point radios) scan channels for RSSI (signal strength) assessments and send the RSSI data obtained to a specified MPact server resource.

Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`rssi-interval-duration <1-60>`

**Parameters**

- `rssi-interval-duration <1-60>`

| rssi-interval-duration <1-60> | Configures the RSSI interval duration in seconds. This is the interval at which the sensor scans channels for RSSI data and forwards the data to a MPact server resource. The MPact server calculates real-time locations of Wi-Fi devices based on this data.
|                            | - `<1-60>` – Specify the RSSI interval duration from 1 - 60 seconds. The default is 1 second.
|                            | **Note:** The channels scanned for RSSI assessment depends on the scan-mode selected. For more information, see `scan-mode` and `custom-scan`.
|                            | Ensure that the MPact server’s IP address or hostname has been configured in the access point sensor’s RF Domain context. The sensor sends only the locationing related data to the MPact server. |

#### Examples

```plaintext
nx9500-6C8809(config-sensor-policy-test)#rssi-interval-duration 30
nx9500-6C8809(config-sensor-policy-test)#show context sensor-policy test
  rssi-interval-duration 30
  scan-mode Custom-Scan
  custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
  custom-scan channel-frequency 2417 width 20MHz scan-weight 1000
nx9500-6C8809(config-sensor-policy-test)#
```

**Related Commands**

| **no** | Resets the interval at which RSSI data is collected and sent by the sensor to the MPact server host to default (1 second) |
### 4.1.92.2.3 scan-mode

**sensor-policy-mode commands**

Configures the mode of scanning used by dedicated sensors (access point radios).

Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
scan-mode [Channel-Lock|Custom-Scan|Default-Scan]
scan-mode Channel-Lock lock-frequency <LOCK-FREQUENCY>
scan-mode [Custom-Scan|Default-Scan]
```

**Parameters**

- **scan-mode Channel-Lock lock-frequency <LOCK-FREQUENCY>**
  - Configures the mode of scanning as Channel-Lock
  - lock-frequency <LOCK-FREQUENCY> — Locks scanning for RSSI data to one specific channel identified by the <LOCK-FREQUENCY> parameter. When specified, the existing channel, channel width, and scan weight table items are replaced by channel specified here.
  - <LOCK-FREQUENCY> — Specify the channel frequency. When specified, the existing channel, channel width, and scan weight table items are replaced by channel specified here. The sensor scans only this specified channel.

- **scan-mode [Custom-Scan|Default-Scan]**

**Examples**

```
nx9500-6C8809(config-sensor-policy-test)#scan-mode Custom-Scan

nx9500-6C8809(config-sensor-policy-test)#show context sensor-policy test
  rssi-interval-duration 30
  scan-mode Custom-Scan
  custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
  custom-scan channel-frequency 2417 width 20MHz scan-weight 1000

nx9500-6C8809(config-sensor-policy-test)#
```

**Related Commands**

- **no** Reverts the scan-mode to default (Default-Scan)
4.1.92.2.4 no

sensor-policy-mode commands

Removes or reverts to default a sensor policy’s settings

Supported in the following platforms:
  • Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [custom-scan|rss1-interval-duration|scan-mode]

no custom-scan channel-frequency <CHANNEL-FREQUENCY-LIST>

no rssi-interval-duration

no scan-mode

Parameters

• no <PARAMETERS>

no <PARAMETERS> Removes or reverts to default a sensor policy settings based on the parameters passed

Examples

The following example shows the sensor-policy 'test' settings before the 'no' commands are executed:

nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
  rssi-interval-duration 30
  scan-mode Custom-Scan
  custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
  custom-scan channel-frequency 2417 width 20MHz scan-weight 1000

The scan-mode is reverted back to the default setting of 'Default-Scan', as show in the following output:

nx9500-6C8809(config-sensor-policy-test)#no scan-mode
nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
  rssi-interval-duration 30
  scan-mode Default-Scan
  custom-scan channel-frequency 2412 width 20MHz scan-weight 1000
  custom-scan channel-frequency 2417 width 20MHz scan-weight 1000

nx9500-6C8809(config-sensor-policy-test)#no custom-scan channel-frequency 2412

nx9500-6C8809(config-sensor-policy-test)#no custom-scan channel-frequency 2417

nx9500-6C8809(config-sensor-policy-test)#no context

nx9500-6C8809(config-sensor-policy-test)#show context
sensor-policy test
  rssi-interval-duration 30
  scan-mode Default-Scan

nx9500-6C8809(config-sensor-policy-test)#
4.1.93 smart-rf-policy

Global Configuration Commands

Configures a Smart RF policy

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
smart-rf-policy <SMART-RF-POLICY-NAME>

Parameters
- smart-rf-policy <SMART-RF-POLICY-NAME>

Examples
rfs7000-37FABE(config)#smart-rf-policy test
rfs7000-37FABE(config-smart-rf-policy-test)##

Smart RF Mode commands:
- area Specify channel list/ power for an area
- assignable-power Specify the assignable power during power-assignment
- avoidance-time Time to avoid a channel once dfs/adaptivity avoidance is necessary
- channel-list Select channel list for smart-rf
- channel-width Select channel width for smart-rf
- coverage-hole-recovery Recover from coverage hole
- enable Enable this smart-rf policy
- group-by Configure grouping parameters
- interference-recovery Recover issues due to excessive noise and interference
- neighbor-recovery Recover issues due to faulty neighbor radios
- no Negate a command or set its defaults
- sensitivity Configure smart-rf sensitivity (Modifies various other smart-rf configuration items)
- smart-ocs-monitoring Smart off channel scanning
- clrscr Clears the display screen
- commit Commit all changes made in this session
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or term

rfs7000-37FABE(config-smart-rf-policy-test)##

Related Commands

| no | Removes an existing Smart RF policy |

**NOTE:** For more information on Smart RF policy commands, see Chapter 19, SMART-RF-POLICY.
4.1.94 t5

**Global Configuration Commands**

Invokes the configuration mode of a t5 wireless controller

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices.

Supported in the following platforms:

- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

t5 <T5-DEVICE-MAC>

**Parameters**

- t5 <T5-DEVICE-MAC>

<table>
<thead>
<tr>
<th>t5 &lt;T5-DEVICE-MAC&gt;</th>
<th>Specify the t5 device’s MAC address. The system enters the identified device’s configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The Customer Premises Equipment (CPEs) are the T5 controller managed radio devices using the IPX operating system. These CPEs use a Digital Subscriber Line (DSL) as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack. <strong>Note:</strong> After logging on to the T5 device, use the ‘cpe’ keyword and configure the following mandatory settings:</td>
</tr>
<tr>
<td></td>
<td>• vlan – Set a VLAN from 1 - 4,094 used as a virtual interface for connections between the T5 controller and its managed CPE devices.</td>
</tr>
<tr>
<td></td>
<td>• start ip – Set a starting IP address used in a range of addresses available to T5 controller connecting CPE devices.</td>
</tr>
<tr>
<td></td>
<td>• end ip – Set an end IP address used in a range of addresses available to T5 controller connecting CPE devices.</td>
</tr>
</tbody>

**Examples**

rfs7000-37FABE(config)#t5 B4:C7:99:ED:5C:2C
rfs7000-37FABE(config-device-B4:C7:99:ED:5C:2C)#?

T5 Device Mode commands:

- adsp-sensor-server Configure WIPS server
- bridge Sets MAC address expiration time in the bridge address table
- clock Configure clock options
- cpe T5 CPE configuration
- hostname Set system’s network name
- interface Select an interface to configure
- ip Internet Protocol (IP)
- no Negate a command or set its defaults
- ntp Configure NTP
- override-wlan Configure RF Domain level overrides for wlan
- password T5 password configuration
- qos QoS settings
- radius-server Radius server settings
- t5 T5 configuration
- t5-logging Modify message logging facilities

</tr>
</tbody>
</table>
4.1.95.1 web-filter-policy

web-filter-policy

Creates a Web Filtering policy and enters its configuration mode. This policy defines rules managing the local classification database and the cached data. When configured and applied, this policy also enables caching of URL classification records in a local database in a controller-based, hierarchically managed (HM) deployment. Use this option to specify the following: classification server details, size of the local database, time for which records are cached in the database, the action taken in case the classification server is unavailable, etc.

The Web filter policy is applied at the profile or device level.

For more information on URL filtering, see url-filter.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

web-filter-policy <WEB-FILTER-POLICY-NAME>

Parameters

- <WEB-FILTER-POLICY-NAME>

Specify the Web filter policy name. If the policy does not exist, it is created.

Examples

nx4500-5CFA2B(config)#web-filter-policy test
nx4500-5CFA2B(config-web-filter-policy-test)#?

Content Filter Mode commands:

- cache-max-recs: Configure the maximum number of records in local cache
- cache-save-interval: Configure the time a record is saved in local cache
- logging: Select logging method
- no: Negate a command or set its defaults
- server-host: Configure URL classification server if it is not the adopted controller
- server-unreachable: Permission to access website when classification server is unreachable (default is pass)
- uncategorized-url: Permission to website when server fails to classify the URL request (default is pass)
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

Related Commands

| no | Removes an existing Web filter policy |

</tbody>
</table>
4.95.2.1 cache-max-recs

**web-filter-policy-config-mode commands**

Configures the maximum number of records (URL and Web page classification entries) cached in the local database.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

cache-max-recs <1-1000000>

**Parameters**
- cache-max-recs <1-1000000>

<table>
<thead>
<tr>
<th>cache-max-recs &lt;1-1000000&gt;</th>
<th>Specify the maximum number of records cached in the local database from 1 - 1000000. When configuring this value take into consideration the type of device using the Web Filter policy. The value should approximately be as per the following information:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• NX95XX – &lt;1-1000000&gt; (default is 100000)</td>
</tr>
<tr>
<td></td>
<td>• NX45XX/NX65XX/NX75XX – &lt;1-1000000&gt; (default is 10000)</td>
</tr>
<tr>
<td></td>
<td>• RFS Switches – &lt;1-10000&gt; (default is 1000)</td>
</tr>
<tr>
<td></td>
<td>• Access Points – &lt;1-1500&gt; (default is 500)</td>
</tr>
</tbody>
</table>

**Examples**

nx4500-5CFA2B(config-web-filter-policy-test)#cache-max-recs 9000

nx4500-5CFA2B(config-web-filter-policy-test)#show context web-filter-policy test
cache-max-recs 9000
nx4500-5CFA2B(config-web-filter-policy-test)#

**Related Commands**

| no | Reverts the maximum number of stored records to default. Please see the parameter table for default values for the different device types. |
4.95.2.2 cache-save-interval

Configures the maximum time period, in seconds, for which a record (URL and Web page classification entry) is cached in the local database. Once the specified time has expired the record is removed from the cache.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

\[ \text{cache-save-interval} \ <1-86400> \]

Parameters

\[ \text{cache-save-interval} \ <1-86400> \]

<table>
<thead>
<tr>
<th>cache-save-interval &lt;1-86400&gt;</th>
<th>Specify the maximum time period, in seconds, for which a record is cached in the local database from 1 - 86400 seconds. The default is 60 seconds.</th>
</tr>
</thead>
</table>

Examples

\[
\begin{align*}
nx4500-5CFA2B(config-web-filter-policy-test)# & \text{cache-save-interval} 1000 \\
nx4500-5CFA2B(config-web-filter-policy-test)# & \text{show context} \\
& \text{web-filter-policy test} \\
& \text{cache-max-recs} 9000 \\
& \text{cache-save-interval} 1000 \\
nx4500-5CFA2B(config-web-filter-policy-test)# & \\
\end{align*}
\]

Related Commands

\[ \text{no} \]

Reverts the maximum time period for which a record (URL and Web page classification entry) is cached in the local database to default (60)
4.1.95.2.3 logging

- **web-filter-policy-config-mode commands**

Configures the method used to log Web filtering events

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

`logging [logfile|syslog]`

**Parameters**
- `logging [logfile|syslog]`

| logging [logfile|syslog] | Selects the method used to log Web filtering events. The options are: |
|------------------------|-------------------------------------------------------------------|
|                        | • logfile – Logs to a file.                                       |
|                        | • syslog – Logs to the syslog server. This is the default setting.|

**Examples**

```
nx9500-6C8809(config-web-filter-policy-test)#logging logfile

nx9500-6C8809(config-web-filter-policy-test)#show context
web-filter-policy test
  logging logfile

nx9500-6C8809(config-web-filter-policy-test)#
```
4.1.95.2.4 no

web-filter-policy-config-mode commands

Reverts the selected Web Filter policy settings to default, based on the parameters passed

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

no [cache-max-recs|cache-save-interval|server-host|server-unreachable|uncategorized-url]

Parameters

- no <PARAMETERS>

no <PARAMETERS> Reverts the selected Web Filter policy settings to default, based on the parameters passed. Specify the parameters to revert back to default value.

Examples

The following example shows the Web Filter policy ‘test’ settings before the ‘no’ command is executed:

```
nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
  uncategorized-url block
  server-unreachable block
  server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#
```

```
nx4500-5CFA2B(config-web-filter-policy-test)#no cache-max-recs
nx4500-5CFA2B(config-web-filter-policy-test)#no server-unreachable
nx4500-5CFA2B(config-web-filter-policy-test)#no uncategorized-url
```

The following example shows the Web Filter policy ‘test’ settings after the ‘no’ command has been executed:

```
nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-save-interval 1000
  server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#
```
4.1.95.2.5 server-host

**web-filter-policy-config-mode commands**

Configures the URL classification server in case it is not the adopted controller.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**
```
server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]
```

**Parameters**
- `server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]`

| server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>] | Use one of the following options to identify the URL classification server: |
| --- | --- |
|  | • host-name <SERVER-HOST-NAME> – Identifies the classification server by its hostname. |
|  | • ip-address <SERVER-IPv4> – Identifies the classification server by its IP address. |
|  | • mint-id <SERVER-MiNT-ID> – Identifies the classification server by its MiNT ID. |

**Examples**
```
nx4500-5CFA2B(config-web-filter-policy-test)#server-host ip-address 192.168.13.13
```
```
nx4500-5CFA2B(config-web-filter-policy-test)#show context
```
```
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
  server-host ip-address 192.168.13.13
```
```
nx4500-5CFA2B(config-web-filter-policy-test)#
```

**Related Commands**

| no | Removes the URL classification server’s configured details, such as hostname, ip-address, or MiNT ID. |
4.1.95.2.6 server-unreachable

Configures the action taken in case the classification server is unreachable. Based on the value configured the an end user’s request for a URL/Website is either blocked or passed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax
server-unreachable [block|pass]

Parameters
- server-unreachable [block|pass]

| server-unreachable [block|pass] | Configures the action taken in case the classification server is unreachable. The options are:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>block – Denies access to the requested URL/Website</td>
</tr>
<tr>
<td></td>
<td>pass – Allows access to the requested URL/Website. This is the default value.</td>
</tr>
</tbody>
</table>

Examples
nx4500-5CFA2B(config-web-filter-policy-test)#server-unreachable block

nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
  server-unreachable block
  server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#

Related Commands
- no Reverts the action taken in case the classification server is unreachable to default (pass)
4.1.95.2.7 uncategorized-url

**web-filter-policy-config-mode commands**

Configures the action taken in case the classification server fails to classify a URL/Website. Based on the value configured, the end user's request for a non-classified URL/Website is either blocked or passed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
uncategorized-url [block|pass]
```

**Parameters**

\* uncategorized-url [block|pass]

| uncategorized-url [block|pass] | Configures the action taken in case the classification server fails to classify a URL/Website. The options are: |
|-----------------------------|-------------------------------------------------------------------------------------------------------------|
| block | Denies access to the requested non-classified URL/Website |
| pass | Allows access to the requested non-classified URL/Website. This is the default value. |

**Examples**

```
nx4500-5CFA2B(config-web-filter-policy-test)#uncategorized-url block
```

```
nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
  uncategorized-url block
  server-unreachable block
  server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#
```

**Related Commands**

```
no
```

Reverts the action taken in case the classification server fails to classify a URL/Website to default (pass)
### 4.1.96 wips-policy

**Global Configuration Commands**

Configures a WIPS policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
wips-policy <WIPS-POLICY-NAME>
```

**Parameters**

- `wips-policy <WIPS-POLICY-NAME>`

<table>
<thead>
<tr>
<th><code>&lt;WIPS-POLICY-NAME&gt;</code></th>
<th>Specify the WIPS policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
</table>

**Examples**

```
rfs7000-37FABE(config)#wips-policy test
rfs7000-37FABE(config-wips-policy-test)#?
```

Wips Policy Mode commands:

- `ap-detection` Rogue AP detection
- `enable` Enable this wips policy
- `event` Configure an event
- `history-throttle-duration` Configure the duration for which event duplicates are not stored in history
- `interference-event` Specify events which will contribute to smart-rf wifi interference calculations
- `no` Negate a command or set its defaults
- `signature` Signature to configure
- `use` Set setting to use
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-wips-policy-test)#
```

**Related Commands**

| `no` | Removes an existing WIPS policy |

**NOTE:** For more information on WIPS policy commands, see *Chapter 20, WIPS-POLICY*. 
4.1.97 wlan

Global Configuration Commands

Configures a Wireless Local Area Network (WLAN)

The following table lists WLAN configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan</td>
<td>Creates a new wireless LAN and enters its configuration mode</td>
<td>page 4-410</td>
</tr>
<tr>

<td>page 4-413</td>
</tr>
<tr>
<td>commands</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 4.49 WLAN-Policy Config Commands
4.1.97.1 wlan

Configures a WLAN and enters its configuration mode. Use this command to modify an existing WLAN's settings.

A WLAN is a data-communications system that flexibly extends the functionality of a wired LAN. A WLAN links two or more computers or devices using spread-spectrum or Orthogonal Frequency Division Multiplexing (OFDM) modulation based technology. WLANs do not require lining up devices for line-of-sight transmission, and are thus, desirable for wireless networking. Roaming users can be handed off from one access point to another, like a cellular phone system. WLANs can therefore be configured around the needs of specific user groups, even when they are not in physical proximity.

WLANs can provide an abundance of services, including data communications (allowing mobile devices to access applications), e-mail, file, and print services or even specialty applications (such as guest access control and asset tracking).

Each WLAN configuration contains encryption, authentication and QoS policies and conditions for user connections. Connected access point radios transmit periodic beacons for each BSS. A beacon advertises the SSID, security requirements, supported data rates of the wireless network to enable clients to locate and connect to the WLAN.

WLANs are mapped to radios on each access point. A WLAN can be advertised from a single access point radio or can span multiple access points and radios. WLAN configurations can be defined to provide service to specific areas of a site. For example, a guest access WLAN may only be mapped to a 2.4 GHz radio in a lobby or conference room providing limited coverage, while a data WLAN is mapped to all 2.4 GHz and 5.0 GHz radios at the branch site to provide complete coverage.

The maximum number of WLANs supported by different devices is as follows:
- RFS4000 and RFS6000 wireless controllers – 32 WLANs
- RFS7000 wireless controller – 256 WLANs
- NX4500 and NX6500 series service platforms – 32 WLANs
- NX9000 series service platforms – 1000 WLANs
- Access Points – 16 WLANs

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

wlan {<WLAN-NAME>|containing <WLAN-NAME>}

Parameters

- wlan {<WLAN-NAME>|containing <WLAN-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan &lt;WLAN-NAME&gt;</td>
<td>Configures a new WLAN</td>
</tr>
<tr>
<td></td>
<td>• &lt;WLAN-NAME&gt; – Optional. Specify the WLAN name.</td>
</tr>
<tr>
<td></td>
<td>The WLAN name could be a logical representation of its coverage area (for example, engineering, marketing, etc.). The name cannot exceed 32 characters.</td>
</tr>
<tr>
<td>containing &lt;WLAN-NAME&gt;</td>
<td>Optional. Configures an existing WLAN’s settings</td>
</tr>
<tr>
<td></td>
<td>• &lt;WLAN-NAME&gt; – Specify a sub-string in the WLAN name. Use this parameter to filter a WLAN. This option allows you to select and enter the configuration mode of one or more WLANs.</td>
</tr>
</tbody>
</table>
Examples

rfs7000-37FABE(config)#wlan 1
rfs7000-37FABE(config-wlan-1)#!

Wireless LAN Mode commands:

- **accounting**
- **acl**
- **answer-broadcast-probes**
- **assoc-response**
- **association-list**
- **authentication-type**
- **bridging-mode**
- **broadcast-dhcp**
- **broadcast-ssid**
- **captive-portal-enforcement**
- **client-access**
- **client-client-communication**
- **client-load-balancing**
- **controller-assisted-mobility**
- **data-rates**
- **description**
- **downstream-group-addressed-forwarding**
- **dpi**
- **dynamic-vlan-assignment**
- **eap-types**
- **encryption-type**
- **enforce-dhcp**
- **fast-bss-transition**
- **http-analyze**
- **ip**
- **ipv6**
- **kerberos**
- **mac-authentication**
- **no**
- **nsight**
- **opendns**
- **protected-mgmt-frames**
- **proxy-arp-mode**
- **proxy-nd-mode**
- **qos-map**

- **Examples**
- **rfs7000-37FABE(config)#wlan 1**
- **rfs7000-37FABE(config-wlan-1)#?**

- **accounting**
  - Configure how accounting records are created for this wlan
- **acl**
  - Actions taken based on ACL configuration [packet drop being one of them]
- **answer-broadcast-probes**
  - Include this wlan when responding to probe requests that do not specify an SSID
- **assoc-response**
  - Association response threshold
- **association-list**
  - Configure the association list for the wlan
- **authentication-type**
  - The authentication type of this WLAN
- **bridging-mode**
  - Configure how packets to/from this wlan are bridged
- **broadcast-dhcp**
  - Configure broadcast DHCP packet handling
- **broadcast-ssid**
  - Advertise the SSID of the WLAN in beacons
- **captive-portal-enforcement**
  - Enable captive-portal enforcement on the wlan
- **client-access**
  - Enable client-access (normal data operations) on this wlan
- **client-client-communication**
  - Allow switching of frames from one wireless client to another on this wlan
- **client-load-balancing**
  - Configure load balancing of clients on this wlan
- **controller-assisted-mobility**
  - Enable controller assisted mobility to determine wireless clients' VLAN assignment
- **data-rates**
  - Specify the 802.11 rates to be supported on this wlan
- **description**
  - Configure a description of the usage of this wlan
- **downstream-group-addressed-forwarding**
  - Enable downstream group addressed forwarding of packets
- **dpi**
  - Deep-Packet-Inspection (Application Assurance)
- **dynamic-vlan-assignment**
  - Dynamic VLAN assignment configuration
- **eap-types**
  - Configure client access based on eap-type used for authentication
- **encryption-type**
  - Configure the encryption to use on this wlan
- **enforce-dhcp**
  - Drop packets from Wireless Clients with static IP address
- **fast-bss-transition**
  - Configure support for 802.11r Fast BSS Transition
- **http-analyze**
  - Enable HTTP URL analysis on the wlan
- **ip**
  - Internet Protocol (IP)
- **ipv6**
  - Internet Protocol version 6 (IPv6)
- **kerberos**
  - Configure kerberos authentication parameters
- **mac-authentication**
  - Configure mac-authentication related parameters
- **no**
  - Negate a command or set its defaults
- **nsight**
  - Nsight Server
- **opendns**
  - OpenDNS related config for this wlan
- **protected-mgmt-frames**
  - Protected Management Frames (IEEE 802.11w) related configuration (DEMO FEATURE)
- **proxy-arp-mode**
  - Configure handling of ARP requests with proxy-arp is enabled
- **proxy-nd-mode**
  - Configure handling of IPv6 ND requests with proxy-nd is enabled
- **qos-map**
  - Support the 802.11u QoS map element
The following example shows how to use the 'containing' keyword to enter the configuration mode of an existing WLAN:

```bash
rfs7000-37FABE(config)#wlan containing wlan1
rfs7000-37FABE(config-wlan-{containing: 'wlan1'})#```
### 4.1.97.2 wlan-mode commands

This section documents the WLAN configuration mode commands in detail. Use the (config) instance to configure WLAN related parameters. To navigate to this instance, use the following command:

```
<DEVICE>(config)#wlan <WLAN-NAME>
```

The following table summarizes WLAN configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>accounting</td>
<td>Defines a WLAN accounting configuration</td>
<td>page 4-416</td>
</tr>
<tr>
<td>acl</td>
<td>Defines the actions based on an ACL rule configuration</td>
<td>page 4-418</td>
</tr>
<tr>
<td>answer-broadcast-probes</td>
<td>Allows a WLAN to respond to probes for broadcast ESS</td>
<td>page 4-420</td>
</tr>
<tr>
<td>assoc-response</td>
<td>Configures a minimum receive signal strength indication (RSSI) value, below which the WLAN does not send a response to a client’s association request</td>
<td>page 4-421</td>
</tr>
<tr>
<td>association-list</td>
<td>Attaches an existing global association list to a WLAN</td>
<td>page 4-422</td>
</tr>
<tr>
<td>authentication-type</td>
<td>Sets a WLAN’s authentication type</td>
<td>page 4-423</td>
</tr>
<tr>
<td>bridging-mode</td>
<td>Configures how packets to/from this WLAN are bridged</td>
<td>page 4-425</td>
</tr>
<tr>
<td>broadcast-dhcp</td>
<td>Configures broadcast DHCP packet handling</td>

4.1.97.2.1 accounting

- *wlan-mode commands*

Defines the WLAN’s accounting configuration

Accounting is the method of collecting user data, such as start and stop times, executed commands (for example, PPP), number of packets and number of bytes received and transmitted. This data is sent to the security server for billing, auditing, and reporting purposes. Accounting enables wireless network administrators to track the services and network resources accessed and consumed by users. When enabled, this feature allows the network access server to report and log user activity to a RADIUS security server in the form of accounting records. Each accounting record is comprised of AV pairs and is stored on the access control server. The data can be analyzed for network management, client billing, and/or auditing. Accounting methods must be defined through AAA policies.

Accounting can be enabled and applied to access point, wireless controller, or service platform managed WLANs. Once enabled, it uniquely logs accounting events specific to the managed WLAN. Accounting logs contain information about the use of remote access services by users. This information is of great assistance in partitioning local versus remote users and how to best accommodate each. Remote user information can be archived to a location outside of the access point for periodic network and user permission administration.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8532
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
accounting [radius|syslog|wait-client-ip]
accounting [radius|wait-client-ip]
accounting syslog [host|mac-address-format]
accounting syslog host <IP/HOSTNAME> {port <1-65535>}
   {proxy-mode [none|through-controller|through-rf-domain-manager]}
accounting syslog mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot] case [lower|upper]
```

**Parameters**

- accounting [radius|wait-client-ip]
  
  **accounting radius** Enables support for WLAN RADIUS accounting messages. This option is disabled by default. When enabled, the WLAN uses an external RADIUS resource for accounting. **Note:** Use the `use > aaa-policy > <AAA-POLICY-NAME>` command to associate an appropriate AAA policy with this WLAN. This AAA policy should be existing and should define the accounting, authentication, and authorization parameters.

  **accounting wait-client-ip** Enables waiting for client’s IP before commencing the accounting procedure

- accounting syslog host <IP/HOSTNAME> {port <1-65535>}
  {proxy-mode [none|through-controller|through-rf-domain-manager]}

  **accounting syslog** Enables support for WLAN syslog accounting messages in standard syslog format (RFC 3164). This option is disabled by default.
<table>
<thead>
<tr>
<th><strong>GLOBAL CONFIGURATION COMMANDS 4-417</strong></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>command</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>host</strong></td>
<td>Configures a syslog destination hostname or IP address for accounting records</td>
</tr>
<tr>
<td><code>&lt;IP/HOSTNAME&gt;</code></td>
<td>Specify the IP address or name of the destination host.</td>
</tr>
<tr>
<td><strong>port</strong></td>
<td>Optional. Configures the syslog server’s UDP port (this port is used to connect to the server)</td>
</tr>
<tr>
<td><code>&lt;1-65535&gt;</code></td>
<td>Specify the port from 1 - 65535. Default port is 514.</td>
</tr>
<tr>
<td><strong>proxy-mode</strong></td>
<td>Optional. Configures the request proxying mode</td>
</tr>
<tr>
<td>[none]</td>
<td>Requests are directly sent to the server from the device</td>
</tr>
<tr>
<td>through-controller]</td>
<td>Proxies requests through the controller (access point, wireless controller, or service platform) configuring the device</td>
</tr>
<tr>
<td>through-rf-domain-manager]</td>
<td>Proxies requests through the local RF Domain manager</td>
</tr>
</tbody>
</table>

- `accounting syslog mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot] case [lower|upper]`

| **accounting syslog** | Enables support for WLAN syslog accounting messages |
| **mac-address-format** | Configures the MAC address format used in syslog messages |
| **middle-hyphen** | Configures the MAC address format with middle hyphen (AABBCC-DDEEFF) |
| **no-delim** | Configures the MAC address format without delimiters (AABBCCDDEEFF) |
| **pair-colon** | Configures the MAC address format with pair-colon delimiters (AA:BB:CC:DD:EE:FF) |
| **pair-hyphen** | Configures the MAC address format with pair-hyphen delimiters (AA-BB-CC-DD-EE-FF). This is the default setting. |
| **quad-dot** | Configures the MAC address format with quad-dot delimiters (AABB.CCDD.EEFF) |
| **case [lower|upper]** | The following keywords are common to all: |
| [lower] | Specifies MAC address case (upper or lower) |
| [lower] | Specifies MAC address is filled in lower case (for example, aa-bb-cc-dd-ee-ff) |
| [upper] | Specifies MAC address is filled in upper case (for example, AA-BB-CC-DD-EE-FF) |

**Examples**

```bash
rfs7000-37FABE(config-wlan-test)#accounting syslog host 172.16.10.4 port 2 proxy-mode none

rfs7000-37FABE(config-wlan-test)#show context wlan test ssid test bridging-mode tunnel encryption-type none authentication-type none accounting syslog host 172.16.10.4 port 2
```

**Related Commands**

| **no** | Disables sending of accounting message to the RADIUS server, disables syslog accounting, or disables waiting for client’s IP before sending accounting messages |
4.1.97.2.2 acl

wlan-mode commands

Defines the actions taken based on an ACL rule configuration

Use the `use > ip-access-list <IP-ACCESS-LIST-NAME>` command to associate an ACL with the WLAN. The ACL rule is determined by the associated ACL's configuration.

A firewall is a mechanism enforcing access control, and is considered a first line of defense in protecting proprietary information within the network. The means by which this is accomplished varies, but in principle, a firewall can be thought of as mechanisms allowing and denying data traffic in respect to administrator defined rules. For an overview of firewalls, see FIREWALL-POLICY.

WLANs use firewalls like Access Control Lists (ACLs) to filter/mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of Access Control Entries (ACEs). Each ACE specifies an action and a set of conditions (rules) a packet must satisfy to match the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP based firewall rules are specific to source and destination IP addresses and the unique rules and precedence orders assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, administrators can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC Firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
aclexceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400>|
dissociate}
```

Parameters

- `acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400>|
dissociate}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
|acl exceed-rate| Sets the action taken based on an ACL rule configuration (for example, drop a packet)
- exceed-rate – Action is taken when the rate exceeds a specified value|
|wireless-client-denied-traffic <0-1000000>| Sets the action to deny traffic to the wireless client when the rate exceeds the specified value
- `<0-1000000>` – Specify a allowed rate threshold of disallowed traffic in packets/sec.
If enabled, this option allows an associated client, exceeding the thresholds configured for storm traffic, to be either de-authenticated or blacklisted depending on the action selected. This option is disabled by default.|
|blacklist <0-86400>| Optional. When enabled, sets the time interval, in seconds, to blacklist a wireless client.
- `<0-86400>` – Configures the blacklist duration from 0 - 86400 seconds. Offending clients are re-authenticated once the blacklist duration, configured here, has exceeded.|
|dissociate| Optional. When enabled, disassociates a wireless client|
### Examples

```bash
rfs7000-37FABE(config-wlan-test)#acl exceed-rate wireless-client-denied-traffic 20 disassociate

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test)#
```

4.1.97.2.3 **answer-broadcast-probes**

* wlan-mode commands

Allows the WLAN to respond to probe requests that do not specify a SSID. These probes are for broadcast ESS. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
answer-broadcast-probes
```

**Parameters**

None

**Examples**

```plaintext
rfs7000-37FABE(config-wlan-1)#answer-broadcast-probes
rfs7000-37FABE(config-wlan-1)#
```

4.1.97.2.4 assoc-response

wlan-mode commands

Configures the deny-threshold and rssi-threshold values. These threshold values are considered when responding to a client's association/authentication request.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]

Parameters

- assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]

<table>
<thead>
<tr>
<th>assoc-response</th>
<th>Configures the association response thresholds</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny-threshold</td>
<td>Configures the number of times association/authentication request, from a client, is ignored if the RSSI is less than the configured RSSI threshold. This option is disabled by default.</td>
</tr>
<tr>
<td>&lt;1-12&gt;</td>
<td>• &lt;1-12&gt; – Specify the deny-threshold from 1 - 12.</td>
</tr>
<tr>
<td>rssi-threshold</td>
<td>Configures an association response RSSI threshold value. If the RSSI is below the configured threshold value, the client's association/authentication request is ignored. This option is disabled by default.</td>
</tr>
<tr>
<td>&lt;-100--40&gt;</td>
<td>• rssi-threshold &lt;-100--40&gt; – Specify a value from -100 - -40 dBm.</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809(config-wlan-test)#assoc-response rssi-threshold -60
nx9500-6C8809(config-wlan-test)#assoc-response deny-threshold 4
```

```
nx9500-6C8809(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none
  assoc-response rssi-threshold -60
  assoc-response deny-threshold 4
  registration user group-name guest expiry-time 2000 agreement-refresh 14400
```

Related Commands

no

Removes the configured deny-threshold and rssi-threshold values
4.1.97.2.5 association-list

wlan-mode commands

Attaches an existing global association list with this WLAN. For more information on global association lists, see global-association-list.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

association-list global <GLOBAL-ASSO-LIST-NAME>

Parameters

- association-list global <GLOBAL-ASSO-LIST-NAME>

Examples

rfs4000-229D58(config-wlan-test)#association-list global my-clients

rfs4000-229D58(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  association-list global my-clients
rfs4000-229D58(config-wlan-test)#

Related Commands

no

Removes the global association list's association with this WLAN
### 4.1.97.2.6 authentication-type

Sets the WLAN's authentication type

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none]
```

**Parameters**

- `authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none]`

<table>
<thead>
<tr>
<th>authentication-type</th>
<th>Description</th>
</tr>
</thead>
</table>
| authentication-type | Configures a WLAN’s authentication type  
The authentication types are: EAP, EAP-MAC, EAP-PSK, Kerberos, MAC, and none. |
| eap                 | Configures EAP authentication (802.1X)  
EAP is the de-facto standard authentication method used to provide secure authenticated access to controller managed WLANs. EAP provides mutual authentication, secured credential exchange, dynamic keying and strong encryption. 802.1X EAP can be deployed with WEP, WPA or WPA2 encryption schemes to further protect user information forwarded over controller managed WLANs.  
The EAP process begins when an unauthenticated supplicant (client device) tries to connect with an authenticator (in this case, the authentication server). An access point passes EAP packets from the client to an authentication server on the wired side of the access point. All other packet types are blocked until the authentication server (typically, a RADIUS server) verifies the client’s identity.  
If using EAP authentication ensure that a AAA policy is mapped to the WLAN. |
| eap-mac             | Configures EAP or MAC authentication depending on client. (This setting is valid only with the None encryption type.  
EAP-MAC is useful when in a hotspot environment, as some clients support EAP and an administrator may want to authenticate based on just the MAC address of the device. |
| eap-psk             | Configures EAP authentication or pre-shared keys depending on client (This setting is only valid with Temporal Key Integrity Protocol (TKIP) or Counter Mode with Cipher Block Chaining Message Authentication Code Protocol (CCMP) encryption types).  
When using PSK with EAP, the controller sends a packet requesting a secure link using a pre-shared key. The controller and authenticating device must use the same authenticating algorithm and pass code during authentication. EAP-PSK is useful when transitioning from a PSK network to one that supports EAP.  
If using eap-psk authentication ensure that a AAA policy is mapped to the WLAN. |
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kerberos</td>
<td>Configures Kerberos authentication (encryption will change to WEP128 if it's not already WEP128 or Keyguard) Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection. Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses Network Time Protocol (NTP) for synchronizing the clocks of its Key Distribution Center (KDC) server(s).</td>
</tr>
<tr>
<td>mac</td>
<td>Configures MAC authentication (RADIUS lookup of MAC address) MAC is a device level authentication method used to augment other security schemes when legacy devices are deployed using static WEP. MAC authentication can be used for device level authentication by permitting WLAN access based on device MAC address. MAC authentication is typically used to augment WLAN security options that do not use authentication (such as static WEP, WPA-PSK and WPA2-PSK) MAC authentication can also be used to assign VLAN memberships, Firewall policies and time and date restrictions. MAC authentication can only identify devices, not users. If using mac authentication ensure that a AAA policy is mapped to the WLAN.</td>
</tr>
<tr>
<td>none</td>
<td>No authentication is used or the client uses pre-shared keys. This is the default value.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-wlan-test)#authentication-type eap
```

```
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type eap
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
```

**Related Commands**

```
no
```

Resets the authentication mode used with this WLAN to default (none/pre-shared keys)
### 4.1.97.2.7 bridging-mode

<table>
<thead>
<tr>
<th>bridging-mode</th>
<th>Configures how packets are bridged to and from a WLAN. The options are local and tunnel.</th>
</tr>
</thead>
<tbody>
<tr>
<td>local</td>
<td>Bridges packets between WLAN and local ethernet ports. This is the default mode.</td>
</tr>
<tr>
<td>tunnel</td>
<td>Tunnels packets to other devices (typically a wireless controller or service platform)</td>
</tr>
</tbody>
</table>

**Parameters**

- `bridging-mode [local|tunnel]`

**Syntax**

```
bridging-mode [local|tunnel]
```

**Examples**

- `rfs7000-37FABE(config-wlan-test)#bridging-mode local`
- `rfs7000-37FABE(config-wlan-test)#show context wlan test
ssid test
  bridging-mode local
  encryption-type none
  authentication-type eap
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test)#
```
4.1.97.2.8 broadcast-dhcp

**wlan-mode commands**

Configures broadcast DHCP packet handling parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
broadcast-dhcp validate-offer
```

**Parameters**

- `broadcast-dhcp validate-offer`

**Examples**

```
rfs7000-37FABE(config-wlan-test)#broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type eap
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
  broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#
```

**Related Commands**

```
no
```

Disables validation of the broadcast DHCP packet destination (a wireless client associated to the radio) before forwarding over the air.
### 4.1.97.2.9 broadcast-ssid

**wlan-mode commands**

Advertises the WLAN SSID in beacons. If a hacker tries to isolate and hack a SSID from a client, the SSID will display since the ESSID is in the beacon. This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
broadcast-ssid
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-wlan-1)#broadcast-ssid
rfs7000-37FABE(config-wlan-1)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>no</strong></td>
<td>Disables the broadcasting of the WLAN’s SSID in beacons</td>
</tr>
</tbody>
</table>
4.1.97.2.10 captive-portal-enforcement

**wlan-mode commands**

Configures the captive portal enforcement on this WLAN. When enabled, provides successfully authenticated guests temporary and restricted access to the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

captive-portal-enforcement  {fall-back}

**Parameters**
- captive-portal-enforcement  {fall-back}

<table>
<thead>
<tr>
<th>captive-portal-enforcement</th>
<th>Enables captive portal enforcement on a WLAN. This option is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>fall-back</td>
<td>Optional. Enforces captive portal validation if WLAN authentication fails (applicable to EAP or MAC authentication only)</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-wlan-test)#captive-portal-enforcement fall-back

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type eap
  accounting syslog host 172.16.10.4 port 2
  captive-portal-enforcement fall-back
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
  broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#

**Related Commands**

| no  | Disables captive portal enforcement |
4.1.97.2.11 client-access

* wlan-mode commands

Enables WLAN client access (for normal data operations)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

client-access

Parameters

None

Examples

rfs7000-37FABE(config-wlan-1)#client-access
rfs7000-37FABE(config-wlan-1)#

Related Commands

| no | Disables WLAN client access |
### 4.1.97.2.12 client-client-communication

#### wlan-mode commands

Allows frame switching from one client to another on a WLAN

This option is enabled by default. It allows clients to exchange packets with other clients. It does not necessarily prevent clients on other WLANs from sending packets to this WLAN, but as long as this setting is also disabled on that WLAN, clients are not permitted to interoperate.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

client-client-communication

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-wlan-1)#client-client-communication
rfs7000-37FABE(config-wlan-1)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables frame switching from one client to another on a WLAN</td>
</tr>
</tbody>
</table>
4.1.97.2.13 client-load-balancing

wlan-mode commands

Enforces client load balancing on a WLAN's access point radios. AP6522, AP6532, AP6562, AP81XX, and AP82XX models can support 256 clients per access point. AP6511 and AP6521 models can support up to 128 clients per access point. When enforced, loads are balanced by ignoring association and probe requests. Probe and association requests are not responded to, forcing a client to associate with another access point radio.

This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

client-load-balancing {allow-single-band-clients [2.4ghz|5ghz]|band-discovery-intvl <0-10000>|capability-ageout-time <0-10000>}

client-load-balancing {max-probe-req [2.4ghz|5ghz]|probe-req-intvl <0-10000>}

Parameters

- client-load-balancing {allow-single-band-clients [2.4ghz|5ghz]|band-discovery-intvl <0-10000>|capability-ageout-time <0-10000>}

### client-load-balancing Configures WLAN client load balancing

<table>
<thead>
<tr>
<th>client-load-balancing</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow-single-band-clients [2.4ghz</td>
<td>5ghz]</td>
</tr>
<tr>
<td>band-discovery-intvl &lt;0-10000&gt;</td>
<td>Optional. Configures the interval to discover a client's band capability before connection</td>
</tr>
<tr>
<td>capability-ageout-time &lt;0-10000&gt;</td>
<td>Optional. Configures a client's capability ageout interval. This is the time for which a client's capabilities are retained in the device's internal table. Once this time is exceeded the client's capabilities are aged out.</td>
</tr>
<tr>
<td>max-probe-req [2.4ghz</td>
<td>5ghz] &lt;0-10000&gt;</td>
</tr>
</tbody>
</table>

- max-probe-req [2.4ghz|5ghz] <0-10000> | Optional. Configures client probe request interval limits for device association |
- 2.4ghz – Configures maximum client probe requests on 2.4 GHz radios |
- 5ghz – Configures maximum client probe requests on 5.0 GHz radios |
- <0-10000> – Specify a client probe request threshold from 0 - 10000. The default for both 2.4 and 5.0 GHz radios is 60.
Examples

rfs7000-37FABE(config-wlan-test)#client-load-balancing band-discovery-intvl 2
rfs7000-37FABE(config-wlan-test)#client-load-balancing probe-req-intvl 5ghz 5

rfs7000-37FABE(config-wlan-test)#

Related Commands

| no | Disables client load balancing on a WLAN’s access point radios |
4.97.2.14 controller-assisted-mobility

wlan-mode commands

Enables controller or service platform assisted mobility to determine a wireless client’s VLAN assignment. When enabled, a controller or service platform’s mobility database is used to assist in roaming between RF Domains. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
controller-assisted-mobility

Parameters
None

Examples
rfs4000-229D58(config-wlan-test)#controller-assisted-mobility

rfs4000-229D58(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#

4.1.97.2.15  data-rates

wlan-mode commands

Specifies the 802.11 rates supported on a WLAN

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

data-rates [2.4GHz|5GHz]

data-rates 2.4GHz [b-only|bg|bgn|custom|default|g-only|gn]

data-rates 2.4GHz custom [1|11|12|18|2|24|36|48|5.5|54|6|9|basic-1|basic-11|basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|basic-9|basic-mcs-1s|mcs-1s|mcs-2s|mcs-3s]

data-rates 5GHz [a-only|an|custom|default]

data-rates 5GHz custom [12|18|24|36|48|54|6|9|basic-1|basic-11|basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|basic-9|basic-mcs-1s|mcs-1s|mcs-2s|mcs-3s]

Parameters

- data-rates 2.4GHz [b-only|bg|bgn|default|g-only|gn]
  - **data-rates** Specifies the 802.11 rates supported when mapped to a 2.4 GHz radio
    - **b-only** Uses rates that support only 11b clients
    - **bg** Uses rates that support both 11b and 11g clients
    - **bgn** Uses rates that support 11b, 11g and 11n clients
    - **default** Uses the default rates configured for a 2.4 GHz radio
    - **g-only** Uses rates that support operation in 11g only
    - **gn** Uses rates that support 11g and 11n clients

- data-rates 5GHz [a-only|an|default]
  - **data-rates** Specifies the 802.11 rates supported when mapped to a 5.0 GHz radio
    - **a-only** Uses rates that support operation in 11a only
    - **an** Uses rates that support 11a and 11n clients
    - **default** Uses default rates configured for a 5.0 GHz

- data-rates [2.4GHz|5GHz] custom [1|11|12|18|2|24|36|48|5.5|54|6|9|basic-1|basic-11|basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|basic-9|basic-mcs-1s|mcs-1s|mcs-2s|mcs-3s]

- data-rates [2.4GHz|5GHz] Specifies the 802.11 rates supported when mapped to a 2.4 GHz or 5.0 GHz radio
**custom**

Configures a data rates list by specifying each rate individually. Use 'basic-' prefix before a rate to indicate it is used as a basic rate (For example, 'data-rates custom basic-1 basic-2 5.5 11').

The data-rates for 2.4 GHz and 5.0 GHz channels are the same with a few exceptions. The 2.4 GHz channel has a few extra data rates: 1, 11, 2, and 5.5.

<table>
<thead>
<tr>
<th>1,11,2,5.5</th>
</tr>
</thead>
</table>

The following data rates are specific to the 2.4 GHz channel:

- 1 – 1-Mbps
- 11 – 11-Mbps
- 2 – 2-Mbps
- 5.5 – 5.5-Mbps

<table>
<thead>
<tr>
<th>[12,18,24,36,48,54,6,9,basic-1,basic-11, basic-12,basic-18, basic-2,basic-36, basic-48,basic-5.5, basic-54,basic-6, basic-9, basic-mcs-1s, mcs-1s,mcs2s, mcs-3s]</th>
</tr>
</thead>
</table>

The following data rates are common to both the 2.4 GHz and 5.0 GHz channels:

- 12 – 12 Mbps
- 18 – 18-Mbps
- 24 – 24 Mbps
- 36 – 36-Mbps
- 48 – 48-Mbps
- 54 – 54-Mbps
- 6 – 6-Mbps
- 9 – 9-Mbps
  - basic-1 – basic 1-Mbps
  - basic-11 – basic 11-Mbps
  - basic-12 – basic 12-Mbps
  - basic-18 – basic 18-Mbps
  - basic-2 – basic 2-Mbps
  - basic-36 – basic 36-Mbps
  - basic-48 – basic 48-Mbps
  - basic-5.5 – basic 5.5-Mbps
  - basic-54 – basic 54-Mbps
  - basic-6 – basic 6-Mbps
  - basic-9 – basic 9-Mbps
  - basic-mcs-1s – Modulation and coding scheme data rates for 1 Spatial Stream
  - mcs-1s – Applicable to 1-spatial stream data rates
  - mcs-2s – Applicable to 2-spatial stream data rates
  - mcs-3s – Applicable to 3-spatial stream data rates
Examples
rfs7000-37FABE(config-wlan-test)#data-rates 2.4GHz gn
rfs7000-37FABE(config-wlan-test)#show context wlan test
ssid test bridging-mode local encryption-type none
authentication-type eap accounting syslog host 172.16.10.4 port 2

4.1.97.2.17 downstream-group-addressed-forwarding

* wlan-mode commands

Enables forwarding of downstream broadcast/multicast (BC/MC) packets to a group on this WLAN. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

downstream-group-addressed-forwarding

**Parameters**

None

**Examples**

rfs4000-229D58(config-wlan-test)#downstream-group-addressed-forwarding

rfs4000-229D58(config-wlan-test)#

**Related Commands**

<tr>
<td>no</td>
<td>Disables forwarding of downstream BCMC packets to a group on this WLAN</td>
</tr>
</tbody>
</table>
4.1.97.2.18 dpi

**wlan-mode commands**

Enables extraction of metadata flows on the WLAN. The *Deep Packet Inspection* (DPI) engine, integrated in the WING devices, has the capability of identifying 400 and more applications and application categories. However, in large deployments where a large number of users are guests, the DPI engine is inadequate in detecting applications or Websites not included in its database. This gap in the DPI application database is overcome by enabling extraction of AVC metadata flows. When enabled this option allows tracking of all HTTP/SSL websites accessed by clients (internal and/or guests) and monitoring of voice-video calls.

Supported in the following platforms:

- Access Points — AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dpi metadata [http|ssl|voice-video]

**Parameters**

- dpi metadata [http|ssl|voice-video]

<table>
<thead>
<tr>
<th>dpi metadata</th>
<th>Enables extraction of the following metadata flows:</th>
</tr>
</thead>
<tbody>
<tr>
<td>http</td>
<td>Extracts HTTP metadata flows. When enabled, administrators can track HTTP Websites accessed by both internal and guest clients and visualize HTTP data usage, hits, active time and total clients on the NSight application’s dashboard. This setting is disabled by default.</td>
</tr>
<tr>
<td>ssl</td>
<td>Extracts SSL metadata flows. When enabled, administrators can track SSL Websites accessed by both internal and guest clients and visualize SSL data usage, hits, active time and total clients on the NSight application’s dashboard. This setting is disabled by default.</td>
</tr>
<tr>
<td>voice-video</td>
<td>Extracts voice and video metadata flows. When enabled, voice and video calls can be tracked by extracting parameters, such as packets transferred and lost, jitter, and application name. Most Enterprise VoIP applications like facetime, skype for business and VoIP terminals can be monitored for call quality and visualized on the NSight dashboard in manner similar to HTTP and SSL. Call quality and metrics can only be determined from calls established unencrypted. This setting is disabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-wlan-test)#dpi metadata http
rfs7000-37FABE(config-wlan-test)#dpi metadata ssl
rfs7000-37FABE(config-wlan-test)#dpi metadata voice-video
```

```
rfs7000-37FABE(config-wlan-test)#show context
wlan test
ssid test
bridging-mode tunnel
encryption-type none
authentication-type none
dpi metadata voice-video
dpi metadata http
dpi metadata ssl
```

**Related Commands**

| no | Disables extraction of metadata flows on the WLAN |
4.1.97.2.19 dynamic-vlan-assignment

* wlan-mode commands

Enables dynamic VLAN assignment on this WLAN, and adds or removes VLANs for the selected WLAN. Configure this feature to allow an override to the WLAN configuration. If, as part of the authentication process, the RADIUS server returns a client's VLAN-ID in a RADIUS Access-Accept packet, and this feature is enabled, all client traffic is forward on that VLAN. If disabled, the RADIUS server returns VLAN-ID is ignored and the WLAN's VLAN configuration is used. For more information, see *vlan*. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
dynamic-vlan-assignment allowed-vlans <VLAN-ID>
```

**Parameters**

- `dynamic-vlan-assignment allowed-vlans <VLAN-ID>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic-vlan-assignment</td>
<td>Enables dynamic VLAN assignment and configures a list of VLAN IDs or VLAN alias allowed access to the WLAN</td>
</tr>
<tr>
<td>allowed-vlans</td>
<td>&lt;VLAN-ID&gt; Specify the list of VLAN IDs or the VLAN alias names. For example, 10-20, 25, 30-35, $guest. For information on VLAN aliases, see alias.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config-wlan-test)#dynamic-vlan-assignment allowed-vlans 10-20
```

```
rfs4000-229D58(config-wlan-test)#show context
wlan test
ssid test
bridging-mode tunnel
encryption-type none
authentication-type none
dynamic-vlan-assignment allowed-vlans 10-20
rfs4000-229D58(config-wlan-test)#
```

**Related Commands**

- `no` Disables dynamic VLAN assignment on this WLAN
4.1.97.2.20 eap-types

wlan-mode commands

Configures client access based on the EAP type used

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls]
{aka|all|fast|peap|sim|tls|ttls}
```

Parameters

- eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls]
{aka|all|fast|peap|sim|tls|ttls}

| eap-types [allow|deny] | Configures a list of allowed or denied EAP types |
|------------------------|--------------------------------------------------|
| allow                  | Configures a list of EAP types allowed for WLAN client authentication |
| deny                   | Configures a list of EAP types not allowed for WLAN client authentication |

| [aka|all|fast|peap|sim|tls|ttls] | The following EAP types are common to the ‘allow’ and ‘deny’ keywords: |
|--------------------------|------------------------------------------------------------------------|
| aka                      | Configures EAP Authentication and Key Agreement (AKA) and EAP-AKA’ (AKA Prime). EAP-AKA is one of the methods in the EAP authentication framework. It uses Universal Mobile Telecommunications System (UMTS) and Universal Subscriber Identity Module (USIM) for client authentication and key distribution. |
| all                      | Allows or denies usage of all EAP types on the WLAN. This is the default setting. |
| peap                     | Configures Protected Extensible Authentication Protocol (PEAP). PEAP or Protected EAP uses encrypted and authenticated TLS tunnel to encapsulate EAP. |
| sim                      | Configures EAP Subscriber Identity Module (SIM). EAP-SIM uses Global System for Mobile Communications (GSMC) SIM for client authentication and key distribution. |
| tls                      | Configures EAP Transport Layer Security (TLS). EAP-TLS is an EAP authentication method that uses PKI to communicate with a RADIUS server or any other authentication server. |
| ttls                     | Configures Tunneled Transport Layer Security (TTLS). EAP-TTLS is an extension of TLS. Unlike TLS, TTLS does not require every client to generate and install a CA- signed certificate. |

Note: These options are recursive, and more than one EAP type can be selected. The selected options are added to the allowed or denied EAP types list.
Examples

rfs7000-37FABE(config-wlan-test)#eap-types allow fast sim tls

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  eap-types allow fast sim tls
rfs7000-37FABE(config-wlan-test)#

```

**Related Commands**

| no          | Disables dropping of packets from clients with a static IP address |
4.1.97.23 fast-bss-transition

wlan-mode commands

Enables support for 802.11r Fast-BSS Transition (FT) on the selected WLAN. This feature is disabled by default. 802.11r is an attempt to undo the burden that security and QoS added to the handoff process, and restore it back to an original four message exchange process. The central application for the 802.11r standard is VOIP using mobile phones within wireless Internet networks. 802.11r FT redefines the security key negotiation protocol, allowing parallel processing of negotiation and requests for wireless resources.

Enabling FT standards provides wireless clients fast, secure and seamless transfer from one base station to another, ensuring continuous connectivity.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
fast-bss-transition {over-ds}

Parameters
- fast-bss-transition {over-ds}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fast-bss-transition</td>
<td>Enables 802.11r FT support on this WLAN</td>
</tr>
<tr>
<td>over-ds</td>
<td>• over-ds – Optional. Enables 802.11r client roaming over the Distribution System (DS). When enabled, all client communication with the target AP is via the current AP. This communication, carried in FT action frames, is first sent by the client to the current AP, then forwarded to the target AP through the controller.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-wlan-test)#fast-bss-transition

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  vlan 1

### 4.1.97.2.25 ip

#### wlan-mode commands

Configures Internet Protocol (IP) settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
ip [arp|dhcp]

ip arp [header-mismatch-validation|trust]

ip dhcp trust
```

**Parameters**

- **ip arp [header-mismatch-validation|trust]**
  - `header-mismatch-validation`: Verifies mismatch of source MAC address in the ARP and Ethernet headers. This option is enabled by default.
  - `trust`: Sets ARP responses as trusted for a WLAN/range. This option is disabled by default.

- **ip dhcp trust**
  - Configures the IP settings for DHCP packets
  - Sets DHCP responses as trusted for a WLAN/range. This option is disabled by default.

**Examples**

```plaintext
rfs7000-37FABE(config-wlan-test)#ip dhcp trust

rfs7000-37FABE(config-wlan-test)#show context wlan test
description TestWLAN
ssid test
bridging-mode local
encryption-type tkip-ccmp
authentication-type eap
accounting syslog host 172.16.10.4 port 2
data-rates 2.4GHz gn
client-load-balancing probe-req-intvl 5ghz 5
client-load-balancing band-discovery-intvl 2
captive-portal-enforcement fail-back
ip dhcp trust
   acl exceed-rate wireless-client-denied-traffic 20 disassociate
   enforce-dhcp
   broadcast-dhcp validate-offer
   http-analyze controller
rfs7000-37FABE(config-wlan-test)#
```

**Related Commands**

- **no**
  - Resets IP ARP or DHCP trust parameters to default. ARP trust is disabled, ARP mismatch verification is enabled, or DHCP trust is disabled.
### 4.1.97.2.26 ipv6

#### 4.1.97.2.26.1 wlan-mode commands

Sets the DHCPv6 and ICMPv6 neighbor discovery (ND) components for this WLAN

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

- `ipv6 [dhcpv6|nd]`
- `ipv6 dhcpv6 trust`
- `ipv6 nd [header-mismatch-validation|raguard|trust]`

#### Parameters

- **ipv6 dhcpv6 trust**
  - Enables DHCPv6 trust state for DHCPv6 responses on this WLAN. When enabled, all DHCPv6 responses received on this WLAN are trusted and forwarded. This option is disabled by default.

- **ipv6 nd [header-mismatch-validation|raguard|trust]**
  - Sets the IPv6 ND settings for this WLAN
  - **header-mismatch-validation**
    - Checks for mismatch of source MAC address in the ICMPv6 ND message and Ethernet header (link layer option). This option is enabled by default.
  - **raguard**
    - Allows redirection of router advertisements (RAs) and ICMPv6 packets originating on this WLAN. This option is disabled by default.
  - **trust**
    - Enables trust state for ND requests received on this WLAN. When enabled, all ND requests on an IPv6 firewall, on this WLAN, are trusted. This option is disabled by default.

#### Examples

- `rfs7000-37FABE(config-wlan-test)#ipv6 dhcpv6 trust`
- `rfs7000-37FABE(config-wlan-test)#ipv6 nd trust`
- `rfs7000-37FABE(config-wlan-test)#show context wlan test`
  - `ssid test`
  - `vlan 1`
  - `bridging-mode tunnel`
  - `encryption-type none`
  - `authentication-type none`
  - `ipv6 dhcpv6 trust`
  - `ipv6 nd trust`
- `rfs7000-37FABE(config-wlan-test)#`

#### Related Commands

- **no**
  - Resets IPv6 ND or DHCPv6 trust parameters to default. ND request trust is disabled, ND header mismatch verification is enabled, ND RA and ICMPv6 redirection is disabled, or DHCPv6 trust is disabled.
4.1.97.2.27 **kerberos**

Configure Kerberos authentication parameters on a WLAN.

Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection.

Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses **Network Time Protocol (NTP)** for synchronizing the clocks of its **Key Distribution Center (KDC)** server(s).

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5600, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
kerberos [password|realm|server]
kerberos password [0 <LINE>|2 <LINE>|<LINE>]
kerberos realm <REALM>
kerberos server [primary|secondary|timeout]
kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}
kerberos server timeout <1-60>
```

**Parameters**
- **kerberos password [0 <LINE>|2 <LINE>|<LINE>]**
  - Configures a Kerberos KDC server password. The password should not exceed 127 characters. The password options are:
    - 0 <LINE> – Configures a clear text password
    - 2 <LINE> – Configures an encrypted password
    - <LINE> – Specify the password.

- **kerberos realm <REALM>**
  - Configures a Kerberos KDC server realm. The REALM should not exceed 127 characters.

- **kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>**}
  - Configures a Kerberos KDC server host. The host name or IP address can be specified along with an optional port number.

- **kerberos server timeout <1-60>**
  - Configures a timeout period for Kerberos server communication.

---

4.1.97.2.28  **mac-authentication**

**wlan-mode commands**

Enables MAC authentication. When enabled, the system uses cached credentials (RADIUS server lookups are skipped) to authenticate clients.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

mac-authentication [cached-credentials|enforce-always]

**Parameters**

- **mac-authentication [cached-credentials|enforce-always]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-authentication</td>
<td>Enables MAC authentication on this WLAN and configures related parameters</td>
</tr>
<tr>
<td>cached-credentials</td>
<td>Uses cached credentials to skip RADIUS lookups. This option is disabled by default.</td>
</tr>
<tr>
<td>enforce-always</td>
<td>Enforces MAC authentication on this WLAN. When enabled, MAC authentication is enforced, each time a client logs in, even when the authentication type specified (using the authentication-type command) is not MAC authentication. This option is disabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

rfs4000-229D58(config-wlan-test)#mac-authentication cached-credentials  
rfs4000-229D58(config-wlan-test)#

**Related Commands**

- **no**  
  Disables MAC authentication related parameters: Disables use of cached credentials to skip RADIUS lookups, or disables enforcement of MAC authentication on this WLAN.
4.1.97.2.29  no

wlan-mode commands

Negates WLAN mode commands and reverts values to their default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no accounting [radius|syslog|wait-client-ip]

no acl exceed-rate wireless-client-denied-traffic

no wireless-client [count-per-radio|cred-cache-ageout|hold-time|inactivity-timeout|max-firewall-sessions|reauthentication|roam-notification|t5-inactivity-timeout|tx-power|vlan-cache-ageout]

Parameters

- no <PARAMETERS>

no <PARAMETERS> Removes or reverts this WLAN's settings based on the parameters passed

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

rfs7000-37FABE(config-wlan-test)#no 

accounting Configure how accounting records are created for this wlan

acl Actions taken based on ACL configuration [ packet drop being one of them]

answer-broadcast-probes Do not Include this wlan when responding to probe requests that do not specify an SSID

assoc-response Association response threshold

association-list Configure the association list for the wlan

authentication-type Reset the authentication to use on this wlan to default (none/Pre-shared keys)

broadcast-dhcp Configure broadcast DHCP packet handling

broadcast-ssid Do not advertise the SSID of the WLAN in beacons

captive-portal-enforcement Configure how captive-portal is enforced on the wlan

client-access Disallow client access on this wlan (no data operations)

client-client-communication Disallow switching of frames from one wireless client to another on this wlan

client-load-balancing Disable load-balancing of clients on this wlan

controller-assisted-mobility Disable configure assisted mobility

data-rates Reset data rate configuration to default

description Reset the description of the wlan

downstream-group-addressed-forwarding Disable downstream group addressed forwarding of packets

dpi Deep-Packet-Inspection (Application Assurance)

4.1.97.2.30 nsight

wlan-mode commands

Enables retention of client-history

A typical NSight-server enabled, guest access environment may be visited by thousands of unique clients on a daily basis. Some of these guest clients are not regular visitors, accessing the network infrequently. However, by default, historical data of all guest clients, irrespective of their network access frequency, is retained by the NSight server for up to 180 days. This results in the database containing thousands if not millions of unique MAC addresses of infrequent guest clients. To address this potential problem it is recommended to disable client-history retention on a guest WLAN, and use the nsight-policy context to configure a separate timer (8 hours by default) specifying the guest client data lifespan in the MongoDB database.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

nsight client-history

Parameters

- nsight client-history

| nsight client-history | Enables retention of client-history in the MongoDB database. This option is enabled by default. |

Examples

On a WLAN, the client-history option is enabled by default. When enabled, all client history (including guest-clients) is retained in the NSight server database for 180 days.

To disable this option, execute the no > nsight > client-history command. When disabled, guest client history is retained only for 8 hours, which is the default setting defined by the NSight policy applied on the access point (through which the guest client accesses the WLAN) or the access point’s RF Domain. However, the default historical data retention duration for regular clients and devices (access point and controllers) remains unchanged (180 days) as per the NSight policy settings.

```
nx9500-6C8809(config-wlan-test3)#no nsight client-history
nx9500-6C8809(config-wlan-test3)#show context
wlan test3
  ssid test3
  bridging-mode local
  encryption-type none
  authentication-type none
  no nsight client-history
nx9500-6C8809(config-wlan-test3)#
```

Use the NSight policy context to define separate client-history retention time for regular clients, devices, and guest clients. For more information, see nsight-policy.

Related Commands

| no | Disables client-history retention in the NSight MongoDB database |
Enables integration of access points, wireless controllers, and service platforms with OpenDNS. When configured, DNS queries from wireless clients are redirected to OpenDNS (208.67.220.220 OR 208.67.222.222). These OpenDNS resolvers act as proxy DNS servers that provide additional functionalities, such as Web filtering, reporting, and performance enhancement.

This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`opendns device-id <DEVICE-ID>`

**Parameters**

- `opendns device-id <DEVICE-ID>`

<table>
<thead>
<tr>
<th><code>opendns device-id &lt;DEVICE-ID&gt;</code></th>
<th>Configures the device ID sent to OpenDNS</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>&lt;DEVICE-ID&gt;</code> – Specify the device ID. The device-id entered here is obtained from the OpenDNS site by executing the following command in the Privi Exec Mode: <code>opendns &gt; username &lt;WORD&gt; password &lt;WORD&gt; label &lt;WORD&gt;</code>. For more information, see <code>opendns</code>.</td>
</tr>
<tr>
<td></td>
<td>Once configured on a WLAN, this value is embedded in each DNS query packet going out from an access point, wireless controller, or service platform to the OpenDNS server. The device ID is a sixteen (16) character hex string representing a 64 bit unsigned integer. Use the <code>no &gt; opendns &gt; device-id</code> command to remove the configured device-id.</td>
</tr>
<tr>
<td></td>
<td>Therefore, when a wireless client associates with a OpenDNS enabled WLAN, all DNS queries originating from the client are appended with an additional 31 bytes of data (representing the device ID) at the end of the DNS packet.</td>
</tr>
<tr>
<td>Note:</td>
<td>To enable redirection of DNS query to OpenDNS it is necessary that the DNS server's IP address provided in the DHCP Server policy (used by the client) should point to the OpenDNS IP address (208.67.220.220 OR 208.67.222.222). For more information, see <code>dns-server</code>.</td>
</tr>
<tr>
<td>For example:</td>
<td><code>rfs7000-37FABE(config-dhcp-policy-dhcppolicy-pool-dhcppool)#show context</code></td>
</tr>
<tr>
<td></td>
<td><code>dhcppool dhcppool</code></td>
</tr>
<tr>
<td></td>
<td><code>network 192.168.13.0/24</code></td>
</tr>
<tr>
<td></td>
<td><code>address range 192.168.13.160 192.168.13.200</code></td>
</tr>
<tr>
<td></td>
<td><code>default-router 192.168.13.105</code></td>
</tr>
<tr>
<td></td>
<td><code>dns-server 208.67.220.220 208.67.222.222</code></td>
</tr>
<tr>
<td></td>
<td><code>rfs7000-37FABE(config-dhcp-policy-dhcppolicy-pool-dhcppool)#</code></td>
</tr>
<tr>
<td>Contd...</td>
<td></td>
</tr>
</tbody>
</table>
Examples
Following examples show all configurations required to integrate access points and controllers with the OpenDNS service:

Step 1. In the Privilege Executable Mode:

```
ap7131-E6D512#opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
```
ap7131-E6D512#

Step 2: To enable OpenDNS on a WLAN, apply the device-id, obtained in the preceding step, to the WLAN:

```
ap7131-E6D512(config)#wlan opendns
ap7131-E6D512(config-wlan-opendns)#opendns device-id 0014AADF8EDC6C59
ap7131-E6D512(config-wlan-opendns)#commit
```
ap7131-E6D512(config-wlan-opendns)#

The following examples show the other mandatory configurations needed to redirect wireless client DNS queries to the OpenDNS server:

```
ap7131-E6D512(config)#self
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#
```

Step 3: To enable DNS resolution on the access point or controller, execute the following commands:

```
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#ip name-server 144.189.100.51
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#ip dns-server-forward
```
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#

Note: To prevent wireless clients from bypassing the OpenDNS resolver by adding their own DNS servers, configure and apply an IP ACL on the access point, wireless controller, or service platform containing the following firewall rules:

```
rf7000-37FABE(config-ip-acl-dns-list)#show context
ip access-list dns-list
   permit udp any host 208.67.222.222 eq dns rule-precedence 1 rule-description "allow dns queries only to OpenDNS"
   deny udp any any eq dns rule-precedence 10 rule-description "block all other dns queries"
   permit ip any any rule-precedence 100 rule-description "allow all other ip packets"
rf7000-37FABE(config-ip-acl-dns-list)#
```

Note:
wlan opendns bss 1 primary
interface ge1
  switchport mode access
  switchport access vlan 10
interface vlan1
  ip address 192.168.1.105/24
  ip dhcp client request options all
  ip nat inside
  no ipv6 enable
  no ipv6 request-dhcpv6-options
interface vlan10
  ip address 144.190.204.218/24
  no ipv6 enable
  no ipv6 request-dhcipv6-options
  use dhcp-server-policy dhcppolicy

ip dns-server-forward

  ip nat inside source list my_list precedence 10 interface vlan10 overload
  enforce-version adoption none

ap7131-E6D512(config-device-00-15-70-E6-D5-12)#

Step 4: To ensure that the OpenDNS-enabled WLAN's client's DNS queries are redirected to the OpenDNS server, execute the following commands:

ap7131-E6D512(config)#dhcp-server-policy dhcppolicy
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#dhcp-pool opendns
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#show context
dhcp-server-policy dhcppolicy
  dhcp-pool dhcppool
    network 192.168.1.0/24
    address range 192.168.1.160 192.168.1.200
    default-router 192.168.1.105
dns-server 208.67.222.222
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#

ap7131-E6D512(config)#self
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#use dhcp-server-policy dhcppolicy

Related Commands

| no | Removes the device ID configured to be forwarded to the DNS query |
4.1.97.2.32 protected-mgmt-frames

wlan-mode commands

Configures the WLAN's frame protection mode and security association (SA) query parameters.

802.11w provides protection for both unicast management frames and broadcast/multicast management frames. The 'robust management frames' are action, disassociation, and deauthentication frames. The standard provides one security protocol CCMP for protection of unicast robust management frames. Protected management frames (PMF) protocol only applies to robust management frames after establishment of RSNA PTK. Robust management frame protection is achieved by using CCMP for unicast management frames, broadcast/multicast integrity protocol (BIP) for broadcast/multicast management frames and SA query protocol for protection against (re)association attacks.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|timeout <100-1000>]]

Parameters
- protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|timeout <100-1000>]]

<table>
<thead>
<tr>
<th>protected-mgmt-frames</th>
<th>Enables and configures WLAN's frame protection mode and SA query parameters. Use this command to specify whether management frames are continually or optionally protected. Frame protection mode is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>mandatory</td>
<td>Enforces protected management frames (PMF) on this WLAN (management frames are continually optionally protected)</td>
</tr>
<tr>
<td>optional</td>
<td>Provides PMF only for those clients that support PMF (management frames are optionally protected)</td>
</tr>
<tr>
<td>sa-query [attempts &lt;1-10&gt;</td>
<td>timeout &lt;100-1000&gt;]]</td>
</tr>
<tr>
<td></td>
<td>• attempts &lt;1-10&gt; – Configures the number of SA query attempts from 1 - 10. The default is 5.</td>
</tr>
<tr>
<td></td>
<td>• timeout &lt;100-1000&gt; – Configures the interval, in milliseconds, used to timeout association requests that exceed the defined interval. Specify a value from 100 - 1000 milliseconds. The default value is 201 milliseconds.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-wlan-test)#protected-mgmt-frames mandatory

4.1.97.2.33 proxy-arp-mode

Enables proxy ARP mode for handling ARP requests.

Proxy ARP is the technique used to answer ARP requests intended for another system. By faking its identity, the access point accepts responsibility for routing packets to the actual destination.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
proxy-arp-mode [dynamic|strict]

Parameters
- proxy-arp-mode [dynamic|strict]

<table>
<thead>
<tr>
<th>proxy-arp-mode</th>
<th>Enables proxy ARP mode for handling ARP requests. The options available are dynamic and strict.</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic</td>
<td>Forwards ARP requests to the wireless side (for which a response could not be proxied). This is the default setting.</td>
</tr>
<tr>
<td>strict</td>
<td>Does not forward ARP requests to the wireless side</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-wlan-test)#proxy-arp-mode strict
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none

  client-load-balancing band-discovery-intvl 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test)#proxy-arp-mode strict
rfs7000-37FABE(config-wlan-test)#broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#http-analyze controller

Related Commands
- **no** Reverts the proxy ARP mode to default (dynamic)
4.1.97.2.34  proxy-nd-mode

   wlan-mode commands

Configures the proxy ND mode for this WLAN member clients as either strict or dynamic
ND proxy is used in IPv6 to provide reachability by allowing a client to act as proxy. Proxy certificate signing can
be done either dynamically (requiring exchanges of identity and authorization information) or statically when the
network topology is defined.

Supported in the following platforms:
   • Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX,
     AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8532
   • Wireless Controllers — RFS4000, RFS6000, RFS7000
   • Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530,
     NX9000, NX9500, NX9510, NX9600

Syntax
proxy-nd-mode [dynamic|strict]

Parameters
• proxy-nd-mode [dynamic|strict]

+------------------|-------------------------------------------------------------------------------------------------
| proxy-nd-mode     | Configures the proxy ND mode for this WLAN member clients. The options are: dynamic and strict    |
| [dynamic|strict]    | • dynamic – Forwards ND request to wireless for which a response could not be proxied. This is the default value. |
|                   | • strict – Does not forward ND requests to the wireless side                                   |

Examples
rfs7000-37FABE(config-wlan-test)#proxy-nd-mode strict
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none

4.1.97.2.36 radio-resource-measurement

- **wlan-mode commands**

   Enables support for 802.11k radio resource measurement capabilities (IEEE 802.11k) on this WLAN. 802.11k improves how traffic is distributed. In a WLAN, devices normally connect to the access point with the strongest signal. Depending on the number and location of clients, this arrangement can lead to excessive demand on one access point and underutilization of others, resulting in degradation of overall network performance. With 802.11k, if the access point with the strongest signal is loaded to its capacity, a client connects to an under-utilized access point. Even if the signal is weaker, the overall throughput is greater since it's an efficient use of the network's resources. This feature is disabled by default.

   Supported in the following platforms:
   - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
   - Wireless Controllers — RFS4000, RFS6000, RFS7000
   - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
radio-resource-measurement {channel-report|neighbor-report {hybrid}}
```

**Parameters**

- **radio-resource-measurement**
  - {channel-report|neighbor-report {hybrid}}

<table>
<thead>
<tr>

4.1.97.2.37 radius

\* wlan-mode commands

Configures RADIUS related parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

radius [dynamic-authorization|nas-identifier|nas-port-id|vlan-assignment]

radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|vlan-assignment]

Parameters
- radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|vlan-assignment]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic-authorization</td>
<td>Enables support for disconnect and change of authorization messages (RFC5176) When enabled, this option extends the RADIUS protocol to support unsolicited messages from the RADIUS server. These messages allow administrators to issue change of authorization (CoA) messages, which affect session authorization, or disconnect messages (DM) that terminate a session immediately. This option is disabled by default.</td>
</tr>
</tbody>
</table>
| nas-identifier <NAS-ID> | Configures the network access server (NAS) identifier attribute, a value that identifies the access point or controller where the RADIUS messages originate. The value specified here is included in the RADIUS NAS-Identifier field for WLAN authentication and accounting packets.  
  • <NAS-ID> – Specify the NAS identifier attribute (should not exceed 256 characters in length). |
| nas-port-id <NAS-PORT-ID> | Configures the NAS port ID attribute, a value that identifies the port from where the RADIUS messages originate  
  • <NAS-PORT-ID> – Specify the NAS port ID attribute (should not exceed 256 characters in length).  
  The profile database on the RADIUS server consists of user profiles for each connected NAS port. Each profile is matched to a username representing a physical port. When authorizing users, it queries the user profile database using a username representative of the physical NAS port making the connection. Set the numeric port value from 0 - 4294967295. |
| vlan-assignment | Configures the VLAN assignment of a WLAN. RADIUS VLAN assignment is disabled by default.  
  When enabled, this option assigns clients to the RADIUS server specified VLANs, overriding the WLAN configuration. This option is disabled by default. If, as part of the authentication process, the RADIUS server returns a client's VLAN-ID in a RADIUS access-accept packet, and this feature is enabled, all client traffic is forwarded on that VLAN. If disabled, the RADIUS server returned VLAN-ID is ignored and the VLAN specified using the vlan/vlan-pool-member options (in the WLAN config mode) is used.  
  Note: If both the RADIUS VLAN assignment and the post authentication VLAN options are enabled, then RADIUS VLAN assignment takes priority over post authentication VLAN configuration. |
Examples

rfs7000-37FABE(config-wlan-test)#radius vlan-assignment

rfs7000-37FABE(config-wlan-test)#show context
wlan test
ssid test

4.1.97.2.38 **registration**

**wlan-mode commands**

Configures settings enabling dynamic validation of devices by MAC address to continue the authentication process. When enabled, this option registers a device’s MAC address, and allows direct access to a previously registered device.

Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

registration [device|device-OTP|external|user]

registration [device|device-OTP|user] group-name <RAD-GROUP-NAME> {agreement-refresh <0-144000>|expiry-time <1-43800>}

registration external host <IP/HOSTNAME> {proxy-mode [none|through-controller|through-rf-domain-manager]}

**Parameters**

- registration external host <IP/HOSTNAME> {proxy-mode [none|through-controller|through-rf-domain-manager]}

<table>
<thead>
<tr>
<th>registration</th>
<th>Enables dynamic user registration. This option is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>external</td>
<td>Forwards user information to an external device (i.e. WLAN authentication is handled by an external controller or access point). Use this option to specify the external controller or access point’s details. This option is disabled by default.</td>

</tr>
</tbody>
</table>
### Examples

- **nx9500-6C8809(config-wlan-test)#registration user group-name guest agreement-refresh 14400 expiry-time 2000**
- **nx9500-6C8809(config-wlan-test)#show context wlan test ssid test bridging-mode local encryption-type none authentication-type none registration user group-name guest expiry-time 2000 agreement-refresh 14400**

**Related Commands**

- **no**
  
  Disables dynamic user registration and removes associated configurations. Also disables forwarding of user information to an external device.
4.1.97.2.39 relay-agent

wlan-mode commands

Enables support for DHCP/DHCPv6 relay agent information (option 82 and DHCPv6-LDRA) feature on this WLAN. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
relay-agent [dhcp-option82|dhcpv6-ldra]

Parameters
- relay-agent [dhcp-option82|dhcpv6-ldra]

| relay-agent | Enables support for the following DHCP and DHCPv6 options: option 82 and Lightweight DHCPv6 Relay Agent (LDRA) respectively. When enabled, this feature allows the DHCP/DHCPv6 relay agent to insert the relay agent information option (option 82, LDRA) in client requests forwarded to the DHCP/DHCPv6 server. This information provides the following:
| dhcp-option82 | Enables DHCP option 82. DHCP option 82 provides client physical attachment information. This option is disabled by default.
| dhcpv6-ldra | Enables the DHCPv6 relay agent. The DHCPv6 LDRA allows DHCPv6 messages to be transmitted on existing networks that do not currently support IPv6 or DHCPv6. This option is disabled by default.

Examples
rfs4000-229D58(config-wlan-test)#relay-agent dhcp-option82
rfs4000-229D58(config-wlan-test)#show context
wlan test
 ssid test

</tr>
</tbody>
</table>
4.1.97.2.40 shutdown

Auto shuts down a WLAN

The auto shutdown mechanism helps regulate the availability of a WLAN based on an administrator defined access period. Use this feature to shut down a WLAN on specific days and hours and restrict periods when the WLAN traffic is either not desired or cannot be properly administered. The normal practice is to shut down WLANs when there are no users on the network, such as after hours, weekends or holidays. This allows administrators more time to manage mission critical tasks since the WLAN's availability is automated.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
shutdown {on-critical-resource <CR-NAME>|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}
```

Parameters

- `shutdown {on-critical-resource <CR-NAME>|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>shutdown</code></td>
<td>Auto shuts down the WLAN when specified events occur. Disabled by default.</td>
</tr>
</tbody>
</table>
  - `<CR-NAME>` – Specifies the name of the critical resource being monitored for this WLAN.                                        |
| on-meshpoint-loss          | Optional. Auto shuts down the WLAN when the root meshpoint link fails (is unreachable). Disabled by default.                           |
| on-primary-port-link-loss  | Optional. Auto shuts down the WLAN when a device losses its primary Ethernet port (ge1/up1) link. Disabled by default.                  |
| on-unadoption              | Optional. Auto shuts down the WLAN when an adopted device becomes unadopted. Disabled by default.                                    |

Usage Guidelines

If the shutdown on-meshpoint-loss feature is enabled, the WLAN status changes only if the meshpoint and the WLAN are mapped to the same VLAN. If the meshpoint is mapped to VLAN 1 and the WLAN is mapped to VLAN 2, then the WLAN status does not change on loss of the meshpoint.

Examples

```
rfs7000-37FABE(config-wlan-test)#shutdown on-unadoption
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local

Removes the WLAN's SSID
4.197.2.42 t5-client-isolation

Disallows clients connecting to the WLAN to communicate with one another. This setting applies exclusively to CPE devices managed by a T5 controller and is disabled by default.

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.

Supported in the following platforms:

- Wireless Controllers — RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

t5-client-isolation

Parameters

None

Examples

nx9500-6C8809(config-wlan-test)#t5-client-isolation

nx9500-6C8809(config-wlan-test)#show context wlan test

ssid test

encryption-type none

authentication-type none

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
t5-security [static-wep|wpa-enterprise|wpa-personal]
```

```
t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]
```

```
t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp] version [mixed|wpa|wpa2]
```

**Parameters**

- `t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]`

- `t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp] version [mixed|wpa|wpa2]`

<table>
<thead>
<tr>
<th>t5-security static-wep</th>
<th>Configures the T5 WLAN security type as static-wep</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryption-type [wep128</td>
<td>wep64]</td>
</tr>
<tr>
<td>hex &lt;STRING&gt;</td>
<td>Configures the hex password (used to derive the security key)</td>
</tr>
<tr>
<td>passphrase &lt;STRING&gt;</td>
<td>Configures the passphrase shared by both transmitting and receiving authenticators</td>
</tr>
</tbody>
</table>

**NOTE:** This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

`t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp] version [mixed|wpa|wpa2]`

| t5-security [wpa-enterprise|wpa-personal] | Configures the T5 WLAN security type as: wpa-enterprise OR wpa-personal |
### Examples

```
nx9500-6C8809(config-wlan-test)#t5-security wpa-enterprise encryption-type ccmp
version wpa

nx9500-6C8809(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none
  t5-security wpa-enterprise encryption-type ccmp version wpa
  t5-client-isolation
nx9500-6C8809(config-wlan-test)#
```
4.1.97.2.44 time-based-access

Configure time-based access to the network resources.

Administrators can use this feature to assign fixed days and time of WLAN access for wireless clients.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
```
time-based-access days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start <START-TIME>} [end <END-TIME>]
```

Parameters
- `day <option>` Specifies the day or days on which the client can access the WLAN
  - sunday – Allows access on Sundays only
  - monday – Allows access on Mondays only
  - tuesday – Allows access on Tuesdays only
  - wednesday – Allows access on Wednesdays only
  - thursday – Allows access on Thursdays only
  - friday – Allows access on Fridays only
  - saturday – Allows access on Saturdays only
  - weekends – Allows access on weekends only
  - weekdays – Allows access on weekdays only
  - all – Allows access on all days
- `start <START-TIME>` Optional. Specifies the access start time in hours and minutes (HH:MM)
- `end <END-TIME>` Specifies the access end time in hours and minutes (HH:MM)

Usage Guidelines
Ensure the system clock is configured correctly.

Examples
```
rfs7000-37FABE(config-wlan-test)#time-based-access days weekdays start 10:00 end 16:30
```
```
rfs7000-37FABE(config-wlan-test)#show context
wlan test
 ssid testWLAN1
 bridging-mode local
 encryption-type none
 authentication-type none
 protected-mgmt-frames mandatory
 radius vlan-assignment
time-based-access days weekdays start 10:00 end 16:30
--More--
rfs7000-37FABE(config-wlan-test)#
```

Related Commands
- `no` Removes the configured time-based-access settings
4.1.97.2.45 use

**wlan-mode commands**

This command associates an existing captive portal with a WLAN.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
use [aaa-policy|application-policy|association-acl-policy|bonjour-gw-discovery-policy|
captive-portal|ip-access-list|ipv6-access-list|mac-access-list|passpoint-policy|
roaming-assist-policy|url-filter|wlan-qos-policy]
```

```
use [aaa-policy <AAA-POLICY-NAME>|application-policy <POLICY-NAME>|association-acl-policy |
bonjour-gw-discovery-policy <POLICY-NAME>|captive-portal <CAPTIVE-PORTAL-NAME>|passpoint-policy |
```

```
use ip-access-list [in|out] <IP-ACCESS-LIST-NAME>
```

```
use ipv6-access-list [in|out] <IPv6-ACCESS-LIST-NAME>
```

```
use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME>
```

**Parameters**

- **aaa-policy <AAA-POLICY-NAME>**
  - Uses an existing AAA policy with a WLAN
  - **<AAA-POLICY-NAME>** – Specify the AAA policy name.

- **application-policy <POLICY-NAME>**
  - Uses an existing application policy with a WLAN. An application policy defines actions to perform on a packet when it matches a specified set of pre-defined applications or application categories. For more information, see `application-policy`.
  - **<POLICY-NAME>** – Specify the policy name.

- **association-acl <ASSOCIATION-POLICY-NAME>**
  - Uses an existing association ACL policy with a WLAN
  - **<ASSOCIATION-POLICY-NAME>** – Specify the association ACL policy name.

- **bonjour-gw-discovery-policy <POLICY-NAME>**
  - Uses an existing Bonjour GW Discovery policy with a WLAN. When associated, the Bonjour GW Discovery policy defines a list of services clients can discover across subnets.
  - Bonjour enables discovery of services on a LAN. Bonjour allows the setting up a network (without any configuration) in which services such as printers, scanners and file-sharing servers can be found using Bonjour. Bonjour only works within a single broadcast domain. However, with a special DNS configuration, it can be extended to find services across broadcast domains.
  - **<POLICY-NAME>** – Specify the Bonjour GW Discovery policy name (should be existing and configured).
  - **Note:** For more information on Bonjour GW Discovery policy, see `bonjour-gw-discovery-policy`.

Usage Guidelines

IP and MAC ACLs act as firewalls within a WLAN. WLANs use ACLs as firewalls to filter or mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of Access Control Entries (ACEs). Each ACE specifies a set of conditions (rules) and the action taken in case of a match. The action can be permit, deny, or mark. Therefore, when a packet matches an ACE’s conditions, it is either forwarded, dropped, or marked depending on the action specified in the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP ACLs contain deny and permit rules specifying source and destination IP addresses. Each rule has a precedence order assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, you can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny, or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

Examples

```

```

Related Commands

```
no
```

Removes the following policies associated with a WLAN: aaa-policy, application-policy, association-acl-policy, bonjour-gw-discovery-policy, captive-portal, ip-access-list, ipv6-access-list, mac-access-list, passpoint-policy, roaming-assist-policy, url-filter, or wlan-qos-policy.
4.1.97.2.46  vlan

 Sets the VLAN where traffic from a WLAN is mapped

 Supported in the following platforms:

 - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
 - Wireless Controllers — RFS4000, RFS6000, RFS7000
 - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

 Syntax
 vlan [<1-4094>|<VLAN-ALIAS-NAME>]

 Parameters

 - vlan [<1-4094>|<VLAN-ALIAS-NAME>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-4094&gt;</td>
<td>Sets a WLAN's VLAN ID. This command starts a new VLAN assignment for a WLAN index. All prior VLAN settings are erased. Use this command to assign just one VLAN to the WLAN. Utilizing a single VLAN per WLAN is a more typical deployment scenario than using a VLAN pool.</td>
</tr>
<tr>
<td>&lt;VLAN-ALIAS-NAME&gt;</td>
<td>Assigns a VLAN alias to the WLAN. The VLAN alias should exist and be configured. Note: A VLAN alias maps a name to a VLAN ID. When applied to ports (for example GE ports) using the trunk mode, a VLAN alias denies or permits traffic, on the port, to and from the VLANs specified in the alias. For more information on aliases, see alias.</td>
</tr>
</tbody>
</table>

 Examples
 rfs7000-37FABE(config-wlan-test)#vlan 4
rfs7000-37FABE(config-wlan-test)#show context wlan test
 ssid testWLAN1
 vlan 4
 bridging-mode local
 encryption-type none

 proxy-arp-mode strict
 broadcast-dhcp validate-offer
 shutdown on-unadoption
 http-analyze controller
 rfs7000-37FABE(config-wlan-test)#

 Related Commands

 - no: Removes a WLAN’s default VLAN mapping
4.1.97.2.47 vlan-pool-member

 Adds a member VLAN to a WLAN's VLAN pool. Use this option to define the VLANs available to this WLAN. Additionally, define the number of wireless clients supported by each VLAN.

NOTE: Configuration of a VLAN pool overrides the 'vlan' configuration.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

vlan-pool-member <WORD> {limit <0-8192>}

Parameters

- vlan-pool-member <WORD> {limit <0-8192>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan-pool-member &lt;WORD&gt;</td>
<td>Adds a member VLAN to a WLAN's VLAN pool</td>
</tr>
<tr>
<td>Note: Since users belonging to separate VLANs can share the same WLAN, it is not necessary to create a new WLAN for every VLAN in the network.</td>
<td></td>
</tr>
<tr>
<td>&lt;WORD&gt;</td>
<td>Define the VLANs available to this WLAN. It is either a single index, or a list of VLAN IDs (for example, 1,3,7), or a range (for example, 1-10)</td>
</tr>
<tr>
<td>limit &lt;0-8192&gt;</td>
<td>Optional. Is ignored if the number of clients are limited and well within the limits of the DHCP pool on the VLAN</td>
</tr>
<tr>
<td></td>
<td>- &lt;0-8192&gt; – Specifies the number of users allowed</td>
</tr>
</tbody>
</table>

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

wep128 [key|keys-from-passkey|transmit-key]

wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]

wep128 keys-from-passkey <WORD>

wep128 transmit-key <1-4>

Parameters

- **wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]**

  sets keys as ASCII characters (5 characters for WEP64, 13 for WEP128)
  - **0 <WORD>** – Configures a clear text key
  - **2 <WORD>** – Configures an encrypted key
  - **<WORD>** – Configures keys as 13 ASCII characters converted to hex, or 26 hexadecimal characters

- **wep128 keys-from-passkey <WORD>**

  Specifies a passphrase from which keys are derived
  - **<WORD>** – Specify a passphrase from 4 - 32 characters.

- **wep128 transmit-key <1-4>**

  Configures the key index used for transmission from an AP to a wireless client or service platform
  - **<1-4>** – Specify a key index from 1 - 4.
Examples

rfs7000-37FABE(config-wlan-test)#wep128 keys-from-passkey example@123

wlan-mode commands

Configures WEP64 parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

wep64 [key|keys-from-passkey|transmit-key]
wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
wep64 keys-from-passkey <WORD>
wep64 transmit-key <1-4>

Parameters

- **wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]**
  - Configures pre-shared hex keys
  - **<1-4>** — Configures a maximum of four key indexes. Select a key index from 1 - 4.
  - **ascii**
    - [0 <WORD>|2 <WORD>|<WORD>]
    - Sets keys as ASCII characters (5 characters for WEP64, 13 for WEP128)
    - **0 <WORD>** — Configures a clear text key
    - **2 <WORD>** — Configures an encrypted key
    - **<WORD>** — Configures the key (10 hex or 5 ASCII characters for WEP64, 26 hex or 13 ASCII characters for WEP128).

- **wep64 keys-from-passkey <WORD>**
  - Specifies a passphrase from which keys are derived
  - **<WORD>** — Specify a passphrase from 4 - 32 characters.

- **wep64 transmit-key <1-4>**
  - Configures the key index used for transmission from an AP to a wireless client or service platform
  - **<1-4>** — Specify a key index from 1 - 4.
### Examples

4.197.2.50 wing-extensions

wlan-mode commands

Enables support for WiNG-specific client extensions to the IEEE 802.11x WLAN standards that potentially increase client roaming reliability and handshake speed

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
wing-extensions [ap-attributes-information {include-hostname}]
coverage-hole-detection {11k-clients|offset <5-20>|threshold <-80--60}]
ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}
smart-scan|wing-load-information|wmm-load-information]
```

Parameters

- wing-extensions [ap-attributes-information {include-hostname}]
- coverage-hole-detection {11k-clients|offset <5-20>|offset <5-20>|threshold <-80--60}]
- ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}
- smart-scan|wing-load-information|wmm-load-information]

</tr>
<tr>
<td></td>
<td>• include-hostname – Optional. When enabled, includes AP's hostname, as a sub-element, in the AP attributes IE.</td>
</tr>
<tr>
<td></td>
<td>The AP attributes IE is vendor-specific and, when enabled, is added to beacons and probe responses. Inclusion of AP attributes IE allows Zebra terminals to:</td>
</tr>
<tr>
<td></td>
<td>- Recognize Zebra APs</td>
</tr>
<tr>
<td></td>
<td>- Determine if the AP supports PAN BU features, irrespective of whether these features are enabled or not.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> AP attributes IE is not added to beacons and probe responses by default.</td>
</tr>
<tr>
<td>coverage-hole-detection {11k-clients</td>
<td>offset &lt;5-20&gt;threshold &lt;-80--60}&gt;</td>
</tr>
<tr>
<td></td>
<td>After enabling CHD, optionally configure the following parameters:</td>
</tr>
<tr>
<td></td>
<td>• 11k-clients – Optional. Provides coverage hole detection to 802.11k-only-capable clients. This is a reduced set of coverage hole detection capabilities (standard 11k messages and behaviors). This option is disabled by default.</td>
</tr>
<tr>
<td></td>
<td>• offset &lt;5-20&gt; – Optional. Configures the offset added to the threshold to obtain the access point’s signal strength (as seen by the client) considered adequate.</td>
</tr>
<tr>
<td></td>
<td>• &lt;5-20&gt; – Specify the offset value from 5 - 20. The default is 5.</td>
</tr>
<tr>
<td></td>
<td>• threshold – Optional. Configures the access point’s signal strength threshold. When Radio Resource Measurement and CVG Hole are enabled, specify a threshold for the AP’s signal strength (as seen by the client) below which a coverage hole incident is reported by the client.</td>
</tr>
<tr>
<td></td>
<td>• &lt;-80--60&gt; – Specify the threshold from -80 - -60 dBm. The default is -70 dBm.</td>
</tr>
</tbody>
</table>
### ft-over-ds-aggregate
Enables fast-transition (FT) aggregation of action frames. When enabled, increases roaming speed by eliminating separate key exchange handshake frames with potential roam candidates. Enable fast transition to complete an initial FT over distribution system (DS) handshake with multiple roam candidates (up to 6) at once, eliminating the need to send separate FT over DS handshakes to each roam candidate. This option is disabled by default.

### move-command
Enables use of Hyper Fast Secure Roaming (HFSR) for clients on this WLAN. This feature applies only to certain client devices. This option is disabled by default.

### scan-assist
Enables support for scanning assist. When enabled, allows faster roams on Dynamic Frequency Selection (DFS) channels by eliminating passive scans. Clients get channel information directly from possible roam candidates. This option is disabled by default.

- channel-info-interval <6-9> – Optional. Configures the interval at which channel information is periodically retrieved from potential roam candidates without requesting scan assist.
- <6-9> – Specify the interval from 6 - 9 seconds. When enabled, the default value is 8 seconds.

### smart-scan
Enables a smart scan to refine a clients channel scans to just a few channels as opposed to all available channels. This option is disabled by default.

### wing-load-information
Enables support for the WiNG load information element (Element ID 173) with legacy Symbol Technology clients, thus making them optimally interoperable with the latest Zebra access points. This option is enabled by default.

### wmm-load-information
Enables support for WiNG Wi-Fi MultiMedia (WMM) Load Information Element in radio transmissions with legacy clients. This option is disabled by default.

### Examples
```
rfs7000-37FABE(config-wlan-test)#wing-extensions wmm-load-information

<td></td>
</tr>
</tbody>
</table>
tx-power <0-20> Configures the transmit power indicated to clients
  • <0-20> – Specify a value from 0 - 20 dBm.

vlan-cache-ageout <60-86400> Configures the timeout period for which client VLAN information is cached across associations.
  • <60-86400> – Specify a value from 60 - 86400 seconds.

- wireless-client roam-notification [after-association|after-data-ready|auto]
  wireless-client Configures the transmit power indicated to wireless clients for transmission
  roam-notification Configures when a roam notification is transmitted
  after-association Transmits a roam notification after a client has associated
  after-data-ready Transmits a roam notification after a client is data-ready (after completion of authentication, handshakes, etc.)
  auto Transmits a roam notification upon client association (if the client is known to have authenticated to the network)

4.1.97.252 wpa-wpa2

* wlan-mode commands *

Modifies TKIP-CCMP (WPA/WPA2) related parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|server-only-authentication|psk|tkip-countermeasures|use-sha256-akm]
wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|server-only-authentication|use-sha256-akm]
```

```
wpa-wpa2 handshake [attempts|init-wait|priority|timeout]
wpa-wpa2 handshake [attempts <1-5>|init-wait <5-1000000>|priority [high|normal]|timeout <10-5000> {10-5000}]
wpa-wpa2 key-rotation [broadcast|unicast] <30-86400>
wpa-wpa2 psk [0 <LINE>|2 <LINE>|<LINE>]
wpa-wpa2 tkip-countermeasures holdtime <0-65535>
```

Parameters

- `wpa-wpa2` Modifies TKIP-CCMP (WPA/WPA2) related parameters
- `exclude-wpa2-tkip` Excludes the Wi-Fi Protected Access II (WPA2) version of TKIP. It supports the WPA version of TKIP only. This option is disabled by default.
- `opp-pmk-caching` Uses opportunistic key caching (same Pairwise Master Key (PMK) across APs for fast roaming with EAP.802.1x. This option is enabled by default.
- `pmk-caching` Uses cached pair-wise master keys (fast roaming with eap/802.1x). This option is enabled by default.
- `preauthentication` Uses pre-authentication mode (WPA2 fast roaming)
- `server-only-authentication` Uses online sign up server-only-authenticated encryption network. This option is disabled by default.
- `use-sha256-akm` Uses sha256 authentication key management suite. This option is disabled by default.

- `wpa-wpa2 handshake` Configures WPA/WPA2 handshake parameters
  - `attempts <1-5>` Configures the total number of times a message is transmitted towards a non-responsive client
  - `<1-5>` — Specify a value from 1 - 5. The default is 2.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| init-wait <5-1000000> | Configures a minimum wait-time period, in microseconds, before the first handshake message is transmitted from the AP. This option is disabled by default.  
  • <5-1000000> – Specify a value from 5 - 1000000 microseconds. |
| priority [high|normal] | Configures the relative priority of handshake messages compared to other data traffic  
  • high – Treats handshake messages as high priority packets on a radio. This is the default setting.  
  • normal – Treats handshake messages as normal priority packets on a radio |
| timeout <10-5000> <10-5000> | Configures the timeout period, in milliseconds, for a handshake message to retire. Once this period is exceed, the handshake message is retired.  
  • <10-5000> – Specify a value from 10 - 5000 milliseconds. The default is 500 milliseconds.  
  • <10-5000> – Optional. Configures a different timeout between the second and third attempts |

- **wpa-wpa2 key-rotation [broadcast|unicast] <30-86400>**

- **wpa-wpa2** Modifies TKIP-CCMP (WPA/WPA2) related parameters

  - **key-rotation** Configures parameters related to periodic rotation of encryption keys. The periodic key rotation parameters are broadcast, multicast, and unicast traffic.

  - **broadcast <30-86400>** Configures the periodic rotation of keys used for broadcast and multicast traffic. This parameter specifies the interval, in seconds, at which keys are rotated. This option is disabled by default.  
    • <30-86400> – Specify a value from 30 - 86400 seconds.

  - **unicast <30-86400>** Configures a periodic interval for the rotation of keys, used for unicast traffic. This option is disabled by default.  
    • <30-86400> – Specify a value from 30 - 86400 seconds.

- **wpa-wpa2 psk [0 <LINE>|2 <LINE>|<LINE>]**

  - **psk** Configures a pre-shared key. The key options are: 0, 2, and LINE  
    • 0 <LINE> – Configures a clear text key  
    • 2 <LINE> – Configures an encrypted key  
    • <LINE> – Enter the pre-shared key either as a passphrase not exceeding 8 - 63 characters, or as a 64 character (256bit) hexadecimal value

- **wpa-wpa2 tkip-countermeasures holdtime <0-65535>**

  - **tkip-countermeasures** Configures a hold time period for implementation of TKIP counter measures  
    - **holdtime <0-65535>** Configures the amount of time a WLAN is disabled when TKIP counter measures are invoked  
      • <0-65535> – Specify a value from 0 - 65535 seconds. The default is 60 seconds.

4.1.97.2.53 service

▲ wlan-mode commands

Invokes service commands applicable in the WLAN configuration mode

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6522, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

service [allow-ht-only|allow-open-passpoint|cred-cache|eap-mac-mode|eap-mac-multicopy|
eap-mac-multikeys|eap-throttle|enforce-pmkid-validation|key-index|monitor|
radio-crypto|reauthentication|session-timeout|tx-deauth-on-roam-detection|
unresponsive-client|wpa-wpa2|show]

service [allow-ht-only|allow-open-passpoint|cred-cache [clear-on-4way-timeout|
clear-on-disconnect]|eap-mac-multicopy|eap-mac-multikeys|enforce-pmkid-validation|
radio-crypto|reauthentication seamless|session-timeout mac|
trans-deauth-on-roam-detection|show cli]

service eap-mac-mode [mac-always|normal]

service eap-throttle <0-254>

service key-index eap-wep-unicast <1-4>

service monitor [aaa-server|adoption|captive-portal|dhcp|dns]

service monitor [aaa-server|adoption vlan <1-4094>|captive-portal external-server]

service monitor [dhcp|dns] crm <RESOURCE-NAME> vlan <1-4094>

service unresponsive-client [attempts <1-1000>|ps-detect {threshold <1-1000>|
timeout <1-60>]]

service wpa-wpa2 exclude-ccmp

Parameters

- service [allow-ht-only|allow-open-passpoint|cred-cache [clear-on-4way-timeout|clear-
on-disconnect]|eap-mac-multicopy|eap-mac-multikeys|enforce-pmkid-validation|radio-
crypto|reauthentication seamless|session-timeout mac|trans-deauth-on-roam-detection|show cli]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow-ht-only</td>
<td>Only allows clients capable of High Throughput (802.11n) data rates to associate. This option is disabled by default.</td>
</tr>
<tr>
<td>allow-open-passpoint</td>
<td>Enables non-WPA2 security for passpoint WLANs. This option is disabled by default. For more information on passpoint policy and configuration, see PASSPOINT POLICY.</td>
</tr>
</tbody>
</table>
| cred-cache                | Clears credential cache based on the parameter passed
<p>| [clear-on-4way-timeout]    | • clear-on-4way-timeout – Clears cached client credentials after the 4way handshake with a client has timed out. This option is enabled by default. |
| [clear-on-disconnect]     | • clear-on-disconnect – Clears cached client credentials after the client has disconnected from the network. This option is disabled by default. |
| eap-mac-multicopy         | Enables sending of multiple copies of broadcast and unicast messages. This option is disabled by default. |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>eap-mac-multikeys</code></td>
<td>Enables configuration of different key indices for MAC authentication. This option is disabled by default.</td>
</tr>
<tr>
<td><code>enforce-pmkid-validation</code></td>
<td>Validates the <em>Predictive real-time pairwise master key identifier</em> (PMKID) contained in a client’s association request against the one present in the wpa-wpa2 handshake. This option is enabled by default. This functionality is based on the <em>Proactive Key Caching</em> (PKC) extension of the 802.11 EEEE standard. Whenever a wireless client successfully authenticates with an AP it receives a <em>pairwise master key</em> (PMK). PKC allows clients to cache this PMK and reuse it for future re-authentications with the same AP. The PMK is unique for every client and is identified by the PMKID. The PMKID is a combination of the hash of the PMK, a string, the station and the MAC addresses of the AP.</td>
</tr>
<tr>
<td><code>radio-crypto</code></td>
<td>Uses radio hardware for encryption and decryption. This is applicable only for devices using <em>Counter Cipher Mode with Block Chaining Message Authentication Code Protocol</em> (CCMP) encryption mode. This option is enabled by default.</td>
</tr>
<tr>
<td><code>reauthentication seamless</code></td>
<td>Enables seamless EAP client reauthentication without disconnecting client after the session has timed out. This option is enabled by default.</td>
</tr>
<tr>
<td><code>session-timeout mac</code></td>
<td>Enables reauthentication of MAC authenticated clients without disconnecting client after the session has timed out. This option is enabled by default.</td>
</tr>
<tr>
<td><code>tx-deauth-on-roam-detection</code></td>
<td>Transmits a deauthentication on the air while disassociating a client because its roam is detected on the wired side. This option is disabled by default.</td>
</tr>
<tr>
<td><code>show cli</code></td>
<td>Displays the CLI tree of the current mode. When used in the WLAN mode, this command displays the WLAN CLI structure.</td>
</tr>
<tr>
<td>• `service eap-mac-mode [mac-always</td>
<td>normal]`</td>
</tr>
<tr>
<td><code>eap-mac-mode</code></td>
<td>Configures the EAP and/or MAC authentication mode used with this WLAN. This option is enabled by default.</td>
</tr>
<tr>
<td><code>mac-always</code></td>
<td>Enables both EAP and MAC authentication. MAC authentication is performed first, followed by EAP authentication. Clients are granted access based on the EAP authentication result. If a client does not have EAP, the MAC authentication result is used to grant access.</td>
</tr>
<tr>
<td><code>normal</code></td>
<td>Grants client access if the client clears either EAP or MAC authentication. This is the default setting.</td>
</tr>
<tr>
<td>• <code>service eap-throttle &lt;0-254&gt;</code></td>
<td>Enables EAP request throttling. Use this command to specify the maximum number of parallel EAP sessions allowed on this WLAN. Once this specified value is exceeded, all incoming EAP session requests are throttled. This option is enabled by default. <em>&lt;0-254&gt; – Specify a value from 0 - 254. This default value is 0.</em></td>
</tr>
<tr>
<td>• <code>service key-index eap-wep-unicast &lt;1-4&gt;</code></td>
<td>Configures an index with each key during EAP authentication with WEP. This option is enabled by default. <em>&lt;1-4&gt; – Select a index from 1 - 4. The default value is 1.</em></td>
</tr>
</tbody>
</table>
### wpa-wpa2 exclude-ccmp

**Service:**

Configures exclusion of CCMP requests when the authentication mode is set to tkip-ccmp. When enabled, it provides compatibility for client devices not compliant with tkip-ccmp. This option is disabled by default.

### service monitor [aaa-server|adoption vlan <1-4094>|captive-portal external-server]

<table>
<thead>
<tr>
<th><strong>Monitor</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>monitor</strong></td>
<td>Enables critical resource monitoring. In a WLAN, service monitoring enables regular monitoring of external AAA servers, captive portal servers, access point adoption, DHCP, and DNS servers. When enabled, it allows administrators to notify users of a service's availability and make resource substitutions in case of unavailability of a service.</td>
</tr>
<tr>
<td><strong>aaa-server</strong></td>
<td>Enables external AAA server failure monitoring. When enabled monitors an external RADIUS server resource’s AAA activity and ensures its adoption and availability. This feature is disabled by default.</td>
</tr>
<tr>
<td><strong>adoption vlan &lt;1-4094&gt;</strong></td>
<td>Enables adoption failure monitoring on an adopted AP. Also configures a adoption failover VLAN. This feature is disabled by default.</td>
</tr>
<tr>
<td><strong>captive-portal external-server</strong></td>
<td>Enables external captive portal server failure monitoring. When enabled, monitors externally hosted captive portal activity, and user access to the controller or service platform managed network. This feature is disabled by default.</td>
</tr>
</tbody>
</table>

### dhcp

**Service:**

Enables monitoring of a specified DHCP server. When the connection to the DHCP server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default.

**Note:** Use the `crm` keyword to specify the DHCP server to monitor.

### dns

**Service:**

Enables monitoring of a specified DNS server. When the connection to the DNS server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default.

**Note:** Use the `crm` keyword to specify the DNS server to monitor.
### GLOBAL CONFIGURATION COMMANDS 4-501

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **crm <RESOURCE-NAME>** | This keyword is common to the 'dhcp' and 'dns' parameters.  
• **crm** – Identifies the DHCP and/or DNS server to monitor  
• **<RESOURCE-NAME>** – Specify the name of the DHCP or DNS server.  
**Note:** Once enabled, the CRM server monitors the DHCP/DNS server and updates their status as 'up' or 'down' depending on the availability of the resource. When either of these resources is down the wireless client is mapped to the failover VLAN and served with the 'no-service' page through the access point. |
| **vlan <1-4094>** | This keyword is common to the 'dhcp' and 'dns' parameters.  
After specifying the DHCP/DNS server resource, specify the failover VLAN.  
• **VLAN <1-4094>** – Configures the failover VLAN from 1 - 4094.  
**Note:** When the DHCP server resource becomes unavailable, the device falls back to the VLAN defined here. This VLAN has a DHCP server configured that provides a pool of IP addresses with a lease time less than the main DHCP server.  
**Note:** When this DNS server resource becomes unavailable, the device falls back to the VLAN defined here. This VLAN has a DNS server configured that provides DNS address resolution until the main DNS server becomes available. |
| **eap-mac-mode** | Configures handling of unresponsive clients |
| **attempts <1-1000>** | Configures the maximum number of successive packets that failed transmission  
• **<1-1000>** – Specify a value from 1 - 1000. The default is 7. |
| **ps-detect {threshold <1-1000>** | Enables the detection of power-save mode clients, whose PS stats has not been updated on the AP. This option is enabled by default.  
• **threshold** – Optional. Configures the threshold at which power-save client detection is triggered  
• **<1-1000>** – Configures the number of successive unacknowledged packets received before power-save detection is triggered. Specify a value from 1 - 1000. The default is 3. |
| **timeout <1-60>** | Configures the interval, in seconds, for successive packets not acknowledged by the client  
• **<1-60>** – Specify a value from 1 - 60 seconds. The default is 3 seconds. |

### Examples

```plaintext
rfs4000-229D58(config-wlan-test)#service allow-ht-only

rfs4000-229D58(config-wlan-test)#service monitor aaa-server

rfs4000-229D58(config-wlan-test)#show context wlan test ssid test vlan 1 bridging-mode tunnel encryption-type none authentication-type none service monitor aaa-server service allow-ht-only controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#
```

4.1.98 wlan-qos-policy

Global Configuration Commands

Configures a WLAN QoS policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

wlan-qos-policy <WLAN-QOS-POLICY-NAME>

Parameters

- wlan-qos-policy <WLAN-QOS-POLICY-NAME>

Examples

rfs7000-37FABE(config)#wlan-qos-policy test
rfs7000-37FABE(config-wlan-qos-test)#?

WLAN QoS Mode commands:

- accelerated-multicast Configure accelerated multicast streams address asnd
  forwarding QoS classification
- classification Select how traffic on this WLAN must be classified
  (relative prioritization on the radio)
- multicast-mask Egress multicast mask (frames that match bypass the
  PSPqueue. This permits intercom mode operation
  without delay even in the presence of PSP clients)
- no Negate a command or set its defaults
- qos Quality of service
- rate-limit Configure traffic rate-limiting parameters on a
  per-wlan/per-client basis
-svp-prioritization Enable spectralink voice protocol support on this
  wlan
- voice-prioritization Prioritize voice client over other client (for
  non-WMM clients)
- wmm Configure 802.11e/Wireless MultiMedia parameters

<tr>
<td><code>smart-cache-policy-mode commands</code></td>
<td>Summarizes the smart cache policy configuration mode commands</td>
<td>page 4-507</td>
</tr>
</tbody>
</table>
4.1.99.1 smart-cache-policy

smart-cache-policy

Creates a new smart cache policy and enters its configuration mode.

Content caching is a mechanism that allows temporary caching of frequently accessed content on intermediate network devices. When enabled, subsequent requests for the same content are serviced from the cache locally and not fetched from originating servers, resulting in reduced bandwidth usage, lower latency, and reduced data transfers from originating servers. The WiNG smart cache policy supports both forward caching and transparent caching.

Forward content caching stores content temporarily on the local network. This locally stored content can be retrieved, when required, without routing a request to an external server on the Internet.

Transparent content caching, on the other hand, acts as an intermediary for the originating servers and returns cached content to clients as if the data originated from the associated servers. Transparent caching proxies perform server load-balancing and compression to regulate load on the originating servers and reduce bandwidth usage.

The smart cache policy also supports dynamic content caching, allowing caching of content from popular video content sharing sites, such as youtube.com, cnn.com, msn.com, etc.

Enabling content caching improves Web browsing (for data and video content) for consumers using Kiosks, tablets, and smart phones. A smart cache policy is enabled by associating it with a device or a profile.

Configure the policy’s forward proxy, transparent proxy and several additional settings before actual HTML pages can be defined for the smart caching configuration.

NOTE: Content caching is a licensed feature, supported only on the NX45XX and NX65XX series service platforms. To enable content caching on a device, use the license command (in the device-config mode) and provide the SMART-CACHE license key. For more information, see license.

NOTE: Though the NX9000 series service platforms do not support content caching, they support the configuration of smart-content caching policies that can be applied to the NX45XX and NX65XX series service platforms. The NX9000 series service platforms are capable of adopting and configuring NX45XX and NX65XX series service platforms.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

smart-cache-policy <SMART-CACHE-POLICY-NAME>

Parameters

- smart-cache-policy <SMART-CACHE-POLICY-NAME>

| <SMART-CACHE-POLICY-NAME> | Creates a new smart content cache policy. Specify the policy name. If the policy does not exist, it is created. |

Examples

nx4500-5CFA2B(config)#smart-cache-policy ?
SMART-CACHE-POLICY Name of the content caching to be configured (will be created if it does not exist)

nx4500-5CFA2B(config)#smart-cache-policy test

</table>
4.1.99.2.1 access-log

smart-cache-policy-mode commands

Enables client request logging. When enabled, this feature logs client access details to the `/var/log/smart-cache.log`. This feature is enabled by default.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

access-log {rotate <0-10> rotate-type [duration <1-100> day|size <1-100> MB]}

Parameters
- access-log {rotate <0-10> rotate-type [duration <1-100> day|size <1-100> MB]}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotate &lt;0-10&gt;</td>
<td>Optional. Enables log file rotation, and configures the number of rotation. This is the number of log files retained (stored locally) out of the total generated.</td>
</tr>
<tr>
<td></td>
<td>• &lt;0-10&gt; – Optional. Specify the number of rotations from 0 - 10. The default is 10 rotations on every 1 MB.</td>
</tr>
<tr>
<td>rotate-type</td>
<td>Optional. Configures access log file rotation conditions, such as duration and size</td>
</tr>
<tr>
<td>[duration &lt;1-100&gt; day]</td>
<td>duration &lt;1-100&gt; – Rotates log files by time. Specify the time from 1 - 100 days. The default is 1 day.</td>
</tr>
<tr>
<td></td>
<td>size &lt;1-100&gt; – Rotates log files by file size. Specify the size from 1 - 100 MB.</td>
</tr>
</tbody>
</table>

Examples

```
nx4500-5CFA2B(config-smart-cache-policy-test)#access-log rotate 10 rotate-type duration 10 day
```

```
nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
  access-log rotate 10 rotate-type duration 10 day
```

Related Commands

- **no** Disables client request logging
4.1.99.2.2 aging

smart-cache-policy-mode commands

Configures the aging rule (refresh pattern) for specific content types

The aging parameters configured are the maximum and minimum age, freshness factor, and the URL regular expressions. These parameters enable the content caching engine to determine if a given request can be processed and the content loaded from the cache or not.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
aging precedence <1-100> [<WORD>|ignore-case <WORD>] min-age <0-525600>
freshness-factor <0-100> max-age <0-525600> { (override-expire|override-lastmod|
reload-into-ims) }
```

Parameters

- **aging precedence <1-100> [<WORD]|ignore-case <WORD>] min-age <0-525600>**
  freshness-factor <0-100> max-age <0-525600> { (override-expire|override-lastmod|
  reload-into-ims) }

<table>
<thead>
<tr>
<th>aging precedence &lt;1-100&gt;</th>
<th>Configures content cache aging rules and assigns a precedence to each rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>Specifies the regular expression to match. This option is case sensitive, and is the default setting.</td>
</tr>
<tr>
<td>ignore-case &lt;WORD&gt;</td>
<td>Specifies the regular expression to match. This option is not case sensitive.</td>
</tr>
<tr>
<td>min-age &lt;0-525600&gt;</td>
<td>Configures the minimum age, in minutes, of matched objects. This value specifies the lower limit on the staleness of a response. A response is not considered stale unless its time in the cache exceeds the specified minimum value.</td>
</tr>
<tr>
<td></td>
<td>• &lt;0-525600&gt; – Specify a value from 0 - 525600 minutes. The default is 1 minute.</td>
</tr>
<tr>
<td>freshness-factor &lt;0-100&gt;</td>
<td>Configures the freshness factor of matched objects as a percentage value. freshness is an expression of how long Web content resides on the service platform's local cache before being updated or removed.</td>
</tr>
<tr>
<td></td>
<td>• &lt;0-100&gt; – Specify a value from 0 - 100%. The default is 100%.</td>
</tr>
<tr>
<td>max-age &lt;0-525600&gt;</td>
<td>Configures the maximum age, in minutes, of matched objects. This value specifies the upper limit on the freshness of a response. A response is not considered fresh unless its time in the cache is less than the specified maximum value.</td>
</tr>
</tbody>
</table>
|                         | • <0-525600> – Specify a value from 0 - 525600 minutes. The default is 525600.
4-510 WiNG 5.8.4 CLI Reference Guide

| (override-expire| override-lastmod| reload-into-ims) | Applies overrides. The options are: |
| | | | • override-expire – Optional. When selected, this option overrides the server sent explicit expiry time by the configured minimum age value. This option causes the content cache engine to check the min value before checking the Expires header. Thus, a non-zero min time makes the engine return an un-validated cache hit even if the response is pre-expired. |
| | | | • override-lastmod – Optional. When selected, this option enforces minimum age even on objects that were modified recently to force the minimum age period on recently modified cached content. This option causes the content cache engine to check the min value before the LM-factor percentage. |
| | | | • reload-into-ims – Optional. When selected, this option makes the content cache engine to transform a request with a no-cache directive into a validation (If-Modified-Since) request. In other words, the engine adds an If-Modified-Since header to the request before forwarding. Note: This works only for objects that have a Last-Modified timestamp. The outbound request retains the nocache directive, so that it reaches the originating server. |

**Examples**

nx4500-5CFA2B(config-smart-cache-policy-test)#aging precedence 1 ignore-case \\.jgp$ min-age 100 freshness-factor 75 max-age 200 reload-into-ims

nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test

  aging precedence 1 ignore-case \\.jgp$ min-age 100 freshness-factor 75 max-age 200 reload-into-ims

  access-log rotate 10 rotate-type duration 10 day

nx4500-5CFA2B(config-smart-cache-policy-test)#

**Related Commands**

| no | Removes an existing aging rule (refresh pattern) |
4.1.99.2.3 cache

smart-cache-policy-mode commands

Configures cache management settings
This command specifies content cache rules that determine if a content is cached or not. Use this feature to filter content before caching. By default content is not cached.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
cache [media|precedence|size]
```

```
cache media { (all|aol|bing|break|cnn|daily-motion|metacafe|vimeo|youtube) }
```

```
cache precedence <1-100> [deny|permit] { destination-domain <DOMAIN-NAME> | destination-domain-regex <WORD> | destination-ip [<IP/M]|any | source-ip <IP/M> | url-regex <URL> }
```

```
cache size <1-32>
```

Parameters

- cache media { (all|aol|bing|break|cnn|daily-motion|metacafe|vimeo|youtube) }

<table>
<thead>
<tr>
<th>cache media</th>
<th>Enables content caching from the following video content sharing sites. The sites currently supported are:</th>

</table>

- cache precedence <1-100> [deny|permit] { destination-domain <DOMAIN-NAME> | destination-domain-regex <WORD> | destination-ip [<IP/M]|any | source-ip <IP/M> | url-regex <URL> }

<table>
<thead>
<tr>
<th>cache precedence &lt;1-100&gt;</th>
<th>Configures cache filtering rules that determine if a content received from the originating server is to be cached or not. You can create multiple cache filtering rules and assign precedence values to each. These rules are applied in order of their precedence.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-100&gt; – Specify a precedence rule from 1 - 100.</td>
</tr>
</tbody>
</table>

| [deny|permit] | Configures the deny or permit caching parameters for this rule |
|-------------|----------------------------------------------------------------|
|             | • permits – Caches content if it matches the defined permit parameters |
|             | • deny – Does not cache content if it matches the defined deny parameters |
cache size <1-32> Configures the maximum caching storage size. This is upper limit on the disk space used for storing cached contents.

Examples

```
x4500-5CFA2B(config-smart-cache-policy-test)#cache size 30

nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
  cache size 30
  aging precedence 1 ignore-case \\.jpg$ min-age 100 freshness-factor 75 max-age 200
  reload-into-ims
  access-log rotate 10 rotate-type duration 10 day

Resets or removes cache management settings
4.1.99.2.4 forward-proxy

smart-cache-policy-mode commands

Enables forward proxy mode on this smart cache policy. This option is disabled by default.
Devices using this smart-cache policy act as a forward proxy on specified VLANs.
This command configures the IP address and port on which the forward proxy server listens for incoming HTTP
requests.
Forward content caching stores content temporarily on the local network. This locally stored content can be
retrieved, when required, without routing a request to an external server on the Internet.
Supported in the following platforms:
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530,
  NX9000, NX9500, NX9510, NX9600

Syntax

forward-proxy {ip|protocol|vlan}
forward-proxy {ip <IP> port <1-32768>}
forward-proxy {protocol [all|ftp|gopher|https]}
forward-proxy {vlan <VLAN-ID>}

Parameters

• forward-proxy {ip <IP> port <1-32768>}

| ip <IP> port <1-32768> | Optional. Configures the IP address and TCP port for forward proxying. If no IP address
| | is provided, the system uses the default smart caching proxy server’s IP (127.0.1.1).
The default port is 3128.

• forward-proxy {protocol [all|ftp|gopher|https]}

| protocol [all|ftp|gopher|https] | Optional. Selects the additional forward proxy resource protocol for smart caching. The options are:
| | • ftp – Selects FTP as the forward proxy resource protocol
| | • gopher – Selects Gopher as the forward proxy resource protocol
| | • https – Selects HTTPS as the forward proxy resource protocol
| | • all – Selects all protocols (this is the default setting)

• forward-proxy {vlan <VLAN-ID>}

| vlan <VLAN-ID> | Optional. Configures the VLAN(s) for which forward proxy mode (content caching) is
| | enabled. By default content caching is disabled on all VLANs. This option is disabled by default.
| | • <VLAN-ID> – Specify the list of VLANs.

Examples

nx4500-5CFA2B(config-smart-cache-policy-test)#forward-proxy vlan 10-20

nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
  forward-proxy vlan 10-20
  cache size 30
  aging precedence 1 ignore-case \\ .jpg$ min-age 100 freshness-factor 75 max-age 200
  reload-into-ims
  access-log rotate 10 rotate-type duration 10 day
  nx4500-5CFA2B(config-smart-cache-policy-test)#

### 4.1.99.2.5 http-access

**smart-cache-policy-mode commands**

Configures HTTP filters. This command configures rules to deny or permit HTTP access. A deny rule specifies the destination domains and source and destination IPs to deny content access. A permit rule specifies the destination domains and source and destination IPs to permit content access.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
http-access precedence <1-100> [deny|permit] {destination-domain <DOMAIN-NAME>|destination-domain-regex <WORD>|destination-ip <IP/M>|mimetype-regex <WORD>|source-ip <IP/M>|url-regex <URL>}
```

**Parameters**

- **http-access precedence <1-100> [deny|permit]**

  Configures HTTP access rules that determine if a IP address is to be accessed or not. You can create multiple HTTP access rules and assign precedence values to each. These rules are applied in order of their precedence.

  - `<1-100>` — Specify a precedence rule from 1 - 100.
  - **Note:** Lower the precedence, higher is the rule priority.

  - **[deny|permit]**

    Configures the deny or permit access parameters for this rule

    - permits — Permits access if the specified parameters are matched
    - deny — Denies access if the specified parameters are matched

- **destination-domain <DOMAIN-NAME>**

  Optional. Specifies the destination domain to match against the hostname in the HTTP request URL

  - `<DOMAIN-NAME>` — Specify the domain name.

- **destination-domain-regex <WORD>**

  Optional. Specifies a regular expression matching on originating server names

  - `<WORD>` — Specify the regular expression.

  The destination domain regex is the same as the destination domain, but the destination domain regex allows you to use standard expression matching on originating server names.

- **destination-ip [IP/M][any]**

  Optional. Specifies the destination server’s IP address, obtained from the HTTP request URL

  - `<IP/M>` — Specify the destination server’s IP address and mask. This is used as the match criteria.
  - **any** — Select to specify any destination IP address as the match criteria.

  - **Note:** Provide the IP address in the A.B.C.D/M format.

  - **Note:** Specify `any` to consider all servers.

- **mimetype-regex <WORD>**

  Optional. Specifies the regular expression used to match the mimetype of a HTTP request
source-ip \[<IP/M>|any\]  
| Optional. Specifies the source IP address (client’s IP address) that is sent out as part of the HTTP request. |
| • \(<IP/M>\) – Specify the source IP address and mask. This is used as the match criteria. |
| • any – Select to specify any source IP address as the match criteria. |
| **Note:** Provide the IP address in the A.B.C.D/M format. |
| **Note:** Specify any to consider all client requests. |

url-regex <URL>  
| Optional. Specifies regular expressions used to match any part of a requested URL, including the transfer protocol and originating server hostname. |
| • <URL> – Specify the regular expression. |

**Examples**

nx4500-5CFA2B(config-smart-cache-policy-test)#http-access precedence 4 deny destination-domain .TechPubs

nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
forward-proxy vlan 10-20
cache size 30
aging precedence 1 ignore-case \\.jgp\$ min-age 100 freshness-factor 75 max-age 200
reload-into-ims
  http-access precedence 4 deny destination-domain .TechPubs
  access-log rotate 10 rotate-type duration 10 day
nx4500-5CFA2B(config-smart-cache-policy-test)#

**Related Commands**

| no | Removes an ACL |
4.1.99.2 no

smart-cache-policy-mode commands

Removes or resets smart cache policy settings

Supported in the following platforms:

• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [access-log|aging|cache|forward-proxy|http-access|parent-proxy|pre-fetch|smart-cache|transparent-proxy]

Parameters

• no <PARAMETERS>

removes or reverts this Smart Cache policy’s settings based on the parameters passed

Examples

The following example displays the content cache policy ‘test’ settings before the no commands are executed:

```
nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
   forward-proxy vlan 10-20
   aging precedence 1 ignore-case \\.jgp\$ min-age 100 freshness-factor 75 max-age 200
   reload-into-ims
   http-access precedence 4 deny destination-domain .TechPubs
   access-log rotate 10 rotate-type duration 10 day
   nx4500-5CFA2B(config-smart-cache-policy-test)#
```

```
nx4500-5CFA2B(config-content-cache-policy-test)#no forward-proxy vlan 10-20
nx4500-5CFA2B(config-smart-cache-policy-test)#no aging precedence 1
nx4500-5CFA2B(config-smart-cache-policy-test)#no access-log rotate
```

The following example displays the content cache policy ‘test’ settings after the no commands are executed:

```
nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
    cache size 30
    http-access precedence 4 deny destination-domain .TechPubs
    nx4500-5CFA2B(config-smart-cache-policy-test)#
```
### 4.1.99.2.7 pre-fetch

**smart-cache-policy-mode commands**

Pre-fetches a specified list of URLs (whose credentials can be stored in the local cache)

This command allows the content cache engine to pre-fetch URLs specified in a URL list. The pre-fetch function is performed immediately or at a scheduled time, based on configuration.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
pre-fetch <URL-LIST-NAME> schedule <TIME>
```

**Parameters**

- `pre-fetch <URL-LIST-NAME> schedule <TIME>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;URL-LIST-NAME&gt;</code></td>
<td>Pre-fetches a list of URLs identified by the <code>&lt;URL-LIST-NAME&gt;</code> keyword. URL lists are used to select highly utilized URLs for smart caching. The selected URLs are monitored and routed according to existing cache content policies. The URL list should be existing and configured. For more information on configuring URL lists, see <code>url-list</code>.</td>
</tr>
<tr>
<td><code>schedule &lt;TIME&gt;</code></td>
<td>Pre-fetches the specified URL list at a specified time</td>
</tr>
<tr>
<td><code>&lt;TIME&gt;</code></td>
<td>Specify the time in the HH:MM format.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx4500-5CFA2B(config-content-cache-policy-test)#pre-fetch test schedule 12:30
```

```
nx4500-5CFA2B(config-content-cache-policy-test)#show context
content-cache-policy test
  forward-proxy vlan 10-20
  cache media all
  cache size 30
  http-access precedence 100 deny destination-domain test destination-domain-regexp test
  access-log rotate 10 every 50 day
  pre-fetch test schedule 12:30
nx4500-5CFA2B(config-content-cache-policy-test)#
```

4.1.99.2.8  parent-proxy

▶ smart-cache-policy-mode commands

Enables upper-layer parent proxy on this smart cache policy

The parent proxy server requires users to authenticate to access Web sites like WinRoute. This setting is disabled by default.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

parent-proxy [enable|host <IP/HOST-NAME> port <1-32768>]

Parameters

- parent-proxy [enable|host <IP/HOST-NAME> port <1-32768>]

<table>
<thead>
<tr>
<th>enable</th>
<th>Enables parent proxy on this smart cache policy</th>
</tr>
</thead>
</table>
| host <IP/HOST-NAME> port <1-32768> | Configures the hostname or IP address of the parent proxy server
- <IP/HOST-NAME> — Specify the parent proxy server’s IP address or hostname.
- port <1-32768> — Specify the TCP port number for the parent proxy server. The default port is 8080.

Examples

nx4500-5CFA2B(config-smart-cache-policy-test)#parent-proxy host 192.168.13.8 port 21

nx4500-5CFA2B(config-smart-cache-policy-test)#show context

parent-proxy host 192.168.13.8 port 21

http-access precedence 4 deny destination-domain .TechPubs

nx4500-5CFA2B(config-smart-cache-policy-test)#

Related Commands

| no | Disables parent proxy on this smart cache policy |
### 4.199.2.9 smart-cache

**smart-cache-policy-mode commands**

Enables smart content caching

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

smart-cache enable

**Parameters**

- smart-cache enable

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>smart-cache enable</td>
<td>Enables smart content caching. When enabled, devices using this smart-cache policy act as forward proxy.</td>
</tr>
</tbody>
</table>

**Examples**

nx4500-5CFA2B(config-smart-cache-policy-test)#smart-cache enable

nx4500-5CFA2B(config-smart-cache-policy-test)#

**Related Commands**

- no
  - Disables smart content caching
**4.1.99.2.10 transparent-proxy**

*smart-cache-policy-mode commands*

Enables the transparent proxy mode on a device. This is the default mode of proxying.

When enabled, all packets are automatically routed to the port on which the content cache engine listens (3128) by default. The advantage of the transparent proxy mode is that clients need not be configured with an explicit proxy.

Transparent content caching, on the other hand, acts as an intermediary for the originating servers and returns cached content to clients as if the data originated from the associated servers. Transparent caching proxies perform server load-balancing and compression to regulate load on the originating servers and reduce bandwidth usage.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

transparent-proxy {protocol|vlan}

transparent-proxy {protocol {all|https}}

transparent-proxy {vlan <VLAN-ID>}

**Parameters**

- transparent-proxy {protocol {all|https}}
  - protocol {all|https} Optional. Selects the protocols used for transparent proxy mode
    - https – Optional. Enables HTTPS for transparent proxy
    - all – Optional. Enables all protocols for transparent proxy
  - transparent-proxy {vlan <VLAN-ID>}
  - vlan <VLAN-ID> Optional. Configures the VLAN(s) for which transparent proxy mode (content caching) is enabled. By default content caching is disabled on all VLANs.
    - <VLAN-ID> – Specify the list of VLANs.

**Examples**

nx4500-5CFA2B(config-smart-cache-policy-test)#transparent-proxy vlan 10-20

nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
  parent-proxy host 192.168.13.8 port 21
  transparent-proxy vlan 10-20
  http-access precedence 4 deny destination-domain .TechPubs

nx4500-5CFA2B(config-smart-cache-policy-test)#

<td>page 4-526</td>
</tr>
</tbody>
</table>
4.1.100.1 url-filter

url-filter

Creates a new URL filter (Web filter) and enters its configuration mode. URL filtering is a licensed feature. When applied to a WiNG device the license allows you to enable URL filtering on the device, create and apply a URL filter defining the banned and/or allowed URLs. When enabled, the URL filter is applied to all user-initiated URL requests to determine if the requested URL is banned or allowed. Only if allowed is the user’s request (in the form of a HTTP request packet) forwarded to the Web server.

URL filters can be applied at any of the following points: the user’s application (browser/email reader), the network’s gateway, at the Internet service provider’s (ISP) end, and also on a Web portal. For wireless clients, the WLAN infrastructure is the best place to implement these filters.

A URL filter is a set of whitelist and/or blacklist rules. The whitelist allows access only to those Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the whitelist, are banned. On the other hand, the blacklist bans all Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the blacklist, are allowed.

To simplify URL filter configuration, Websites have been classified into pre-defined category-types and categories. The system provides 12 category-types and 64 categories. To further simplify configuration, these 12 category-types have been grouped into five (5) pre-defined levels. (See Usage Guidelines section for the list of category-types, categories, and levels). The actual classification of URLs (on the basis of the pre-defined factors mentioned above) is done by the classification server. A local database also helps by caching URL records for a user-defined time period. The classification server host is specified in the Web filter policy. The Web filter policy also defines the URL database parameters. For more information, see web-filter-policy.

The WiNG software also allows you to create URL lists. Each URL list contains a list of user-defined URLs. Use the URL list in a URL filter (whitelist or blacklist rule) to identify the URLs to ban or allow. For example, a URL list named SocialNetworking is created listing the following three sites: Facebook, Twitter, and LinkedIn. When applied to a URL filter’s blacklist these three sites are banned. Where as, when applied to a whitelist only these three sites are allowed. For more information on configuring a URL list, see url-list.

**NOTE:** URL filtering is a licensed feature. Procure and install the license in the device configuration mode. For more information, see license.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
url-filter <URL-FILTER-NAME>
```

**Parameters**

- `url-filter <URL-FILTER-NAME>`

| <URL-FILTER-NAME> | Creates a new URL filter and enters its configuration mode. Specify the URL filter name. If the filter does not exist, it is created. |

<td>Creates a whitelist rule defining a list of Websites and URLs allowed access by clients.</td>
<td>page 4-533</td>
</tr>
</tbody>
</table>
4.1.100.2.1 blacklist

url-filter-config-mode commands

Creates a blacklist rule. A blacklist is a list of Websites and URLs denied access by clients. Clients requesting blacklisted URLs are presented with a page displaying the 'Web page blocked' message. Parameters relating to this page are configured using the 'blockpage' option.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the URL category-types and categories to include in the blacklist.

In addition to identifying URLs by the categories and category-types they are classified into, the system also provides five (5) levels of Web filtering (basic, high, low, medium, and medium-high). Each level identifies a specific set of URL categories to blacklist. For more information on category-types, categories, and URL filtering levels, see url-filter.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

blacklist [category-type|level|url-list]

blacklist category-type [adult-content|all|business|communication|entertainment|
  file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
  social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}

blacklist level [basic|high|low|medium|medium-high] precedence <1-500>
  {description <LINE>}

blacklist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}

Parameters
- blacklist category-type [adult-content|all|business|communication|entertainment|
  file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
  social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}

| blacklist category-type <SELECT-CATEGORY-TYPE> | Selects the category-type to blacklist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can be created with the URL List and added to the database. Websites have been classified into the following 12 category types: adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates. Select 'all' to blacklist all category-types. Some of the category-types are further classified into categories. For example, the 'adult-content' category-type is differentiated into the following categories: alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons. The system blocks all categories (URLs falling within their limits) within the selected category-type. |
| precedence <1-500> | Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first. |
## blacklist level

<table>
<thead>
<tr>
<th>blacklist level</th>
<th>basic</th>
<th>high</th>
<th>low</th>
<th>medium</th>
<th>medium-high</th>
</tr>
</thead>
</table>

Configures the Web filtering level as basic, high, low, medium, or medium-high. Each of these filter-levels are pre-configured to use a set of category types and this mapping cannot be modified.

### precedence <1-500>

Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.

### description <LINE>

Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.

## blacklist url-list

<table>
<thead>
<tr>
<th>blacklist url-list</th>
<th>&lt;URL-LIST-NAME&gt;</th>
</tr>
</thead>
</table>

Associates a URL list with this URL filter. When associated with a blacklist rule, all URLs listed in the specified URL list are blacklisted.

URL lists are customized categories included in the custom filter-level setting. URL lists enable an administrator to blacklist or whitelist URLs in addition to the built-in categories. For more information on configuring a URL list, see `url-list`.

### precedence <1-500>

Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.

### description <LINE>

Optional. Configures a description (not exceeding 80 characters) for this blacklist rule. Enter a description that allows you to identify the purpose of the rule.

## Examples

- `rfs7000-6DCD4B(config-url-filter-test)#blacklist level medium-high precedence 10`
- `rfs7000-6DCD4B(config-url-filter-test)#blacklist category-type adult-content category alcohol-tobacco precedence 1`
- `rfs7000-6DCD4B(config-url-filter-test)#blacklist category-type security-risk category botnets precedence 3`
- `rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test blacklist level medium-high precedence 10 blacklist category-type security-risk category botnets precedence 3 blacklist category-type adult-content category alcohol-tobacco precedence 1`
- `rfs7000-6DCD4B(config-url-filter-test)#`

## Related Commands

| no | Removes a blacklist rule from this URL filter. Specify the category-type, category, and precedence to identify the blacklist rule. The identified rule is removed form the URL filter. |
4.1.100.2.2 blockpage

url-filter-config-mode commands

Configures the parameters that retrieve the page or content displayed by the client’s browser when a requested URL is blocked and cannot be viewed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

blockpage [external|internal|path]

blockpage path [external|internal]

blockpage external url <URL>

blockpage internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title] <LINE/IMAGE-URL>

Parameters

- **blockpage path [external|internal]**
  
  Specifies if the location of the page displayed, to the client when a requested URL is blocked, is external or internal.
  - external – Indicates the page displayed is hosted on an external Web server resource. If selecting this option, use the `blockpage > external > url <URL>` command to provide the path to the external Web server hosting the page.
  
  Note: internal – Indicates the page displayed is hosted internally. This is the default setting. If selecting this option, use the `blockpage > internal > <SELECT-PAGE-TYPE> > <LINE/IMAGE-URL>` command to define the page configuration.

- **blockpage external url <URL>**

  Configures the URL of the external Web server hosting the page (displayed to the client when a requested URL is blocked).
  - url <URL> – Specify the URL of the Web server and the blocking page name

  Valid URLs should begin with `http://` or `https://`

  The URL can contain query strings.

  Use ‘&’ or ‘?’ character to separate field-value pair.

  Enter ‘ctrl-v’ followed by ‘?’ to configure query strings.

- **blockpage internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title] <LINE/IMAGE-URL>**

  Configures the internally hosted blocking page parameters, such as the content displayed, page footer and header, organization (the organization enforcing the Web page blocking) details (name, signature, and logo), and page title.
  - content – Configures the text (message) displayed on the blocking page.

  Contd...
Examples

rfs7000-6DCD4B(config-url-filter-test)#blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"

rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test
  blacklist level medium-high precedence 10
  blacklist category-type security-risk category botnets precedence 3
  blacklist category-type adult-content category alcohol-tobacco precedence 1
  blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"

rfs7000-6DCD4B(config-url-filter-test)#

4.1.100.2.3 description

*url-filter-config-mode commands*

Configures a description for this URL filter. Provide a description that enables you to identify the purpose of this URL filter.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

description <LINE>

**Parameters**

- description <LINE>

| description <LINE> | Enter an appropriate description for this URL filter. The description should identify the URL filter’s purpose and should not exceed 80 characters in length. |

**Examples**

rfs7000-6DCD4B(config-url-filter-test)#description Blacklists sites inappropriate for children and are security risks.

rfs7000-6DCD4B(config-url-filter-test)#show context
url-filter test
description "Blacklists sites inappropriate for children and are security risks."
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"

rfs7000-6DCD4B(config-url-filter-test)#

**Related Commands**

- no
  
  Removes this URL filter’s description

4.1.100.2.4 no

url-filter-config-mode commands

Use the no command to remove this URL filter’s configured parameters.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

no [blacklist|blockpage|description|whitelist]

no blacklist [category-type|level|url-list]
no blacklist [category-type <SELECT-CATEGORY-TYPE>|level <SELECT-LEVEL>|url-list <URL-LIST-NAME>] precedence <1-500>

no blockpage [external|internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title]|path]

no description

no whitelist [category-type|url-list]
no whitelist [category-type <SELECT-CATEGORY-TYPE>|url-list <URL-LIST-NAME>] precedence <1-500>

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes this URL filter’s configured parameters based on the values passed here |

Examples

The following example displays the URL filter ‘test’ settings before the ‘no’ is executed:

```
rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test
description "Blacklists sites inappropriate for children and are security risks." blacklist level medium-high precedence 10
whitelist category-type communication category chat precedence 7
whitelist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#
```

```
rfs7000-6DCD4B(config-url-filter-test)#no description
```

```
rfs7000-6DCD4B(config-url-filter-test)#no blacklist category-type adult-content category alcohol-tobacco precedence 1
```

```
rfs7000-6DCD4B(config-url-filter-test)#no whitelist category-type communication category chat precedence 7
```

The following example displays the URL filter ‘test’ settings after the ‘no’ is executed:

```
rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#
```
4.1.100.2.5 whitelist

**url-filter-config-mode commands**

Creates a whitelist rule. A whitelist is a list of Websites and URLs allowed access by clients. URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the category-types and categories to include in the whitelist.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

whitelist [category-type|url-list]
whitelist category-type [adult-content|all|business|communication|entertainment|file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
whitelist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}

**Parameters**

- **whitelist category-type [adult-content|all|business|communication|entertainment|file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}

  Selects the category-type to add to this whitelist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can be created with the URL List and added to the database.

  Websites have been classified into the following 12 category types: adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates.

  Select ‘all’ to whitelist all category-types.

  Some of the category-types are further classified into categories. For example, the ‘adult-content’ category-type is differentiated into the following categories:

  - alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons.

  The system allows all categories (URLs falling within their limits) within the selected category-type.

- **precedence <1-500>**

  Configures the precedence value for this whitelist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.

- **description <LINE>**

  Optional. Configures a description (not exceeding 80 characters) for this whitelist rule. Enter a description that allows you to identify the purpose of the rule.
whitelist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}

- **whitelist url-list** *<URL-LIST-NAME>*
  Associates a URL list with this URL filter. When associated with a whitelist rule, all URLs listed in the specified URL list are allowed access. URL lists are customized categories included in the custom filter-level setting. URL lists enable an administrator to blacklist or whitelist URLs in addition to the built-in categories. For more information on configuring a URL list, see *url-list*.
  - *<URL-LIST-NAME>* – Enter URL list name (should be existing and configured)

- **precedence** <1-500>
  Configures the precedence value for this whitelist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.

- **description <LINE>** Optional. Configures a description (not exceeding 80 characters) for this whitelist rule. Enter a description that allows you to identify the purpose of the rule.

**Examples**

```
rfs7000-6DCD4B(config-url-filter-test)#whitelist category-type communication category chat precedence 7
rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test
description "Blacklists sites inappropriate for children and are security risks."
blacklist level medium-high precedence 10
whitelist category-type communication category chat precedence 7
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#
```

**Related Commands**

- **no**
  Removes a whitelist rule from this URL filter. Specify the category-type, category, and precedence to identify the blacklist rule. The identified rule is removed from the URL filter.
4.1.101 url-list

The following table lists the commands that allow you to enter the URL list configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>url-list</td>
<td>Creates a new URL list and enters its configuration mode</td>
<td>page 4-536</td>
</tr>
<tr>
<td>url-list-config-mode</td>
<td>Summarizes the URL list configuration mode commands</td>
<td>page 4-537</td>
</tr>
</tbody>
</table>
url-list

Creates a URL list and enters its configuration mode. After creating the URL list, add URL entries to the list. URL lists are used to pre-fetch content from the listed URLs. URL Lists are used to select highly utilized URLs for smart caching. The selected URLs are monitored and routed according to existing cache content policies. To enable pre-fetching of cached content, use the `smart-cache > pre-fetch-immediate > <URL-LIST-NAME>` command. For more information, see `smart-cache`.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

```
url-list <URL-LIST-NAME>
```

Parameters

- `url-list <URL-LIST-NAME>`

Examples

```
nx4500-5CFA2B(config)#url-list URLlist1
nx4500-5CFA2B(config-url-list-URLlist1)#?
```

URL List Mode commands:
- `description` Description of the category
- `no` Negate a command or set its defaults
- `url` Add a URL entry
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
nx4500-5CFA2B(config-url-list-URLlist1)#
```

```
nx4500-5CFA2B(config-url-list-URLlist1)#url http://www.example_company.com depth 10
```

```
nx4500-5CFA2B(config-url-list-test)#show context
url-list test
  url http://www.example_company.com depth 10
```

```
nx4500-5CFA2B(config-url-list-URLlist1)#
```
4.1.101.2 url-list-config-mode commands

- **url-list**

  The following table summarizes URL list configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>Creates a blacklist rule defining a list of banned Web sites and URLs</td>
<td>page 4-538</td>
</tr>
<tr>
<td>url</td>
<td>Adds URL entries to this URL list</td>
<td>page 4-539</td>
</tr>
<tr>
<td>no</td>
<td>Removes this URL list's settings</td>
<td>page 4-540</td>
</tr>
</tbody>
</table>
4.1.101.2.1 description

* url-list-config-mode commands

Configures a description for this URL list. The description should be unique and enable you to identify the type of URLs listed in the URL list.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**
description <LINE>

**Parameters**
- description <LINE>

<table>
<thead>
<tr>
<th>Description</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provide a unique description for this URL list (should not exceed 500 characters in length)</td>
<td>description &lt;LINE&gt;</td>
</tr>
</tbody>
</table>

**Examples**
nx4500-5CFA2B(config-url-list-test)#description "This URL list contains social media URLs"
nx4500-5CFA2B(config-url-list-test)#show context
description "This URL list contains social media URLs"
nx4500-5CFA2B(config-url-list-test)#

**Related Commands**
- no
  Removes this URL list’s description
4.1.101.2.2 url

▶ url-list-config-mode commands

Adds URL entries to this URL list

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax
url <WORD> {depth <1-10>}

Parameters
- url <WORD> {depth <1-10>}

<table>
<thead>
<tr>
<th>url &lt;WORD&gt; {depth &lt;1-10&gt;}</th>
<th>Adds a URL entry</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;WORD&gt; – Specify the URL to add.</td>
</tr>
<tr>
<td></td>
<td>• depth – Optional. Sets number of levels to be cached. Since Web sites have different parameters to uniquely identify specific content, the same content may be stored on multiple origin servers. Smart caching uses subsets of these parameters to recognize that the content is the same and serves it from cache.</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-10&gt; – Specify the depth from 1 - 10.</td>
</tr>
</tbody>
</table>

Examples
nx4500-5CFA2B(config-url-list-test)#url http://www.facebook.com

nx4500-5CFA2B(config-url-list-test)#show context url-list test
description "This URL list contains social communication URLs"
  url https://www.facebook.com depth 5
nx4500-5CFA2B(config-url-list-test)#

Related Commands

no | Removes a URL entry from this URL list
4.1.101.2.3 no

url-list-config-mode commands

Removes this URL list's settings

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax
no [description|url]
no description
no url <WORD>

Parameters
- no <PARAMETERS>

no <PARAMETERS> Removes this URL's settings based on the parameters passed

Examples
The following example displays the URL list 'test' settings before the 'no' command is executed:

```
nx4500-5CFA2B(config-url-list-test)#show context
url-list test
description "This URL list contains social communication URLs"
url https://www.facebook.com depth 5
```

nx4500-5CFA2B(config-url-list-test)#no url www.facebook.com

The following example displays the URL list 'test' settings after the 'no' command is executed:

```
nx4500-5CFA2B(config-url-list-test)#show context
url-list test
description "This URL list contains social communication URLs"
```
4.1.102 vx9000

Global Configuration Commands

Configures a Virtual WLAN Controller (V-WLC) in a virtual machine (VM) environment. V-WLC can be deployed on a shared, third-party server hardware, thereby reducing overhead costs of procuring and maintaining dedicated appliances. The external, third-party hardware needs to have installed hypervisors, such as VmWare, Xen, VirtualBox, KVM, Amazon EC2 or Hyper-V, enabling it to communicate with V-WLC software.

The V-WLC controls and manages access points and other controllers (at NOC or as a site-controller) in the network. The traffic between the access points and the V-WLC is over the layer-3 MINT protocol.

V-WLC is a licensed feature, and the WiNG software provides the following two new licenses:

- VX – When installed, this license activates VM controller instance, and enables the V-WLC to trigger adoption process allowing access points to adopt to the V-WLC. The adoption capacity of the V-WLC is determined by the number of licenses installed on it.
- VX-DEMO – This is a 60 day trial license. This license also activates VM controller instance, and enables the V-WLC to adopt access points. But, the access point adoption capacity is limited to 16. Having installed this license on a device, the only other license that you can install on it is the VX license. All existing installed licenses will continue to work as before. Since this license has a limited validity period, ensure that the system clock on the license generating tool and the device are in sync. preferably through NTP.

To install the VX or VX-DEMO license on an existing V-WLC instance, use the license command. For more information, see the examples provided in this section.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

vx9000 <MAC>

Parameters
- vx9000 <MAC>

vx <MAC>  Configures a V-WLC and enters its configuration mode

Note: The V-WLC configuration is the same as that of a normal controller.

Examples

nx9500-6C8809(config)#vx9000 11-22-33-44-55-66
nx9500-6C8809(config-device-11-22-33-44-55-66)#?

Device Mode commands:

- adopter-auto-provisioning-policy-lookup  Use centralized auto-provisioning policy when adopted by another controller
- adoption  Adoption configuration
- adoption-site  Set system's adoption site
- alias  Alias
- application-policy  Application Policy configuration
- area  Set name of area where the system is located
- arp  Address Resolution Protocol (ARP)
- auto-learn  Auto learning
- autogen-uniqueid  Autogenerate a unique id
- autoinstall  Autoinstall settings
- bluetooth-detection  Detect Bluetooth devices using the Bluetooth USB module - there will be interference on 2.4 Ghz radio in wlan mode
- bridge  Ethernet bridge
- captive-portal  Captive portal
- cdp  Cisco Discovery Protocol
- channel-list  Configure channel list to be advertised to wireless clients

Related Commands

no
   Removes a VX9000 wireless controller
This chapter describes the CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes. The PRIV EXEC command set contains commands available within the USER EXEC mode. Some commands can be entered in either mode. Commands entered in either the USER EXEC or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.
5.1 Common Commands

The following table summarizes commands common to the User Exec, Priv Exec, and Global Config modes:

### Table 5.1 Commands Common to Controller CLI Modes

NOTE: The input parameter `<HOSTNAME>` cannot include an underscore character. In other words, a device’s hostname cannot contain an underscore.
5.1.1 clrscr

Common Commands

Clears the screen and refreshes the prompt, irrespective of the mode

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

clrscr

Parameters

None

Examples

The terminal window or screen before the clrscr command is executed:

rfs4000-229D58#device-upgrade ?

DEVICE-NAME  Name/MAC address of device
  all          Upgrade all devices
  ap621        Upgrade AP621 Device
  ap622        Upgrade AP622 Device
  ap650        Upgrade AP650 Device
  ap6511       Upgrade AP6511 Device
  ap6521       Upgrade AP6521 Device
  ap6522       Upgrade AP6522 Device
  ap6532       Upgrade AP6532 Device
  ap6562       Upgrade AP6562 Device
  ap71xx       Upgrade AP71XX Device
  ap7502       Upgrade AP7502 Device
  ap7522       Upgrade AP7522 Device
  ap7532       Upgrade AP7532 Device
  ap7562       Upgrade AP7562 Device
  ap81xx       Upgrade AP81XX Device
  ap82xx       Upgrade AP82XX Device
  ap8432       Upgrade AP8432 Device
  ap8533       Upgrade AP8533 Device
  cancel-upgrade  Cancel upgrading the device
  load-image    Load the device images to controller for device-upgrades
  rf-domain    Upgrade all devices belonging to an RF Domain
  rfs4000      Upgrade RFS4000 Device

rfs4000-229D58#

The terminal window or screen after the clrscr command is executed:

rfs4000-229D58#
5.1.2 commit

Common Commands

Commits changes made in the active session. Use the commit command to save and invoke settings entered during the current transaction.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

commit {write}{memory}

Parameters

- commit {write}{memory}

<table>
<thead>
<tr>
<th>write</th>
<th>Optional. Commits changes made in the current session</th>
</tr>
</thead>
<tbody>
<tr>
<td>memory</td>
<td>Optional. Writes to memory. This option ensures current changes persist across reboots.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE#commit write memory
[OK]
rfs7000-37FABE#
5.1.3 exit

The exit command works differently in the User Exec, Priv Exec, and Global Config modes. In the Global Config mode, it ends the current mode and moves to the previous mode, which is Priv Exec mode. The prompt changes from `(config)#` to `#`. When used in the Priv Exec and User Exec modes, the exit command ends the current session, and connection to the terminal device is terminated. If the current session has changes that have not been committed, the system prompts you to either do a commit or a revert before terminating the session.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
exit
```

Parameters

None

Examples

```
rfs7000-37FABE(config)#exit
rfs7000-37FABE#
```
5.1.4 help

Common Commands

Describes the interactive help system

Use this command to access the advanced help feature. Use “?” anytime at the command prompt to access the help topic.

Two kinds of help are provided:

• Full help is available when ready to enter a command argument
• Partial help is provided when an abbreviated argument is entered and you want to know what arguments match the input (for example ‘show ve?’).

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
• Wireless Controllers — RFS4000, RFS6000, RFS7000
• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

help {search}

help {search <WORD>} {detailed|only-show|skip-no|skip-show}

Parameters

• help {search <WORD>} {detailed|only-show|skip-no|skip-show}

<table>
<thead>
<tr>
<th>search &lt;WORD&gt;</th>
<th>Optional. Searches for CLI commands related to a specified target term</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt; – Specify a target term (for example, a feature or a configuration parameter). After specifying the term, select one of the following options: detailed, only-show, skip-no, or skip-show. The system displays information based on the option selected.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>detailed</th>
<th>Optional. Searches and displays help strings in addition to mode and commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>only-show</td>
<td>Optional. Displays only “show” commands. Does not display configuration commands</td>
</tr>
<tr>
<td>skip-no</td>
<td>Optional. Displays only configuration commands. Does not display “no” commands</td>
</tr>
<tr>
<td>skip-show</td>
<td>Optional. Displays only configuration commands. Does not display “show” commands</td>
</tr>
</tbody>
</table>

rfs7000-37FABE>
5.1.5 no

Common Commands

Negates a command or sets its default. Though the `no` command is common to the User Exec, Priv Exec, and Global Config modes, it negates a different set of commands in each mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
no <PARAMETERS>
```

Parameters

- `no <PARAMETERS>`

| no <PARAMETERS> | The no command is common across all configuration modes and sub modes. It resets or reverts settings based on the mode in which executed. For example, when executed in the AAA policy configuration mode, it allows you to reset or revert a specific AAA policy settings. Similarly, when executed in the global configuration mode, it only resets or reverts settings configured in the global configuration mode. |

Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

Global Config mode: No command options
Enter configuration commands, one per line. End with CTRL/Z.
```
rfs7000-37FABE(config)#no ?
aaa-policy                          Delete a aaa policy
aaa-tacacs-policy                   Delete a aaa tacacs policy
alias                              Alias

5.1.6 revert

Reverts changes made, in the current session, to their last saved configuration

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
revert

Parameters
None

5.1.7 service

Common Commands

Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode. The User Exec mode and Priv Exec mode commands provide same functionalities with a few minor changes. The Global Config service command sets the size of history files. It also enables viewing the current mode’s CLI tree.

This section consists of the following sub-sections:

- Syntax (User Exec Mode)
- Syntax (Privilege Exec Mode)
- Syntax (Privilege Exec Mode: NX9000, NX9500, and NX9510)
- Syntax (Global Config Mode)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax (User Exec Mode)

```

Parameters (User Exec Mode)

- service [block-adopter-config-update|request-full-config-from-adopter]

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>block-adopter-config-update</td>
<td>Blocks the configuration updates sent from the NOC server</td>
</tr>
<tr>
<td>request-full-config-from-adopter</td>
<td>Configures a request for full configuration updates from the adopter device</td>
</tr>
</tbody>
</table>

In an **hierarchically managed** (HM) network devices are deployed in two levels. The first level consists of the **Network Operations Center** (NOC) controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (access points and site controllers) are referred to as the adoptee. The devices adopting the adoptee are the 'adopters'.
### clear adoption history

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear adoption history {on &lt;DEVICE-NAME&gt;}</code></td>
<td>Clears adoption history on this device and its adopted access points. Optional. Clears adoption history on a specified device. <strong>&lt;DEVICE-NAME&gt;</strong> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

### clear device-upgrade history

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear device-upgrade history {on &lt;DOMAIN-NAME&gt;}</code></td>
<td>Clears device upgrade history. Optional. Clears all firmware upgrade history in a specified RF Domain. <strong>&lt;DOMAIN-NAME&gt;</strong> – Specify the RF Domain name.</td>
</tr>
</tbody>
</table>

### clear dpi

<table>

<tbody>
<tr>
<td><code>clear captive-portal-page-upload history {on &lt;DOMAIN-NAME&gt;}</code></td>
<td>Clears captive portal page upload history. Optional. Clears captive portal page upload history on a specified RF Domain. <strong>&lt;DOMAIN-NAME&gt;</strong> – Specify the RF Domain name.</td>
</tr>
</tbody>
</table>
### COMMON COMMANDS 5-17

#### Service Clear Commands

- **service clear** [command-history|reboot-history|upgrade-history|virtual-machine-history] {on <DEVICE-NAME>}

  **clear [command-history|reboot-history|upgrade-history]**

  Clears command history, reboot history, or device upgrade history

  **clear virtual-machine-history**

  Clears virtual-machine history on the logged device or a specified device

  **Note:** This command is applicable only on the NX45XX, NX65XX, NX9500, and NX9510 series service platforms.

  **on <DEVICE-NAME>**

  Optional. Clears history on a specified device

  - **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

  **Note:** When executing the clear virtual-machine-history command, provide the name of the service platform running the VMs.

- **service clear noc statistics**

  **clear noc statistics**

  Clears Network Operations Center (NOC) applicable statistics counters

- **service clear unsanctioned aps** {on <DEVICE-OR-DOMAIN-NAME>}

  **clear unsanctioned aps**

  Clears the unsanctioned APs list

  **on <DEVICE-OR-DOMAIN-NAME>**

  Optional. Clears the unsanctioned APs list on a specified device or RF Domain

  - **<DEVICE-OR-DOMAIN-NAME>** – Specify the name of the AP, wireless controller, service platform, or RF Domain.

- **service clear wireless [ap|client] {<MAC>} {on <DEVICE-OR-DOMAIN-NAME>}}

  **clear wireless [ap|client] statistics**

  Clears wireless statistics counters based on the parameters passed

  - **ap statistics** – Clears applicable AP statistics counters

  - **client statistics** – Clears applicable wireless client statistics counters

  - **<DEVICE-OR-DOMAIN-NAME>** – Specify the name of the AP, wireless controller, service platform, or RF Domain.

  **<MAC>**

  **{on <DEVICE-OR-DOMAIN-NAME>}}**

  The following keywords are common to the ‘ap’ and ‘client’ parameters:

  - **<MAC>** – Optional. Clears statistics counters for a specified AP or client. Specify the AP/client MAC address.

  - **on <DEVICE-OR-DOMAIN-NAME>** – Optional. Clears AP/client statistics counters on a specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain.

- **service clear wireless controller-mobility-database**

  **clear wireless controller-mobility-database**

  Clears the controller assisted mobility database

- **service clear web-filter cache** {on <DEVICE-NAME>}

  **clear web-filter cache**

  Clears the cache used for Web filtering
on `<DEVICE-NAME>` Optional. Clears the Web filtering cache on a specified device
  • `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

• `service clear wireless radio statistics` `{<MAC/HOSTNAME>} {<1-3>}
  (on `<DEVICE-OR-DOMAIN-NAME>`)`

clear wireless radio statistics Clears applicable wireless radio statistics counters

`<MAC/HOSTNAME> <1-3>` Optional. Specify the MAC address or hostname of the radio, or append the interface number to form the radio ID in the AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX format.
  • `<1-3>` – Optional. Specify the radio interface index, if not specified as part of the radio ID.

on `<DEVICE-OR-DOMAIN-NAME>` Optional. This is a recursive parameter, which clears wireless radio statistics on a specified device or RF Domain. Specify the name of the device.
  • `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

• `service clear wireless wlan statistics` `{<WLAN-NAME>}
  (on `<DEVICE-OR-DOMAIN-NAME>`)`

clear wireless wlan statistics Clears WLAN statistics counters

`<WLAN-NAME>` Optional. Clears statistics counters on a specified WLAN. Specify the WLAN name.

on `<DEVICE-OR-DOMAIN-NAME>` Optional. This is a recursive parameter, which clears WLAN statistics on a specified device or RF Domain. Specify the name of the device.
  • `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

• `service clear xpath requests` `{<1-100000>}`

clear xpath Clears XPATH related information
requests Clears pending XPATH get requests

`<1-100000>` Optional. Specifies the session number (cookie from show sessions)
  • `<1-100000>` – Specify the session number from 1 - 100000.
  **Note:** Omits clearing the current session’s pending XPATH get requests.

• `service cli-tables-skin` `{ansi|hashes|minimal|none|percent|stars|thick|thin|utf-8}
  (grid)`

cli-tables-skin Selects a formatting layout or skin for CLI tabular outputs
  [ansi|hashes|minimal|none|percent|stars|thick|thin|utf-8]

  • `ansi` – Uses ANSI characters for borders
  • `hashes` – Uses hashes (#) for borders
  • `minimal` – Uses one horizontal line between title and data rows
  • `none` – Displays space separated items with no decoration
  • `percent` – Uses the percent sign (%) for borders

</tr>
<tr>
<td>guest-registration backup [delete</td>
<td>restore]</td>
</tr>
</tbody>
</table>

**Note:** To view the status of the restore process, use the `service > show > guest-registration > restore-status` command.
service guest-registration delete [all|email <EMAIL-ADD>|group <RAD-GROUP-NAME>|mac <MAC>|mobile <MOBILE-NUMBER>|name <CLIENT-FULL-NAME>|on-social|offline-for days <1-999>|wlan <WLAN-NAME>|otp-incomplete-for days <1-999>|social [facebook|google]

Deletes a specified user or all user records from the guest-registration database. To delete a specific user, use one of the following options as an identification parameter: email, group, mac, mobile number, name, offline-for, wlan, otp-incomplete-for, or social.

Following are the user filtering options: The user identified by one of the following parameters is deleted from the guest-registration database.
- email <EMAIL-ADD> – Identifies user by the e-mail address
  - <EMAIL-ADD> – Provide the user’s e-mail address.
- mac <MAC> – Identifies user by the MAC address
  - <MAC> – Provide the user’s MAC address.
- group <RAD-GROUP-NAME> – Identifies users by their RADIUS group association
  - <RAD-GROUP-NAME> – Specify the RADIUS group name.
- mobile <MOBILE-NUMBER> – Identifies user by the registered mobile number
  - <MOBILE-NUMBER> – Provide the user’s mobile number.
- name <CLIENT-FULL-NAME> – Identifies user by the registered full name
  - <CLIENT-FULL-NAME> – Provide the user’s full name.
- non-social – Identifies users not registered through social authentication
- offline-for days <1-999> – Filters users who have not accessed the network for a specified number of days
  - days <1-999> – Specify the number of days from 1 - 999.
- wlan <WLAN-NAME> – Identifies users accessing a specified WLAN
  - <WLAN-NAME> – Specify the WLAN name.
- otp-incomplete-for days <1-999> – Identifies records of users that have not used their one-time-password (OTP) to complete registration within a specified number of days
  - days <1-999> – Specify the number of days from 1 - 999.
- social [facebook|google] – Identifies users using either Facebook or Google credentials to access the network
  - facebook – Identifies users using Facebook authentication
  - google – Identifies users using Google authentication

service guest-registration export format [csv|json] <DEST-URL> { (rfdomain <DOMAIN-NAME>|time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]|wlan <WLAN-NAME>) }

Exports guest registration user data files in the Comma-Separated Values (CSV) or JavaScript Object Notation (JSON) format. Use the ‘rfdomain’, ‘wlan’, and ‘time’ options to filter users for a specified RF Domain, WLAN, and/or time period. These are recursive parameters and you can apply all or any of these three filters.

format [csv|json]

Specifies the file format. The options are:
- csv – Exports user data files in the CSV format
- json – Exports user data files in the JSON format
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;DEST-URL&gt;</code></td>

</tbody>
</table>
| clear-client-capability [<MAC>][all] | Clears a specified client or all client’s capability records  
|-------------------------------------|---------------------------------------------------------------  
| <MAC> – Clears capability records of a specified client. Specify the client’s MAC address in the AA-BB-CC-DD-EE-FF format.  
| all – Clears the capability records of all clients  
| on <DEVICE-NAME> | Optional. Clears client capability records on a specified device  
| <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.  
| load-ssh-authorized-keys <PUBLIC-KEY> [on <DEVICE-NAME>] | Loads SSH public (client) key on a device  
| <PUBLIC-KEY> | Enter the public key. The public key should be in the OpenSSH rsa/dsa format.  
| on <DEVICE-NAME> | Optional. Loads the specified public key on a specified device  
| <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.  
| locator {<1-60>} {on <DEVICE-NAME>} | Enables LEDs  
| <1-60> | Sets LED flashing time from 1 - 60 seconds.  
| on <DEVICE-NAME> | The following keyword is recursive and common to the <1-60> parameter:  
| <DEVICE-NAME> | Optional. Enables LEDs on a specified device  
| <DEVICE-NAME> – Specify name of the AP, wireless controller, or service platform.  
| nsight clear-offline [all|offline-for days <0-999> {time <TIME>} | Clears NSight data received from offline controllers, based on the parameters passed. Select one of the following options:  
| all – Clears NSight data received from all offline controllers  
| offline-for days <0-999> time <TIME> – Clears NSight data received from controllers that have been offline for a specified time period  
| days <0-999> – Specifies the number of days controllers have been offline  
| <0-999> – Specify the number of days from 0 - 999 days. Select “0” to identify controllers offline less than 24 hours.  
| time <TIME> – Optional. Specifies the total time for which controllers have been offline  
| <TIME> – Specify the time in HH:MM:SS format.  
| Note: This command is applicable only to the NX9XXX and NX9600 service platforms.  
| service radio <1-3> adaptivity | Configures radio’s parameters  
| <1-3> – Specify the radio index from 1 - 3.  
| adaptivity | Simulates the presence of interference on the current channel |
- **service radio <1-3> channel-switch <36-196> [160|20|40|80|80-80]**

  | **radio <1-3>** | Configures radio's parameters  
  | - <1-3> – Specify the radio index from 1 - 3. |

  | **channel-switch <36-196> [160|20|40|80|80-80]** | Enables channel switching  
  | - <36-196> – Specifies the channel to switch to from 36 - 196.  
  | - 160|20|40|80|80-80 – Specifies the bandwidth for the above specified channel. Select the appropriate option. |

- **service radio <1-3> dfs simulate-radar [extension|primary]**

  | **radio <1-3>** | Configures radio's parameters  
  | - <1-3> – Specify the radio index from 1 - 3. |

  | **dfs** | Enables *Dynamic Frequency Selection* (DFS) |

  | **simulate-radar [extension|primary]** | Simulates the presence of a radar on a channel. Select the channel type from the following options:  
  | - extension – Simulates a radar on the radio’s current extension channel  
  | - primary – Simulates a radar on the radio’s current primary channel |

- **service radius test [<IP>|<HOSTNAME>] <WORD> <USERNAME> <PASSWORD> {wlan <WLAN-NAME> ssid <SSID>} {(on <DEVICE-NAME>)}**

  | **radius test** | Tests RADIUS server’s account. This command sends an access-request packet to the RADIUS server. Use this command to confirm time and data/bandwidth parameters for valid wireless clients.  
  | - test – Tests the RADIUS server’s account with user provided parameters |

  | **[<IP>|<HOSTNAME>]** | Sets the RADIUS server’s IP address or hostname  
  | - <IP> – Specifies the RADIUS server’s IP address  
  | - <HOSTNAME> – Specifies the RADIUS server’s hostname |

  | **<WORD>** | Specify the RADIUS server’s shared secret. |

  | **<USERNAME>** | Specify username for authentication. |

  | **<PASSWORD>** | Specify the password. |

  | **wlan <WLAN-NAME> ssid <SSID>** | Optional. Tests the RADIUS server on the local WLAN. Specify the local WLAN name.  
  | - ssid <SSID> – Specify the local RADIUS server’s SSID. |

  | **on <DEVICE-NAME>** | Optional. This is a recursive parameter also applicable to the WLAN parameter. Performs tests on a specified device  
  | - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **service radius test [<IP>|<HOSTNAME>] port 1024-65535 <WORD> <USERNAME> <PASSWORD> {wlan <WLAN-NAME> ssid <SSID>} {(on <DEVICE-NAME>)}**

  | **radius test** | Tests a RADIUS server’s account. This command sends an access-request packet to the RADIUS server. Use this command to confirm time and data/bandwidth parameters for valid wireless clients.  
  | - test – Tests the RADIUS server’s account with user provided parameters |
### service set validation-mode [full|partial] \{on <DEVICE-NAME>\}

| [<IP>|<HOSTNAME>] | Sets the IP address or hostname of the RADIUS server  
| • <IP> – Specify the RADIUS server’s IP address.  
| • <HOSTNAME> – Specify the RADIUS server’s hostname. |
| port <1024-65535> | Specify the RADIUS server port from 1024 - 65535. The default port is 1812. |
| <WORD> | Specify the RADIUS server’s shared secret. |
| <USERNAME> | Specify username for authentication. |
| <PASSWORD> | Specify the password. |
| wlan <WLAN-NAME> ssid <SSID> | Optional. Tests the RADIUS server on the local WLAN. Specify the local WLAN name.  
| • ssid <SSID> – Specify the RADIUS server’s SSID. |
| on <DEVICE-NAME> | Optional. This is a recursive parameter also applicable to the WLAN parameter. Performs tests on a specified device  
| • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

### show Displays running system statistics based on the parameters passed

| block-adopter-config-update | Displays NOC configuration blocking status |
| show captive-portal log-internal | Displays recent captive portal debug logs (information and above severity level) |

### service show captive-portal [servers|user-cache] \{on <DEVICE-NAME>\}

| show captive-portal | Displays captive portal information |
| servers | Displays server information for active captive portals |
| user-cache | Displays cached user details for a captive portal |
| on <DEVICE-NAME> | Optional. Displays server information or cached user details on a specified device  
| • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
- `service show [cli|client-identity-defaults|configuration-revision|mac-user-import-status|mac-vendor <OUI/MAC>|noc diag|snmp session|xpath-history]`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show</code></td>
<td>Displays running system statistics based on the parameters passed</td>
</tr>

<tr>
<td><code>upgrade-history</code></td>
<td>Displays the device’s upgrade history (displays details, such as date, time, and status of the upgrade, old version, new version, etc.)</td>
</tr>
<tr>
<td><code>watchdog</code></td>
<td>Displays the device’s watchdog status</td>
</tr>
</tbody>
</table>
The following keywords are common to all of the above:
- **on <DEVICE-NAME>** – Optional. Displays information for a specified device. If no device is specified, the system displays information for logged device(s).
- **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

### service show dhcp-lease

<table>
<thead>
<tr>
<th>show dhcp-lease</th>
<th>Displays DHCP lease information received from the server</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&lt;INTERFACE-NAME&gt;</strong></td>
<td>Optional. Displays DHCP lease information for a specified router interface</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays DHCP lease information for a specified device</td>
</tr>
<tr>
<td>pppoe1</td>
<td>Optional. Displays DHCP lease information for a PPP over Ethernet interface</td>
</tr>
<tr>
<td>vlan &lt;1-4094&gt;</td>
<td>Optional. Displays DHCP lease information for a VLAN interface</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays DHCP lease information for a specified device. If no device is specified, the system displays information for the logged device.</td>
</tr>
<tr>
<td>wwan1</td>
<td>Optional. Displays DHCP lease information for a Wireless WAN interface</td>
</tr>
</tbody>
</table>

### service show diag

| show diag [led-status|psu|stats] | Displays running system statistics based on the parameters passed |
|-----------------------------|--------------------------------------------------------|
| on <DEVICE-NAME> | Optional. Displays diagnostic statistics for a specified device. If no device is specified, the system displays information for the logged device. |
| <DEVICE-NAME> | Specify the name of the AP, wireless controller, or service platform. |
| diag | Displays diagnostic statistics, such as LED status, fan speed, and sensor temperature |
| led-status | Displays LED state variables and the current state |
| psu | Displays power supply information |
| stats | Displays fan speed and sensor temperature statistics |

### service show guest-registration

| show guest-registration [export-status|import-status|restore-status] | Displays status of the guest-registration database snapshot related processes (export, import, and restore) |
|-----------------------------|--------------------------------------------------------|
| on <DEVICE-NAME> | Optional. Displays diagnostic statistics for a specified device. If no device is specified, the system displays information for the logged device. |
| <DEVICE-NAME> | Specify the name of the AP, wireless controller, or service platform. |
| guest-registration | Displays status of the guest-registration database snapshot related processes (export, import, and restore) |
| export-status | Displays the status of the latest export process initiated |

**Note:** To export, import, or restore a guest-registration database, use the `service > guest-registration > [backup|export|import]` command.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>import-status</td>
<td>Displays the status of the latest import process initiated</td>
</tr>
<tr>
<td>export-status</td>
<td>Displays the status of the latest restore process initiated</td>
</tr>
<tr>
<td>service show fast-switching {on &lt;DEVICE-NAME&gt;}</td>
<td>Displays fast switching state (enabled or disabled)</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays fast switching state for a specified device. If no device is specified, the system displays information for the logged device.</td>
</tr>
<tr>
<td>show</td>
<td>Displays running system statistics based on the parameters passed</td>
</tr>
<tr>
<td>fast-switching</td>
<td>Displays running system statistics based on the parameters passed</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Displays fast switching state (enabled or disabled)</td>
</tr>
<tr>
<td>fib</td>
<td>Displays entries in the Forwarding Information Base (FIB)</td>
</tr>
<tr>
<td>fib6</td>
<td>Displays FIB IPv6 static routing entries</td>
</tr>
<tr>
<td></td>
<td>The WiNG software allows the IPv6 FIB to maintain only IPv6 static and interface routes.</td>
</tr>
<tr>
<td></td>
<td>FIB is a collection of routing entries. A route entry consists of IPv6 network (which can also be a host) address, the prefix length for the network (for IPv6 routes this is between 0 - 128), and the next hop's (gateway) IPv6 address. Since a destination can be reached through multiple next hops, you can configure multiple routes to the same destination with multiple next hops.</td>
</tr>
<tr>
<td>table-id &lt;0-255&gt;</td>
<td>Optional. Displays FIB information maintained by the system based on the table ID</td>
</tr>
<tr>
<td></td>
<td>• &lt;0-255&gt; – Specify the table ID from 0 - 255.</td>
</tr>
<tr>
<td>service show mint [adopted-devices {on &lt;DEVICE-NAME&gt;}</td>
<td>Displays MiNT protocol details</td>
</tr>
<tr>
<td>adopted-devices on &lt;DEVICE-NAME&gt;</td>
<td>Displays adopted devices status in dpd2</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays MiNT protocol details for a specified device. If no device is specified, the system displays information for the logged device.</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
<tr>
<td>ports</td>
<td>Displays MiNT ports used by various services and features</td>
</tr>
<tr>
<td>service show pm {history} {(on &lt;DEVICE-NAME&gt;)}</td>
<td>Displays running system statistics based on the parameters passed</td>
</tr>
<tr>
<td>pm</td>
<td>Displays the Process Monitor (PM) controlled process details</td>
</tr>
<tr>
<td>history</td>
<td>Optional. Displays process change history (the time at which the change was implemented, and the events that triggered the change)</td>
</tr>
</tbody>
</table>
on `<DEVICE-NAME>`

Optional. Displays process change history for a specified device. If no device is specified, the system displays information for the logged device.
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- `service show rf-domain-manager [diag|info] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

#### level
Optional. Sets the logging level. In case syslog server is unreachable, an event is logged based on the logging level defined. This is an optional parameter, and the system configures default settings, if no logging severity level is specified.

- <0-7> – Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows:
  - alerts – Optional. Immediate action needed (severity=1)
  - critical – Optional. Critical conditions (severity=2)
  - debugging – Optional. Debugging messages (severity=7)
  - emergencies – Optional. System is unusable (severity=0)
  - errors – Optional. Error conditions (severity=3)
  - informational – Optional. Informational messages (severity=6)
  - notifications – Optional. Normal but significant conditions (severity=5)
  - warnings – Optional. Warning conditions (severity=4). This is the default setting.

#### on <DEVICE-NAME>
Optional. Executes the command on a specified device.

- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

#### service wireless client beacon-request **<MAC>** **mode** [active|passive|table] ssid [SSID|any] channel-report [<CHANNEL-LIST>|none] {on <DEVICE-NAME>}
Sends beacon measurement requests to a wireless client.

- <MAC> Specify the wireless client’s MAC address.
- <SSID> – Requests beacon measurement for a specified SSID
- any – Requests beacon measurement for any SSID
- <CHANNEL-LIST> – Request includes a list of channels. The client has to send beacon measurements only for those channels included in the request
- none – Request applies to all channels

#### channel-report
Configures channel report in the request. The request can include a list of channels or can apply to all channels.
- <CHANNEL-LIST> – Request includes a list of channels. The client has to send beacon measurements only for those channels included in the request
- none – Request applies to all channels

#### on <DEVICE-NAME>
Optional. Sends requests on a specified device.

- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

</tr>
<tr>
<td>service wireless meshpoint zl &lt;MESHPOINT-NAME&gt; [on &lt;DEVICE-NAME&gt;] {&lt;ARGS&gt;}</td>
<td>Triggers a zonal level debug of a specified meshpoint’s modules</td>
</tr>
</tbody>
</table>

- **wireless client quiet-element**
  - Enables the quite-element information in beacons sent to wireless clients
- **start**
  - Enables the quite-element information in beacons sent to wireless clients. This is the interval for which all wireless clients are to remain quiet.
- **stop**
  - Disables the quite-element information in beacons sent to wireless clients. Once disabled, this information is no longer included in beacons.
- **wireless client trigger-bss-transition**
  - Sends a 80211v-Wireless Network Management BSS transition request to a client
  - mac <MAC>
    - Specifies the wireless client’s MAC address
  - timeout <0-65535>
    - Specifies the time remaining, for this client, before BSS transition is initiated. In other words on completion of the specified time period, BSS transition is triggered.
    - `<0-65535>` – Specify a time from 0 -65535 seconds.
  - url <URL>
    - Optional. Specifies session termination URL
  - on <DEVICE-OR-DOMAIN-NAME>
    - Optional. Sends request on a specified device
    - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.
- **wireless client trigger-wnm**
  - Sends a WNM notification (action frame) to a wireless client
  - mac <MAC>
    - Specifies the wireless client’s MAC address
  - type [deauth-imminent|subscription-remediation]
    - Configures the WNM notification type
    - `<deauth-imminent>` – Sends a de-authentication imminent frame
    - `<subscription-remediation>` – Sends a subscription remediation needed frame
  - uri <WORD>
    - Optional. Specifies the `unique resource identifier` (URI)
- **service wireless dump-core-snapshot**
  - Triggers a debug core dump of the wireless module
- **service wireless meshpoint zl <MESHPOINT-NAME> [on <DEVICE-NAME>] \{<ARGS>\}**
  - Triggers a zonal level debug of a specified meshpoint’s modules
  - <MESHPOINT-NAME>
    - Specify the meshpoint name
### on `<DEVICE-NAME>`
Triggers zonal level debug of a specified meshpoint's modules on a specified device
- `<DEVICE-NAME>` – Specify the name of the device (AP, wireless controller, or service platform)

### `<ARGS>`
Optional. Specifies the zonal arguments. These zonal arguments represent the meshpoint modules identified by the zonal and subzonal arguments passed here. Also specify the debug level from 0 - 7. Please see the Examples section, at the end of this topic, for more information.

### timeout `<1-65535>`
Optional. Specifies a timeout value from 1 - 65535 seconds. When specified, meshpoint logs are debugged for the time specified here.

- **service wireless qos delete-tspec `<MAC>` tid `<0-7>`**
  - sends a delete TSPEC request to a wireless client
  - `<MAC>` – Specify the MAC address of the wireless client.
  - `tid `<0-7>` – Deletes the Traffic Identifier (TID)
    - `<0-7>` – Select the TID from 0 - 7.

- **service wireless trace pattern `<WORD>` {on `<DEVICE-NAME>`}
  - displays the wireless module trace based on parameters passed
  - `<WORD>` – Specify the pattern to match.
  - on `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- **service wireless unsanctioned ap air-terminate `<MAC>` {on `<DOMAIN-NAME>`}
  - enables unsanctioned access points termination
  - `<MAC>` – Configures the unsanctioned access points’ BSSID (MAC address)
  - on `<DOMAIN-NAME>` – Optional. Specifies the RD Domain of the access point
    - `<DOMAIN-NAME>` – Specify the name of the RF Domain.

- **service wireless wips clear-client-blacklist [all|mac `<MAC>`]
  - enables management of WIPS parameters
  - clear-client-blacklist [all|mac `<MAC>`] – Removes a specified client or all clients from the blacklist
    - all – Removes all clients from the blacklist
    - mac `<MAC>` – Removes a specified client form the blacklist
      - `<MAC>` – Specify the wireless client’s MAC address.

- **service wireless wips clear-event-history {on `<DEVICE-OR-DOMAIN-NAME>`
  - enables WIPS management
  - clear-event-history – Clears event history

**Syntax (Privilege Exec Mode)**

**NOTE:** The “service” command of the Priv Exec Mode is the same as the service command in the User Exec Mode. There are a few modifications that have been documented in this section. For the syntax and parameters of the other commands refer to the (User Exec Mode) syntax and (User Exec Mode) parameters sections of this chapter.

```
service

service [block-adopter-config-updates|clear|cli-tables-skin|cluster|copy|database|
delete|delete-offline-aps|force-send-config|force-update-vm-stats|
guest-registration|load-balancing|locator|mint|pktcap|pm|radio|radius|

</tbody>
</table>

- service database compact [all|captive-portal|nsight]

<table>
<thead>
<tr>
<th>database</th>
<th>Performs database (MongoDB) related actions. The database could either be a captive-portal database or NSight database.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note:</strong> This command is supported only on the NX95XX series and NX9600 service platforms.</td>
</tr>
</tbody>
</table>

Note: This command is supported only on the NX95XX series and NX9600 service platforms.
### common commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>**compact [all</td>
<td>captive-portal</td>
</tr>
</tbody>
</table>
| | • all – Compacts collections within all MongoDB databases (captive-portal and NSight) being maintained  
  • captive-portal – Compacts all collections within the captive portal database only  
  • nsight – Compacts all collections within the NSight database only |
| **database drop [captive-portal| nsight] collection <COLLECTION-NAME>** | Drops the specified collection from the selected database. Select the database type and specify the collection. |
| | • captive-portal – Drops a captive portal database collection  
  • nsight – Drops an NSight database collection |
| **database** | Performs database (MongoDB) related actions. The database could either be a captive-portal database or NSight database. |
| | **Note:** This command is supported only on the NX95XX series and NX9600 service platforms. |
| **drop [captive-portal| nsight] collection <COLLECTION-NAME>** | Drops the specified collection from the selected database. Select the database type and specify the collection. |
| | • captive-portal – Drops a captive portal database collection  
  • nsight – Drops an NSight database collection |
| | The following keyword is common to both the ‘captive-portal’ and ‘NSight’ databases:  
  • collection <COLLECTION-NAME> – Drops the collection identified by the <COLLECTION-NAME> parameter.  
  • <COLLECTION-NAME> – Specify the collection name. |
| **database maintenance-mode** | Places the database server in the maintenance mode |
| **database primary-stepdown** | Requests the primary replica-set to step down. For more information on replica-sets and its creation, see `database-policy`. |
| **database remove-all-files** | Removes all database-server related files (captive-portal and MongoDB). Use in a scenario where complete removal of all database related files is necessary, such as when downgrading to 5.8.1 or 5.8.0 version. Extreme caution is recommended when using this command. |
| **database start-shell** | Starts the MongoDB shell |
| **database replica-set add member [<IP>|<FQDN>] [arbiter|priority <0-255>]** | Adds members in the MongoDB replica set. A replica set in MongoDB is a group of devices running the mongod instances that maintain the same data set. Replica sets provide redundancy and high availability, and are the basis for all production deployments. The replica set can contain a maximum of fifty (50) members, with each member (with the exception of the arbiter) hosts an instance of the MongoDB database. For more information on creating replica sets, see `database-policy`. |
add member [<IP>|<FQDN>]

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adds members to the MongoDB replica set</td>
<td>Add members to the replica set</td>
</tr>
<tr>
<td><strong>&lt;IP&gt;</strong> – Identifies the member by its IP address. Specify the member’s IP address.</td>
<td>Specify the member’s IP address.</td>
</tr>
<tr>
<td><strong>&lt;FQDN&gt;</strong> – Identifies the member by its Fully Qualified Domain Name (FQDN). Specify the member’s FQDN address.</td>
<td>Specify the member’s FQDN address.</td>
</tr>
</tbody>
</table>

**Note:** Ensure that the identified members have the mongod instance running prior to being added to the replica set. It is recommended to create

[arbiter| priority <0-255>]

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>After identifying the new member, optionally specify if the member is the arbiter or not. If not the arbiter, specify the member’s priority value.</td>
<td>Specify if the member is the arbiter or not.</td>
</tr>
<tr>
<td><strong>arbiter</strong> – Identifies the new member as the arbiter. The arbiter does not maintain a data set and is added to the replica set to facilitate the election of the fall-back primary member. It provides that one extra vote required in the election of the primary member.</td>
<td>Specify if the new member is the arbiter.</td>
</tr>
<tr>
<td><strong>priority &lt;0-255&gt;</strong> – Identifies the new member as not being the arbiter and configures its priority value.</td>
<td>Specify the priority value from 0 - 255.</td>
</tr>
<tr>
<td><strong>&lt;0-255&gt;</strong> – Specify the priority value from 0 - 255. Not applicable for the arbiter.</td>
<td>Specify the priority value from 0 - 255.</td>
</tr>
</tbody>
</table>

**Note:** All identified members should have the mongod instances running prior to being added to the replica set.

**database**

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Performs database related actions. The database could either be a captive-portal database or NSight database.</td>
<td>Perform database related actions.</td>
</tr>
<tr>
<td><strong>Note:</strong> This command is supported only on the NX95XX series and NX9600 service platforms.</td>
<td>Support only on the NX95XX series and NX9600 service platforms.</td>
</tr>
</tbody>
</table>

**replica-set**

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allows deletion of members in a MongoDB replica set. For each MongoDB a single three-member replica-set can be created and maintained. For more information on creating replica sets, see database-policy.</td>
<td>Create and maintain a replica set.</td>
</tr>
</tbody>
</table>

**delete member [<IP>|<FQDN>]**

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deletes members from an existing MongoDB replica set</td>
<td>Delete members from the replica set</td>
</tr>
<tr>
<td><strong>&lt;IP&gt;</strong> – Identifies the member by its IP address. Specify the member’s IP address.</td>
<td>Specify the member’s IP address.</td>
</tr>
<tr>
<td><strong>&lt;FQDN&gt;</strong> – Identifies the member by its FQDN. Specify the member’s FQDN address.</td>
<td>Specify the member’s FQDN address.</td>
</tr>
</tbody>
</table>

**server [restart|start|stop]**

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Performs the following actions on the database server:</td>
<td>Perform actions on the server</td>
</tr>
<tr>
<td><strong>restart</strong> – Reverts the server</td>
<td>Reverts the server</td>
</tr>
<tr>
<td><strong>start</strong> – Starts the server</td>
<td>Starts the server</td>
</tr>
<tr>
<td><strong>stop</strong> – Stops the server</td>
<td>Stops the server</td>
</tr>
</tbody>
</table>
### COMMON COMMANDS 5-39

- **service delete sessions <SESSION-COOKIES>**

  Deletes session cookies
  - `<SESSION-COOKIES>` – Provide a list of cookies to delete.

  mint
  Enables MiNT protocol management (clears LSP database, enables debug logging, enables running silence, etc.)

  clear [lsp-dp|mlcp]
  Clears LSP database and MiNT Link Control Protocol (MLCP) links
  - lsp-dp – Clears MiNT Label Switched Path (LSP) database
  - mlcp – Clears MLCP links

  debug-log [flash-and-syslog|flash-only]
  Enables debug message logging
  - flash-and-syslog – Logs debug messages to the flash and syslog files
  - flash-only – Logs debug messages to the flash file only

  expire [lsp|spf]
  Forces expiration of LSP and recalculation of Shortest Path First (SPF)
  - lsp – Forces expiration of LSP
  - spf – Forces recalculation of SPF

  flood [csnp|lsp]
  Floods control packets
  - csnp – Floods our Complete Sequence Number Packets (CSNP)
  - lsp – Floods our LSP

- **service pm stop {on <DEVICE-NAME>}**

  pm
  Stops the Process Monitor (PM)

  stop
  Stop the PM from monitoring all daemons

  on <DEVICE-NAME>
  Optional. Stops the PM on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- **service pktcap on [bridge|deny|drop|ext-vlan|rim|router|vpn|wireless] {acl-name <ACL>,count <1-1000000>,direction [any|inbound|outbound],filter,hex, rate <1-100>,snap <1-2048>,tcpdump,verbose,write [file|url|tzsp <IP/TZSP-HOSTNAME>]}**

  pktcap on
  Captures data packets crossing at a specified location
  - on – Defines the packet capture location

  bridge
  Captures packets transiting through the Ethernet bridge

  deny
  Captures packets denied by an Access Control List (ACL)

  drop
  Captures packets at the drop locations

  ext-vlan
  Captures packets forwarded to or from an extended VLAN

  rim
  Captures packets at the Radio Interface Module (RIM)

  router
  Captures packets transiting through an IP router

  vpn
  Captures packets forwarded to or from a VPN link

  wireless
  Captures packets forwarded to or from a wireless device
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl-name <strong>&lt;ACL&gt;</strong></td>
<td>Optional. Specify the ACL that matches the acl-name for the 'deny' location.</td>
</tr>
<tr>
<td>count <strong>&lt;1-1000000&gt;</strong></td>
<td>Optional. Limits the captured packet count. Specify a value from 1 -1000000.</td>
</tr>
<tr>
<td>direction</td>
<td>Optional. Changes the packet direction with respect to a device. The direction can be set as any, inbound, or outbound.</td>
</tr>
<tr>
<td>filter</td>
<td>Optional. Filters packets based on the option selected (must be used as a last option). The filter options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>&lt;LINE&gt;</strong> – Defines user defined packet capture filter</td>
</tr>
<tr>
<td></td>
<td>• <strong>arp</strong> – Matches ARP packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>capwap</strong> – Matches CAPWAP packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>cdp</strong> – Matches CDP packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>dot11</strong> – Matches 802.11 packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>dropreason</strong> – Matches packet drop reason</td>
</tr>
<tr>
<td></td>
<td>• <strong>dst</strong> – Matches IP destination</td>
</tr>
<tr>
<td></td>
<td>• <strong>ether</strong> – Matches Ethernet packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>failed</strong> – Matches failed 802.11 transmitted frames</td>
</tr>
<tr>
<td></td>
<td>• <strong>host</strong> – Matches host destination</td>
</tr>
<tr>
<td></td>
<td>• <strong>icmp</strong> – Matches ICMP packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>icmp6</strong> – Matches ICMPv6 frames</td>
</tr>
<tr>
<td></td>
<td>• <strong>ip</strong> – Matches IPV4 packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>ipv6</strong> – Matches IPV6 packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>l2</strong> – Matches L2 header</td>
</tr>
<tr>
<td></td>
<td>• <strong>l3</strong> – Matches L3 header</td>
</tr>
<tr>
<td></td>
<td>• <strong>l4</strong> – Matches L4 header</td>
</tr>
<tr>
<td></td>
<td>• <strong>mint</strong> – Matches MiNT packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>lldp</strong> – Matches LLDP packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>net</strong> – Matches IP in subnet</td>
</tr>
<tr>
<td></td>
<td>• <strong>not</strong> – Filters out any packet that matches the filter criteria (For example, if not TCP is used, all tcp packets are filtered out)</td>
</tr>
<tr>
<td></td>
<td>• <strong>port</strong> – Matches TCP or UDP port</td>
</tr>
<tr>
<td></td>
<td>• <strong>priority</strong> – Matches packet priority</td>
</tr>
<tr>
<td></td>
<td>• <strong>radio</strong> – Matches radio</td>
</tr>
<tr>
<td></td>
<td>• <strong>rssi</strong> – Matches Received Signal Strength Indication (RSSI) of received radio signals</td>
</tr>
<tr>
<td></td>
<td>• <strong>src</strong> – Matches IP source</td>
</tr>
<tr>
<td></td>
<td>• <strong>stp</strong> – Matches STP packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>tcp</strong> – Matches TCP packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>tcp6</strong> – Matches TCP over IPv6 packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>udp</strong> – Matches UDP packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>udp6</strong> – Matches UDP over IPv6 packets</td>
</tr>
<tr>
<td></td>
<td>• <strong>vlan</strong> – Matches VLAN</td>
</tr>
<tr>
<td></td>
<td>• <strong>wlan</strong> – Matches WLAN</td>
</tr>
<tr>
<td>hex</td>
<td>Optional. Provides binary output of the captured packets</td>
</tr>
<tr>
<td>rate <strong>&lt;1-100&gt;</strong></td>
<td>Optional. Specifies the packet capture rate</td>
</tr>
<tr>
<td></td>
<td>• <strong>&lt;1-100&gt;</strong> – Specify a value from 1 - 100 seconds.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>snap &lt;1-2048&gt;</td>
<td>Optional. Captures the data length • &lt;1-2048&gt; – Specify a value from 1 - 2048 characters.</td>
</tr>
<tr>
<td>tcpdump</td>
<td>Optional. Decodes tcpdump. The tcpdump analyzes network behavior, performance, and infrastructure. It also analyzes applications that generate or receive traffic.</td>
</tr>
<tr>
<td>verbose</td>
<td>Optional. Displays full packet body</td>
</tr>
<tr>
<td>write</td>
<td>Captures packets to a specified file. Specify the location to capture file: FILE – flash:/path/file usbX:/path/file vram:startup-config</td>
</tr>
<tr>
<td></td>
<td>Note: The number of USB ports available varies with type. For example, RFS6000 has one (1) port, NX4500 has four (4) ports. URL – Specify the location URL to capture file. Both IPv4 and IPv6 address formats are supported.</td>
</tr>
</tbody>
</table>

- **service pktcap on radio** [<1-1024]|all| ((acl-name <ACL>, count <1-1000000>, direction [any|inbound|outbound], filter <LINE>, hex, promiscuous, rate <1-100>, snap <1-2048>, tcpdump, verbose, write [file|url|tzsp <IP/TZSP-HOSTNAME>])

- **pktcap on radio** Captures data packets on a radio (802.11)
  - <1-1024> Captures data packets on a specified radio • <1-1024> – specify the radio index from 1 - 1024.
  - all Captures data packets on all radios
  - acl-name <ACL> Optional. Specify the ACL that matches the ACL name for the 'deny' location
  - count <1-1000000> Optional. Sets a specified number of packets to capture • <1-1000000> – Specify a value from 1 - 1000000.
  - direction [any|inbound|outbound] Optional. Changes the packet direction with respect to a device. The direction can be set as any, inbound, or outbound.
  - filter <LINE> Optional. Filters packets based on the option selected (must be used as a last option) • <LINE> – Define a packet capture filter or select any one of the available options.
  - hex Optional. Provides binary output of the captured packets
  - rate <1-100> Optional. Specifies the packet capture rate • <1-100> – Specify a value from 1 - 100 seconds.
  - snap <1-2048> Optional. Captures the data length • <1-2048> – Specify a value from 1 - 2048 characters.
  - tcpdump Optional. Decodes the TCP dump
  - verbose Optional. Provides verbose output
write  Captures packets to a specified file. Specify the location to capture file:
   FILE – flash:/path/file
   usbX:/path/file
   nvram:startup-config

Note: The number of USB ports available varies with type. For example, RFS6000 has one (1) port, NX4500 has four (4) ports.
URL – Specify the location URL to capture file. Both IPv4 and IPv6 address formats are supported.
   tftp://<hostname|IPv4/IPv6>[:port]/path/file
   ftp://<user>:<passwd>@<hostname|IPv4/IPv6>[:port]/path/file
   sftp://<user>@<hostname|IPv4/IPv6>[:port]/path/file
   tzsp – The TZSP host. Specify the TZSP host’s IP address or hostname.

| Service pktcap on interface [<INTERFACE>|ge <1-4>|me|port-channel <1-2>|vlan <1-4094>] ([acl-name <ACL>,count <1-1000000>,direction [any|inbound|outbound],filter <LINE>,hex,rate <1-100>,snap <1-2048>,tcpdump,verbose,write [file|url|tzsp <IP/TZSP-HOSTNAME>]]) |Captures data packets at a specified interface
• on – Specify the capture location. |
|---|---|
|interface [<INTERFACE>|ge <1-4>|me1|port-channel <1-2>|vlan <1-4094>] |Captures packets at a specified interface. The options are:
• <INTERFACE> – Specify the interface name.
• ge <1-4> – Selects a GigabitEthernet interface index from 1 - 4
• me1 – Selects the FastEthernet interface
• port-channel <1-2> – Selects a port-channel interface index from 1 - 2
• vlan <1-4094> – Selects a VLAN ID from 1 - 4094 |
|acl-name <ACL> |Optional. Specify the ACL that matches the ACL name for the 'deny' location |
|count <1-1000000> |Optional. Sets a specified number of packets to capture
• <1-1000000> – Specify a value from 1 - 1000000. |
|direction [any|inbound|outbound] |Optional. Changes the packet direction with respect to a device. The direction can be set as any, inbound, or outbound. |
|filter <LINE> |Optional. Filters packets based on the option selected (must be used as a last option)
• <LINE> – Define a packet capture filter or select any one of the available options. |
|hex |Optional. Provides binary output of the captured packets |
|rate <1-100> |Optional. Specifies the packet capture rate
• <1-100> – Specify a value from 1 - 100 seconds. |
|snap <1-2048> |Optional. Captures the data length
• <1-2048> – Specify a value from 1 - 2048 characters. |
|tcpdump |Optional. Decodes the TCP dump |
|verbose |Optional. Provides verbose output |
write | Captures packets to a specified file. Specify the location to capture file:
FILE – flash:/path/file
usbX:/path/file
nvram:startup-config

Note: The number of USB ports available varies with type. For example, RFS6000 has one (1) port, NX4500 has four (4) ports.
URL – Specify the location URL to capture file. Both IPv4 and IPv6 address formats are supported.
  tftp://<hostname|IPv4/IPv6>[:port]/path/file
  ftp://<user>:<passwd>@<hostname|IPv4/IPv6>[:port]/path/file
  sftp://<user>@<hostname|IPv4/IPv6>[:port]/path/file
  tzsp – The TZSP host. Specify the TZSP host’s IP address or hostname.

• service show last-passwd

show | Displays running system statistics based on the parameters passed

last-passwd | Displays the last password used to enter shell

• service signal [abort <PROCESS-NAME> | kill <PROCESS-NAME>]

signal | Sends a signal to a process
  • tech-support – Copies extensive system information useful for troubleshooting

abort | Sends an abort signal to a process, and forces it to dump to core
  • <PROCESS-NAME> – Specify the process name.

kill | Sends a kill signal to a process, and forces it to terminate without a core
  • <PROCESS-NAME> – Specify the process name.

• service start-shell

start-shell | Provides shell access

• service trace <PROCESS-NAME> {summary}

trace | Traces a process for system calls and signals

<PROCESS-NAME> | Specifies the process name

summary | Optional. Generates summary report of the specified process

Syntax (Privilege Exec Mode: NX9000, NX9500, and NX9510)

 service

The following service commands are specific to the NX9000, NX9500, and NX9510 series service platforms:

service copy analytics-support [<FILE>|<URL>]

Parameters (Privilege Exec Mode: NX9000, NX9500, and NX9510)

• service copy analytics-support [<FILE>|<URL>]

copy analytics-support | Enables copying of analytics information to a specified. Use one of the following options to specify the file:
  Note: This information is useful to troubleshoot issues by the Technical Support team.
Usage Guidelines
The NX9500 and NX9510 model service platforms (NOC) provide granular and robust analytic reporting for a RFS4000, RFS6000, RFS7000, NX45XX, or NX65XX device managed network. The data analyzed is collected at intervals specified by the administrator.

To enable data analytics, procure and apply a separate hot spare analytics license at the NOC. The license restricts the number of access point streams processed at the NOC or forwarded to partner systems for further processing. The analytics feature can be turned on at select APs by enabling them in configuration. This way the customer can enable analytics on a select set of APs and not the entire system as long as the number of APs on which it is enabled is less than or equal to the total number of AP analytics licenses available at the NOC controller.

In an NOC managed network, the analytics engine parses and processes Smart RF events as they are received. The analytics engine parses the new channel and power information from the Smart RF event, as opposed to retrieving the event from the devices themselves.

Syntax (Global Config Mode)

```
! service
service [set | show cli]
```

```
service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100>|virtual-machine-history <10-200>] {on <DEVICE-NAME>}
```

```
service show cli
```

Parameters (Global Config Mode)

- `service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100>|virtual-machine-history <10-200>] {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>set</th>
<th>Sets the size of history files</th>
</tr>
</thead>
<tbody>
<tr>
<td>command-history &lt;10-300&gt;</td>
<td>Sets the size of the command history file</td>
</tr>
<tr>
<td>upgrade-history &lt;10-100&gt;</td>
<td>Sets the size of the upgrade history file</td>
</tr>
<tr>
<td>reboot-history &lt;10-100&gt;</td>
<td>Sets the size of the reboot history file</td>
</tr>
<tr>
<td>virtual-machine-history &lt;10-200&gt;</td>
<td>Sets the size of the virtual-machine history file</td>
</tr>
</tbody>
</table>

Note: This command is applicable only to the NX45XX, NX65XX, NX9500, and NX9510 series service platforms. Use the `no > service > set > virtual-machine-history > {on <DEVICE-NAME>} command to revert the history file size to 100.

```
on <DEVICE-NAME> Optional. Sets the size of history files on a specified device
```

- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

### Parameters

- `<FILE>` Specify the file name and location using one of the following formats:
  - `usb1:/path/file`
  - `usb2:/path/file`

- `<URL>` Specify the location URL to copy file. Both IPv4 and IPv6 formats are supported.
  - `ftp://<hostname|IPv4/IPv6>[:port]/path/file`
  - `ftps://<hostname|IPv4/IPv6>[:port]/path/file`
  - `ftp://<user>:<password>@<hostname|IPv4/IPv6>[:port]/path/file`
  - `sftp://<user>:<password>@<hostname|IPv4/IPv6>[:port]/path/file`
• service show cli

show cli Displays running system configuration details
  • cli – Displays the CLI tree of the current mode

</tbody>
</table>

In the preceding example,
- The meshpoint name is **mesh_root**
- The device on which the command is executed is **ROOT1-ap81xx-71174C**
- The vertical **ZONE** column represents meshpoint modules. For example, **3-ND** presents the Neighbor Discovery module.
- The **SUBZONE** 0 to 7 represents the available processes for each of the zonal modules.
- Debugging is disabled for all modules for the mesh-root meshpoint. A value of 0 (Zero) represents debugging disabled.

To enable meshpoint module debugging, specify the module number and the process number separated by a period (.). And then specify the debugging level from 0 - 7.

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 3.2.7
```

In the preceding command,
- The meshpoint module number provided is **3** (ND)
- The process number provided is **2** (RX - Received signals from neighbors)
- The debugging level provided is **7** (highest level - warning)
In the preceding example, level 7 debugging has been enabled only for the ND module’s received signals. Note that debugging for all other modules and processes are still disabled.

To disable debugging for all modules, specify 0 (zero) in the command. For example:

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 0
```

To enable debugging for all modules, specify the debugging level number. For example:

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 5
```
The following examples show the purging of users from the guest-registration database:

nx7500-112233#service guest-registration delete ?
   all                     Delete all users
   email                  Email address
   group                  Group
   mac                    MAC address
   mobile                 Mobile phone number
   name                   Full name
   offline-for            Specify minimum amount of time offline
   otp-incomplete-for     Specify minimum amount of time registration with
                           one-time-passcode incomplete
   social                 Social site used to log in
   wlan                   Wireless LAN

nx7500-112233#

1. Purges users belonging to a specified RADIUS group.

nx7500-112233#service guest-registration delete group mac_reg_gr1
delete user status: delete users matching a group will take time, please wait
nx7500-112233#

2. Purges users using social-site (Facebook or Google) credentials to login.

nx7500-112233#service guest-registration delete social facebook
delete user status: deleting a social category will take time, please wait
nx7500-112233#

3. Purges users inactive for a specified time period.

nx7500-112233#service guest-registration delete offline-for days 5
delete user status: Deleting users offline for minimum 5 days. This will take time,
please wait
nx7500-112233#

4. Purges users who have failed to complete registration using the one-time-passcode (OTP) within a specified time period.

nx7500-112233#service guest-registration delete otp-incomplete-for days 5
delete user status: Deleting registration with one-time-passcode incomplete for
minimum 5 days. This will take time, please wait
nx7500-112233#
5.1.8 show

Common Commands

Displays specified system component settings. There are a number of ways to invoke the show command:

- When invoked without any arguments, it displays information about the current context. If the current context contains instances, the show command (usually) displays a list of these instances.
- When invoked with the display parameter, it displays information about that component.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show <PARAMETERS>

Parameters

- show <PARAMETERS>

The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy’s current settings. The example below shows the configuration details that can be viewed in the Priv Executable mode.

Examples

```
rfs7000-37FABE#show ?
 adoption  Adoption related information
 bluetooth  Bluetooth Configuration/Statistics commands
 bonjour    Bonjour Gateway related commands
 boot       Display boot configuration.
 captive-portal  Captive portal commands
 captive-portal-page-upload  Captive portal advanced page upload
 cdp        Cisco Discovery Protocol
 classify-url  Query the category of an URL
 clock      Display system clock
 cluster    Cluster Protocol
 cmp-factory-certs  Display the CMP certificate status
 commands   Show command lists
 context    Information about current context
 critical-resources  Critical Resources
 crypto     Encryption related commands
 debug      Debugging functions
 debugging  Debugging functions
 device-upgrade  Device Upgrade
 dot1x      802.1X
 dpi        Deep Packet Inspection
 environmental-sensor  Display Environmental Sensor Module status
 event-history  Display event history
 event-system-policy  Display event system policy
 ex3500     EX3500 device details
 extdev     External device (T5, Ex3500..)
 file       Display filesystem information
 file-sync  File sync between controller and adoptees
 firewall   Wireless Firewall
 global     Global-level information
 gre        Show gre tunnel info
 interface  Interface Configuration/Statistics commands
 ip         Internet Protocol (IP)
 ip-access-list  IP ACL
```

**NOTE:** For more information on the show command, see Chapter 6, SHOW COMMANDS.
5.1.9 write

Common Commands

Writes the system running configuration to memory or terminal

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
write [memory|terminal]

Parameters
- write [memory|terminal]

<table>
<thead>
<tr>
<th>memory</th>
<th>Writes to the non-volatile (NV) memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>terminal</td>
<td>Writes to the terminal</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE>write memory
[OK]
rfs7000-37FABE>
Show commands display configuration settings or statistical information. Use this command to view the current running configuration as well as the start-up configuration. The show command also displays the current context’s configuration.

This chapter describes the ‘show’ CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes. Commands entered in either USER EXEC mode or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.

This chapter also describes the ‘show’ commands in the ‘GLOBAL CONFIG’ mode. The commands can be entered in all three modes, except commands like file, IP access list statistics, MAC access list statistics, and upgrade statistics, which cannot be entered in the USER EXEC mode.

---

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore `_` character. In other words, the name of a device cannot contain an underscore.
6.1 show commands

The following table summarizes show commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>show</td>
<td>Displays settings for the specified system component</td>
<td>page 6-6</td>
</tr>
<tr>
<td>adoption</td>
<td>Displays information related to adoption</td>
<td>page 6-12</td>
</tr>
<tr>
<td>bluetooth</td>
<td>Displays Bluetooth radio statistics for RF Domain member access points</td>
<td>page 6-16</td>
</tr>
<tr>
<td>boot</td>
<td>Displays a device boot configuration</td>
<td>page 6-18</td>
</tr>
<tr>
<td>bonjour</td>
<td>Displays the configured Bonjour services available on local and remote sites</td>
<td>page 6-19</td>
</tr>
<tr>
<td>captive-portal</td>
<td>Displays WLAN hotspot functions</td>
<td>page 6-20</td>
</tr>
<tr>
<td>captive-portal-page-upload</td>
<td>Displays captive portal page related information</td>
<td>page 6-22</td>
</tr>
<tr>
<td>cdp</td>
<td>Displays a Cisco Discovery Protocol (CDP) neighbor table</td>
<td>page 6-24</td>
</tr>
<tr>
<td>classify-url</td>
<td>Queries a specified global data center or a pre-configured classification server for the category of a specified URL.</td>
<td>page 6-26</td>
</tr>
<tr>
<td>clock</td>
<td>Displays the software system clock</td>
<td>page 6-27</td>
</tr>
<tr>
<td>cluster</td>
<td>Displays cluster commands</td>
<td>page 6-28</td>
</tr>
<tr>
<td>cmp-factory-certs</td>
<td>Displays factory installed CMP certificates</td>
<td>page 6-29</td>
</tr>
<tr>
<td>commands</td>
<td>Displays command list</td>
<td>page 6-30</td>
</tr>
<tr>
<td>context</td>
<td>Displays information about the current context</td>
<td>page 6-31</td>
</tr>
<tr>
<td>critical-resources</td>
<td>Displays critical resource information</td>

<tr>
<td>crypto</td>
<td>Displays encryption mode information</td>
<td>page 6-33</td>
</tr>
<tr>
<td>database</td>
<td>Displays database-related statistics and status</td>
<td>page 6-36</td>
</tr>
<tr>
<td>device-upgrade</td>
<td>Displays device firmware upgradation information for devices adopted by a wireless controller or access point</td>
<td>page 6-37</td>
</tr>
<tr>
<td>dot1x</td>
<td>Displays dot1x information on interfaces</td>
<td>page 6-40</td>
</tr>
<tr>
<td>dpi</td>
<td>Displays statistics for all configured and canned applications</td>
<td>page 6-42</td>
</tr>
<tr>
<td>environmental-sensor</td>
<td>Displays environmental sensor's historical data (applicable only to AP8132)</td>
<td>page 6-45</td>
</tr>
<tr>
<td>event-history</td>
<td>Displays event history</td>
<td>page 6-48</td>
</tr>
<tr>
<td>event-system-policy</td>
<td>Displays event system policy configuration information</td>
<td>page 6-49</td>
</tr>
<tr>
<td>ex3500</td>
<td>Displays EX3500-related statistical data</td>
<td>page 6-50</td>
</tr>
</tbody>
</table>
### Table 6.1 Show Commands

6.1.1 show

show commands

The show command displays following information:

- A device’s current configuration
- A device’s start-up configuration
- A device’s current context configuration, such as profiles and policies

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5600, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

Syntax

show <PARAMETERS>

Parameters

- show <PARAMETERS>

The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy’s current settings. The examples below show the configuration parameters that can be viewed in the User Executable, Priv Executable, and Global Configurable modes.

Examples

The following examples list the show commands in the User Exec, Priv Exec, and Global Config modes:

GLOBAL CONFIG Mode

<DEVICE>(config)#show ?

adoption Adoption related information
bluetooth Bluetooth Configuration/Statistics commands
bonjour Bonjour Gateway related commands
boot Display boot configuration.
captive-portal Captive portal commands
captive-portal-page-upload Captive portal advanced page upload
cdp Cisco Discovery Protocol
classify-url Query the category of an URL
clock Display system clock
cluster Cluster Protocol
cmp-factory-certs Display the CMP certificate status
commands Show command lists
context Information about current context
critical-resources Critical Resources
crypto Encryption related commands
database Database
debug Debugging functions
debugging Debugging functions
device-upgrade Device Upgrade
dot1x 802.1X
dpi Deep Packet Inspection
environmental-sensor Display Environmental Sensor Module status
event-history Display event history
event-system-policy Display event system policy
ex3500 EX3500 device details
extdev External device (T5, EX3500..)
file Display filesystem information
file-sync File sync between controller and adoptees
firewall Wireless Firewall
SHOW COMMANDS 6-7

- **global**
  - Global-level information

- **gre**
  - Displays gre related information

- **guest-registration**
  - Guest registration commands

- **interface**
  - Interface Configuration/Statistics commands

- **ip**
  - Internet Protocol (IP)

- **ip-access-list**
  - IP ACL

- **ipv6**
  - Internet Protocol version 6 (IPv6)

- **ipv6-access-list**
  - IPv6 ACL

- **l2tpv3**
  - L2TPv3 information

- **ldap-agent**
  - LDAP Agent Configuration

- **licenses**
  - Show installed licenses and usage

- **lldp**
  - Link Layer Discovery Protocol

- **logging**
  - Show logging information

- **mac-access-list**
  - MAC ACL

- **mac-address-table**
  - Display MAC address table

- **mac-auth**
  - MAC authentication

- **mac-auth-clients**
  - MAC authenticated clients

- **mint**
  - MiNT protocol

- **mirroring**
  - Show mirroring sessions

- **nsight**
  - Nsight Server Module

- **ntp**
  - Network time protocol

- **password-encryption**
  - Password encryption

- **pppoe-client**
  - PPP Over Ethernet client

- **privilege**
  - Show current privilege level

- **radius**
  - RADIUS statistics commands

- **raid**
  - Show RAID status

- **reload**
  - Scheduled reload information

- **remote-debug**
  - Show details of remote debug sessions

- **rf-domain-manager**
  - Show RF Domain Manager selection details

- **role**
  - Role based firewall

- **route-maps**
  - Display Route Map Statistics

- **rtls**
  - RTLS Statistics

- **running-config**
  - Current operating configuration

- **session-changes**
  - Configuration changes made in this session

- **session-config**
  - This session configuration

- **sessions**
  - Display CLI sessions

- **site-config-diff**
  - Difference between site configuration on the NOC and actual site configuration

- **slot**
  - Expansion slots stats

- **smart-cache**
  - Content caching

- **smart-rf**
  - Smart-RF Management Commands

- **spanning-tree**
  - Display spanning tree information

- **startup-config**
  - Startup configuration

- **t5**
  - T5 details

- **terminal**
  - Display terminal configuration parameters

- **timezone**
  - The timezone

- **traffic-shape**
  - Display traffic shaping

- **upgrade-status**
  - Display last image upgrade status

- **version**
  - Display software & hardware version

- **virtual-machine**
  - Virtual Machine

- **vrrp**
  - VRRP protocol

- **web-filter**
  - Web filter

- **what**
  - Perform global search

- **wireless**
  - Wireless commands

- **wwan**
  - Display wireless WAN Status

```
<DEVICE>(config)#
rfs7000-37FABE(config)#show clock
2016-01-27 11:25:57 UTC

nx9500-6C874D(config)#
6.1.2 adoption

show commands

Displays adoption related information, and is common to the User Exec, Priv Exec, and Global Config modes.

In an hierarchically managed (HM) network devices are deployed in two levels. The first level consists of the Network Operations Center (NOC) controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (access points and second-level controllers) are referred to as the adoptee. The devices adopting the adoptee are the ‘adopters’.

Use this command to confirm if a device is an adoptee or an adopter. This command also allows you to determine the devices adopted by an adopter device.

**NOTE:** A NOC controller’s capacity is equal to or higher than a site controller’s capacity. The following devices can be deployed at NOC and sites:

- NOC controller – RFS6000, RFS7000, NX65XX, NX9000, NX9500, NX9510, or NX9600.
- Site controller – NX45XX, NX65XX, RFS7000, RFS6000, or RFS4000.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show adoption [config-errors|controllers|history|info|log|offline|pending|status|timeline]

show adoption offline
show adoption config-errors <DEVICE-NAME>
show adoption log [adoptee adopter {<MAC>}] {on <DEVICE-NAME>}
show adoption [controllers|history|info|pending|status|timeline] {on <DEVICE-NAME>}

Parameters

- show adoption offline

| adoption | Displays adoption related information. It also displays configuration errors. |
| offline | Displays non-adopted status of the logged device and its adopted access points |

- show adoption config-errors <DEVICE-NAME>

| adoption | Displays adoption related information. It also displays configuration errors. |
| config-errors <DEVICE-NAME> | Displays configuration errors for a specified adopted device  |
| | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- show adoption log [adoptee adopter {<MAC>}] {on <DEVICE-NAME>}

<p>| adoption | Displays adoption related information. It also displays configuration errors. |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **log [adoptee] adopter {MAC}** {on <DEVICE-NAME>} | Displays adoption logs, for the specified device. If no device name is specified, the system displays logs for the logged device.  
  
  - adoptee – Displays adoption logs for adoptee devices (APs, wireless controllers, and service platforms). To view logs for a specified adoptee, specify the device’s name. If no device name is specified, the system displays logs for the logged device. If the logged device is not an adoptee, the system states that the device is a controller.  
  
  For example, 2013-01-19 22:00:13:MLCP_TAG_CLUSTER_MASTER not present and this device is a controller. Ignoring  
  
  - on <DEVICE-NAME> – Optional. Displays adoptee status and details for the device identified by the <DEVICE-NAME> keyword  
    - <DEVICE-NAME> – Specify the device’s name.  
  
  - adopter – Displays adoption logs for adopter devices (APs, wireless controllers, and service platforms). To view logs for a specified adopter, specify the device’s name. If no device name is specified, the system displays logs for the logged device.  
    - <MAC> – Optional. Filters adopters by the adoptee device’s MAC address. Specify the adoptee device’s MAC address. The system displays logs for the device that has adopted the device identified by the <MAC> keyword.  
    - on <DEVICE-NAME> – Optional. Displays adopter status and details for the device identified by the <DEVICE-NAME> keyword.  
    - <DEVICE-NAME> – Specify the adopter device’s name.  
  
  **Note:** A wireless controller or service platform cannot be configured as an adoptee and an adopter simultaneously. In other words, an adopted wireless controller or service platform cannot be configured to adopt another device and vice versa. |
| **adoption** {on <DEVICE-NAME>} | Displays adoption related information. It also displays configuration errors. |
| **controllers** | Displays information about adopted controllers. This is applicable in a Hierarchically managed network, where site controllers are adopted by the NOC controllers. |
| **history** | Displays adoption history of the logged device and its adopted access points |
| **info** | Displays adopted device information |
| **pending** | Displays information for devices pending adoption |
| **status** | Displays adoption status for logged devices |
| **timeline** | Displays the logged device’s adoption timeline. It also shows the adoption time for logged device’s adopted APs. To view the adoption timeline of a specific device, use the on <device-name> option to specify the device. |
| **on <DEVICE-NAME>** | The following keywords are common to all of the above parameters:  
  
  - on <DEVICE-NAME> – Optional. Displays a device’s adoption information, based on the parameter passed.  
  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
Usage Guidelines

In a device’s Global Config mode, use the `customize > show-adoption-status` command to customize the `show > adoption > status` command output. The following columns can be added to the output:

```
adopted-by     Device name to which the AP is adopted
ap-name        Host-name of the adopted AP
cdp-lldp-info  Cdp/lldp info of the Adopted AP
config-status  Configuration status of the adopted AP
last-adoption  Last known adoption time
msgs           Messages status
uptime         Uptime of the adopted AP
version        Current version of the adopted AP
```

nx9500-6C8809(config)#customize show-adoption-status ?

For more information on the customize command, see `customize`.

Examples

The following example displays details of the:

- logged device (rfs6000-81742D), and
- devices adopted (ap8132-711728) by the logged device.

```
rfs6000-81742D#show adoption status

nx9500-6C8809(config)#
6.1.3 bluetooth

▶ show commands

Displays Bluetooth radio statistics for RF Domain member access points

AP8432 and AP8533 model access points utilize a built-in Bluetooth chip for specific Bluetooth functional behaviors in a WiNG managed network. AP8432 and AP8533 models support both Bluetooth classic and Bluetooth low energy (BLE) technology. These platforms use their Bluetooth classic enabled radio to sense other Bluetooth enabled devices and report device data (MAC address, RSSI and device calls) to an ADSP server for intrusion detection. If the device presence varies in an unexpected manner, ADSP can raise an alarm.

NOTE: AP8132 model access points support an external USB Bluetooth radio providing ADSP Bluetooth classic sensing functionality only, not the BLE beaconing functionality available for AP8432 and AP8533 model access points described in this section.

AP8432 and AP8533 model access points support Bluetooth beaconing to emit either iBeacon or Eddystone-URL beacons. The access point’s Bluetooth radio sends non-connectable, undirected low-energy (LE) advertisement packets periodically. These advertisement packets are short and sent on Bluetooth advertising channels that conform to already-established iBeacon and Eddystone-URL standards.

Supported in the following platforms:
- Access Points — AP8432, AP8533

Syntax

```plaintext
show bluetooth radio {detail|on}
```

show bluetooth radio {detail {<DEVICE-NAME> <1-1>|filter bluetooth-radio-mac <BT-RADIO-MAC>}} {(on <DEVICE-OR-DOMAIN-NAME>)}

Parameters

- show bluetooth radio {detail {<DEVICE-NAME> <1-1>|filter bluetooth-radio-mac <BT-RADIO-MAC>}} {(on <DEVICE-OR-DOMAIN-NAME>)}

<table>
<thead>
<tr>
<th>Bluetooth radio</th>
<th>Displays Bluetooth radio utilization statistics based on the parameters passed</th>

rfs7000-37FABE#
### 6.1.6 captive-portal

#### show commands

Displays WLAN captive portal information. Use this command to view a configured captive portal's client information.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
show captive-portal sessions {include-ipv6|on <DEVICE-OR-DOMAIN-NAME>|statistics}
```

#### Parameters

- **captive-portal sessions**
  Displays active captive portal client session details

- **include-ipv6**
  Optional. Includes IPv6 address (if known) of captive portal clients
  
  **Note**: By default the system only displays IPv4 addresses. The include-ipv6 parameter includes IPv6 address (if known) of each client.

- **statistics**
  Optional. Displays statistical information regarding client sessions

- **on <DEVICE-OR-DOMAIN-NAME>**
  Optional. Displays active captive portal session details on a specified device or RF Domain.
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

- **filter**
  This parameter is recursive and can be used with any of the above parameters to define additional filters.
  Optional. Defines additional filters. Use one of the following options: captive-portal, ip, ipv6, state, vlan, or wlan.

- **captive-portal [<CAPTIVE-PORTAL>|not <CAPTIVE-PORTAL>]**
  Optional. Displays captive portal client and client session information, based on the captive portal name passed
  - `<CAPTIVE-PORTAL>` – Specify the captive portal name. Displays client details for the specified captive portal.
  - not `<CAPTIVE-PORTAL>` – Inverts the match selection. Displays client details for all captive portals other than the specified captive portal.

- **ip [<IPv4>|not <IPv4>]**
  Optional. Displays captive portal client/client sessions information, based on the IPv4 address passed
  - `<IPv4>` – Specify the client's IPv4 address. Displays information of the client identified by the `<IPv4>` parameter
  - not `<IPv4>` – Inverts the match selection. Displays client details for all clients other than the one identified by the `<IPv4>` parameter.
### Examples

```
rfs4000-229D58#show captive-portal sessions
=======================================================================================
CLIENT     IPv4     CAPTIVE-PORTAL   WLAN/PORT    VLAN  STATE  SESSION  TIME

=======================================================================================
```

Total number of captive portal sessions displayed: 1

```
rfs4000-229D58#
```
### 6.1.7 captive-portal-page-upload

**show commands**

Displays captive portal page information, such as upload history, upload status, and page file download status

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP61XX, AP62XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

- `show captive-portal-page-upload [history|list-files|load-image-status|status]`
- `show captive-portal-page-upload load-image-status`
- `show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}`
- `show captive-portal-page-upload status {on [ <RF-DOMAIN-NAME> | <RF-DOMAIN-MANAGER> ]}`
- `show captive-portal-page-upload list-files <CAPTIVE-PORTAL-NAME>`

**Parameters**

- `load-image-status` Displays captive portal advanced page file download status on the logged device

<table>
<thead>
<tr>
<th>load-image-status</th>
<th>Displays captive portal advanced page file download status on the logged device</th>
</tr>
</thead>
<tbody>

6.1.8 cdp

› show commands
Displays the Cisco Discovery Protocol (CDP) neighbor table

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
show cdp [neighbors|report] {detail {on <DEVICE-NAME>}|on <DEVICE-NAME>}

Parameters
- show cdp [neighbors|report] {detail {on <DEVICE-NAME>}|on <DEVICE-NAME>}

| cdp [neighbors|report] | Displays CDP neighbors table or aggregated CDP neighbors table |
|------------------------|---------------------------------------------------------------|
| detail {on <DEVICE-NAME>} | Optional. Displays detailed CDP neighbors table or aggregated CDP neighbors table |
|                        | • on <DEVICE-NAME> – Optional. Displays table details on a specified device |
|                        | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
| on <DEVICE-NAME> | Optional. Displays table details on a specified device |
|                        | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

Examples
The following example shows detailed CDP neighbors table:

```

6.1.9 `classify-url`

Displays a specified URL’s category. Use this command to query the category of a specific URL. The query is sent to a configured classification server. This option is available only if a valid URL filter license is available.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]
```

Parameters

- `show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]`

<table>
<thead>
<tr>
<th>classify-url</th>
<th>Queries the category of a specified URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;URL-TO-QUERY&gt;</td>
<td>Specify the URL to query. The query is sent to the configured classification server.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>datacenter &lt;URL-TO-QUERY&gt;</th>
<th>The query is sent to a global classification datacenter</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- &lt;URL-TO-QUERY&gt; – Specify the URL to query.</td>
</tr>
</tbody>
</table>

Examples

```
nx4500-5CFA2B#show classify-url www.google.com
Categories: search-engines-portals,
Custom Categories:
nx4500-5CFA2B#
```

```
nx4500-5CFA2B#show classify-url www.ndtv.com
Categories: news,
Custom Categories: list1,
nx4500-5CFA2B#
```
6.1.10 clock

show commands

Displays a selected system’s clock

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show clock \{on <DEVICE-NAME>\}

Parameters

- show clock \{on <DEVICE-NAME>\}

<table>
<thead>
<tr>
<th>clock</th>
<th>Displays a system’s clock</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays system clock on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config)#show clock
2016-05-13 12:06:26  UTC
rfs7000-37FABE(config)#
## 6.1.11 cluster

> **show commands**

Displays cluster information (cluster configuration parameters, members, status, etc.)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP91XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```plaintext
show cluster [configuration|members|status]
```

### Parameters

- `show cluster [configuration|members {detail}|status]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster</td>
<td>Displays cluster information</td>
</tr>
<tr>
<td>configuration</td>
<td>Displays cluster configuration parameters</td>
</tr>
<tr>
<td>members {detail}</td>
<td>Displays cluster members configured on the logged device</td>
</tr>
<tr>
<td>status</td>
<td>Displays cluster status</td>
</tr>
<tr>
<td>detail</td>
<td>Optional. Displays detailed information of known cluster members</td>
</tr>
</tbody>
</table>

### Examples

```
rfs6000-380649(config)#show cluster configuration

Cluster Configuration Information
Name : SiteConRFS6k
Configured Mode : Active
Master Priority : 128
Force configured state : Disabled
Force configured state delay : 5 minutes
Handle STP : Disabled
Radius Counter DB Sync Time : 5 minutes
```

```
rfs6000-380649(config)#show cluster members detail

<table>
<thead>
<tr>
<th>ID</th>
<th>MAC</th>
<th>Mode</th>
<th>AP Count</th>
<th>AAP Count</th>
<th>AP License</th>
<th>AAP License</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>70.38.06.49</td>
<td>00-15-70-38-06-49</td>
<td>Active</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>5.8.4.0-008D</td>
</tr>
<tr>
<td>70.81.74.2D</td>
<td>00-15-70-81-74-2D</td>
<td>Active</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>5.8.4.0-008D</td>
</tr>
</tbody>
</table>
```

```
rfs6000-380649(config)#show cluster status

Cluster Runtime Information
Protocol version : 1
Cluster operational state : active
AP license : 1
AAP license : 0
AP count : 0
AAP count : 1
Max AP adoption capacity : 256
Number of connected member(s) : 1
```

```
rfs6000-380649(config)#
```
### 6.1.12 `cmp-factory-certs`

- **show commands**

  Displays factory installed CMP certificates

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show cmp-factory-certs {all}
```

**Parameters**

- `cmp-factory-certs {all}`

<table>
<thead>
<tr>
<th><strong>cmp-factory-certs</strong> {all}</th>
<th>Displays factory installed CMP certificates on the logged device. Optionally use the 'all' keyword to view certificate details.</th>
</tr>
</thead>
</table>

**Examples**

```
nx9500-6C8809>show cmp-factory-certs
No CMP factory certificate exist
nx9500-6C8809>
```
6.1.13 commands

- **show commands**

Displays commands available for the current mode

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show commands
```

**Parameters**

None

**Examples**

```
rfs4000-229D58(config)#show commands
help
help search WORD ([detailed|only-show|skip-show|skip-no)
show commands
show adoption log adoptee([on DEVICE-NAME])
show adoption log adopter ([mac AA-BB-CC-DD-EE-FF] [on DEVICE-NAME])
show adoption info ([on DEVICE-NAME])
show adoption status ([on DEVICE-NAME])
show adoption config-errors DEVICE-NAME
show adoption offline
show adoption pending ([on DEVICE-NAME])

### 6.1.14 context

» show commands

Displays the current context details

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show context \{include-factory|session-config \{include-factory\}\}
```

**Parameters**

- `include-factory` — Optional. Includes factory defaults
- `session-config \{include-factory\}` — Optional. Displays running system information in the current context

- **include-factory** — Optional. Includes factory defaults

**Examples**

```
rfs4000-229D58(config)#show context
!
! Configuration of RFS4000 version 5.8.4.0-008D
!
!
version 2.5

6.1.15 critical-resources

> show commands

Displays critical resource information. Critical resources are resources vital to the network.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show critical-resources {on <DEVICE-NAME>}
```

Parameters

- `critical-resources` Displays critical resources information
- `on <DEVICE-NAME>` Optional. Displays critical resource information on a specified device

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>critical-resources</td>
<td>Displays critical resources information</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays critical resource information on a specified device</td>

</tbody>
</table>
-----------------------------------------------------------
rfs4000-229D58(config)#
```
## 6.1.16 crypto

### show commands

Displays encryption mode information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

- `show crypto [cmp|ike|ipsec|key|pki]`
- `show crypto cmp request status`
- `show crypto ike sa {detail|on|peer|version} {on <DEVICE-NAME>}`
- `show crypto ike sa {version [1|2]} {peer <IP>} {on <DEVICE-NAME>}`
- `show crypto ipsec sa {detail|on|peer} {on <DEVICE-NAME>}`
- `show crypto ipsec sa {version [1|2]} {peer <IP>} {on <DEVICE-NAME>}`
- `show crypto key rsa {on|public-key-detail} {on <DEVICE-NAME>}`
- `show crypto key rsa {public-key-detail} {on <DEVICE-NAME>}`
- `show crypto pki trustpoints {<TRUSTPOINT-NAME>|all|on} {on <DEVICE-NAME>}`
- `show crypto pki trustpoints {<TRUSTPOINT-NAME>|all} {on <DEVICE-NAME>}`

### Parameters

- **crypto cmp request status**
  - Displays current status of in-progress certificate management protocol (CMP) requests
  - **Note:** For more information, see `CRYPTO-CMP-POLICY`.

- **show crypto ike sa {detail|on|peer|version} {on <DEVICE-NAME>}**
  - Displays Internet Key Exchange (IKE) security association (SA) statistics
  - **detail**
  - Displays detailed IKE SA statistics
  - **peer <IP>**
  - Optional. Displays IKE SA statistics for a specified peer
  - <IP> – Specify the peer’s IP address in the A.B.C.D format
  - **on <DEVICE-NAME>**
  - Optional. Displays IKE SA statistics on a specified device
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- **show crypto ike sa {version [1|2]} {peer <IP>} {on <DEVICE-NAME>}**
  - Displays IKE SA details
  - **version [1|2]**
  - Optional. Displays IKE SA version statistics
  - 1 – Displays IKEv1 statistics
  - 2 – Displays IKEv2 statistics
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show crypto ipsec sa</code></td>
<td>Displays Internet Protocol Security (IPSec) SA statistics. The IPSec encryption authenticates and encrypts each IP packet in a communication session.</td>
</tr>
<tr>
<td><code>peer &lt;IP&gt;</code></td>
<td>Optional. Displays IKE SA version statistics for a specified peer. &lt;IP&gt; – Specify the peer’s IP address in the A.B.C.D format.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>The following keyword is recursive and common to the ‘peer ip’ parameter: &lt;DEVICE-NAME&gt; – Optional. Displays IKE SA statistics on a specified device. &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
<tr>
<td><code>detail</code></td>
<td>Optional. Displays detailed IPSec SA statistics.</td>
</tr>
<tr>
<td><code>crypto ipsec sa detail</code></td>
<td>Optional. Displays IPSec SA statistics for a specified peer. &lt;IP&gt; – Specify the peer’s IP address in the A.B.C.D format. detail – Displays detailed IPSec SA statistics for the specified peer</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>Optional. Displays IPSec SAs on a specified device. &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Note:**
- This command displays all trustpoints including CMP-generated trustpoints.
- The following keyword is recursive:
  - <TRUSTPOINT-NAME> – Specify the trustpoint name.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto key rsa</code></td>
<td>Displays RSA public keys.</td>
</tr>
<tr>
<td><code>public-key-detail</code></td>
<td>Optional. Displays public key in the Privacy-Enhanced Mail (PEM) format.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>The following keyword is recursive: &lt;DEVICE-NAME&gt; – Optional. Displays public key on a specified device. &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto pki trustpoints</code></td>
<td>Displays WLAN trustpoints. <strong>Note:</strong> This command displays all trustpoints including CMP-generated trustpoints.</td>
</tr>
<tr>
<td><code>&lt;TRUSTPOINT-NAME&gt;</code></td>
<td>Optional. Displays a specified trustpoint details. Specify the trustpoint name.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Optional. Displays details of all trustpoints.</td>
</tr>
</tbody>
</table>

### 6.1.17 database

- **show commands**
  
  Displays database-related statistics and status

  Supported in the following platforms:

  - Service Platforms — NX9000, NX9500, NX9510

**Syntax**

```
show database [statistics|status] {on <DEVICE-NAME>}
```

**Parameters**

- **show database [statistics|status] {on <DEVICE-NAME>}**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>database</td>
<td>Displays database-related statistics and status</td>
</tr>
<tr>
<td>statistics</td>
<td>Displays database-related statistics, such as name of the database (NSight or captive portal), data size, storage size, free disk space available, etc.</td>
</tr>
<tr>
<td>status</td>
<td>Displays database status, such as online time.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays database-related information on a specified device</td>
</tr>
</tbody>
</table>

- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

**Examples**

```
nx9500-6C8809#show database status

### 6.1.18 device-upgrade

#### show commands

Displays device firmware upgradation information for devices adopted by a wireless controller or access point

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

- **show device-upgrade** [history|load-image-status|status|versions]
- **show device-upgrade** [history {on <DOMAIN-NAME>}|load-image-status] versions {on <DEVICE-OR-DOMAIN-NAME>}
- **show device-upgrade status** {on [<DOMAIN-NAME>|rf-domain-manager]} summary {on <DOMAIN-NAME>}

#### Parameters

- **show device-upgrade** [history {on <DOMAIN-NAME>}|load-image-status|versions {on <DEVICE-OR-DOMAIN-NAME>}] status

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>device-upgrade</strong></td>
<td>Displays device upgrade information based on the parameters passed</td>
</tr>
<tr>
<td><strong>history</strong> {on &lt;DOMAIN-NAME&gt;}</td>
<td>Displays device upgrade history</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DOMAIN-NAME&gt; – Optional. Displays upgrade history for all devices within a specified RF Domain. Specify the RF Domain name.</td>
</tr>
<tr>
<td><strong>load-image-status</strong></td>
<td>Displays firmware image loading status. The output displays the &lt;DEVICE&gt; image loading status in percentage.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>#show device-upgrade load-image-status</td>
</tr>
<tr>
<td></td>
<td>Download of ap81xx firmware file is 47 percent complete</td>
</tr>
<tr>
<td><strong>versions</strong> {on &lt;DEVICE-OR-DOMAIN-NAME&gt;}</td>
<td>Displays firmware image versions</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; – Optional. Displays firmware image versions loaded on specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
<tr>
<td><strong>device-upgrade status</strong> {on [&lt;DOMAIN-NAME&gt;</td>
<td>rf-domain-manager]} summary {on &lt;DOMAIN-NAME&gt;}]</td>
</tr>
<tr>
<td><strong>status</strong></td>
<td>Displays in progress device upgrade status</td>
</tr>
<tr>
<td>on [&lt;DOMAIN-NAME&gt;</td>
<td>rf-domain-manager]</td>
</tr>
<tr>
<td></td>
<td>• &lt;DOMAIN-NAME&gt; – Specify the RF Domain name.</td>
</tr>
<tr>
<td></td>
<td>• rf-domain-manager – Select to view devices upgraded by the RF Domain manager.</td>
</tr>
</tbody>
</table>

rfs7000-37FABE#
6.1.19 **dot1x**

*show commands*

Displays dot1x information on interfaces

Dot1x (or 802.1x) is an IEEE standard for network authentication. Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

Supported in the following platforms:

- Access Points — AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```plaintext
show dot1x [all {on <DEVICE-NAME>} | interface [〈INTERFACE-NAME〉|ge 〈1-4〉|port-channel 〈1-2〉] {on <DEVICE-NAME>]
```

**Parameters**

- **show dot1x [all {on <DEVICE-NAME>} | interface [〈INTERFACE-NAME〉|ge 〈1-4〉|port-channel 〈1-2〉] {on <DEVICE-NAME>]}**

<table>
<thead>
<tr>
<th>dot1x all</th>
<th>Optional. Displays dot1x information for all interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays dot1x information for all interfaces on a specified device</td>
</tr>
<tr>
<td>〈INTERFACE-NAME〉</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>dot1x</th>
<th>Optional. Displays dot1x information for interfaces on a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Specify the name of AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**NOTE:** Dot.1x supplicant configuration is supported on the following platforms:

- Access Points – AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX6524

**NOTE:** Dot.1x authenticator configuration is supported on the following platforms:

- Access Points – ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX4524, NX6500, NX6524

**dot1x all**

Optional. Displays dot1x information for all interfaces

- on <DEVICE-NAME> — Optional. Displays dot1x information for all interfaces on a specified device
- 〈INTERFACE-NAME〉 — Specify the name of the AP, wireless controller, or service platform.

**dot1x**

Optional. Displays dot1x information for interfaces on a specified device

- <DEVICE-NAME> — Specify the name of AP, wireless controller, or service platform.

- show dot1x {interface [〈INTERFACE-NAME〉|ge 〈1-4〉|port-channel 〈1-2〉] {on <DEVICE-NAME>}}

**dot1x interface**

Optional. Displays dot1x information for a specified interface or interface type

- <INTERFACE-NAME> — Displays dot1x information for the layer 2 (Ethernet port) interface specified by the 〈INTERFACE-NAME〉 parameter
| ge <1-4> | Displays dot1x for a specified GigabitEthernet interface  
|          | • <1-4> – Select the interface index from 1 - 4. |
| port-channel <1-2> | Displays dot1x for a specified port channel interface  
|          | • <1-2> – Select the interface index from 1 - 2. |
| on <DEVICE-NAME> | The following keywords are common to all of the above parameters:  
|          | • on <DEVICE-NAME> – Optional. Displays dot1x interface information on a specified device  
|          | • <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform. |

**Examples**

rfs7000-37FABE(config)#show dot1x all

Host Mode = SINGLE  
Auth Vlan = None  
Guest Vlan = None  
--More--  
rfs7000-37FABE(config)#

rfs7000-37FABE(config)#show dot1x interface ge 3  
Dot1x info for interface GE3  
-----------------------------------  
Supplicant MAC N/A  
Auth SM State = FORCE AUTHORIZED  
Bend SM State = REQUEST  
Port Status = AUTHORIZED  
Host Mode = SINGLE  
Auth Vlan = None  
Guest Vlan = None  

rfs7000-37FABE(config)#
6.1.20 dpi

Displays Deep Packet Inspection (DPI) statistics for all configured and canned applications. DPI is an advanced packet filtering technique functioning at the application layer. Use DPI to find, identify, classify, reroute or block packets containing specific data or codes that other packet filtering techniques (examining only packet headers) cannot detect.

RF Domain member devices inspect every byte of each application header packet allowed to pass through the WiNG managed network. When an application is recognized and classified by the WiNG application recognition engine, administrator defined actions can be applied to that specific application.

NOTE: The show > dpi command returns results only if executed on a device that supports DPI and has DPI logging enabled. DPI logging can be enabled either on the device or on the profile applied to the device. For more information, see dpi.

Supported in the following platforms:
- Access Points — AP7522, AP7532, AP7562
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show dpi [app|app-category|application|application-policy|per-category]

show dpi app wireless-clients stats <MAC> {on <DEVICE-OR-DOMAIN-NAME>}

show dpi [app|app-category] stats [<APPLICATION/APP-CATEGORY-NAME>|all] {on <DEVICE-OR-DOMAIN-NAME>}

show dpi application-policy stats <APPLICATION-POLICY-NAME> {on <DEVICE-OR-DOMAIN-NAME>}

show dpi application brief

show dpi per-category stats <APP-CATEGORIES> [bytes-in|bytes-out|total-bytes] {on <DEVICE-OR-DOMAIN-NAME>}

Parameters
- show dpi app wireless-clients stats <MAC> {<DEVICE-OR-DOMAIN-NAME>}

| dpi app wireless-clients <MAC> | Displays application-related statistics for all or a specified wireless clients
|-----------------------------|----------------------------------------------------------------------------------
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Displays statistical data on a specified device or RF Domain
| <MAC> – Displays statistics for a specified wireless client. Specify the client's MAC address.
| <DEVICE-OR-DOMAIN-NAME> – Specify the name of the access point, wireless controller, service platform, or RF Domain.
### SHOW COMMANDS

- `show dpi [app|app-category] stats [<APPLICATION/APP-CATEGORY-NAME>|all] {on <DEVICE-OR-DOMAIN-NAME>}`

<table>
<thead>
<tr>
<th>dpi [app] app-category stats</th>
<th>Displays statistics for an application or application category</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• app – Displays statistics for a specified application or all applications</td>
</tr>
<tr>
<td></td>
<td>• app-category – Displays statistics for a specified application category or all categories.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The applications are the RF Domain member allowed applications whose data (bytes) are passing through the WING managed network. And, the application categories are existing WING or user defined application groups (video, streaming, mobile, audio, etc.) that assist administrators to permit or deny forwarding of application data.</td>
</tr>
<tr>
<td>[&lt;APPLICATION/APP-CATEGORY-NAME&gt;</td>
<td>all]</td>
</tr>
<tr>
<td></td>
<td>• &lt;APPLICATION/APP-CATEGORY-NAME&gt; – Displays statistics for a specified application or application category, depending on the option selected in the previous step. Specify the application name or application category name.</td>
</tr>
<tr>
<td></td>
<td>• all – Displays statistics for all application or application category, depending on the option selected in the previous step</td>
</tr>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>Optional. Displays statistical data on a specified device or RF Domain</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the access point, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

- `show dpi application-policy stats <APPLICATION-POLICY-NAME> {on <DEVICE-OR-DOMAIN-NAME>}`

<table>
<thead>
<tr>
<th>dpi application-policy stats</th>
<th>Displays statistics for an existing application policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;APPLICATION-POLICY-NAME&gt;</td>
<td>Displays statistics for a specified application-policy. Specify the application-policy name.</td>
</tr>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>Optional. Displays application-policy related statistical data on a specified device or RF Domain</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the access point, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

- `show dpi application brief`

| dpi application brief | Displays a brief summary of applications their status and configuration |

- `show dpi per-category stats <APP-CATEGORIES> [bytes-in|bytes-out|total-bytes] {on <DEVICE-OR-DOMAIN-NAME>}`

<table>
<thead>
<tr>
<th>dpi per-category stats</th>
<th>Displays statistics for the top ten applications based on the application category and the Sort ID specified. The Sort ID options are: bytes-in, bytes-out or total-bytes.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;APP-CATEGORIES&gt;</td>
<td>Specify the application category name. The system displays statistics for the top ten applications in this category.</td>
</tr>
</tbody>
</table>

6.1.21 environmental-sensor

Displays environmental sensor’s recorded data. The environmental sensor has to be enabled and configured in order to collect data related to humidity, light, motion, and temperature.

For more information on enabling and configuring environmental sensor settings, see .

**NOTE:** The environmental sensor is supported only on an AP8132. When executed on any controller (other than an AP8132), the show > environmental-sensor > <parameters> command displays environmental-sensor details for adopted AP8132s (if any).

Supported in the following platforms:
- Access Points — AP8132

**Syntax**
```
show environmental-sensor
```

```
show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}
```

```
show environmental-sensor [humidity|light|motion|summary|temperature|version]
```

**Parameters**
- **show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}**

<table>
<thead>
<tr>
<th>environmental-sensor history</th>
<th>Displays environmental sensor history once in every hour, 20 minutes, or 24 hours</th>
</tr>
</thead>
</table>
| Note: History includes the humidity, light, motion, and temperature data recorded by the sensor at specified time interval.

| 1-hour | Optional. Displays environmental sensor history once in every 1 (one) hour |
| 20-minute | Optional. Displays environmental sensor history once in every 20 minutes |
| 24-hour | Optional. Displays environmental sensor history once in every 24 hours |

- **show environmental-sensor [humidity|light|motion|summary|temperature|version]**

<table>
<thead>
<tr>
<th>environmental-sensor</th>
<th>Displays environmental sensor’s recorded data, based on the parameters passed. The system displays the specified recorded data.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: The environmental sensor records data at the following intervals: 20 minutes, 1 hour, and 24 hours.</td>
<td></td>
</tr>
</tbody>
</table>

| humidity | Displays the minimum, average, and maximum humidity recorded |
| light | Displays the minimum, average, and maximum light recorded |
| motion | Displays the minimum, average, and maximum motion recorded |
| temperature | Displays the minimum, average, and maximum temperature recorded |
| version | Displays the hardware and firmware versions |
| summary | Displays a summary of the data recorded at following intervals: |

<DEVICE-NAME>#
6.1.22 event-history

Displays event history report

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show event-history
{on <DEVICE-OR-DOMAIN-NAME>}
```

Parameters

- `show event-history {on <DEVICE-OR-DOMAIN-NAME>}`

<table>
<thead>
<tr>
<th>event-history</th>
<th>Displays event history report</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>Optional. Displays event history report on a device or RF Domain</td>
</tr>
<tr>
<td></td>
<td>&lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

Examples

```

6.1.23 event-system-policy

- show commands

  Displays detailed event system policy configuration

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>

Parameters

- show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>

<table>
<thead>
<tr>
<th>event-system-policy</th>
<th>Displays event system policy configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>config</td>
<td>Displays configuration for a specified policy</td>
</tr>
<tr>
<td>detail</td>
<td>Displays detailed configuration for a specified policy</td>
</tr>
<tr>
<td>&lt;EVENT-SYSTEM-POLICY-NAME&gt;</td>
<td>Specify the event system policy name.</td>
</tr>
</tbody>
</table>

Examples

---------------------------------------------------------------------
rfs7000-37FABE(config)#
6.1.24 ex3500

show commands
Displays EX3500-related statistical data
Supported in the following platforms:
• Wireless Controllers — RFS7000
• Service Platforms — NX7500, NX9500

Syntax
show ex3500 [dir|interfaces|system|upgrade|version|whichboot]
show ex3500 dir {boot-rom|config|on|opcode} {<FILE-NAME>} {on <EX3500-DEVICE-NAME>}
show ex3500 interfaces counters [ether-like stats|ethernet <1-1> <1-52>|ext-if-table stats|if-table stats|portUtil stats|rmon stats] {on <EX3500-DEVICE-NAME>}
show ex3500 [system|upgrade|version|whichboot] {on <EX3500-DEVICE-NAME>}

Parameters
• show ex3500 dir {boot-rom|config|on|opcode} {<FILE-NAME>} {on <EX3500-DEVICE-NAME>}

| ex3500 dir | Displays EX3500 directory information based on the option selected. The options are: boot-rom, config, opcode |
| boot-rom | Optional. Displays only the Boot-ROM information |
| config | Optional. Displays only the configuration file |
| opcode | Optional. Displays only the run-time operation code |
| <FILE-NAME> | Displays the contents of a specified file identified by the <FILE-NAME> keyword. This is the name of configuration file or code image. |
| on | Optional. Executes the command on a specified EX3500 device |
| <EX3500-DEVICE-NAME> | • <DEVICE-NAME> – Specify the device’s name. |

• show ex3500 interfaces counters [ether-like stats|ethernet <1-1> <1-52>|ext-if-table stats|if-table stats|portUtil stats|rmon stats] {on <EX3500-DEVICE-NAME>}

| ex3500 interfaces counters | Displays EX3500 interface counter information based on the option selected. The options are: ether-like, ethernet, ext-if-table, if-table, portUtil, rmon |
| ether-like stats | Displays Managed Information Base (MIB) object statistics for Ethernet-like interfaces |
| ethernet <1-1> <1-52> | Displays the Ethernet port statistics based on the unit identifier and port number selected |
| ext-if-table stats | Displays only the extended interface table statistics |

Notes:
- If none of the specified options is selected, all EX3500 system-related information is displayed.
- This option displays the following for the selected Ethernet interface: extended interface table stats, interface table stats, port utilization information, and remote monitoring stats.
<table>
<thead>
<tr>

nx9500-6C8809#
6.1.25 extdev

Displays external device (T5 or EX3500) configuration error history

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX9000, NX9500, NX9510

Syntax
show extdev error history \{on <T5/EX3500-DEVICE-NAME>\}

Parameters
- show extdev error history \{on <T5/EX3500-DEVICE-NAME>\}

<table>
<thead>
<tr>
<th>extdev error history</th>
<th>Displays external device error history. This command is applicable only to the external devices T5, and EX3500 series switches. Use this command to view configuration error history for all or a specified external device adopted and managed by a WiNG NX9500 series service platform.</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;T5/EX3500-DEVICE-NAME&gt;</td>
<td>Optional. Displays configuration error history on a specified T5 or EX3500 device &lt;T5/EX3500-DEVICE-NAME&gt; – Specify the name of the device.</td>
</tr>
</tbody>
</table>

Examples
nx9500-6C8809#show extdev error history on t5-ED5EAC
%%% No History for this device
nx9500-6C8809#
6.1.26 file

 Displays file system information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show file [information <FILE>|systems]

Parameters

- show file [information <FILE>|systems]

Examples

nx9500-6C8809#show file systems
File Systems:

nx9500-6C8809#
6.1.27 file-sync

show commands

Displays file synchronization settings and status on a controller

The file-sync command syncs EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points. The show > file-sync command displays information related to this process.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show file-sync [configuration|history|load-file-status|status] {on <DEVICE-OR-DOMAIN-NAME>}

Parameters

- show file-sync [configuration|history|load-file-status|status] {on <DEVICE-OR-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>file-sync</th>
<th>Displays the following file-synchronization related information: configuration, history, load-file-status, and status</th>
</tr>
</thead>
</table>
| configuration | Displays the following file-synchronization configuration details:
  - automatic file-syncing enabled or disabled. The default setting is disabled.  
  **Note:** The X.509 certificate needs synchronization only if the access point’s radio2, the client-bridge radio, is configured to use EAP-TLS authentication. In which case PKCS#12 certificate needs to be pushed on AP adoption. To enable automatic file syncing, in the controller’s device/profile configuration mode, execute the file-sync > auto command. For more information, see file-sync.  
  - Number of access points the certificate can be simultaneously uploaded. The default is 10.  
  **Note:** To modify the number of simultaneous uploads, in the controller’s device/profile configuration mode, execute the file-sync > count <1-20> command. For more information, see file-sync.  
  - Scheduled certificate upload, if any, details, such time and date of upload.  
  **Note:** To schedule certificate upload, use the file-sync > wireless-certificate command. For more information, see file-sync. |
| history | Displays file synchronization history. Use this option to view statistical data relating to client-bridge certificate synchronization between staging controller and adoptee access points. when executed, a list of all certificate transfers made to the client-bridge is displayed, with the latest transfer listed at the top. |
| load-file-status | Displays the status of PKCS#12 certificate upload to the controller. Use this command to view the status of a in-progress certificate upload,  
 **Note:** For more information on initiating a PKCS#12 certificate upload, see file-sync. |
| status | Displays status of the PKCS#12 certificate synchronization between the controller and the client-bridge access point. |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Displays file synchronization settings and status on a specified device or RF Domain  
  - <DEVICE-OR-DOMAIN-NAME> — Specify the name of the controller, service platform, or RF Domain. |
Examples

nx9500-6C8809# show file-sync configuration
File Sync Configuration Information
Auto : Disabled
Simultaneous Upload Count : 128
nx9500-6C8809#

nx9500-6C8809# show file-sync load-file-status
Download of wireless_bridge certificate is complete
nx9500-6C8809#

nx9500-6C8809# show file-sync history

nx9500-6C8809#
6.1.28 firewall

Displays wireless firewall information, such as Dynamic Host Configuration Protocol (DHCP) snooping table entries, denial of service statistics, active session summaries, etc.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show firewall [dhcp|dos|flows|neighbors] {on <DEVICE-NAME>}
show firewall [dhcp snoop-table|dos stats] {on <DEVICE-NAME>}
show firewall flows {filter|management|on|stats|wireless-client} {on <DEVICE-NAME>}
show firewall flows {filter} {(dir|dst port <1-65535>|ether|flow-type|icmp|icmpv6|igmp|ip|ipv6|max-idle|min-bytes|min-idle|min-pkts|not|port|src|tcp|udp)} {on <DEVICE-NAME>}
show firewall flows {management {on <DEVICE-NAME>}}{stats {on <DEVICE-NAME>}} {on <DEVICE-NAME>}
show firewall neighbors snoop-table {on <DEVICE-NAME>}

Parameters

- show firewall [dhcp snoop-table|dos stats] {on <DEVICE-NAME>}
- show firewall flows {filter} {(dir|dst|ether|flow-type|icmp|icmpv6|igmp|ip|ipv6|max-idle|min-bytes|min-idle|min-pkts|not|port|src|tcp|udp)} {on <DEVICE-NAME>}

- firewall dhcp
- snoop-table
  Displays DHCP snooping table entries
  - snoop-table – Displays DHCP snooping table entries
  DHCP snooping acts as a firewall between non-trusted hosts and the DHCP server. Snooping table entries contain MAC address, IP address, lease time, binding type, and interface information of non-trusted interfaces.

- dos stats
  Displays Denial of Service (DoS) statistics
  Note: This option is not available in the User Exec mode.

- on <DEVICE-NAME>
  The following keyword is common to the ‘DHCP snooping table’ and ‘DoS stats’ parameters:
  - on <DEVICE-NAME> – Optional. Displays snooping table entries, or DoS stats on a specified device
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- show firewall flows {filter} {(dir|dst|ether|flow-type|icmp|icmpv6|igmp|ip|ipv6|max-idle|min-bytes|min-idle|min-pkts|not|port|src|tcp|udp)} {on <DEVICE-NAME>}

- firewall flows
  Notifies a session has been established

- filter
  Optional. Defines additional firewall flow filter parameters

- dir [wired-wired] [wired-wireless] [wireless-wired] [wireless-wireless]
  Optional. Matches the packet flow direction
  - wired-wired – Wired to wired flows
  - wired-wireless – Wired to wireless flows
  - wireless-wired – Wireless to wired flows
  - wireless-wireless – Wireless to wireless flows

rfs7000-6DCD4B(config)#
6.1.29 global

* show commands

Displays global information for network devices based on the parameters passed.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show global [device-list|domain]

show global device-list {filter {offline|online|rf-domain}}
show global device-list {filter {offline|online}}
show global device-list {filter rf-domain [<DOMAIN-NAME>|not <DOMAIN-NAME>]}  
show global domain managers
```

**Parameters**

- show global device-list {filter {offline|online}}

<table>
<thead>
<tr>
<th>global device-list</th>
<th>Displays global information for all network devices. Use the following keywords to specify additional filters: offline, online, and rf-domain.</th>
</tr>

6.1.30  gre

-show commands

Displays layer 2 Generic Routing Encapsulation (GRE) tunnel traffic flow information

GRE is one of the available tunneling mechanisms which uses IP as the transport protocol and can be used for carrying many different passenger protocols. The tunnels behave as virtual point-to-point links that have two endpoints identified by the tunnel source and tunnel destination addresses at each endpoint.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8532
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show gre info {detail} {(on <DEVICE-NAME>)}

Parameters

- show gre info {detail} {(on <DEVICE-NAME>)}

---

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gre info</td>
<td>Displays GRE tunnel information</td>
</tr>
<tr>
<td>detail</td>
<td>Optional. Displays GRE tunnel information in detail, such as tunnel state, tunnel's remote-end peer device’s IP address, session ID of an operational tunnel, total number of packets received and transmitted through the tunnel, and the number of dropped packets during tunneled exchanges between access point and a peer at the remote end of the tunnel.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Executes the command on a specified device</td>
</tr>
</tbody>
</table>

Examples

nx4500-5CFA2B>show gre info
Gre Tunnel info:

{'No tunnel found': 0}

nx4500-5CFA2B>
## 6.1.31 guest-registration

### show commands

Displays information on the performance of clients using guest access permissions to obtain network resources within the WiNG network. The reporting timeline can be adjusted as needed, as can the RF Domain(s) and WLAN(s) used to filter and report guest client statistics.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

```
show guest-registration [age-range|backup-snapshots|browsers|client|devices|gender|
                      loyalty-app-status|notification-status|os|social|user-trends|visitors]
                     {on <DEVICE-NAME>}

show guest-registration backup-snapshots

show guest-registration [age-range|browsers|devices|gender|os|user-trends|visitors]
                     time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] 
                     { (rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME> ) }  

show guest-registration client [email|mac|member|mobile|name|time]

show guest-registration client [email <EMAIL-ADDRESS>|mac <MAC>|member <MEMBER-ID>|
                         mobile <MOBILE-NUMBER>|name <NAME>]

show guest-registration client time [1-Hour|10-Mins|15-Mins|2-Mins|30-Mins|30-Secs|
                         5-Mins] { (rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME> ) }  

show guest-registration loyalty-app-status time [1-Day|1-Month|1-Week|2-Hours|
                         30-Mins|5-Hours|all] { rfdomain <RF-DOMAIN-NAME>|wlan <WLAN-NAME> }  

show guest-registration notification-status

show guest-registration social time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] 
                         { (facebook|rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>|google) }
```

### Parameters

- `guest-registration` Displays guest registration statistics based on the parameters passed
- `backup-snapshots` Displays a list of periodically backed up snapshots of the database. By default, the system maintains a snapshot of the database on a daily basis.
  
  **Note:** Use the `service > guest-registration > backup [delete|restore]` command to delete these snapshots and to restore deleted snapshots. For more information, see `service`.

- `age-range` Displays the age ranges of logged guest users for a selected time period
- `browsers` Displays the browsers used by guest users logged in within a selected time period
- `devices` Displays the device types used by guest users logged in within a selected time period
- `gender` Displays the gender of guest users logged in within a selected time period

---

<tr>
<td>show guest-registration</td>
<td>Displays guest registration statistics based on the parameters passed</td>
</tr>
</tbody>
</table>
| backup-snapshots | Displays a list of periodically backed up snapshots of the database. By default, the system maintains a snapshot of the database on a daily basis. **Note:** Use the `service > guest-registration > backup [delete|restore]` command to delete these snapshots and to restore deleted snapshots. For more information, see `service`.

- `age-range` | Displays the age ranges of logged guest users for a selected time period |
- `browsers` | Displays the browsers used by guest users logged in within a selected time period |
- `devices` | Displays the device types used by guest users logged in within a selected time period |
- `gender` | Displays the gender of guest users logged in within a selected time period |
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>os</td>
<td>Displays the operating system (OS) of devices logged in within a selected time period.</td>
</tr>
<tr>
<td>user-trends</td>
<td>Displays guest user login trends for a selected time period. It displays statistical data, such as number of new users, number of return users, and total of number users.</td>
</tr>
<tr>
<td>visitors</td>
<td>Displays type of visitors logged in within a selected time period.</td>
</tr>
</tbody>
</table>
| time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] | Displays guest registration statistics, for a specified time period. The stats displayed depends on the option selected in the previous step. Specify the time period using one of the following options:  
- 1-Day – Displays previous day’s statistics  
- 1-Month – Displays previous month’s statistics  
- 1-Week – Displays previous week’s statistics  
- 2-Hours – Displays last 2 hours statistics  
- 30-Mins – Displays last 30 minutes statistics  
- 5-Hours – Displays last 5 hours statistics  
- all – Displays statistics from the day the database was created |
| [rfdomain <DOMAIN-NAME> wlan <WLAN-NAME>] | Use the following options as additional filters:  
- <DOMAIN-NAME> – Specify the RF Domain name.  
- wlan <WLAN-NAME> – Optional. Displays guest registration statistics for a specified WLAN.  
- <WLAN-NAME> – Specify the WLAN name. |
| guest-registration | Displays guest registration statistics based on the parameters and time entered. Optionally, use the ‘rfdomain’ and/or ‘wlan’ keywords to view guest registration statistics for a specified RF Domain and/or WLAN. |
| client | Displays statistical data for a specific client. Use the e-mail, mac, member, mobile, name to provide a match criteria. |
| email <EMAIL-ADDRESS> | Displays statistical data for the client with e-mail address matching the <EMAIL-ADDRESS> parameter.  
- <EMAIL-ADDRESS> – Specify the client’s e-mail address. |
| mac <MAC> | Displays statistical data for the client with MAC address matching the <MAC> parameter.  
- <MAC> – Specify the client’s MAC address. |
| member <MEMBER-ID> | Displays statistical data for the client with member ID matching the <MEMBER-ID> parameter.  
- <MEMBER-ID> – Specify the client’s member ID. |
| mobile <MOBILE-NUMBER> | Displays statistical data for the client with mobile number matching the <MOBILE-NUMBER> parameter.  
- <MOBILE-NUMBER> – Specify the client’s mobile number. |
| name <NAME> | Displays statistical data for the client with name matching the <NAME> parameter.  
- <NAME> – Specify the client’s name. |
show guest-registration client time [1-Hour|10-Mins|15-Mins|2-Mins|30-Mins|30-Secs|5-Mins] {rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>}

guest-registration

Displays guest registration statistics based on the parameters and time entered. Optionally, use the 'rfdomain' and/or 'wlan' keywords to view guest registration statistics for a specified RF Domain and/or WLAN.

client

Displays statistical data for all clients logged in within a specified time period.

time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]

Use one of the following options to specify the time period:
- 1-Day – Displays previous day’s statistics
- 1-Month – Displays previous month's statistics
- 1-Week – Displays previous week’s statistics
- 2-Hours – Displays last 2 hours statistics
- 30-Mins – Displays last 30 minutes statistics
- 5-Hours – Displays last 5 hours statistics
- all – Displays entire statistics, from the day the database was created

[rfdomain <DOMAIN-NAME> wlan <WLAN-NAME>]

Use the following options as additional filters:
- <DOMAIN-NAME> – Specify the RF Domain name.
- wlan <WLAN-NAME> – Optional. Displays guest registration statistics for a specified WLAN.
- <WLAN-NAME> – Specify the WLAN name.

show guest-registration loyalty-app-status time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] {rfdomain <RF-DOMAIN-NAME>|wlan <WLAN-NAME>}

guest-registration

Displays guest registration statistics based on the parameters and time entered.

loyalty-app-status

Displays captive portal clients' Loyalty Application analytics, such as the number of guest clients with loyalty application detection enabled, associating with the captive portal's access point during a specified time period.

Loyalty application detection occurs on the access point to which the guest client is associated, allowing a retail administrator to assess whether a captive portal client is using specific retail (loyalty) applications in their captive portal.

Note: For more information on enabling loyalty application detection on a captive portal, see report-loyalty-application.

time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]

Specifies the time period, using one of the following options:
- 1-Day – Displays previous day’s captive portal clients’ Loyalty Application analytics
- 1-Month – Displays previous month's captive portal clients’ Loyalty Application analytics
- 1-Week – Displays previous week’s captive portal clients’ Loyalty Application analytics
- 2-Hours – Displays last 2 hours captive portal clients’ Loyalty Application analytics
- 30-Mins – Displays last 30 minutes captive portal clients’ Loyalty Application analytics
- 5-Hours – Displays last 5 hours captive portal clients’ Loyalty Application analytics
- all – Displays the entire Loyalty Application analytics, from the day the database was created.
### show guest-registration notification-status

- **guest-registration**
  - Displays guest registration statistics based on the parameters and time entered. Optionally, use the ‘rfdomain’ and/or ‘wlan’ keywords to view guest registration statistics for a specified RF Domain and/or WLAN.

- **notification-status**
  - Displays guest registration notification status.

### show guest-registration social time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] {facebook|rfdomain <DOMAIN-NAME>|wlan <WLAN-NAME>|google}

- **guest-registration social**
  - Displays the social sites used by guests to register. Optionally, use the ‘rfdomain’ and/or ‘wlan’ keywords to view social site used by guests of a specified RF Domain and/or WLAN.

- **time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]**
  - Displays social site statistics for a specified time period. Use one of the following time options:
    - 1-Day – Displays previous day’s statistics
    - 1-Month – Displays previous month’s statistics
    - 1-Week – Displays previous week’s statistics
    - 2-Hours – Displays last 2 hours statistics
    - 30-Mins – Displays last 30 minutes statistics
    - 5-Hours – Displays last 5 hours statistics
    - all – Displays the entire database

- **facebook**
  - Displays guest users using Facebook to log in

- **rfdomain <DOMAIN-NAME>**
  - Displays guest users for a specific RF Domain
    - <DOMAIN-NAME> – Specify the RF Domain name.

- **wlan <WLAN-NAME>**
  - Displays guest users for a specific WLAN
    - <WLAN-NAME> – Specify the WLAN name.

- **google**
  - Displays guest users using Google to log in

### 6.1.32 interface

- **show commands**
  Displays configured system interfaces and their status

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
show interface {<INTERFACE-NAME>|brief|counters|ge <1-4>|me1|port-channel <1-2>|pppoe1|switchport|vlan <1-4094>|wwan1} {on <DEVICE-NAME>}
show interface {<INTERFACE-NAME>|brief|counters|ge <1-4>|me1|port-channel <1-2>|pppoe1|switchport|vlan <1-4094>|wwan1} {on <DEVICE-NAME>}
```

**Parameters**

- **interface**
  Optional. Displays system interface status based on the parameters passed
- **<INTERFACE-NAME>**
  Optional. Displays status of the interface specified by the `<INTERFACE-NAME>` parameter. Specify the interface name.
- **brief**
  Optional. Displays a brief summary of the interface status and configuration
- **counters**
  Optional. Displays interface Tx or Rx counters
- **ge <1-4>**
  Optional. Displays Gigabit Ethernet interface status and configuration
  - `<1-4>` – Select the Gigabit Ethernet interface index from 1 - 4.
  **Note:** For the NX45XX and NX65XX service platforms the index range is <1 - 24>.
- **me1**
  Optional. Displays Fast Ethernet interface status and configuration
- **port-channel <1-2>**
  Optional. Displays port channel interface status and configuration
  - `<1-2>` – Specify the port channel index from 1 - 2.
- **pppoe1**
  Optional. Displays PPP over Ethernet interface status and configuration
- **switchport**
  Optional. Displays layer 2 interface status
- **vlan <1-4094>**
  Optional. Displays VLAN interface status and configuration
  - `<1-4094>` – Specify the `Switch Virtual Interface (SVI)` VLAN ID from 1 - 4094.
- **wwan1**
  Optional. Displays Wireless WAN interface status, configuration, and counters
- **on <DEVICE-NAME>**
  The following keywords are common to all of the above interfaces:
  - **on <DEVICE-NAME>** – Optional. Displays interface related information on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.
Examples

Following interfaces are available on a RFS7000 controller:

```bash
rfs7000-6DCD4B(config)#show interface ?
WORD  Interface name
brief  Brief summary of interface status and configuration
counters Interface tx/rx counters
ge    GigabitEthernet interface
me1   FastEthernet interface
on    On AP/Controller
port-channel Port-Channel interface
pppoel PPP Over Ethernet interface
switchport Status of Layer2 interfaces
vlan  Switch VLAN interface
wwan1 Wireless WAN interface
|    Output modifiers
>    Output redirection
>>   Output redirection appending
<cr>
rfs7000-6DCD4B(config)#
```

Following interfaces are available on a NX45XX and NX65XX series service platform:

```bash
nx4500-5CFA2B(config)#show interface ?
WORD  Interface name
brief  Brief summary of interface status and configuration
counters Interface tx/rx counters
ge    GigabitEthernet interface
on    On AP/Controller
pppoel PPP Over Ethernet interface
serial Serial interface
switchport Status of Layer2 interfaces
tle1  T1/E1 interface
up    WAN Ethernet interface
vlan  Switch VLAN interface
vmif  Virtual Machine interface
wwan1 Wireless WAN interface
|    Output modifiers
>    Output redirection
>>   Output redirection appending
<cr>
nx4500-5CFA2B(config)#
```

```bash
rfs7000-6DCD4B(config)#show interface switchport
------------------------------------------------------------------------
INTERFACE          STATUS   MODE     VLAN(S)
------------------------------------------------------------------------
ge1                UP       access   1
ge2                UP       access   192
ge3                DOWN     access   1
ge4                DOWN     access   1
------------------------------------------------------------------------
A '*' next to the VLAN ID indicates the native vlan for that trunk port
rfs7000-6DCD4B(config)#
```

```bash
rfs7000-6DCD4B(config)#show interface ge 2
Interface ge2 is UP
Hardware-type: ethernet, Mode: Layer 2, Address: B4-C7-99-6D-CD-4D
Index: 2002, Metric: 1, MTU: 1500
Speed: Admin Auto, Operational 100M, Maximum 1G
Duplex: Admin Auto, Operational Full
Active-medium: Copper
Switchport settings: access, access-vlan: 192
Input packets 356055, bytes 118606892, dropped 0
Received 55855 unicasts, 38581 broadcasts, 261619 multicasts
Input errors 0, runts 0, giants 0
CRC 0, frame 0, fragment 0, jabber 0
```
Output packets 24790, bytes 2250297, dropped 0
Sent 21651 unicas, 4 broadcasts, 3135 multicasts

--More--
nx4500-5CFA8E(config)#
6.1.33 ip

> **show commands**

Displays IP related information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show ip [arp|bgp|ddns|default-gateways|dhcp|dhcp-vendor-options|domain-name|
       extcommunity-list|igmp|interface|name-server|nat|ospf|route|routing]
show ip arp {{<VLAN-NAME>}} {on <DEVICE-NAME>}
show ip bgp {{<IP>|<IP/M>|community|community-list|filter-list|neighbors|on|paths|
       prefix-list|regexp|route-map|state|summary}
show ip ddns bindings {on <DEVICE-NAME>}
show ip dhcp [binding|networks|status]
show ip dhcp binding [manual] {on <DEVICE-NAME>}
show ip dhcp [networks|status] {on <DEVICE-NAME>}
show ip [default-gateways|dhcp-vendor-options|domain-name|name-server|routing]
   {on <DEVICE-NAME>}
show ip extcommunity-list [1-500|<NAME>]
show ip igmp snooping [mrouter|querier|vlan]
show ip igmp snooping [mrouter|querier] vlan <1-4095> {on <DEVICE-NAME>}
show ip igmp snooping vlan <1-4095> {{<IP>}} {on <DEVICE-NAME>}
show ip interface {{<INTERFACE-NAME>|brief|on}
show ip interface {{<INTERFACE-NAME>|brief}} {on <DEVICE-NAME>}
show ip nat translations verbose {on <DEVICE-NAME>}
show ip route {{<INTERFACE-NAME>|ge|me1|on|port-channel|pppoel|vlan|wwan1}
show ip route {{<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|vlan <1-4094>|
       pppoe1|wwan1}} {on <DEVICE-NAME>}
show ip ospf {border-router|interface|neighbor|on|route|state}
show ip ospf {border-router|neighbor|route|on|state} {on <DEVICE-NAME>}
show ip ospf {interface} {vlan|on}
show ip ospf {interface} {vlan <1-4094>} {on <DEVICE-NAME>}
```

**NOTE:** The show ip ospf command is also available under the ‘profile’ and ‘device’ modes.

**Parameters**

- **show ip arp {{<VLAN-NAME>}} {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip arp</td>
<td>Displays Address Resolution Protocol (ARP) mappings</td>
</tr>
<tr>
<td>&lt;VLAN-NAME&gt;</td>
<td>Optional. Displays ARP mapping on a specified VLAN. Specify the VLAN name.</td>
</tr>
</tbody>
</table>
| **on <DEVICE-NAME>** | The following keyword is recursive and common to the 'vlan-name' parameter:  
|-----------------------|------------------------------------------------------------------------------------------------------------------|
|                       | • on <DEVICE-NAME> – Optional. Displays ARP configuration details on a specified device 
|                       | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.  

- **show ip bgp** `<IP>/` `<IP/M>/` `community/` `community-list/` `filter-list/` `neighbors/` `on/` `paths/` `prefix-list/` `regexp/` `route-map/` `state/` `summary`  

- **ip bgp** Displays BGP routing table statistics based on the match criteria specified here. Routes matching the specified criteria are filtered. Use available options to filter the information displayed.  
  **Note:** This command is applicable to the RFS4000, RFS6000, NX45XX, NX65XX, NX9XXX model devices.  

- **<IP>** Optional. Filters routes matching the specified IP address  

- **<IP/M>** Optional. Filters routes matching the specified network  

- **community** Optional. Filters routes based on the community attribute specified. The options are:  
  • `AA:NN` – Filters routes based on the community number (`AA:` is the autonomous system number (ASN), `NN:` is the community number within the specified ASN)  
  • `local-as` – Filters routes carrying the local-as attribute (these routes are not sent outside the local AS)  
  • `no-advertise` – Filters routes carrying the no-advertise attribute (these routes are not advertised to any peers)  
  • `no-export` – Filters routes carrying no-export attribute (these routes are not exported to next AS)  

- **community-list** Optional. Displays routes that are members of communities included in the specified BGP community-list  
  • `<1-500>` – Specify the community-list number.  
  • `<WORD>` – Specify the community-list name.  

- **filter-list** Optional. Filters routes having AS-path matching the specified AS-path access list. Specify the AS-path ACL name.  

- **neighbors** Optional. Displays BGP neighbor details. Specify the IP address, to view a specific neighbor details. Use one of the following options to filter information:  
  • `advertised-routes` – Displays route information for routes advertised to the selected neighbor device  
  • `received-routes` – Displays route information for routes received from the selected neighbor device  
  • `routes` – Displays the route information for routes learned from the selected neighbor device  
  **Note:** If no neighbor IP address is specified, the system displays all neighbor-related routes on the logged device.  

- **on <DEVICE-NAME>** Optional. Displays BGP routing table statistics on a specified device  
  • `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.  

- **paths** Optional. Displays BGP path details
### show ip ddns bindings

**Syntax:**
```
show ip ddns bindings {on <DEVICE-NAME>}
```

**Description:**
Displays DDNS address bindings.
- **<DEVICE-NAME>** - Optional. Displays address bindings on a specified device.

### ip ddns

**Syntax:**
```
ip ddns
```

**Description:**
Displays Dynamic Domain Name Server (DDNS) configuration details.

### show ip dhcp [networks|status] {on <DEVICE-NAME>}

**Syntax:**
```
show ip dhcp [networks|status] {on <DEVICE-NAME>}
```

**Description:**
Displays DHCP server related details, such as network and status.
- **networks** - Displays DHCP server network details.
- **status** - Displays DHCP server status.
- **<DEVICE-NAME>** - Optional. Displays server status and network details on a specified device.

### ip dhcp bindings

**Syntax:**
```
ip dhcp bindings {on <DEVICE-NAME>}
```

**Description:**
Displays DHCP address bindings.
- **on <DEVICE-NAME>** - Optional. Displays DHCP address bindings on a specified device.

### show ip dhcp binding {manual} {(on <DEVICE-NAME>)}

**Syntax:**
```
show ip dhcp binding {manual} {(on <DEVICE-NAME>)}
```

**Description:**
Displays the DHCP server configuration details.
- **ip dhcp binding** - Displays DHCP address bindings.
- **manual** - Optional. Displays static DHCP address bindings.
- **<DEVICE-NAME>** - Optional. Displays DHCP address bindings on a specified device.

### show ip extcommunity-list [<1-500>|<NAME>]

**Syntax:**
```
show ip extcommunity-list [<1-500>|<NAME>]
```

**Description:**
Displays the specified extended community list details.
- **<1-500>** - Specify the extended community number from 1 - 500.
- **<NAME>** - Specify the extended community name.

**Note:** This command is applicable to the RFS4000, RFS6000, NX45XX, NX65XX, NX9XXX model devices.
### SHOW COMMANDS

**show ip** [default-gateways|dhcp-vendor-options|domain-name|name-server|routing] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip default-gateways</td>
<td>Displays all learnt default gateways</td>
</tr>
<tr>
<td>show ip dhcp-vendor-options</td>
<td>Displays DHCP 43 parameters received from the DHCP server. This output includes the interface from which the option was learned.</td>
</tr>
<tr>
<td>show ip domain-name</td>
<td>Displays the DNS default domain</td>
</tr>
<tr>
<td>show ip name-server</td>
<td>Displays the DNS name server details</td>
</tr>
<tr>
<td>show ip routing</td>
<td>Displays routing status</td>
</tr>
</tbody>
</table>

**on <DEVICE-NAME>**

The following keywords are common to all of the above parameters:

- on <DEVICE-NAME> – Optional. Displays IP related information, based on the parameters passed, on a specified device
- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

**show ip igmp snooping** [mrouter|querier] vlan <1-4095> {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp snooping</td>
<td>Displays the IGMP snooping configuration</td>
</tr>
<tr>
<td>mrouter</td>
<td>Displays the IGMP snooping multicast router (mrouter) configuration</td>
</tr>
<tr>
<td>querier</td>
<td>Displays the IGMP snooping multicast querier configuration</td>
</tr>
</tbody>
</table>
| vlan <1-4095> {on <DEVICE-NAME>} | Displays the IGMP snooping multicast router configuration for a VLAN
- <1-4095> – Specify the VLAN ID from 1 - 4095.
- on <DEVICE-NAME> – Optional. Displays the IGMP snooping mrouter configuration on a specified device
  - <DEVICE-NAME> – Specify the name of the AP or wireless controller. |

**show ip igmp snooping vlan <1-4095> {<IP>} {on <DEVICE-NAME>}**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp snooping</td>
<td>Displays the IGMP snooping configuration</td>
</tr>
</tbody>
</table>
| vlan <1-4095> {on <DEVICE-NAME>} | Displays the VLAN IGMP snooping configuration
- <1-4095> – Specify the VLAN ID from 1 - 4095. |
| <IP> | Optional. Specifies the multicast group IP address |

**on <DEVICE-NAME>**

The following keyword is recursive and common to the 'ip' parameter:

- on <DEVICE-NAME> – Optional. Displays configuration details on a specified device
- <DEVICE-NAME> – Specify the name of the AP or wireless controller. |

**show ip interface** {<INTERFACE-NAME>|brief} {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip interface</td>
<td>Displays an administrative and operational status of all layer 3 interfaces or a specified layer 3 interface</td>
</tr>
<tr>
<td>&lt;INTERFACE-NAME&gt;</td>
<td>Optional. Displays a specified interface status. Specify the interface name.</td>
</tr>
<tr>
<td>brief</td>
<td>Optional. Displays a brief summary of all interface status and configuration</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>\texttt{show ip nat translations verbose {on &lt;DEVICE-NAME&gt;}}</td>
<td>Displays detailed NAT translations on a specified device.</td>
</tr>
<tr>
<td>\texttt{ip nat translations}</td>
<td>Displays Network Address Translation (NAT) translations.</td>
</tr>
<tr>
<td>\texttt{verbose}</td>
<td>Displays detailed NAT translations on a specified device.</td>
</tr>
<tr>
<td>\texttt{show ip route {&lt;INTERFACE-NAME&gt;</td>
<td>ge &lt;1-4&gt;</td>
</tr>
<tr>
<td>\texttt{ip route}</td>
<td>Displays route table details for a specified interface. Specify the interface name.</td>
</tr>
<tr>
<td>\texttt{&lt;INTERFACE-NAME&gt;}</td>
<td>Optional. Displays GigabitEthernet interface route table details. Specify the GigabitEthernet interface index from 1 - 4.</td>
</tr>
<tr>
<td>\texttt{ge &lt;1-4&gt;}</td>
<td>Optional. Displays Port Channel interface route table details. Specify the Port Channel index from 1 - 2.</td>
</tr>
<tr>
<td>\texttt{me1}</td>
<td>Optional. Displays VLAN interface route table details. Select the VLAN interface ID from 1 - 4094.</td>
</tr>
<tr>
<td>\texttt{port-channel &lt;1-2&gt;}</td>
<td>Optional. Displays Point-to-point Protocol over Ethernet (PPPoE) interface route table details.</td>
</tr>
<tr>
<td>\texttt{vlan &lt;1-4094&gt;}</td>
<td>Optional. Displays Wireless WAN route table details.</td>
</tr>
<tr>
<td>\texttt{pppoe1}</td>
<td>Optional. Displays Wireless WAN route table details.</td>
</tr>
<tr>
<td>\texttt{wwan1}</td>
<td>Optional. Displays Wireless WAN route table details.</td>
</tr>
<tr>
<td>\texttt{on &lt;DEVICE-NAME&gt;}</td>
<td>The following keywords are recursive and common to all of the above parameters: on &lt;DEVICE-NAME&gt; – Displays route table details, based on the parameters passed, on a specified device.</td>
</tr>
<tr>
<td>\texttt{ip ospf}</td>
<td>Displays overall OSPF information.</td>
</tr>
<tr>
<td>\texttt{border-router}</td>
<td>Optional. Displays details of all the border routers connected.</td>
</tr>
</tbody>
</table>
SHOW COMMANDS 6-81

interface
{on| vlan <1-4094>} {on <DEVICE-NAME>}
Optional. Displays details of all the interfaces with OSPF enabled
• on <DEVICE-NAME> – Optional. Displays specified device details
• vlan <1-4094> – Displays VLAN interface details
• <DEVICE-NAME> – Specify the name of the AP or wireless controller.

neighbor
Optional. Displays an OSPF neighbors list

route
Optional. Displays OSPF routes information

on <DEVICE-NAME>
Optional. Displays overall OSPF information on a specified device
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

state
Optional. Displays an OSPF process state

on <DEVICE-NAME>
The following keywords are recursive and common to all of the above parameters:
• on <DEVICE-NAME> – Optional. Displays overall OSPF information, based on the
  parameters passed, on a specified device
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

rfs4000-229D58#
6.1.34 ip-access-list

show commands
Displays IP access list statistics

NOTE: This command is not available in the USER EXEC Mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail|on}
show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>}
{(on <DEVICE-NAME>)}

Parameters

- show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>}
{(on <DEVICE-NAME>)}

ip-access-list stats | Displays IP access list statistics
---|---
<IP-ACCESS-LIST-NAME> | Optional. Displays statistics for a specified IP access list. Specify the IP access list name.
detail <IP-ACCESS-LIST-NAME> | Optional. Displays detailed statistics for a specified IP access list. Specify the IP access list name.
on <DEVICE-NAME> | The following keyword is recursive and common to the 'IP-ACCESS-LIST-NAME' and 'detail' parameters:
on <DEVICE-NAME> – Optional. Displays all or a specified IP access list statistics on a specified device.
<DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

rfs7000-37FABE(config)#show ip-access-list stats
IP Access-list: # Restrict Management ACL #
  permit tcp any any eq ftp rule-precedence 1 Hitcount: 0
  permit tcp any any eq www rule-precedence 2 Hitcount: 4
  permit tcp any any eq ssh rule-precedence 3 Hitcount: 448
  permit tcp any any eq https rule-precedence 4 Hitcount: 0
  permit udp any any eq snmp rule-precedence 5 Hitcount: 0
  permit tcp any any eq telnet rule-precedence 6 Hitcount: 4
rfs7000-37FABE(config)#
The following example displays the 'auto-tunnel-acl' IP ACL configuration:

```bash
rfs4000-229D58(config)#ip access-list auto-tunnel-acl
rfs4000-229D58(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2
permit ip host 200.200.200.99 any rule-precedence 3
rfs4000-229D58(config-ip-acl-auto-tunnel-acl)#
```

The following example displays the statistics for the 'auto-tunnel-acl' ACL:

```bash
rfs4000-229D58#show ip-access-list stats
IP Access-list: auto-tunnel-acl
    permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2        Hitcount: 0
    permit ip host 200.200.200.99 any rule-precedence 3        Hitcount: 0
rfs4000-229D58#
```

```bash
nx6524-5483B0#show ip-access-list stats scaleacl | i 125
Hitcount: 893        Hardware
Hitcount: 3120        Hardware
```

```bash
    permit ip host 125.1.1.1 any rule-precedence 125
    permit ip host 125.2.1.1 any rule-precedence 346
    permit ip host 125.1.1.1 any rule-precedence 346
    permit ip host 125.2.1.1 any rule-precedence 346
Hitcount: 0        Hardware
Hitcount: 0        Hardware
```

```bash
nx6524-5483B0#
```
### 6.1.35 `ipv6`

#### show commands

Displays IPv6 related information

**Supported in the following platforms:**

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
show ipv6 [default-gateways|delegated-prefix|hop-limit|interface|mld|name-server|neighbors|route]
show ipv6 [default-gateways|delegated-prefix|hop-limit|name-server] {on <DEVICE-NAME>}
show ipv6 dhcp [client received-options|relay status|status] {on <DEVICE-NAME>}
show ipv6 interface {<IF-NAME>|brief} {on <DEVICE-NAME>}
show ipv6 mld snooping [mrouter vlan <1-4095>|querier vlan <1-4095>|vlan <1-4095>] {on <DEVICE-NAME>}
show ipv6 neighbors <VLAN-NAME> {on <DEVICE-NAME>}
show ipv6 route {<IF-NAME>|ge <1-X>|me1|port-channel <1-2>|pppoe1|serial <1-4>|te1e <1-4>|<1-1>|up|vlan <1-4095>|vmif <1-X>|wwan1|xge} {on <DEVICE-NAME>}
```

#### Parameters

- `ipv6` Displays IPv6 related information
- `default-gateways` Displays all learnt default gateways
- `delegated-prefix` Displays prefix delegation information
- `hop-limit` Displays the configured IPv6 hop count value
- `name-server` Displays DNS name servers
- `on <DEVICE-NAME>` This parameter is common to all of the above keywords.
  - `on <DEVICE-NAME>` – Optional. Displays the specified information on a device (access point, wireless controller, or service platform)
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- `show ipv6 dhcp [client received-options|relay status|status] {on <DEVICE-NAME>}

```
ipv6                Displays IPv6 related information
dhcp                Displays DHCPv6 related information
client received-options Displays DHCP options received from clients
relay status        Displays the DHCPv6 relay agent’s running status
status              Displays the DHCPv6 stateless server daemon’s status. In case the DHCPv6 server is up and running, it also displays interface names.
```

---

6-86
### SHOW COMMANDS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show ipv6 interface (&lt;IF-NAME&gt;</td>
<td>brief) {on &lt;DEVICE-NAME}&gt;`</td>
</tr>
<tr>
<td>`show ipv6 mld snooping [mrouter vlan &lt;1-4095&gt;</td>
<td>querier vlan &lt;1-4095&gt;</td>
</tr>
<tr>
<td><code>show ipv6 neighbors &lt;VLAN-NAME&gt; {on &lt;DEVICE-NAME&gt;}</code></td>
<td>Shows IPv6 neighbors on the specified VLAN.</td>
</tr>
<tr>
<td>`show ipv6 route (&lt;IF-NAME&gt;</td>
<td>ge &lt;1-X&gt;</td>
</tr>
</tbody>
</table>

*Note: `<DEVICE-NAME>` is a parameter that can be specified for some commands to display the specified information on a device.*

**ipv6** Displays IPv6 related information

**interface**

- `<IF-NAME>` (Optional): Specifies the interface name.
- `brief` (Optional): Displays a brief summary of IPv6 status and configuration on the specified interface.

**mld snooping**

- `<mrouter vlan <1-4095>|querier vlan <1-4095>|vlan <1-4095>` (Optional): Displays MLD snooping related information.

**mroute vlan**

- `<1-4095>` (Optional): Displays IPv6 multicast router information on the specified VLAN.

**querier vlan**

- `<1-4095>` (Optional): Displays IPv6 multicast querier information on the specified VLAN.

**vlan**

- `<1-4095>` (Optional): Displays MLD snooping related information on the specified VLAN.

**neighbors**

- `<VLAN-NAME>` (Optional): Displays IPv6 neighbors on the specified VLAN.

**route**

- `<IF-NAME>|ge <1-X>|me1|port-channel <1-2>|pppoe1|serial <1-4>|tel <1-4>|up|vlan <1-4095>|vmif|wwan1|xge>` (Optional): Displays IPv6 routes.

---

*Note: `<DEVICE-NAME>` is a parameter that can be specified for some commands to display the specified information on a device.*

**on <DEVICE-NAME>** This parameter is common to all of the above keywords.

- `<DEVICE-NAME>` (Optional): Specifies the name of the AP, wireless controller, or service platform.

**Access Point (AP)**, **Wireless Controller (WC)**, **Service Platform (SP)**
route | Displays IPv6 route table
---|---
<IF-NAME> | Optional. Displays IPv6 route table for the interface identified by the <IF-NAME> keyword
ge <1-X> | Optional. Displays IPv6 route table for the selected GigabitEthernet interface
me1 | Optional. Displays IPv6 route table for the FastEthernet interface
port-channel <1-2> | Optional. Displays IPv6 route table for the selected port-channel interface
ppoe1 | Optional. Displays IPv6 route table for the PPP over Ethernet interface
serial <1-4> | Optional. Displays IPv6 route table for the selected serial (slot) interface
Note: Applicable only for the NX4500, NX4524, NX6500, and NX6524.
t1e1 <1-4> <1-1> | Optional. Displays IPv6 route table for the selected t1e1 interface. Specify the slot ID and the port ID.
Note: Applicable only for the NX4500, NX4524, NX6500, and NX6524.
vlan <1-4095> | Optional. Displays IPv6 route table for the selected VLAN interface
up | Optional. Displays IPv6 route table for the WAN Ethernet interface
vmif <1-8> | Optional. Displays IPv6 route table for the selected virtual machine (VM) interface
Note: Applicable only for the NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, and NX9510.
wwan1 | Optional. Displays IPv6 route table for the wireless WAN interface
xge <1-4> | Optional. Displays IPv6 route table for the selected TenGigabitEthernet interface
Note: Applicable only for the NX9000, NX9500, and NX9510.
on <DEVICE-NAME> | This parameter is common to all of the above keywords.
• on <DEVICE-NAME> – Optional. Displays the specified information on a device (access point, wireless controller, or service platform)
• <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

rfs4000-229D58#
6.1.36 ipv6-access-list

Displays IPv6 access list statistics

NOTE: This command is not available in the USER EXEC Mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {(on <DEVICE-NAME>)}

Parameters
- show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> {(on <DEVICE-NAME>)}

Examples

rfs6000-6DB5D4#show ipv6-access-list stats
IPV6 Access-list: test
  deny ipv6 any any rule-precedence 20        Hitcount: 4
rfs6000-6DB5D4#
6.1.37 l2tpv3

Show commands

Displays a Layer 2 Tunnel Protocol Version 3 (L2TPV3) session information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
l2tpv3 {on|tunnel|tunnel-summary}
l2tpv3 {on <DEVICE-NAME>}
l2tpv3 {tunnel <L2TPV3-TUNNEL-NAME>} {session <L2TPV3-SESSION-NAME>}
   {(on <DEVICE-NAME>)}
l2tpv3 {tunnel-summary} {down|on|up}
l2tpv3 {tunnel-summary} {on <DEVICE-NAME>}
l2tpv3 {tunnel-summary} {down|up} {on <DEVICE-NAME>}
```

Parameters
- **l2tpv3 {on <DEVICE-NAME>}**
  - Displays a L2TPv3 tunnel and session details or summary
    - on <DEVICE-NAME> – Optional. Displays L2TPv3 information on a specified access point or wireless controller
    - <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

- **l2tpv3 {tunnel <L2TPV3-TUNNEL-NAME>} {session <L2TPV3-SESSION-NAME>}**
  - Displays a L2TPv3 tunnel and session details or summary
    - <L2TPV3-TUNNEL-NAME> – Specify the L2TPv3 tunnel name.
    - <L2TPV3-SESSION-NAME> – Specify the session name.

- **on <DEVICE-NAME>**
  - The following keyword is recursive and common to the ‘session <L2TPV3-SESSION-NAME>’ parameter.
    - on <DEVICE-NAME> – Optional. Displays a L2TPv3 tunnel and session details, based on the parameters passed, on a specified device.
    - <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.
l2tpv3 {tunnel-summary} {on <DEVICE-NAME>}

Displays L2TPv3 tunnel and session details or summary

Note: For an L2TPv3 tunnel over Auto IPSec, the tunnel status is displayed as: Established (secured by ipsec)

l2tpv3 tunnel-summary {on <DEVICE-NAME>}

Optional. Displays L2TPv3 tunnel summary

- on <DEVICE-NAME> – Optional. Displays a L2TPv3 tunnel summary on a specified device
- <DEVICE-NAME> – Specify the name of AP, wireless controller, or service platform.

Examples

ap7131-11B6C4#
6.1.38 ldap-agent

▲ show commands

Displays an LDAP agent's join status (join status to a LDAP server domain)

Use this command When LDAP is specified the external resource (as opposed to local RADIUS resources) to validate PEAP-MS-CHAP v2 authentication requests, user credentials, and password information needs to be made available locally to successfully connect to the external LDAP server. Up to two LDAP Agents (primary and secondary external resources) can be defined as external resources for PEAP-MS-CHAP v2 authentication requests.

NOTE: This command is not available in the USER EXEC Mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show ldap-agent join-status {on <DEVICE-NAME>}

Parameters

- show ldap-agent join-status {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>ldap-agent</th>
<th>Displays LDAP agent related configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>join-status</td>
<td>Displays if the LDAP agent has successfully joined a LDAP server’s domain</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays if the LDAP agent has successfully joined a specified LDAP server’s domain.</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; — Specify the name of the device running the LDAP server (access point, wireless controller, or service platform).</td>
</tr>
</tbody>
</table>

Examples

rfs6000-81701D#show ldap-agent join-status
Primary LDAP Server's agent join-status : Joined domain TEST.
Secondary LDAP Server's agent join-status : Not Configured
rfs6000-81701D#
### 6.1.39 licenses

Show commands

Displays installed licenses and usage information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show licenses {borrowed|lent}
```

**Parameters**

- `show licenses {borrowed|lent}`

| licenses {borrowed|lent} | Displays installed licenses and usage information
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- borrowed – Optional. Displays information on licenses borrowed</td>
</tr>
<tr>
<td></td>
<td>- lent – Optional. Displays information on licenses lent</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single Network Operations Center (NOC) controller. The NOC and the site controllers constitute the first and second tiers of the hierarchy respectively. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy. The site controllers may or may not be grouped to form clusters.

At the time of adoption, access points and adaptive access points are provided license by the adopting controller. These license packs can be installed on both the NOC and site controllers. When a AP/AAP is adopted by a controller, the controller pushes a license on to the device. At this point the various possible scenarios are:

- **AP/AAP license packs installed on the NOC controller only.**
  - The NOC controller provides the site controllers with the AP licenses, ensuring that per platform limits are not exceeded.

- **AP/AAP license packs installed on the NOC and site controllers.**
  - The site controller uses its installed licenses and, in case of a shortage, the site controller borrows additional licenses from the NOC. If the NOC controller is unable to allocate sufficient licenses, the site controller unadopts some of the AP/AAPs.

- **AP/AAP license packs installed on one controller within a cluster.**
  - The site controller shares its installed and borrowed licenses with other cluster controllers.

**Examples**

```
rfs4000-229D58#show licenses
Serial Number : 9184521800027
Device Licenses:
  AP-LICENSE
    String : DEFAULT-6AP-LICENSE
    Value  : 6
    Borrowed : 0
    Total   : 6
    Used    : 0
  AAP-LICENSE
    String :
    Value  : 0
    Borrowed : 0
    Total : 0
    Used  : 0
```
The following example shows the show > licenses command output on a NOC controller:

```
nx4500-5CFA2B#show licenses
Serial Number : 6283529900127

Device Licenses:
  AP-LICENSE
    String : 41a5a30ee9bb0bd78e943dba0a36ac34d3c66c956ef1f449d89f1c28beb032ac9747a8f0c9f98f
    Value  : 1
  AAP-LICENSE
    String : 41a5a30ee9bb0bd7f8d421c001f7c9cb3cd66c956ef1f41960aa2a030abb41ac9747a8f0c9f98f
    Value  : 1

Total Licenses:
  AP-LICENSE
    Value : 263
    Used : 0
  AAP-LICENSE
    Value : 329
    Used : 3

Cluster Licenses:
  AP-LICENSE
    Value : 257
    Used : 0
  AAP-LICENSE
    Value : 257
    Used : 2

<td>AAP</td>
<td>51</td>
<td>0</td>
<td>51</td>
<td>93 days, 5 hours</td>
</tr>
</tbody>
</table>
```

nx4500-5CFA2B#
In the following example, the ‘VALIDITY(HRS)’ column specifies the validity period, in days and hours, of a lent license. On a NOC controller, a ‘VALIDITY(HRS)’ value of ‘current’ implies that the site controller is currently adopted. Whereas, a numerical ‘VALIDITY(HRS)’ value indicates the days and hours the lent license is valid for a site controller that is not reachable.

6.1.40 lldp

show commands

Displays Link Layer Discovery Protocol (LLDP) information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show lldp [neighbors|report]
show lldp neighbors {on <DEVICE-NAME>}
show lldp report {detail|on}
show lldp report {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}

Parameters

- show lldp neighbors {on <DEVICE-NAME>}
- show lldp report {detail} {(on <DEVICE-OR-DOMAIN-NAME>)}

Examples

rfs7000-37FABE(config)#show lldp neighbors
-------------------------
Chassis ID: 00-23-68-22-9D-58
System Name: L3-Router
Platform: RFS-4010-00010-WR, Version 5.8.4.0-008D
Capabilities: Bridge  Router
Enabled Capabilities: Bridge  Router
Local Interface: ge1, Port ID (outgoing port): ge2
TTL: 148 sec
Management Addresses: 10.2.0.1,172.18.0.1
rfs7000-37FABE(config)#
6.1.41 logging

show commands

Displays the network’s activity log

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show logging {on <DEVICE-NAME>}
```

Parameters

- `on <DEVICE-NAME>` – Optional. Executes the command on a specified device.
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

Examples

```
nx9500-6C8809#show logging

6.1.42 mac-access-list

show commands

Displays MAC access list statistics

NOTE: This command is not present in USER EXEC mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show mac-access-list stats {<MAC-ACCESS-LIST-NAME>|on}
show mac-access-list stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>)}

Parameters

mac-access-list stats | Displays MAC access list statistics

- <MAC-ACCESS-LIST-NAME> | Optional. Displays statistics for a specified MAC access list. Specify the MAC access list name.
  Note: The system displays all configured ACL statistics if no ACL name is specified.

on <DEVICE-NAME> | Optional. Displays all or a specified MAC access list statistics on a specified device
- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

nx6524-5483B0#show mac-access-list stats scalemacacl | i 311

```

```
rfs7000-6DCD4B(config)#
```
6.1.44 mac-auth

Displays details of wired ports that have MAC address authentication enabled

Use this command to view MAC authentication configuration and authentication state. The command displays the current authentication state of the wired host, the authorization state of the Ge1 port, and the wired hosts’ MAC address. The port status displays as Authorized if the wired host has successfully authenticated and Not Authorized if the wired host has not authenticated or has failed MAC authentication.

For more information on enabling MAC address authentication on a wired port, see `mac-auth`.

Supported in the following platforms:
- Access Points — AP6511
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

```
show mac-auth {all|interface <INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|t1e1 <1-4>|up <1-2>|vmif <1-X>|xge <1-4>|} {on <DEVICE-NAME>}
```

Parameters

- `show mac-auth {all|interface <INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|t1e1 <1-4>|up <1-2>|vmif <1-X>|xge <1-4>|} {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-auth</td>
<td>Displays MAC authentication related information for all interfaces or all interfaces</td>
</tr>
<tr>
<td>all</td>
<td>Optional. Displays MAC authentication related information for all interfaces</td>
</tr>
</tbody>
</table>
| interface [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|t1e1 <1-4>|up <1-2>|vmif <1-X>|xge <1-4>] | Optional. Displays MAC authentication related information for a specified interface. Specify the interface using one of the following options:
  - `<INTERFACE-NAME>` – Selects the interface identified by the `<INTERFACE-NAME>` keyword
  - `ge <1-5>` – Selects the GigabitEthernet interface identified by the index number
  - `port-channel <1-3>` – Selects the port channel interface identified by the index number
  - `t1e1 <1-4>` – Selects the layer 2 interface (Ethernet port)
  - `up <1-2>` – Selects the WAN Ethernet interface identified by the index number
  - `vmif <1-X>` – Selects the `virtual machine interface` (VMIF) identified by the index number
  - `xge <1-4>` – Selects the TenGigabitEthernet interface identified by the index number

- `on <DEVICE-NAME>`

The following keywords are common to the 'all' and 'interface' parameters:
- `on <DEVICE-NAME>` – Optional. Displays MAC authentication related information on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

**Note:** When the 'on' keyword is used exclusively, without the 'all' and 'interface' options, the system displays MAC authentication related information for interfaces configured on the specified device.
Examples
rfs4000-229D58(config)#show mac-auth all

6.1.47 nsight

Displays NSight module related statistics and also displays the database server status (reachable or not)

Supported in the following platforms:
   • Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax
show nsight status

Parameters
• show nsight status

<table>
<thead>
<tr>
<th>nsight</th>
<th>Displays the NSight module related status, such as:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• NSight is enabled or not on the device</td>
</tr>
<tr>
<td></td>
<td>• NSight report and aggregation daemon is running or not</td>
</tr>
<tr>
<td></td>
<td>• NSight alarm daemon is running or not</td>
</tr>
<tr>
<td></td>
<td>• NSight server daemon is running or not</td>
</tr>
<tr>
<td></td>
<td>• Database server is reachable or not</td>
</tr>
</tbody>
</table>

Examples
nx9500-6C8809(config)#show nsight status
Nsight is enabled
Nsight report and aggregation daemon is running
Nsight alarm daemon is running
Nsight server daemon is running
Database server is not reachable
nx9500-6C8809(config)#
# 6.1.48 ntp

## show commands

Displays *Network Time Protocol* (NTP) information. NTP enables clock synchronization within a network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

## Syntax

```
show ntp [associations|status]
```

```
show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]  
```

### Parameters

- `show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]`

## ntp associations

**detail/on**

Displays existing NTP associations. The interaction between the controller or service platform and a SNTP server constitutes an association. SNTP associations are of two kinds:
- peer associations - where a controller or service platform synchronizes to another system or allows another system to synchronize to it, or
- server associations - where only the controller or service platform synchronizes to the SNTP resource, not the other way around.

- **detail** – Optional. Displays detailed NTP associations
- **on <DEVICE-NAME>** – Optional. Displays NTP associations on a specified device

**<DEVICE-NAME>**

Specify the name of the AP, wireless controller, or service platform.

**Note:** If the ‘on’ keyword is used without the ‘detail’ keyword, the system displays a summary of existing NTP associations on the specified device or RF Domain.

## ntp status

**on <DEVICE-NAME>**

Displays the performance (status) information relative to the NTP association status. Use this command to view the access point, controller, or service platform’s current NTP resource.

- **on <DEVICE-NAME>** – Optional. Displays NTP association status on a specified device

**<DEVICE-NAME>**

Specify the name of the AP, wireless controller, or service platform.

## Examples

```
nx9500-6C8809#show ntp associations
```

```
+-----------------------+-----------------+----------+---------+---------+---------+---------+---------+----------+
| STATUS   | NTP SERVER IP ADDR | REF CLOCK | IP ADDR | STRATUM | WHEN | POLL | REACH | DELAY |

nx9500-6C8809#
6.1.49 password-encryption

Displays password encryption status (enabled/disabled)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show password-encryption status
```

Parameters

- `show password-encryption status`

Examples

```
rfs7000-37FABE(config)#show password-encryption status
Password encryption is enabled
rfs7000-37FABE(config)#
```
6.1.50 **pppoe-client**

*show commands*

Displays *Point-to-Point Protocol over Ethernet* (PPPoE) client information

Use this command to view PPPoE statistics derived from access to high-speed data and broadband networks. PPPoE uses standard encryption, authentication, and compression methods as specified by the PPPoE protocol. PPPoE enables point-to-points connection to an ISP over existing Ethernet interface.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show pppoe-client [configuration|status] {on <DEVICE-NAME>}
```

**Parameters**

- `show pppoe-client [configuration|status] {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pppoe-client</td>
<td>Displays PPPoE client information (configuration and status)</td>
</tr>
<tr>
<td>configuration</td>
<td>Displays detailed PPPoE client configuration</td>
</tr>
<tr>
<td>status</td>
<td>Displays detailed PPPoE client status</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>The following keywords are common to ‘configuration’ and ‘status’ parameters:</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays detailed PPPoE client status or configuration on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config)#show pppoe-client configuration
PPPoE Client Configuration:
+-------------------------------------------|
| Mode           : Disabled                  |
| Service Name   :                          |
| Auth Type      : pap                       |
| Username       :                          |
| Password       :                          |
| Idle Time      : 600                       |
| Keepalive      : Disabled                  |
| Local n/w      : vlan1                     |
| Static IP      : 0.0.0.0                   |
| MTU            : 1492                      |
+-------------------------------------------|
```

```
rfs7000-37FABE(config)#
```
6.1.51 privilege

show commands

Displays a device's existing privilege level

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show privilege

Parameters

None

Examples

rfs7000-37FABE(config)#show privilege
Current user privilege: superuser
rfs7000-37FABE(config)#
6.1.52 radius

Displays the amount of access time consumed and the amount of access time remaining for all guest users configured on a RADIUS server.

Every captive portal guest user can access the captive portal for a specified duration. This results in following three scenarios:

- Scenario 1: Access duration not specified (in this case the default of 1440 minutes is applied)
- Scenario 2: Access duration is specified and is greater than 0
- Scenario 3: Access duration is specified and equals to 0 (in this case the guest user has unlimited access)

In all the three scenarios the access time consumed is the duration for which the guest user has logged. But the access time remaining varies. It is calculated as follows:

- Scenarios 1 & 2 - It is the lesser of the following two values: difference between the configured access duration and the time consumed AND the time until user account expiration.
- Scenario 3 - It is the time until user account expiration

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show radius [guest-users|server]
show radius guest-users {brief|<GUEST-USER-NAME>}
show radius server
```

Parameters

- `show radius guest-users {brief|<GUEST-USER-NAME>}`

| radius guest-users {brief|<GUEST-USER-NAME>} | Displays RADIUS server’s guest user’s access details: total time for which the user has logged in, and the amount of access time remaining. |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| • brief – Displays the total number of guest users provided RADIUS access |
| • <GUEST-USER-NAME> – Optional. Provide the name of the guest user (whose access details are to be viewed). If no name is provided, the system displays details of all guest users who have successfully logged in at least once. |

Use this command in the captive-portal context to view time and data statistics for guest user(s) having bandwidth-based or time-based vouchers configured. In such a scenario, the system displays the following information: data configured, data remaining, configured and current bandwidths (for both downlink and uplink), time configured, and time remaining. If bandwidth-based voucher is not applicable to a guest user, the data configured and data remaining values are displayed as ‘unlimited’. The bandwidth columns are blank. If time-based voucher is not applicable to a guest user, the only value displayed is the time remaining (which is the time till the expiration of the guest user’s account).

**Note:** For more information on configuring bandwidth-based and time-based vouchers, see `user`. 

show radius server

rfs4000-229D58(config-captive-portal-wdws)
6.1.53 **reload**

- **show commands**

Displays scheduled reload information for a specific device

---

**NOTE:** This command is not present in the USER EXEC mode.

---

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show reload {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

- `show reload {on <DEVICE-OR-DOMAIN-NAME>}`

---

**reload {on <DEVICE-OR-DOMAIN-NAME>}**

Displays scheduled reload information for a specified device

- on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays configuration on a specified device
- <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

**Examples**

```
rfs7000-37FABE(config)#show reload
No reload is scheduled.
rfs7000-37FABE(config)#
```
6.1.54 rf-domain-manager

- show commands
  Displays RF Domain manager selection details

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}

Parameters

- show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>rf-domain-manager</th>
<th>Displays RF Domain manager selection details</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>Optional. Displays RF Domain manager selection details on a specified device or domain</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config)#show rf-domain-manager
RF Domain RFDOMAIN_TechPubsLabLan
RF Domain Manager:
  ID: 70.37.FA.BE
  Priority: 180
  Has IP MiNT link
  Has wired MiNT links
Device under query:
  Priority: 180
  Has IP MiNT links
  Has wired MiNT links
rfs7000-37FABE(config)#
6.1.55 role

show commands
Displays role based firewall information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
show role [ldap-stats|wireless-clients]
show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}

Parameters
- show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>role ldap-stats</th>
<th>Displays LDAP server status and statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>role wireless-clients</td>
<td>Displays clients associated with roles</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>The following parameters are common to the 'ldap-stats' and 'wireless-clients' keywords:</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays clients associated with roles on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, and service platform.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config)#show role wireless-clients
No ROLE statistics found.
rfs7000-37FABE(config)#
6.1.56 route-maps

Displays route map statistics for defined device routes

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
show route-maps {on <DEVICE-NAME>}

Parameters
- show route-maps {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>route-maps</th>
<th>Displays configured route map statistics for all defined routes</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays route map statistics on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; — Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config)#show route-maps
rfs7000-37FABE(config)#
6.1.57 **rtls**

> show commands

Displays *Real Time Location Service* (RTLS) statistics for access points contributing locationing information supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show rtls [aeroscout|ekahau] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

**Parameters**

- `show rtls [aeroscout|ekahau] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rtls</code></td>
<td>Displays access point RTLS statistics</td>
</tr>
<tr>
<td><code>aeroscout</code></td>
<td>Displays access point Aeroscout statistics</td>
</tr>
<tr>
<td><code>ekahau</code></td>
<td>Displays access point Ekahau statistics</td>
</tr>
<tr>
<td><code>&lt;MAC/HOSTNAME&gt;</code></td>
<td>Optional. Displays Aeroscout or Ekahau statistics for a specified access point. Specify the MAC address or hostname of the access point.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</code></td>
<td>The following keyword is recursive and common to ‘Aeroscout’ and ‘Ekahau’ parameters:</td>
</tr>
</tbody>
</table>

- `on <DEVICE-OR-DOMAIN-NAME>` — Optional. Displays Aeroscout or Ekahau statistics on a specified device or domain.
- `<DEVICE-OR-DOMAIN-NAME>` — Specify the name of the AP, wireless controller, service platform, or RF Domain.

**Examples**

```
rfs4000-229D58(config)#show rtls aeroscout

Aeroscout Engine IP: 0.0.0.0 Port: 0
Send Count : 0
Recv Count : 0
Tag Reports : 0
Nacks : 0
Acks : 0
Lbs : 0
AP Status : 0
AP Notif : 0
Send Err : 0
Errmsg Count : 0

Total number of APs displayed: 1
rfs4000-229D58(config)#
```
### 6.1.58 running-config

**Show commands**

Displays configuration files (where all configured MAC and IP access lists are applied to an interface)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show running-config {aaa-policy|application|application-policy|association-acl-policy|
    auto-provisioning-policy|capture-portal-policy|device|database-client-policy|
    database-policy|device|device-overrides|dhcp-server-policy|dhcpv6-server-policy|
    ex3500-management-policy|ex3500-qos-class-map-policy|ex3500-qos-policy-map|
    exclude-devices|firewall-policy|guest-management-policy|hide-encrypted-values|
    include-factory|interface|ip-access-list|ipv6-access-list|mac-access-list|
    management-policy|meshpoint|nsight-policy|profile|radio-qos-policy|rf-domain|
    roaming-assist-policy|rtl-server-policy|schedule-policy|smart-cache-policy|
    smart-rf-policy|url-filter|url-list|web-filter-policy|wlan|wlan-qos-policy}
```

```
show running-config {aaa-policy|application|application-policy|association-acl-policy|
    auto-provisioning-policy|capture-portal-policy|device|database-client-policy|
    database-policy|device|device-overrides|dhcp-server-policy|dhcpv6-server-policy|
    ex3500-management-policy|ex3500-qos-class-map-policy|ex3500-qos-policy-map|
    firewall-policy|management-policy|nsight-policy|radio-qos-policy|
    roaming-assist-policy|rtl-server-policy|schedule-policy|smart-cache-policy|
    smart-rf-policy|url-filter|url-list|web-filter-policy|wlan|wlan-qos-policy}
```

```
show running-config application <APPLICATION-NAME>
```

```
show running-config exclude-devices
```

```
show running-config {device [<MAC>|self]} {include-factory}
```

```
show running-config {device-overrides {brief}}
```

```
show running-config {hide-encrypted-values {exclude-devices|include-factory}}
```

```
show running-config {include-factory}
```

```
show running-config {interface} {<INTERFACE-NAME>|ge|include-factory|me|port-channel|
    pppoe1|vlan|wwan1}
```

```
show running-config {interface} {<INTERFACE-NAME>|ge <1-4>|include-factory|
    me1|port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {include-factory}
```

```
show running-config {ip-access-list <IP-ACCESS-LIST-NAME>|
    ipv6-access-list <IPv6-ACCESS-LIST-NAME>|mac-access-list <MAC-ACCESS-LIST-NAME} {include-factory}
```

```
show running-config {meshpoint <MESHPOINT-NAME>} {include-factory}
```

```
show running-config {profile [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8432|ap8533|rfs4000|
    rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600} <PROFILE-NAME>}
```

```
show running-config {rf-domain <DOMAIN-NAME>} {include-factory}
```

```
show running-config {wlan <WLAN-NAME>} {include-factory}
```

```
show running-config url-filter <URL-FILTER-NAME>
```

```
show running-config url-list <URL-LIST-NAME> {include-factory}
```
### Parameters

| running-config | Optional. Displays current running configuration
| device [<MAC>|self] | Optional. Displays device configuration
| hide-encrypted-values {exclude-devices|include-factory} | Optional. Replaces all encrypted passwords with the standard characters ****** in the show > running-config output
| device-overrides brief | Optional. Displays overrides applied at the device’s configuration

**Note:** If the command is executed without a keyword, the system displays the entire running configuration.

- **<POLICY-TYPE> <POLICY-NAME>** Optional. Select the policy type, for example, aaa-policy, auto-provisioning-policy, captive-portal-policy, etc. and then specify the policy name. The system displays the selected policy’s configuration.
  - *(include-factory)*

- **include-factory** The following keyword is common to all policies:
  - *(include-factory)* – Optional. Includes factory defaults

- **show running-config** *(device [<MAC]/self]) {include-factory}*

- **running-config** Displays current running configuration

- **device [<MAC]/self]** Optional. Displays device configuration
  - *(<MAC>)* – Displays a specified device configuration. Specify the MAC address of the device.
  - *(self)* – Displays the logged device’s configuration

- **include-factory** The following keyword is common to the ‘<MAC>’ and ‘self’ parameters:
  - *(include-factory)* – Optional. Displays factory defaults

- **show running-config** *(hide-encrypted-values {exclude-devices|include-factory})* 

- **running-config** Displays current running configuration

- **hide-encrypted-values {exclude-devices|include-factory}** Optional. Replaces all encrypted passwords with the standard characters ****** in the show > running-config output
  - *(exclude-devices)* – Optional. Excludes devices from the running configuration displayed
  - *(include-factory)* – Optional. Includes factory default values in the running configuration displayed

- **show running-config** *(device-overrides {brief})*

- **running-config** Displays current running configuration

- **device-overrides brief** Optional. Displays overrides applied at the device’s configuration
  - *(brief)* – Optional. Displays a brief summary of device overrides
### show running-config {exclude-devices}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>running-config</td>
<td>Displays current running configuration</td>
</tr>
<tr>
<td>exclude-devices</td>
<td>Optional. Excludes device configuration details from the running configuration displayed</td>
</tr>
</tbody>
</table>

### show running-config {include-factory}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>running-config</td>
<td>Displays current running configuration</td>
</tr>
<tr>
<td>include-factory</td>
<td>Optional. Includes factory defaults</td>
</tr>
</tbody>
</table>

### show running-config {interface} {<INTERFACE-NAME>|ge <1-4>|include-factory|me1|port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {include-factory}

<table>

6.1.59 session-changes

Displays configuration changes made in the current session

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show session-changes

Parameters

None

Examples

rfs7000-37FABE(config)#show session-changes

No changes in this session

rfs7000-37FABE(config)#
### 6.1.60 session-config

**show commands**

Lists active open sessions on a device

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show session-config {exclude-devices|include-factory}
```

**Parameters**

- `session-config {exclude-devices|include-factory}`

| session-config {exclude-devices|include-factory} | Displays current session configuration |
|--------------------------------------------------|--------------------------------------|
| `exclude-devices` – Optional. Excludes device configuration details from the output |
| `include-factory` – Optional. Includes factory defaults |

**Examples**

```
x9500-6C8809(config)#show session-config

Configuration of NX9500 version 5.8.4.0-008D
 version 2.5
 client-identity-group default
  load default-fingerprints

6.1.61 sessions

show commands

Displays CLI sessions initiated on a device

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`show sessions all {on <DEVICE-NAME>}`

Parameters

- `show sessions all {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>sessions</th>
<th>Displays CLI sessions initiated on a device</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays all sessions including internal</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. This is a recurring keyword and is common to the 'all' parameter. Displays CLI sessions on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809# show sessions
INDEX COOKIE NAME START TIME FROM ROLE
1 2        snmp     2016-04-29 12:06:13 127.0.0.1 superuser
2 3        snmp2    2016-04-29 12:06:13 127.0.0.1 superuser
3 15       admin    2016-04-29 14:36:37 192.168.100.193 superuser
```

nx9500-6C8809#
6.1.62 site-config-diff

Displays the difference in site configuration available on the NOC and a site.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single Network Operations Center (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

NOC controllers possess default site configuration details. Overrides applied at the site level result in a mismatch of configuration at the site and the default site configuration available on the NOC controller. Use this command to view this difference.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

NOTE: This command returns an output only when executed on a NOC controller.

Syntax

```
show site-config-diff <SITE-NAME>
```

Parameters

- `site-config-diff <SITE-NAME>`

  | Displays the configuration difference for the specified site |
  | <SITE-NAME> | | | |

Examples

```
nx9500-6C874D#show site-config-diff 5C-0E-8B-18-06-F4
----- Config diff for switch 5C-0E-8B-18-06-F4 ----
rfs6000 5C-0E-8B-18-06-F4
interface pppoel
  no shutdown
nx9500-6C874D#
```
6.1.63  **smart-rf**

### show commands

Displays **Self-Monitoring At Run Time** (Smart RF) statistical history to assess adjustments made to device configurations to compensate for detected coverage holes or device failures. When invoked by an administrator, Smart RF instructs access point radios to change to a specific channel and begin beaconing using the maximum available transmit power. Within a well-planned deployment, any RF Domain member access point radio should be reachable by at least one other radio. Smart RF records signals received from its neighbors as well as signals from external, un-managed radios. AP-to-AP distance is recorded in terms of signal attenuation. The information from external radios is used during channel assignment to minimize interference.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

- `show smart-rf` [ap|channel-distribution|history|history-timeline|interfering-ap|interfering-neighbors|radio]
- `show smart-rf ap` {%MAC|<DEVICE-NAME>|activity|energy|neighbors|on <DOMAIN-NAME>}
- `show smart-rf ap` {%MAC|<DEVICE-NAME>}{on <DOMAIN-NAME>}
- `show smart-rf ap` {activity|energy|neighbors} {%MAC|<DEVICE-NAME>}{(on <DOMAIN-NAME>)}
- `show smart-rf channel-distribution` [history|history-timeline]{on <DOMAIN-NAME>}
- `show smart-rf radio` {%MAC|activity|all-11an|all-11bgn|channel|energy|neighbors|on <DOMAIN-NAME>}
- `show smart-rf radio` {%MAC|all-11an|all-11bgn|energy <MAC>}{on <DOMAIN-NAME>}
- `show smart-rf radio` {activity|neighbors} {%MAC|all-11an|all-11bgn}{on <DOMAIN-NAME>}
- `show smart-rf interfering-ap` {%MAC|<DEVICE-NAME>}{on <DOMAIN-NAME>}
- `show smart-rf interfering-neighbors` {%MAC|<DEVICE-NAME>}{on <DOMAIN-NAME}{threshold <50-100>}

### Parameters

- **show smart-rf ap** {%MAC|<DEVICE-NAME>}{on <DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>smart-rf</th>
<th>Displays Smart RF related information</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap</td>
<td>Displays access point related Smart RF information</td>
</tr>
<tr>
<td>&lt;MAC&gt;</td>
<td>Optional. Uses MAC addresses to identify access points. Displays all access points, if no MAC address is specified.</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Optional. Uses an administrator defined name to identify an access point</td>
</tr>
<tr>
<td>on &lt;DOMAIN-NAME&gt;</td>
<td>Optional. Displays access point details on a specified RF Domain</td>
</tr>
<tr>
<td></td>
<td>• &lt;DOMAIN-NAME&gt; – Specify the domain name.</td>
</tr>
</tbody>
</table>

- **show smart-rf ap** {activity|energy|neighbors} {%MAC|<DEVICE-NAME>}{(on <DOMAIN-NAME>)}

<table>
<thead>
<tr>
<th>smart-rf</th>
<th>Displays Smart RF related information</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap</td>
<td>Displays AP related Smart RF information</td>
</tr>
</tbody>
</table>
### SHOW COMMANDS 6-133

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>activity</td>
<td>Optional. Displays Smart RF activity related information. Use this option to view the following:</td>
</tr>
<tr>
<td></td>
<td>• Time-period – Lists the frequency Smart RF activity is trended for the RF Domain.</td>
</tr>
<tr>
<td></td>
<td>Trending periods include the current hour, last 24 hours, or the last seven days.</td>
</tr>
<tr>
<td></td>
<td>Comparing Smart RF adjustments versus the last seven days enables an administrator to assess</td>
</tr>
<tr>
<td></td>
<td>whether periods of interference and poor performance were relegated to just specific periods.</td>
</tr>
<tr>
<td></td>
<td>• Power changes – Displays the number of Smart RF initiated power level changes needed for RF</td>
</tr>
<tr>
<td></td>
<td>Domain member devices during each of the three trending periods. Determine whether power</td>
</tr>
<tr>
<td></td>
<td>compensations were relegated to known device outages or if compensations were consistent</td>
</tr>
<tr>
<td></td>
<td>over the course of a day or week.</td>
</tr>
<tr>
<td></td>
<td>• Channel changes – Lists the number of Smart RF initiated channel changes needed for RF Domain</td>
</tr>
<tr>
<td></td>
<td>member devices during each of the three trending periods. Determine if channel adjustments</td>
</tr>
<tr>
<td></td>
<td>were relegated to known device count increases or decreases over the course of a day or week.</td>
</tr>
<tr>
<td></td>
<td>• Coverage changes – Displays the number of Smart RF initiated coverage changes needed for RF</td>
</tr>
<tr>
<td></td>
<td>Domain member devices during each of the three trending periods. Determine if coverage</td>
</tr>
<tr>
<td></td>
<td>changes were relegated to known device failures or known periods of interference over the</td>
</tr>
<tr>
<td></td>
<td>course of a day or week.</td>
</tr>
<tr>
<td>energy</td>
<td>Optional. Displays AP energy for a specified AP or all APs. Use this option to view an RF Domain</td>
</tr>
<tr>
<td></td>
<td>member access point's operating channels, noise level and neighbor count. This information</td>
</tr>
<tr>
<td></td>
<td>helps assess whether Smart RF neighbor recovery is needed in respect to poorly performing</td>
</tr>
<tr>
<td></td>
<td>access points.</td>
</tr>
<tr>
<td>neighbors</td>
<td>Optional. Displays AP neighbors. Use this option to view attributes of neighbor radio resources</td>
</tr>
<tr>
<td></td>
<td>available for Smart RF radio compensations for other RF Domain member device radios.</td>
</tr>
<tr>
<td>smart-rf</td>
<td>Displays Smart RF related information.</td>
</tr>
<tr>
<td>channel-distribution</td>
<td>Displays Smart RF channel distribution information. This provides an overview of how RF Domain</td>
</tr>
<tr>
<td>history</td>
<td>member devices are utilizing different channels to optimally support connect devices and avoid</td>
</tr>
<tr>
<td></td>
<td>congestion and interference with neighboring devices. Assess whether the channel spectrum is</td>
</tr>
<tr>
<td></td>
<td>being effectively utilized and whether channel changes are warranted to improve RF Domain</td>
</tr>
<tr>
<td></td>
<td>member device performance.</td>
</tr>
<tr>
<td>history-timeline</td>
<td>Displays Smart RF calibration history. Use this option to view description and types of Smart</td>
</tr>
<tr>
<td></td>
<td>RF events impacting RF Domain member devices.</td>
</tr>
<tr>
<td>on &lt;DOMAIN-NAME&gt;</td>
<td>Optional. Displays access point details on a specified RF Domain</td>
</tr>
<tr>
<td></td>
<td>• &lt;DOMAIN-NAME&gt; – Specify the domain name.</td>
</tr>
</tbody>
</table>

* show smart-rf [channel-distribution|history|history-timeline] {on <DOMAIN-NAME>}
### smart-rf radio

- **history-timeline**: Displays extended Smart RF calibration history on an hourly or daily timeline. Use this option to view the time stamp when Smart RF status was updated on behalf of a Smart RF adjustment within the selected RF Domain.

- **on <DOMAIN-NAME>**: The following keyword is common to all of the above parameters:
  - **on <DOMAIN-NAME>** – Optional. Displays Smart RF configuration, based on the parameters passed, on a specified RF Domain.
  - **on <DOMAIN-NAME>** – Specify the RF Domain name.

#### smart-rf
- Displays Smart RF related information

#### radio
- Displays radio related commands

- **<MAC>**: Optional. Displays details of a specified radio. Specify the radio’s MAC address in the AA-BB-CC-DD-EE-FF format.

- **all-11an**: Optional. Displays all 11a radios currently in the configuration

- **all-11bgn**: Optional. Displays all 11bg radios currently in the configuration

#### energy <MAC>
- Optional. Displays radio energy
  - **<MAC>** – Optional. Specify the radio’s MAC address in the AA-BB-CC-DD-EE-FF format.
  - Use this option to view an RF Domain member access point radio’s operating channel, noise level and neighbor count. This information helps assess whether Smart RF neighbor recovery is needed in respect to poorly performing radios.

- **on <DOMAIN-NAME>**: The following keyword is common to all of the above parameters:
  - **on <DOMAIN-NAME>** – Optional. Displays radio details on a specified RF Domain.
  - **<DOMAIN-NAME>** – Specify the RF Domain name.

#### show smart-rf radio {<MAC>|all-11an|all-11bgn|energy <MAC>} {on <DOMAIN-NAME>}

#### activity
- Optional. Displays changes related to radio power, number of radio channels, or coverage holes. Use additional filters to view specific details.

- **<MAC>**: Optional. Displays radio activity for a specified radio
  - **<MAC>** – Specify the radio’s MAC address.

- **all-11an**: Optional. Displays radio activity of all 11a radios in the configuration

- **all-11bgn**: Optional. Displays radio activity of all 11bg radios in the configuration

- **on <DOMAIN-NAME>**: Optional. Displays radio activity of all radios within a specified RF Domain
  - **<DOMAIN-NAME>** – Specify the RF Domain name.

- **show smart-rf radio {activity|neighbors} {<MAC>|all-11an|all-11bgn} {on <DOMAIN-NAME>}

#### interfering-ap
- Displays interfering access points (requiring potential isolation) information
### show smart-rf interfering-neighbors

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;MAC&gt;</code></td>
<td>Optional. Displays information of a specified interfering access point</td>
</tr>
<tr>
<td><code>&lt;DEVICE-NAME&gt;</code></td>
<td>Optional. Displays interfering access point information on a specified device</td>
</tr>
<tr>
<td><code>on &lt;DOMAIN-NAME&gt;</code></td>
<td>Optional. Displays all interfering access point information within a specified RF Domain</td>
</tr>
</tbody>
</table>

**Note:** Considers all APs if this parameter is omitted.

- **show smart-rf interfering-neighbors `<MAC>`|`<DEVICE-NAME>`|`on <DOMAIN-NAME>`|`threshold <50-100>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>smart-rf</code></td>
<td>Displays Smart RF related information</td>
</tr>
<tr>
<td><code>interfering-ap</code></td>
<td>Displays interfering neighboring access point information</td>
</tr>
<tr>
<td><code>&lt;MAC&gt;</code></td>
<td>Optional. Displays interfering neighboring access point information</td>
</tr>
<tr>
<td><code>&lt;DEVICE-NAME&gt;</code></td>
<td>Optional. Displays all interfering neighboring access point information on a specified device</td>
</tr>
</tbody>
</table>

**Note:** Considers all APs if this parameter is omitted.

- **threshold `<50-100>`**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>on &lt;DOMAIN-NAME&gt;</code></td>
<td>Optional. Displays radio activity of all radios within a specified RF Domain</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config)#show smart-rf calibration-status
No calibration currently in progress
rfs7000-37FABE(config)#

rfs7000-37FABE(config)#show smart-rf history
===============================================================================================

### 6.1.64 spanning-tree

#### show commands

Displays spanning tree utilization information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
show spanning-tree mst {configuration|detail|instance|on <DEVICE-NAME>}
show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}
show spanning-tree mst {detail} {interface|on}
show spanning-tree mst {detail} interface {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {(on <DEVICE-NAME>)}
show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>} {(on <DEVICE-NAME>)}
```

#### Parameters

- **show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}**

<table>
<thead>
<tr>
<th>spanning-tree</th>
<th>Displays spanning tree utilization information</th>
</tr>
</thead>
<tbody>
<tr>
<td>mst</td>
<td>Displays Multiple Spanning Tree (MST) related information</td>
</tr>
<tr>
<td>configuration</td>
<td>Optional. Displays MST configuration</td>
</tr>
<tr>
<td>{on &lt;DEVICE-NAME&gt;}</td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays MST configuration on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP or wireless controller.</td>
</tr>
<tr>
<td>Note:</td>
<td>If the ‘on’ keyword is used without any of the other options, the system displays a summary of spanning tree utilization information on the specified device.</td>
</tr>
</tbody>
</table>

- **show spanning-tree mst {detail} interface {<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {(on <DEVICE-NAME>)}**

<table>
<thead>
<tr>
<th>spanning-tree</th>
<th>Displays spanning tree information</th>
</tr>
</thead>
<tbody>
<tr>
<td>mst</td>
<td>Displays MST configuration</td>
</tr>
<tr>
<td>detail</td>
<td>Optional. Displays detailed MST configuration, based on the parameters passed</td>
</tr>
<tr>
<td>interface</td>
<td>Displays detailed MST configuration for a specified interface</td>
</tr>
<tr>
<td>[&lt;INTERFACE&gt;</td>
<td>ge &lt;1-4&gt;</td>
</tr>
<tr>
<td></td>
<td>• ge &lt;1-4&gt; – Displays GigabitEthernet interface MST configuration</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-4&gt; – Select the GigabitEthernet interface index from 1 - 4.</td>
</tr>
<tr>
<td>Note:</td>
<td>The GE interface range for NX45XX and NX65XX service platforms is &lt;1 - 24&gt;</td>
</tr>
<tr>
<td></td>
<td>• me1 – Displays FastEthernet interface MST configuration</td>
</tr>
</tbody>
</table>

Contd..
show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>} 
(on <DEVICE-NAME>)

### 6.1.66 t5

**show commands**

Displays adopted T5 controller statistics

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX9000, NX9500, NX9510, NX9600

**Syntax**

- `show t5 [boot|clock|cpe|interface|mac|system|temperature|uptime|version|wireless] {on <T5-DEVICE-NAME>}`
- `show t5 [boot|clock|system|temperature|uptime|version] {on <T5-DEVICE-NAME>}`
- `show t5 cpe [address|boot|ether port status|led|reset|system|uptime|version] {on <T5-DEVICE-NAME>}`
- `show t5 interface [dsl|fe|ge|radio] {on <T5-DEVICE-NAME>}`
- `show t5 interface [dsl|fe|ge] [counter|description|errors|status|utilization] {on <T5-DEVICE-NAME>}`
- `show t5 interface dsl custom [avg|dse|dsses|peak|uses|usses] {on <T5-DEVICE-NAME>}`
- `show t5 interface radio [stats|status|wlam-map] {on <T5-DEVICE-NAME>}`
- `show t5 mac table [filter name [dsl<1-24]|ge <1-2]|vlan <1-4094]|wlan <1-24]] {on <T5-DEVICE-NAME>}`
- `show t5 wireless [client|wlan] {on <T5-DEVICE-NAME>}`
- `show t5 wireless client {filter name [association-status|authentication-status|bss|mac-address|retry-percentage|rssi-value]} {on <T5-DEVICE-NAME>}`
- `show t5 wireless wlan counters [qos|rate|size] {on <T5-DEVICE-NAME>}`

**Parameters**

- `show t5 [boot|clock|system|temperature|uptime|version] {on <T5-DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t5</td>
<td>Displays adopted T5 controller statistics</td>

| `show t5 interface [dsl|fe|ge] [counter|description|errors|status|utilization] {on <T5-DEVICE-NAME>}` | Displays T5 interface-related statistics based on the interface selected. Select the interface type. The options are: dsl, fe, ge. 
  * dsl – Displays Digital Subscriber Line (DSL) interface related information
  * fe – Displays Fast Ethernet (FE) interface related information
  * ge – Displays Gigabit Ethernet (GE) interface related information

The system displays the following information for the DSL, GE, and FE ports:
  * counter – Displays the following:
    * Number of octets (bytes) received and transmitted on this port
    * Number of data packets received and transmitted on this port
    * Number of flow control (layer 2) packets received and transmitted on this port

<p>| t5 | Displays adopted T5 controller statistics |
| interface | Displays T5 interface-related statistics based on the interface selected |
| dsl | Selects A T5 controller’s DSL interface. |
| | A T5 controller uses the operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS controllers and NX service platforms. |
| | However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack. |</p>

### show t5 mac table

- **filter name [dsl <1-24> | ge <1-2> | vlan <1-4094> | wlan <1-24>]**
  - Displays T5 MAC address table. The T5 MAC table displays a dynamic list of MAC addresses learned by the T5 controller over its ethernet interfaces. Use this information to identify devices and the interfaces on which they can be found.
  - Use the following additional filters to filter on the basis of the VLAN or DSL interface:
    - `dsl <1-24>` – Filters information on the basis of the selected DSL port
    - `ge <1-2>` – Filters information on the basis of the selected GE port
    - `vlan <1-4094>` – Filters information on the basis of the selected VLAN port
    - `wlan <1-24>` – Filters on the basis of the selected CPE

### show t5 wireless client

- **filter name [association-status | authentication-status | bss | mac-address | retry-percentage | rssi-value]**
  - Displays the T5 wireless client and WLAN related statistics
  - Use the additional filters available to view specific client-related information. The options are:
    - `association-status`
    - `authentication-status`
    - `bss`
    - `retry-percentage`
    - `rssi-value`
on <T5-DEVICE-NAME> | Optional. Executes the command on a specified T5 device
• <T5-DEVICE-NAME> – Specify the T5 device’s hostname. An error message is displayed if no T5 device name is specified.

• show t5 wireless wlan counters [qos|rate|size] {on <T5-DEVICE-NAME>}

| t5 | Displays adopted T5 controller statistics |
| wireless wlan [qos|rate|size] | Displays the T5 wireless WLAN related statistics |
| • wlan – Displays following T5 controller traffic counter statistics: |
| • qos – T5 controller WLAN QoS utilization. Displays the number of background (low priority) and best-effort packets received and transmitted on each listed T5 controller managed WLANs |
| • rates – Displays T5 controller’s WLAN utilization data rate statistics |
| • lists the number of data packets received and transmitted in the WLAN that have been relegated to a 1 Mbps data rate |
| • Lists the number of data packets received and transmitted in the WLAN by T5 controller connected devices at 54Mbps |
| • size – Displays the number of data packets received and transmitted, in each listed WLAN, greater than 1024 bytes |

Examples
The following examples are for show commands executed on the ‘t5-ED7C6C’ controller adopted by the ‘nx9500-6C8809’ wireless controller:

nx9500-6C8809(config)#
6.1.67 terminal

*show commands*

Displays terminal configuration parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7622, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

show terminal

**Parameters**

None

**Examples**

rfs7000-37FABE(config)#show terminal
Terminal Type: xterm
Length: 24 Width: 200
rfs7000-37FABE(config)#
6.1.68  timezone

Displays a device's timezone

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`show timezone`

Parameters

None

Examples

```
rfs7000-37FABE(config)#show timezone
Timezone is America/Los_Angeles
rfs7000-37FABE(config)#
```
6.1.69 traffic-shape

Displays traffic-shaping related configuration details and statistics

Traffic shaping regulates network data transfers to ensure a specific performance level. Traffic shaping delays the flow of packets defined as less important than prioritized traffic streams. Traffic shaping enables traffic control out an interface to match its flow to the speed of a remote target’s interface and ensure traffic conforms applied policies. Traffic can be shaped to meet downstream requirements and eliminate network congestion when data rates are in conflict.

Apply traffic shaping to specific applications to apply application categories. When application and ACL rules are conflicting, ACL rules take precedence for the traffic shaping class. Using traffic shaping, an application takes precedence over an application category.

Supported in the following platforms:
- Access Points — AP622, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530

Syntax
```
show traffic-shape [priority-map|statistics {class <1-4>}|status] {on <DEVICE-NAME>}
```

Parameters
- `show traffic-shape [priority-map|statistics {class <1-4>}|status] {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>traffic-shape</th>
<th>Displays traffic-shaping related configuration details and statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority-map</td>
<td>Displays the traffic shaper queue priority. There are 8 queues (0 - 7), and traffic is queued in each based on incoming packets 802.1p markings.</td>
</tr>
<tr>
<td>statistics class &lt;1-4&gt;</td>
<td>Displays traffic-shaping related statistics for all traffic shaper classes or for a selected class</td>
</tr>
</tbody>
</table>
  - class <1-4> – Optional. Specify the traffic class from 1 - 4. The system displays traffic shaping statistics for the selected class. If not selected, the system statistics for all classes. |
| status        | Displays the controller or service platform’s traffic shaping status (whether running or not) |
| on <DEVICE-NAME> | Optional. Displays traffic-shaping related configuration details and statistics on a specified device |
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

Examples
```
ap7532-DEB9B0#show traffic-shape priority-map

Successful

rfs4000-229D58(config)#
6.1.71 **version**

Show commands

Displays a device's software and hardware version

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show version {on <DEVICE-NAME>}
```

**Parameters**

- `show version {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| version {on <DEVICE-NAME>} | Displays software and hardware versions on all devices or a specified device
| on <DEVICE-NAME> | Optional. Displays software and hardware versions on a specified device
| <DEVICE-NAME> | Specify the name of the AP, wireless controller, or service platform.

**Examples**

```
rfs4000-229D58(config)#show version
RFS4000 version 5.8.4.0-008D
Copyright (c) 2004-2016 Symbol Technologies, Inc. All rights reserved.

Radio HAL version is 92 (DFS:73)
rfs4000-229D58(config)#
```
### 6.1.72 vrrp

**show commands**

Displays the following Virtual Router Redundancy Protocol (VRRP) related statistics: configuration error, router redundancy information in brief and detail. VRRP configuration errors include mismatch of authentication credentials, invalid packet checksums, invalid packet types, invalid virtual route IDs, TTL errors, packet length errors and invalid (non matching) VRRP versions.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show vrrp [brief|details|error-stats|stats] {<1-255>} {(on <DEVICE-NAME>)}
show vrrp error-stats {on <DEVICE-NAME>}
```

**Parameters**

- **vrrp [brief|details|stats] {<1-255>} {(on <DEVICE-NAME>)}**
  - **brief** Displays VRRP related statistics in brief or in detail depending on the option selected
  - **details** Displays virtual router information in brief
  - **stats** Displays virtual router information in detail
  - **<1-255>** The following keyword is common to all of the above parameters:
    - **<1-255>** – Optional. Displays information for a specified Virtual Router. Specify the router's ID from 1 -255.
  - **on <DEVICE-NAME>** The following keyword is recursive and common to the ‘<1-255>’ parameter:
    - **on <DEVICE-NAME>** – Optional. Displays specified router information on a specified device
    - **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

- **show vrrp error-stats {on <DEVICE-NAME>**

- **error-stats {on <DEVICE-NAME>**
  - Displays VRRP related statistics in brief or in detail depending on the option selected
  - **error-stats** Displays global error statistics
  - **<DEVICE-NAME>** – Optional. Displays global error statistics on a specified device
  - **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.
Examples
rfs7000-37FABE(config)#show vrrp error-stats
Last protocol error reason: none
IP TTL errors: 0
Version mismatch: 0
Packet Length error: 0
Checksum error: 0
Invalid virtual router id: 0
Authentication mismatch: 0
Invalid packet type: 0
rfs7000-37FABE(config)#

rfs7000-37FABE(config)#show vrrp details
VRRP Group 1:
  version 2
  interface none
  configured priority 1
  advertisement interval 1 sec
  preempt enable, preempt-delay 0
  virtual mac address 00-00-5E-00-01-01
  sync group disable
rfs7000-37FABE(config)#
### 6.1.73 web-filter

#### show commands

Displays Web filtering related information

Use this command to view information on Web requests for content and whether the requests were blocked or approved based on URL filter settings defined for the selected controller or service platform. A URL filter is comprised of several filter rules. A whitelist bans all sites except the categories and URL lists defined in the whitelist. The blacklist allows all sites except the categories and URL lists defined in the blacklist.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
show web-filter [category|category-type|config|filter-level [basic|high|low|medium|medium-high]|statistics {on <DEVICE-NAME>}]|status
```

#### Parameters

- **show web-filter [category|category-type|config|filter-level [basic|high|low|medium|medium-high]|statistics {on <DEVICE-NAME>}]|status**
  - **web-filter** Displays an existing and configured Web filter details
  - **category** Displays Web filter categories. A category is a pre-defined URL list available in the WiNG software.
  - **category-type** Displays the Web filter category types. This is a pre-configured list of categories and sub-categories in which commonly accessed URLs have been classified.
  - **config** Displays all existing Web filters and their configuration details
  - **filter-level [basic|high|low|medium|medium-high]** Displays category types for the selected filter-level. Each filter level is pre-configured to use a set of category types. You cannot change the categories in the category types used for these pre-configured filter-level settings. Nor can you add, modify, or remove the category types mapped to a filter-level setting. The options are:
    - basic – Displays all category types configured for the basic filter-level
    - high – Displays all category types configured for the high filter-level
    - low – Displays all category types configured for the low filter-level
    - medium – Displays all category types configured for the medium filter-level
    - medium-high – Displays all category types configured for the medium-high filter-level
  - **statistics {on <DEVICE-NAME>}** Displays Web filter statistics on a specified device
    - on <DEVICE-NAME> – Optional. Specifies the device name
  - **status {on <DEVICE-NAME>}** Displays Web filter status on a specified device
    - on <DEVICE-NAME> – Optional. Specifies the device name

#### Note:
Web filtering is a licensed feature, and only when enforced can the system display Web filtering statistics.
Examples

nx9500-6C8809(config)#show web-filter category
    advertisement-popsups
        Sites that provide advertising graphics or other ad content files such as banners and pop-ups.
    alcohol-tobacco
        Sites that promote or sell alcohol- or tobacco-related products or services.
    anonymizers
        Sites and proxies that act as an intermediary for surfing to other websites in an anonymous fashion, whether to circumvent web filtering or for other reasons.
    arts
        Sites with artistic content or relating to artistic institutions such as theaters, museums, galleries, dance companies, photography, and digital graphic resources.
    botnets
        Sites that use bots (zombies) including command-and-control sites.
--More--
nx9500-6C8809(config)#

nx9500-6C8809(config)#show web-filter config
URL filters configured for this device are:
    WebFilter_ShoppingSites
        Blacklisted categories:
            shopping,
        Whitelisted categories:
            <AllowedShopping>,
nx9500-6C8809(config)#
6.1.74 what

Show commands

Displays details of a specified search phrase (performs global search)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, AP8432, AP8533
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show what [contain|is] <WORD> {on <DEVICE-OR-DOMAIN-NAME>}

Parameters

- contain <WORD> Searches on all the items that contain a specified word
  - <WORD> – Specify a word to search (for example, MAC address, hostname, etc.).
- is <WORD> Searches on an exact match
  - <WORD> – Specify a word to search (for example, MAC address, hostname, etc.).
- on <DEVICE-OR-DOMAIN-NAME> Optional. Performs global search on a specified device or RF Domain
  - <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

Examples

rfs4000-229D58#show what contain default

---------------------------------------------------------------------------------------
NO. CATEGORY             MATCHED                        OTHER KEY INFO (1)             OTHER KEY INFO (2)             OTHER KEY INFO (3)             OTHER

### Command: `show wireless client {filter} {wlan [<WLAN-NAME>|not <WLAN-NAME>]} {on <DEVICE-OR-DOMAIN-NAME>}`

- **wireless**: Displays wireless configuration parameters
- **client**: Displays client information based on the parameters passed

| filter wlan [ <WLAN-NAME> | not <WLAN-NAME> ] | Optional. Filters clients on a specified WLAN |
|------------------------|-------------------|
|                       | • <WLAN-NAME> – Specify the WLAN name. |
|                       | • not <WLAN-NAME> – Inverts the match selection |

| on <DEVICE-OR-DOMAIN-NAME> | The following keyword is common to the ‘WLAN and ‘not’ parameters: |
|----------------------------|• on <DEVICE-OR-DOMAIN-NAME> – Optional. Filters clients on a specified device or RF Domain |
|                            |• <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain. |

### Command: `show wireless client {statistics} {detail <MAC>|rf|window-data <MAC>} {on <DEVICE-OR-DOMAIN-NAME>}`

- **wireless**: Displays wireless configuration parameters
- **client**: Displays client information based on the parameters passed

| statistics {detail <MAC>|rf|window-data <MAC>} | Optional. Displays detailed client statistics. Use additional filters to view specific details. |
|--------------------------------------------------|• detail <MAC> – Optional. Displays detailed client statistics |
|                                                  |• <MAC> – Optional. Displays detailed statistics for a specified client. Specify the client’s MAC address. |
|                                                  |• rf – Optional. Displays detailed client statistics on a specified device or RF Domain |
|                                                  |• window-data <MAC> – Optional. Displays historical data, for a specified client |
|                                                  |• <MAC> – Optional. Specify the client’s MAC address |

| on <DEVICE-OR-DOMAIN-NAME> | The following keyword is recursive and common to the ‘detail <MAC>’, ‘RF’, and ‘window-data <MAC>’ parameters: |
|----------------------------|• on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays client statistics, based on the parameters passed, on a specified device or RF Domain |
|                            |• <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain. |

### Command: `show wireless client {tspec} <MAC> {on <DEVICE-OR-DOMAIN-NAME>}`

- **wireless**: Displays wireless configuration parameters
- **client**: Displays client information based on the parameters passed

| tspec <MAC> | Optional. Displays detailed traffic specification (TSPEC) information for all clients or a specified client |
|------------|• <MAC> – Optional. Displays detailed TSPEC information for a specified client. Specify the MAC address of the client. |

<p>| on &lt;DEVICE-OR-DOMAIN-NAME&gt; | The following keyword is recursive and common to the ‘tspec &lt;MAC&gt;’ parameter: |
|----------------------------|• on &lt;DEVICE-OR-DOMAIN-NAME&gt; – Optional. Displays detailed TSPEC information for wireless clients on a specified device or RF Domain |
|                            |• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain. |</p>

</tr>
</tbody>
</table>
**detail filters**

```
[ap <MAC/ HOSTNAME>| client-mac <MAC>]
```

Optional. Displays detailed coverage-hole related statistics

- filters – Optional. Displays detailed coverage-hole related statistics on a per access point or wireless-client basis
  - ap <MAC/HOSTNAME> – Displays detailed coverage-hole related statistics for a specified access point
  - <MAC/HOSTNAME> – Specify the access point’s device name or MAC address.
- client-mac <MAC> – Displays detailed coverage-hole related statistics encountered by a specified wireless client
  - <MAC> – Specify the wireless client’s MAC address

**Note:** If the command is executed without any parameters being included, the system displays all coverage-hole related statistics.

**summary**

Optional. Displays a summary of coverage-hole related statistics

**on <DOMAIN-NAME>**

This parameter is recursive and is common to the ‘detail’ and ‘summary’ keywords:

- on <DOMAIN-NAME> – Optional. Displays detailed or summary coverage-hole related statistics on a specified RF Domain
  - <DOMAIN-NAME> – Specify the domain name.

- show wireless meshpoint {config} {filter [device <DEVICE-NAME>|rf-domain <DOMAIN-NAME>]}

**wireless**

Displays wireless configuration parameters. Use this option to view detailed statistics on each Mesh-capable client available within controller’s adopted access point’s radio coverage area.

A mesh network is where one where each node is able to communicate with other nodes and maintain more then one path to the other mesh nodes within the mesh network. A mesh network provides robust, reliable and redundant connectivity to all the members of the mesh network. When one member of the mesh network becomes unavailable, the other mesh nodes are still able to communicate with one another either directly or indirectly through intermediate nodes.

**meshpoint**

Displays meshpoint related information

**config**

Optional. Displays all meshpoint configuration

**filters**

```
[device <DEVICE-NAME>|rf-domain <DOMAIN-NAME>]
```

Optional. Provides additional filter options, such as device name and RF Domain name.

- device <DEVICE-NAME> – Displays meshpoints applied to a specified device
  - <DEVICE-NAME> – Specify the device name.
- rf-domain – <DOMAIN-NAME> – Displays meshpoints applied to a specified RF Domain
  - <DOMAIN-NAME> – Specify the domain name.

- show wireless meshpoint {detail} {<MESHPOINT-NAME>}

**wireless**

Displays wireless configuration parameters

**meshpoint**

Displays meshpoint related information. Use this option to view detailed statistics on each Mesh-capable client available within controller’s adopted access point’s radio coverage area.

Contd..
A mesh network is where one where each node is able to communicate with other nodes and maintain more then one path to the other mesh nodes within the mesh network. A mesh network provides robust, reliable and redundant connectivity to all the members of the mesh network. When one member of the mesh network becomes unavailable, the other mesh nodes are still able to communicate with one another either directly or indirectly through intermediate nodes.

| detail | Optional. Displays detailed information for all meshpoints or a specified meshpoint |
| <MESHPOINT-NAME> | • <MESHPOINT-NAME> – Optional. Displays detailed information for a specified meshpoint. Specify the meshpoint name. |

• show wireless meshpoint {multicast|path|proxy|root|security|statistics} [<MESHPOINT-NAME>|detail] {on <DEVICE-OR-DOMAIN-NAME>}

| wireless | Displays wireless configuration parameters |
| meshpoint | Displays meshpoint related information. Use this option to view detailed statistics on each Mesh-capable client available within controller’s adopted access point’s radio coverage area. A mesh network is where one where each node is able to communicate with other nodes and maintain more then one path to the other mesh nodes within the mesh network. A mesh network provides robust, reliable and redundant connectivity to all the members of the mesh network. When one member of the mesh network becomes unavailable, the other mesh nodes are still able to communicate with one another either directly or indirectly through intermediate nodes. |
| multicast | Optional. Displays meshpoint multicast information |
| path | Optional. Displays meshpoint path information |
| proxy | Optional. Displays meshpoint proxy information |
| root | Optional. Displays meshpoint root information |
| security | Optional. Displays meshpoint security information |
| statistics | Optional. Displays meshpoint statistics |

[<MESHPOINT-NAME>| detail] The following keywords are common to all of the above parameters: 
• <MESHPOINT-NAME> – Displays meshpoint related information for a specified meshpoint. Specify the meshpoint name. 
• detail – Displays detailed multicast information for all meshpoints 

on <DEVICE-OR-DOMAIN-NAME> The following keyword is common to all of the above parameters: 
• on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays detailed multicast information on a specified device or RF Domain. 
• <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.

• show wireless meshpoint {neighbor} [<MESHPOINT-NAME>|detail|statistics {rf}] {on <DEVICE-OR-DOMAIN-NAME>}

<p>| wireless | Displays wireless configuration parameters |</p>
