Chapter 3, PRIVILEGED EXEC MODE COMMANDS

3.1 Privileged Exec Mode Commands

3.1.1 archive                      ................................................................. 3-6
3.1.2 boot                         ................................................................. 3-8
3.1.3 captive-portal-page-upload  ...................................................... 3-9
3.1.4 cd                           ................................................................. 3-12
3.1.5 change-pwd                   ............................................................... 3-13
3.1.6 clock                        ................................................................. 3-14
3.1.7 clock                        ................................................................. 3-26
3.1.8 cluster                      ................................................................. 3-27
3.1.9 configure                   ................................................................. 3-28
3.1.10 connect                    ................................................................. 3-29
3.1.11 copy                       ................................................................. 3-30
3.1.12 cpe                        ................................................................. 3-31
3.1.13 create-cluster             ............................................................... 3-33
3.1.14 crypto                     ................................................................. 3-35
3.1.15 crypto-cmp-cert-update     ...................................................... 3-34
3.1.16 database                   ................................................................. 3-45
3.1.17 database-backup            ............................................................ 3-46
3.1.18 database-restore           ............................................................ 3-47
3.1.19 delete                     ................................................................. 3-48
Chapter 4, GLOBAL CONFIGURATION COMMANDS

4.1 Global Configuration Commands .......................................................... 4-4
4.1.1 aaa-policy ......................................................................................... 4-9
4.1.2 alias ........................................................................................................................................... 4-10
4.1.3 aaa-tacacs-policy .................................................................................................................. 4-17
4.1.4 ap621 ........................................................................................................................................ 4-18
4.1.5 ap622 ........................................................................................................................................ 4-19
4.1.6 ap650 ........................................................................................................................................ 4-20
4.1.7 ap6511 ...................................................................................................................................... 4-21
4.1.8 ap6521 ...................................................................................................................................... 4-22
4.1.9 ap6522 ...................................................................................................................................... 4-23
4.1.10 ap6532 .................................................................................................................................... 4-24
4.1.11 ap6562 .................................................................................................................................... 4-25
4.1.12 ap71xx .................................................................................................................................... 4-26
4.1.13 ap7502 .................................................................................................................................... 4-27
4.1.14 ap7522 .................................................................................................................................... 4-28
4.1.15 ap7532 .................................................................................................................................... 4-29
4.1.16 ap7562 .................................................................................................................................... 4-30
4.1.17 ap811x .................................................................................................................................... 4-31
4.1.18 ap82xx .................................................................................................................................... 4-32
4.1.19 application .............................................................................................................................. 4-33
4.1.20 application-policy .................................................................................................................. 4-42
4.1.21 association-acl-policy ........................................................................................................... 4-59
4.1.22 auto-provisioning-policy ....................................................................................................... 4-60
4.1.23 bgp .......................................................................................................................................... 4-61
4.1.24 bonjour-gw-discovery-policy .............................................................................................. 4-63
4.1.25 bonjour-gw-forwarding-policy ............................................................................................ 4-65
4.1.26 bonjour-gw-query-forwarding-policy .................................................................................... 4-66
4.1.27 captive portal ........................................................................................................................ 4-67
4.1.28 clear ........................................................................................................................................ 4-105
4.1.29 client-identity-group .............................................................................................................. 4-106
4.1.30 client-identity-group .............................................................................................................. 4-114
4.1.31 clone ....................................................................................................................................... 4-121
4.1.32 crypto-cmp-policy ................................................................................................................ 4-122
4.1.33 customize ............................................................................................................................. 4-123
4.1.34 device ..................................................................................................................................... 4-134
4.1.35 device-categorization ........................................................................................................... 4-136
4.1.36 dhcp-server-policy ................................................................................................................. 4-142
4.1.37 dhcpv6-server-policy ............................................................................................................. 4-143
4.1.38 dns-whitelist ........................................................................................................................ 4-145
4.1.39 end ......................................................................................................................................... 4-150
4.1.40 event-system-policy .............................................................................................................. 4-151
4.1.41 ex3500 .................................................................................................................................... 4-157
4.1.42 ex3500-management-policy .................................................................................................. 4-174
4.1.43 ex3500-qos-class-map-policy ............................................................................................... 4-192
4.1.44 ex3500-qos-policy-map ....................................................................................................... 4-200
4.1.45 ex3524 .................................................................................................................................... 4-214
4.1.46 ex3548 .................................................................................................................................... 4-216
4.1.47 firewall-policy ....................................................................................................................... 4-217
4.1.48 global-association-list ......................................................................................................... 4-219

  7.3.6 ntp ........................................................................... 7-487
  7.3.7 override-wlan ....................................................... 7-488
  7.3.8 t5-logging ............................................................. 7-489
  7.3.9 use ........................................................................... 7-490

7.4 EX3524 & EX3548 Profile/Device Config Commands .... 7-491
  7.4.1 interface ...................................................................... 7-492
  7.4.2 ip .............................................................................. 7-512
  7.4.3 power ......................................................................... 7-513
  7.4.4 upgrade ....................................................................... 7-514
  7.4.5 use ........................................................................... 7-516
  7.4.6 no ............................................................................ 7-517

Chapter 8, AAA-POLICY

8.1 aaa-policy ......................................................................... 8-3
  8.1.1 accounting ................................................................. 8-4
  8.1.2 attribute ...................................................................... 8-8
  8.1.3 authentication ............................................................ 8-11
  8.1.4 health-check .............................................................. 8-16
  8.1.5 mac-address-format .................................................. 8-17
  8.1.6 no ............................................................................ 8-19
  8.1.7 proxy-attribute ......................................................... 8-21
  8.1.8 server-pooling-mode ............................................... 8-22
  8.1.9 use ........................................................................... 8-23

Chapter 9, AUTO-PROVISIONING-POLICY

9.1 auto-provisioning-policy .................................................... 9-4
  9.1.1 adopt .......................................................................... 9-5
  9.1.2 default-adoption ....................................................... 9-10
  9.1.3 deny ........................................................................ 9-11
  9.1.4 evaluate-always ....................................................... 9-14
  9.1.5 redirect ...................................................................... 9-15
Chapter 12, DHCP-SERVER-POLICY

12.1 dhcp-server-policy ................................................................. 12-3
  12.1.1 bootp ................................................................. 12-4
  12.1.2 dhcp-class .............................................................. 12-5

Chapter 11, ACCESS-LIST

11.1 ip-access-list ........................................................................ 11-4
  11.1.1 deny ........................................................................... 11-5
  11.1.2 disable ........................................................................ 11-16
  11.1.3 insert ........................................................................... 11-19
  11.1.4 no ................................................................................ 11-21
  11.1.5 permit .......................................................................... 11-22
11.2 mac-access-list .................................................................... 11-32
  11.2.1 deny ........................................................................... 11-33
  11.2.2 disable ........................................................................ 11-36
  11.2.3 ex3500 ....................................................................... 11-38
  11.2.4 insert ........................................................................... 11-41
  11.2.5 no ................................................................................ 11-43
  11.2.6 permit .......................................................................... 11-44
11.3 ipv6-access-list ................................................................... 11-47
  11.3.1 deny ........................................................................... 11-48
  11.3.2 no ................................................................................. 11-54
  11.3.3 permit .......................................................................... 11-55
11.4 ip-snmp-access-list ............................................................. 11-61
  11.4.1 deny ........................................................................... 11-62
  11.4.2 permit .......................................................................... 11-63
  11.4.3 no ................................................................................ 11-64
11.5 ex3500-ext-access-list ......................................................... 11-65
  11.5.1 deny ........................................................................... 11-66
  11.5.2 permit .......................................................................... 11-69
  11.5.3 no ................................................................................ 11-72
11.6 ex3500-std-access-list ......................................................... 11-73
  11.6.1 deny ........................................................................... 11-74
  11.6.2 permit .......................................................................... 11-75
  11.6.3 no ................................................................................ 11-76
Chapter 13, FIREWALL-POLICY

13.1 firewall-policy .......................................................... 13-3
13.1.1 acl-logging ........................................................... 13-4
13.1.2 alg ................................................................. 13-5
13.1.3 clamp ............................................................... 13-7
13.1.4 dhcp-offer-convert ................................................ 13-8
13.1.5 dns-snoop ........................................................... 13-9
13.1.6 firewall .............................................................. 13-10
13.1.7 flow ................................................................. 13-11
13.1.8 ip ................................................................. 13-13
13.1.9 ip-mac ............................................................. 13-21
13.1.10 ipv6 ............................................................... 13-24
13.1.11 ipv6-mac ......................................................... 13-27
13.1.12 logging ............................................................ 13-29
13.1.13 no ................................................................. 13-31
13.1.14 proxy-arp ......................................................... 13-33
13.1.15 proxy-nd ........................................................ 13-34
13.1.16 stateful-packet-inspection-12 ......................... 13-35
13.1.17 storm-control .................................................. 13-36
13.1.18 virtual-defragmentation ...................................... 13-38

Chapter 14, MINT-POLICY

14.1 mint-policy .............................................................. 14-2
14.1.1 level ................................................................. 14-3
14.1.2 mtu ................................................................. 14-4
14.1.3 router ............................................................. 14-5
14.1.4 udp ............................................................... 14-6
14.1.5 no ................................................................. 14-7

Chapter 15, MANAGEMENT-POLICY

15.1 management-policy .................................................. 15-3
15.1.1 aaa-login ........................................................ 15-4
Chapter 18, ROLE-POLICY

18.1 role-policy ................................................................. 18-3
18.1.1 default-role .............................................................. 18-4
18.1.2 ldap-deadperiod .................................................... 18-6
18.1.3 ldap-query ............................................................... 18-7
18.1.4 ldap-server ............................................................. 18-8
18.1.5 ldap-timeout .......................................................... 18-9
18.1.6 no ................................................................. 18-10
18.1.7 user-role ............................................................... 18-11
18.1.8 enable .............................................................. 18-12

Chapter 19, SMART-RF-POLICY

19.1 smart-rf-policy ............................................................. 19-3
19.1.1 area .......................................................... 19-4
19.1.2 assignable-power ................................................ 19-5
19.1.3 avoidance-time ..................................................... 19-6
19.1.4 channel-list ........................................................... 19-7
19.1.5 channel-width ....................................................... 19-8
19.1.6 coverage-hole-recovery ........................................ 19-9
19.1.7 dfs .......................................................... 19-10
19.1.8 enable .............................................................. 19-11
19.1.9 group-by .............................................................. 19-12
19.1.10 interference-recovery ........................................... 19-13
19.1.11 neighbor-recovery ................................................ 19-14
19.1.12 no .......................................................... 19-15
19.1.13 sensitivity ............................................................. 19-16
19.1.14 smart-ocs-monitoring ......................................... 19-17
19.1.15 dfs .......................................................... 19-18
19.1.16 no .......................................................... 19-19
19.1.17 interference-recovery ........................................... 19-20
19.1.18 no .......................................................... 19-21
19.1.19 no .......................................................... 19-22
19.1.20 no .......................................................... 19-23

Chapter 20, WIPS-POLICY

20.1 wips-policy ................................................................. 20-4
20.1.1 ap-detection .............................................................. 20-5
20.1.2 enable .............................................................. 20-6
20.1.3 event .............................................................. 20-7
20.1.4 history-throttle-duration ....................................... 20-8
20.1.5 interference-event ................................................... 20-9
20.1.6 no .......................................................... 20-10
20.1.7 signature .............................................................. 20-11
20.1.8 use .............................................................. 20-12
Chapter 21, WLAN-QOS-POLICY

21.1 wlan-qos-policy ................................................................. 21-3
  21.1.1 accelerated-multicast ...................................................... 21-4
  21.1.2 classification .............................................................. 21-6
  21.1.3 multicast-mask ............................................................ 21-8
  21.1.4 no .................................................................................. 21-9
  21.1.5 qos .............................................................................. 21-10
  21.1.6 rate-limit ................................................................. 21-11
  21.1.7 svp-prioritization ...................................................... 21-14
  21.1.8 voice-prioritization .................................................. 21-15
  21.1.9 wmm ............................................................................. 21-16

Chapter 22, L2TPV3-POLICY

22.1 l2tpv3-policy-commands .................................................. 22-3
  22.1.1 cookie-size ................................................................. 22-5
  22.1.2 failover-delay .............................................................. 22-6
  22.1.3 force-l2-path-recovery ............................................... 22-7
  22.1.4 hello-interval .............................................................. 22-8
  22.1.5 no .................................................................................. 22-9
  22.1.6 reconnect-attempts .................................................. 22-10
  22.1.7 reconnect-interval ..................................................... 22-11
  22.1.8 retry-attempts ........................................................... 22-12
  22.1.9 retry-interval ............................................................. 22-13
  22.1.10 rx-window-size ...................................................... 22-14
  22.1.11 tx-window-size ...................................................... 22-15

22.2 l2tpv3-tunnel-commands .................................................. 22-16
  22.2.1 establishment-criteria .................................................. 22-17
  22.2.2 hostname ................................................................. 22-18
  22.2.3 local-ip-address ......................................................... 22-19
  22.2.4 mtu ............................................................................... 22-20
  22.2.5 no .............................................................................. 22-21
  22.2.6 peer ............................................................................. 22-22
  22.2.7 router-id ................................................................. 22-25
  22.2.8 session ................................................................. 22-26
  22.2.9 use .............................................................................. 22-28

22.3 l2tpv3-manual-session-commands .................................... 22-29
  22.3.1 local-cookie ............................................................... 22-30
  22.3.2 local-ip-address ........................................................... 22-31
  22.3.3 local-session-id .......................................................... 22-32
  22.3.4 mtu ............................................................................... 22-33
  22.3.5 no .............................................................................. 22-34
  22.3.6 peer ............................................................................. 22-35
  22.3.7 remote-cookie ........................................................... 22-36
  22.3.8 remote-session-id ....................................................... 22-37
  22.3.9 traffic-source ............................................................. 22-38
Chapter 23, ROUTER-MODE COMMANDS

23.1 router-mode ................................................................. 23-3
23.1.1 area ........................................................................ 23-4
23.1.2 auto-cost ................................................................. 23-13
23.1.3 default-information .................................................. 23-14
23.1.4 ip ............................................................................. 23-15
23.1.5 network ................................................................. 23-16
23.1.6 ospf ......................................................................... 23-17
23.1.7 passive ................................................................. 23-18
23.1.8 redistribute ............................................................ 23-19
23.1.9 route-limit .............................................................. 23-20
23.1.10 router-id .............................................................. 23-21
23.1.11 no .......................................................................... 23-22

Chapter 24, ROUTING-POLICY

24.1 routing-policy-commands ........................................... 24-3
24.1.1 apply-to-local-packets ............................................ 24-4
24.1.2 logging ................................................................. 24-5
24.1.3 route-map ............................................................. 24-6
24.1.4 route-map-mode .................................................... 24-9
24.1.5 use ........................................................................ 24-17
24.1.6 no .......................................................................... 24-18

Chapter 25, AAA-TACACS-POLICY

25.1 aaa-tacacs-policy ..................................................... 25-2
25.1.1 accounting ............................................................ 25-3
25.1.2 authentication ....................................................... 25-6
25.1.3 authorization ........................................................ 25-9
25.1.4 no .......................................................................... 25-12

Chapter 26, MESHPOINT

26.1 meshpoint-config-instance ......................................... 26-2
26.1.1 allowed-vlans ....................................................... 26-4
26.1.2 beacon-format ..................................................... 26-5
26.1.3 control-vlan ......................................................... 26-6
26.1.4 data-rates .............................................................. 26-7
26.1.5 description ............................................................ 26-11
26.1.6 meshid ................................................................. 26-12
26.1.7 neighbor .............................................................. 26-13
26.1.8 no .......................................................................... 26-14
26.1.9 root ...................................................................... 26-16
26.1.10 security-mode ..................................................... 26-18
26.1.11 service ............................................................... 26-20
26.1.12 shutdown .......................................................... 26-21
Chapter 27, PASSPOINT POLICY

27.1 passpoint-policy ................................................................. 27-3
   27.1.1 3gpp ........................................................................... 27-4
   27.1.2 access-network-type .................................................. 27-5
   27.1.3 connection-capability ................................................... 27-6
   27.1.4 domain-name .............................................................. 27-8
   27.1.5 hessid ......................................................................... 27-9
   27.1.6 internet ...................................................................... 27-10
   27.1.7 nai-realm ................................................................. 27-11
   27.1.8 nai-realm ................................................................... 27-13
   27.1.9 net-auth-type ............................................................ 27-19
   27.1.10 no .............................................................................. 27-20
   27.1.11 operator ................................................................. 27-21
   27.1.12 osu ............................................................................ 27-22
   27.1.13 roam-consortium ...................................................... 27-32
   27.1.14 venue ................................................................. 27-33
   27.1.15 wan-metrics ........................................................... 27-37

Chapter 28, BORDER GATEWAY PROTOCOL

28.1 bgp-ip-prefix-list-config commands .................................. 28-3
   28.1.1 deny ........................................................................... 28-4
   28.1.2 permit .......................................................................... 28-5
   28.1.3 no ............................................................................... 28-6
28.2 bgp-ip-access-list-config commands ............................... 28-7
   28.2.1 deny ........................................................................... 28-8
   28.2.2 permit ........................................................................... 28-9
   28.2.3 no ............................................................................... 28-10
28.3 bgp-as-path-list-config commands ................................ 28-11
   28.3.1 deny ........................................................................... 28-12
   28.3.2 permit ........................................................................... 28-13
   28.3.3 no ............................................................................... 28-14
28.4 bgp-community-list-config commands ....................... 28-15

Appendix C, CUSTOMER SUPPORT
This manual supports the following wireless controllers, service platforms, and access points:

- **Wireless Controllers** – RFS4000, RFS6000, RFS7000
- **Service Platforms** – NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
- **Access Points** – AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP7131, AP7161, AP7181, AP7502, AP7522, AP7532, AP7562, AP8122, AP8132, AP8163, AP8222, AP8232

---

**NOTE:** ES6510 is an *Ethernet Switch* managed by a wireless controller or service platform, such as RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, and NX9600. ES6510 does not have radios and does not provide WLAN support.

---

**NOTE:** In this guide,

- AP7131, AP7161, and AP7181 are collectively represented as AP71XX.
- AP8122, AP8132, and AP8163 are collectively represented as AP81XX. AP8163 is an outdoor mesh supporting access point.
- AP8222 and AP8232 are collectively represented as AP82XX.
- NX4500 and NX4524 are collectively represented as NX45XX.
- NX6500 and NX6524 are collectively represented as NX65XX.
- NX7510, NX7520, and NX7530 are collectively represented as NX7500 series.
- NX9000, NX9500, and NX9510 are collectively represented as NX9000 series.

---

A simplified version of the WiNG operating system *user interface* (UI) is available on the following access point and service platform models with the E-SKU:

- AP6511, AP6521, AP6522, AP6562, AP7502, AP7522, AP7532, and AP7562
- NX7510
This new UI, referred to as the *WiNG Express* (WE) UI, simplifies configuration and monitoring of small access point deployments by limiting monitoring, analytics, and configuration capabilities. The WE UI is designed for single-site access point deployments not exceeding more than 24 access points of the same model.

**CAUTION:** If using the *WiNG Express* (WE) UI, to configure a WE access point, use the WE UI exclusively. Do not use the *command line interface* (CLI) along with it. Similarly, when using the CLI to configure the WE access point, do not use the WE UI along with it.

This section is organized into the following topics:

- *Document Conventions*
- *Notational Conventions*
- *End-User Software License Agreement*
Document Conventions

The following conventions are used in this document to draw your attention to important information:

- **NOTE:** Indicates tips or special requirements.

- **CAUTION:** Indicates conditions that can cause equipment damage or data loss.

- **WARNING!** Indicates a condition or procedure that could result in personal injury or equipment damage.

- **Switch Note:** Indicates caveats unique to a RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, or NX9600 model controller.
Notational Conventions

The following notational conventions are used in this document:

- Italics are used to highlight specific items in the general text, and to identify chapters and sections in this and related documents.

- Bullets (*) indicate:
  - lists of alternatives
  - lists of required steps that are not necessarily sequential
  - action items

- Sequential lists (those describing step-by-step procedures) appear as numbered lists.

Understanding Command Syntax

<table>
<thead>
<tr>
<th>&lt;variable&gt;</th>
<th>Variables are described with a short description enclosed within a '&lt;' and a '&gt;' pair. For example, the command, rfs7000-37FABE&gt;show interface ge 1 is documented as: show interface ge &lt;1-4&gt; where: • show – is the command – displays information • interface – is the keyword – represents the interface type • &lt;1-4&gt; – is the variable – represents the ge interface index value</th>
</tr>
</thead>
</table>
|  | The pipe symbol. This is used to separate the variables/keywords in a list. For example, the command, rfs7000-37FABE> show ..... is documented as: show [adoption|bonjour|boot| ..... where: • show – is the command – displays information • [adoption|bonjour|......] – indicates the different keywords that can be combined with the show command. However, only one of the above option can be used at a time. show adoption ... show bonjour ... show boot ...
| command / keyword | Of the different keywords and variables listed inside a ‘[’ & ‘]’ pair, only one can be used. Each choice in the list is separated with a ‘|’ (pipe) symbol. For example, the command, rfs7000-37FABE#clear ... is documented as: clear [arp-cache|bonjour|cdp|counters|crypto|event-history|firewall|gre|ip|ipv6|l2tpv3-stats|license|lldp|logging|mac-address-table|mint|role|rtls|spanning-tree|traffic-shape|vrrp] where:
- clear – is the command
- [arp-cache|cdp|bonjour|counters|crypto|event-history|firewall|gre|ip|ipv6|l2tpv3-stats|license|lldp|logging|mac-address-table|mint|role|rtls|spanning-tree|traffic-shape|vrrp] – indicates that these keywords are available for this command. However, only one can be used at a time. |

| {} | Any command/keyword/variable or a combination of them inside a ‘{’ & ‘}’ pair is optional. All optional commands follow the same conventions as listed above. However, they are displayed italicized. For example, the command, rfs7000-37FABE> show adoption .... is documented as: show adoption info {on <DEVICE-NAME>} here:
- show adoption info – is the command. This command can also be used as:
  show adoption info
The command can also be extended as:
  show adoption info {on <DEVICE-NAME>}
here:
- {on <DEVICE-NAME>} – is the keyword, which is optional. |

| command / keyword | The first word is always a command. Keywords are words that must be entered as is. Commands and keywords are mandatory. For example, the command, rfs7000-37FABE>show wireless is documented as: show wireless where:
- show – is the command
- wireless – is the keyword |
Any command/keyword/variable or a combination of them inside a ‘(‘ & ‘)’ pair are recursive. All recursive commands can be listed in any order and can be used once along with the rest of the commands.

For example, the command,

```
crypto pki export request generate-rsa-key
test autogen-subject-name ...
```

is documented as:

```
rfs7000-37FABE#crypto pki export request
generate-rsa-key test autogen-subject-name
(<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>)
```

here:

- `crypto pki export request generate-rsa-key <RSA-KEYPAIR-NAME>`
  auto-gen-subject-name – is the command
- `<RSA-KEYPAIR-NAME>` – is the RSA keypair name (in this example, the keypair name is ‘test’), and is a variable
- `(<URL>,email <EMAIL>,fqdn <FQDN>,ip-address <IP>)` – is the set of recursive parameters (separated by commas) that can be used in any order.
End-User Software License Agreement

BY INSTALLING AND/OR USING THIS PRODUCT, YOU ACKNOWLEDGE THAT YOU HAVE READ THIS AGREEMENT, UNDERSTAND IT AND AGREE TO BE BOUND ITS TERMS. IF YOU DO NOT AGREE TO THE TERMS OF THIS AGREEMENT, ZEBRA IS NOT WILLING TO LICENSE THE PRODUCT TO YOU, AND YOU MUST NOT INSTALL OR USE THIS PRODUCT.

GRANT OF LICENSE. Zebra Technologies Corporation (“Zebra”) grants you (“Licensee” or “you”) a personal, nonexclusive, nontransferable, revocable, nonassignable, limited license to use the software and documentation (“Product(s)”) subject to the terms and conditions of this Agreement. You shall use the Products only for your internal business purposes, exclusively to support Zebra devices. Any use of the Products outside of the conditions set forth herein is strictly prohibited and will be deemed a breach of this Agreement resulting in immediate termination of your License. In the event of a breach of this Agreement, Zebra will be entitled to all available remedies at law or in equity (including immediate termination of the license without notice, immediate injunctive relief and repossession of all Products unless Licensee is a Federal agency of the United States Government).

You shall not distribute, sublicense, rent, loan, lease, export, re-export, resell, ship or divert or cause to be exported, re-exported, resold, shipped or diverted, directly or indirectly, the Products under this Agreement. You shall not, and shall not permit others to: (i) modify, translate, decompile, bootleg, reverse engineer, disassemble, or extract the inner workings of the Products; (ii) copy the look-and-feel or functionality of the Products; (iii) remove any proprietary notices, marks, labels, or logos from the Products; (iv) rent or transfer all or some of the Products to any other party without Zebra's prior written consent; or (v) utilize any computer software or hardware which is designed to defeat any copy protection device, should the Products be equipped with such a protection device.

Title to all copies of Products will not pass to Licensee at any time and remains vested exclusively in Zebra. All intellectual property developed, originated, or prepared by Zebra in connection with the Products remain vested exclusively in Zebra, and this Agreement does not grant to Licensee any intellectual property rights.

Portions of the Products are protected by United States patent and copyright laws, international treaty provisions, and other applicable laws. Therefore, you must treat the Products like any other copyrighted material (e.g., a book or musical recording) except that you may make one copy of the Product solely for back-up purposes. Unauthorized duplication of the Products constitutes copyright infringement, and in the United States is punishable in federal court by fine and imprisonment.

LIMITED WARRANTY. Zebra warrants for a period of ninety (90) days from your receipt of the Products to you that the Software, under normal use, will perform substantially in accordance with Zebra’s published specifications for that release level of the Software. The written materials are provided “AS IS” and without warranty of any kind. Zebra’s entire liability and your sole and exclusive remedy for any breach of the foregoing limited warranty will be, at Zebra’s option, the provision of a downloadable patch or replacement code, or a refund of the unused portion of your bargained for contractual benefit up to the amount paid for the Products.

DISCLAIMER. THIS LIMITED WARRANTY IS THE ONLY WARRANTY PROVIDED BY ZEBRA, AND ZEBRA MAKES, AND YOU RECEIVED, NO OTHER WARRANTIES OF ANY KIND, WHETHER EXPRESS, IMPLIED, STATUTORY, OR IN ANY COMMUNICATION WITH YOU. ZEBRA SPECIFICALLY DISCLAIMS ANY WARRANTY INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY, NONINFRINGEMENT, OR FITNESS FOR A PARTICULAR PURPOSE. ZEBRA DOES NOT WARRANT THAT THE PRODUCTS WILL MEET YOUR REQUIREMENTS, OR THAT THE OPERATION OF THE PRODUCTS WILL BE UNINTERRUPTED OR ERROR FREE, OR THAT DEFECTS IN THE PRODUCTS WILL BE CORRECTED. ZEBRA MAKES NO WARRANTY WITH RESPECT TO THE CORRECTNESS, ACCURACY, OR RELIABILITY OF THE PRODUCTS. Some jurisdictions do not allow the exclusion of implied warranties, so the above exclusion may not apply to you.

LIMITATION OF LIABILITY. THE TOTAL LIABILITY OF ZEBRA UNDER THIS AGREEMENT FOR DAMAGES SHALL NOT EXCEED THE FAIR MARKET VALUE OF THE PRODUCTS LICENSED UNDER THIS AGREEMENT. IN NO EVENT WILL ZEBRA BE LIABLE IN ANY WAY FOR INCIDENTAL, CONSEQUENTIAL, INDIRECT, SPECIAL OR PUNITIVE DAMAGES OF ANY NATURE, INCLUDING WITHOUT LIMITATION, LOST BUSINESS PROFITS, OR LIABILITY OR INJURY TO THIRD PERSONS, WHETHER FORESEEABLE OR NOT, REGARDLESS OF WHETHER ZEBRA HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. Some jurisdictions do not permit limitations of liability for incidental or consequential damages, so the above exclusions may not apply to you. This
Limitation of Liability provision survives the termination of this Agreement and applies notwithstanding any contrary provision in this Agreement. Licensee must bring any action under this Agreement within one (1) year after the cause of action arises.

MAINTENANCE. Unless provided for in a separate agreement, Zebra shall not be responsible for maintenance or field service of the Products.

HIGH RISK ACTIVITIES. The Products are not fault-tolerant and are not designed, manufactured or intended for use or resale as on-line control software in hazardous environments requiring fail-safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life support machines, or weapons systems, in which the failure of the Products could lead directly to death, personal injury, or severe physical or environmental damage ("High Risk Activities").

Zebra and its suppliers specifically disclaim any express or implied warranty of fitness for High Risk Activities, and if you elect to use the Products in any High Risk Activities, you agree to indemnify, defend, and hold Zebra harmless from and against any and all costs, damages, and losses related to that use.

U.S. GOVERNMENT. If you are acquiring the Products on behalf of any unit or agency of the U.S. Government, the following shall apply. Use, duplication, or disclosure of the Products is subject to the restrictions set forth in subparagraphs (c) (1) and (2) of the Commercial Computer Software - Restricted Rights clause at FAR 52.227-19 (JUNE 1987), if applicable, unless being provided to the Department of Defense. If being provided to the Department of Defense, use, duplication, or disclosure of the Products is subject to the restricted rights set forth in subparagraph (c) (1) (ii) of the Rights in Technical Data and Computer Software clause at DFARS 252.227-7013 (OCT 1988), if applicable. Products may or may not include a Restricted Rights notice, or other notice referring specifically to the terms and conditions of this Agreement. The terms and conditions of this Agreement shall each continue to apply, but only to the extent that such terms and conditions are not inconsistent with the rights provided to you under the aforementioned provisions of the FAR and DFARS, as applicable to the particular procuring agency and procurement transaction.

ASSIGNMENT. Except as otherwise provided in this section, neither party may assign this Agreement, or any of its rights or obligations under this Agreement, without the prior written approval of the other party, which will not be unreasonably withheld. Any attempted assignment, delegation, or transfer without the necessary approval will be void. Notwithstanding the foregoing, for any Zebra acquisition, merger, consolidation, reorganization, or similar transaction, or any spin-off, divestiture, or other separation of a Zebra business, Zebra may, without the prior written consent of the other party: (i) assign its rights and obligations under this Agreement, in whole or in part, or (ii) split and assign its rights and obligations under this Agreement so as to retain the benefits of this Agreement for both Zebra and the assignee entity(ies) (and their respective Affiliates) following the split.

GOVERNING LAW. This Agreement shall be governed by the laws of the United States of America to the extent that they apply and otherwise by the laws of the State of New York without regard to its conflict of laws provisions or by the internal substantive laws of the country to which the Products is shipped if end-user customer is a sovereign governmental entity. The terms of the U.N. Convention on Contracts for the International Sale of Goods do not apply. In the event that the Uniform Computer Information Transaction Act, any version of this Act, or a substantially similar law (collectively “UCITA”) becomes applicable to a Party’s performance under this Agreement, UCITA does not govern any aspect of this End User License Agreement or any license granted under this End-User License Agreement, or any of the parties’ rights or obligations under this End User License Agreement. The governing law will be that in effect prior to the applicability of UCITA.

COMPLIANCE WITH LAWS. Licensee will comply with all applicable laws and regulations, including export laws and regulations of the United States. Licensee will not, without the prior authorization of Zebra and the appropriate governmental authority of the United States, in any form export or re-export, sell or resell, ship or reship, or divert, through direct or indirect means, any item or technical data or direct or indirect products sold or otherwise furnished to any person within any territory for which the United States Government or any of its agencies at the time of the action, requires an export license or other governmental approval. Violation of this provision will be a material breach of this Agreement, permitting immediate termination by Zebra.

THIRD PARTY SOFTWARE. The Products may contain one or more items of Third-Party Software. The terms of this Agreement govern your use of any Third-Party Software UNLESS A SEPARATE THIRD-PARTY SOFTWARE LICENSE IS INCLUDED, IN WHICH CASE YOUR USE OF THE THIRD-PARTY SOFTWARE WILL THEN BE GOVERNED BY THE SEPARATE THIRD-PARTY LICENSE.
OPEN SOURCE SOFTWARE. The Products may contain one or more items of Open Source Software. Open Source Software is software covered by a publicly available license governed solely under Copyright law, whereas the complete terms and obligations of such license attach to a licensee solely through the act of copying, using and/or distribution of the licensed software, such obligations often include one or more of attribution obligations, distribution obligations, copyleft obligations, and intellectual property encumbrances. The use of any Open Source Software is subject to the terms and conditions of this Agreement as well as the terms and conditions of the corresponding license of each Open Source Software package. If there is a conflict between the terms and conditions of this Agreement and the terms and conditions of the Open Source Software license, the applicable Open Source Software license will take precedence. Copies of the licenses for the included Open Source Software, if any, as well as their attributions, acknowledgements, and software information details, are provided in the electronic copy of this Agreement, which is available in the Legal Notices or README file associated with the Product. Zebra is required to reproduce the software licenses, acknowledgments and copyright notices as provided by the authors and owners, thus, all such information is provided in its native language form, without modification or translation. Depending on the license terms of the specific Open Source Software, source code may not be provided. Please reference and review the entire Open Source Software information to identify which Open Source Software packages have source code provided or available. For instructions on how to obtain a copy of any source code made publicly available by Zebra related to Open Source Software distributed by Zebra, you may send your request (including the Zebra Product name and version, along with the Open Source Software specifics) in writing to: Zebra Technologies Corporation, Open Source Software Director, Legal Department, 3 Overlook Point, Lincolnshire, IL 60069 USA.

This chapter describes the commands available within a device’s Command Line Interface (CLI) structure. CLI is available for wireless controllers, access points (APs), and service platforms.

Access the CLI by using:

- A terminal emulation program running on a computer connected to the serial port on the device (access point, wireless controller, and service platform).
- A Telnet session through Secure Shell (SSH) over a network.

**Configuration for connecting to a Controller using a terminal emulator**

If connecting through the serial port, use the following settings to configure your terminal emulator:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits Per Second</td>
<td>19200</td>
</tr>
<tr>
<td>Data Bits</td>
<td>8</td>
</tr>
<tr>
<td>Parity</td>
<td>None</td>
</tr>
<tr>
<td>Stop Bit</td>
<td>1</td>
</tr>
<tr>
<td>Flow Control</td>
<td>None</td>
</tr>
</tbody>
</table>

When a CLI session is established, complete the following (user input is in **bold**):

login as: <username>

administrator’s login password: <password>

**User Credentials**

Use the following credentials when logging into a device for the first time:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>admin</td>
</tr>
<tr>
<td>Password</td>
<td>admin123</td>
</tr>
</tbody>
</table>

When logging into the CLI for the first time, you are prompted to change the password.
Examples in this reference guide

Examples used in this reference guide are generic to each supported wireless controller, service platform, and AP model. Commands that are not common, are identified using the notation “Supported in the following platforms:” For an example, see below:

Supported in the following platforms:
- Wireless Controller – RFS6000

The above example indicates the command is only available for a RFS6000 model wireless controller.

This chapter is organized into the following sections:

- CLI Overview
- Getting Context Sensitive Help
- Using the No Command
- Using CLI Editing Features and Shortcuts
- Using CLI to Create Profiles and Enable Remote Administration

1.1 CLI Overview

INTRODUCTION

The CLI is used for configuring, monitoring, and maintaining the network. The user interface allows you to execute commands on supported wireless controllers, service platforms, and APs, using either a serial console or a remote access method.

This chapter describes basic CLI features. Topics covered include an introduction to command modes, navigation and editing features, help features and command history.

The CLI is segregated into different command modes. Each mode has its own set of commands for configuration, maintenance, and monitoring. The commands available at any given time depend on the mode you are in, and to a lesser extent, the particular model used. Enter a question mark (?) at the system prompt to view a list of commands available for each command mode/instance.

Use specific commands to navigate from one command mode to another. The standard order is: USER EXEC mode, PRIV EXEC mode and GLOBAL CONFIG mode.
Command Modes

A session generally begins in the USER EXEC mode (one of the two access levels of the EXEC mode). For security, only a limited subset of EXEC commands are available in the USER EXEC mode. This level is reserved for tasks that do not change the device’s (wireless controller, service platform, or AP) configuration.

```
rfs7000-37FABE> enable
rfs7000-37FABE#
```

The system prompt signifies the device name and the last three bytes of the device MAC address.

To access commands, enter the PRIV EXEC mode (the second access level for the EXEC mode). Once in the PRIV EXEC mode, enter any EXEC command. The PRIV EXEC mode is a superset of the USER EXEC mode.

```
rfs7000-37FABE> enable
rfs7000-37FABE#
```

Most of the USER EXEC mode commands are one-time commands and are not saved across device reboots. Save the command by executing ‘commit’ command. For example, the show command displays the current configuration and the clear command clears the interface.

Access the GLOBAL CONFIG mode from the PRIV EXEC mode. In the GLOBAL CONFIG mode, enter commands that set general system characteristics. Configuration modes, allow you to change the running configuration. If you save the configuration later, these commands are stored across device reboots.

Access a variety of protocol specific (or feature-specific) modes from the global configuration mode. The CLI hierarchy requires you to access specific configuration modes only through the global configuration mode.

```
rfs7000-37FABE(config)# configure terminal
rfs7000-37FABE(config)# configure terminal
```

You can also access sub-modes from the global configuration mode. Configuration sub-modes define specific features within the context of a configuration mode.

```
rfs7000-37FABE(config)#aaa-policy test
rfs7000-37FABE(config-aaa-policy-test)#
```

The following table summarizes available CLI commands:

<table>
<thead>
<tr>

1.2 Getting Context Sensitive Help

**INTRODUCTION**

Enter a question mark (?) at the system prompt to display a list of commands available for each mode. Obtain a list of arguments and keywords for any command using the CLI context-sensitive help.

Use the following commands to obtain help specific to a command mode, command name, keyword or argument:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(prompt)# help</td>
<td>Displays a brief description of the help system</td>
</tr>
<tr>
<td>(prompt)# abbreviated-command-entry?</td>
<td>Lists commands in the current mode that begin with a particular character string</td>
</tr>
<tr>
<td>(prompt)# abbreviated-command-entry&lt;Tab&gt;</td>
<td>Completes a partial command name</td>
</tr>
<tr>
<td>(prompt)# ?</td>
<td>Lists all commands available in the command mode</td>
</tr>
<tr>
<td>(prompt)# command ?</td>
<td>Lists the available syntax options (arguments and keywords) for the command</td>
</tr>
<tr>
<td>(prompt)# command keyword ?</td>
<td>Lists the next available syntax option for the command</td>
</tr>
</tbody>
</table>

**NOTE:** The system prompt varies depending on the configuration mode.

**NOTE:** Enter Ctrl + V to use ? as a regular character and not as a character used for displaying context sensitive help. This is required when the user has to enter a URL that ends with a ?

**NOTE:** The escape character used throughout the CLI is “\”. To enter a “\” use “\" instead.

When using context-sensitive help, the space (or lack of a space) before the question mark (?) is significant. To obtain a list of commands that begin with a particular sequence, enter the characters followed by a question mark (?). Do not include a space. This form of help is called word help, because it completes a word.

rfs7000-37FABE#service?

rfs7000-37FABE#service
Enter a question mark (?) (in place of a keyword or argument) to list keywords or arguments. Include a space before the “?”.
This form of help is called command syntax help. It shows the keywords or arguments available based on the command/
keyword and argument already entered.

rfs7000-37FABE#service ?
    block-adopter-config-update       Block configuration updates from the
                                       adopter
    clear                            Clear adoption history
    cli-tables-skin                  Choose a formatting layout/skin for CLI

    radius                           Radius test
    request-full-config-from-adopter Request full configuration from the
                                       adopter
    set                              Set validation mode
    show                             Show running system information
    signal                           Send a signal to a process
    smart-rf                         Smart-RF Management Commands
    snmp                             Snmp
    ssm                              Command related to ssm
    start-shell                      Provide shell access
    syslog                           Test the syslog server configuration
    trace                            Trace a process for system calls and
                                       signals
    wireless                         Command related to wireless

rfs7000-37FABE#

It is possible to abbreviate commands and keywords to allow a unique abbreviation. For example, “configure terminal” can be
abbreviated as config t. Since the abbreviated command is unique, the controller accepts the abbreviation and executes
the command.

Enter the help command (available in any command mode) to provide the following description:

rfs7000-37FABE>help

When using the CLI, help is provided at the command line when typing '??'.

If no help is available, the help content will be empty. Backup until entering a '?'
shows the help content.

There are two styles of help provided:
1. Full help. Available when entering a command argument (e.g. 'show ?'). This will
describe each possible argument.

2. Partial help. Available when an abbreviated argument is entered. This will display
which arguments match the input (e.g. 'show ve??').

rfs7000-37FABE>
1.3 Using the No Command

INTRODUCTION

Almost every command has a no form. Use no to disable a feature or function or return it to its default. Use the command without the no keyword to re-enable a disabled feature.

1.3.1 Basic Conventions

Keep the following conventions in mind while working within the CLI structure:

- Use ? at the end of a command to display available sub-modes. Type the first few characters of the sub-mode and press the tab key to add the sub-mode. Continue using ? until you reach the last sub-mode.

- Pre-defined CLI commands and keywords are case-insensitive: cfg = Cfg = CFG. However (for clarity), CLI commands and keywords are displayed (in this guide) using mixed case. For example, apPolicy, trapHosts, channelInfo.

- Enter commands in uppercase, lowercase, or mixed case. Only passwords are case sensitive.

1.4 Using CLI Editing Features and Shortcuts

INTRODUCTION

A variety of shortcuts and edit features are available. The following sections describe these features:

- Moving the Cursor on the Command Line

- Completing a Partial Command Name

- Command Output Pagination

1.4.1 Moving the Cursor on the Command Line

Using CLI Editing Features and Shortcuts

The following table shows the key combinations or sequences to move the command line cursor. Ctrl defines the control key, which must be pressed simultaneously with its associated letter key. Esc means the escape key (which must be pressed first), followed by its associated letter key. Keys are not case sensitive. Specific letters are used to provide an easy way of remembering their functions.

<table>
<thead>
<tr>
<th>Keystrokes</th>
<th>Function Summary</th>
<th>Function Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left Arrow or Ctrl-B</td>
<td>Back character</td>
<td>Moves the cursor one character to the left when entering a command that extends beyond a single line, press the Left Arrow or Ctrl-B keys repeatedly to move back to the system prompt.</td>
</tr>
<tr>
<td>Right Arrow or Ctrl-F</td>
<td>Forward character</td>
<td>Moves the cursor one character to the right</td>
</tr>
<tr>
<td>Esc- B</td>
<td>Back word</td>
<td>Moves the cursor back one word</td>
</tr>
<tr>
<td>Esc- F</td>
<td>Forward word</td>
<td>Moves the cursor forward one word</td>
</tr>
<tr>
<td>Ctrl-A</td>
<td>Beginning of line</td>
<td>Moves the cursor to the beginning of the command line</td>
</tr>
<tr>
<td>Ctrl-E</td>
<td>End of line</td>
<td>Moves the cursor to the end of the command line</td>
</tr>
<tr>
<td>Ctrl-D</td>
<td></td>
<td>Deletes the current character</td>
</tr>
</tbody>
</table>
1.4.2 Completing a Partial Command Name

If you cannot remember a command name (or if you want to reduce the amount of typing you have to perform), enter the first few letters of a command, then press the Tab key. The command line parser completes the command if the string entered is unique to the command mode. If your keyboard does not have a Tab key, press Ctrl-L.

The CLI recognizes a command once you have entered enough characters to make the command unique. If you enter “conf” within the privileged EXEC mode, the CLI associates the entry with the configure command, since only the configure command begins with \texttt{conf}.

In the following example, the CLI recognizes a unique string in the privileged EXEC mode when the Tab key is pressed:

\begin{verbatim}
rfs7000-37FABE# conf<Tab>
rfs7000-37FABE# configure
\end{verbatim}

When using the command completion feature, the CLI displays the full command name. The command is not executed until the Return or Enter key is pressed. Modify the command if the full command was not what you intended in the abbreviation. If entering a set of characters (indicating more than one command), the system lists all commands beginning with that set of characters.

Enter a question mark (?) to obtain a list of commands beginning with that set of characters. Do not leave a space between the last letter and the question mark (?).

For example, entering U lists all commands available in the current command mode:

\begin{verbatim}
rfs7000-37FABE# co?
commit   Commit all changes made in this session
configure Enter configuration mode
connect   Open a console connection to a remote device
copy      Copy from one file to another
rfs7000-37FABE#
\end{verbatim}

<table>
<thead>
<tr>
<th>Keystrokes</th>
<th>Function Summary</th>
<th>Function Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl-U</td>
<td></td>
<td>Deletes text up to cursor</td>
</tr>
<tr>
<td>Ctrl-K</td>
<td></td>
<td>Deletes from the cursor to end of the line</td>
</tr>
<tr>
<td>Ctrl-P</td>
<td></td>
<td>Obtains the prior command from memory</td>
</tr>
<tr>
<td>Ctrl-N</td>
<td></td>
<td>Obtains the next command from memory</td>
</tr>
<tr>
<td>Esc-C</td>
<td></td>
<td>Converts the letter at the cursor to uppercase</td>
</tr>
<tr>
<td>Esc-L</td>
<td></td>
<td>Converts the letter at the cursor to lowercase</td>
</tr>
<tr>
<td>Esc-D</td>
<td></td>
<td>Deletes the remainder of a word</td>
</tr>
<tr>
<td>Ctrl-W</td>
<td></td>
<td>Deletes the word up to the cursor</td>
</tr>
<tr>
<td>Ctrl-Z</td>
<td></td>
<td>Returns to the root prompt</td>
</tr>
<tr>
<td>Ctrl-T</td>
<td></td>
<td>Transposes the character to the left of the cursor with the character located at the cursor</td>
</tr>
<tr>
<td>Ctrl-L</td>
<td></td>
<td>Clears the screen</td>
</tr>
</tbody>
</table>

The table above summarizes the function details of the keystrokes used in the CLI.
1.4.3 Command Output Pagination

Output often extends beyond the visible screen length. For cases where output continues beyond the screen, the output is paused and a `--More--` prompt displays at the bottom of the screen. To resume the output, press the Enter key to scroll down one line or press the Spacebar to display the next full screen of output.

1.5 Using CLI to Create Profiles and Enable Remote Administration

INTRODUCTION
The following sections describe the following essential procedures:

- Creating Profiles
- Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface
- Enabling Remote Administration

1.5.1 Creating Profiles

Profiles are sort of a ‘template’ representation of configuration. The system has:

- a default profile for each of the following devices:
  - RFS4000, RFS6000, RFS7000
- a default profile for each of the following service platforms:
  - NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
- a default profile for each of the following access points:
  - AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX

To modify the default profile to assign an IP address to the management port:

```bash
rfs7000-37FABE(config)#profile rfs7000 default-rfs7000
rfs7000-37FABE(config-profile-default-rfs7000)#interface me1
rfs7000-37FABE(config-profile-default-rfs7000-if-me1)#ip address 172.16.10.2/24
rfs7000-37FABE(config-profile-default-rfs7000-if-me1)#commit
rfs7000-37FABE(config-profile-default-rfs7000)#exit
rfs7000-37FABE(config)#
```

The following command displays a default AP71XX profile:

```bash
rfs7000-37FABE(config)#profile ap71xx default-ap71xx
rfs7000-37FABE(config-profile-default-ap71xx)#
rfs7000-37FABE(config-profile-default-ap71xx)#show context profile ap71xx default-ap71xx
autoinstall configuration
autoinstall firmware
```

--More--

1.5.2 Changing the default profile by creating vlan 150 and mapping to ge3 Physical interface

Using CLI to Create Profiles and Enable Remote Administration

Logon to the controller in config mode and follow the procedure below:

```
1.5.2.1 Viewing Configured APs
To view previously configured APs, enter the following command:

rfs7000-6DCD4B#show wireless ap configured
<table>
<thead>
<tr>
<th>IDX</th>
<th>NAME</th>
<th>MAC</th>
<th>PROFILE</th>
<th>RF-DOMAIN</th>
<th>ADOPTED-BY</th>

<td>un-adopted</td>
</tr>
</tbody>
</table>
```

rfs7000-6DCD4B#
1.5.3 Enabling Remote Administration

A terminal server may function in remote administration mode if either the terminal services role is not installed on the machine or the client used to invoke the session has enabled the admin controller.

- A terminal emulation program running on a computer connected to the serial port on the controller. The serial port is located on the front of the controller.
- A Telnet session through a Secure Shell (SSH) over a network. The Telnet session may or may not use SSH depending on how the controller is configured. It is recommended you use SSH for remote administration tasks.

This section is organized into the following sub sections:

- Configuring Telnet for Management Access
- Configuring SSH

1.5.3.1 Configuring Telnet for Management Access

Login through the serial console. Perform the following:

1. A session generally begins in the USER EXEC mode (one of the two access levels of the EXEC mode).

2. Access the GLOBAL CONFIG mode from the PRIV EXEC mode.

```
    rfs7000-37FABE> en
    rfs7000-37FABE# configure terminal
    Enter configuration commands, one per line. End with CNTL/Z.
```

3. Go to `default-management-policy` mode.

```
    rfs7000-37FABE(config)# management-policy ?
    rfs7000-37FABE(config)# management-policy default
    rfs7000-37FABE(config-management-policy-default)#
```

4. Enter Telnet and the port number at the command prompt. The port number is optional. The default port is 23. Commit the changes after every command. Telnet is enabled.

```
    rfs7000-37FABE(config-management-policy-default)# telnet
    rfs7000-37FABE(config-management-policy-default)# commit write
```

5. Connect to the controller through Telnet using its configured IP address. Use the following credentials when logging on to the device for the first time:

<table>
<thead>
<tr>
<th>User Name</th>
<th>admin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>admin123</td>
</tr>
</tbody>
</table>

When logging into the controller for the first time, you are prompted to change the password.

To change user credentials:

1. Enter the username, password, role and access details.

```
    rfs7000-37FABE(config-management-policy-default)#user testuser password test@123
    role helpdesk access all
    rfs7000-37FABE(config-management-policy-default)#commit
    rfs7000-37FABE(config-management-policy-default)#show context
    management-policy default
    telnet
    http server
    https server
    ssh
```

user admin password 1
ba7da2bf2f7945af1d3ae1b8b762b541bd5bac1f80a54cd4488f38ed44b91ecd role superuser

1.5.3.2 Configuring SSH

Enabling Remote Administration

By default, SSH is enabled from the factory settings on the controller. The controller requires an IP address and login credentials.

To enable SSH access in the default profile, login through the serial console. Perform the following:

1. Access the GLOBAL CONFIG mode from the PRIV EXEC mode.

   rfs7000-37FABE>en
   rfs7000-37FABE#configure
   Enter configuration commands, one per line. End with CNTL/Z.

2. Go to 'config-management-policy-default' mode.

   rfs7000-37FABE(config)#management-policy default
   rfs7000-37FABE(config-management-policy-default)#

3. Enter SSH at the command prompt.

   rfs7000-37FABE(config-management-policy-default)#ssh

4. Log into the controller through SSH using appropriate credentials.

5. Use the following credentials when logging on to the device for the first time:

<table>
<thead>
<tr>
<th>User Name</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin</td>
<td>admin123</td>
</tr>
</tbody>
</table>

When logging into the controller for the first time, you are prompted to change the password.

To change the user credentials:

rfs7000 release 5.8.0.0-007D
rfs7000-37FABE login: testuser
Password:
Welcome to CLI
Starting CLI...
rfs7000-37FABE>
CHAPTER 2
USER EXEC MODE COMMANDS

Logging in to the wireless controller places you within the USER EXEC command mode. Typically, a login requires a user name and password. You have three login attempts before the connection attempt is refused. USER EXEC commands (available at the user level) are a subset of the commands available at the privileged level. In general, USER EXEC commands allow you to connect to remote devices, perform basic tests, and list system information.

To list available USER EXEC commands, use ? at the command prompt. The USER EXEC prompt consists of the device host name followed by an angle bracket (>).

<DEVICE>>?

Command commands:
captive-portal-page-upload  Captive portal advanced page upload
change-passwd               Change password
clear                       Clear
clock                       Configure software system clock
cluster                     Cluster commands
commit                      Commit all changes made in this session
connect                     Open a console connection to a remote device
create-cluster              Create a cluster
crypto                      Encryption related commands
crypto-cmp-cert-update      Update the cmp certs
database                    Database
database-backup             Backup database
database-restore            Restore database
debug                       Debugging functions
device-upgrade              Device firmware upgrade
disable                     Turn off privileged mode command
enable                      Turn on privileged mode command
file-sync                   File sync between controller and adoptees
help                        Description of the interactive help system
join-cluster                Join the cluster
l2tpv3                      L2tpv3 protocol
logging                     Modify message logging facilities
mint                        MiNT protocol
no                          Negate a command or set its defaults
on                          On RF-Domain
opendns                     Opendns username/password configuration
page                        Toggle paging
ping                        Send ICMP echo messages
ping6                       Send ICMPv6 echo messages
revert                      Revert changes
service                     Service Commands
show                        Show running system information
smart-cache                 Content Cache Operation
ssh                         Open an ssh connection
telnet                      Open a telnet connection
terminal                    Set terminal line parameters
time-it: Check how long a particular command took between request and completion of response
traceroute: Trace route to destination
traceroute6: Trace route to destination (IPv6)
virtual-machine: Virtual Machine
watch: Repeat the specific CLI command at a periodic interval
write: Write running configuration to memory or terminal

clrscr: Clears the display screen
exit: Exit from the CLI

<DEVICE>
### 2.1 User Exec Commands

The following table summarizes the User Exec Mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal-page-upload</td>
<td>Uploads captive portal advanced pages</td>
<td>page 2-5</td>
</tr>
<tr>
<td>change-passwd</td>
<td>Changes the password of a logged user</td>
<td>page 2-8</td>
</tr>
<tr>
<td>clear</td>
<td>Resets the last saved command</td>
<td>page 2-9</td>
</tr>
<tr>
<td>clock</td>
<td>Configures the system clock</td>
<td>page 2-20</td>
</tr>
<tr>
<td>cluster</td>
<td>Accesses the cluster context</td>
<td>page 2-21</td>
</tr>
<tr>
<td>connect</td>
<td>Establishes a console connection to a remote device</td>
<td>page 2-22</td>
</tr>
<tr>
<td>create-cluster</td>
<td>Creates a new cluster on a specified device</td>
<td>page 2-23</td>
</tr>
<tr>
<td>crypto</td>
<td>Enables encryption</td>
<td>page 2-25</td>
</tr>
<tr>
<td>crypto-cmp-cert-update</td>
<td>Triggers a CMP certificate update on a specified device or devices</td>
<td>page 2-34</td>
</tr>
<tr>
<td>database</td>
<td>Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight)</td>
<td>page 2-34</td>
</tr>
<tr>
<td>database-backup</td>
<td>Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server</td>
<td>page 2-36</td>
</tr>
<tr>
<td>database-restore</td>
<td>Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored to the original database.</td>
<td>page 2-37</td>
</tr>
<tr>
<td>device-upgrade</td>
<td>Configures device firmware upgrade settings</td>
<td>page 2-38</td>
</tr>
<tr>
<td>disable</td>
<td>Turns off (disables) the privileged mode command set</td>
<td>page 2-48</td>
</tr>
<tr>
<td>enable</td>
<td>Turns on (enables) the privileged mode command set</td>
<td>page 2-49</td>
</tr>
<tr>
<td>file-sync</td>
<td>Configures parameters enabling syncing of PKCS#12 certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points</td>
<td>page 2-50</td>
</tr>
<tr>
<td>join-cluster</td>
<td>Adds a device (access point, wireless controller, or service platform) to an existing cluster of devices</td>
<td>page 2-53</td>
</tr>
<tr>
<td>l2tpv3</td>
<td>Establishes or brings down Layer 2 Tunneling Protocol Version 3 (L2TPV3) tunnels</td>
<td>page 2-55</td>
</tr>
<tr>
<td>logging</td>
<td>Modifies message logging facilities</td>
<td>page 2-57</td>
</tr>
<tr>
<td>mint</td>
<td>Configures MiNT protocol</td>
<td>page 2-59</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or sets its default</td>
<td>page 2-61</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------</td>
</tr>
<tr>
<td><strong>on</strong></td>
<td>Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, show</td>
<td>page 2-63</td>
</tr>
<tr>
<td><strong>opendns</strong></td>
<td>Connects to the OpenDNS site using OpenDNS registered credentials (username, password) to obtain the device-id. This command is a part of the process integrating access points and controllers with the OpenDNS service.</td>
<td>page 2-64</td>
</tr>
<tr>
<td><strong>page</strong></td>
<td>Toggles a device’s (access point, wireless controller, or service platform) paging function</td>
<td>page 2-66</td>
</tr>
<tr>
<td><strong>ping</strong></td>
<td>Sends ICMP echo messages to a user-specified location</td>
<td>page 2-67</td>
</tr>
<tr>
<td><strong>ping6</strong></td>
<td>Sends ICMPv6 echo messages to a user-specified IPv6 address</td>
<td>page 2-69</td>
</tr>
<tr>
<td><strong>ssh</strong></td>
<td>Opens an SSH connection between two network devices</td>
<td>page 2-70</td>
</tr>
<tr>
<td><strong>telnet</strong></td>
<td>Opens a Telnet session</td>
<td>page 2-71</td>
</tr>
<tr>
<td><strong>terminal</strong></td>
<td>Sets the length and width of the terminal window</td>
<td>page 2-72</td>
</tr>
<tr>
<td><strong>time-it</strong></td>
<td>Verifies the time taken by a particular command between request and response</td>
<td>page 2-73</td>
</tr>
<tr>
<td><strong>traceroute</strong></td>
<td>Traces the route to its defined destination</td>
<td>page 2-74</td>
</tr>
<tr>
<td><strong>traceroute6</strong></td>
<td>Traces the route to a specified IPv6 destination</td>
<td>page 2-75</td>
</tr>
<tr>
<td><strong>watch</strong></td>
<td>Repeats a specific CLI command at a periodic interval</td>
<td>page 2-76</td>
</tr>
<tr>
<td><strong>smart-cache</strong></td>
<td>Pre-fetches content cache from the specified list of URLs. This command is specific to the NX45XX, NX65XX, NX9XXX series service platforms.</td>
<td>page 2-78</td>
</tr>
<tr>
<td><strong>virtual-machine</strong></td>
<td>Installs, configures, and monitors the status of virtual machines (VMs). This command is specific to the NX45XX, NX65XX, NX9XXX series service platforms.</td>
<td>page 2-79</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.

**NOTE:** The input parameter `<HOSTNAME>`, if used in syntaxes across this chapter, cannot include an underscore (_) character.
2.1.1 captive-portal-page-upload

Uploads captive portal advanced pages to connected access points. Use this command to provide connected access points with specific captive portal configurations so that they can successfully provision login, welcome, and condition pages to requesting clients attempting to access the wireless network using the captive portal.

**NOTE:** Ensure that the captive portal pages uploaded are *.tar files.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

captive-portal-page-upload [<CAPTIVE-PORTAL-NAME>|cancel-upload|delete-file|load-file]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all|rf-domain]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all]
  {upload-time <TIME>}
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [<DOMAIN-NAME]|all]
  {from-controller} {(upload-time <TIME>)}
captive-portal-page-upload cancel-upload [<MAC/HOSTNAME]|all] on rf-domain
  [<DOMAIN-NAME]|all]
captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>

**Parameters**
- captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [<MAC/HOSTNAME]|all]
  {upload-time <TIME>}
  Uploads advanced pages of the captive-portal identified by the <CAPTIVE-PORTAL-NAME>
  parameter
  - <CAPTIVE-PORTAL-NAME> – Specify the captive portal’s name (should be existing and
    configured).
  - <MAC/HOSTNAME> – Specify AP’s MAC address or hostname.
  - all – Uploads to all APs
  - upload-time <TIME> – Optional. Configures an AP upload time
    - <TIME> – Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format.
### captive-portal-page-upload

**captive-portal-page-upload** `<CAPTIVE-PORTAL-NAME>` rf-domain []<DOMAIN-NAME>|[all]>{from-controller}{(upload-time <TIME>)}

Uploads advanced pages of the captive portal identified by the `<CAPTIVE-PORTAL-NAME>` parameter
- `<CAPTIVE-PORTAL-NAME>` – Specify captive portal's name (should be existing and configured).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rf-domain</td>
<td>Uploads to all APs within a specified RF Domain or all RF Domains</td>
</tr>
<tr>
<td><code>&lt;CAPTIVE-PORTAL-NAME&gt;</code></td>
<td>- Uploads to APs within a specified RF Domain. Specify the RF Domain name.</td>
</tr>
<tr>
<td><code>&lt;DOMAIN-NAME&gt;</code></td>
<td>- Uploads to APs across all RF Domains</td>
</tr>
<tr>
<td>from-controller</td>
<td>Optional. Uploads to APs from the adopted device</td>
</tr>
<tr>
<td>upload-time &lt;TIME&gt;</td>
<td>Optional. Configures an AP upload time</td>
</tr>
<tr>
<td><code>&lt;TIME&gt;</code></td>
<td>- Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format.</td>
</tr>
</tbody>
</table>

### captive-portal-page-upload cancel-upload

**captive-portal-page-upload** cancel-upload []<MAC/HOSTNAME>|[all] on rf-domain []<DOMAIN-NAME>|[all]]

Cancels a scheduled AP upload

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;MAC/HOSTNAME&gt;</code></td>
<td>Cancels scheduled upload to a specified AP. Specify the AP's MAC address or hostname.</td>
</tr>
<tr>
<td>all</td>
<td>Cancels all scheduled AP uploads</td>
</tr>
<tr>
<td>on rf-domain</td>
<td>Cancels all scheduled uploads within a specified RF Domain or all RF Domains</td>
</tr>
<tr>
<td><code>&lt;DOMAIN-NAME&gt;</code></td>
<td>Cancels scheduled uploads within a specified RF Domain. Specify RF Domain name.</td>
</tr>
<tr>
<td>all</td>
<td>Cancels scheduled uploads across all RF Domains</td>
</tr>
</tbody>
</table>

### captive-portal-page-upload delete-file

**captive-portal-page-upload** delete-file []<CAPTIVE-PORTAL-NAME>|[all] `<FILE-NAME>`

Deletes a specified captive portal internal page files

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;CAPTIVE-PORTAL-NAME&gt;</code></td>
<td>- Specify the captive portal’s name.</td>
</tr>
<tr>
<td><code>&lt;FILE-NAME&gt;</code></td>
<td>- Specify the file name. The specified internal captive portal page is deleted.</td>
</tr>
</tbody>
</table>

### captive-portal-page-upload load-file

**captive-portal-page-upload** load-file []<CAPTIVE-PORTAL-NAME>|[all] `<URL>`

Loads captive-portal advanced pages

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;CAPTIVE-PORTAL-NAME&gt;</code></td>
<td>- Specify the captive portal’s name and location. The captive portal should be existing and configured.</td>
</tr>
<tr>
<td><code>&lt;URL&gt;</code></td>
<td>- Specifies location of the captive-portal's advanced pages. Use one of the following formats to specify the location:</td>
</tr>
</tbody>
</table>

Contd..
Examples

ap6562-B1A214> captive-portal-page-upload load-file captive_portal_test tftp://89.89.89.17/pages_new_only.tar

Download of captive_portal_test advanced page file is complete

ap6562-B1A214> captive-portal-page-upload captive_portal_test all

<table>
<thead>
<tr>
<th>CONTR TLER</th>
<th>STATUS</th>
<th>MESSAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>FC-0A-81-B1-A2-14</td>
<td>Success</td>
<td>Added 6 APs to upload queue</td>
</tr>
</tbody>
</table>

ap6562-B1A214> show captive-portal-page-upload status
Number of APs currently being uploaded : 1
Number of APs waiting in queue to be uploaded : 0

<table>
<thead>
<tr>
<th>AP</th>
<th>STATE</th>
<th>UPLOAD TIME</th>
<th>PROGRESS</th>
<th>RETRIES</th>
<th>LAST UPLOAD ERROR</th>
<th>UPLOADED BY</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap6562-B1A738</td>
<td>downloading</td>
<td>immediate</td>
<td>100</td>
<td>0</td>
<td>-</td>
<td>None</td>
</tr>
</tbody>
</table>

IPv4 URLs:
- tftp://<hostname|IP>[:port]/path/file
- ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
- sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
- http://<hostname|IP>[:port]/path/file
- cf:/path/file
- usb<n>:/path/file

IPv6 URLs:
- tftp://<hostname|[IPv6]>[:port]/path/file
- ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file
- sftp://<user>:<passwd>@<hostname|[IPv6]>/path/file

*Note:* The captive portal pages are downloaded to the controller from the location specified here. After downloading use the `captive-portal-page-upload > <CAPTIVE-PORTAL-NAME> > <DEVICE-OR-DOMAIN-NAME>` command to upload these pages to APs.
2.1.2 change-passwd

Changes the password of a logged user. When this command is executed without any parameters, the password can be changed interactively.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

change-passwd {<OLD-PASSWORD>} <NEW-PASSWORD>

Parameters

- change-passwd {<OLD-PASSWORD>} <NEW-PASSWORD>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;OLD-PASSWORD&gt;</td>
<td>Optional. Specify the password to be changed.</td>
</tr>
<tr>
<td>&lt;NEW-PASSWORD&gt;</td>
<td>Specify the new password.</td>
</tr>
</tbody>
</table>

**Note:** The password can also be changed interactively. To do so, press [Enter] after the command.

Usage Guidelines

A password must be from 1 - 64 characters.

Examples

```
rfs7000-37FABE>change-passwd
Enter old password: 
Enter new password: 
Password for user 'admin' changed successfully
Please write this password change to memory(write memory) to be persistent.
rfs7000-37FABE#write memory
OK
rfs7000-37FABE>
```
2.1.3 clear

User Exec Commands

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared, using this command, depends on the mode where the clear command is executed.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**NOTE:** When using the `clear` command, refer to the interface details provided in Chapter 7, interface.

**Syntax**

```
clear [arp-cache|bonjour|cdp|counters|crypto|event-history|gre|ip|ipv6|lldp|
      mac-address-table|mint|role|rtls|smart-cache|spanning-tree|traffic-shape|vrrp]
clear arp-cache {on <DEVICE-NAME>}
clear bonjour cache {on <DEVICE-NAME>}
clear [cdp|lldp] neighbors {on <DEVICE-NAME>}
clear counters [ap|radio|wireless-client] {on <DEVICE-NAME>|
clear counters [ap {<MAC>}|radio {<MAC/DEVICE-NAME>} {<1-X>}|wireless-client {<MAC>}] {on <DEVICE-OR-DOMAIN-NAME>)}
clear crypto [ike|ipsec] sa
clear crypto ike sa [<IP>|all] {on <DEVICE-NAME>}
clear crypto ipsec sa {on <DEVICE-NAME>}
clear event-history
clear gre stats {on <DEVICE-NAME>}
clear ip [bgp|dhcp|ospf]
clear ip bgp [<IP>|all|external|process]
clear ip bgp [<IP>|all|external] {in|on|out|soft}
clear ip bgp [<IP> all external] {in prefix-filter} {on <DEVICE-NAME>}
clear ip bgp [<IP> all external] {out} {on <DEVICE-NAME>))
clear ip bgp [<IP> all external] {soft {in|out}} {on <DEVICE-NAME>}
clear ip bgp process {on <DEVICE-NAME>}
clear ip dhcp bindings [<IP>|all] {on <DEVICE-NAME>}
clear ip ospf process {on <DEVICE-NAME>}
clear ipv6 neighbor-cache {on <DEVICE-NAME>}
clear mac-address-table {address|interface<vlan} {on <DEVICE-NAME>}
clear mac-address-table {address <MAC>|vlan <1-4094>} {on <DEVICE-NAME>}
clear mac-address-table {interface [<IF-NAME>|ge <1-X]|port-channel <1-X>|
t1e1 <1-4> <1-1>|up <1-X>|vmif <1-X>|xge <1-4>]} {on <DEVICE-NAME>}
clear mint mlcp history {on <DEVICE-NAME>}
clear role ldap-stats {on <DEVICE-NAME>}
```
clear rtls [aeroscout|ekahau] {<MAC/DEVICE-NAME> {on <DEVICE-OR-DOMAIN-NAME>}}

clear spanning-tree detected-protocols {interface|on}

clear spanning-tree detected-protocols {on <DEVICE-NAME>}

clear spanning-tree detected-protocols {interface [<INTERFACE-NAME>|ge <1-X>|me1|port-channel <1-X>|pppoe1|up1|vlan <1-4094>|wwan1|vmif <1-X>] {on <DEVICE-NAME>}

clear traffic-shape statistics class <1-4> {(on <DEVICE-NAME>)}

clear vrrp [error-stats|stats] {on <DEVICE-NAME>}

The following clear command is specific to the NX45XX, NX65XX, and NX9XXX series service platforms:

clear smart-cache storage [all|url-regex <WORD>] {on <DEVICE-NAME>}

**Parameters**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear arp-cache {on &lt;DEVICE-NAME&gt;}</td>
<td>Clears Address Resolution Protocol (ARP) cache entries on a device. This protocol matches layer 3 IP addresses to layer 2 MAC addresses.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears ARP cache entries on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

| clear bonjour cache {on <DEVICE-NAME>} | Clears all Bonjour cached statistics. Once cleared the system has to re-discover available Bonjour services. |
| on <DEVICE-NAME>                    | Optional. Clears all Bonjour cached statistics on a specified device         |
|                                   | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

| clear [cdp|lldp] neighbors {on <DEVICE-NAME>} | Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step. |
| on <DEVICE-NAME>                        | Optional. Clears CDP or LLDP neighbor table entries on a specified device  |
|                                           | • <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

<p>| clear counters [ap &lt;MAC&gt;|radio &lt;MAC/DEVICE-NAME&gt;]|wireless-client &lt;MAC&gt; {on &lt;DEVICE-OR-DOMAIN-NAME&gt;} | Clears counters based on the parameters passed. The options are: AP, radio, and wireless clients. |
| counters                                        |                                                                 |
| ap &lt;MAC&gt;                                        | Clears counters for all APs or a specified AP                        |
|                                           | • &lt;MAC&gt; – Optional. Specify the AP’s MAC address.                     |
| Note: If no MAC address is specified, all AP counters are cleared. |</p>

</tbody>
</table>
| **clear ip bgp [ip] |all| external] {soft {in|out}} {on <DEVICE-NAME>}** | Clears on-going BGP sessions based on the option selected  
- **ip** – Clears the BGP peer session with the peer identified by the <IP> keyword. Specify the BGP peer's IP address.  
- **all** – Clears all BGP peer sessions  
- **external** – Clears eBGP peer sessions  
**Note:** This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, NX9000, and NX9600 platforms. |
| **soft {in|out}** | Optional. Initiates soft-reconfiguration of route updates for the specified IP address  
- **in** – Optional. Enables soft reconfiguration of inbound route updates  
- **out** – Optional. Enables soft reconfiguration of outbound route updates  
**Note:** Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy etc.) take effect only after on-going BGP sessions are cleared. The `clear ip bgp` command clears BGP sessions. To reduce loss of route updates during the process, use the 'soft' option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage. |
| **on <DEVICE-NAME>** | Optional. Initiates soft reconfiguration inbound/outbound route updates on a specified device  
- **<DEVICE-NAME>** – Specify the name of the AP or service platform. |
| **ip bgp process** | Clears all BGP processes running  
**Note:** This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, NX9000, and NX9600 platforms. |
| **on <DEVICE-NAME>** | Optional. Clears all BGP processes on a specified device  
- **<DEVICE-NAME>** – Specify the name of the AP or service platform. |
| **clear ip dhcp bindings [ip] |all] {on <DEVICE-NAME>}** | Clears a Dynamic Host Configuration Protocol (DHCP) server's IP address binding entries  
- **ip** – Clears specific address binding entries. Specify the IP address to clear binding entries.  
- **all** – Clears all address binding entries  
**on <DEVICE-NAME>** – Optional. Clears a specified address binding or all address bindings on a specified device  
- **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform. |
<p>| <strong>ip ospf process</strong> | Clears already enabled Open Shortest Path First (OSPF) process and restarts the process |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear ipv6 neighbor-cache {on &lt;DEVICE-NAME&gt;}</code></td>
<td>Clears IPv6 neighbor cache entries</td>
</tr>
<tr>
<td>`clear mac-address-table {address &lt;MAC&gt;</td>
<td>vlan &lt;1-4094&gt;} {on &lt;DEVICE-NAME&gt;}`</td>
</tr>
<tr>
<td><code>mac-address-table</code></td>
<td>Optional. Clears a specified MAC address from the MAC address table.</td>
</tr>
<tr>
<td><code>vlan &lt;1-4094&gt;</code></td>
<td>Optional. Clears all MAC addresses for a specified VLAN</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>Optional. Clears a single MAC entry or all MAC entries, for the specified VLAN on a specified device</td>
</tr>
<tr>
<td>`clear mac-address-table interface [&lt;IF-NAME&gt;</td>
<td>ge &lt;1-X&gt;</td>

<tr>
<td><code>ge &lt;1-X&gt;</code></td>
<td>Clears MAC address forwarding table for the specified GigabitEthernet interface</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>Optional. Clears the GigabitEthernet interface index from 1 - X.</td>
</tr>
</tbody>
</table>

**Note:** On the NX45XX and NX65XX series service platform, this command clears the MAC address forwarding table on the device's hardware and not the dataplane.

OSPF is a link-state **interior gateway protocol** (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighboring routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer, which makes routing decisions based solely on the destination IP address found in IP packets.

- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

<td>Optional. Clears spanning tree entries on a specified device. Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Note:** The number of Ethernet interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 24 GE interfaces. Where as, RFS4000 supports 5 GE interfaces.

- ge <1-X> – Clears detected spanning tree entries for the selected GigabitEthernet interface. Select the GigabitEthernet interface index from 1 - X.
- me1 – Clears FastEthernet interface spanning tree entries.
- port-channel <1-X> – Clears detected spanning tree entries for the selected port channel interface. Select the port channel index from 1 - X.
- pppoe1 – Clears detected spanning tree entries for Point-to-Point Protocol over Ethernet (PPPoE) interface.
- vlan 1-4094 – Clears detected spanning tree entries for the selected VLAN interface. Select a Switch Virtual Interface (SVI) VLAN ID from 1-4094.
- wwan1 – Clears detected spanning tree entries for wireless WAN interface.
- vmif <1-X> – Clears detected spanning tree entries for VM interfaces.

**Note:** The VMIF interfaces are supported only on the NX45XX, NX65XX, NX9500, and NX9510 series service platforms. The number of supported VMIFs varies for different device types.
on `<DEVICE-NAME>` Optional. Clears spanning tree entries on a specified device  
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

<table>
<thead>
<tr>
<th>clear traffic-shape statistics class &lt;1-4&gt; {on <code>&lt;DEVICE-NAME&gt;</code>}</th>
</tr>
</thead>
<tbody>
<tr>
<td>clears traffic shaping statistics</td>
</tr>
</tbody>
</table>
| class <1-4> Optional. Clears traffic shaping statistics for a specific traffic class  
  - `<DEVICE-NAME>` – Specify the name of the access point, wireless controller, or service platform.  
  **Note:** If the traffic class is not specified, the system clears all traffic shaping statistics. |

on `<DEVICE-NAME>` Optional. Clears traffic shaping statistics for the specified traffic class on a specified device  
- `<DEVICE-NAME>` – Specify the name of the access point, wireless controller, or service platform.  
  **Note:** For more information on configuring traffic-shape, see `traffic-shape`. |

| clear vrrp [error-stats|stats] {on `<DEVICE-NAME>`} |
|-----------------------------------------------------|
| clears a device's Virtual Router Redundancy Protocol (VRRP) statistics  
  VRRP allows a pool of routers to be advertized as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address. |

error-stats Clears global error statistics

stats Clears VRRP related statistics

on `<DEVICE-NAME>` The following keywords are common to the `error-stats` and `stats` parameters:  
- `<DEVICE-NAME>` – Optional. Clears VRRP statistics on a specified device  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |

| clear smart-cache storage [all|regex <WORD>] {on `<DEVICE-NAME>`} |
|---------------------------------------------------------------|
| clears the smart-cache storage  
  Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see `smart-cache-policy`.  
  - all – Clears all cached content  
  - regex <WORD> – Clears only those URLs matching the specified expression  
    - `<WORD>` – Provide the URL in the following format: e.g. `.xxx/\.+\.(flv|mp4)`. |

on `<DEVICE-NAME>` Optional. Clears stored content on a specified device  
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |

2.1.4 clock

Sets a device’s system clock

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}

Parameters

- clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}

- clock set
  - <HH:MM:SS> Sets the current time (in military format hours, minutes, and seconds)
  - <1-31> Sets the numerical day of the month
  - <MONTH> Sets the month of the year (Jan to Dec)
  - <1993-2035> Sets a valid four digit year from 1993 - 2035
  - on <DEVICE-NAME> Optional. Sets the clock on a specified device
    - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

Examples

The following commands set the timezone and clock for the logged device:

nx4500-5CFA8E(config-device-B4-C7-99-5C-FA-8E)#timezone America/Los_Angeles

nx4500-5CFA8E#clock set 10:13:00 24 Mar 2015

nx4500-5CFA8E#show clock
2015-03-24 10:13:07 PDT
nx4500-5CFA8E#
2.1.5  cluster

User Exec Commands
Initiates cluster context. The cluster context provides centralized management to configure all cluster members from any one member.

Commands executed under this context are executed on all members of the cluster.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
cluster start-election

Parameters
- cluster start-election

| start-election | Starts a new cluster master election |

Examples
rfs7000-37FABE>cluster start-election
rfs7000-37FABE>

Related Commands
- create-cluster: Creates a new cluster on the specified device
- join-cluster: Adds a wireless controller or service platform, as a member, to an existing cluster of controllers
### 2.1.6 connect

**User Exec Commands**

Begins a console connection to a remote device using the remote device’s MiNT ID or name.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]
```

#### Parameters

- `connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]`

<table>
<thead>
<tr>
<th>mint-id &lt;MINT-ID&gt;</th>
<th>Connects to the remote system using its MiNT ID</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;MINT-ID&gt; – Specify the remote device’s MiNT ID.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&lt;REMOTE-DEVICE-NAME&gt;</th>
<th>Connects to the remote system using its name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;REMOTE-DEVICE-NAME&gt; – Specify the remote device’s name.</td>
</tr>
</tbody>
</table>

#### Examples

```
nx4500-5CFA2B>show mint lsp-db
6 LSPs in LSP-db of 19.5C.FA.2B:
LSP 19.58.72.58 at level 1, hostname "ap5142-587258", 5 adjacencies, seqnum 643541
LSP 19.5C.FA.2B at level 1, hostname "nx4500-5CFA2B", 5 adjacencies, seqnum 293584
LSP 19.5C.FA.8E at level 1, hostname "nx4500-5CFA8E", 5 adjacencies, seqnum 291299
LSP 19.6C.88.09 at level 1, hostname "nx9500-6C8809", 5 adjacencies, seqnum 292181
LSP 19.6D.CD.4B at level 1, hostname "rfs7000-6DCD4B", 5 adjacencies, seqnum 129177
LSP 19.71.17.28 at level 1, hostname "ap8132-711728", 5 adjacencies, seqnum 323509
nx4500-5CFA2B>connect mint-id 19.71.17.28
```

2.1.7 create-cluster

User Exec Commands

Creates a new device cluster with the specified name and assigns it an IP address and routing level.

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member's failure.

A cluster's load balance is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
create-cluster name <CLUSTER-NAME> ip <IP> {level [1/2]}
```

Parameters

- `create-cluster name <CLUSTER-NAME> ip <IP> {level [1/2]}`

<table>
<thead>
<tr>
<th>create-cluster</th>
<th>Creates a cluster</th>
</tr>
</thead>
<tbody>
<tr>
<td>name &lt;CLUSTER-NAME&gt;</td>
<td>Configures the cluster name</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;CLUSTER-NAME&gt;</code> – Specify a cluster name. Define a name for the cluster name unique to its configuration or profile support requirements. The name cannot exceed 64 characters.</td>
</tr>
<tr>
<td>ip &lt;IP&gt;</td>
<td>Specifies the device's IP address used for cluster creation</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;IP&gt;</code> – Specify the device's IP address in the A.B.C.D format.</td>
</tr>
<tr>
<td>level [1/2]</td>
<td>Optional. Configures the cluster's routing level</td>
</tr>
<tr>
<td></td>
<td>• 1 – Configures level 1 (local) routing</td>
</tr>
<tr>
<td></td>
<td>• 2 – Configures level 2 (inter-site) routing</td>
</tr>
</tbody>
</table>

2.1.8 crypto

User Exec Commands

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate Certificate Signing Request (CSR).

This command also enables trustpoint configuration. Trustpoints contain the CA's identity and configuration parameters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

crypto [key|pki]

crypto key [export|generate|import|zeroize]

crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|on|passphrase}
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|on|passphrase}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}

crypto pki [authenticate|export|generate|import|zeroize]

crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background}
{(on <DEVICE-NAME>)}

crypto pki export [request|trustpoint]

crypto pki export request [generate-rsa-key|short|use-rsa-key] <RSA-KEYPAIR-NAME>
{autogen-subject-name|subject-name}
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>
autogen-subject-name <EXPORT-TO-URL>, email <SEND-TO-EMAIL>, fqdn <FQDN>,
ip-address <IP>
crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]|
use-rsa-key] <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
<ORGANIZATION> <ORGANIZATION-UNIT> <EXPORT-TO-URL>, email <SEND-TO-EMAIL>,

<td>Exports CSR to the CA for a digital identity certificate. The CSR contains applicant's details and RSA Keypair's public key.</td>
</tr>
</tbody>
</table>

#### [generate-rsa-key|short] [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>

Generates a new RSA Keypair or uses an existing RSA Keypair

- **generate-rsa-key** – Generates a new RSA Keypair for digital authentication
- **use-rsa-key** – Uses an existing RSA Keypair for digital authentication
- **<RSA-KEYPAIR-NAME>** – If generating a new RSA Keypair, specify a name for it. If using an existing RSA Keypair, specify its name.

#### [generate-rsa-key|short] [generate-rsa-key|use-rsa-key] [subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY> <ORGANIZATION> <ORGANIZATION-UNIT>] <EXPORT-TO-URL>, email <SEND-TO-EMAIL>, fqdn <FQDN>, ip-address <IP>

Auto generates subject name from configuration parameters. The subject name identifies the certificate.

#### email <SEND-TO-EMAIL>

Exports CSR to a specified e-mail address

- **<SEND-TO-EMAIL>** – Specify the CA's e-mail address.

#### fqdn <FQDN>

Exports CSR to a specified Fully Qualified Domain Name (FQDN)

- **<FQDN>** – Specify the CA's FQDN.

#### ip-address <IP>

Exports CSR to a specified device or system

- **<IP>** – Specify the CA's IP address.
<table>

<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| subject-name        | Configures a subject name, defined by the `<COMMON-NAME>` keyword, to identify the certificate  
| `<COMMON-NAME>`     | • `<COMMON-NAME>` – Specify the common name used with the CA certificate. The name should enable you to identify the certificate easily (2 to 64 characters in length). |
| `<COUNTRY>`         | Sets the deployment country code (2 character ISO code)                                                                                       |
| `<STATE>`           | Sets the state name (2 to 64 characters in length)                                                                                           |
| `<CITY>`            | Sets the city name (2 to 64 characters in length)                                                                                             |
| `<ORGANIZATION>`    | Sets the organization name (2 to 64 characters in length)                                                                                   |
| `<ORGANIZATION-UNIT>` | Sets the organization unit (2 to 64 characters in length)                                                                                     |
| `<EXPORT-TO-URL>`   | Specify the CA's location. Both IPv4 and IPv6 address formats are supported.  
|                     | • The CSR is exported to the specified location.                                                                                              |
| email `<SEND-TO-EMAIL>` | Exports CSR to a specified e-mail address  
|                     | • `<SEND-TO-EMAIL>` – Specify the CA's e-mail address.                                                                                       |
| fqdn `<FQDN>`       | Exports CSR to a specified FQDN  
|                     | • `<FQDN>` – Specify the CA's FQDN.                                                                                                        |
| ip-address `<IP>`   | Exports CSR to a specified device or system  
|                     | • `<IP>` – Specify the CA's IP address.                                                                                                       |
| pki                 | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.     |
| export trustpoint `<TRUSTPOINT-NAME>` | Exports a trustpoint along with CA certificate, Certificate Revocation List (CRL), server certificate, and private key  
|                     | • `<TRUSTPOINT-NAME>` – Specify the trustpoint name (should be authenticated).                                                             |
| `<EXPORT-TO-URL>`   | Specify the destination address. Both IPv4 and IPv6 address formats are supported. The trustpoint is exported to the address specified here.  |
| background           | Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on  |
| passphrase `<KEY-PASSPHRASE>` background | Optional. Encrypts the key with a passphrase before exporting  
|                     | • `<KEY-PASSPHRASE>` – Specify the passphrase to encrypt the trustpoint.  
|                     | • background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.  |
| on `<DEVICE-NAME>`  | The following parameter is recursive and common to the 'background' and 'passphrase' keywords:  
|                     | • on `<DEVICE-NAME>` – Optional. Performs export operation on a specified device  
|                     | • `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.                                                       |

- **crypto pki export trustpoint `<TRUSTPOINT-NAME>` `<EXPORT-TO-URL>` `{background|passphrase `<KEY-PASSPHRASE>` background}` `{(on `<DEVICE>`)`}**

- pki

- export trustpoint `<TRUSTPOINT-NAME>`

- `<EXPORT-TO-URL>`
**pki**

Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates.

| **generate self-signed**<TRUSTPOINT-NAME> | Generates a self-signed certificate and a trustpoint
| --- | ---
| [generate-rsa-key|use-rsa-key]<RSA-KEYPAIR-NAME> | Generates a new RSA Keypair, or uses an existing RSA Keypair
| subject-name<COMMON-NAME><COUNTRY><STATE><CITY><ORGANIZATION><ORGANIZATION-UNIT> | Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate
| on<DEVICE-NAME> | Optional. Exports the self-signed certificate on a specified device
| email<SEND-TO-EMAIL> | Optional. Exports the self-signed certificate to a specified e-mail address
| fqdn<FQDN> | Optional. Exports the self-signed certificate to a specified FQDN
| ip-address<IP> | Optional. Exports the self-signed certificate to a specified device or system

```
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> autogen-subject-name {(email <SEND-TO-EMAIL>, fqdn <FQDN>, ip-address <IP>, on <DEVICE-NAME>)}
```

| subject-name<COMMON-NAME> | Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate
| --- | ---
| (email <SEND-TO-EMAIL>, fqdn <FQDN>, ip-address <IP>, on <DEVICE-NAME>) | Optional. Exports the self-signed certificate on a specified device
| <SEND-TO-EMAIL> | Specify the e-mail address.
| <FQDN> | Specify the FQDN.
| <IP> | Specify the device's IP address.
| <DEVICE-NAME> | Specify the name of the AP, wireless controller, or service platform.

```
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> subject-name<COMMON-NAME><COUNTRY><STATE><CITY><ORGANIZATION><ORGANIZATION-UNIT>
```

| email | Optional. Exports the self-signed certificate to a specified e-mail address  
- `<SEND-TO-EMAIL>` – Specify the e-mail address. |
| fqdn | Optional. Exports the self-signed certificate to a specified FQDN  
- `<FQDN>` – Specify the FQDN. |
| ip-address | Optional. Exports the self-signed certificate to a specified device or system  
- `<IP>` – Specify the device’s IP address. |
| crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background} | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| import | Imports certificates, Certificate Revocation List (CRL), or a trustpoint to the selected device |
| pki | Imports a signed server certificate or CRL  
- certificate – Imports signed server certificate  
- crl – Imports CRL  
- `<TRUSTPOINT-NAME>` – Specify the trustpoint name (should be authenticated). |
| <IMPORT-FROM-URL> | Specify the signed server certificate or CRL source address. Both IPv4 and IPv6 address formats are supported.  
The server certificate or the CRL (based on the parameter passed in the preceding step) is imported from the location specified here. |
| background | Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on. |
| on <DEVICE-NAME> | The following parameter is recursive and optional:  
- on `<DEVICE-NAME>` – Optional. Performs import operation on a specified device  
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background|passphrase <KEY-PASSPHRASE> background} | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates. |
| import | Imports certificates, CRL, or a trustpoint to the selected device |
| trustpoint | Imports a trustpoint and its associated CA certificate, server certificate, and private key  
- `<TRUSTPOINT-NAME>` – Specify the trustpoint name (should be authenticated). |
| <IMPORT-FROM-URL> | Specify the trustpoint source address. Both IPv4 and IPv6 address formats are supported. |
background
Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.

passphrase
<KEY-PASSPHRASE>
Optional. Decrypts trustpoint with a passphrase after importing
- `<KEY-PASSPHRASE>` – Specify the passphrase. After specifying the passphrase, optionally specify the device to perform import on.
- `background` – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on.

on <DEVICE-NAME>
The following parameter is recursive and optional:
- `<DEVICE-NAME>` – Optional. Performs import operation on a specified device
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- `crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}`

pki
Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

zeroize trustpoint
<TRUSTPOINT-NAME>
Deletes a trustpoint and its associated CA certificate, server certificate, and private key
- `<TRUSTPOINT-NAME>` – Specify the trustpoint name (should be authenticated).

del-key
Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on.

on <DEVICE-NAME>
The following parameter is recursive and optional:
Optional. Deletes the trustpoint on a specified device
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

Usage Guidelines
The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

- **IPv4 URLs:**
  - `tftp://<hostname>|IP>[:port]/path/file`
  - `ftp://<user>:<passwd>@<hostname>|IP>[:port]/path/file`
  - `sftp://<user>@<hostname>|IP>[:port]/path/file`
  - `http://<hostname>|IP>[:port]/path/file`
  - `cf:/path/file`
  - `usb<n>:/path/file`

- **IPv6 URLs:**
  - `tftp://<hostname>|[IPv6]>[:port]/path/file`
  - `ftp://<user>:<passwd>@<hostname>|[IPv6]>[:port]/path/file`
  - `sftp://<user>:<passwd>@<hostname>|[IPv6]>[:port]/path/file`
Examples

rfs7000-37FABE>crypto key generate rsa key 1025
RSA Keypair successfully generated
rfs7000-37FABE>

rfs7000-37FABE>crypto key import rsa test123 url passphrase word background
RSA key import operation is started in background
rfs7000-37FABE>

rfs7000-37FABE>crypto pki generate self-signed word generate-rsa-key word autogen-
subject-name fqdn word
Successfully generated self-signed certificate
rfs7000-37FABE>

rfs7000-37FABE>crypto pki zeroize trustpoint word del-key
Successfully removed the trustpoint and associated certificates
%Warning: Applications associated with the trustpoint will start using default-trustpoint
rfs7000-37FABE>

rfs7000-37FABE>crypto pki authenticate word url background
Import of CA certificate started in background
rfs7000-37FABE>

rfs7000-37FABE>crypto pki import trustpoint word url passphrase word
Import operation started in background
rfs7000-37FABE>

Related Commands

no

Removes server certificates, trustpoints and their associated certificates
2.1.9 crypto-cmp-cert-update

Triggers a Certificate Management Protocol (CMP) certificate update on a specified device or devices

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

Parameters
- crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

Examples

rfs4000-229D58>crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
rfs4000-229D58>
2.1.10 **database**

*User Exec Commands*

Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight)

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

`database [drop|repair]`

`database drop [all|captive-portal|nsight]`

`database repair {on <DEVICE-NAME>}`

**Parameters**
- `database drop [all|captive-portal|nsight]`
  - Drops (deletes) all or a specified database
    - `all` — Drops all databases, captive portal and NSight.
    - `captive-portal` — Drops captive-portal database only
    - `nsight` — Drops NSight database only

- `database repair {on <DEVICE-NAME>}`
  - Enables automatic repairing of all databases
    - `<DEVICE-NAME>` — Optional. Specifies the name of the access point, wireless controller, or service platform hosting the database. When specified, databases on the specified device are periodically checked through to identify and remove obsolete data documents.

**Note:** If no device is specified, the system repairs all databases.

**Examples**

```
nx9500-6C8809>database repair on nx9500-6C8809
nx9500-6C8809>
```

2.1.11 database-backup

User Exec Commands

Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

database-backup database [captive-portal|nsight] <URL>

Parameters
- database-backup database [captive-portal|nsight] <URL>

| database-backup database [captive-portal|nsight] | Backs up captive portal and/or NSight database to a specified location and file. Select the database to backup |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <URL>                                         | Configures the destination location. The database is backed up at the specified location. Specify the location URL in one of the following formats: |
|                                               | ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz |

Examples

(nx9500-6C8809>database-backup database nsight ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz

</tbody>
</table>
2.1.12 database-restore

User Exec Commands

Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored from the backed-up location to the original database.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

database-restore database [captive-portal|nsight] <URL>

Parameters
- database-restore database [captive-portal|nsight] <URL>

<table>

2.1.13 device-upgrade

Enables firmware upgrade on an adopted device or a set of adopted devices (access points, wireless controllers, and service platforms)

In an hierarchically managed (HM) network, this command enables centralized device upgradation across the network.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single Network Operations Center (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

**NOTE:** Hierarchical management allows the NOC controller to upgrade controllers and access points that are directly or indirectly adopted to it. However, ensure that the NOC controller is loaded with the correct firmware version.

All adopted devices (access points and second-level controllers) are referred to as the ‘adoptee’. The adopting devices are the ‘adopters’. A controller cannot be configured as an adoptee and an adopter simultaneously. In other words, a controller can either be an adopter (adopts another controller) or an adoptee (is adopted by another controller).

Network administrators can use the device-upgrade command to schedule firmware upgrades across adopted devices within the network. Devices are upgraded based on their device names, MAC addresses, or RF Domain. The firmware image used for the upgrade can either be user-defined or built-in.

The user-defined image is pulled from the defined location and applied to the device(s). Use the `device-upgrade > load-image` command to provide the image file name and location. User-defined images always get precedence over built-in images.

NOC and site controllers possess built-in firmware images for the various device types. If the administrator has not specified an image file name and location, the image on the controller is used to upgrade the device. The following example describes the various scenarios possible in the absence of a user-defined image.

A site controller has been scheduled to upgrade all adopted AP6562s. Before executing the upgrade, the site controller compares the image it possesses with the image on the NOC controller. In case of an image version mismatch, the site controller does the following:

1. If the site controller is a cluster member, it pulls the image:
   - From a cluster peer, provided the AP6562 image version on the peer and the NOC controller matches.
   - From the NOC controller, if the AP6562 image version on the peer and the NOC controller are mismatched.
   - From the NOC controller, if none of the cluster members possess a AP6562 image.

2. If the site controller is not a cluster member, it pulls the image from the NOC controller.

When upgrading devices in a RF Domain, the process is controlled and driven by the NOC controller. For example, in case of a scheduled upgrading of all AP6562s within an RF Domain, the NOC controller:

1. Adopts all controllers, in the RF Domain, to the NOC cluster and gets the status of each controller.

2. Upgrades all controllers, in the cluster, without rebooting them.

Once the upgrade is complete, the following two scenarios are possible:

**Scenario 1:** If the upgrade/reboot options ARE NOT specified by the network administrator, the NOC controller:

a. Pushes the AP6562 image on to the RF Domain manager.

b. Reboots the active controller within the RF Domain.

c. Reboots standby controllers after the active controller has successfully rebooted.
If the controllers are auto upgrade enabled, all AP6562s are upgraded after the controllers have rebooted and the APs have been re-adopted.

Scenario 2: If the upgrade/reboot options ARE specified by the network administrator, the NOC controller:

a. Reboots the active controller followed by the standby controllers.
b. Pushes the AP6562 image file on to the RF Domain manager.
c. Initiates upgrades on all AP6562 within the RF Domain.

Ensure the RF Domain controllers are auto upgrade enabled.

NOTE: If the persist-images option is selected, the RF Domain manager retains the old firmware image, or else deletes it. For more information on enabling device upgrade on profiles and devices (including the ‘persist-images’ option), see device-upgrade.

NOTE: A NOC controller’s capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller – RFS7000, NX9000, NX95XX (NX9500 and NX9510), NX9600
- Site controller – RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX56XX, NX65XX, NX9000, or NX95XX

Within a HM network, the devices deployed as site controllers depends on the NOC controller device type. For more information on the adoption capabilities of various NOC controller devices, see Usage Guidelines (NOC controller adoption matrix).

NOTE: Standalone devices have to be manually upgraded.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

device-upgrade [MAC/HOSTNAME|all|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|vx9000|cancel-upgrade|load-image|rf-domain]

Parameters

- device-upgrade <MAC/HOSTNAME> {no-reboot|reboot-time TIME|upgrade-time TIME} {no-reboot|reboot-time TIME}{staggered-reboot|upgrade-time TIME}

### <MAC/HOSTNAME>
Upgrades firmware on the device identified by the <MAC/HOSTNAME> keyword

- **<MAC/HOSTNAME>** – Specify the device’s MAC address or hostname.

### no-reboot
Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)

### reboot-time <TIME>
Optional. Schedules an automatic reboot after a successful upgrade

- **<TIME>** – Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

### upgrade-time <TIME>
Optional. Schedules an automatic device firmware upgrade on a specified day and time

- **<TIME>** – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. The following actions can be performed after a scheduled upgrade:
  - **no-reboot** – Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
  - **reboot-time <TIME>** – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

### all
Upgrades firmware on all devices

### force
Optional. Select this option to force upgrade on the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.

### no-reboot
Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)

### reboot-time <TIME>
Optional. Schedules an automatic reboot after a successful upgrade

- **<TIME>** – Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.
### User Exec Mode Commands

**Upgrade-time** `<TIME>`
- **Optional.** Schedules an automatic device firmware upgrade on all devices on a specified day and time
  - `<TIME>` – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. The following actions can be performed after a scheduled upgrade:
    - no-reboot – **Optional.** Disables automatic reboot after a successful upgrade (the device must be manually restarted)
    - reboot-time `<TIME>` – **Optional.** Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

**staggered-reboot**
- This keyword is recursive and common to all of the above.
- **Optional.** Enables staggered device reboot (one at a time) without network impact

- **device-upgrade** `[ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|vx9000] all
  - **force** | no-reboot | reboot-time `<TIME>` | upgrade-time `<TIME>`
    - **no-reboot** | reboot-time `<TIME>`

  **Optional.** Enables staggered device reboot (one at a time) without network impact

- **force**
  - **Optional.** Select this option to force upgrade on the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or staggered-reboot.

- **no-reboot**
  - **Optional.** Disables automatic reboot after a successful upgrade (the device must be manually restarted)

- **reboot-time `<TIME>`**
  - **Optional.** Schedules an automatic reboot after a successful upgrade
    - `<TIME>` – Optional. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

- **upgrade-time `<TIME>`**
  - **Optional.** Schedules an automatic firmware upgrade on all devices, of the specified type, on a specified day and time
    - `<TIME>` – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. The following actions can be performed after a scheduled upgrade:
      - no-reboot – **Optional.** Disables automatic reboot after a successful upgrade (the device must be manually restarted)
      - reboot-time `<TIME>` – **Optional.** Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

- **staggered-reboot**
  - This keyword is recursive and common to all of the above.
  - **Optional.** Enables staggered device reboot (one at a time) without network impact
- **device-upgrade cancel-upgrade** 
  ```
  [<MAC/HOSTNAME>|all|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45XX|nx5500|nx65XX|nx75xx|nx9000|nx9600|vx9000] on rf-domain 
  [<RF-DOMAIN-NAME>|all]
  ```

  Cancels a scheduled firmware upgrade based on the parameters passed. This command provides the following options to cancel scheduled firmware upgrades:
  - Cancels upgrade on specific device(s). The devices are identified by their MAC addresses or hostnames.
  - Cancels upgrade on all devices within the network
  - Cancels upgrade on all devices of a specific type. Specify the device type.
  - Cancels upgrade on specific device(s) or all device(s) within a specific RF Domain or all RF Domains. Specify the RF Domain name.

<table>
<thead>
<tr>
<th>cancel-upgrade</th>
<th>Cancels a scheduled firmware upgrade on a specified device or on all devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>[&lt;MAC/HOSTNAME]</td>
<td>&lt;MAC/HOSTNAME&gt; – Cancels a scheduled upgrade on the device identified by the</td>
</tr>
<tr>

<td>&lt;MAC/HOSTNAME&gt; keyword. Specify the device’s MAC address or hostname.</td>
</tr>
<tr>
<td>all</td>
<td>all – Cancels scheduled upgrade on all devices</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>cancel-upgrade on rf-domain</th>
<th>Cancels scheduled firmware upgrade on all devices in a specified RF Domain or all RF Domains</th>
</tr>
</thead>
<tbody>
<tr>
<td>[&lt;RF-DOMAIN-NAME&gt;</td>
<td>all]</td>
</tr>
<tr>
<td>all</td>
<td>Domain. Specify the RF Domain name.</td>
</tr>
<tr>
<td>all</td>
<td>all – Cancels scheduled device upgrade on all devices across all RF Domains</td>
</tr>
</tbody>
</table>

- **device-upgrade load-image** 
  ```
  [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45XX|nx5500|nx65XX|nx75xx|nx9000|nx9600|vx9000] on rf-domain 
  [<RF-DOMAIN-NAME>|all]
  ```

  Loads device firmware image from a specified location. Use this command to specify the device type and the location of the corresponding image file.
  ```
  <DEVICE-TYPE> – Specify the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000.
  ```

  After specifying the device type, provide the location of the required device firmware image.

<table>
<thead>
<tr>
<th>load-image</th>
<th>Specify the device’s firmware image location in one of the following formats:</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IMAGE-URL&gt;</td>
<td>IPv4 URLs: tftp://&lt;hostname</td>
</tr>
</tbody>
</table>
### IPv6 URLs:
- `http://<hostname>[[:port]]/path/file`
- `ftp://<user>:<password>@<hostname>[[:port]]/path/file`
- `sftp://<user>:<password>@<hostname>[[:port]]/path/file`
- `http://<hostname>[[:port]]/path/file`

### on <DEVICE-OR-DOMAIN-NAME>
- **Specify the name of the AP, wireless controller, service platform, or RF Domain.** The image, of the specified device type is loaded from the device specified here. In case of an RF Domain, the image available on the RF Domain manager is loaded.

### rf-domain
- **<RF-DOMAIN-NAME>** - Upgrades devices in the RF Domain identified by the `<RF-DOMAIN-NAME>` keyword.
- **<RF-DOMAIN-NAME>** - Specify the RF Domain name.
- **all** - Upgrades devices across all RF Domains
- **containing <WORD>** - Filters RF Domains by their names. RF Domains with names containing the sub-string identified by the `<WORD>` keyword are filtered. Devices on the filtered RF Domains are upgraded.
- **filter location <WORD>** - Filters devices by their location. All devices with location matching the `<WORD>` keyword are upgraded.

### <DEVICE-TYPE>
- After specifying the RF Domain, select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000.
- After specifying the RF Domain and the device type, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller.

### <MAC/HOSTNAME>
- Optional. Use this option to identify specific devices for upgradeation. Specify the device’s MAC address or hostname. The device should be within the specified RF Domain and of the specified device type. After identifying the devices to upgrade, configure any one of the following actions: force devices to upgrade, or initiate an upgrade through the adopting controller.

Note: If no MAC address or hostname is specified, all devices of the type selected are upgraded.

### force
- Optional. Select this option to force upgrade for the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.

### from-controller
- Optional. Upgrades a device through the adopted device. If initiating an upgrade through the adopting controller, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.
The following table displays NOC controllers and the corresponding site-level controllers supported by each:

<table>

Usage Guidelines (NOC controller adoption matrix)

- **no-reboot** {staggered-reboot}
  - Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)

- **reboot-time <TIME>** {staggered-reboot}
  - Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

- **staggered-reboot**
  - This keyword is common to all of the above.
  - Optional. Enables staggered reboot (one at a time) without network impact

- **upgrade-time <TIME>** {no-reboot} {reboot-time <TIME>}
  - Optional. Schedules an automatic firmware upgrade
  - <TIME> – Specify the upgrade time in the MM/DD/YYYY-HH:MM or HH:MM format. After a scheduled upgrade, the following actions can be performed:
    - no-reboot – Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)
    - reboot-time <TIME> – Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

</tbody>
</table>
The following example shows two devices, in the RF domain 'TechPubs' that are adopted to the same controller:

```
rfs6000-6DB5D4>show wireless ap on TechPubs
---------------------------------------------------------------------------------------
<table>
<thead>
<tr>
<th></th>
<th>AP-NAME</th>
<th>AP-LOCATION</th>
<th>RF-DOMAIN</th>
<th>AP-MAC</th>
<th>#RADIOS</th>
<th>MODE</th>
<th>CLIENT</th>
<th>IPv4</th>
<th>IPv6</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ap6522-43C78C</td>
<td></td>
<td>TechPubs..</td>
<td>B4-C7-99-43-C7-8C</td>
<td>2</td>
<td>W-W</td>
<td>0</td>
<td>192.168.13.136</td>
<td>::</td>
</tr>
<tr>
<td></td>
<td>ap6522-57F674</td>
<td></td>
<td>TechPubs..</td>
<td>B4-C7-99-57-F6-74</td>
<td>2</td>
<td>W-W</td>
<td>0</td>
<td>192.168.13.214</td>
<td>::</td>
</tr>
<tr>
<td></td>
<td>Total number of APs displayed: 2</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

Both APs and the controller are running the same image. Therefore, the device-upgrade command fails. This is shown in the following example:

```
rfs6000-6DB5D4>device-upgrade rf-domain TechPubs ap6522
In progress ....
---------------------------------------------------------------------------------------
<table>
<thead>
<tr>
<th>CONTROLLER</th>
<th>STATUS</th>
<th>MESSAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>B4-C7-99-6D-B5-D4</td>
<td>Fail</td>
<td>Techpubs(Upgrade not required in TechPubs)</td>
</tr>
</tbody>
</table>
```

Use the 'force' parameter to forcefully upgrade the APs.

```
rfs6000-6DB5D4#device-upgrade rf-domain TechPubs ap6522 force
In progress ....
---------------------------------------------------------------------------------------
<table>
<thead>
<tr>
<th>CONTROLLER</th>
<th>STATUS</th>
<th>MESSAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>B4-C7-99-6D-B5-D4</td>
<td>Success</td>
<td>TechPubs(device type(s) ap6522 added for upgrade),</td>
</tr>
</tbody>
</table>
```

The following examples show the upgradation of devices in a HM network.

The HM setup is as follows:

```
rfs7000-6DCD4B (NOC) > l3-adoption > rfs6000-81701D (SITE-CONTROLLER) > l2-adoption > ap8132-711728 (access point)
```

**Step 1:** Load AP81XX firmware on the NOC (rfs7000-6DCD4B):

```
rfs7000-6DCD4B#device-upgrade load-image ap81XX
ftp://anonymous:anonymous@192.168.13.10/LatestBuilds/W58/AP81XX-012D.img
```

```
---------------------------------------------------------------------------------------
<table>
<thead>
<tr>
<th>CONTROLLER</th>
<th>STATUS</th>
<th>MESSAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>rfs7000-6DCD4B</td>
<td>Success</td>
<td>Successfully initiated load image</td>
</tr>
</tbody>
</table>
```

```
rfs7000-6DCD4B#```
Step 2: Execute the upgrade command on the NOC. This pushes the AP81XX image through the Site Controller on to the adopted AP81XX (ap8132-711728).

rfs7000-6DCD4B#device-upgrade ap8132-711728

```
<table>
<thead>
<tr>
<th>CONTROLLER</th>
<th>STATUS</th>
<th>MESSAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>B4-C7-99-6D-CD-4B</td>
<td>Success</td>
<td>Queued 1 devices to upgrade</td>
</tr>
</tbody>
</table>
```

rfs7000-6DCD4B#show device-upgrade status

```

rfs7000-6DCD4B#
2.1.14 disable

This command can be executed in the Priv Exec Mode only. This command turns off (disables) the privileged mode command set and returns to the User Executable Mode. The prompt changes from `rfs7000-37FABE#` to `rfs7000-37FABE>.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
disable

Parameters
None

Examples
rfs7000-37FABE#disable
rfs7000-37FABE>
2.1.15 enable

User Exec Commands

Turns on (enables) the privileged mode command set. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
enable
```

Parameters

None

Examples

```
rfs7000-37FABE>enable
rfs7000-37FABE#
```
2.1.16 file-sync

User Exec Commands

Syncs EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points. Use this command to configure parameters that enable syncing of PKCS#12 certificate.

When enabling file syncing, consider the following points:

- The X.509 certificate needs synchronization only if the access point’s radio2, the client-bridge radio, is configured to use EAP-TLS authentication
- Execute the command on the controller adopting the access point
- Ensure that the X.509 certificate file is installed on the controller
- If the adopting device is a site controller with layer 3 adoption to the NoC, ensure that the X.509 certificate is synced across the hierarchically managed setup – between the NoC, site-controller (the staging-controller), and the client-bridge access points.

Syncing of wireless client-bridge certificate can to be automated. To automate file syncing, in the controller’s device/profile configuration mode, execute the following command: `file-sync [auto|count <1-20>]`. For more information, see `file-sync`.

For more information on configuring a AP client-bridge, see `bridge`.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
file-sync [cancel|load-file|wireless-bridge]
```

```
file-sync cancel wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]
```

```
file-sync load-file wireless-bridge <URL>
```

```
file-sync wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all] {from-controller}] {reset-radio|upload-time <TIME>}
```

Parameters

- `file-sync cancel wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]`
  - Cancels scheduled wireless client-bridge certificate synchronization on a specified AP, or all APs, or APs within an RF Domain
    - `<DEVICE-NAME>` – Cancels scheduled certificate synchronization on the AP identified by the `<DEVICE-NAME>` parameter. Specify the AP’s hostname or MAC address.
    - all – Cancels scheduled certificate synchronization on all APs
    - `rf-domain [<DOMAIN-NAME>|all]` – Cancels scheduled certificate synchronization on all APs in a specified RF Domain or in all RF Domains
      - `<DOMAIN-NAME>` – Cancels scheduled certificate synchronization on all APs within the RF Domain identified by the `<DOMAIN-NAME>` parameter. Specify the RF Domain’s name.
    - all – Cancels scheduled certificate synchronization on all RF Domains
**file-sync load-file wireless-bridge <URL>**

Loads the client-bridge certificate to the staging controller. Use this command to load the certificate to the controller before scheduling or initiating a certificate synchronization.

- **<URL>** – Provide the certificate location using one of the following formats:
  - tftp://<hostname|IP>[:port]/path/file
  - ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
  - sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
  - http://<hostname|IP>[:port]/path/file
  - cf:/path/file
  - usb<n>:/path/file

**Note:** Both IPv4 and IPv6 address types are supported.

**file-sync wireless-bridge [DEVICE-NAME]|all|rf-domain [DOMAIN-NAME]|all} {from-controller} [reset-radio|upload-time <TIME>]

Configures the following file-sync parameters:

- post certificate synchronization action
- upload time

These file-sync options can be applied to a specified AP, all APs, or all APs within a specified RF Domain or on all RF Domains.

- **<DEVICE-NAME>** – Applies these parameters to the AP identified by the **<DEVICE-NAME>** parameter. Specify the AP's hostname or MAC address.
- **all** – Applies these parameters to all APs
- **rf-domain [DOMAIN-NAME]|all** – Applies these parameters to all APs within a specified RF Domain or on all RF Domains
  - **<DOMAIN-NAME>** – Select to apply to APs within the RF Domain identified by the **<DOMAIN-NAME>** parameter. Specify the RF Domain’s name.
  - **all** – Select to apply these parameters to APs in all RF Domains
  - **from-controller** – Optional. Loads certificate to the APs from the adopting controller and not the RF Domain manager

After specify the access points to load certificate, specify the following options: reset-radio and upload-time

**reset-radio**

This keyword is recursive and applicable to all of the above parameters.

Optional. Resets the radio after file synchronization. Reset the radio in case the certificate is renewed along with no changes made to the ‘bridge EAP username’ and ‘bridge EAP password’.

**upload-time <TIME>**

This keyword is recursive and applicable to all of the above parameters.

Optional. Schedules certificate upload at a specified time

- **<TIME>** – Specify the time in the MM/DD/YYYY-HH:MM or HH:MM format. If no time is configured, the process is initiated as soon as the command is executed.
Examples

```
file-sync wireless-bridge ap7131-11E6C4 upload-time 12/12/2015-12:30
```

```
CONTROLLER               STATUS                  MESSAGE
--------------------------------------------------------------------------------
B4-C7-99-6D-CD-4B           Success           Queued 1 APs to upload
--------------------------------------------------------------------------------
```

```
file-sync wireless-bridge all upload-time 06/05/2015-23:42
```

The following uploads certificate to all access points:

```
file-sync wireless-bridge all upload-time 06/05/2015-23:42
```
2.1.17 join-cluster

Adds a device (access point, wireless controller, or service platform), as a member, to an existing cluster of devices. Assign a static IP address to the device before adding to a cluster.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
join-cluster <IP> user <USERNAME> password <WORD> {level|mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}
```

**Parameters**

- `join-cluster <IP> user <USERNAME> password <WORD> {level [1|2]|mode [active|standby]}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>Specify the cluster member’s IP address.</td>
</tr>
<tr>
<td>user &lt;USERNAME&gt;</td>
<td>Specify a user account with super user privileges on the new cluster member</td>
</tr>
<tr>
<td>password &lt;WORD&gt;</td>
<td>Specify password for the account specified in the user parameter</td>
</tr>
<tr>
<td>level [1</td>
<td>2]</td>
</tr>
<tr>
<td></td>
<td>• 1 – Configures level 1 routing</td>
</tr>
<tr>
<td></td>
<td>• 2 – Configures level 2 routing</td>
</tr>
<tr>
<td>mode [active</td>
<td>standby]</td>
</tr>
<tr>
<td></td>
<td>• active – Configures this cluster as active</td>
</tr>
<tr>
<td></td>
<td>• standby – Configures this cluster to be on standby mode</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To add a device to an existing cluster:

- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding the device to a cluster, execute the “write memory” command to ensure the configuration persists across reboots.

**Examples**

```
rfs7000-37FABE> join-cluster 192.168.13.15 user admin password superuser level 1 mode standby
... connecting to 192.168.13.15
... applying cluster configuration
... committing the changes
... saving the changes
[OK]
rfs7000-37FABE>

## 2.1.18 12tpv3

**User Exec Commands**

Establishes or brings down an Layer 2 Tunnel Protocol Version 3 (L2TPV3) tunnel

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>12tpv3 tunnel [&lt;TUNNEL-NAME&gt;</td>
<td>all]</td>
</tr>
<tr>
<td>12tpv3 tunnel &lt;TUNNEL-NAME&gt; [down</td>
<td>up]</td>
</tr>
<tr>
<td>12tpv3 tunnel &lt;TUNNEL-NAME&gt; session &lt;SESSION-NAME&gt; [down</td>
<td>up]</td>
</tr>
<tr>
<td>12tpv3 tunnel all [down</td>
<td>up]</td>
</tr>
</tbody>
</table>

### Parameters

**12tpv3 tunnel**: Enables or brings down L2TPv3 tunnels

- `<TUNNEL-NAME>`: Specifies the tunnel name to establish or bring down
  - `down`: Brings down the specified tunnel
  - `up`: Establishes the specified tunnel

- `on <DEVICE-NAME>`: Optional. Establishes or brings down a tunnel on a specified device
  - `<DEVICE-NAME>`: Specify the name of the AP, wireless controller, or service platform.

**12tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up]**: Enables or brings down a specified session inside a tunnel

- `<TUNNEL-NAME>`: Specifies the tunnel name.
- `<SESSION-NAME>`: Specifies the session name.
  - `down`: Brings down the specified session
  - `up`: Establishes the specified session

- `on <DEVICE-NAME>`: Optional. Establishes or brings down a tunnel session on a specified device
  - `<DEVICE-NAME>`: Specify the name of the AP, wireless controller, or service platform.

**12tpv3 tunnel all [down|up]**: Enables or brings down all L2TPv3 tunnels

- `on <DEVICE-NAME>`: Optional. Establishes or brings down all tunnels on a specified device
  - `<DEVICE-NAME>`: Specify the name of the AP, wireless controller, or service platform.
Examples

rfs7000-37FABE>l2tpv3 tunnel Tunnel1 session Tunnel1Session1 up on rfs7000-37FABE

NOTE: For more information on the L2TPv3 tunnel configuration mode and commands, see Chapter 22, L2TPV3-POLICY.
2.1.19 logging

User Exec Commands

Modifies message logging settings

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}
```

**Parameters**

- **logging monitor** `{<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}

<table>
<thead>
<tr>
<th>monitor</th>
<th>Sets the terminal lines logging levels. The logging severity levels can be set from 0 - 7. The system configures default settings, if no logging severity level is specified.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;0-7&gt;</td>
<td>- Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows:</td>
</tr>
<tr>
<td>alerts</td>
<td>- Optional. Immediate action needed (severity=1)</td>
</tr>
<tr>
<td>critical</td>
<td>- Optional. Critical conditions (severity=2)</td>
</tr>
<tr>
<td>debugging</td>
<td>- Optional. Debugging messages (severity=7)</td>
</tr>
<tr>
<td>emergencies</td>
<td>- Optional. System is unusable (severity=0)</td>
</tr>
<tr>
<td>errors</td>
<td>- Optional. Error conditions (severity=3)</td>
</tr>
<tr>
<td>informational</td>
<td>- Optional. Informational messages (severity=6)</td>
</tr>
<tr>
<td>notifications</td>
<td>- Optional. Normal but significant conditions (severity=5)</td>
</tr>
<tr>
<td>warnings</td>
<td>- Optional. Warning conditions (severity=4)</td>
</tr>
</tbody>
</table>

**Note:** Before configuring the message logging level, ensure logging module is enabled. To enable message logging, in the device's configuration mode, execute the `logging > on` command. Message logging can also be enabled on a profile. All devices using the profile will have message logging enabled.

**Examples**

```plaintext
rfs7000-6DCD4B(config-device-B4-C7-99-6D-CD-4B)#logging on
rfs7000-6DCD4B>logging monitor debugging
rfs7000-6DCD4B>show logging
```

**Log Buffer (103 bytes):**
May 17 22:03:53 2015: rfs7000-6DCD4B : %SYSTEM-3-LOGIN_FAIL: Log-in failed for user 'admin' from 'ssh'

2.1.20 mint

**User Exec Commands**

Uses MiNT protocol to perform a ping and traceroute to a remote device

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
mint ping <MINT-ID> \{(count <1-10000>|size <1-64000>|timeout <1-10>)\}
mint traceroute <MINT-ID> \{(destination-port <1-65535>|max-hops <1-255>|source-port <1-65535>|timeout <1-255>)\}
```

**Parameters**
- mint ping <MINT-ID> \{(count <1-10000>|size <1-64000>|timeout <1-10>)\}
  - ping <MINT-ID> Sends a MiNT echo message to a specified destination
    - <MINT-ID> — Specify the destination device’s MiNT ID.
  - count <1-10000> Optional. Sets the pings to the MiNT destination
    - <1-10000> — Specify a value from 1 - 10000. The default is 3.
  - size <1-64000> Optional. Sets the MiNT payload size in bytes
    - <1-64000> — Specify a value from 1 - 640000 bytes. The default is 64 bytes.
  - timeout <1-10> Optional. Sets a response time in seconds
    - <1-10> — Specify a value from 1 sec - 10 sec. The default is 1 second.

- mint traceroute <MINT-ID> \{(destination-port <1-65535>|max-hops <1-255>|source-port <1-65535>|timeout <1-255>)\}
  - traceroute <MINT-ID> Prints the route packets trace to a device
    - <MINT-ID> — Specify the destination device’s MiNT ID.
  - destination-port <1-65535> Optional. Sets the Equal-cost Multi-path (ECMP) routing destination port
    - <1-65535> — Specify a value from 1 - 65535. The default port is 45.
  - max-hops <1-255> Optional. Sets the maximum number of hops a traceroute packet traverses in the forward direction
    - <1-255> — Specify a value from 1 - 255. The default is 30.
  - source-port <1-65535> Optional. Sets the ECMP source port
    - <1-65535> — Specify a value from 1 - 65535. The default port is 45.
  - timeout <1-255> Optional. Sets the minimum response time period in seconds
    - <1-255> — Specify a value from 1 sec - 255 sec. The default is 30 seconds.
Examples

rfs7000-37FABE>mint ping 68.22.9D.58 count 5 size 120
MiNT ping 68.22.9D.58 with 120 bytes of data.
  Response from 68.22.9D.58: id=1 time=0.341 ms
  Response from 68.22.9D.58: id=2 time=0.313 ms
  Response from 68.22.9D.58: id=3 time=0.314 ms
  Response from 68.22.9D.58: id=4 time=0.333 ms
  Response from 68.22.9D.58: id=5 time=0.291 ms
--- 68.22.9D.58 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.291/0.318/0.341 ms
rfs7000-37FABE>
2.1.21 no

User Exec Commands

Use the no command to revert a command or to set parameters to their default. This command turns off an enabled feature or reverts settings to default.

NOTE: The commands have their own set of parameters that can be reset.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [adoption|captive-portal|crypto|debug|logging|page|service|terminal|
    virtual-machine|wireless]

no adoption {on <DEVICE-OR-DOMAIN-NAME>}

no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>]
    {on <DEVICE-OR-DOMAIN-NAME>}

no crypto pki [server|trustpoint]
no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>}}
    {on <DEVICE-NAME>}

no logging monitor

no page

no service [block-adopter-config-update|locator|snmp|ssm|wireless]

no service snmp sysoid wing5

no service block-adopter-config-update

no service wireless [trace pattern {<WORD>} {on <DEVICE-NAME>}]|unsanctioned ap
    air-terminate <BSSID> {on <DOMAIN-NAME>}

no service locator {on <DEVICE-NAME>}

no terminal [length|width]

no virtual-machine assign-usb-ports {on <DEVICE-NAME>}

no wireless client [all|<MAC>]

no wireless client all {filter|on}

no wireless client all {filter [wlan <WLAN-NAME>]}

no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}

NOTE: The commands have their own set of parameters that can be reset.
### Parameters

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no <code>&lt;PARAMETERS&gt;</code></td>
<td>Resets or reverts settings based on the parameters passed</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

### Examples

```
>>> rfs7000-37FABE>no adoption
>>> rfs7000-37FABE>no page
>>> rfs7000-37FABE>no service cli-tables-expand line
```
2.1.22 on

User Exec Commands

Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

on rf-domain [RF-DOMAIN-NAME]|all]

**Parameters**

- on rf-domain [RF-DOMAIN-NAME]|all]
  - Enters the RF Domain context based on the parameter specified
  - <RF-DOMAIN-NAME> – Specify the RF Domain name. Enters the specified RF Domain context.
  - all – Specifies all RF Domains.

**Examples**

nx9500-6C8809(rf-domain-all)>

on RF-Domain Mode commands:

- clrscr Clears the display screen
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- service Service Commands
- show Show running system information

nx9500-6C8809(rf-domain-all)>
2.1.23 opendns

Retrieves the OpenDNS device-id from the OpenDNS site

This command integrates access points and controllers with OpenDNS. It obtains the device-id (16 character hex-string) from OpenDNS. This device-id is configured under all WLANs that are to be OpenDNS enabled. When configured and enabled on a WLAN, DNS queries from all wireless clients on the WLAN are redirected to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers. These OpenDNS resolvers act as proxy DNS servers, and also provide additional features, such as Web filtering, performance improvements etc.

**NOTE:** OpenDNS is a free, alternative DNS service that is faster and more reliable than other DNS services available. OpenDNS enables swift navigation of the Web without the outages that are frequent in other ISP provided DNS services. It also blocks inappropriate Web sites, phishing sites, and prevents virus and malware attacks.

**NOTE:** The ‘username’ and ‘password’ values passed in this command should be pre-registered with the OpenDNS site. The ‘label’ can be any value. Only with a combination of a valid ‘username’, ‘password’, and any ‘label’ the OpenDNS server returns a device-id.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>`

**Parameters**

- **username <USERNAME>**
  - Configures the OpenDNS user name (should be valid username registered with OpenDNS)
  - `<USERNAME>` – Provide the OpenDNS user name.

- **password <OPENDNS-PSWD>**
  - Configures the password associated with the user configured in the previous step
  - `<OPENDNS-PSWD>` – Provide the OpenDNS password for the user.

- **label <LABEL>**
  - Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal.
  - `<LABEL>` – Specify your OpenDNS server label.

**Note:** For every unique set of username, password, and label only one device-id is returned. Apply this device-id in WLANs that are to be OpenDNS enabled. For information on configuring the device-id in the WLAN context, see `opendns`.
Usage Guidelines
Use your OpenDNS credentials to logon to the opendns.org site and use the labels, edit settings, and customize content filtering options to configure Web filtering settings.

Examples
ap7131-E6D512#opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...

device_id = 0014AADF8EDC6C59
ap7131-E6D512#
2.1.24 page

User Exec Commands

Toggles a device's paging function. Enabling this command displays the CLI command output page by page, instead of running the entire output at once.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```

2.1.25 ping

User Exec Commands

Sends Internet Controller Message Protocol (ICMP) echo messages to a user-specified location.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|source [<IP]|pppoe|vlan <1-4094>|wwan}]

Parameters
- ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|source [<IP]|pppoe|vlan <1-4094>|wwan}]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Specify the destination IP address or hostname. When entered without any parameters, this command prompts for an IP address or a hostname.</td>
</tr>
</tbody>
</table>
| count <1-10000> | Optional. Sets the pings to the specified destination<br>
|                 | • <1-10000> — Specify a value from 1 - 10000. The default is 5.             |
| dont-fragment   | Optional. Sets the don’t fragment bit in the ping packet. Packets with the dont-fragment bit specified are not fragmented. When a packet, with the dont-fragment bit specified, exceeds the specified maximum transmission unit (MTU) value, an error message is sent from the device trying to fragment it.<br>
| {count|size}     | • count <1-10000> — Optional. Sets the pings to the specified destination from 1 - 10000. The default is 5.<br>
|                 | • size <1-64000> — Optional. Sets the ping payload size from 1 - 64000 bytes. The default is 100 bytes. |
| size <1-64000>  | Optional. Sets the ping payload size in bytes<br>
|                 | • <1-64000> — Specify the ping payload size from 1 - 64000. The default is 100 bytes. |
| source[<IP]|pppoe|vlan <1-4094>|wwan] | Optional. Sets the source address or interface name. This is the source of the ICMP packet to the specified destination.<br>
|                 | • <IP> — Specifies the source IP address<br>
|                 | • pppoe — Selects the PPP over Ethernet interface<br>
|                 | • vlan <1-4094> — Selects the VLAN interface from 1 - 4094<br>
|                 | • wwan — Selects the wireless WAN interface |
Examples

rfs7000-37FABE>ping 172.16.10.4 count 6
PING 172.16.10.4 (172.16.10.4): 100 data bytes
108 bytes from 172.16.10.4: seq=0 ttl=64 time=0.851 ms
108 bytes from 172.16.10.4: seq=1 ttl=64 time=0.430 ms
108 bytes from 172.16.10.4: seq=2 ttl=64 time=0.509 ms
108 bytes from 172.16.10.4: seq=3 ttl=64 time=0.507 ms
108 bytes from 172.16.10.4: seq=4 ttl=64 time=0.407 ms
108 bytes from 172.16.10.4: seq=5 ttl=64 time=0.402 ms

--- 172.16.10.4 ping statistics ---
6 packets transmitted, 6 packets received, 0% packet loss
round-trip min/avg/max = 0.402/0.517/0.851 ms
rfs7000-37FABE>

rfs7000-6DCD4B>ping 10.2.0.99 source vlan 1
PING 10.2.0.99 (10.2.0.99) from 172.18.0.2 vlan1: 100(128) bytes of data.
108 bytes from 10.2.0.99: icmp_seq=1 ttl=63 time=1.09 ms
108 bytes from 10.2.0.99: icmp_seq=2 ttl=63 time=0.648 ms
108 bytes from 10.2.0.99: icmp_seq=3 ttl=63 time=0.735 ms
108 bytes from 10.2.0.99: icmp_seq=4 ttl=63 time=0.746 ms
108 bytes from 10.2.0.99: icmp_seq=5 ttl=63 time=0.732 ms

--- 10.2.0.99 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4001ms
rtt min/avg/max/mdev = 0.648/0.790/1.091/0.156 ms
rfs7000-6DCD4B>
2.1.26 ping6

User Exec Commands

Sends ICMPv6 echo messages to a user-specified IPv6 address

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ping6 <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}

Parameters

- ping <IPv6/HOSTNAME> {<INTF-NAME>} {(count <1-10000>|size <1-64000>)}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IPv6/HOSTNAME&gt;</td>
<td>Specify the destination IPv6 address or hostname.</td>
</tr>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Specify the interface name for link local/broadcast address</td>
</tr>
<tr>
<td>count &lt;1-10000&gt;</td>
<td>Optional. Sets the pings to the specified IPv6 destination.</td>
</tr>
<tr>
<td>size &lt;1-64000&gt;</td>
<td>Optional. Sets the IPv6 ping payload size in bytes.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To configure a device's IPv6 address, in the VLAN interface configuration mode, use the `ipv6 > address <IPv6-ADDRESS>` command. After configuring the IPv6 address, use the `ipv6 > enable` command to enable IPv6. For more information see, `ipv6`.

Examples

```
rfs4000-1B3596(config-device-00-23-68-1B-35-96-if-ge4)#show ipv6 interface brief
---------------------------------------------------------------------------------------
INTERFACE          IPV6 MODE  IPV6-ADDRESS/MASK                             TYPE
STATUS   PROTOCOL
---------------------------------------------------------------------------------------
vlan1              True       fe80::223:68ff:fe88:da7/64                    Link-Local
    UP       up
vlan1         True     2001:10:10:10:10:10:10:1/64                Global-Permanent
    UP       up
vlan2            False      UNASSIGNED                                     None
    UP       up
---------------------------------------------------------------------------------------
rfs4000-1B3596(config-device-00-23-68-1B-35-96-if-ge4)#
108 bytes from 2001:10:10:10:10:10:10:1: icmp_seq=1 ttl=64 time=0.401 ms
108 bytes from 2001:10:10:10:10:10:10:1: icmp_seq=2 ttl=64 time=0.311 ms
108 bytes from 2001:10:10:10:10:10:10:1: icmp_seq=3 ttl=64 time=0.300 ms
108 bytes from 2001:10:10:10:10:10:10:1: icmp_seq=4 ttl=64 time=0.309 ms
108 bytes from 2001:10:10:10:10:10:10:1: icmp_seq=5 ttl=64 time=0.299 ms
108 bytes from 2001:10:10:10:10:10:10:1: icmp_seq=6 ttl=64 time=0.313 ms
6 packets transmitted, 6 received, 0% packet loss, time 6999ms
rtt min/avg/max/mdev = 0.299/0.318/0.401/0.031 ms
```

rfs4000-229D58>
### 2.1.27 ssh

**User Exec Commands**

Opens a Secure Shell (SSH) connection between two network devices.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ssh <IP/HOSTNAME> <USERNAME> {<INF-NAME/LINK-LOCAL-ADD>}
```

**Parameters**
- **ssh <IP/HOSTNAME> <USERNAME> {<INF-NAME/LINK-LOCAL-ADD>}**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Specify the remote system’s IP address or hostname.</td>
</tr>
<tr>
<td>&lt;USERNAME&gt;</td>
<td>Specify the name of the user requesting SSH connection with the remote system.</td>
</tr>
<tr>
<td>&lt;INF-NAME/LINK-LOCAL-ADD&gt;</td>
<td>Optional. Specify the interface’s name or link local address.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809>ssh 192.168.13.15 admin
admin@192.168.13.15’s password:
rfs7000-37FABE>
```
2.1.28 telnet

Open a Telnet session between two network devices

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
```
telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}
```

Parameters
- telnet <IP/HOSTNAME> {<TCP-PORT>} {<INTF-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Configures the destination remote system’s IP (IPv4 or IPv6) address or hostname. The Telnet session is established between the connecting system and the remote system.</td>
</tr>
<tr>
<td></td>
<td>- &lt;IP/HOSTNAME&gt; — Specify the remote system’s IPv4 or IPv6 address or hostname.</td>
</tr>
<tr>
<td>&lt;TCP-PORT&gt;</td>
<td>Optional. Specify the Transmission Control Protocol (TCP) port number.</td>
</tr>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Optional. Specify the interface name for the link local address.</td>
</tr>
</tbody>
</table>

Examples
```
nx4500-5CFA8E>telnet 192.168.13.13
Entering character mode
Escape character is '^]'.

NX9500 release 5.8.0.0-027D
nx9500-6C8809 login: admin
Password:
nx9500-6C8809>
```
2.1.29 terminal

Sets the length and width of the CLI display window on a terminal

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
terminal [length|width] <0-512>
```

Parameters

- `terminal [length|width] <0-512>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `length <0-512>` | Sets the number of lines displayed on the terminal window  
  - `<0-512>` — Specify a value from 0 - 512. |
| `width <0-512>` | Sets the width (the number of characters displayed in one line) of the terminal window  
  - `<0-512>` — Specify a value from 0 - 512. |

Examples

```
rfs7000-37FABE>terminal length 150
rfs7000-37FABE>terminal width 215
rfs7000-37FABE>show terminal
Terminal Type: xterm
Length: 150     Width: 215
rfs7000-37FABE>
```

Related Commands

```
no
```

Resets the width and length of the terminal window
2.1.30 time-it

- **User Exec Commands**

Verifies the time taken by a particular command between request and response

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
time-it <COMMAND>
```

**Parameters**

- `time-it <COMMAND>`

<table>
<thead>
<tr>
<th>time-it &lt;COMMAND&gt;</th>
<th>Verifies the time taken by a particular command to execute and provide a result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;COMMAND&gt;</td>
<td>Specify the command.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE>time-it enable
That took 0.00 seconds..
rfs7000-37FABE#`
```
2.1.31 **traceroute**

> **User Exec Commands**

Traces the route to a defined destination

Use `--help` or `-h` to display a complete list of parameters for the traceroute command

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
traceroute <LINE>
```

**Parameters**

- `traceroute <LINE>` Traces the route to a destination IP address or hostname
- `<LINE>` – Specify the destination IPv6 address or hostname.

**Examples**

```bash
rfs7000-37FABE> traceroute --help
BusyBox v1.14.1 () multi-call binary
Usage: traceroute [-F1ldnr] [-f lst_ttl] [-m max_ttl] [-p port#] [-q nqueries]
         [-s src_addr] [-t tos] [-w wait] [-g gateway] [-i iface]
         [-z pausemsecs] HOST [data size]
Trace the route to HOST
Options:
   -F      Set the don't fragment bit
   -I      Use ICMP ECHO instead of UDP datagrams
   -l      Display the ttl value of the returned packet
   -d      Set SO_DEBUG options to socket
   -n      Print hop addresses numerically rather than symbolically
   -r      Bypass the normal routing tables and send directly to a host
   -v      Verbose
   -m max_ttl  Max time-to-live (max number of hops)
   -p port#    Base UDP port number used in probes (default is 33434)
   -q nqueries Number of probes per 'ttl' (default 3)
   -s src_addr  IP address to use as the source address
   -t tos      Type-of-service in probe packets (default 0)
   -w wait     Time in seconds to wait for a response (default 3 sec)
   -g          Loose source route gateway (8 max)
```

```bash
rfs7000-6DCD4B> traceroute 192.168.13.16
traceroute to 192.168.13.16 (192.168.13.16), 30 hops max, 38 byte packets
 1  192.168.13.16 (192.168.13.16)  5.071 ms  0.294 ms  0.283 ms
rfs7000-6DCD4B>
```
2.1.32 traceroute6

User Exec Commands

Traces the route to a specified IPv6 destination

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

traceroute6 <LINE>

Parameters

- traceroute6 <LINE>
  Traces the route to a destination IPv6 address or hostname
  - <LINE> — Specify the destination IPv6 address or hostname.

Examples

rfs4000-229D58>traceroute6 2001:10:10:10:10:10:10:1
rfs4000-229D58>
2.1.33 **watch**

Repeats the specified CLI command at periodic intervals

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

\[ \text{watch \ <1-3600> \ <LINE>} \]

**Parameters**

- watch \(<1-3600> \ <LINE>\)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>watch</td>
<td>Repeats a CLI command at a specified interval (in seconds)</td>
</tr>
<tr>
<td>(&lt;1-3600&gt;)</td>
<td>Select an interval from 1 - 3600 sec. Pressing CTRL-Z halts execution of the command.</td>
</tr>
<tr>
<td>(&lt;LINE&gt;)</td>
<td>Specify the CLI command.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-6DCD4B>watch 40 ping 192.168.13.16
PING 192.168.13.16 (192.168.13.16) 100(128) bytes of data.
108 bytes from 192.168.13.16: icmp_seq=1 ttl=64 time=0.565 ms
108 bytes from 192.168.13.16: icmp_seq=2 ttl=64 time=0.393 ms
108 bytes from 192.168.13.16: icmp_seq=3 ttl=64 time=0.344 ms
108 bytes from 192.168.13.16: icmp_seq=4 ttl=64 time=0.433 ms
108 bytes from 192.168.13.16: icmp_seq=5 ttl=64 time=0.352 ms
--- 192.168.13.16 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3997ms
rtt min/avg/max/mdev = 0.344/0.417/0.565/0.082 ms

rfs7000-6DCD4B>
```
2.1.34 exit

User Exec Commands

Ends the current CLI session and closes the session window

For more information, see exit.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

exit

Parameters

None

Examples

rfs7000-37FABE>exit
2.1.35 **smart-cache**

Pre-fetches cached content from the specified list of URLs.

Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see *smart-cache-policy*.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
smart-cache pre-fetch-immediate <URL-LIST-NAME>
```

**Parameters**

- **smart-cache pre-fetch-immediate <URL-LIST-NAME>**

<table>
<thead>
<tr>
<th>smart-cache</th>
<th>Pre-fetches content from the specified list of URLs</th>
</tr>
</thead>
<tbody>
<tr>
<td>pre-fetch-immediate &lt;URL-LIST-NAME&gt;</td>
<td>Provide the URL list names (should be existing and configured). For more information on configuring URL lists, see <em>url-list</em>.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx4500-5CFA2B#smart-cache pre-fetch-immediate ?
      URL-LIST  URL List to be Pre Fetched

nx4500-5CFA2B#
```
2.1.36 virtual-machine

User Exec Commands

Installs, configures, and monitors the status of third-party virtual machines (VMs).

In addition to the WiNG VMs, the NX45XX, NX65XX, NX9500, and NX9510 series service platforms support the installation and administration of third-party VMs. However, the third-party VMs supported by these devices varies.

The third-party VMs supported on NX45XX and NX65XX are:

- TEAM-URC
- TEAM-RLS
- TEAM-VoWLAN

The VM supported on NX9500 and NX9510 is:

- ADSP

Use the virtual-machine command to install the third-party VMs, and configure parameters, such as install media type and location, number of Virtual Central Processing Units (VCPUS), VM memory, VM disk, number of Virtual Network Interfaces (VIFs), and Virtual Networking Computing (VNC) port.

Installing third-party VMs saves on hardware cost and provides a unified VM management interface.

This section is organized into the following sub-sections:

- Syntax
- Syntax

virtual-machine stop [\(<VM-NAME>|team-urc|team-rls|team-vowlan\) \{on \(<DEVICE-NAME>\)\}
virtual-machine stop hard [\(<VM-NAME>|team-urc|team-rls|team-vowlan\) \{on \(<DEVICE-NAME>\)\}
virtual-machine uninstall [\(<VM-NAME>|team-urc|team-rls|team-vowlan\) \{on \(<DEVICE-NAME>\)\]

Parameters NX45XX, NX65XX
- virtual-machine assign-usb-ports team-vowlan \{on \(<DEVICE-NAME>\)\}

<table>
<thead>
<tr>
<th>assign-usb-ports</th>
<th>team-vowlan</th>
<th>Assigns USB ports to TEAM-VoWLAN on a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• on (&lt;DEVICE-NAME&gt;) – Optional. Specify the device name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Use the <code>no &gt; virtual-machine &gt; assign-usb-ports</code> to reassign the port to WiNG.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.</td>
</tr>
</tbody>
</table>

- virtual-machine console [\(<VM-NAME>|team-urc|team-rls|team-vowlan\) \{on \(<DEVICE-NAME>\)\]

| virtual-machine console | \(<VM-NAME>|team-urc|team-rls|team-vowlan\) | Connects to the VM’s console, based on the parameters passed. Select one of the following console options: |
|-------------------------|--------------------------|---------------------------------------------------------------------------------|
|                         |                          | • \(<VM-NAME>\) – Connects to the console of the VM identified by the \(<VM-NAME>\) keyword. Specify the VM name. |
|                         |                          | • team-urc – Connects to the VM TEAM Unified Retail Communication’s (URC) (IP-PBX) console |
|                         |                          | • team-rls – Connects to the VM TEAM Radio Link Service (RLS) server’s console |
|                         |                          | • team-vowlan – Connects to the VM TEAM-VoWLAN’s (Voice over WLAN) console |

- virtual-machine export \(<VM-NAME>\) \[\(<FILE>|<URL>\) \{on \(<DEVICE-NAME>\)\]

| virtual-machine export | \(<VM-NAME>\) \[\(<FILE>|<URL>\) \{on \(<DEVICE-NAME>\)\] | Exports an existing VM image and settings. Use this command to export the VM to another NX45XX or NX65XX device in the same domain. |
|------------------------|---------------------------------------------------------------|---------------------------------------------------------------------------------|
|                       | • \(<VM-NAME>\) – Specify the VM name. |
|                       | • \(<FILE>\) – Specify the location and name of the source file (VM image). The VM image is retrieved and exported from the specified location. |
|                       | • \(<URL>\) – Specify the destination location. This is the location to which the VM image is copied. Use one of the following formats to provide the destination path: |
|                       | tftp://\(<hostname|IP>[:<port>]/\<path>\\<file> |
|                       | ftp://\(<username>:\<password>@\<hostname|IP>[:<port>]/\<path>\\<file> |
|                       | sftp://\(<username>:\<password>@\<hostname|IP>[:<port>]/\<path>\\<file> |
|                       | http://\<hostname|IP>[:<port>]/\<path>\\<file> |
|                       | • on \(<DEVICE-NAME>\) – Optional. Executes the command on a specified device or devices |
|                       | • \(<DEVICE-NAME>\) – Specify the service platform name. In case of multiple devices, list the device names separated by commas. |
|                       | **Note:** The VM should be in a stop state during the export process. |
|                       | **Note:** If the destination is a device, the image is copied to a predefined location (VM archive). |
• **virtual-machine install** `<VM-NAME>` `type [disk|iso disk-size <SIZE>|vm-archive] install-media [<FILE>|<URL>|<USB>] {autostart|memory|on|vcpus|vif-count|vnc}`

<table>
<thead>
<tr>
<th>virtual-machine install</th>
<th>Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;VM-NAME&gt;</code></td>
<td>Specify the VM name.</td>
</tr>
<tr>
<td><code>type</code></td>
<td>Specify the install-media (image) type. The options are:</td>
</tr>
<tr>
<td><code>disk</code></td>
<td>Specifies the install media type as pre-installed OS disk image (located in the flash memory)</td>
</tr>
<tr>
<td><code>iso disk-size &lt;SIZE&gt;</code></td>
<td>Specifies the install media type as ISO file. This is a single file, which contains the OS bootable install media.</td>
</tr>
<tr>
<td><code>vm-archive</code></td>
<td>Specifies the install media type as VM archive. The VM archive file is a tar.gz file consisting of a pre-installed OS disk image and an associated configuration file. The configuration is a standard libvirt VM template consisting of VM specific information.</td>
</tr>
<tr>
<td><code>install-media</code> `&lt;FILE&gt;</td>
<td>&lt;URL&gt;</td>
</tr>
<tr>
<td><code>&lt;FILE&gt;</code></td>
<td>Specifies the install-media file is located on flash, for example flash:/cache</td>
</tr>
<tr>
<td><code>&lt;URL&gt;</code></td>
<td>Specifies the install-media file is located on a remote URL. Provide the URL using one of the following formats:</td>
</tr>
<tr>
<td></td>
<td>tftp://&lt;hostname</td>
</tr>
<tr>
<td></td>
<td>ftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname</td>
</tr>
<tr>
<td></td>
<td>sftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname</td>
</tr>
<tr>
<td></td>
<td>http://&lt;hostname</td>
</tr>
<tr>
<td><code>&lt;USB&gt;</code></td>
<td>Specifies the install-media file is located on a USB. Provide the USB path and file name using the following format:</td>
</tr>
<tr>
<td></td>
<td>usb&lt;n&gt;:/path/file</td>
</tr>
</tbody>
</table>

After specifying the image location, you may provide the following information:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>autostart</td>
<td>Optional. Specifies whether to autostart the VM on system reboot</td>

virtual-machine set [autostart |ignore|start] |memory <512-8192>|vcpus <1-4>|
vif-count <0-2>|vif-mac <VIF-INDEX> <MAC-INDEX>|vif-to-vmif <VIF-INDEX> <VMIF-INDEX>|
vnc [disable|enable]] [ <VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

Configures the VM settings

- **autostart** – Specifies whether to autostart the VM on system reboot
- **ignore** – Enables autostart on each system reboot
- **start** – Disables autostart

- **memory** – Defines the VM memory size
  - `<512-8192>` – Specify the VM memory from 512 - 8192 MB. The default is 1024 MB.

- **vcpus** – Specifies the number of VCPUS for this VM
  - `<1-4>` – Specify the number of VCPUS from 1 - 4.

- **vif-count** – Configures or resets the VM’s VIFs
  - `<0-2>` – Specify the VIF number from 0 - 2.

- **vif-mac** – Configures the MAC address of the selected virtual network interface
  - `<1-2>` – Select the VIF
  - `<1-8>` – Specify the MAC index for the selected VIF
  - `<MAC>` – Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format.

Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the ‘set’ keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the dataplane (referred to as VMIF). These VMIFs are standard l2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM’s interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the **vif-to-vmif** command to map a VIF to a VMIF on the DP bridge.

- **vnc** – Disables/enables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client.
  - **disable** – Disables VNC port
  - **enable** – Enables VNC port

Contd..
The following keywords are common to all of the above parameters:

- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Note:** This command releases the VM's resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.

---

**Syntax NX9500 and NX9510**

- `virtual-machine console adsp`
- `virtual-machine install [adsp] {on <DEVICE-NAME>}`
- `virtual-machine restart [adsp] {on <DEVICE-NAME>}`
- `virtual-machine set disk-size <100-500> adsp {on <DEVICE-NAME>}`
- `virtual-machine set wing-memory <12288-32739>`
- `virtual-machine [start|stop] adsp {on <DEVICE-NAME>}`
- `virtual-machine uninstall adsp {on <DEVICE-NAME>}`

---

**Parameters NX9500 and NX9510**

- `virtual-machine console adsp`

**virtual-machine console**

Connects to the Air-Defense Services Platform (ADSP) VM’s management console

When ADSP is running on the NX9500 and NX9510 model service platforms, WiNG communicates with ADSP using a single sign-on (SSO) authentication mechanism. Once the user is logged in, WiNG gains access to ADSP without being prompted to login again at ADSP. However, the WiNG and ADSP databases are not synchronized. ADSP has its own user database, stored locally within its VM, which is accessed whenever a user logs directly into ADSP.

WiNG and ADSP must be consistent in the manner events are reported up through a network hierarchy to ensure optimal interoperability and event reporting. To provide such consistency, WiNG has added support for an ADSP-like hierarchal tree. The tree resides within WiNG, and ADSP reads it from WiNG and displays the network hierarchy in its own ADSP interface. The hierarchal tree can also be used to launch ADSP modules (like Spectrum Analyzer) directly from WiNG. For more information on configuring WiNG tree-node structure, see `tree-node`.

- `virtual-machine install adsp {on <DEVICE-NAME>}`

**virtual-machine install**

Installs the ADSPVM

- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
- <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Before installing the ADSP VM, execute the upgrade command, giving the path and file name of the ADSP firmware image. This extracts the image on to the device (NX9500 or NX9510) on which the command has been executed. On successful completion of this process, execute the reload command to reboot the device. Once the device has been successfully rebooted, execute the `virtual-machine > install > adsp` command.

Contd..
### virtual-machine restart adsp {on <DEVICE-NAME>}

Restarts the ADSP VM
- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

### virtual-machine set disk-size <100-500> adsp {on <DEVICE-NAME>}

Sets the ADSP VM’s disk size (in GB). Specify a value from 100 - 500 GB.
- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Note:** Stop the ADSP VM before executing this command.

### virtual-machine set memory <512-8192> adsp {on <DEVICE-NAME>}

Modifies the ADSP VM’s memory. Specify a value from 512 - 8192 MB.
- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
- **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

### virtual-machine set wing-memory <12288-32739>

Specifies the WiNG memory size in MB
**Note:** This command is applicable only to the NX9500 and NX9510 service platforms. Use the show > virtual-machine-configuration command to view the configured memory allocation. Use the show > virtual-machine-statistics to view the current allocated memory allocation.
- **<12288-32739>** – Specify a value from 12288 - 32739 MB. The default is 18432 MB.

**Note:** The new memory setting takes effect only after the next boot.
**virtual-machine [start|stop] adsp {on <DEVICE-NAME>}

Starts/stops the ADSP VM
- **start** – Starts the ADSP VM. Use this command to boot a shut down VM (in a stop state).
- **stop** – Stops a running ADSP VM. Use this command to shut down a running VM.
  - **on <DEVICE-NAME>** – Optional. Executes the start/stop command on a specified device or devices
    - **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**virtual-machine uninstall adsp {on <DEVICE-NAME>}

Uninstalls the ADSP VM
- **on <DEVICE-NAME>** – Optional. Executes the command on a specified device or devices
  - **<DEVICE-NAME>** – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

---

**Examples**

The following examples show the VM installation process:

**Installation media: USB**

```
<DEVICE>#virtual-machine install <VM-NAME> type iso disk-size 8 install-media usb1://vms/wind7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable
```

In the preceding example, the command is executed on the device identified by the `<DEVICE-NAME>` keyword. In such a scenario, the disk-size is ignored if specified. The VM has the install media as first boot device.

**Installation media: pre-installed disk image**

```
<DEVICE>#virtual-machine install <VM-NAME> type disk install-media flash:/vms/win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on <DEVICE-NAME>
```

In the preceding example, the default configuration attached with the VM archive overrides any parameters specified.

**Exporting an installed VM:**

```
<DEVICE>#virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>
```

In the preceding example, the command copies the VM archive on to the URL (VM should be in stop state).

```
nx4500-5CFA2B>virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.
nx4500-5CFA2B>
```

---

**NOTE:** Use the `show > virtual-machine > [configuration|debugging|export|statistics]` command to view installed VM details.
Most PRIV EXEC commands set operating parameters. Privileged-level access should be password protected to prevent unauthorized use. The PRIV EXEC command set includes commands contained within the USER EXEC mode. The PRIV EXEC mode also provides access to configuration modes, and includes advanced testing commands.

The PRIV EXEC mode prompt consists of the hostname of the device followed by a pound sign (#).

To access the PRIV EXEC mode, enter the following at the prompt:

<DEVICE>>enable
<DEVICE>#

The PRIV EXEC mode is often referred to as the enable mode, because the enable command is used to enter the mode.

There is no provision to configure a password to get direct access to PRIV EXEC (enable) mode.

<DEVICE>#

Privileged command commands:

- archive: Manage archive files
- boot: Boot commands
- captive-portal-page-upload: Captive portal advanced page upload
- cd: Change current directory
- change-passwd: Change password
- clear: Clear
- clock: Configure software system clock
- cluster: Cluster commands
- commit: Commit all changes made in this session
- configure: Enter configuration mode
- connect: Open a console connection to a remote device
- copy: Copy contents of one dir to another
- cpe: T5 CPE configuration
- create-cluster: Create a cluster
- crypto: Encryption related commands
- crypto-cmp-cert-update: Update the cmp certs
- database: Database commands
- database-backup: Backup database
- database-restore: Restore database
- debug: Debugging functions
- delete: Deletes specified file from the system
- device-upgrade: Device firmware upgrade
- diff: Display differences between two files
- dir: List files on a filesystem
- disable: Turn off privileged mode command
- edit: Edit a text file
- enable: Turn on privileged mode command
- erase: Erase a filesystem
- ex3500: EX3500 commands
file-sync                   File sync between controller and adoptees
format                      Format file system
halt                        Halt the system
help                        Description of the interactive help system
join-cluster                Join the cluster
l2tpv3                      L2tpv3 protocol
logging                     Modify message logging facilities
mint                        MiNT protocol
mkdir                       Create a directory
more                        Display the contents of a file
no                          Negate a command or set its defaults
on                          On RF-Domain
opendns                     Opendns username/password configuration
page                        Toggle paging
ping                        Send ICMP echo messages
ping6                       Send ICMPv6 echo messages
pwd                         Display current directory
raid                        RAID operations
re-elect                    Perform re-election
reload                      Halt and perform a warm reboot
remote-debug                Troubleshoot remote system(s)
rename                      Rename a file
revert                      Revert changes
rmkdir                      Delete a directory
self                        Config context of the device currently logged into
service                     Service Commands
show                        Show running system information
smart-cache                 Content Cache Operation
ssh                         Open an ssh connection
t5                          T5 commands
telnet                      Open a telnet connection
time-it                     Check how long a particular command took between request and completion of response
ttraceroute                 Trace route to destination
traceroute6                 Trace route to destination(IPv6)
upgrade                     Upgrade software image
upgrade-abort               Abort an ongoing upgrade
virtual-machine             Virtual Machine
watch                       Repeat the specific CLI command at a periodic interval
write                       Write running configuration to memory or terminal
clrscr                      Clears the display screen
exit                        Exit from the CLI

**NOTE:** The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character.
## 3.1 Privileged Exec Mode Commands

The following table summarizes the PRIV EXEC Mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>archive</td>
<td>Manages file archive operations</td>
<td>page 3-6</td>
</tr>
<tr>
<td>boot</td>
<td>Specifies the image used after reboot</td>
<td>page 3-8</td>
</tr>
<tr>
<td>captive-portal-page-upload</td>
<td>Uploads captive portal advanced pages</td>
<td>page 3-9</td>
</tr>
<tr>

---

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS.*

---

**NOTE:** The input parameter `<HOSTNAME>`, if used in syntaxes across this chapter, cannot include an underscore (_) character.
3.1.1 archive

*Privileged Exec Mode Commands*

Manages file archive operations

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

- archive tar /table [<FILE>|<URL>]
- archive tar /create [<FILE>|<URL>] <FILE>
- archive tar /xtract [<FILE>|<URL>] <DIR>

**Parameters**

- **archive tar /table [<FILE>|<URL>]**
  - tar: Manipulates (creates, lists, or extracts) a tar file
  - /table: Lists the files in a tar file
  - <FILE>: Defines a tar filename
  - <URL>: Sets the tar file URL

- **archive tar /create [<FILE>|<URL>] <FILE>**
  - tar: Manipulates (creates, lists or extracts) a tar file
  - /create: Creates a tar file
  - <FILE>: Defines tar filename
  - <URL>: Sets the tar file URL

- **archive tar /xtract [<FILE>|<URL>] <DIR>**
  - tar: Manipulates (creates, lists or extracts) a tar file
  - /xtract: Extracts content from a tar file
  - <FILE>: Defines tar filename
  - <URL>: Sets the tar file URL
  - <DIR>: Specify a directory name. When used with /create, dir is the source directory for the tar file. When used with /xtract, dir is the destination file where contents of the tar file are extracted.

3.1.2 boot

Specifies the image used after reboot

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

boot system [primary|secondary] {on <DEVICE-NAME>}

Parameters

- boot system [primary|secondary] {on <DEVICE-NAME>}

| system [primary|secondary] | Specifies the image used after a device reboot |
|---------------------------|-----------------------------------------------|
|                          | • primary – Uses the primary image after reboot |
|                          | • secondary – Uses the secondary image after reboot |

<table>
<thead>
<tr>
<th>on &lt;DEVICE-NAME&gt;</th>

```
3.1.3 captive-portal-page-upload

Uploads captive portal advanced pages to connected access points. Use this command to provide connected access points with specific captive portal configurations so they can successfully provision login, welcome, and condition pages to requesting clients attempting to access the wireless network using the captive portal.

NOTE: Ensure that the captive portal pages to be uploaded are *.tar files.

Syntax

```
captive-portal-page-upload [cancel-upload|delete-file|load-file]
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [all|rf-domain] {upload-time <TIME>}
captive-portal-page-upload <CAPTIVE-PORTAL-NAME> rf-domain [all] {from-controller} {(upload-time <TIME>)}
captive-portal-page-upload cancel-upload [all|on rf-domain [all]]
captive-portal-page-upload delete-file <CAPTIVE-PORTAL-NAME> <FILE-NAME>
captive-portal-page-upload load-file <CAPTIVE-PORTAL-NAME> <URL>
```

Parameters

- `captive-portal-page-upload <CAPTIVE-PORTAL-NAME> [all|rf-domain]` Uploads advanced pages specified by the `<CAPTIVE-PORTAL-NAME>` parameter
  - `<CAPTIVE-PORTAL-NAME>` – Specify captive portal name (should be existing and configured).
  - `<MAC/HOSTNAME>` – Specify the AP's MAC address or hostname.
  - `all` Uploads to all APs
  - `upload-time <TIME>` Optional. Schedules an upload time
    - `<TIME>` – Specify upload time in the MM/DD/YYYY-HH:MM or HH:MM format.
<table>

<td>Success</td>
<td>Added 6 APs to upload queue</td>
</tr>
</tbody>
</table>

```
ap6562-B1A214# captive-portal-page-upload captive_portal_test all
```

---

### Captive Portal Page Upload Command

- `<CAPTIVE-PORTAL-NAME>` - Specifies location of the captive-portal’s advanced pages. Use one of the following formats:

**IPv4 URLs:**
- `tftp://<hostname|IP>[:port]/path/file`
- `ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
- `sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
- `http://<hostname|IP>[:port]/path/file`
- `cf://path/file`
- `usb<n>://path/file`

**IPv6 URLs:**
- `tftp://<hostname|IPv6>[:port]/path/file`
- `ftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file`
- `sftp://<user>:<passwd>@<hostname|IPv6>[:port]/path/file`
- `http://<hostname|IPv6>[:port]/path/file`

**Note:** The captive portal pages are downloaded to the controller from the location specified here. After downloading use the `captive-portal-page-upload` command to upload these pages to APs.
3.1.4 cd

Privileged Exec Mode Commands

Changes the current directory

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
cd {<DIR>}
```

Parameters

- `cd {<DIR>}`

  | `<DIR>` | Optional. Changes the current directory to the directory identified by the `<DIR>` keyword. If a directory name is not provided, the system displays the current directory. |

Examples

```
rfs7000-37FABE#cd flash:/log/
rfs7000-37FABE#pwd
flash:/log/
rfs7000-37FABE#
```
### 3.1.5 change-passwd

Changes the password of a logged user. When this command is executed without any parameters, the password can be changed interactively.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
change-passwd \{<OLD-PASSWORD>\} <NEW-PASSWORD>
```

**Parameters**

- `change-passwd \{<OLD-PASSWORD>\} <NEW-PASSWORD>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;OLD-PASSWORD&gt;\</td>
<td>Optional. Specify the password to be changed.</td>
</tr>
<tr>
<td>&lt;NEW-PASSWORD&gt;\</td>
<td>Specify the new password.</td>
</tr>
</tbody>
</table>

**Note:** The password can also be changed interactively. To do so, press `[Enter]` after the command.

**Usage Guidelines**

A password must be from 1 - 64 characters.

**Examples**

```
rfs7000-37FABE#change-passwd
Enter old password:
Enter new password:
Password for user 'admin' changed successfully
Please write this password change to memory(write memory) to be persistent.
rfs7000-37FABE#write memory
OK
rfs7000-37FABE#
```
3.1.6 clear

Privileged Exec Mode Commands

Clears parameters, cache entries, table entries, and other entries. The clear command is available for specific commands only. The information cleared using this command varies depending on the mode where the clear command is executed.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

NOTE: When using the clear command, refer to the interface details provided in Chapter 7, PROFILES, section interface.

Syntax

clear [arp-cache|bonjour|cdp|counters|crypto|event-history|firewall|gre|ip|ipv6|
    l2tpv3-stats|license|lldp|logging|mac-address-table|mint|role|rtls|smart-cache|
    spanning-tree|traffic-shape|vrrp]
clear arp-cache {on <DEVICE-NAME>}
clear bonjour cache {on <DEVICE-NAME>}
clear [cdp|lldp] neighbors {on <DEVICE-NAME>}
clear counters [all|ap|bridge|interface|radio|router|thread|wireless-client]
clear counters [all|bridge|router|thread]
clear counters [ap|wireless-client] {<MAC>} {on <DEVICE-OR-DOMAIN-NAME>}
clear counters interface [{INTERFACE-NAME}|all|ge <1-X>|me1|port-channel <1-X>|pppoel|
    vlan <1-4094>|wwan1|vmif <1-X>|xge <1-4>]
clear counters radio {<MAC/HOSTNAME>|on}
clear counters radio {<MAC/HOSTNAME> <1-X>} {on <DEVICE-OR-DOMAIN-NAME>}
clear crypto [ike|ipsec]
clear crypto ike sa [<IP>|all] {on <DEVICE-NAME>}
clear crypto ipsec sa {on <DEVICE-NAME>}

clear traffic-shape class <1-4> {(on <DEVICE-NAME>)}
clear vrrp [error-stats|stats] {on <DEVICE-NAME>}

The following clear command is specific to the NX45XX, NX65XX, and NX9XXX series service platforms:
clear smart-cache storage [all|url-regex <WORD>] {on <DEVICE-NAME>}
clear logging analytics {on <DEVICE-NAME>}

**Parameters**

- **clear arp-cache {on <DEVICE-NAME>**
  
<table>
<thead>
<tr>
<th>arp-cache</th>
<th>Clears Address Resolution Protocol (ARP) cache entries on a device. This protocol matches layer 3 IP addresses to layer 2 MAC addresses.</th>
</tr>
</thead>
</table>
| on <DEVICE-NAME>  | Optional. Clears ARP cache entries on a specified device  
  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **clear bonjour cache {on <DEVICE-NAME>**
  
| bonjour cache     | Clears all Bonjour cached statistics. Once cleared, the system has to re-discover available Bonjour services.  
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| on <DEVICE-NAME>  | Optional. Clears all Bonjour cached statistics on a specified device  
  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |

- **clear [cdp|lldp] neighbors {on <DEVICE-NAME>**
  
| cdp               | Clears Cisco Discovery Protocol (CDP) table entries  
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| ldp               | Clears Link Layer Discovery Protocol (LLDP) neighbor table entries  
  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
Clears CDP or LLDP neighbor table entries based on the option selected in the preceding step.

| clear counters [all|bridge|router|thread] |
|-----------------------------------------|

- Optional. Clears CDP or LLDP neighbor table entries on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

### counters

#### [ap|wireless-client]

Clears counters on a system
- `all` – Clears all counters irrespective of the interface type
- `bridge` – Clears bridge counters
- `router` – Clears router counters
- `thread` – Clears per-thread counters

The following keyword is common to the ‘ap’ and ‘wireless-client’ parameters:
- `<MAC>` – Optional. Clears counters of the AP/wireless client identified by the `<MAC>` keyword. Specify the MAC address of the AP or wireless client.

**Note:** The system clears all AP or wireless client counters, if no MAC address is specified.

#### on `<DEVICE-OR-DOMAIN-NAME>`

The following keyword is recursive and is applicable to the `<MAC>` parameter:
- `<DEVICE-OR-DOMAIN-NAME>` – Optional. Clears AP/wireless-client counters on a specified device or RF Domain

**Note:** If no MAC address is specified, the system clears all AP or wireless client counters on the specified AP, wireless controller, service platform, or RF Domain.

### counters interface

- `<INTERFACE-NAME>` – Clears a specified interface counters. Specify the interface name.
- `all` – Clears all interface counters
- `ge <1-X>` – Clears GigabitEthernet interface counters. Specify the GigabitEthernet interface index from `1-X`.

**Note:** The number of Ethernet interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 24 GE interfaces. Whereas, RFS4000 supports 5 GE interfaces.
- `me1` – Clears FastEthernet interface counters
- `port-channel <1-X>` – Clears port-channel interface counters. Specify the port channel interface index from `1-X`.

**Note:** The number of port-channel interfaces supported varies for different device types. For example, the NX45XX and NX65XX support 13 port-channels. Whereas, RFS4000 supports 3 port-channels.
- `pppoe1` – Clears Point-to-Point Protocol over Ethernet (PPPoE) interface counters

Contd..
- `clear counters radio` `{<MAC/HOSTNAME> <1-X>} {on <DEVICE-OR-DOMAIN-NAME>}`
  - Clears wireless radio counters.
  - `<MAC/HOSTNAME>`: Optional. Specify the hostname or MAC address. Optionally, append the interface number to form radio ID in the form of AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX.
  - `<1-X>`: Optional. Specify the radio index (if not specified as part of the radio ID). The maximum number of radio antennas supported varies with the access point type.
  - **Note:** If no MAC address or radio index is specified, the system clears all radio counters.

<table>
<thead>
<tr>
<th>counters radio</th>
<th>Clearing radio counters.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;MAC/HOSTNAME&gt;</code></td>
<td>Clear counters of a radio identified by the <code>&lt;MAC/HOSTNAME&gt;</code> keyword.</td>
</tr>
<tr>
<td><code>&lt;1-X&gt;</code></td>
<td>Optional. Specify the hostname or MAC address. Optionally, append the interface number to form radio ID in the form of AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX.</td>
</tr>
<tr>
<td><code>&lt;1-X&gt;</code></td>
<td>Optional. Specify the radio index (if not specified as part of the radio ID). The maximum number of radio antennas supported varies with the access point type.</td>
</tr>
<tr>
<td><strong>Note:</strong> If no MAC address or radio index is specified, the system clears all radio counters.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>on <code>&lt;DEVICE-OR-DOMAIN-NAME&gt;</code></th>
<th>The following keyword is recursive and is applicable to the <code>&lt;MAC&gt;</code> parameter:</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
### clear ip bgp

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `clear ip bgp [all|external] {soft {in|out}} {on <DEVICE-NAME>}` | Clears BGP routing table information based on the option selected.  
  - `<IP>` – Clears the BGP peer identified by the `<IP>` keyword. Specify the BGP peer’s IP address.  
  - `all` – Clears route updates received from all BGP peers  
  - `external` – Clears route updates received from external BGP peers  
  *Note:* This command is applicable only to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 series service platforms.  
  *Note:* In case of a change in routing policy it is necessary to clear BGP routing table entries in order for the new policy to take effect.  
  *Note:* Modifications made to BGP settings (BGP access lists, weight, distance, route-maps, versions, routing policy etc.) take effect only after on-going BGP sessions are cleared. The `clear ip bgp` command clears BGP sessions. To reduce loss of route updates during the process, use the ‘soft’ option. Soft reconfiguration stores inbound/outbound route updates to be processed later and updated to the routing table. This requires high memory usage. |

| Optional. Clears soft-reconfiguration inbound/outbound route updates on a specified device  
  - `<DEVICE-NAME>` – Specify the name of the AP or service platform. |

### clear ip dhcp bindings

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `ip dhcp bindings [all] {on <DEVICE-NAME>}` | Clears a Dynamic Host Configuration Protocol (DHCP) server’s IP address bindings entries.  
  - `<IP>` – Clears specific address binding entries. Specify the IP address to clear binding entries.  
  - `all` – Clears all address binding entries  
  *Optional. Clears a specified address binding or all address bindings on a specified device  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
- `clear ip ospf process {on <DEVICE-NAME>}`

  `ip ospf process` Clears already enabled *open shortest path first* (OSPF) process and restarts the process

  `on <DEVICE-NAME>` Optional. Clears OSPF process on a specified device

  OSPF is a link-state *interior gateway protocol* (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet layer which makes routing decisions based solely on the destination IP address found in IP packets.

  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- `clear ipv6 neighbor-cache {on <DEVICE-NAME>}`

  `clear ipv6 neighbor-cache` Clears IPv6 neighbor cache entries

  `on <DEVICE-NAME>` Optional. Clears IPv6 neighbor cache entries on a specified device

  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- `clear l2tpv3-stats tunnel <L2TPV3-TUNNEL-NAME> {session <SESSION-NAME>} {(on <DEVICE-NAME>))}

  `l2tpv3-stats` Clears L2TPv3 tunnel session statistics

  `tunnel <L2TPV3-TUNNEL-NAME>` Clears all sessions associated with a specified L2TPv3 tunnel

  - `<L2TPV3-TUNNEL-NAME>` – Specify the L2TPv3 tunnel name.

  `session <SESSION-NAME>` Optional. Clears a specified L2TPv3 tunnel session, identified by the `<SESSION-NAME>` keyword

  - `<SESSION-NAME>` – Specify the session name.

  `on <DEVICE-NAME>` The following parameter is recursive and optional:

  - `<DEVICE-NAME>` – Optional. Specifies the device running the L2TPv3 tunnel session

  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

  **Note:** If no optional parameters are specified, the system clears all L2TPv3 tunnel session statistics.

- `clear license borrowed {on <DEVICE-NAME>}`

  `license borrowed {on <DEVICE-NAME>}` Releases or revokes all licenses borrowed by a site controller

  - `on <DEVICE-NAME>` – Optional. Specifies the borrowing controller’s name.

  **Note:** If no device name is specified, the system clears all borrowed licenses on the logged device.

- `clear license lent to <DEVICE-NAME> {on <DEVICE-NAME>}`

  `license lent to <DEVICE-NAME>` NOC controller releases or revokes all licenses loaned to a site controller

  - `<DEVICE-NAME>` – Specify the borrowing controller’s name

  - `<DEVICE-NAME>` – Specify the controller’s name.

  `on <DEVICE-NAME>` Optional. Specifies the controller’s name

  **Note:** If no device name is specified, the system clears all loaned licenses on the logged device.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear mac-address-table</code></td>
<td>Clears the MAC address forwarding table.</td>

</tr>
</tbody>
</table>

### clear smart-cache storage [all|regex <WORD>] {on <DEVICE-NAME>}

Clears the smart-cache storage

Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see `smart-cache-policy`.

<table>
<thead>
<tr>

3.1.7 clock

Sets a device’s system clock

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}

Parameters

- clock set <HH:MM:SS> <1-31> <MONTH> <1993-2035> {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="">HH:MM:SS</a></td>
<td>Sets the current time (in military format hours, minutes and seconds)</td>

</tr>
<tr>
<td>&lt;MONTH&gt;</td>
<td>Sets the month of the year from Jan - Dec</td>
</tr>
<tr>
<td>&lt;1993-2035&gt;</td>
<td>Sets a valid four digit year from 1993 - 2035</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Sets the clock on a specified device</td>
</tr>
<tr>
<td>- &lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Examples

The following commands set the timezone and clock for the logged device:

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#timezone America/Los_Angeles

nx9500-6C8809#clock set 10:13:00 24 Mar 2015

nx9500-6C8809#show clock
2015-03-24 10:13:07 PDT
nx9500-6C8809#
3.1.8 cluster

Privileged Exec Mode Commands

Initiates the cluster context. The cluster context provides centralized management to configure all cluster members from any one member.

Commands executed under this context are executed on all members of the cluster.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
cluster start-election
```

Parameters

- `cluster start-election`

Examples

```
rfs7000-37FABE#cluster start-election
rfs7000-37FABE#
```

Related Commands

3.1.9 configure

- **Privileged Exec Mode Commands**

Enters the configuration mode. Use this command to enter the current device’s configuration mode, or enable configuration from the terminal.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`configure {self|terminal}`

**Parameters**

- `configure {self|terminal}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>Optional. Enables the current device’s configuration mode</td>
</tr>
<tr>
<td>terminal</td>
<td>Optional. Enables configuration from the terminal</td>
</tr>
</tbody>
</table>

**Examples**

```bash
rfs7000-37FABE#configure self
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#
```
3.1.10 connect

**Privileged Exec Mode Commands**

Begins a console connection to a remote device using the remote device’s MiNT ID or name

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]
```

**Parameters**

- `connect [mint-id <MINT-ID>|<REMOTE-DEVICE-NAME>]`
  
  **mint-id <MINT-ID>** Connects to a remote system using the MiNT ID
  - `<MINT-ID>` – Specify the remote device’s MiNT ID.

  **<REMOTE-DEVICE-NAME>** Connects to a remote system using its name
  - `<REMOTE-DEVICE-NAME>` – Specify the remote device’s name.

**Examples**

```
rfs7000-6DCD4B#show mint lsp-db
6 LSPs in LSP-db of 19.6D.CD.4B:
  LSP 19.58.72.58 at level 1, hostname "ap5142-587258", 5 adjacencies, seqnum 748149
  LSP 19.5C.FA.2B at level 1, hostname "nx4500-5CFA2B", 5 adjacencies, seqnum 337443
  LSP 19.5C.FA.8E at level 1, hostname "nx4500-5CFA8E", 5 adjacencies, seqnum 333443
  LSP **19.6C.88.09** at level 1, hostname "nx9500-6C8809", 5 adjacencies, seqnum 333247

```

```
NX9500 release 5.8.0.0-020D
nx9500-6C8809 login:admin
Password:
nx9500-6C8809>
```
3.1.11 copy

Privileged Exec Mode Commands

Copies a file (config, log, txt...etc) from any location to the access point, wireless controller, or service platform and vice-versa

**NOTE:** Copying a new config file to an existing running-config file merges it with the existing running-config file on the wireless controller. Both the existing running-config and the new config file are applied as the current running-config.

Copying a new config file to a start-up config file replaces the existing start-up config file with the parameters of the new file. It is better to erase the existing start-up config file and then copy the new config file to the startup config.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
copy [<SOURCE-FILE>|<SOURCE-URL>] [<DESTINATION-FILE>|<DESTINATION-URL>]
```

**Parameters**

- `<SOURCE-FILE>` Specify the source file to copy.
- `<SOURCE-URL>` Specify the source file’s location (URL).
- `<DESTINATION-FILE>` Specify the destination file to copy to.
- `<DESTINATION-URL>` Specify the destination file’s location (URL).

**Examples**

Transferring file snmpd.log to remote TFTP server.
```
rfs7000-37PABE#copy flash:/log/snmpd.log
tftp://157.235.208.105:/snmpd.log
```

Accessing running-config file from remote TFTP server into switch running-config.
```
rfs7000-37PABE#copy tftp://157.235.208.105:/running-config running-config
```
3.1.12 cpe

Privileged Exec Mode Commands

Enables a WiNG controller to perform certain operations on Customer Premises Equipment (CPEs) through an adopted T5 controller.

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in its management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a Digital Subscriber Line (DSL) as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

cpe [boot|led|reload|upgrade]

cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}

cpe [led|reload|upgrade <IMAGE-LOCATION>] cpe [<1-24>|all] {on <T5-DEVICE-NAME>}

Parameters

- cpe boot system cpe [<1-24>|all] [primary|secondary] {on <T5-DEVICE-NAME>}

| cpe [<1-24>|all] | Changes the image used by a CPE to boot. When reloading, the CPE uses the specified image. |
|-----------------|---------------------------------------------------------------------------------------------|
| [primary|secondary] | Select the next boot image |
| on <T5-DEVICE-NAME> | Optional. Performs this operation on a specified T5 device. Specify the T5 device's hostname. |

- cpe [led|reload|upgrade <IMAGE-LOCATION>] cpe [<1-24>|all] {on <T5-DEVICE-NAME>}

Performs the following operations on CPEs
- led — Enables/disables flashing of LEDs
- reload — Reloads the device
- upgrade <IMAGE-LOCATION> — Upgrades the device
- <IMAGE-LOCATION> — Specify the location of the firmware image. Both IPv4 and IPv6 addresses are supported.

Contd..
Use one of the following options to provide the location:

IPv4 URLs:
- `tftp://<hostname|IP>[:port]/path/file`
- `ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
- `sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
- `http://<hostname|IP>[:port]/path/file`
- `cf:/path/file`
- `usb<n>:/path/file`

IPv6 URLs:
- `tftp://<hostname|[IPv6]>[:port]/path/file`
- `ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file`
- `sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file`

**Note:** After specifying the operation to perform, identify the device(s).

| cpe [<1-24>|all] | Identifies the CPE(s) on which the operation is performed |
|------------------|----------------------------------------------------------|
|                  | • <1-24> – Configures the CPE’s ID from 1 - 24 |
|                  | • all – Configures all CPEs |

| on <T5-DEVICE-NAME> | Optional. Performs this operation on a specified T5 device. Specify the T5 device’s hostname. |

**Examples**

```plaintext
rfs7000-37FABE#cpe led cpe all on t5-ED5C2C
Updated T5 CPE led state
rfs7000-37FABE#
```
### 3.1.13 create-cluster

**Privileged Exec Mode Commands**

Creates a new device cluster, with the specified name, and assigns it an IP address and routing level.

A cluster (or redundancy group) is a set of controllers or service platforms (nodes) uniquely defined by a profile configuration. Within the cluster, members discover and establish connections to other members and provide wireless network self-healing support in the event of member's failure.

A cluster’s load balance is typically distributed evenly amongst its members. An administrator needs to define how often the profile is load balanced for radio distribution, as radios can come and go and members join and exit the cluster.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}
```

**Parameters**

- `create-cluster name <CLUSTER-NAME> ip <IP> {level [1|2]}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>Configures the cluster name</td>
</tr>
<tr>
<td>&lt;CLUSTER-NAME&gt;</td>
<td>• <code>&lt;CLUSTER-NAME&gt;</code> – Specify a cluster name unique to its configuration or profile support requirements. The name cannot exceed 64 characters.</td>
</tr>
<tr>
<td><code>ip &lt;IP&gt;</code></td>
<td>Specifies the device's IP address used for cluster creation</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;IP&gt;</code> – Specify the device's IP address in the A.B.C.D format.</td>
</tr>
<tr>
<td>`level [1</td>
<td>2]`</td>
</tr>
<tr>
<td></td>
<td>• 1 – Configures level 1 (local) routing</td>
</tr>
<tr>
<td></td>
<td>• 2 – Configures level 2 (inter-site) routing</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58# create-cluster name TechPubsLAN ip 192.168.13.8 level 2
... creating cluster
... committing the changes
... saving the changes
Please Wait.

3.1.14 crypto

Privileged Exec Mode Commands

Enables digital certificate configuration and RSA Keypair management. Digital certificates are issued by CAs and contain user or device specific information, such as name, public key, IP address, serial number, company name etc. Use this command to generate, delete, export, or import encrypted RSA Keypairs and generate Certificate Signing Request (CSR).

This command also enables trustpoint configuration. Trustpoints contain the CA's identity and configuration parameters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

crypto [key|pki]
crypto key [export|generate|import|zeroize]
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL> {background|on|passphrase}
crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key generate rsa <RSA-KEYPAIR-NAME> [2048|4096] {on <DEVICE-NAME>}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL> {background|on|passphrase}
crypto key import rsa <RSA-KEYPAIR-NAME> <IMPORT-FROM-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto key zeroize rsa <RSA-KEYPAIR-NAME> {force} {(on <DEVICE-NAME>)}
crypto pki [authenticate|export|generate|import|zeroize]
crypto pki authenticate <TRUSTPOINT-NAME> <LOCATION-URL> {background} {(on <DEVICE-NAME>)}
crypto pki export [request|trustpoint]
crypto pki export request [generate-rsa-key|short|use-rsa-key] <RSA-KEYPAIR-NAME>
{autogen-subject-name|subject-name}
crypto pki export request [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME>
autogen-subject-name (<EXPORT-TO-URL>, email <SEND-TO-EMAIL>, fqdn <FQDN>, ip-address <IP>)
crypto pki export request [generate-rsa-key|short [generate-rsa-key|use-rsa-key]]
use-rsa-key <RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
<ORGANIZATION> <ORGANIZATION-UNIT> (<EXPORT-TO-URL>, email <SEND-TO-EMAIL>,
fqdn <FQDN>, ip-address <IP>)
crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL>
{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key] <RSA-KEYPAIR-NAME> [autogen-subject-name|subject-name]
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key]<RSA-KEYPAIR-NAME> autogen-subject-name (<email <SEND-TO-EMAIL>,
fqdn <FQDN>, ip-address <IP>, on <DEVICE-NAME>)}
crypto pki generate self-signed <TRUSTPOINT-NAME> [generate-rsa-key|use-rsa-key]
<RSA-KEYPAIR-NAME> subject-name <COMMON-NAME> <COUNTRY> <STATE> <CITY>
<ORGANIZATION> <ORGANIZATION-UNIT> (<email <SEND-TO-EMAIL>, fqdn <FQDN>,
ip-address <IP>), on <DEVICE-NAME>)}
crypto pki import [certificate|crl|trustpoint]
crypto pki import \[certificate|crl\] <TRUSTPOINT-NAME> <IMPORT-FROM-URL>{background} {(on <DEVICE-NAME>)}

crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL>{background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {(on <DEVICE-NAME>)}

Parameters

- crypto key export rsa <RSA-KEYPAIR-NAME> <EXPORT-TO-URL><background|passphrase <KEY-PASSPHRASE> background} {(on <DEVICE-NAME>)}

<table>
<thead>
<tr>
<th>key</th>
<th>Enables RSA Keypair management. Use this command to export, import, generate, or delete a RSA key.</th>
</tr>
</thead>
<tbody>
<tr>
<td>export rsa &lt;RSA-KEYPAIR-NAME&gt;</td>
<td>Exports an existing RSA Keypair to a specified destination</td>

</tbody>
</table>
subject-name
<COMMON-NAME>  | Configures a subject name, defined by the <COMMON-NAME> keyword, to identify the certificate
• <COMMON-NAME> – Specify the common name used with the CA certificate. The name should enable you to identify the certificate easily (2 to 64 characters in length).

<COUNTRY> | Sets the deployment country code (2 character ISO code)

<STATE> | Sets the state name (2 to 64 characters in length)

<CITY> | Sets the city name (2 to 64 characters in length)

<ORGANIZATION> | Sets the organization name (2 to 64 characters in length)

<ORGANIZATION-UNIT> | Sets the organization unit (2 to 64 characters in length)

<EXPORT-TO-URL> | Specify the CA's location. Both IPv4 and IPv6 address formats are supported. The CSR is exported to the specified location.

email
<SEND-TO-EMAIL> | Exports CSR to a specified e-mail address
• <SEND-TO-EMAIL> – Specify the CA's e-mail address.

fqdn <FQDN> | Exports CSR to a specified FQDN
• <FQDN> – Specify the CA's FQDN.

ip-address <IP> | Exports CSR to a specified device or system
• <IP> – Specify the CA's IP address.

• crypto pki export trustpoint <TRUSTPOINT-NAME> <EXPORT-TO-URL> {background|passphrase <KEY-PASSPHRASE> background} {on <DEVICE>}

pki | Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

export trustpoint
<TRUSTPOINT-NAME> | Exports a trustpoint along with CA certificate, Certificate Revocation List (CRL), server certificate, and private key
• <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).

<EXPORT-TO-URL> | Specify the destination address. Both IPv4 and IPv6 address formats are supported. The trustpoint is exported to the address specified here.

background | Optional. Performs export operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on.

passphrase
<KEY-PASSPHRASE> | Optional. Encrypts the key with a passphrase before exporting
• <KEY-PASSPHRASE> – Specify the passphrase to encrypt the trustpoint.
• background – Optional. Performs export operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the export on.

on <DEVICE> | The following parameter is recursive and common to the 'background' and 'passphrase' keywords:
• on <DEVICE> – Optional. Performs export operation on a specified device
• <DEVICE> – Specify the name of the AP, wireless controller, or service platform.
**pki)** Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated certificates.

<table>

**email**

Optional. Exports the self-signed certificate to a specified e-mail address
- `<SEND-TO-EMAIL>` – Specify the e-mail address.

**fqdn**

Optional. Exports the self-signed certificate to a specified FQDN
- `<FQDN>` – Specify the FQDN.

**ip-address**

Optional. Exports the self-signed certificate to a specified device or system
- `<IP>` – Specify the device’s IP address.

- `crypto pki import [certificate|crl] <TRUSTPOINT-NAME> <IMPORT-FROM-URL> {background}
  {on <DEVICE-NAME>}`

- `crypto pki import trustpoint <TRUSTPOINT-NAME> <IMPORT-FROM-URL>
  {background|passphrase <KEY-PASSPHRASE> background} {on <DEVICE-NAME>}`

**pki**

Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

**import**

Imports certificates, Certificate Revocation List (CRL), or a trustpoint to the selected device

- `<TRUSTPOINT-NAME>` – Specify the trustpoint name (should be authenticated).
- `<IMPORT-FROM-URL>` Specify the signed server certificate or CR L source address. Both IPv4 and IPv6 address formats are supported.
- The server certificate or the CRL (based on the parameter passed in the preceding step) is imported from the location specified here.

**background**

Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the import on.

**on <DEVICE-NAME>**

The following parameter is recursive and optional:
- `<DEVICE-NAME>` – Optional. Performs import operation on a specified device
- `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

**fqdn**

Optional. Exports the self-signed certificate to a specified FQDN
- `<FQDN>` – Specify the FQDN.

**ip-address**

Optional. Exports the self-signed certificate to a specified device or system
- `<IP>` – Specify the device’s IP address.
background

Optional. Performs import operation in the background. If selecting this option, you can optionally specify the device (access point or controller) to perform the export on.

passphrase

<KEY-PASSPHRASE>

background

Optional. Decrypts trustpoint with a passphrase after importing

- <KEY-PASSPHRASE> – Specify the passphrase. After specifying the passphrase, optionally specify the device to perform import on.
- background – Optional. Performs import operation in the background. After specifying the passphrase, optionally specify the device (access point or controller) to perform the import on.

on <DEVICE-NAME>

The following parameter is recursive and optional:
Optional. Performs import operation on a specified device

- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- crypto pki zeroize trustpoint <TRUSTPOINT-NAME> {del-key} {on <DEVICE-NAME>}

pki

Enables PKI management. Use this command to authenticate, export, generate, or delete a trustpoint and its associated CA certificates.

zeroize trustpoint

<TRUSTPOINT-NAME>

Deletes a trustpoint and its associated CA certificate, server certificate, and private key

- <TRUSTPOINT-NAME> – Specify the trustpoint name (should be authenticated).

del-key

Optional. Deletes the private key associated with the server certificate. Optionally specify the device to perform deletion on.

on <DEVICE-NAME>

The following parameter is recursive and optional:
Optional. Deletes the trustpoint on a specified device

- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- IPv4 URLs:
  tftp://<hostname|Ip>[:port]/path/file
  ftp://<user>:<passwd>@<hostname|Ip>[:port]/path/file
  sftp://<user>@<hostname|Ip>[:port]/path/file
  http://<hostname|Ip>[:port]/path/file
  cf:/path/file
  usb<n>:/path/file

- IPv6 URLs:
  tftp://<hostname|[IPv6]>[:port]/path/file
  ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file
  sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file

Usage Guidelines

The system supports both IPv4 and IPv6 address formats. Provide source and destination locations using any one of the following options:

- IPv4 URLs:
  tftp://<hostname|Ip>[:port]/path/file
  ftp://<user>:<passwd>@<hostname|Ip>[:port]/path/file
  sftp://<user>@<hostname|Ip>[:port]/path/file
  http://<hostname|Ip>[:port]/path/file
  cf:/path/file
  usb<n>:/path/file

- IPv6 URLs:
  tftp://<hostname|[IPv6]>[:port]/path/file
  ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file
  sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file
Examples

rfs7000-37FABE#crypto key generate rsa key 1025

Related Commands

no | Removes server certificates, trustpoints and their associated certificates
3.1.15 crypto-cmp-cert-update

Triggers a Certificate Management Protocol (CMP) certificate update on a specified device or devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530N9000, NX9500, NX9510, NX9600

Syntax

crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

Parameters

- crypto-cmp-cert-update <TRUSTPOINT-NAME> {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto-cmp-cert-update &lt;TRUSTPOINT-NAME&gt; {on &lt;DEVICE-NAME&gt;}</td>
<td>Triggers a CMP certificate update on a specified device or devices</td>
</tr>
<tr>
<td>&lt;TRUSTPOINT-NAME&gt;</td>
<td>Specify the target trustpoint name. A trustpoint represents a CA/identity pair containing the identity of the CA, CA specific configuration parameters, and an association with an enrolled identity certificate. Use the crypto-cmp-policy context to configure the trustpoint.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Triggers a CMP certificate update and response on a specified device or devices. Specify the name of the AP, wireless controller, or service platform. Multiple devices can be provided as a comma separated list.</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58#crypto-cmp-cert-update test on B4-C7-99-71-17-28
CMP Cert update success
rfs4000-229D58#
3.1.16 database

*Privileged Exec Mode Commands*

Enables automatic repairing (vacuuming) and dropping of databases (Captive-portal and NSight)

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
database [drop|repair]
database drop [all|captive-portal|nsight]
database repair {on <DEVICE-NAME>}
```

**Parameters**

- `database drop [all|captive-portal|nsight]`
  - Drops (deletes) all or a specified database
  - `all` — Drops all databases, captive portal and NSight.
  - `captive-portal` — Drops captive-portal database only
  - `nsight` — Drops NSight database only

- `database repair {on <DEVICE-NAME>}`
  - Enables automatic repairing of all databases
  - `<DEVICE-NAME>` — Optional. Specifies the name of the access point, wireless controller, or service platform hosting the database. When specified, databases on the specified device are periodically checked through to identify and remove obsolete data documents.
  - **Note:** If no device is specified, the system repairs all databases.

**Examples**

```plaintext
nx9500-6C8809#database repair on nx9500-6C8809
nx9500-6C8809#
```

</tbody>
</table>
3.1.17 database-backup

Privileged Exec Mode Commands

Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

```
database-backup database [captive-portal|nsight] <URL>
```

Parameters

- `database-backup database [captive-portal|nsight] <URL>`

| <URL> | Configures the destination location. The database is backed up at the specified location. Specify the location URL in one of the following formats:
|ftp://<user>:<passwd>@<hostname|IP>[<port>]/path/file.tar.gz|
sftp://<user>:<passwd>@<hostname|IP>[<port>]/path/file.tar.gz|

Examples

```
nx9500-6C8809#database-backup database nsight ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

### 3.1.18 database-restore

> Privileged Exec Mode Commands

Restores a previously exported database [captive-portal and/or NSight]. Previously exported databases (backed up to a specified FTP or SFTP server) are restored from the backed-up location to the original database.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

```
database-restore database [captive-portal|nsight] <URL>
```

**Parameters**

- **database-restore database [captive-portal|nsight]**

  Restores previously exported (backed up) captive-portal and/or NSight database. Specify the database type:

  - captive-portal – Restores captive portal database
  - nsight – Restores NSight database

  After specifying the database type, configure the destination location and file name from where the files are restored.

- **<URL>**

  Configures the destination location. The database is restored from the specified location. Specify the location URL in one of the following formats:

  ```
  ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz
  sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file.tar.gz
  ```

**Examples**

```
nx9500-6C8809#database-restore database nsight
ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

**Related Commands**

3.1.19 delete

Privileged Exec Mode Commands

delete [/force <FILE>|/recursive <FILE>|<FILE>]

**Syntax**

```
delete [/force <FILE>|/recursive <FILE>|<FILE>]
```

**Parameters**

- **/force <FILE>** Forces deletion without a prompt
- **/recursive <FILE>** Performs a recursive delete
- **<FILE>** Specifies the file name
  - Deletes the file specified by the **<FILE>** parameter

**Examples**

```
rfs7000-37FABE#delete flash:/out.tar flash:/out.tar.gz
Delete flash:/out.tar [y/n]? y
Delete flash:/out.tar.gz [y/n]? y
rfs7000-37FABE#
rfs7000-37FABE#delete /force flash:/tmp.txt
rfs7000-37FABE#
rfs7000-37FABE#delete /recursive flash:/backup/
Delete flash:/backup//fileMgmt_350_180B.core
[y/n]? y
Delete flash:/backup//fileMgmt_350_18212X.core_bk
[y/n]? n
Delete flash:/backup//imish_1087_18381X.core.gz
[y/n]? n
rfs7000-37FABE#
```
3.1.20 device-upgrade

Privileged Exec Mode Commands

Enables firmware upgrade on an adopted device or a set of adopted devices (access points, wireless controllers, and service platforms).

This command simplifies device upgradation within a hierarchically managed (HM) network. For more information on HM networks, see device-upgrade.

NOTE: A NOC controller’s capacity is equal to, or higher than that of a site controller. The following devices can be deployed at NOC and sites:

- NOC controller — RFS7000, NX9000, NX95XX (NX9500 and NX9510), NX9600
- Site controller — RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX

Within a HM network, the devices deployed as site controllers depends on the NOC controller device type. For more information on the adoption capabilities of various NOC controller devices, see Usage Guidelines (NOC controller adoption matrix).

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

device-upgrade [<MAC/HOSTNAME>|all|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap75xx|ap75xx|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|vx9000] {cancel-upgrade|load-image|rf-domain}

device-upgrade <MAC/HOSTNAME> {no-reboot|reboot-time <TIME>}

device-upgrade all {force|no-reboot|reboot-time <TIME>}[upgrade-time <TIME> {no-reboot|reboot-time <TIME>}] {(staggered-reboot)}

device-upgrade cancel-upgrade [<MAC/HOSTNAME>|all|ap621|ap622|ap650|ap6511|ap6521|ap6532|ap6562|ap71xx|ap7502|ap75xx|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|vx9000] on rf-domain [<RF-DOMAIN-NAME>|all]

device-upgrade load-image [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap75xx|ap75xx|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|vx9000] {<IMAGE-URL>|on <DEVICE-OR-DOMAIN-NAME>}

device-upgrade rf-domain [<RF-DOMAIN-NAME>|all] containing <WORD> [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap75xx|ap75xx|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|vx9000] {(ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap75xx|ap75xx|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|vx9000] [on rf-domain [<RF-DOMAIN-NAME>|all]]
### Parameters

- **device-upgrade** `<MAC/HOSTNAME>` `{no-reboot|reboot-time <TIME>|upgrade-time <TIME>}{no-reboot|reboot-time <TIME>}`

<table>

</tr>
<tr>
<td><strong>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</strong></td>
<td>Specify the name of the AP, wireless controller, service platform, or RF Domain. The image, of the specified device type is loaded from the device specified here. In case of an RF Domain, the image available on the RF Domain manager is loaded.</td>
</tr>
</tbody>
</table>
### Privileged Exec Mode Commands

- **device-upgrade rf-domain**

  **[<RF-DOMAIN-NAME>|all|containing <WORD>|filter location <WORD>]**

  - **<RF-DOMAIN-NAME>** – Upgrades devices in the RF Domain identified by the `<RF-DOMAIN-NAME>` keyword.
  - **<RF-DOMAIN-NAME>** – Specify the RF Domain name.
  - **all** – Upgrades devices across all RF Domains
  - **containing <WORD>** – Filters RF Domains by their names. RF Domains with names containing the sub-string identified by the `<WORD>` keyword are filtered. Devices on the filtered RF Domains are upgraded.
  - **filter location <WORD>** – Filters devices by their location. All devices with location matching the `<WORD>` keyword are upgraded.

  After specifying the RF Domain, select the device type. The options are: AP621, AP622, AP650, AP6511, AP652, AP6532, AP6562, AP71XX, AP7502, AP7522, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000.

  After specifying the RF Domain and the device type, configure any one of the following actions:

  - force devices to upgrade, or initiate an upgrade through the adopting controller.

  **<MAC/HOSTNAME>**

  Optional. Use this option to identify specific devices for upgradation. Specify the device’s MAC address or hostname. The device should be within the specified RF Domain and of the specified device type. After identifying the devices to upgrade, configure any one of the following actions:

  - force devices to upgrade, or initiate an upgrade through the adopting controller.

  **Note:** If no MAC address or hostname is specified, all devices of the type selected are upgraded.

  **force**

  Optional. Select this option to force upgrade for the selected device(s). When selected, the devices are upgraded even if they have the same firmware as the upgrading access point, wireless controller, or service platform. If forcing a device upgrade, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.

  **from-controller**

  Optional. Upgrades a device through the adopted device. If initiating an upgrade through the adopting controller, optionally specify any one of the following options: no-reboot, reboot-time, upgrade-time, or reboot-time.

  **no-reboot**

  Optional. Disables automatic reboot after a successful upgrade (the device must be manually restarted)

  **reboot-time <TIME>**

  Optional. Schedules an automatic reboot after a successful upgrade. Specify the reboot time in the MM/DD/YYYY-HH:MM or HH:MM format.

  **staggered-reboot**

  This keyword is common to all of the above.

  Optional. Enables staggered reboot (one at a time), without network impact.
Usage Guidelines (NOC controller adoption matrix)

rfs7000-6DCD4B#
3.1.21 diff

Privileged Exec Mode Commands

Displays the differences between two files on a device's file system or a particular URL.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

diff [<$FILE>|<$URL>] [<$FILE>|<$URL>]

Parameters

- diff [<$FILE>|<$URL>] [<$FILE>|<$URL>]

| $FILE | The first $FILE is the source file for the diff command. The second $FILE is used for comparison.
| $URL  | The first $URL is the source file's URL. The second $URL is the second file's URL.

Examples

```

Privileged Exec Mode Commands

Lists files on a device’s file system

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dir [/all][/recursive]<DIR>|all-filesystems

Parameters

- dir [/all][/recursive]<DIR>|all-filesystems

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/all</td>
<td>Optional. Lists all files</td>
</tr>
<tr>
<td>/recursive</td>
<td>Optional. Lists files recursively</td>
</tr>
<tr>
<td>&lt;DIR&gt;</td>
<td>Optional. Lists files in the named file path</td>
</tr>
<tr>
<td>all-filesystems</td>
<td>Optional. Lists files on all file systems</td>
</tr>
</tbody>
</table>

--More--
nx9500-6C8809#
3.1.23 disable

Privileged Exec Mode Commands

Turns off (disables) the privileged mode command set. This command returns to the User Executable mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

disable

Parameters

None

Examples

rfs7000-37FABE#disable
rfs7000-37FABE>
3.1.24 edit

Privileged Exec Mode Commands

Edits a text file on the device’s file system

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
edit <FILE>

Parameters
- edit <FILE>

| <FILE> | Specify the name of the file to modify. |

Examples
rfs4000-229D58#edit startup-config
GNU nano 1.2.4                File: startup-config

! Configuration of RFS4000 version 5.8.0.0-021D

3.1.25 enable

Privileged Exec Mode Commands

Turns on (enables) the privileged mode command set. This command does not do anything in the Privilege Executable mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
enable
```

Parameters

None

Examples

```
rfs7000-37FABE#enable
rfs7000-37FABE#
```
3.1.26 erase

Privileged Exec Mode Commands

Erases a device’s (wireless controller, access point, and service platform) file system. Erases the content of the specified storage device. Also erases the startup configuration to restore the device to its default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
erase [flash:|nvram:|startup-config|usb1:|usb2:|usb3:|usb4:]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flash:</td>
<td>Erases everything in the device’s flash: file</td>
</tr>
<tr>
<td>nvram:</td>
<td>Erases everything in the device’s nvram: file</td>
</tr>
<tr>
<td>startup-config</td>
<td>Erases the device’s startup configuration file. The startup configuration file is used to configure the device when it reboots.</td>
</tr>
<tr>
<td>usb1:</td>
<td>Erases everything in the device’s usb1: file</td>
</tr>
<tr>
<td>usb2:</td>
<td>Erases everything in the device’s usb2: file</td>
</tr>
<tr>
<td>usb3:</td>
<td>Erases everything in the device’s usb3: file</td>
</tr>
<tr>
<td>usb4:</td>
<td>Erases everything in the device’s usb4: file</td>
</tr>
</tbody>
</table>

Note: The number of USB ports displayed varies for different device types. For example, an NX95XX has two USB ports, while an NX45XX has four USB ports.

Examples

nx4500-5CFA2B#erase ?
flash:         Erase everything in flash:
nvram:         Erase everything in nvram:
startup-config Erase configuration to factory default
usb1:          Erase everything in usb1:
usb2:          Erase everything in usb2:
usb3:          Erase everything in usb3:
usb4:          Erase everything in usb4:

rfs7000-37FABE#erase startup-config
Erase startup-config? (y/n): n
rfs7000-37FABE#
3.1.27 ex3500

Privileged Exec Mode Commands

Enables EX3500 switch firmware management. Use this command to perform the following operations: boot, copy, delete, and IP-related configurations.

The copy keyword provides multiple copy options. It allows you to upload or download code images or configuration files between the switch’s flash memory and an FTP/TFTP server. When you save the system code or configuration settings to a file on an FTP/TFTP server, that file can later be downloaded to the switch to restore system operation. The success of the file transfer depends on the accessibility of the FTP/TFTP server and the quality of the network connection.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
ex3500 [adoptd|boot|copy|delete|ip]

ex3500 adoptd upgrade <URL> on <EX3500-DEVICE-NAME>

ex3500 boot system <1-1> (config|opcode) <FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy [file|ftp|running-config|startup-config|tftp|unit]

ex3500 copy [file file] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy [ftp|tftp] [add-to-running-config|file|https-certificate|public-key|running-config|startup-config]

ex3500 copy startup-config [file ftp|tftp] <FTP/TFTP-SERVER-IP> <USER-NAME> <PASS-WORD> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy startup-config [file ftp|tftp] <FTP/TFTP-SERVER-IP> <USER-NAME> <PASS-WORD> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 copy unit file <1-1> [1|2] <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>

ex3500 delete [file|public-key]

ex3500 delete file [name <FILE-NAME>|unit <1-1> name <FILE-NAME>] on <EX3500-DEVICE-NAME>

ex3500 delete public-key <USER-NAME> [dsa|rsa] on <EX3500-DEVICE-NAME>

ex3500 ip ssh [crypto|save]

ex3500 ip ssh crypto host-key generates [dsa|rsa] on <EX3500-DEVICE-NAME>
```
### ex3500 ip ssh crypto zeroize [dsa|rsa] on <EX3500-DEVICE-NAME>

### Parameters
- **ex3500 adopted upgrade** <URL> on <EX3500-DEVICE-NAME>
  - **<URL>**
    - Specifies the location and image file name in the following format: `tftp://<IP>/[path]/file`
  - Optional. Executes the command on a specified EX3500 switch
    - `<EX3500-DEVICE-NAME>` – Specify the EX3500 switch’s hostname.

### ex3500 boot system <1-1> (config|opcode) <FILE-NAME> on <EX3500-DEVICE-NAME>

- **<1-1>**
  - Identifies the EX3500 unit by its ID number. Specify the EX3500 ID from 1 - 1.
  - **Note:** As of now only one (1) EX3500 unit can be managed through a NoC controller.
  - **(config|opcode)**
    - `<FILE-NAME>`
      - The following keywords are recursive:
        - Specifies the image file to use for booting. The options are:
          - **config** – Uses the configuration file to boot the switch
          - **opconfig** – Uses the **Operation Code** (opcode), which is the runtime code, to boot the switch. The opcode is like an operating system that enables the WiNG software to communicate with the EX3500 device.
          - The following parameter is common to the ‘config’ and opcode’ keywords:
            - `<FILE-NAME>` – Specify the configuration/runtime-code file name.

- **on** <EX3500-DEVICE-NAME>
  - Optional. Reloads a specified EX3500 switch
    - `<EX3500-DEVICE-NAME>` – Specify the EX3500 switch’s hostname. You can also specify its MAC address.

### ex3500 copy file file <SOURCE-FILE-NAME> <DEST-FILE-NAME> on <EX3500-DEVICE-NAME>

- **file**
  - `<SOURCE-FILE-NAME>`
    - Copies a specified file (this is the source configuration file)
      - **file** – Copies the specified source file to a specified file (this is the destination configuration file)
  - `<DEST-FILE-NAME>`
    - Copies the destination configuration file’s name
  - Optional. Reloads a specified EX3500 switch
    - `<EX3500-DEVICE-NAME>` – Specify the EX3500 switch’s hostname. You can also specify its MAC address.

When specifying the destination file name, keep in mind the following points:
- It should not contain slashes (/ or /),
- It should not exceed 32 characters for files on the switch, or 127 characters for files on the server.

</table>
Usage Guidelines

When using the EX3500 command and its parameters, keep in mind the following:

- Destination file names should not:
  - Contain slashes (\ or /).
  - Exceed 32 characters for files on the switch, or 127 characters for files on the server
- The FTP server’s default user name is set as “anonymous”.
- The Boot ROM and Loader cannot be uploaded or downloaded from the FTP/TFTP server. Follow instructions provided in the release notes for new firmware, or contact your distributor for help.
- The “Factory_Default_Config.cfg” can be used as the source to copy from, but cannot be used as the destination.
- Although the switch supports only two operation code files, the maximum number of user-defined configuration files supported is 16.

Examples

nx9500-6C8809#adoptd upgrade tftp://192.168.0.99/ex3500-adoptd-5.8.0.0.img on ex3524-ED5EAC
Flash programming started
Flash programming completed
Successful
nx9500-6C8809#

nx9500-6C8809#ex3500 copy tftp file 10.2.0.100 1 m360.bix m360.bix on ex3524-ED5EAC
\Write to FLASH Programming.
-Write to FLASH finish.
Success.
nx9500-6C8809#

nx9500-6C8809#ex3500 copy tftp startup-config 10.2.0.99 startup.01 startup on ex3524-ED5EAC
TFTP server ip address: 10.1.0.99

3.1.28 file-sync

Privileged Exec Mode Commands

Synchronizes EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adoptee AP6522/AP6562 client-bridge access points. Use this command to configure parameters that enable syncing of PKCS#12 certificate.

When enabling file syncing, consider the following points:

- The X.509 certificate needs synchronization only if the access point’s radio2, the client-bridge radio, is configured to use EAP-TLS authentication.
- Execute the command on the controller adopting the access point.
- Ensure that the X.509 certificate file is installed on the controller.
- If the adopting device is a site controller with layer 3 adoption to the NoC, ensure that the X.509 certificate is synced across the hierarchically managed setup – between the NoC, site-controller (the staging-controller), and the client-bridge access points.

Syncing of wireless client-bridge certificate can be automated. To automate the file syncing process, in the controller’s device/profile configuration mode, execute the following command: `file-sync auto|count <1-20>`. For more information, see `file-sync`.

For more information on configuring an AP client-bridge, see `bridge`.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
file-sync [cancel|load-file|wireless-bridge]
file-sync cancel wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]
file-sync load-file wireless-bridge <URL>
file-sync wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]
    {from-controller} {reset-radio|upload-time <TIME>}
```

Parameters

- `file-sync cancel wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all]]`
  - Cancels scheduled wireless client-bridge certificate synchronization on a specified AP, or all APs, or APs within a RF Domain.
    - `<DEVICE-NAME>` – Cancels scheduled certificate synchronization on the AP identified by the `<DEVICE-NAME>` parameter. Specify the AP’s hostname or MAC address.
    - `all` – Cancels scheduled certificate synchronization on all APs.
    - `rf-domain [<DOMAIN-NAME>|all]` – Cancels scheduled certificate synchronization on all APs in a specified RF Domain or in all RF Domains.
    - `<DOMAIN-NAME>` – Cancels scheduled certificate synchronization on all APs within the RF Domain identified by the `<DOMAIN-NAME>` parameter. Specify the RF Domain’s name.
    - `all` – Cancels scheduled certificate synchronization on all RF Domains.
- **file-sync load-file wireless-bridge <URL>**

  Loads the client-bridge certificate to the staging controller. Use this command to load the certificate to the controller before scheduling or initiating a certificate synchronization.

  - `<URL>` – Provide the certificate location using one of the following formats:
    - tftp://<hostname|IP>[:port]/path/file
    - ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
    - sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file
    - http://<hostname|IP>[:port]/path/file
    - cf:/path/file
    - usb<n>:/path/file

  **Note:** Both IPv4 and IPv6 address types are supported.

  - **file-sync wireless-bridge [<DEVICE-NAME>|all|rf-domain [<DOMAIN-NAME>|all] {from-controller}] {reset-radio|upload-time <TIME>}**

    Configures the following file-sync parameters:
    - post certificate synchronization action
    - upload time

    These file-sync options can be applied to a specified AP, all APs, or all APs within a specified RF Domain or on all RF Domains.

    - `<DEVICE-NAME>` – Applies these parameters to the AP identified by the `<DEVICE-NAME>` parameter. Specify the AP's hostname or MAC address.
    - `all` – Applies these parameters to all APs
    - `rf-domain [<DOMAIN-NAME>|all]` – Applies these parameters to all APs in a specified RF Domain or in all RF Domains
      - `<DOMAIN-NAME>` – Select to apply to APs within the RF Domain identified by the `<DOMAIN-NAME>` parameter. Specify the RF Domain's name.
      - `all` – Select to apply these parameters to APs in all RF Domains
    - `from-controller` – Optional. Loads certificate to the APs from the adopting controller and not the RF Domain manager

    After specify the access points to load certificate, specify the following options: reset-radio and upload-time

  - **reset-radio**
    - This keyword is recursive and applicable to all of the above parameters.
    - Optional. Resets the radio after file synchronization

  - **upload-time <TIME>**
    - This keyword is recursive and applicable to all of the above parameters.
    - Optional. Schedules file upload at a specified time
    - `<TIME>` – Specify the time in the MM/DD/YYYY-HH:MM or HH:MM format. If no time is configured, the process is initiated as soon as the command is executed.

  **Examples**

### 3.1.29 halt

Privileged Exec Mode Commands

Stops (halts) a device (access point, wireless controller, or service platform). Once halted, the system must be restarted manually.

This command stops the device immediately. No indications or notifications are provided while the device shuts down.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

`halt {force} {on <DEVICE-NAME>}`

#### Parameters
- `halt {force} {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>halt</td>
<td>Halts a device</td>
</tr>
<tr>
<td>force</td>
<td>Optional. Forces a device to halt ignoring in-progress operations, such as firmware upgrades, downloads, unsaved configuration changes etc.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>The following keywords are recursive and applicable to the ‘force’ parameter:</td>
</tr>
<tr>
<td></td>
<td>- on &lt;DEVICE-NAME&gt; – Optional. Specifies the name of the device to be halted</td>
</tr>
<tr>
<td></td>
<td>- &lt;DEVICE-NAME&gt; – Enter the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

#### Note:
If the device name is not specified, the logged device is halted.

#### Examples

```
rfs7000-37FABE#halt on rfs7000-37FABE
rfs7000-37FABE#
```
### 3.1.30 `join-cluster`

#### Privileged Exec Mode Commands

Adds a device (access point, wireless controller, or service platform), as cluster member, to an existing cluster of devices.

Assign a static IP address to the device before adding to a cluster.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
join-cluster <IP> user <USERNAME> password <WORD> {level | mode}
join-cluster <IP> user <USERNAME> password <WORD> {level [1|2] | mode [active | standby]}
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>join-cluster &lt;IP&gt;</code></td>
<td>Adds a access point, wireless controller, or service platform to an existing cluster</td>
</tr>
<tr>
<td><code>&lt;IP&gt;</code></td>
<td>Specify the cluster member’s IP address.</td>
</tr>
<tr>
<td><code>user &lt;USERNAME&gt;</code></td>
<td>Specify a user account with super user privileges on the new cluster member.</td>
</tr>
<tr>
<td><code>password &lt;WORD&gt;</code></td>
<td>Specify password for the account specified in the user parameter.</td>
</tr>
<tr>
<td>`level [1</td>
<td>2]`</td>
</tr>
<tr>
<td></td>
<td>1 – Configures level 1 routing</td>
</tr>
<tr>
<td></td>
<td>2 – Configures level 2 routing</td>
</tr>
<tr>
<td>`mode [active</td>
<td>standby]`</td>
</tr>
<tr>
<td></td>
<td>active – Configures cluster mode as active</td>
</tr>
<tr>
<td></td>
<td>standby – Configures cluster mode as standby</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

To add a device to an existing cluster:

- Configure a static IP address on the device (access point, wireless controller, or service platform).
- Provide username and password for superuser, network admin, system admin, or operator accounts.

After adding the device to a cluster, execute the "write memory" command to ensure the configuration persists across reboots.

#### Examples

```
rfs6000-6DB5D4#join-cluster 192.168.13.16 user admin password superuser level 1 mode standby
... connecting to 192.168.13.16
... applying cluster configuration
... committing the changes
... saving the changes
[OK]
rfs6000-6DB5D4#
```

```
rfs6000-6DB5D4#show context
! Configuration of RFS6000 version 5.8.0.0-021D
!
version 2.3
!```

interface ge1
  switchport mode access
  switchport access vlan 1
interface vlan1
  ip address 192.168.13.16/24
  ip dhcp client request options all
  no ipv6 enable
  no ipv6 request-dhcpv6-options
cluster name TechPubs
cluster mode standby
cluster member ip 192.168.13.16 level 1
logging on
logging console warnings
logging buffered warnings
!
end
rfs6000-6DB5D4#

3.1.31 l2tpv3

Privileged Exec Mode Commands

Establishes or brings down an L2TPv3 tunnel

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

- l2tpv3 tunnel [all]
  - l2tpv3 tunnel <TUNNEL-NAME> [down|session|up] 
  - l2tpv3 tunnel <TUNNEL-NAME> [down|session|up] {on <DEVICE-NAME>}
  - l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}

Parameters

- l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}

- l2tpv3 tunnel <TUNNEL-NAME> [down|up] {on <DEVICE-NAME>}
  - <TUNNEL-NAME> – Specify the tunnel name.
  - down – Brings down the specified tunnel
  - up – Establishes the specified tunnel

- l2tpv3 tunnel <TUNNEL-NAME> session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}

- l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}

- l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}
  - <TUNNEL-NAME> – Specify the tunnel name.

- l2tpv3 tunnel session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}
  - <SESSION-NAME> – Specify the session name.
  - down – Brings down the specified tunnel session
  - up – Establishes the specified tunnel session

- l2tpv3 tunnel all [down|up] {on <DEVICE-NAME>}
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- l2tpv3 tunnel session <SESSION-NAME> [down|up] {on <DEVICE-NAME>}
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
Examples
rfs7000-37FABE#l2tpv3 tunnel Tunnel1 session Tunnel1Session1 up on rfs7000-37FABE

NOTE: For more information on the L2TPv3 tunnel configuration mode and commands, see Chapter 22, L2TPV3-POLICY.
3.1.32 logging

Privileged Exec Mode Commands

Modifies message logging settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|warnings|notifications}

Parameters

- logging monitor {<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}

Examples

rfs4000-229D58(config-device-00-23-68-22-9D-58)#logging on
rfs4000-229D58(logging monitor debugging
rfs4000-229D58#show logging

Logging module: enabled
Aggregation time: disabled
Console logging: level debugging
Monitor logging: level debugging
Buffered logging: level warnings
Syslog logging: level warnings
Facility: local7

Log Buffer (804 bytes):

May 30 11:23:13 2015: rfs4000-229D58 : %NSM-4-IFUP: Interface ge4 is up
May 30 11:23:11 2015: rfs4000-229D58 : %NSM-4-IFUP: Interface ge4 is up

### 3.1.33 mint

*Privileged Exec Mode Commands*

Uses MiNT protocol to perform a ping and traceroute to a remote device

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```plaintext
mint ping <MINT-ID> \{count <1-10000>|size <1-64000>|timeout <1-10>\}
mint traceroute <MINT-ID> \{destination-port <1-65535>|max-hops <1-255>|source-port <1-65535>|timeout <1-255>\}
```

### Parameters

- mint ping <MINT-ID> \{count <1-10000>|size <1-64000>|timeout <1-10>\}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ping &lt;MINT-ID&gt;</strong></td>
<td>Sends a MiNT echo message to a specified destination</td>
</tr>
<tr>
<td></td>
<td>• &lt;MINT-ID&gt; – Specify the destination device’s MiNT ID.</td>
</tr>
<tr>
<td><strong>count &lt;1-10000&gt;</strong></td>
<td>Optional. Sets the pings to the MiNT destination</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-10000&gt; – Specify a value from 1 - 60. The default is 3.</td>
</tr>
<tr>
<td><strong>size &lt;1-64000&gt;</strong></td>
<td>Optional. Sets the MiNT payload size in bytes</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-64000&gt; – Specify a value from 1 - 640000 bytes. The default is 64 bytes.</td>
</tr>
<tr>
<td><strong>timeout &lt;1-10&gt;</strong></td>
<td>Optional. Sets a response time in seconds</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-10&gt; – Specify a value from 1 - 10 seconds. The default is 1 second.</td>
</tr>
</tbody>
</table>

- mint traceroute <MINT-ID> \{destination-port <1-65535>|max-hops <1-255>|source-port <1-65535>|timeout <1-255>\}

<table>
<thead>
<tr>

</table>
Examples

rfs4000-229D58#mint ping 68.88.0D.A7
MiNT ping 68.88.0D.A7 with 64 bytes of data.
Response from 68.88.0D.A7: id=1 time=0.364 ms
Response from 68.88.0D.A7: id=2 time=0.333 ms
Response from 68.88.0D.A7: id=3 time=0.368 ms

--- 68.88.0D.A7 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 0.333/0.355/0.368 ms
rfs4000-229D58#
3.1.34 mkdir

Creates a new directory in the file system.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
mkdir <DIR>
```

**Parameters**

- mkdir <DIR>

  - <DIR> Specify a directory name.
  
  **Note:** A directory, specified by the <DIR> parameter, is created within the file system.

**Examples**

```
rfs4000-229D58#dir
Directory of flash:/.

3.1.35 more

Privileged Exec Mode Commands

Displays files on the device’s file system. This command navigates and displays specific files in the device’s file system. Provide the complete path to the file more <file>.

The more command also displays the startup configuration file.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

more <FILE>

Parameters

- more <FILE>

<table>
<thead>
<tr>
<th>&lt;FILE&gt;</th>
<th>Specify the file name and location.</th>
</tr>
</thead>
</table>

Examples

--More--

rfs4000-229D58#
3.1.36 **no**

Privileged Exec Mode Commands

Use the `no` command to revert a command or a set of parameters to their default. This command is useful to turn off an enabled feature or to revert to default settings.

The `no` commands have their own set of parameters that can be reset. These parameters depend on the context in which the command is being used.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Supported Platforms**

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no [adoption|captive-portal|cpe|crypto|debug|logging|page|raid|service|
    terminal|upgrade|virtual-machine|wireless]
no adoption {on <DEVICE-OR-DOMAIN-NAME>}
no captive-portal client [captive-portal <CAPTIVE-PORTAL-NAME>|mac <MAC>]
    {on <DEVICE-OR-DOMAIN-NAME>}
no crypto pki [server|trustpoint]
no crypto pki [server|trustpoint] <TRUSTPOINT-NAME> {del-key {on <DEVICE-NAME>}}
    {on <DEVICE-NAME>}
no logging monitor
no page
no service [block-adopter-config-update|locator|snmp|ssm|wireless]
no service block-adopter-config-update
no service locator {on <DEVICE-NAME>}
no service snmp sysoid wing5
no service ssm trace pattern {<WORD>}) {on <DEVICE-NAME>}
no service wireless [trace pattern {<WORD>}) {on <DEVICE-NAME>}]|unsanctioned ap air-terminate <BSSID> {on <DOMAIN-NAME>}
no terminal [length|width]
no upgrade <PATCH-NAME> {on <DEVICE-NAME>}
no wireless client [all|<MAC>]
no wireless client all {filter|on}
no wireless client all {filter [wlan <WLAN-NAME>]}
no wireless client all {on <DEVICE-OR-DOMAIN-NAME>} {filter [wlan <WLAN-NAME>]}
no wireless client mac <MAC> {on <DEVICE-OR-DOMAIN-NAME>}
```

The following command is available only on the RFS4000, RFS7000, NX45XX, NX65XX, and NX9000 series service platforms:

```
no cpe led cpe [<1-24>|all] {on <T5-DEVICE-NAME>}
```

The following command is available only on the NX45XX, NX65XX, and NX9000 series service platforms:

```
no virtual-machine assign-usb-ports {on <DEVICE-NAME>}
```

The following commands are available only on the NX9000 series service platforms:

```
no raid locate
no service analytics wifi
```
Parameters

- `no <PARAMETERS>`

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no &lt;PARAMETERS&gt;</code></td>
<td>Resets or reverts settings based on the parameters passed</td>
</tr>
</tbody>
</table>

Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

```bash
rfs7000-37FABE# no adoption
rfs7000-37FABE#

rfs7000-37FABE# no page
rfs7000-37FABE#

rfs7000-37FABE# no service cli-tables-expand line
rfs7000-37FABE#

nx9500-6C8809# no service analytics wifi
Wifi data polling will be enabled. Please run status command to check Wifi data polling status.
nx9500-6C8809#
```
3.1.37 on

Privileged Exec Mode Commands

Executes the following commands in the RF Domain context: clrscr, do, end, exit, help, service, and show

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

on rf-domain [〈RF-DOMAIN-NAME〉|all]

Parameters
- on rf-domain [〈RF-DOMAIN-NAME〉|all]

on rf-domain [〈RF-DOMAIN-NAME〉|all] Enter the RF Domain context based on the parameter specified
- 〈RF-DOMAIN-NAME〉 – Specify the RF Domain name. Enters the specified RF Domain context.
- all – Specifies all RF Domains.

nx9500-6C8809(TechPubs) #
3.1.38 opendns

Retrieves the OpenDNS device-id from the OpenDNS site

This command integrates access points and controllers with OpenDNS. It obtains the device-id (16 character hex-string) from OpenDNS. This device-id is configured under all WLANs that are to be OpenDNS enabled. When configured and enabled on a WLAN, DNS queries from all wireless clients on the WLAN are redirected to OpenDNS (208.67.220.220 or 208.67.222.222) resolvers. These OpenDNS resolvers act as proxy DNS servers, and also provide additional features, such as Web filtering, performance improvements etc.

**NOTE:** OpenDNS is a free, alternative DNS service that is faster and more reliable than other DNS services available. OpenDNS enables swift navigation of the Web without the outages that are frequent in other ISP provided DNS services. It also blocks inappropriate Web sites, phishing sites, and prevents virus and malware attacks.

**NOTE:** The ‘username’ and ‘password’ values passed in this command should be pre-registered with the OpenDNS site. The ‘label’ can be any value. Only with a combination of a valid ‘username’, ‘password’, and any ‘label’ the OpenDNS server returns a device-id.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>

**Parameters**
- opendns username <USERNAME> password <OPENDNS-PSWD> label <LABEL>

<table>
<thead>
<tr>
<th>opendns</th>
<th>Obtains the OpenDNS device-id from the OpenDNS site</th>
</tr>
</thead>
<tbody>
<tr>
<td>username &lt;USERNAME&gt;</td>
<td>Configures the OpenDNS user name (should be valid username registered with OpenDNS)</td>
</tr>
<tr>
<td>password &lt;OPENDNS-PSWD&gt;</td>
<td>Configures the password associated with the user configured in the previous step</td>
</tr>
<tr>
<td>label &lt;LABEL&gt;</td>
<td>Configures the network label. This the label (the user friendly name) of your network, and should be the same as the label (name) configured on the OpenDNS portal.</td>
</tr>
</tbody>
</table>

**Note:** For every unique set of username, password, and label only one device-id is returned. Apply this device-id in WLANs that are to be OpenDNS enabled. For information on configuring the device-id in the WLAN context, see `opendns`.
Usage Guidelines

Use your OpenDNS credentials to logon to the opendns.org site and use the labels, edit settings, and customize content filtering options to configure Web filtering settings.

Examples

ap7131-E6D512#opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7131-E6D512#
3.1.39 page

Privileged Exec Mode Commands

Toggles controller paging. Enabling this command displays the CLI command output page by page, instead of running the entire output at once.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
page
```

Parameters

None

Examples

```plaintext
rfs7000-37FABE#page
rfs7000-37FABE#
```

### 3.1.40 ping

Sends Internet Controller Message Protocol (ICMP) echo messages to a user-specified location.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
ping <IP/HOSTNAME> {count <1-10000>|dont-fragment {count|size}|size <1-64000>|source [<IP]|pppoe|vlan <1-4094>|wwan}]
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IP/HOSTNAME&gt;</code></td>
<td>Specify the destination IP address or hostname. When entered without any parameters, this command prompts for an IP address or a hostname.</td>
</tr>
<tr>
<td><code>count &lt;1-10000&gt;</code></td>
<td>Optional. Sets the pings to the specified destination. If not specified, the default is 5.</td>
</tr>
<tr>
<td>`dont-fragment {count</td>
<td>size}`</td>
</tr>
<tr>
<td><code>size &lt;1-64000&gt;</code></td>
<td>Optional. Sets the ping packet's size in bytes. If not specified, the default is 100 bytes.</td>
</tr>
<tr>
<td>`source [&lt;IP]</td>
<td>pppoe</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;IP&gt;</code> — Specifies the source IP address</td>
</tr>
<tr>
<td></td>
<td>- <code>pppoe</code> — Selects the PPP over Ethernet interface</td>
</tr>
<tr>
<td></td>
<td>- <code>vlan &lt;1-4094&gt;</code> — Selects the VLAN interface from 1 - 4094</td>
</tr>
<tr>
<td></td>
<td>- <code>wwan</code> — Selects the wireless WAN interface</td>
</tr>
</tbody>
</table>
Examples

rfs7000-37FABE#ping 172.16.10.4 count 6
PING 172.16.10.4 (172.16.10.4) 100(128) bytes of data.

108 bytes from 10.2.0.99: icmp_seq=4 ttl=63 time=0.662 ms
108 bytes from 10.2.0.99: icmp_seq=5 ttl=63 time=0.651 ms
--- 10.2.0.99 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 3998ms
rtt min/avg/max/mdev = 0.648/0.774/1.168/0.202 ms
rfs7000-6DCD4B#
### ping6

**Privileged Exec Mode Commands**

Sends ICMPv6 echo messages to a user-specified IPv6 address

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

\[ ping6 \textless\text{IPv6/HOSTNAME}\rangle \{\textless\text{INTF-NAME}\rangle|\text{count} \text{<1-10000>}\text{|size} \text{<1-64000>}\}

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textless\text{IPv6/HOSTNAME}\rangle</td>
<td>Specify the destination IPv6 address or hostname.</td>
</tr>
<tr>
<td>\textless\text{INTF-NAME}\rangle</td>
<td>Optional. Specify the interface name for link local/broadcast address</td>
</tr>
<tr>
<td>count \textless\text{&lt;1-10000&gt;\rangle}</td>
<td>Optional. Sets the pings to the specified IPv6 destination</td>
</tr>
<tr>
<td>size \textless\text{&lt;1-64000&gt;\rangle}</td>
<td>Optional. Sets the IPv6 ping payload size in bytes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To configure a device's IPv6 address, in the VLAN interface configuration mode, use the `ipv6 > address <IPv6-ADDRESS>` command. After configuring the IPv6 address, use the `ipv6 > enable` command to enable IPv6. For more information see, page 7-207.

**Examples**

```
rfs4000-1B3596#ping6 2001:10:10:10:10:10:10:2 count 6 size 200
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=1 ttl=64 time=0.509 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=2 ttl=64 time=0.323 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=3 ttl=64 time=0.318 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=4 ttl=64 time=0.317 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=5 ttl=64 time=0.314 ms
208 bytes from 2001:10:10:10:10:10:10:2: icmp_seq=6 ttl=64 time=0.318 ms
6 packets transmitted, 6 received, 0% packet loss, time 4999ms
rtt min/avg/max/mdev = 0.314/0.349/0.509/0.075 ms
rfs4000-1B3596#
```
3.1.42 pwd

Displays the full path of the present working directory, similar to the UNIX pwd command

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
pwd
```

**Parameters**

None

**Examples**

```
rfs4000-229D58#pwd
flash:/
rfs4000-229D58#
```

```
    drwx       Thu Apr 16 04:03:34 2015   log

```

```
rfs4000-229D58#
```
3.1.43 re-elect

Privileged Exec Mode Commands

Re-elects the tunnel controller (wireless controller or service platform)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>} | on <DEVICE-NAME>}

Parameters

- re-elect tunnel-controller {<WORD> {on <DEVICE-NAME>} | on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>re-elect tunnel-controller</th>
<th>Re-elects the tunnel controller</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt; {on &lt;DEVICE-NAME&gt;}</td>
<td>Optional. Re-elects the tunnel controller on all devices whose preferred tunnel controller name matches &lt;WORD&gt;</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Re-elects the tunnel controller on a specified device</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE#re-elect tunnel-controller
OK
rfs7000-37FABE#
### 3.1.44 reload

**Privileged Exec Mode Commands**

Halts a device or devices and performs a warm reboot.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
reload {<DEVICE-MAC-OR-HOSTNAME> | at | cancel | force | in | on | staggered}
reload {(at <TIME> <1-31> <MONTH> <1993-2035>{on <DEVICE-OR-DOMAIN-NAME>})
reload {cancel} {on <DEVICE-OR-DOMAIN-NAME>}
reload {force} {(<DEVICE-MAC-OR-HOSTNAME>) | on <DEVICE-OR-DOMAIN-NAME> | staggered}
reload {force} {on <DOMAIN-NAME> | staggered {<DEVICE-MAC-OR-HOSTNAME>} | containing <WORD>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}
reload {in <1-999>} {list|on}
reload {in <1-999>} {list {<LINE>|all}|on <DEVICE-OR-DOMAIN-NAME>}
reload {on <DOMAIN-NAME>} {containing <WORD>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}
reload {staggered} {(<DEVICE-MAC-OR-HOSTNAME>) | on <DOMAIN-NAME> | containing <WORD>|exclude-controllers|exclude-rf-domain-manager|filter <DEVICE-TYPE>}
```

**Parameters**

- **reload {<DEVICE-MAC-OR-HOSTNAME>}**
  - Optional. Reloads the device identified by the `<DEVICE-MAC-OR-HOSTNAME>` keyword. The following keyword is recursive and allows you to specify multiple devices:
    - `<DEVICE-MAC-OR-HOSTNAME>` — Optional. Specify the device’s hostname or MAC address.
  - **Note:** If no device is specified, the system reloads the logged device.

- **reload at**
  - Optional. Schedules a reload at a specified time and day. Use the following keywords to specify the time and day: `<TIME>`, `<1-31>`, `<MONTH>`, and `<1993-2035>`.
  
  - `<TIME>`
    - Specifies the time in the HH:MM:SS format
  
  - `<1-31>`
    - Specifies the day of the month from 1 - 31
  
  - `<MONTH>`
    - Specifies the month from Jan - Dec
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1993-2035&gt;</td>
<td>Specifies the year from 1993 - 2035. It should be a valid 4 digit year.</td>
</tr>
</tbody>
</table>
| on <DEVICE-OR-DOMAIN-NAME> | Optional. Performs reload at the scheduled time, on a specified device or all devices within a specified RF Domain  
  - <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain. When a RF Domain name is provided, all devices within the specified RF Domain are reloaded at the scheduled time.  
  **Note:** If no device is specified, the reload is scheduled on the logged device. |
| reload cancel on <DEVICE-OR-DOMAIN-NAME> | Optional. Cancels all pending reloads  
  - on <DEVICE-OR-DOMAIN-NAME> – Optional. Cancels reloads pending on a specified device or all devices within a specified RF Domain  
    - <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.  
  **Note:** If no device is specified, the system cancels reloads pending on the logged device. |
| reload force | Optional. Forces device(s) to reload, while ignoring conditions like upgrade in progress, unsaved changes etc. Use the options provided to force a reload on a specified device or all devices in a RF Domain.  
  - <DEVICE-MAC-OR-HOSTNAME> – Optional. Forces a reload on a specified device identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device's hostname or MAC address. When executed, the specified device(s) are forced to halt and a warm reboot is performed.  
    - <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.  
  **Note:** If no device is specified, the system forcefully reloads the logged device. |
| on <DOMAIN-NAME> staggered | Optional. Forces a reload on all devices in a RF Domain  
  - <DOMAIN-NAME> – Optional. Specify the name of the RF Domain. When executed, all devices within the specified RF Domain are forced to halt and a warm reboot is performed.  
    - staggered – Optional. Enables staggered reload of devices (one at a time) without network impact. Use this option when rebooting multiple devices within an RF Domain. When executed, all devices within the specified RF Domain are forced to halt and reboot in a staggered manner. |

</tr>
</tbody>
</table>

**Note:** If no device or RF Domain is specified, the system forcefully reloads the logged device.
When reloading devices in a RF Domain, you can use following options to filter specific devices or device types:

- containing <WORD> – Optional. Filters out devices containing a specified sub-string in their hostnames.
- <WORD> – Optional. Provide the sub-string to match. All devices having hostnames containing the provided sub-string are filtered and forcefully reloaded.
- exclude-controllers – Optional. Excludes all controllers in the specified RF Domain from the reload process.
- exclude-rf-domain-manager – Optional. Excludes the RF Domain manager from the reload process.
- filter <DEVICE-TYPE> – Optional. Filters devices by the device type specified. Select the type of device to reload. All devices, of the specified type, within the specified RF Domain, are forcefully reloaded.

reload staggered

Optional. Enables staggered reload of devices (one at a time) without network impact.

- <DEVICE-MAC-OR-HOSTNAME> – Optional. Performs staggered reload on specified device(s) identified by the <DEVICE-MAC-OR-HOSTNAME> keyword. Specify the device’s hostname or MAC address. This is a recursive keyword that allows you to specify multiple devices. When executed, the specified device(s) are halted and a warm reboot is performed. Multiple devices are halted and rebooted one at a time without impacting network functioning.
- <DOMAIN-NAME> – Optional. Performs staggered reload of all devices in a RF Domain. Specify the name of the RF Domain. When executed, devices in the specified RF Domain are halted and rebooted one at a time without impacting network functioning. Use additional filter options to filter devices in the specified RF Domain.

Note: If no device or RF Domain is specified, the system reloads the logged device.

When reloading devices in a RF Domain, you can use following options to filter specific devices or device types:

- containing <WORD> – Optional. Filters out devices containing a specified sub-string in their hostnames.
- <WORD> – Optional. Provide the sub-string to match. All devices having hostnames containing the provided sub-string are filtered and forcefully reloaded.
- exclude-controllers – Optional. Excludes all controllers in the specified RF Domain from the reload process.
- exclude-rf-domain-manager – Optional. Excludes the RF Domain manager from the reload process.
- filter <DEVICE-TYPE> – Optional. Filters devices by the device type specified. Select the type of device to reload. All devices, of the specified type, within the specified RF Domain, are forcefully reloaded.

Contd..
Examples

rfs7000-6DCD4B#reload at 12:30:00 31 Mar 2015 on rfs6000-81742D
Reload scheduled at 2015-03-31 12:30:00 UTC ...

rfs7000-6DCD4B#

rfs7000-6DCD4B#reload cancel on rfs6000-81742D
Scheduled reload cancelled.
rfs7000-6DCD4B#

The following example schedules a reload on all non-controller devices in the RF Domain ‘default’:

rfs7000-6DCD4B#reload on default exclude-controllers
ap8132-711728: OK

rfs7000-6DCD4B#

• filter <DEVICE-TYPE> – Optional. Filters devices by the device type specified. Select the type of device. All devices, of the specified type, within the specified RF Domain, are reloaded.
• <DEVICE-TYPE> – Select the type of device to reload. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, VX9000, t5.

3.1.45 rename

Renames a file in the devices’ file system

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

rename <OLD-FILE-NAME> <NEW-FILE-NAME>

Parameters

- rename <OLD-FILE-NAME> <NEW-FILE-NAME>

<table>
<thead>
<tr>
<th>&lt;OLD-FILE-NAME&gt;</th>
<th>Specify the file to rename.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;NEW-FILE-NAME&gt;</td>
<td>Specify the new file name.</td>
</tr>
</tbody>
</table>

rfs4000-229D58#
3.1.46 rmdir

Privileged Exec Mode Commands

Deletes an existing directory from the file system (only empty directories can be removed)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

\texttt{rmdir <DIR>}

Parameters

- \texttt{rmdir <DIR>}

\texttt{rmdir <DIR>} \hspace{1cm} \textbf{Specifies the directory name}

\textbf{Note:} The directory, specified by the \texttt{<DIR>} parameter, is removed from the file system.

Examples

```
rfs4000-229D58#dir
Directory of flash:/.
  drwx  Wed Jan 30 02:45:10 2014   log
  drwx  Sat Jan  1 00:00:09 2000   configs
  drwx  Fri Feb 15 14:50:49 2014   Final
  drwx  Sat Jan  1 00:00:08 2000   cache
  drwx  Wed Jan 16 22:26:53 2014   crashinfo
  drwx  Sat Jan  1 00:00:08 2000   upgrade
  drwx  Sat Jan  1 00:00:09 2000   hotspot
  drwx  Sat Jan  1 00:00:09 2000   floorplans
  drwx  Sat Jan  1 00:00:09 2000   startuplog
  -rw-  176128  Fri Feb 15 14:32:51 2014   out.tar
rfs4000-229D58#
```

```
rfs4000-229D58#rmdir Final
rfs4000-229D58#
```

```
rfs4000-229D58#dir
Directory of flash:/.

rfs4000-229D58#
```
3.1.47 self

Privileged Exec Mode Commands

Enters the logged device’s configuration context

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
self

Parameters
None

Examples
rfs7000-37FABE#self
Enter configuration commands, one per line. End with CNTL/Z.
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#
3.1.48 ssh

Privileged Exec Mode Commands

Opens a Secure Shell (SSH) connection between two network devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ssh <IP/HOSTNAME> <USERNAME> {<INF-NAME/LINK-LOCAL-ADD>}

Parameters

- ssh <IP/HOSTNAME> <USERNAME> {<INF-NAME/LINK-LOCAL-ADD>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Specify the remote system's IP address or hostname.</td>
</tr>
<tr>
<td>&lt;USERNAME&gt;</td>
<td>Specify the name of the user requesting the SSH connection.</td>
</tr>
<tr>
<td>&lt;INF-NAME/LINK-LOCAL-ADD&gt;</td>
<td>Optional. Specify the interface's name or link local address.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To exit the other device's context, use the command that is relevant to that device.

Examples

nx9500-6C8809#ssh 192.168.13.16 admin
admin@192.168.13.16's password:
rf6000-6DB5D4>

nx9500-6C8809#ssh 192.168.13.14 admin
The authenticity of host '192.168.13.14 (192.168.13.14)' can't be established.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '192.168.13.14' (RSA) to the list of known hosts.
admin@192.168.13.14's password:
x4500-5CFA8E>
3.1.49 t5

Privileged Exec Mode Commands

Executes following operations on a T5 device through the WiNG controller:

- copy, rename, and delete files on the T5 device’s file system
- write running configuration to the T5 device’s memory

The T5 switch is a means of providing cost-effective, high-speed, wall-to-wall coverage across a building. The T5 switch leverages the in-building telephone lines to extend Ethernet and Wireless LAN networks without additional expenditure on rewiring. This setup is ideally suited for hotels, providing high-speed Wi-Fi coverage to guest rooms.

The entire setup consists of the DSL T5 switch, TW-510 Ethernet wallplates, and TW-511 wireless wallplate access points. Replace the phone jack plate in a room with the TW-511 delivers 802.11 a/b/g/n and extend wireless connectivity in that room and the neighboring rooms. These TW-511 wallplates (also referred to as the CPEs) are connected to the T5 switch over the DSL interface using a phone block.

The T5 switch is adopted and managed through a WiNG controller. The connection between the T5 and WiNG switches is over a WebSocket.

- **NOTE:** For more information on other T5 CPE related commands, see cpe.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
t5 [copy <SOURCE-FILE-NAME> <DEST-FILE-NAME>|delete <FILE-NAME>|rename <SOURCE-FILE-NAME> <DEST-FILE-NAME>|write memory] {on <T5-DEVICE-NAME>}
```

**Parameters**

- **copy** `<SOURCE-FILE-NAME> <DEST-FILE-NAME>`
  - Copies file to an external server
  - `<SOURCE-FILE-NAME>` – Specify the source file name.
  - `<DEST-FILE-NAME>` – Specify the destination file name.

  **Note:** The content from the source file is copied to the destination file.
  The source or destination files can be local or remote FTP or TFTP files. The source file also can be a pre-defined keyword. At least one of the files should be a local file. Use this command to copy the startup and/or running configurations to an external server.

- **delete** `<FILE-NAME>`
  - Deletes files on the T5 device’s file system
  - `<FILE-NAME>` – Specify the file name. The specified file is deleted.

- **rename** `<SOURCE-FILE-NAME> <DEST-FILE-NAME>`
  - Renames a file on the T5 device’s file system
  - `<SOURCE-FILE-NAME>` – Specify the source file name
  - `<DEST-FILE-NAME>` – Specify the new file name. The source file is renamed to the input provided here.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>write memory</td>
<td>Writes running configuration to an adopted T5 device’s memory</td>
</tr>
<tr>
<td></td>
<td>• memory – Writes running configuration to the T5 device’s non-volatile (NV) memory.</td>
</tr>
<tr>
<td>on &lt;T5-DEVICE-NAME&gt;</td>
<td>Optional. Executes these operation on a specified wireless controller or service platform</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE#t5 write memory on t5-ED5C2C
Success
rfs7000-37FABE#
```
### 3.1.50 telnet

**Privileged Exec Mode Commands**

Opens a Telnet session between two network devices

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

telnet &lt;IP/HOSTNAME&gt; &lt;TCP-PORT&gt; &lt;INTF-NAME&gt;

#### Parameters

- **telnet &lt;IP/HOSTNAME&gt; &lt;TCP-PORT&gt; &lt;INTF-NAME&gt;**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/HOSTNAME&gt;</td>
<td>Configures the remote system's IP (IPv4 or IPv6) address or hostname. The Telnet session will be established between the connecting system and the remote system.</td>
</tr>
<tr>
<td>&lt;TCP-PORT&gt;</td>
<td>Optional. Specify the Transmission Control Protocol (TCP) port.</td>
</tr>
<tr>
<td>&lt;INTF-NAME&gt;</td>
<td>Optional. Specify the interface name for the link local address.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

To exit the other device's context, use the command relevant to that device.

#### Examples

nx9500-6C8809#telnet 192.168.13.22

3.1.51 terminal

Privileged Exec Mode Commands

Sets the number of characters per line, and the number of lines displayed within the terminal window

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
terminal [length|width] <0-512>
```

Parameters

- **terminal [length|width] <0-512>**

| length <0-512> | Sets the number of lines displayed on the terminal window  
|                | • <0-512> – Specify a value from 0 - 512.  
| width <0-512>  | Sets the width or number of characters displayed on the terminal window  
|                | • <0-512> – Specify a value from 0 - 512.  

Examples

```
rfs7000-37FABE#terminal length 150
rfs7000-37FABE#terminal width 215
rfs7000-37FABE#show terminal
Terminal Type: xterm
Length: 150     Width: 215
rfs7000-37FABE#
```

Related Commands

- **no**

  Resets the width of the terminal window or the number of lines displayed on a terminal window
### 3.1.52 time-it

**Privileged Exec Mode Commands**

Verifies the time taken by a particular command between request and response

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
 time-it <COMMAND>
```

**Parameters**

- `time-it <COMMAND>`

<table>
<thead>
<tr>
<th>time-it &lt;COMMAND&gt;</th>
<th>Verifies the time taken by a particular command to execute and provide a result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;COMMAND&gt;</td>
<td>Specify the command name.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE#time-it config terminal
Enter configuration commands, one per line.  End with CNTL/Z.
That took 0.00 seconds..
rfs7000-37FABE(config)#
```
3.1.53 traceroute

Traces the route to a defined destination

Use ‘--help’ or ‘-h’ to display a complete list of parameters for the traceroute command

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
traceroute <LINE>

Parameters
- traceroute <LINE>

| <LINE> | Traces the route to a destination IP address or hostname
| <LINE> | Specify the destination IPv4 address or hostname.

Examples

nx9500-6C8809#traceroute 192.168.13.16
traceroute to 192.168.13.16 (192.168.13.16), 30 hops max, 46 byte packets
  1 192.168.13.16 (192.168.13.16)  0.479 ms  0.207 ms  0.199 ms
nx9500-6C8809#
3.1.54 traceroute6

Privileged Exec Mode Commands

Traces the route to a specified IPv6 destination

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
traceroute6 <LINE>

Parameters

- traceroute6 <LINE>
  - <LINE> — Specify the destination IPv6 address or hostname.

Examples

1  2001:10:10:10:10:10:10:2 (2001:10:10:10:10:10:10:2)  0.622 ms  0.497 ms  0.531 ms
rfs4000-1B3596#
### 3.1.55 upgrade

**Privileged Exec Mode Commands**

Upgrades a device’s software image

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
upgrade [<FILE>|<URL>] {background|on <DEVICE-NAME>}
```

#### Parameters

- `upgrade [<FILE>|<URL>] {background|on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `<FILE>` | Specify the target firmware image location in the following format:  
  - `cf:/path/file`  
  - `usb1:/path/file`  
  - `usb2:/path/file`  
  - `usb<n>/path/file`  |
| `<URL>` | Specify the target firmware image location. Use one of the following formats: IPv4 URLs:  
  - `tftp://<hostname|IP>[:port]/path/file`  
  - `ftp://<user>:<password>@<hostname|IP>[:port]/path/file`  
  - `sftp://<user>:<password>@<hostname|IP>[:port]/path/file`  
  - `http://<hostname|IP>[:port]/path/file`  
  - `cf:/path/file`  
  - `usb<n>/path/file` IPv6 URLs:  
  - `tftp://<hostname|[IPv6]>[:port]/path/file`  
  - `ftp://<user>:<password>@<hostname|[IPv6]>[:port]/path/file`  
  - `sftp://<user>:<password>@<hostname|[IPv6]>[:port]/path/file`  
| background | Optional. Performs upgrade in the background |
| on `<DEVICE-NAME>` | Optional. Upgrades the software image on a specified remote device  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
Examples

rfs7000-37FABE#show boot

<table>
<thead>
<tr>
<th>IMAGE</th>

3.1.56 *upgrade-abort*

Aborts an ongoing software image upgrade

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
upgrade-abort \{on <DEVICE-OR-DOMAIN-NAME>\}
```

**Parameters**

- **upgrade-abort \{on <DEVICE-OR-DOMAIN-NAME>\}**
  - Optional. Aborts an ongoing software image upgrade on a specified device or domain
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

**Examples**

```
rfs4000-229D58#upgrade ftp://anonymous:anonymous@192.168.13.10/LatestBuilds/W58/RFS4000.img
Running from partition /dev/mtdblock6

### 3.1.57 watch

*Privileged Exec Mode Commands*

Repeats a specified CLI command at periodic intervals

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
watch <1-3600> <LINE>
```

**Parameters**

- `watch <1-3600> <LINE>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;1-3600&gt;</code></td>
<td>Repeats a CLI command at a specified interval.</td>
</tr>
<tr>
<td><code>&lt;LINE&gt;</code></td>
<td>Specify the CLI command name.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE#watch 1 show clock
rfs7000-37FABE#
```
3.1.58 exit

Privileged Exec Mode Commands

Ends the current CLI session and closes the session window

For more information, see exit.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9000, NX9500, NX9510, NX9600

Syntax

exit

Parameters

None

Examples

rfs7000-37FABE#exit
3.1.59 smart-cache

Privileged Exec Mode Commands

Pre-fetches cached content from the specified list of URLs.

Smart caching is a licensed service available on the NX45XX and NX65XX series service platforms. It allows the temporary storage of frequently accessed Web content (Web pages, graphics, audio and video files etc.) on network infrastructure devices. When this content is requested, it is retrieved from a local content cache and not from the origin server. For more information on enabling content caching, see smart-cache-policy.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

smart-cache pre-fetch-immediate <URL-LIST-NAME>

Parameters

- smart-cache pre-fetch-immediate <URL-LIST-NAME>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>smart-cache</td>
<td>Pre-fetches content from the specified list of URLs</td>
</tr>
<tr>
<td>pre-fetch-immediate</td>
<td>Provide the URL list names (should be existing and configured). For more information on configuring URL lists, see url-list.</td>
</tr>
</tbody>
</table>

Examples

nx4500-5CFA2B#smart-cache pre-fetch-immediate ?

  URL-LIST  URL List to be Pre Fetched

nx4500-5CFA2B#
3.1.60 virtual-machine

Privileged Exec Mode Commands

Installs, configures, and monitors the status of third-party virtual machines (VMs)

In addition to the WiNG VMs, the NX45XX, NX65XX, NX9500, and NX9510 series service platforms support the installation and administration of third-party VMs. However, the third-party VMs supported by these devices varies.

The third-party VMs supported on NX45XX and NX65XX are:

- TEAM-URC
- TEAM-RLS
- TEAM-VoWLAN

The VM supported on NX9500 and NX9510 is:

- ADSP

Use the virtual-machine command to install the third-party VMs, and configure parameters, such as install media type and location, number of Virtual Central Processing Units (VCPUS), VM memory, VM disk, number of Virtual Network Interfaces (VIFs), and Virtual Networking Computing (VNC) port.

Installing third-party VMs saves on hardware cost and provides a unified VM management interface.

This section is organized into the following sub-sections:

- Syntax NX45XX, NX65XX
- Syntax NX9500 and NX9510

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX9500, NX9510, NX9600

Syntax NX45XX, NX65XX

```
virtual-machine [assign-usb-ports|console|export|install|restart|set|start|stop|uninstall]
virtual-machine assign-usb-ports team-vowlan {on <DEVICE-NAME>}

virtual-machine start [team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
virtual-machine stop [hard|team-urc|team-rls|team-vowlan]
virtual-machine stop [team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}
```
virtual-machine stop hard [〈VM-NAME〉|team-urc|team-rls|team-vowlan] {on 〈DEVICE-NAME〉}

virtual-machine uninstall [〈VM-NAME〉|team-urc|team-rls|team-vowlan] {on 〈DEVICE-NAME〉}

**Parameters** NX45XX, NX65XX

- virtual-machine assign-usb-ports team-vowlan {on 〈DEVICE-NAME〉}
  
  **Assigns USB ports to TEAM-VoWLAN on a specified device**
  
  - on 〈DEVICE-NAME〉 – Optional. Specify the device name.
  
  **Note:** Use the no > virtual-machine > assign-usb-ports to reassign the port to WiNG.
  
  **Note:** TEAM-RLS VM cannot be installed when USB ports are assigned to TEAM-VoWLAN.

- virtual-machine console [〈VM-NAME〉|team-urc|team-rls|team-vowlan]
  
  **Connects to the VM's console, based on the parameters passed. Select one of the following console options:**
  
  - 〈VM-NAME〉 – Connects to the console of the VM identified by the 〈VM-NAME〉 keyword. Specify the VM name.
  - team-urc – Connects to the VM TEAM-URC's (IP-PBX) console
  - team-rls – Connects to the VM TEAM Radio Link Server's (RLS) console
  - team-vowlan – Connects to the VM TEAM-VoWLAN's (Voice over WLAN) console

- virtual-machine export 〈VM-NAME〉 [〈FILE〉|〈URL〉] {on 〈DEVICE-NAME〉}
  
  **Exports an existing VM image and settings. Use this command to export the VM to another NX45XX or NX65XX device in the same domain.**
  
  - 〈VM-NAME〉 – Specify the VM name.
  - 〈FILE〉 – Specify the location and name of the source file (VM image). The VM image is retrieved and exported from the specified location.
  - 〈URL〉 – Specify the destination location. This is the location to which the VM image is copied. Use one of the following formats to provide the destination path:
    tftp://〈hostname|IP>[:port]/path/file
    ftp://〈user>:〈passwd>@〈hostname|IP>[:port]/path/file
    sftp://〈user>:〈passwd>@〈hostname|IP>[:port]/path/file
    http://〈hostname|IP>[:port]/path/file
  
  - on 〈DEVICE-NAME〉 – Optional. Executes the command on a specified device or devices
  
  **Note:** The VM should be in a stop state during the export process.
  
  **Note:** If the destination is a device, the image is copied to a predefined location (VM archive).
### virtual-machine install

Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process.

- `<VM-NAME>` – Specify the VM name.
- `type` – Specify the install-media (image) type. The options are:
  - `disk` – Specifies the install media type as pre-installed OS disk image (located in the flash memory).
  - `iso disk-size <SIZE>` – Specifies the install media type as ISO file. This is a single file, which contains the OS bootable install media.
  - `disk-size <SIZE>` – If the install media type is ISO, specify the disk size in GB.
  - `vm-archive` – Specifies the install media type as VM archive. The VM archive file is a tar.gz file consisting of a pre-installed OS disk image and an associated configuration file. The configuration is a standard libvirt VM template consisting of VM specific information.

**Note:** After specifying the install media type, specify the location of the image. The image can be located in any of the following supported locations: FLASH, USB, or a remote location, such as http, ftp, sftp, tftp.

<table>
<thead>
<tr>
<th>install-media</th>
<th>Specifies the install media location</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;FILE&gt;</code></td>
<td>Specifies the install-media file is located on flash, for example flash:/cache</td>
</tr>
<tr>
<td><code>&lt;URL&gt;</code></td>
<td>Specifies the install-media file is located on a remote URL. Provide the URL using one of the following formats:</td>
</tr>
<tr>
<td></td>
<td>tftp://&lt;hostname</td>
</tr>
<tr>
<td></td>
<td>ftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname</td>
</tr>
<tr>
<td></td>
<td>sftp://&lt;user&gt;:&lt;passwd&gt;@&lt;hostname</td>
</tr>
<tr>
<td></td>
<td>http://&lt;hostname</td>
</tr>
<tr>
<td><code>&lt;USB&gt;</code></td>
<td>Specifies the install-media file is located on a USB. Provide the USB path and file name using the following format:</td>
</tr>
<tr>
<td></td>
<td>usb&lt;n&gt;/path/file</td>
</tr>
</tbody>
</table>

After specifying the image location, you may provide the following information:

- `autostart` – Optional. Specifies whether to autostart the VM on system reboot
- `ignore` – Enables autostart on each system boot/reboot
- `start` – Disables autostart (default setting)
- `memory` – Optional. Defines the VM memory size
  - `<512-8192>` – Specify the VM memory from 512 - 8192 MB. The default is 2048 MB.
- `on` – Optional. Executes the command on a specified device
  - `<DEVICE-NAME>` – Specify the service platform name.
- `vcpus` – Optional. Specifies the number of VCPUS for this VM
  - `<1-4>` – Specify the number of VCPUS from 1 - 4. The default setting is 4.

Contd...
virtual-machine install [team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

- vif-count – Optional. Configures or resets the VIF number for this VM
  - <0-2> – Specify the VIF number from 0 - 2. The default setting is 1. If assigning a virtual network interface for the VM, optionally specify the following parameters:
    - vif-mac – Sets the MAC index for the virtual interfaces 1 & 2.
    - vif-to-vmif – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8. VMIFs are layer 2 interfaces on the WiNG bridge. Each custom VM can have up to a maximum of 2 virtual Ethernet interfaces. By default, these interfaces are internally connected to the Dataplane bridge through VMIF1, which is an untagged port with access VLAN 1.
    - vnc – Enables or disables VNC on the virtual interfaces 1 & 2
- vnc – Optional. Disables/enables VNC port. When enabled, provides remote access to VGA through the noVNC client.
- disable – Disables VNC
- enable – Enables VNC (default setting)

virtual-machine install Installs the VM. The install command internally creates a VM template, consisting of the specified parameters, and starts the installation process. Select one of the following options:

- team-urc – Installs the VM TEAM-URC image
- team-rls – Installs the VM TEAM-RLS image
- team-vowlan – Installs the VM TEAM-VoWLAN image

The following keywords are common to all of the above parameters:

- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

virtual-machine restart [{team-urc|hard|team-rls|team-vowlan}]
{on <DEVICE-NAME>}

Restarts the VM

- <VM-NAME> – Restarts the VM identified by the <VM-NAME> keyword
- team-urc – Restarts the VM TEAM-URC
- team-rls – Restarts the VM TEAM-RLS
- team-vowlan – Restarts the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:

- on <DEVICE-NAME> – Optional. Executes the command on a specified device or devices
  - <DEVICE-NAME> – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Note: The option ‘hard’ forces the specified VM to restart.
• virtual-machine set [autostart [ignore|start]]|memory <512-8192>|vcpus <1-4>|vif-count <0-2>|vif-mac <VIF-INDEX> <MAC-INDEX>|vif-to-vmif <VIF-INDEX> <VMIF-INDEX>|vnc [disable|enable] | [ <VM-NAME>|team-urc|team-rls|team-vowlan] {on <DEVICE-NAME>}

<table>

<tr>
<td>start – Disables autostart</td>
<td></td>
</tr>
<tr>
<td>memory – Defines the VM memory size</td>
<td></td>
</tr>
<tr>
<td>&lt;512-8192&gt; – Specify the VM memory from 512 - 8192 MB. The default is 1024 MB.</td>
<td></td>
</tr>
<tr>
<td>vcpus – Specifies the number of VCPUS for this VM</td>
<td></td>
</tr>
<tr>
<td>&lt;1-4&gt; – Specify the number of VCPUS from 1 - 4.</td>
<td></td>
</tr>
<tr>
<td>vif-count – Configures or resets the VM’s VIFs</td>
<td></td>
</tr>
<tr>
<td>&lt;0-2&gt; – Specify the VIF number from 0 - 2.</td>
<td></td>
</tr>
<tr>
<td>vif-mac – Configures the MAC address of the selected virtual network interface</td>
<td></td>
</tr>
<tr>
<td>&lt;1-2&gt; – Select the VIF</td>
<td></td>
</tr>
<tr>
<td>&lt;1-8&gt; – Specify the MAC index for the selected VIF</td>
<td></td>
</tr>
<tr>
<td>&lt;MAC&gt; – Specify the customized MAC address for the selected VIF in the AA-BB-CC-DD-EE-FF format.</td>
<td></td>
</tr>
</tbody>
</table>

Each VM has a maximum of two network interfaces (indexed 1 and 2, referred to as VIF). By default, each VIF is automatically assigned a MAC from the range allocated for that device. However, you can use the ‘set’ keyword to specify the MAC from within the allocated range. Each of these VIFs are mapped to a layer 2 port in the Dataplane (referred to as VMIF). These VMIFs are standard l2 ports on the DP bridge, supporting all VLAN and ACL commands. The WiNG software supports up to a maximum of 8 VMIFs. By default, a VM’s interface is always mapped to VMIF1. You can map a VIF to any of the 8 VMIFs. Use the vif-to-vmif command to map a VIF to a VMIF on the DP bridge.

• vif-to-vmif – Maps the virtual interface (1 or 2) to the selected VMIF interface. Specify the VMIF interface index from 1 - 8.

WiNG provides a dataplane bridge for external network connectivity for VMs. VM Interfaces define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two VM interfaces. Each VM interface can be mapped to one of eight VMIF ports for NX4500 and NX6500 service platforms and twelve ports for NX9500 on the dataplane bridge. This mapping determines the destination for service platform routing.

By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1, by default, is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.

• vnc – Disables/enables VNC port option for an existing VM. When enabled, provides remote access to VGA through the noVNC client.
  • disable – Disables VNC port
  • enable – Enables VNC port

Contd...
virtual-machine start  

Starts the VM, based on the parameters passed. Select one of the following options:
- `<VM-NAME>` – Starts the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Starts the VM TEAM-URC
- `team-rls` – Starts the VM TEAM-RLS
- `team-vowlan` – Starts the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:
- `on <DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
- `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Note: The option ‘hard’ forces the selected VM to shutdown.

virtual-machine stop  

Stops the VM, based on the parameters passed. Select one of the following options:
- `<VM-NAME>` – Stops the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Stops the VM TEAM-URC
- `team-rls` – Stops the VM TEAM-RLS
- `team-vowlan` – Stops the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:
- `on <DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
- `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Note: The option ‘hard’ forces the selected VM to shutdown.

virtual-machine uninstall  

Uninstalls the specified VM
- `<VM-NAME>` – Uninstalls the VM identified by the `<VM-NAME>` keyword. Specify the VM name.
- `team-urc` – Uninstalls the VM TEAM-URC
- `team-rls` – Uninstalls the VM TEAM-RLS
- `team-vowlan` – Uninstalls the VM TEAM-VoWLAN

The following keywords are common to all of the above parameters:
- `on <DEVICE-NAME>` – Optional. Executes the command on a specified device or devices
- `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

Note: This command releases the VM’s resources, such as memory, VCPUS, VNC port, disk space, and removes the RF Domain reference from the system.
Syntax NX9500 and NX9510

```plaintext
virtual-machine console adsp
virtual-machine install adsp {on <DEVICE-NAME>}
virtual-machine restart adsp {on <DEVICE-NAME>}
virtual-machine set disk-size <100-500> adsp {on <DEVICE-NAME>}
virtual-machine set memory <512-8192> adsp {on <DEVICE-NAME>}
virtual-machine set wing-memory <12288-32739>
virtual-machine [start|stop] adsp {on <DEVICE-NAME>}
virtual-machine uninstall adsp {on <DEVICE-NAME>}
```

**NOTE:** On an NX95XX, you can use the install, start, stop, restart, and set commands to manage a third-party VM running on a NX45XX and NX65XX. You can also configure a third-party VM’s settings through a NX95XX series service platform.

---

### Parameters NX9500 and NX9510

- `virtual-machine console adsp`

| virtual-machine console | Connects to the Air-Defense Services Platform (ADSP) VM’s console
|-------------------------|-------------------------------------------------------------------
<p>|                         | When ADSP is running on the NX9500 and NX9510 model service platforms, WiNG communicates with ADSP using a <em>single sign-on</em> (SSO) authentication mechanism. Once the user is logged in, WiNG gains access to ADSP without being prompted to login again at ADSP. However, the WiNG and ADSP databases are not synchronized. ADSP has its own user database, stored locally within its VM, which is accessed whenever a user logs directly into ADSP. WiNG and ADSP must be consistent in the manner events are reported up through a network hierarchy to ensure optimal interoperability and event reporting. To provide such consistency, WiNG has added support for an ADSP-like hierarchal tree. The tree resides within WiNG, and ADSP reads it from WiNG and displays the network hierarchy in its own ADSP interface. The hierarchal tree can also be used to launch ADSP modules (like Spectrum Analyzer) directly from WiNG. For more information on configuring WiNG tree-node structure, see <code>tree-node</code>. |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>virtual-machine install adsp</td>
<td>Installs the ADSP VM</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>- Optional. Executes the command on a specified device or devices</td>
</tr>
<tr>
<td></td>
<td>- &lt;DEVICE-NAME&gt; – Specify the service platform name. In case of multiple devices, list the device names separated by commas.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Before installing the ADSP VM, execute the upgrade command, giving the path and file name of the ADSP firmware image. This extracts the image on to the device (NX9500 or NX9510) on which the command has been executed. On successful completion of this process, execute the reload command to reboot the device. Once the device has been successfully rebooted, execute the virtual-machine &gt; install &gt; adsp command. For example:</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td>virtual-machine restart adsp</td>
<td>Restarts the ADSP VM</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>- Optional. Executes the command on a specified device or devices</td>
</tr>
<tr>
<td></td>
<td>- &lt;DEVICE-NAME&gt; – Specify the service platform name. In case of multiple devices, list the device names separated by commas.</td>
</tr>
<tr>
<td>virtual-machine set disk-size</td>
<td>Sets the ADSP VM’s disk size (in GB). Specify a value from 100 - 500 GB.</td>
</tr>
<tr>
<td>&lt;100-500&gt; adsp</td>
<td>- Optional. Executes the command on a specified device or devices</td>
</tr>
<tr>
<td></td>
<td>- &lt;DEVICE-NAME&gt; – Specify the service platform name. In case of multiple devices, list the device names separated by commas.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Stop the ADSP VM before executing this command.</td>
</tr>
<tr>
<td>virtual-machine set memory</td>
<td>Modifies the ADSP VM's memory. Specify a value from 512 - 8192 MB.</td>
</tr>
<tr>
<td>&lt;512-8192&gt; adsp</td>
<td>- Optional. Executes the command on a specified device or devices</td>
</tr>
<tr>
<td></td>
<td>- &lt;DEVICE-NAME&gt; – Specify the service platform name. In case of multiple devices, list the device names separated by commas.</td>
</tr>
</tbody>
</table>
• virtual-machine set wing-memory <12288-32739>

Specifies the WiNG memory size in MB

**Note:** This command is applicable only to the NX9500 and NX9510 service platforms. Use the `show > virtual-machine-configuration` command to view the configured memory allocation. Use the `show > virtual-machine-statistics` to view the current allocated memory allocation.

• `<12288-32739>` – Specify a value from 12288 - 32739 MB. The default is 18432 MB.

**Note:** The new memory setting takes effect only after the next boot.

• virtual-machine [start|stop] adsp {on <DEVICE-NAME>}

Starts/stops the ADSP VM

- **start** – Starts the ADSP VM. Use this command to boot a shut down VM (in a stop state).
- **stop** – Stops a running ADSP VM. Use this command to shut down a running VM.
- {on <DEVICE-NAME>} – Optional. Executes the start/stop command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

• virtual-machine uninstall adsp {on <DEVICE-NAME>}

Uninstalls the ADSP VM

- {on <DEVICE-NAME>} – Optional. Executes the command on a specified device or devices
  - `<DEVICE-NAME>` – Specify the service platform name. In case of multiple devices, list the device names separated by commas.

**Examples**

The following examples show the VM installation process:

**Installation media: USB**

```bash
<DEVICE>#virtual-machine install <VM-NAME> type iso disk-size 8 install-media usb1://vms/win7.iso autostart start memory 512 vcpus 3 vif-count 2 vnc enable
```

In the preceding example, the command is executed on the device identified by the `<DEVICE-NAME>` keyword. In such a scenario, the disk-size is ignored if specified. The VM has the install media as first boot device.

**Installation media: pre-installed disk image**

```bash
<DEVICE>#virtual-machine install <VM-NAME> type disk install-media flash:/vms/win7_disk.img autostart start memory 512 vcpus 3 vif-count 2 vnc-enable on <DEVICE-NAME>
```

In the preceding example, the command copies the VM archive on to the URL (VM should be in stop state).

**Exporting an installed VM:**

```bash
<DEVICE>#virtual-machine export <VM-NAME> <URL> on <DEVICE-NAME>
```

In the preceding example, the command copies the VM archive on to the URL (VM should be in stop state).
nx4500-5CFA2B>virtual-machine install team-urc
Virtual Machine install team-urc command successfully sent.
nx4500-5CFA2B>

**NOTE:** Use the show > virtual-machine > [configuration|debugging|export|statistics] command to view installed VM details.
### 3.1.61 raid

**Privileged Exec Mode Commands**

Enables *Redundant Array of Independent Disks (RAID)* management

RAID is a group of one or more independent, physical drives, referred to as an array or drive group, These physically independent drives are linked together and appear as a single storage unit or multiple virtual drives. Replacing a single, large drive system with an array, improves performance (input and output processes are faster) and increases fault tolerance within the data storage system.

In an array, the drives can be organized in different ways, resulting in different RAID types. Each RAID type is identified by a number, which determines the RAID level. The common RAID levels are 0, 00, 1, 5, 6, 50 and 60. The WiNG MegaRAID implementation supports RAID-1, which provides data mirroring, but does not support data parity. RAID-1 consists of a two-drive array, where the data is simultaneously written on both drives, ensuring total data redundancy. In case of a drive failure the information on the other drive is used to rebuild the failed drive.

An array is said to be degraded when one of its drives has failed. A degraded array continues to function and can be rebooted using the one remaining functional drive. When a drive fails, the chassis sounds an alarm (if enabled), and the CLI prompt changes to “RAID degraded”. The failed drive is automatically replaced with a hot spare (provided a spare is installed). The spare is used to re-build the array.

Use this command to:

- Verify the current array status
- Start and monitor array consistency checks
- Retrieve date and time of the last consistency check
- Shut down drives before physically removing them
- Install new drives
- Assign drives as hot spares
- Identify a degraded drive
- Deactivate an alarm (triggered when a drive is removed from the array)

Supported in the following platforms:
- Service Platforms — NX7530, NX9500

---

**NOTE:** RAID controller drive arrays are available within NX7530 and NX9000 series service platforms (NX9000, NX9500 and NX9510 models) only. However, they can be administered on behalf of a NX9000 profile by a different model service platform or controller. The NX9500 service platform includes a single Intel MegaRAID controller, configured to provide a single virtual drive. This virtual drive is of the RAID-1 type, and has a maximum of two physical drives. In addition to these two drives, there are three hot spares, which are used in case of a primary drive failure.

---

**Syntax**

- `raid [check|install|locate|remove|silence|spare]`
- `raid [check|silence]`
- `raid [install|locate|remove|spare] drive <0-4>`
### Parameters

- **raid [check|silence]**
  - **check**
    - Starts a consistency check on the RAID array. Use the `show > raid` command to view consistency check status.
    - A consistency check verifies the data stored in the array. When regularly executed, it helps protect against data corruption, and ensures data redundancy. Consistency checks also warn of potential disk failures.
  - **silence**
    - Deactivates an alarm
    - **Note:** When enabled, an audible alarm is triggered when a drive in the array fails. The `silence` command deactivates the alarm (sound).
    - **Note:** To enable RAID alarm, in the device configuration mode, use the `raid > alarm > enable` command. A NX9500 profile can also have the RAID alarm feature activated. For more information on the enabling RAID alarm, see `raid`.

- **raid [install|locate|remove|spare] drive <0-4>**
  - **install <0-4>**
    - Includes a new drive, inserted in one of the available slots, in the array. Specify the drive number.
    - **Note:** Drives 0 and 1 are the array drives. Drives 2, 3, and 4 are the hot spare drives. You can include the new drive in a degraded array, or enable it as a hot spare.
    - **Note:** If the array is in a degraded state, the re-build process is triggered and the new drive is used to repair the degraded array.
  - **locate <0-4>**
    - Enables LEDs to blink on a specified drive. Specify the drive number.
    - **Note:** Blinking LEDs enable you correctly locate a drive.
  - **remove <0-4>**
    - Removes (shuts downs) a disk from the array, before it is physically removed from its slot. Specify the drive number containing the disk.
    - **Note:** Use this command to also remove a hot spare.
  - **spare <0-4>**
    - Converts an unused drive into a hot spare. Specify the drive number.

### Examples

```
nx9500-6C874D#raid install drive 0
Error: Input Error: Drive 0 is already member of array, can't be added
nx9500-6C874D#
```
This chapter summarizes the global-configuration commands in the CLI command structure.

The term global indicates characteristics or features effecting the system as a whole. Use the Global Configuration Mode to configure the system globally, or enter specific configuration modes to configure specific elements (such as interfaces or protocols). Use the configure terminal command (under PRIV EXEC) to enter the global configuration mode.

The following example describes the process of entering the global configuration mode from the privileged EXEC mode:

```plaintext
<DEVICE># configure terminal
<DEVICE>(config)#
```

**NOTE:** The system prompt changes to indicate you are now in the global configuration mode. The prompt consists of the device host name followed by (config) and a pound sign (#).

Commands entered in the global configuration mode update the running configuration file as soon as they are entered. However, these changes are not saved in the startup configuration file until a `commit write memory` command is issued.

<DEVICE>(config)#?

</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS*. 
NOTE: The input parameter <<HOSTNAME>>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character.
4.1.1 aaa-policy

Configures an Authentication, Accounting, and Authorization (AAA) policy. This policy configures multiple servers for authentication and authorization. Up to six servers can be configured for providing AAA services.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
aaa-policy <AAA-POLICY-NAME>
```

Parameters

- `aaa-policy <AAA-POLICY-NAME>`

| <AAA-POLICY-NAME> | Specify the AAA policy name. If the policy does not exist, it is created. |

Examples

```
rfs7000-37FABE(config)#aaa-policy test
rfs7000-37FABE(config-aaa-policy-test)#?
```

AAA Policy Mode commands:

- `accounting` Configure accounting parameters
- `attribute` Configure RADIUS attributes in access and accounting requests
- `authentication` Configure authentication parameters
- `health-check` Configure server health-check parameters
- `mac-address-format` Configure the format in which the MAC address must be filled in the Radius-Request frames
- `no` Negate a command or set its defaults
- `proxy-attribute` Configure radius attribute behavior when proxying through controller or rf-domain-manager
- `server-pooling-mode` Configure the method of selecting a server from the pool of configured AAA servers
- `use` Set setting to use
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-aaa-policy-test)#
```

Related Commands

```
no
```

Removes an existing AAA policy

---

**NOTE:** For more information on the AAA policy commands, see *Chapter 8, AAA-POLICY*. 
4.1.2 alias

Global Configuration Commands

Configures network, VLAN, host, string, and network-service aliases

Aliases are objects having a unique name and content that is determined by the alias type (network, VLAN, and network-service).

A typical large enterprise network, consists of multiple sites (RF Domains) having similar configuration parameters with few elements that vary, such as networks or network ranges, hosts having different IP addresses, and VLAN IDs or URLs. These elements can be defined as aliases (object oriented wireless firewalls) and used across sites by applying overrides to the object definition. Using aliases results in a configuration that is easier to understand and maintain.

Multiple instances of an alias (same type and same name) can be defined at any of the following levels: global, RF Domain, profile, or device. An alias defined globally functions as a top-level-object (TLO). Global aliases are not mandatory, and can be defined at the domain-level, or profile, or device-level only. An alias defined on a device is applicable to that device only. An alias defined on a profile applies to every device using the profile. Similarly, aliases defined at the RF Domain level apply to all devices within that domain.

Aliases defined at any given level can be overridden at any of the next lower levels. For example, a global alias can be redefined on a selected set of RF Domains, profiles, or devices. Overrides applied at the device level take precedence.

Aliases can be classified as:

- **address-range alias** – Maps a name to a range of IP addresses. An address-range alias can be utilized at different deployments. For example, if an ACL defines a pool of network addresses as 192.168.10.10 through 192.168.10.100 for an entire network, and a remote location’s network range is 172.16.13.20 through 172.16.13.110, the remote location’s ACL can be overridden using an alias. At the remote location, the ACL works with the 172.16.13.20-110 address range. A new ACL need not be created specifically for the remote deployment location.

- **host alias** – Maps a name to a specific host (identified by its IP address. For example, 192.168.10.23). A host alias can be utilized at different deployments. For example, if a central network DNS server is set a static IP address, and a remote location’s local DNS server is defined, this host can be overridden at the remote location. At the remote location, the network is functional with a local DNS server, but uses the name set at the central network. A new host need not be created at the remote location. This simplifies creating and managing hosts and allows an administrator to better manage specific local requirements.

- **network alias** – Maps a name to a network. A network alias can be utilized at different deployments. For example, if a central network ACL defines a network as 192.168.10.0/24, and a remote location’s network range is 172.16.10.0/24, the ACL can be overridden at the remote location to suit their local (but remote) requirement. At the remote location, the ACL functions with the 172.16.10.0/24 network. A new ACL need not be created specifically for the remote deployment. This simplifies ACL definition and allows an administrator to better manage specific local requirements.

- **network-group alias** – Maps a name to a single or a range of addresses of devices, hosts, and network configurations. Network configurations are complete networks in the form 192.168.10.0/24 or IP address range in the form 192.168.10.10-192.168.10.20. A network-group alias can contain a maximum of eight (8) host entries, eight (8) network entries, and eight (8) IP address-range entries. A maximum of 32 network-group alias entries can be created. A network-group alias can be used in IP firewall rules to substitute hosts, subnets, and IP address ranges.

- **network-service alias** – Maps a name to service protocols and ports to match. Both source and destination ports are configurable. For each protocol, up to 2 source port ranges and up to 2 destination port ranges can be configured. A maximum of 4 protocol entries can be configured per network-service alias. When used with an ACL, the network-service alias defines the service-specific components of the ACL rule. Overrides can be applied to the service alias, at the device level, without modifying the ACL. Application of overrides to the service alias allows an ACL to be used across sites.
Use a network-service alias to associate more than one IP address to a network interface, providing multiple connections to a network from a single IP node.

NOTE: When used with ACLs, network, network-group, and network-service aliases act as enhanced firewalls.

- number alias – Maps a name to a number
- vlan alias – Maps a name to a VLAN ID. A VLAN alias can be used at different deployments. For example, if a named VLAN is defined as 10 for the central network, and the VLAN is set to 26 at a remote location, the VLAN can be overridden at the deployment location with an alias. At the remote deployment location, the network is functional with a VLAN ID of 26 but utilizes the name defined at the centrally managed network. A new VLAN need not be created specifically for the remote deployment.
- string alias – Maps a name to a specific string (for example, RF Domain name). A host alias can be utilized at different deployments. For example, if the main domain at a remote location is called loc1.domain.com and at another deployment location it is called loc2.domain.com, the alias can be overridden at the remote location to suit the local (but remote) requirement. At one remote location, the alias functions with the loc1.domain.com domain and at the other with the loc2.domain.com domain.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
alias [address-range|host|network|network-group|network-service|number|string|vlan]
alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
alias host <HOST-ALIAS-NAME> <HOST-IP>
alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]
alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP>] [host <HOST-IP> [<HOST-IP>]]
network <NETWORK-ADDRESS/MASK> {<NETWORK-ADDRESS/MASK>}
alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp] {<1-65535>}[<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|nntp|ntp|pop3|proto|sip|smtp|sourceport|ssh|telnet|tftp|www]
alias number <NUMBER-ALIAS-NAME> <0-4294967295>
alias string <STRING-ALIAS-NAME> <LINE>
alias vlan <VLAN-ALIAS-NAME> <1-4094>
```
### Parameters

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>alias address-range</strong> <code>&lt;ADDRESS-RANGE-ALIAS-NAME&gt;</code> <code>&lt;STARTING-IP&gt;</code> to <code>&lt;ENDING-IP&gt;</code></td>
<td>Creates a address range alias, defining a range of IP addresses</td>
</tr>
<tr>
<td>*<code>&lt;ADDRESS-RANGE-ALIAS-NAME&gt;</code> – Specify the address range alias name.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> Alias name should begin with <code>$</code>.</td>
<td></td>

<tr>
<td>*to <code>&lt;ENDING-IP&gt;</code> – Specify the last IP address in the range.</td>
<td></td>
</tr>
<tr>
<td>* <code>&lt;STARTING-IP&gt;</code> to <code>&lt;ENDING-IP&gt;</code> – Optional. Specifies more than one</td>
<td></td>
</tr>
<tr>
<td>range of IP addresses. A maximum of eight (8) IP address ranges can</td>
<td></td>
</tr>
<tr>
<td>be configured.</td>
<td></td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| **host** `<HOST-IP>` \{<HOST-IP>\} | Associates a single or multiple hosts with this network-group alias  
  - `<HOST-IP>` – Specify the hosts’ IP address.  
  - `<HOST-IP>` – Optional. Specifies more than one host. A maximum of eight (8) hosts can be configured. |
| **network** `<NETWORK-ADDRESS/MASK>` \{<NETWORK-ADDRESS/MASK>\} | Associates a single or multiple networks with this network-group alias  
  - `<NETWORK-ADDRESS/MASK>` – Specify the network’s address and mask.  
  - `<NETWORK-ADDRESS/MASK>` – Optional. Specifies more than one network. A maximum of eight (8) networks can be configured. |
| **alias network-service** `<NETWORK-SERVICE-ALIAS-NAME>` proto \[{<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp\}]\{\{<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|ntpv|ntp|pop3|proto|sip|smtp|sourceport \[{<1-65535>|<WORD>|ssh|telnet|tftp|www}\]\} | Configures an alias that specifies available network services and the corresponding source and destination software ports  
  - `<NETWORK-SERVICE-ALIAS-NAME>` – Specify a network-service alias name.  
  - **Note:** Alias name should begin with ‘$’.  
  - **Note:** Network-service aliases are used in ACLs, to define the service-specific components. ACLs using aliases can be used across sites by re-defining the network-service alias elements at the device or profile level. |
| **proto** \[{<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp}\} | Use one of the following options to associate an Internet protocol with this network-service alias:  
  - `<0-254>` – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the Protocol field of the IPv4 header and the Next Header field of IPv6 header. For example, the **User Datagram Protocol**’s (UDP) designated number is 17.  
  - `<WORD>` – Identifies the protocol by its name. Specify the protocol name.  
  - **gre** – Selects **Generic Routing Encapsulation** (GRE). The protocol number is 47.  
  - **igmp** – Selects **Internet Group Management Protocol** (IGMP). The protocol number is 2.  
  - **igp** – Selects **Interior Gateway Protocol** (IGP). The protocol number is 9.  
  - **ospf** – Selects **Open Shortest Path First** (OSPF). The protocol number is 89.  
  - **vrrp** – Selects **Virtual Router Redundancy Protocol** (VRRP). The protocol number is 112. |
| `\{\{<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|ntpv|ntp|pop3|proto|sip|smtp|sourceport \[{<1-65535>|<WORD>|ssh|telnet|tftp|www}\]\} ` | After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports.  
  - `<1-65535>` – Optional. Configures a destination port number from 1 - 65535  
  - `<WORD>` – Optional. Identifies the destination port by the service name provided. For example, the **secure shell** (SSH) service uses TCP port 22.  
  - **bgp** – Optional. Configures the default **Border Gateway Protocol** (BGP) services port (179)  
  - **dns** – Optional. Configures the default **Domain Name System** (DNS) services port (53)  
  - **ftp** – Optional. Configures the default **File Transfer Protocol** (FTP) control services port (21)  
  - **ftp-data** – Optional. Configures the default FTP data services port (20)  
  - **gopher** – Optional. Configures the default gopher services port (70)  
  - **Contd.**
- **https** – Optional. Configures the default HTTPS services port (443)
- **ldap** – Optional. Configures the default Lightweight Directory Access Protocol (LDAP) services port (389)
- **nttp** – Optional. Configures the default Newsgroup (NNTP) services port (119)
- **ntp** – Optional. Configures the default Network Time Protocol (NTP) services port (123)
- **POP3** – Optional. Configures the default Post Office Protocol (POP3) services port (110)
- **proto** – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step.
- **sip** – Optional. Configures the default Session Initiation Protocol (SIP) services port (5060)
- **smtp** – Optional. Configures the default Simple Mail Transfer Protocol (SMTP) services port (25)
- **sourceport** `<1-65535>|<WORD>` – Optional. After specifying the destination port, you may specify a single or range of source ports.
  - `<1-65535>` – Specify the source port from 1 - 65535.
  - `<WORD>` – Specify the source port range, for example 1-10.
- **ssh** – Optional. Configures the default SSH services port (22)
- **telnet** – Optional. Configures the default Telnet services port (23)
- **tftp** – Optional. Configures the default Trivial File Transfer Protocol (TFTP) services port (69)
- **www** – Optional. Configures the default HTTP services port (80)

| alias number `<NUMBER-ALIAS-NAME>` `<0-4294967295>` | Creates a number alias identified by the `<NUMBER-ALIAS-NAME>` keyword. Number aliases map a name to a numeric value. For example, ‘alias number $NUMBER 100’
- The number alias name is: $NUMBER
- The value assigned is: 100
  The value referenced by alias $NUMBER, wherever used, is 100.
- `<NUMBER-ALIAS-NAME>` – Specify the number alias name.
- `<0-4294967295>` – Specify the number, from 0 - 4294967295, assigned to the number alias created.
  
  **Note:** Alias name should begin with `$`.

| alias string `<STRING-ALIAS-NAME>` `<LINE>` | Creates a string alias identified by the `<STRING-ALIAS-NAME>` keyword
- `<STRING-ALIAS-NAME>` – Specify the string alias name.
- `<LINE>` – Specify the string value.
  String aliases map a name to an arbitrary string value. For example, ‘alias string $DOMAIN test.example_company.com’.
- The string alias name is: $DOMAIN
- The value assigned is: test.example_company.com (a domain name)
  The value referenced by alias $DOMAIN, wherever used, is test.example_company.com.
  
  **Note:** Alias name should begin with `$`.
GLOBAL CONFIGURATION COMMANDS

• alias vlan <VLAN-ALIAS-NAME> <1-4094>

<table>
<thead>
<tr>
<th>alias vlan &lt;VLAN-ALIAS-NAME&gt;</th>
<th>Creates a VLAN alias identified by the &lt;VLAN-ALIAS-NAME&gt; keyword</th>

rfs4000-229D58(config)#
**Example 1:**
rfs4000-229D58(config)# alias network-group $test host 192.168.1.10 192.168.1.11
rfs4000-229D58(config)# alias network-group $test network 192.168.2.0/24 192.168.3.0/24
rfs4000-229D58(config)# alias network-group $test address-range 192.168.4.10 to 192.168.4.20

In the preceding example, the network-group alias `$test` includes hosts 192.168.1.10 and 192.168.1.11, networks 192.168.2.0/24 and 192.168.3.0/24 and address-range 192.168.4.10 to 192.168.4.20.

**Example 2:**
rfs4000-229D58(config)#alias network-service $kerberos proto tcp 749 750 80 proto tcp sourceport 20 proto udp 68 sourceport 67
rfs4000-229D58(config)#commit

In the preceding example, the network-service alias `$kerberos` is configured to allow following traffic:

- TCP traffic to destination ports 749, 750, and 80
- TCP traffic from source port 20
- UDP traffic to destination port 68 and from source port 67

rfs4000-229D58(config)#alias string $DOMAIN test.example_company.com
rfs4000-229D58(config)#show context

| ! Configuration of RFS4000 version 5.8.0.0-021D |
| ! version 2.3 |
| ! alias string $DOMAIN test.example_company.com |

4.1.3 aaa-tacacs-policy

Configures AAA Terminal Access Controller Access-Control System (TACACS) policy. This policy configures multiple servers for authentication and authorization. A TACACS Authentication server should be configured when the server preference is authenticated server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>

Parameters

- aaa-tacacs-policy <AAA-TACACS-POLICY-NAME>

| <AAA-TACACS-POLICY-NAME> | Specify the AAA-TACACS policy name. If the policy does not exist, it is created. |

Examples

rfs7000-37FABE(config)#aaa-tacacs-policy testpolicy
rfs7000-37FABE(config-aaa-tacacs-policy-testpolicy)#?

AAA TACACS Policy Mode commands:
- accounting Configure accounting parameters
- authorization Configure authorization parameters
- no Negate a command or set its defaults
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-aaa-tacacs-policy-testpolicy)#

Related Commands

| no | Removes an existing AAA TACACS policy |

NOTE: For more information on the AAA-TACACS policy commands, see Chapter 25, AAA-TACACS-POLICY.
4.1.4 ap621

Global Configuration Commands

Adds an AP621 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
ap621 <MAC>
```

Parameters

- `ap621 <MAC>`

Examples

```
rfs7000-37FABE(config)#ap621 5C-0E-8B-E3-C3-56
rfs7000-37FABE(config-device-5C-0E-8B-E3-C3-56)#show context

ap621 5C-0E-8B-E3-C3-56
use profile default-ap621
use rf-domain default
hostname ap621-E3C356
rfs7000-37FABE(config-device-5C-0E-8B-E3-C3-56)#
```

```
rfs7000-37FABE(config)#show wireless ap configured

</tr>
</tbody>
</table>
```

Related Commands

- `no` Removes an AP621 from the network
### 4.1.5 ap622

**Global Configuration Commands**

Adds an AP622 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ap622 <MAC>
```

**Parameters**

- `ap622 <MAC>`

  - `<MAC>` Specify the AP622's MAC address.

**Examples**

```
rfs7000-37FABE(config)#ap622 B4-C7-99-43-C3-DC
rfs7000-37FABE(config-device-B4-C7-99-43-C3-DC)#show context

    ap622 B4-C7-99-43-C3-DC
    use profile default-ap622
    use rf-domain default
    hostname ap622-43C3DC
rfs7000-37FABE(config-device-B4-C7-99-43-C3-DC)#
```

```

```
rfs7000-37FABE(config)#
```

**Related Commands**

- `no` Removes an AP622 from the network
4.1.6 ap650

Global Configuration Commands

Adds an AP650 to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ap650 <MAC>

Parameters

- ap650 <MAC>

Examples

rfs7000-37FABE(config)#ap650 5C-0E-8B-34-81-BC
rfs7000-37FABE(config-device-5C-0E-8B-34-81-BC)#show context

Related Commands

no Removes an AP71XX from the network
4.1.13 ap7502

Global Configuration Commands

Adds an AP7502 series to the network. If a profile for the AP is not available, a new profile is created.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
ap7502 <MAC>
```

Parameters

- `ap7502 <MAC>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;MAC&gt;</td>
<td>Specify the AP7502's MAC address.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config)#ap71xx 00-23-68-99-BF-A8
rfs7000-37FABE(config-device-00-23-68-99-BF-A8)#
```

Related Commands

</tr>
<tr>
<td>application-config-mode commands</td>
<td>Summarizes application definition configuration mode commands.</td>
<td>page 4-36</td>
</tr>
</tbody>
</table>
4.1.19.1 application

Creates a new application definition and enters its configuration mode. This command allows you to create a customized application recognition definition.

The WiNG software uses Protocol and Application Classification Engine (PACE), a third-party Deep Packet Inspection (DPI) engine from IPOQUE, to enable application recognition. When enabled, the PACE evaluation package inspects network traffic to determine the application/protocol type. It can detect common HTTP-based applications (for example, Youtube and Facebook), enterprise-based applications (for example, Lync and Webex), and peer-to-peer applications (for example Facetime and Bittorrent) in the network’s traffic. PACE uses a range of DPI technologies to identify approximately 700 built-in applications that are grouped into twenty two (22) application categories. You can use this command to add applications not included in the PACE package.

Application recognition can be used as a filter to classify packets based on their application/protocol type. Once classified, an action is applied, such as deny, allow, mark, or rate-limit on the packet. These actions are defined in an application policy. Therefore, an application policy, like an Access Control List (ACL), is a set of rules that control traffic within the managed network. The match criteria, used by the application policy, are the built-in PACE app-categories and/or the customized applications configured here.

**NOTE:** The PACE DPI engine has to be enabled to trigger application recognition. To enable DPI, in the device or profile configuration mode, execute the `dpi` command. To enable customized application detection, in the device/profile configuration mode execute the `dpi > custom-app <APPLICATION-NAME>` command. For more information, see `dpi`.

**NOTE:** To enable application recognition based traffic control, apply this application or PACE app-categories to an application policy, and use the policy with the RADIUS user authentication process, user role, WLAN, or bridge VLAN. For more information, see `application-policy`.

Supported in the following platforms:
- Access Points — AP7522, AP7532, AP7562
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
application <APPLICATION-NAME>
```

**Parameters**

- `application <APPLICATION-NAME>`

<table>
<thead>
<tr>
<th>application &lt;APPLICATION-NAME&gt;</th>
<th>Creates a new application definition and enters its configuration mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;APPLICATION-NAME&gt;</td>

</thead>
<tbody>
<tr>
<td>application-policy</td>
<td>Creates an application policy and enters its configuration mode</td>
<td>page 4-43</td>
</tr>
<tr>
<td>application-policy-mode</td>
<td>Summarizes the application policy configuration mode commands</td>
<td>page 4-45</td>
</tr>
</tbody>
</table>
4.1.20.1 application-policy

*application-policy*

Creates an application policy and enters its configuration mode

An application policy defines actions to perform on a packet when it matches a specified set of pre-defined applications or application categories. These rules are numbered and are applied to each packet sequentially in increasing order of their precedence number. Once a match is made, the packet is either forwarded, dropped, marked, or rate limited depending on the action specified in that rule.

Application recognition is the most important aspect of application-based traffic control and prioritization within a managed network. The WiNG software uses PACE, a third-party DPI engine from IPOQUE, to enable application recognition. When enabled, PACE uses various DPI technologies to identify a range of applications that include Web-based and other difficult-to-classify protocols utilizing dynamic TCP/UDP port assignments. When an application is recognized and classified, a pre-defined application policy invokes appropriate action for that specific application. PACE provides a default database of application definitions (approximately 700 canned application signatures). In addition, to these, there is a provision to add new customized application definitions. You can also customize the default, canned application definitions.

To enable an application policy, apply it at one or all of the following levels within the network to enforce application assurance:

- RADIUS CoA usage – In the device/profile configuration mode, use the `application-policy > radius > <APPLICATION-POLICY-NAME>` command to apply the policy to every user successfully authenticated by RADIUS server.
- User role – In the role-policy-user-role configuration mode, use the `use > application-policy <APPLICATION-POLICY-NAME>` command to apply the policy to all users assigned to the role.
- WLAN – In the WLAN configuration mode, use the `use > application-policy <APPLICATION-POLICY-NAME>` command to apply the policy to all users accessing the WLAN.
- Bridge VLAN – In the bridge VLAN configuration mode, use the `use > application-policy <APPLICATION-POLICY-NAME>` command to apply the policy for the traffic corresponding to the bridged VLAN.

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`application-policy <APPLICATION-POLICY-NAME>`

**Parameters**

- `application-policy <APPLICATION-POLICY-NAME>` Specify the application policy name. If the policy does not exist, it is created.

**Examples**

```
nx9500-6C8809(config-app-policy-TestAppliPolicy)#?
Application Policy Mode commands:
allow          Allow packets
deny           Deny packets
description    Application policy description
enforcement-time Configure policy enforcement based on time
logging        Application recognition logging
mark           Mark packets
no             Negate a command or set its defaults
rate-limit     Rate-limit packets
clear恭敬           Clears the display screen```

### 4.1.20.2.1 allow

**application-policy-mode commands**

Creates an allow rule and configures the match criteria based on which packets are filtered and the allow access action applied.

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

allow [app-category [APP-CATEGORY-NAME]|all]|application <APPLICATION-NAME>]
preamble <1-256>

**Parameters**

- allow [app-category [APP-CATEGORY-NAME]|all]|application <APPLICATION-NAME>]
preamble <1-256>

<table>
<thead>
<tr>
<th>allow</th>
<th>Creates an allow rule and configures the match criteria. The options are app-category and application name</th>
</tr>
</thead>
<tbody>
<tr>
<td>app-category [APP-CATEGORY-NAME]</td>
<td>all]</td>
</tr>
<tr>
<td>application &lt;APPLICATION-NAME&gt;</td>
<td>Uses application name as the match criteria</td>
</tr>
<tr>
<td>precedence &lt;1-256&gt;</td>
<td>Assigns a precedence value for this allow rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.</td>
</tr>
</tbody>
</table>

**Note:** The WiNG database provides approximately 381 canned applications. In addition to these, the database also includes custom-made applications. These are application definitions created using the application command.

Let us consider application youtube belonging to app-category streaming.

The action required is: Allow youtube packets and deny all other applications belonging to app-category streaming.

The rules can be defined as:

```
#allow application youtube precedence 1
#deny app-category streaming precedence 2
```

Contd..
The following configuration is incorrect:

```bash
#deny app-category streaming precedence 1
#allow application youtube precedence 2
```

Once the `deny` app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent `allow` rule.

**Note:** The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.

---

**Examples**

The following examples show two `allow` rules, allowing access to all packets belonging to the application category ‘business’ and the application ‘Bing’:

```bash
nx9500-6C8809(config-app-policy-Bing)#allow application Bing
BitTorrent                BitTorrent_encrypted
BitTorrent_plain          BitTorrent_uTP               BitTorrent_uTP_encrypted
nx9500-6C8809(config-app-policy-Bing)#
```

Note: Bing is not one of the WiNG built-in database applications. It is a customized application created using the `application` command.

```bash
nx9500-6C8809(config-app-policy-Bing)#allow application Bing precedence 1
```

```bash
nx9500-6C8809(config-app-policy-Bing)#allow app-category all

<table>
<thead>
<tr>
<th>application-type</th>
<th>categories</th>
</tr>
</thead>
<tbody>
<tr>
<td>antivirus\ update</td>
<td>update</td>
</tr>
<tr>
<td>conference</td>
<td>custom</td>
</tr>
<tr>
<td>database</td>
<td>filetransfer</td>
</tr>
<tr>
<td>generic</td>
<td>im</td>
</tr>
<tr>
<td>mobile</td>
<td>network\ management</td>
</tr>
<tr>
<td>p2p</td>
<td>remote\control</td>
</tr>
<tr>
<td>standard</td>
<td>streaming</td>
</tr>
<tr>
<td>video</td>
<td>voip</td>
</tr>
<tr>
<td></td>
<td>web</td>
</tr>
</tbody>
</table>
```

```bash
nx9500-6C8809(config-app-policy-Bing)#
```

```bash
nx9500-6C8809(config-app-policy-Bing)#allow app-category business precedence 2
```

```bash
nx9500-6C8809(config-app-policy-Bing)#show context application-policy Bing
```

```bash
allow application Bing precedence 1
allow app-category business precedence 2
```

```bash
nx9500-6C8809(config-app-policy-Bing)#
```

---

**Related Commands**

- `no` Removes this allow rule from the application policy
### 4.1.20.2.2 deny

*application-policy-mode commands*

Creates a deny rule and configures the match criteria based on which packets are filtered and the deny access action applied.

#### Syntax

`deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] precedence <1-256>`

#### Parameters

- `deny [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] precedence <1-256>`

<table>
<thead>
<tr>
<th>deny</th>
<th>Creates a deny rule and configures the match criteria. The options are app-category and application name</th>
</tr>
</thead>
</table>
| app-category [<APP-CATEGORY-NAME>|all] | Uses application category as the match criteria
- `<APP-CATEGORY-NAME>` – Specify the application category name. The options are: antivirus\update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\management, other, p2p, remote\control, social\networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system drops the packet.
- `all` – The system drops all packets irrespective of the application category. |
| application <APPLICATION-NAME> | Uses application name as the match criteria
- `<APPLICATION-NAME>` – Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system drops the packet. |
| precedence <1-256> | Assigns a precedence value for this deny rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule. Let us consider application `youtube` belonging to app-category `streaming`. The action required is: Allow `youtube` packets and deny all other applications belonging to app-category `streaming`. The rules can be defined as:

```
#allow application youtube precedence 1
#deny app-category streaming precedence 2
```
The following configuration is incorrect:

```
#deny app-category streaming precedence 1
#allow application youtube precedence 2
```
Once the `deny` app-category streaming precedence 1 rule is hit, all streaming packets, including `youtube`, are dropped. Consequently, there are no packets left to apply the subsequent `allow` rule. **Note:** The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type. |
Examples
The following example shows one *deny* rule, denying access to all packets belonging to the application category 'social/networking':

nx9500-6C8809(config-app-policy-Bing)#**deny app-category social\ networking** precedence 3

nx9500-6C8809(config-app-policy-Bing)#show context application-policy Bing
allow application Bing precedence 1
allow app-category business precedence 2
deny app-category "social networking" precedence 3
nx9500-6C8809(config-app-policy-Bing)#

Note, In the preceding example, none of the allow and deny rules apply to the same application or app-category.

4.1.20.2.3 description

- **application-policy-mode commands**

  Configures a brief description for this application policy that enables you to differentiate it from other application policies

Supported in the following platforms:
  - Access Points — AP7522, AP7532
  - Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
description <LINE>
```

**Parameters**

- `description <LINE>`

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;LINE&gt;</code></td>
<td>Configures this application policy's description</td>

</table>
4.1.20.2.4 enforcement-time

application-policy-mode commands

Configures an enforcement time period in days and hours for this application policy. The policy is enforced only during the specified time period.

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>}
```

Parameters

- enforcement-time days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start-time <HH:MM> end-time <HH:MM>}

- enforcement-time days
  - sunday – Enforces the policy only on Sundays
  - monday – Enforces the policy only on Mondays
  - tuesday – Enforces the policy only on Tuesdays
  - wednesday – Enforces the policy only on Wednesdays
  - thursday – Enforces the policy only on Thursdays
  - friday – Enforces the policy only on Fridays
  - saturday – Enforces the policy only on Saturdays
  - all – Enforces the policy only on all days
  - weekends – Enforces the policy only on weekends
  - weekdays – Enforces the policy only on weekdays

- start-time <HH:MM>
  - Optional. Configures the policy's enforcement period
  - start-time – Configures the start time. This is the time at which the application policy is enforced on the specified days.
  - end-time – Configures the end time. This is the time at which the application policy enforcement ends.
  - <HH:MM> – Specify the start and end time in the HH:MM format.

Examples

```
nx9500-6C8809(config-app-policy-Bing)#enforcement-time days weekdays start-time 10:30 end-time 20:00
```

```
nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
  description "This application policy allows Bing search engine packets"
  enforcement-time days weekdays start-time 10:30 end-time 20:00
  allow application Bing precedence 1
  allow app-category business precedence 2
  deny app-category "social networking" precedence 3
```

Related Commands

```
no
```

Removes this application policy's enforcement period
4.1.20.2.5 logging

application-policy-mode commands

Enables/disables logging of application recognition hits made by the PACE DPI engine. It also sets the logging level.

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

logging [level|on]

logging on

logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|
    notifications|warnings]

Parameters

- logging on

| logging on | Enables/disables logging of application recognition hits made by the PACE DPI engine. This option is disabled by default. |
| logging level [<0-7>|alerts|critical|debugging|emergencies|errors|informational|
    notifications|warnings] | Enables/disables logging of application recognition hits made by the PACE DPI engine. This option is disabled by default.
  - <0-7> – Sets the message logging severity level on a scale of 0 - 7
  - emergencies – Severity level 0: System is unusable
  - alerts – Severity level 1: Requires immediate action
  - critical – Severity level 2: Critical conditions
  - errors – Severity level 3: Error conditions
  - warnings – Severity level 4: Warning conditions
  - notifications – Severity level 5: Normal but significant conditions (this is the default setting)
  - informational – Severity level 6: Informational messages
  - debugging – Severity level 7: Debugging messages

Examples

nx9500-6C8809(config-app-policy-Bing)#logging level critical

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
description "This application policy allows Bing search engine packets"
enforcement-time days weekdays start-time 12:30 end-time 20:00
allow application Bing precedence 1
allow app-category "business" precedence 2
deny app-category "social networking" precedence 3
logging level critical
nx9500-6C8809(config-app-policy-Bing)#

Related Commands

| no | Resets the logging level to default (notifications). And the no > logging > on command disables DPI logging. |
4.1.20.2.6 mark

**application-policy-mode commands**

Creates a mark rule and configures the match criteria based on which packets are marked

Marks packets, matching a specified set of application categories or applications/protocols, with 8021p priority level or **Differentiated Services Code Point (DSCP) type of service (ToS)** code. Marking packets is a means of identifying them for specific actions, and is used to provide different levels of service to different traffic types.

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>] 
[8021p <0-7>|dscp <0-63>] precedence <1-256>

**Parameters**

- **mark [app-category [<APP-CATEGORY-NAME>|all]|application <APPLICATION-NAME>]**
  - **app-category [<APP-CATEGORY-NAME>|all]**
    - Uses application category as the match criteria
      - `<APP-CATEGORY-NAME>` – Specify the application category. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote\_control, social\_networking, standard, streaming, tunnel, video, voip, and web. Each packet's app-category is matched with the value specified here. In case of a match, the system marks the packet.
      - `all` – The system marks all packets irrespective of the application category.

- **application <APPLICATION-NAME>**
  - Uses application name as the match criteria
    - `<APPLICATION-NAME>` – Specify the application name. Each packet's application is matched with the application name specified here. In case of a match, the system marks the packet.

  **Note:** The WiNG database provides approximately 381 canned applications. In addition to these, the database includes custom-made applications. These are application definitions created using the **application** command.

- **8021p <0-7>**
  - Marks packets matching the specified criteria with 802.1p priority value
    - `<0-7>` – Specify a value from 0 - 7.
  
  **Note:** The IEEE 802.1p signaling standard enables marking of layer 2 network traffic. Layer 2 network devices (such as switches), using 802.1p standards, group traffic into classes based on their 802.1p priority value, which is appended to the packet's MAC header. In case of traffic congestion, packets with higher priority get precedence over lower priority packets and are forwarded first.

- **dscp <0-63>**
  - Marks packets matching the specified criteria with DSCP ToS code
    - `<0-63>` – Specify a value from 0 - 63.
  
  **Note:** The DSCP protocol marks layer 3 network traffic. Layer 3 network devices (such as routers) using DSCP, mark each layer 3 packet with a six-bit DSCP code, which is appended to the packet's IP header. Each DSCP code is assigned a corresponding level of service, enabling packet prioritization.
### Examples

nx9500-6C8809(config-app-policy-Bing)#mark app-category video dscp 9 precedence 4

nx9500-6C8809(config-app-policy-Bing)#mark application facetime dscp 10 precedence 5

nx9500-6C8809(config-app-policy-Bing)#show context
application-policy Bing
  description "This application policy allows Bing search engine packets"
  enforcement-time days weekdays start-time 12:30 end-time 20:00
  allow application Bing precedence 1
  deny app-category "social networking" precedence 2
  mark app-category video dscp 9 precedence 4
  mark application facetime dscp 10 precedence 5
  logging level critical
nx9500-6C8809(config-app-policy-Bing)#

---

| `precedence <1-256>` | Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule. |

Let us consider application `youtube` belonging to app-category `streaming`.

The action required is: Allow `youtube` packets and deny all other applications belonging to app-category `streaming`.

The rules can be defined as:
- `#allow application youtube precedence 1`
- `#deny app-category streaming precedence 2`

The following configuration is incorrect:
- `#deny app-category streaming precedence 1`
- `#allow application youtube precedence 2`

Once the `deny` app-category streaming precedence 1 rule is hit, all streaming packets, including `youtube`, are dropped. Consequently, there are no packets left to apply the subsequent `allow` rule.

**Note:** The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.
### 4.1.20.2.7 rate-limit

*application-policy-mode commands*

Creates a rate-limit rule and configures the match criteria

Supported in the following platforms:
- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
rate-limit [app-category [<APP-CATEGORY-NAME>|all]]|application <APPLICATION-NAME>]
[egress|ingress] rate <50-1000000> max-burst-size <2-1024> precedence <0-256>
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rate-limit</code></td>
<td>Creates a rate-limit rule and configures the match criteria. When applied, the rule applies a rate-limit to incoming and outgoing packets, matching the criteria configured here. The match criteria options are: app-category and application name.</td>
</tr>
<tr>
<td><code>app-category</code></td>
<td>Uses application category as the match criteria. The options are: antivirus\ update, audio, business, conference, custom, database, file transfer, gaming, generic, im, mail, mobile, network\ management, other, p2p, remote_control, social\ networking, standard, streaming, tunnel, video, voip, and web. Each packet’s app-category is matched with the value specified here. In case of a match, the system rate-limits the packet.</td>
</tr>
<tr>
<td><code>application &lt;APPLICATION-NAME&gt;</code></td>
<td>Uses application name as the match criteria. Each packet’s application is matched with the application name specified here. In case of a match, the system rate-limits the packet.</td>
</tr>
<tr>
<td>`egress</td>
<td>ingress`</td>
</tr>
<tr>
<td><code>rate &lt;50-1000000&gt;</code></td>
<td>Configures the rate limit, in Kbps, for both incoming and outgoing packets. The options are: 50 - 1000000 Kbps.</td>
</tr>
<tr>
<td><code>max-burst-size</code></td>
<td>Configures the maximum burst size, in Kbytes, for both incoming and outgoing packets. The options are: 2 - 1024 Kbytes.</td>
</tr>
<tr>
<td><code>precedence &lt;1-256&gt;</code></td>
<td>Assigns a precedence value for this mark rule. The precedence value differentiates between rules applicable to applications and the application categories they belong. The allow, deny, mark, rate-limit options are mutually exclusive. In other words, in an application policy, for a specific application or application category, you can create either an allow rule, or a deny rule, or a mark and rate-limit rule.</td>
</tr>
</tbody>
</table>

Let us consider application `youtube` belonging to app-category `streaming`.

The action required is: Allow `youtube` packets and deny all other applications belonging to app-category `streaming`.

The rules can be defined as:

```bash
#allow application youtube precedence 1
#deny app-category streaming precedence 2
```

Contd..
The following configuration is incorrect:

```
#deny app-category streaming precedence 1
#allow application youtube precedence 2
```

Once the **deny** app-category streaming precedence 1 rule is hit, all streaming packets, including youtube, are dropped. Consequently, there are no packets left to apply the subsequent **allow** rule.

**Note:** The mark and rate-limit rules are the only two actions that can be combined for a specific application or application category type.

---

### Examples

```
nx9500-6C8809(config-app-policy-Bing)#rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6
```

  mark application facetime dscp 10 precedence 5
  rate-limit application BGP ingress rate 100 max-burst-size 25 egress rate 50 max-burst-size 25 precedence 6
  logging level critical
nx9500-6C8809(config-app-policy-Bing)#
```
4.1.21 association-acl-policy

Configures an association ACL policy. This policy defines a list of devices allowed or denied access to the network.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>

**Parameters**

- association-acl-policy <ASSOCIATION-ACL-POLICY-NAME>

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ASSOCIATION-ACL-POLICY-NAME&gt;</td>
<td>Specify the association ACL policy name. If the policy does not exist, it is created.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config)#association-acl-policy test
rfs7000-37FABE(config-assoc-acl-test)#?
The following commands are available in this context:

- deny: Specify MAC addresses to be denied
- no: Negate a command or set its defaults
- permit: Specify MAC addresses to be permitted

Authority: A user with the correct privilege level is required to execute this command.
```

4.1.22 auto-provisioning-policy

Global Configuration Commands

Configures an auto provisioning policy. This policy configures the automatic provisioning of device adoption. The policy configures how an AP is adopted based on its type.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>

Parameters

- auto-provisioning-policy <AUTO-PROVISIONING-POLICY-NAME>

| <AUTO-PROVISIONING-POLICY-NAME> | Specify the auto provisioning policy name. If the policy does not exist, it is created. |

Examples

rfs7000-37FABE(config)#auto-provisioning-policy test
rfs7000-37FABE(config-auto-provisioning-policy-test)#?

Auto-Provisioning Policy Mode commands:

- adopt: Add rule for device adoption
- default-adoption: Adopt devices even when no matching rules are found.
- deny: Add rule to deny device adoption
- evaluate-always: Set the flag to evaluate the policy everytime, regardless of previous adoption status
- no: Negate a command or set its defaults
- redirect: Add rule to redirect device adoption
- upgrade: Add rule for device upgrade
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

rfs7000-37FABE(config-auto-provisioning-policy-test)#

Related Commands

no | Removes an existing Auto Provisioning policy

NOTE: For more information on the association-acl-policy, see Chapter 9, AUTO-PROVISIONING-POLICY.
4.1.23 bgp

Global Configuration Commands

Configures Border Gateway Protocol (BGP) settings

BGP is an inter-ISP routing protocol which establishes routing between Internet Service Providers (ISPs). ISPs use BGP to exchange routing and reachability information between Autonomous Systems (AS) on the Internet. BGP makes routing decisions based on paths, network policies and/or rules configured by network administrators. The primary role of a BGP system is to exchange network reachability information with other BGP peers. This information includes information on AS that the reachability information traverses. This information is sufficient to create a graph of AS connectivity from which routing decisions can be created and rules enforced.

An AS is a set of routers under the same administration that use Interior Gateway Protocol (IGP) and common metrics to define how to route packets within the AS. AS uses inter-AS routing to route packets to other ASs. For an external AS, an AS appears to have a single coherent interior routing plan and presents a consistent picture of the destinations reachable through it.

Routing information exchanged through BGP supports only destination based forwarding (it assumes a router forwards packets based on the destination address carried in the IP header of the packet).

BGP uses TCP as its transport protocol. This eliminates the need to implement explicit update fragmentation, retransmission, acknowledgment, and sequencing. BGP listens on TCP port 179. The error notification mechanism used in BGP assumes that TCP supports a graceful close (all outstanding data is delivered before the connection is closed).

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>
```

Parameters
- bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as-path-list &lt;LIST-NAME&gt;</td>
<td>Creates an AS path list and enters its configuration mode</td>

</tr>
<tr>
<td>ip-access-list &lt;LIST-NAME&gt;</td>
<td>Creates a BGP IP access list and enters its configuration mode</td>
</tr>
<tr>
<td>ip-prefix-list &lt;LIST-NAME&gt;</td>
<td>Creates a BGP IP prefix list and enters its configuration mode</td>
</tr>
</tbody>
</table>

- `<LIST-NAME>` – Provide the AS-PATH-LIST name.
- `<LIST-NAME>` – Provide the COMMUNITY-LIST name.
- `<LIST-NAME>` – Provide the EXTCOMMUNITY-LIST name.
- `<LIST-NAME>` – Provide the BGP IP-ACCESS-LIST name.
- `<LIST-NAME>` – Provide the BGP IP-PREFIX-LIST name.
Examples

nx4500-5CFA2B(config)#bgp ?
  as-path-list  BGP AS path list Configuration
  community-list Add a community list entry
  extcommunity-list Add a extended community list entry (EXPERIMENTAL)
  ip-access-list Add an access list entry

### 4.1.24 bonjour-gw-discovery-policy

**Global Configuration Commands**

Bonjour is Apple’s zero-configuration networking (Zeroconf) implementation. Zeroconf is a group of technologies that include service discovery, address assignment and hostname resolution. Bonjour locates the devices (printers, computers etc.) and services these computers provide over a local network.

Bonjour provides a method to discover services on a local area network (LAN). Bonjour allows users to set up a network without any configuration. Services such as printers, scanners and file-sharing servers can be found using Bonjour. Bonjour only works within a single broadcast domain. However, with a special DNS configuration, it can be extended to find services across broadcast domains.

This command configures a Bonjour GW Discovery policy. The policy defines a list of services clients can discover across subnets. A maximum of 8 (eight) policies can be created on access point, wireless controller, or service platform.

When configured and applied, this feature enables discovery of Bonjour services on local and/or tunneled VLANs.

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
bonjour-gw-discovery-policy <POLICY-NAME>
```

**Parameters**

- bonjour-gw-discovery-policy <POLICY-NAME>

| <POLICY-NAME> | Specify the Bonjour GW Discovery policy name. If the policy does not exist, it is created. In the Bonjour GW Discovery policy configuration mode, use the allow-service keyword to configure the services that the Bonjour gateway is allowed to discover. A maximum of 16 (sixteen) service rules can be created. Optionally, you can restrict this facility for users on specific VLANs. To do so, specify the VLAN IDs. |
| Note: | Execute the bonjour-gw-forwarding-policy command to enable forwarding of Bonjour service responses across VLANs. |
| Note: | To associate a Bonjour GW Discovery policy with a WLAN, in the WLAN configure mode, execute the following command: `use > bonjour-gw-discovery-policy > <POLICY-NAME>` For more information see, `use`. |
| Note: | To associate a Bonjour GW Discovery policy with a VLAN, in the interface VLAN configure mode, execute the following command: `use > bonjour-gw-discovery-policy > <POLICY-NAME>` For more information see, `use`. |
| Note: | To associate a Bonjour GW Discovery policy with a user role, in the role-policy - user-role config mode, execute the following command: `use > bonjour-gw-discovery-policy > <POLICY-NAME>` For more information see, `use`. |
Examples

rfs7000-37FABE(config)#bonjour-gw-discovery-policy TestPolicy
rfs7000-37FABE(config-bonjour-gw-discovery-policy-TestPolicy)#?

commands:

  allow-service  Allow Bonjour Service on local or tunneled vlan, Optionally
                  VLAN IDs can be given so service will be discovered for those
                  vlan only
  no             Negate a command or set its defaults

clrscr         Clears the display screen
commit         Commit all changes made in this session
do             Run commands from Exec mode
end            End current mode and change to EXEC mode
exit           End current mode and down to previous mode
help           Description of the interactive help system
revert         Revert changes
service        Service Commands
show           Show running system information
write          Write running configuration to memory or terminal

rfs7000-37FABE(config-bonjour-gw-discovery-policy-TestPolicy)#

</tr>
</tbody>
</table>
4.1.25 bonjour-gw-forwarding-policy

Configures a Bonjour GW Forwarding policy. When configured and applied on the controller, the policy defines the service VLANs (the VLANs on which Bonjour services are running) and client VLANs where clients are present. All Bonjour responses from service VLANs are forwarded to client VLANs. A maximum of 2 (two) policies can be created on a wireless controller or service platform. And only 1 (one) policy can be created on an access point.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

## Syntax

`bonjour-gw-forwarding-policy <POLICY-NAME>`

## Parameters

- `bonjour-gw-forwarding-policy <POLICY-NAME>`

### Examples

```
rfs7000-37FABE(config)#bonjour-gw-forwarding-policy TestPolicy
rfs7000-37FABE(config-bonjour-gw-forwarding-policy-TestPolicy)#?
commands:
  forward-bonjour-response  Forwards bonjour service response across vlans
  no                        Negate a command or set its defaults
  clrscr                    Clears the display screen
  commit                    Commit all changes made in this session
  do                        Run commands from Exec mode
  end                       End current mode and change to EXEC mode
  exit                      End current mode and down to previous mode
  help                      Description of the interactive help system
  revert                    Revert changes
  service                   Service Commands
  show                      Show running system information
  write                     Write running configuration to memory or terminal
rfs7000-37FABE(config-bonjour-gw-forwarding-policy-TestPolicy)#
```

## Related Commands

- `no` Removes an existing Bonjour GW Forwarding policy
4.1.26 bonjour-gw-query-forwarding-policy

Configures a Bonjour GW Query Forwarding policy and enters its configuration mode. When created and applied, this policy enables forwarding of Bonjour queries across VLANs.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
bonjour-gw-query-forwarding-policy <POLICY-NAME>
```

Parameters

- `bonjour-gw-query-forwarding-policy <POLICY-NAME>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

Removes an existing Bonjour GW Query Forwarding policy
4.1.27 captive portal

Global Configuration Commands

A captive portal provides secure guest access and authentication services within the network.

The following table lists the commands available to enter the captive portal configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal</td>
<td>Creates a new captive portal and enters its configuration mode</td>
<td>page 4-68</td>
</tr>
<tr>
<td>captive-portal-mode</td>
<td>Summarizes captive portal configuration commands</td>
<td>page 4-70</td>
</tr>
</tbody>
</table>
4.1.27.1 captive-portal

Configures a captive portal

A captive portal provides secure access using a standard Web browser. Captive portals provide authenticated access by capturing and re-directing a wireless user's Web browser session to a captive portal login page where the user must enter valid credentials to access to the wireless network. Once logged into the captive portal, additional Acknowledgment, Agreement, Welcome, No Service, and Fail pages provide the administrator options to customize the screen flow and user appearance.

Captive portals are recommended for providing guests or visitors authenticated access to network resources when 802.1X EAP is not a viable option. Captive portal authentication does not provide end-user data encryption, but it can be used with static WEP, WPA-PSK or WPA2-PSK encryption.

Authentication for captive portal access requests is performed using a username and password pair, authenticated by an integrated RADIUS server. Authentication for private network access is conducted either locally on the requesting wireless client, or centrally at a datacenter.

Captive portals use a Web provisioning tool to create guest user accounts directly on the controller, service platform, or access point. The connection medium defined for the Web connection is either HTTP or HTTPS. Both HTTP and HTTPS use a request and response procedure to disseminate information to and from requesting wireless clients.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
captive-portal <CAPTIVE-PORTAL-NAME>
```

Parameters

- `captive-portal <CAPTIVE-PORTAL-NAME>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;CAPTIVE-PORTAL-NAME&gt;</td>
<td>Specify the captive portal name. If the captive portal does not exist, it is created.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config)#captive-portal test
rfs7000-37FABE(config-captive-portal-test)#?
```

Captive Portal Mode commands:

- `access-time` Allowed access time for the client. Used when there is no session time in radius response
- `access-type` Access type of this captive portal
- `accounting` Configure how accounting records are created for this captive portal policy
- `bypass` Bypass captive portal
- `connection-mode` Connection mode for this captive portal
- `custom-auth` Custom user information
- `data-limit` Enforce data limit for clients
- `inactivity-timeout` Inactivity timeout in seconds. If a frame is not received from client for this amount of time, then current session will be removed
- `ipv6` Internet Protocol version 6 (IPv6)
- `logout-fqdn` Configure the FQDN address to logout the session from client
- `no` Negate a command or set its defaults
- `oauth` OAuth 2.0 authentication configuration
- `post-authentication-vlan` Configure post authentication vlan for captive portal users
radius-vlan-assignment Enable radius vlan assignment for captive portal users
redirection Configure connection redirection parameters
server Configure captive portal server parameters
simultaneous-users Particular username can only be used by a certain number of MAC addresses at a time
terms-agreement User needs to agree for terms and conditions
use Set setting to use
webpage Configure captive portal webpage parameters
webpage-auto-upload Enable automatic upload of advanced webpages
webpage-location The location of the webpages to be used for authentication. These pages can either be hosted on the system or on an external web server.

4.1.27.2.1 access-time

Defines the permitted access time for a client. It is used when no session time is defined in the RADIUS response.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
access-time <10-10080>

Parameters

- access-time <10-10080>

<table>
<thead>
<tr>
<th>access-time &lt;10-10080&gt;</th>
<th>Defines the duration wireless clients are allowed access to the Internet using this captive portal policy</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;10-10080&gt; – Specify a value from 10 - 10080 minutes. The default is 1440 minutes.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-captive-portal-test)#access-time 35
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
rfs7000-37FABE(config-captive-portal-test)#
```

Related Commands

| no | Reverts to the default permitted access time (1440 minutes) |
4.1.27.2.2 access-type

Defines the captive portal’s access type. The authentication scheme configured here is applied to wireless clients using this captive portal.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
access-type [custom-auth-radius|logging|no-auth|radius|registration]
```

**Parameters**

- `access-type [custom-auth-radius|logging|no-auth|radius|registration]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>custom-auth-radius</td>
<td>Specifies the custom user information used for authentication (RADIUS lookup of given information, such as name, e-mail address, telephone etc.). When configured, accessing clients are required to provide a 1-32 character lookup data string used to authenticate their credentials. <strong>Note:</strong> When selecting this option, use the custom-auth command to configure the required user information.</td>
</tr>
<tr>
<td>logging</td>
<td>Provides users access without authentication. The system logs access details of users allowed access.</td>
</tr>
<tr>
<td>no-auth</td>
<td>Defines no authentication required for a guest (guest is redirected to welcome message). Provides users access to the captive portal without authentication.</td>
</tr>
<tr>
<td>radius</td>
<td>Enables RADIUS authentication for wireless clients. Provides captive portal access to successfully authenticated users only. This is the default setting.</td>
</tr>
<tr>
<td>registration</td>
<td>Enables captive portal’s clients to self register in the captive portal’s database. <strong>Note:</strong> If enabled, use the <code>webpage &gt; internal &gt; registration &gt; field</code> command to customize the registration page. If not customized, the default, built-in registration Web page is displayed.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#access-type logging
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
    access-type logging
    access-time 35
rfs7000-37FABE(config-captive-portal-test)#
```

**Related Commands**

- `no`: Removes the captive portal access type or reverts to default (radius)
4.1.27.2.3 accounting

Enables support for accounting messages for this captive portal

When enabled, accounting for clients entering and exiting the captive portal is initiated. Accounting is the method of collecting and sending security server information for billing, auditing, and reporting user data. This data includes information, such as start and stop times, executed commands (such as PPP), number of packets and number of bytes transmitted etc. Accounting enables tracking of captive portal services consumed by clients.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

accounting [radius|syslog]

accounting radius

accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}

Parameters

- accounting radius

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>radius</td>
<td>Enables support for RADIUS accounting messages. When enabled, this option uses an external RADIUS resource for AAA accounting. This option is disabled by default.</td>
</tr>
<tr>
<td>syslog host &lt;IP/HOSTNAME&gt;</td>
<td>Enables support for syslog accounting messages. When enabled, data relating to wireless client usage of remote access services is logged on the specified external syslog resource. This information assists in differentiating between local and remote users. Remote user information can be archived to an external location for periodic network and user administration. This option is disabled by default.</td>
</tr>
<tr>
<td>port &lt;1-65535&gt;</td>
<td>Optional. Specifies the syslog server’s listener port</td>
</tr>
<tr>
<td>proxy-mode [none</td>
<td>through-controller</td>
</tr>
</tbody>
</table>

- host <IP/HOSTNAME> — Specifies the destination where accounting messages are sent. Specify the destination’s IP address or hostname.

- port <1-65535> — Specify the UDP port from 1-65535. The default is 514.

- none – Accounting messages are sent directly to the syslog server
- through-controller – Accounting messages are sent through the controller configuring the device
- through-rf-domain-manager – Accounting messages are sent through the local RF Domain manager
Examples

rfs7000-37FABE(config-captive-portal-test)#accounting syslog host 172.16.10.13 port 1

rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-type logging
  access-time 35
  accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#

Related Commands

| no   | Disables accounting records for this captive portal |
4.1.27.2.4 bypass

- **captive-portal-mode commands**

Enables bypassing of captive portal detection requests from wireless clients

Certain devices, such as Apple IOS devices send *Captive Network Assistant* (CNA) requests to detect existence of captive portals. When enabled, the bypass option does not allow CNA requests to be redirected to the captive portal pages.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

bypass captive-portal-detection

**Parameters**

- bypass captive-portal-detection

<table>
<thead>
<tr>
<th>bypass captive-portal-detection</th>
<th>Bypasses captive portal detection requests</th>
</tr>
</thead>
</table>

**Examples**

```bash
rfs4000-229D58(config-captive-portal-test)#bypass captive-portal-detection
```

```bash
rfs4000-229D58(config-captive-portal-test)#show context captive-portal test bypass captive-portal-detection
```

```bash
rfs4000-229D58(config-captive-portal-test)#
```

**Related Commands**

- **no** Disables bypassing of captive portal detection requests
4.1.27.2.5 connection-mode

- captive-portal-mode commands

Configures a captive portal's mode of connection to the Web server. HTTP uses plain unsecured connection for user requests. HTTPS uses an encrypted connection to support user requests.

Both HTTP and HTTPS use the same *Uniform Resource Identifier* (URI), so controller and client resources can be identified. However, the use of HTTPS is recommended, as it affords controller and client transmissions some measure of data protection HTTP cannot provide.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
connection-mode [http|https]
```

**Parameters**

- **connection-mode [http|https]**

<table>
<thead>
<tr>
<th>Connection Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>http</td>
<td>Sets HTTP as the default connection mode. This is the default setting.</td>
</tr>
<tr>
<td>https</td>
<td>Sets HTTPS as the default connection mode</td>
</tr>
</tbody>
</table>

**Note:** HTTPS is a more secure version of HTTP, and uses encryption while sending and receiving requests.

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#connection-mode https
rfs7000-37FABE(config-captive-portal-test)#show context
  captive-portal test
  access-type logging
  access-time 35
  connection-mode https
  accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#
```

**Related Commands**

- `no` Removes this captive portal's connection mode
4.1.27.2.6 custom-auth

* captive-portal-mode commands

Configures custom user information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
custom-auth info <LINE>
```

Parameters

- `custom-auth info <LINE>`

<table>
<thead>
<tr>
<th>info &lt;LINE&gt;</th>
<th>Configures information used for RADIUS lookup when custom-auth RADIUS access type is configured</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;LINE&gt;</td>
<td>- Guest data needs to be provided. Specify the name, e-mail address, and telephone number of the user.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-captive-portal-test)#custom-auth info bob bob@examplecompany.com
rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
   access-type logging
   access-time 35
   connection-mode https
   accounting syslog host 172.16.10.13 port 1

```

Related Commands

```
no
```

Removes custom user information configured with this captive portal
4.1.27.2.7 data-limit

Enforces data transfer limits on captive portal clients. This feature enables the tracking and logging of user usage. Users exceeding the allowed bandwidth are restricted from the captive portal.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

data-limit <1-102400> {action [log-and-disconnect|log-only]}

**Parameters**
- **data-limit <1-102400>**
  - Sets a captive portal client's data transfer limit in megabytes. This limit is applicable for both upstream and downstream data transfer.
  - <1-102400> – Specify a value from 1 - 102400 MB.

- **action [log-and-disconnect|log-only]**
  - Optional. Specifies the action taken when a client exceeds the configured data limit. The options are:
    - log-and-disconnect – Logs a record and disconnects the client
    - log-only – Only a log is generated and the client remains connected to the captive portal. This is the default setting.

**Examples**

rfs7000-37FABE(config-captive-portal-test)#data-limit 200 action log-and-disconnect
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
data-limit 200 action log-and-disconnect
rfs7000-37FABE(config-captive-portal-test)#

**Related Commands**

- **no**
  - Removes data limit enforcement for captive portal clients
4.1.27.2.8 inactivity-timeout

- captive-portal-mode commands

Defines an inactivity timeout in seconds. If a frame is not received from a client for the specified interval the current session is terminated.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

inactivity-timeout <60-86400>

Parameters

- inactivity-timeout <60-86400>

<table>
<thead>
<tr>
<th>&lt;60-86400&gt;</th>
<th>Defines the timeout interval after which a captive portal session is automatically terminated.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;60-86400&gt;</td>
<td>Specify a value from 60 - 86400 seconds. The default is 10 minutes or 600 seconds.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-captive-portal-test)#inactivity-timeout 750

rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
access-type logging
access-time 35
custom-auth info bob bob@examplecompany.com
connection-mode https

inactivity-timeout 750
accounting syslog host 172.16.10.13 port 1

### 4.1.27.2.9 ipv6

#### captive-portal-mode commands

Configures the internal captive portal server’s (running on the centralized mode) IPv6 address. If using centralized server mode, use this option to define the controller, service platform, or access point resource’s (hosting the captive portal) IPv6 address. For information on configuring the server mode, see `server`.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
ipv6 server host <IPv6>
```

#### Parameters

- `ipv6 server host <IPv6>`
  - Configures the IPv6 address of the internal captive portal server
  - `<IPv6>` – Specify the captive portal server’s global IPv6 address.

#### Examples

```
rfs7000-6DCD4B(config-captive-portal-test2)#show context captive-portal test2
    access-type OAuth
        OAuth client-id Google TechPubs.printer.google.com
rfs7000-6DCD4B(config-captive-portal-test2)#
```

#### Related Commands

- `no` Removes the captive portal server’s IPv6 address
4.1.27.2.10 logout-fqdn

* captive-portal-mode commands

Configures the *Fully Qualified Domain Name* (FQDN) address to logout of the session from the client

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`logout-fqdn <WORD>`

**Parameters**

- `logout-fqdn <WORD>`

  ```
  logout-fqdn <WORD>  Configures the FQDN address used to logout
  <WORD> – Provide the FQDN address (for example, logout.guestaccess.com).
  ```

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#logout-fqdn logout.testuser.com
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
rfs7000-37FABE(config-captive-portal-test)#
```

**Related Commands**

- `no`  Clears the logout FQDN address
4.1.27.2.11 no

**captive-portal-mode commands**

The `no` command reverts the selected captive portal’s settings or resets settings to default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```

no welcome-back pass-through
```

**Parameters**

- `no <PARAMETERS>`

  Removes or resets this captive portal’s settings, based on the parameters passed.
Examples
The following example shows the captive portal ‘test’ settings before the ‘no’ commands are executed:

rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test

access-type logging
access-time 35
custom-auth info bob bob@examplecompany.com
connection-mode https
inactivity-timeout 750
accounting syslog host 172.16.10.13 port 1
rfs7000-37FABE(config-captive-portal-test)#

rfs7000-37FABE(config-captive-portal-test)#no accounting syslog
rfs7000-37FABE(config-captive-portal-test)#no access-type

The following example shows the captive portal ‘test’ settings after the ‘no’ commands are executed:

rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test

access-time 35
custom-auth info bob bob@examplecompany.com
connection-mode https
inactivity-timeout 750
rfs7000-37FABE(config-captive-portal-test)#
4.1.27.2.12 oauth

Enables OAuth-based authentication support on this captive portal. When enabled, OAuth allows captive-portal users to sign
in to guest WLANs using their Facebook or Google credentials.

OAuth is an open-source protocol that allows secure authorization from Web, mobile, and desktop applications. The OAuth 2.0
authorization framework enables a third-party application (which, in this scenario, is the WiNG software) to obtain limited
access to an HTTP service. The WiNG software running on an access point or a controller provides the captive portal
authentication service. Wireless clients accessing a guest WLAN using OAuth are asked for their Google or Facebook
credentials, and are allowed network access only upon successful authentication.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
oauth {client-id [facebook|google] <WORD>}
```

Parameters

- `oauth {client-id [facebook|google] <WORD>}`

<table>
<thead>
<tr>
<th>oauth</th>
<th>Configures OAuth 2.0 settings required to provide OAuth access to clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-id [facebook</td>
<td>google] &lt;WORD&gt;</td>
</tr>
<tr>
<td></td>
<td>- facebook – Configures the client’s Facebook ID</td>
</tr>
<tr>
<td></td>
<td>- google – Configures the client’s Google ID</td>
</tr>
<tr>
<td></td>
<td>- &lt;WORD&gt; – Provide the client’s Facebook/Google ID (should be registered with the OAuth provider)</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-6DCD4B(config-captive-portal-test2)#OAuth client-id Google 
TechPubs.printer.google.com
rfs7000-6DCD4B(config-captive-portal-test2)#show context 
captive-portal test2
OAuth client-id Google TechPubs.printer.google.com
rfs7000-6DCD4B(config-captive-portal-test2)#
```

Related Commands

```
no
```

Removes all OAuth client identities configured for this captive portal
4.1.27.2.13 post-authentication-vlan

> captive-portal-mode commands

Configures the VLAN that is assigned to this captive portal's users upon successful authentication

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]

Parameters
- post-authentication-vlan [<1-4096>|<VLAN-ALIAS>]

<table>
<thead>
<tr>
<th>post-authentication-vlan [&lt;1-4096&gt;]</th>
<th>Configures the post authentication VLAN. The VLAN specified here is assigned to this captive portal's users after they have authenticated and logged on to the network. Provide the VLAN ID, or use an existing VLAN alias to identify the post authentication VLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-4096&gt;</td>
<td>&lt;1-4096&gt; – Specify the VLAN's number from 1 - 4096.</td>
</tr>
<tr>
<td>&lt;VLAN-ALIAS&gt;</td>
<td>&lt;VLAN-ALIAS&gt; – Specify the VLAN alias (should be existing and configured).</td>
</tr>
</tbody>
</table>

Note: VLAN alias names begin with a '$'.

Examples
rfs4000-229D58(config-captive-portal-test)#post-authentication-vlan 1
rfs4000-229D58(config-captive-portal-test)#show context captive-portal test

<td>radius-vlan-assignment</td>
<td>Enables assignment of a RADIUS VLAN for this captive portal</td>
</tr>
</tbody>
</table>
4.1.27.2.14 radius-vlan-assignment

Enables assignment of a RADIUS VLAN for this captive portal

When enabled, if the RADIUS server as part of the authentication process returns a client’s VLAN-ID in a RADIUS access-accept packet, then all client traffic is forwarded on the post authentication VLAN. If disabled, the RADIUS server’s VLAN assignment is ignored and the VLAN configuration defined within the WLAN configuration is used instead. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
radius-vlan-assignment

Parameters
None

Examples
rfs4000-229D58 (config-captive-portal-test)#radius-vlan-assignment

4.1.27.2.15 redirection

**captive-portal-mode commands**

Configures a list of destination ports (separated by commas, or using a dash for a range) that are taken into consideration when redirecting client connections.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

redirection ports <LIST-OF-PORTS>

**Parameters**

- redirection ports <LIST-OF-PORTS>

<table>
<thead>
<tr>
<th>ports &lt;LIST-OF-PORTS&gt;</th>
<th>Configures destination ports considered for redirecting client connection</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> A maximum of 16 ports can be specified. Standard ports 80 and 443 are always considered for client connections regardless of what’s entered by the administrator.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

rfs4000-229D58(config-captive-portal-test)#redirection ports 1,2,3

rfs4000-229D58(config-captive-portal-test)#show context captive-portal test

redirection ports 1-3

rfs4000-229D58(config-captive-portal-test)#

**Related Commands**

- **no** Disables redirection of client connection
### 4.1.27.2.16 server

**captive-portal-mode commands**

Configures captive portal server parameters, such as the hostname, IP address, and mode of operation. This is the server validating guest user permissions.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
server [host|mode]
server host <IP/HOSTNAME>
server mode [centralized|centralized-controller {hosting-vlan-interface <0-4096>}|self]
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>host &lt;IP/HOSTNAME&gt;</strong></td>
<td>Configures the internal captive portal authentication server (wireless controller, access point, service platform)</td>
</tr>
<tr>
<td>- &lt;IP/HOSTNAME&gt;</td>
<td>Specify the IPv4 address or hostname of the captive portal server.</td>
</tr>
<tr>
<td><strong>Note:</strong> For centralized wireless controller mode, this should be a virtual hostname and not an IP address.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> This option is available only when hosting the captive portal on an external (fixed) server resource.</td>
<td></td>
</tr>
<tr>
<td><strong>mode</strong></td>
<td>Configures the captive portal server mode</td>
</tr>
<tr>
<td>- centralized</td>
<td>Considers the configured server’s hostname or IP address as the centralized captive portal server. Select this option if the captive portal is supported on an external server.</td>
</tr>
<tr>
<td><strong>centralized-controller {hosting-vlan-interface &lt;0-4096&gt;}</strong></td>
<td>Configures the numeric IP address (or DNS hostname) for the server validating guest user permissions for the captive portal policy. This option is available only for the centralized (external) AND centralized-controller captive portal server resources.</td>
</tr>
<tr>
<td>- hosting-vlan-interface</td>
<td>Optional. Configures the VLAN where the client can reach the wireless controller (server). This option is available only for the centralized-controller mode.</td>
</tr>
<tr>
<td>- &lt;0-4096&gt;</td>
<td>Specify the VLAN number (0 implies the controller is available on the client’s VLAN).</td>
</tr>
<tr>
<td><strong>self</strong></td>
<td>Selects the captive portal server as the same device supporting the WLAN (the captive portal and the WLAN are configured on the same device). Select this option to maintain the captive portal configuration (Web pages) internally. This is the default setting.</td>
</tr>
</tbody>
</table>
Examples

rfs7000-37FABE(config-captive-portal-test)#server host 172.16.10.9
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  inactivity-timeout 750
rfs7000-37FABE(config-captive-portal-test)#

4.1.27.2.17 simultaneous-users

Specifies the number of users (client MAC addresses) that can simultaneously logon to the captive portal. This option is disabled by default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`simultaneous-users <1-8192>`

**Parameters**

- **simultaneous-users <1-8192>**

<table>
<thead>
<tr>
<th>simultaneous-users</th>
<th>Specifies the number of MAC addresses that can simultaneously access the captive portal</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-8192&gt;</td>
<td>&lt;1-8192&gt; — Select a number from 1 - 8192.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#simultaneous-users 5
rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  inactivity-timeout 750
  server host 172.16.10.9

</tbody>
</table>
4.1.27.2.18 terms-agreement

- captive-portal-mode commands

Enforces the user to agree to terms and conditions (included in the login page) for captive portal access. This feature is disabled by default.

When enabled, the system enforces a previously registered user to re-confirm the terms of agreement, on successive log ins, only if the interval between the last log out and the current log in exceeds the agreement-refresh timeout configured in the WLAN context. For more information on configuring the agreement-refresh timeout value, see registration.

For example:

If the agreement-refresh timeout is set at 20 minutes, the following two possibilities can arise:

- The interval between logging out and re-logging exceeds 20 minutes - in which case the user is served the Terms of Agreement page on successful authentication.
- The interval between logging out and re-logging is less than 20 minutes - in which case the user is provided direct Internet access.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`terms-agreement`

Parameters

None

Examples

```
rfs7000-37FABE(config-captive-portal-test)#terms-agreement
rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  inactivity-timeout 750
  server host 172.16.10.9

4.1.27.2.19 use

#### captive-portal-mode commands

Configures a AAA policy and DNS whitelist with this captive portal policy. AAA policies are used to configure authentication and accounting servers for this captive portal. DNS whitelists restrict users to a set of configurable domains on the Internet.

For more information on AAA policies, see Chapter 8, AAA-POLICY.

For more information on DNS whitelists, see Chapter 4, dns-whitelist.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]
```

**Parameters**

- **use [aaa-policy <AAA-POLICY-NAME>|dns-whitelist <DNS-WHITELIST-NAME>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa-policy &lt;AAA-POLICY-NAME&gt;</td>
<td>Configures a AAA policy with this captive portal. AAA policies validate user credentials and provide captive portal access to the network.</td>
</tr>
<tr>
<td>dns-whitelist &lt;DNS-WHITELIST-NAME&gt;</td>
<td>Configures a DNS whitelist to use with this captive portal. DNS whitelists restrict captive portal access.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-captive-portal-test)#use aaa-policy test

4.1.27.2.20 webpage

Use this command to define the appearance and flow of Web pages requesting clients encounter when accessing a controller, service platform, or access point managed captive portal. Define whether the Web pages are maintained locally or externally to the managing device as well as messages displayed requesting clients.

Configures Web pages displayed when interacting with a captive portal. There are six (6) different pages.

- acknowledgment – This page displays details for the user to acknowledge
- agreement – This page displays “Terms and Conditions” that a user accepts before allowed access to the captive portal.
- fail – This page is displayed when the user is not authenticated.
- login – This page is displayed when the user connects to the captive portal. It fetches login credentials from the user.
- no-service – This page is displayed when a captive portal user is unable to access the captive portal due to unavailability of critical services.
- registration – This page is displayed when users are redirected to a Web page where they have to register in the captive portal's database.
- welcome – This page is displayed to welcome an authenticated user to the captive portal.

These Web pages, which interact with captive portal users, can be located either on the controller or an external location.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

webpage [external|internal]

webpage external [acknowledgment|agreement|fail|login {post}|no-service|registration|welcome] <URL>

webpage internal [acknowledgment|agreement|fail|login|no-service|org-name|org-signature|registration|welcome]
[description|footer|header|title] <CONTENT>

[body-background-color|body-font-color|org-background-color|org-font-color] <WORD>

webpage internal [acknowledgment|agreement|fail|login|no-service|registration|welcome]
[main-logo use-as-banner|small-logo] <URL>

webpage internal registration field [age-range|city|country|custom|disclaimer|dob|email|gender|member|mobile|name|optout|street|via-email|via-sms|zip] type [checkbox|date|dropdown-menu|e-address|number|radio-button|text] enable {label <LINE>|mandatory|title <LINE>|placeholder <LINE>}

webpage internal welcome use-external-success-url

webpage internal [org-name|org-signature] <LINE>
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>webpage external</strong> [acknowledgment</td>
<td>agreement</td>
</tr>
<tr>
<td>external</td>
<td>Indicates the page is displayed for user acknowledgment of details. Users are redirected to this page to acknowledge information provided.</td>
</tr>
<tr>
<td>acknowledgment</td>
<td>Indicates the page is displayed for “Terms &amp; Conditions”. The agreement page provides conditions that must be agreed to before captive portal access is permitted.</td>
</tr>
<tr>
<td>fail</td>
<td>Indicates the page is displayed for login failure. The fail page asserts authentication attempt has failed, the user is not allowed to access the Internet (using this captive portal) and must provide the correct login information again to access the Internet.</td>
</tr>
<tr>
<td>login {post}</td>
<td>Indicates the page is displayed for getting user credentials. This page is displayed by default. <em>post – Optional. Redirects users to post externally during authentication</em> The login page prompts the user for a username and password to access the captive portal and proceed to either the agreement page (if used) or the welcome page.</td>
</tr>
</tbody>
</table>
| no-service | Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The no-service page asserts the captive portal service is temporarily unavailable due to technical reasons. Once the services become available, the captive portal user is automatically connected back to the services available through the captive portal. The possible scenarios are:  
- The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated  
- The external captive portal server is not reachable  
- The connectivity between the adopted AP and controller is lost  
- The external DHCP server is not reachable  
To provide this service, enable the following:  
- External captive portal server monitoring  
- AAA server monitoring. This enables detection of RADIUS server failure.  
- External DHCP server monitoring  
**Note:** For more information on enabling these critical resource monitoring, see service. |
| registration | Indicates the page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register. |
| welcome | Indicates the page is displayed after a user has been successfully authenticated. The welcome page asserts a user has logged in successfully and can access the captive portal. |
<URL> This parameter is common to all of the above mentioned Web pages, and specifies the Web page URL. The Web page is retrieved and served from the specified external location.

The URL can include following query tags:

- `WING_TAG_CLIENT_IP` - Captive portal client IPv4 address
- `WING_TAG_CLIENT_MAC` - Captive portal client MAC address
- `WING_TAG_WLAN_SSID` - Captive portal client WLAN ssid
- `WING_TAG_AP_MAC` - Captive portal client AP MAC address
- `WING_TAG_AP_NAME` - Captive portal client AP Name
- `WING_TAG_RF_DOMAIN` - Captive portal client RF Domain
- `WING_TAG_CP_SERVER` - Captive portal server address
- `WING_TAG_USERNAME` - Captive portal authentication username

Example:

```
```

Use '&' or '?' character to separate field-value pair.

**Note:** Enter 'ctrl-v' followed by '?' to configure query string.

<table>
<thead>
<tr>
<th>Parameter</th>

<td>Indicates the Web page is displayed for users to acknowledge the information provided</td>
</tr>
<tr>
<td><code>agreement</code></td>
<td>Indicates the page is displayed for “Terms &amp; Conditions”</td>
</tr>
<tr>
<td><code>fail</code></td>
<td>Indicates the page is displayed for login failure</td>
</tr>
<tr>
<td><code>login</code></td>
<td>Indicates the page is displayed for entering user credentials</td>
</tr>
<tr>
<td><code>no-service</code></td>
<td>Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The possible scenarios are:</td>
</tr>
<tr>
<td></td>
<td>• The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated</td>
</tr>
<tr>
<td></td>
<td>• The external captive portal server is not reachable</td>
</tr>
<tr>
<td></td>
<td>• The connectivity between the adopted AP and controller is lost</td>
</tr>
<tr>
<td></td>
<td>• The external DHCP server is not reachable</td>
</tr>
<tr>
<td>To provide this service, enable the following:</td>
<td></td>
</tr>
<tr>
<td>• External captive portal server monitoring</td>
<td></td>
</tr>
<tr>
<td>• AAA server monitoring. This enables detection of RADIUS server failure.</td>
<td></td>
</tr>
<tr>
<td>• External DHCP server monitoring</td>
<td></td>
</tr>
<tr>
<td>• AP to controller connectivity monitoring</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> For more information on enabling these critical resource monitoring, see service.</td>
<td></td>
</tr>
<tr>
<td>keyword</td>
<td>description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>registration</td>
<td>Indicates the page is displayed when users are redirected to a Web page where they have to register in the captive portal’s database. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register.</td>
</tr>
<tr>
<td>welcome</td>
<td>Indicates the page is displayed after a user has been successfully authenticated.</td>
</tr>
<tr>
<td>description</td>
<td>Indicates the content is the description portion of each of the following internal Web pages: acknowledgment, agreement, fail, login, no-service, and welcome.</td>
</tr>
<tr>
<td>footer</td>
<td>Indicates the content is the footer portion of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, and welcome. The footer portion contains the signature of the organization that hosts the captive portal.</td>
</tr>
<tr>
<td>header</td>
<td>Indicates the content is the header portion of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, and welcome. The header portion contains the heading information for each of these pages.</td>
</tr>
<tr>
<td>title</td>
<td>Indicates the content is the title of each of the following internal Web pages: acknowledgment, agreement, fail, no-service, and welcome. The title for each of these pages is configured here.</td>
</tr>
</tbody>
</table>
| <CONTENT> | The following keyword is common to all of the above internal Web page options:  
• <CONTENT> – Specify the content displayed for each of the different components of the internal Web page. Enter up to 900 characters for the description and 256 characters each for header, footer, and title. |
| internal | Indicates the Web pages are hosted on an internal server resource. |
| agreement | Indicates the page is displayed for “Terms & Conditions.” |
| acknowledgment | Indicates the Web page is displayed for users to acknowledge the information provided. |
| fail | Indicates the page is displayed for login failure. |
| login | Indicates the page is displayed for user credentials. |
| no-service | Indicates the page is displayed when certain critical services are unavailable and the user fails to access the captive portal. The possible scenarios are:  
• The RADIUS server (on-board or external) is not reachable and the user cannot be authenticated  
• The external captive portal server is not reachable  
• The connectivity between the adopted AP and controller is lost  
• The external DHCP server is not reachable  
To provide this service, enable the following:  
• External captive portal server monitoring  
• AAA server monitoring. This enables detection of RADIUS server failure. |

Contd..
| registration | Indicates the page displayed is the registration page to which users are redirected in order to register in the captive portal’s database. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) upon association to a captive portal SSID, where previously, not-registered guest users can register. |
| registration | Note: For more information on enabling these critical resource monitoring, see wlan. |
| welcome | Indicates the page is displayed after a user has been successfully authenticated. |
| main-logo | The following keyword is common to all of the above internal Web page options: |
| use-as-banner | • main-logo – Indicates the main logo displayed in the header of each Web page |
| | • use-as-banner – Uses the image, specified here, as the Web page banner, in place of the logo and organization name, |
| small-logo | The following keyword is common to all of the above internal Web page options: |
| | • small-logo – Indicates the logo image displayed in the footer of each Web page, and constitutes the organization’s signature |
| <URL> | This parameter is common to the ‘main-logo’ and ‘small-logo’ keywords and provides the complete URL from where the main-logo and small-logo files are loaded and subsequently cached on the system. |
| | • <URL> – Specify the location and name of the main-logo and the small-logo image files. |

### Field Options

<table>
<thead>
<tr>
<th>Field Options</th>

</tbody>
</table>

After specifying the field, configure the field type. The options displayed depend on the field selected in the previous step. These options are: checkbox, date, dropdown-menu, e-address, number, radio-button, and text.

- checkbox – Configures the field as a check box
- date – Configures the field as only date-format input field
- dropdown-menu – Configures the field as a drop-down menu
- e-address – Configures the field as an e-mail address input field
- number – Configures the field as only-numeric characters input field
- radio-button – Configures the field as a radio button
- text – Configures the field as only alpha-numeric and special characters input field

**Note:** Some of the fields can have more than one field type options. For example, the field ‘zip’ can either be a numerical field or a text. Select the one best suited for your captive-portal.

4.1.27.2.21 webpage-auto-upload

This command enables automatic upload of advanced Web pages to requesting clients on association. Enable this option if the webpage-location is selected as advanced. For more information see, webpage-location.

If this feature is enabled, access points shall request for Web pages from the controller during adoption. If the controller has a different set of Web pages, than the ones existing on the access points, the controller shall distribute the Web pages uploaded on it to the access points.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
webpage-auto-upload

Parameters
None

Examples
rfs7000-37FABE(config-captive-portal-test)#webpage-auto-upload
rfs7000-37FABE(config-captive-portal-test)#show context captive-portal test webpage-auto-upload
logout fqdn logout.testuser.com
rfs7000-37FABE(config-captive-portal-test)#

4.1.27.22 webpage-location

webpage-location [advanced|external|internal]

Parameters

- **advanced**
  - Uses Web pages for login, welcome, failure, and terms created and stored on the controller. Select `advanced` to use a custom-developed directory full of Web page content that can be copied in and out of the controller, service platform, or access point.
  - If selecting advanced, enable the `webpage-auto-upload` option to automatically launch the advanced pages to requesting clients upon association. For more information, see `webpage-auto-upload`.

- **external**
  - Uses Web pages for login, welcome, failure, and terms located on an external server. Provide the URL for each of these pages.

- **internal**
  - Uses Web pages for login, welcome, and failure that are automatically generated.

Examples

```
rfs7000-37FABE(config-captive-portal-test)#webpage-location external
rfs7000-37FABE(config-captive-portal-test)#show context
captive-portal test
  access-time 35
  custom-auth info bob bob@examplecompany.com
  connection-mode https
  inactivity-timeout 750
  server host 172.16.10.9
  simultaneous-users 5
  terms-agreement
  webpage-location external
  use aaa-policy test
rfs7000-37FABE(config-captive-portal-test)#
```

Related Commands

- `no`  - Resets or disables captive portal Web page settings
- `webpage`  - Configures a captive portal’s Web page (acknowledgment, agreement, login, welcome, fail, no-service, and terms) settings
- `webpage-auto-upload`  - Enables an automatic upload of advanced Web pages on a captive portal
4.1.27.2.23 welcome-back

Enables the provision of direct Internet access to once-registered, captive-portal guest users on subsequent log-ins when enabled, a previously registered captive-portal guest user, on subsequent logins, is served the Acknowledgement page only if:

- The agreement-refresh option is enabled for device-based (device and device-OTP) registration, and
- The interval between logout and login is lesser than the agreement-refresh timeout configured in the WLAN context. If this interval exceeds the agreement-refresh timeout, the user is served the Agreement page. For more information on configuring the agreement-refresh timeout value, see registration.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
welcome-back pass-through
```

Parameters

- welcome-back pass-through

| welcome-back pass-through | Enables display of the Acknowledgement page to an already registered user on subsequent captive-portal log-ins, provided the interval between logout and login is lesser than the agreement-refresh timeout
| - pass-through | Provides user direct Internet access, from the Welcome-back page, without any user action

Examples

```plaintext
nx9500-6C8809(config-captive-portal-test)#show context captive-portal test
welcome-back pass-through
webpage internal registration field city type text enable label "City" placeholder "Enter City"
webpage internal registration field street type text enable label "Address" placeholder "123 Any Street"
webpage internal registration field zip type number enable label "Zip" placeholder "Zip"
webpage internal registration field via-sms type checkbox enable title "SMS Preferred"
webpage internal registration field mobile type number enable label "Mobile" placeholder "Mobile Number with Country code"
webpage internal registration field age-range type dropdown-menu enable label "Age Range" title "Age Range"
webpage internal registration field email type e-address enable mandatory label "Email" placeholder "you@domain.com"
webpage internal registration field via-email type checkbox enable title "Email Preferred"
nx9500-6C8809(config-captive-portal-test)#
```

Related Commands

| no | Disables the provision of direct Internet access to once-registered, captive-portal guest users on subsequent log-ins |
4.1.28 clear

- **Global Configuration Commands**

Clears parameters, cache entries, table entries, and other similar entries. The clear command is available for specific commands only. The information cleared using this command varies depending on the mode where executed.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext

4.1.29 client-identity

Global Configuration Commands

With an increase in Bring Your Own Device (BYOD) corporate networks, there is a parallel increase in the number of possible attack scenarios within the network. BYOD devices are inherently unsafe, as the organization’s security mechanisms do not extend to these personal devices deployed in the corporate wireless network. Organizations can protect their network by limiting how and what these BYODs can access on and through the corporate network.

Device fingerprinting assists administrators by controlling how BYOD devices access a corporate wireless domain.

Device fingerprinting uses DHCP options sent by the client in request or discover packets to derive a unique signature specific to device class. For example, Apple devices have a different signature from Android devices. The signature is used to classify the devices and assign permissions and restrictions on each device class.

The following table summarizes the commands available for creating and configuring a set of new client identity parameters:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-identity</td>

<td>page 4-109</td>
</tr>
<tr>
<td>client-identity-group</td>
<td>Creates a new client identity group and enters its configuration mode</td>
<td>page 4-114</td>
</tr>
</tbody>
</table>
4.1.29.1 client-identity

Creates a new client identity and enters its configuration mode. Client identity is a set of unique fingerprints used to identify a class of devices. This information is used to configure permissions and access rules for the identified class of devices in the network. The client-identity feature enables device fingerprinting.

Device fingerprinting is a technique of collecting, analyzing, and identifying traffic patterns originating from remote computing devices. When enabled, device fingerprinting helps to identify a wireless client’s device type. There are two methods of fingerprinting devices: Active and Passive.

Active fingerprinting is based on the fact that traffic patterns vary with varying device types. It involves the sending of requests (HTTP etc.) to devices (clients) and analyzing their response to determine the device type. For example, an invalid request is sent to a device, and its error response is analyzed to identify the device type. Since active device fingerprinting involves sending of packets, the probability of the network getting flooded is very high, especially when many devices are being fingerprinted simultaneously.

Passive fingerprinting involves monitoring of devices to check for known traffic patterns specific to devices based on the protocol, driver implementation etc. This method accurately classifies a client’s TCP/IP configuration, OS fingerprints, wireless settings etc. No packets are sent to the device. Some of the commonly used protocols for passive device fingerprinting are, TCP, DHCP, HTTP etc.

This feature implements DHCP device fingerprinting, which relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
client-identity <CLIENT-IDENTITY-NAME>

Parameters
- client-identity <CLIENT-IDENTITY-NAME>

<table>
<thead>
<tr>
<th>client-identity &lt;CLIENT-IDENTITY-NAME&gt;</th>
<th>Creates a new client identity policy and enters its configuration mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;CLIENT-IDENTITY-NAME&gt;</td>
<td>&lt;CLIENT-IDENTITY-NAME&gt; – Specify a client identity policy name. If the client identity policy does not exist, it is created.</td>
</tr>
</tbody>
</table>

Usage Guidelines
The following points should be considered when configuring the client identity (device fingerprinting) feature:

1. Ensure that DHCP is enforced on the WLANs. For more information on enforcing DHCP on WLANs, see enforce-dhcp.
2. Successful identification of different device types depends on the uniqueness of the configured fingerprints. DHCP fingerprinting identifies clients based on the patterns (fingerprints) in the DHCP discover and request messages sent by clients. If different operating systems have the same fingerprints, it will be difficult to identify the device type.
3. When associating client identities with a role policy, ensure that the profile/device, under which the role policy is being used, also has an associated client identity group (containing all the client identities used by the role policy).
Examples

rfs4000-229D58(config)#client-identity test
rfs4000-229D58(config-client-identity-test)#?

Client Identity Mode commands:

dhcp                     Add a DHCP option based match criteria
dhcp-match-message-type  Specify DHCP message type to match
no                       Negate a command or set its defaults
clrscr                   Clears the display screen
commit                   Commit all changes made in this session
do                       Run commands from Exec mode
end                      End current mode and change to EXEC mode
exit                     End current mode and down to previous mode
help                     Description of the interactive help system
revert                   Revert changes
service                  Service Commands
show                     Show running system information
write                    Write running configuration to memory or terminal

rfs4000-229D58(config-client-identity-test)#
### 4.1.29.2 client-identity-mode commands

The following table summarizes client identity configuration mode commands:

**Table 4.9 Client-Identity-Mode Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp</td>
<td>Configures the DHCP option match criteria for device fingerprinting</td>
<td>page 4-110</td>
</tr>
<tr>

<td>Configures the DHCP message type for device fingerprinting</td>
<td>page 4-112</td>
</tr>
<tr>
<td>no</td>
<td>Removes the DHCP option (used for client identification) configurations</td>
<td>page 4-113</td>
</tr>
</tbody>
</table>
4.1.29.2.1 dhcp

• client-identity-mode commands

Configures the DHCP option match criteria (signature) for the discover and request message types received from wireless clients.

When accessing a network, DHCP discover and request messages are passed between wireless clients and the DHCP server. These messages contain DHCP options and option values that differ from device to device and are based on the DHCP implementation in the device's operating system (OS). Options and option values contained in a client's messages are parsed and compared against the configured DHCP option values to identify the device. Once a device type is identified, the wireless client database is updated with the discovered device type.

Supported in the following platforms:

• Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX

• Wireless Controllers — RFS4000, RFS6000, RFS7000

• Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dhcp <1-16> message-type [discover|request] [option|option-codes]
dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes] [contains|exact|starts-with] [ascii|hexstring] <WORD>

Parameters

• dhcp <1-16> message-type [discover|request] [option <1-254>|option-codes] [contains|exact|starts-with] [ascii|hexstring] <WORD>

<table>
<thead>
<tr>
<th>dhcp &lt;1-16&gt;</th>
<th>Adds a DHCP option match criteria signature</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-16&gt;</td>
<td>Specify an index for this DHCP match criteria from 1 - 16.</td>
</tr>
</tbody>
</table>

**Note:** A maximum of 16 match criteria can be configured.

| message-type [discover|request] | Specifies the message type to which this DHCP match criteria is applicable |
|-------------------------------|-----------------------------------------------------------------|
| discover                      | Applies this match criteria to DHCP discover messages only. Indicates that the fingerprint is only checked with any DHCP discover messages received from any device. |
| request                       | Applies this match criteria to DHCP request messages only. Indicates that the fingerprint is only checked with any DHCP request messages received from any device. |

**Note:** It is recommended to configure client-identity with request messages, because clients rarely send discover messages. 

<table>
<thead>
<tr>
<th>option &lt;1-254&gt;</th>
<th>The following keywords are common to the ‘discover’ and ‘request’ message types:</th>
</tr>
</thead>
<tbody>
<tr>
<td>option</td>
<td>Configures a DHCP option value, which is used as the match criteria</td>
</tr>
<tr>
<td>&lt;1-254&gt;</td>
<td>Configures a code for this DHCP option from 1 - 254 (except option 53)</td>
</tr>
</tbody>
</table>

**Note:** If the message type is not specified, the fingerprint is checked with all message types (DHCP request and DHCP discover).
| **option-codes** | The following keyword is common to the ‘discover’ and ‘request’ message types:  
| | • option-codes – Matches criteria based on the DHCP option codes contained in the client’s discover/request messages  
| **Note:** Devices pass options in their DHCP discover/request messages as option codes, option types, and option value sets. These option codes are extracted and matched against the configured DHCP option codes and a fingerprint is derived. This derived fingerprint is used to identify the device.  
| **contains** | The following keyword is common to the ‘discover’ and ‘request’ message types:  
| | • contains – Specifies that the DHCP options received in the client’s discover/request messages contains the configured option code string  
| **exact** | The following keyword is common to the ‘discover’ and request message types:  
| | • exact – Specifies that the DHCP options received in the client’s discover/request messages is an exact match with the configured option code string  
| **starts-with** | The following keyword is common to the ‘discover’ and ‘request’ message types:  
| | • starts-with – Specifies that the DHCP options received in the client’s discover/request messages starts with the configured option code string  
| **ascii <WORD>** | The following keywords are common to the ‘contains’, ‘exact’, and ‘starts-with’ parameters:  
| | • ascii – Configures the DHCP option in the ASCII format  
| | • <WORD> – Specify the DHCP option ASCII value to match.  
| **hexstring <WORD>** | The following keywords are common to the ‘contains’, ‘exact’, and ‘starts-with’ parameters:  
| | • hexstring – Configures the DHCP option in the hexa-decimal format  
| | • <WORD> – Specify the DHCP option hexstring value to match.  

**Usage Guidelines**

The following DHCP options are useful for identifying different device types:

1. **Option 55**: Used by a DHCP client to request values for specific configuration parameters. It is a list of DHCP option codes and can be in the client’s order of preference.
2. **Client configured list of DHCP options**: (all options parsed into a hex string).
3. **Option 60**: Vendor class identifier. Used to identify the vendor and functionality of a DHCP client (some devices do not set the value of this field).

Though it is possible to use any option to configure a device fingerprint, the use of a combination of one or more of the preceding options to define a device is recommended.

**Examples**

```plaintext
rfs4000-229D58(config-client-identity-test)#dhcp 1 message-type request option 60 exact ascii MSFT\5.0
rfs4000-229D58(config-client-identity-test)#dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
rfs4000-229D58(config-client-identity-test)#show context client-identity test
dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT5.0
rfs4000-229D58(config-client-identity-test)#
```

**Related Commands**

| **no** | Removes a DHCP option signature (match criteria) |
### 4.1.29.2.2 dhcp-match-message-type

Configures the DHCP message type to match

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dhcp-match-message-type [all|any|discover|request]

**Parameters**
- dhcp-match-message-type [all|any|discover|request]

| dhcp-match-message-type [all|any|discover|request] | Specifies the DHCP message type to consider for matching |
|---------------------------------------------------|-------------------------------------------------------|
| all | Matches all message types: discover and request. Indicates that the fingerprint is checked with both the DHCP request and the DHCP discover message. |
| any | Matches any message type: discover or request. Indicates that the fingerprint is checked with either the DHCP request or the DHCP discover message. |
| discover | Matches discover messages only. Client matches the client identity only if the discover message sent by the client matches. Values configured for request messages are ignored. |
| request | Matches request messages only. Client matches the client identity only if the request message sent by the client matches. Values configured for discover messages are ignored. |

**Examples**

rfs4000-229D58(config-client-identity-test)#dhcp-match-message-type all

rfs4000-229D58(config-client-identity-test)#show context client-identity test
dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT5.0
dhcp-match-message-type all
rfs4000-229D58(config-client-identity-test)#

**Related Commands**

| no | Removes the DHCP message type to match |
4.1.29.2.3 no

**client-identity-mode commands**

Removes the DHCP options match criteria configurations

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

no [dhcp <1-16>|dhcp-match-message-type]

**Parameters**

- no [dhcp <1-16>|dhcp-match-message-type]

| dhcp <1-16> | Removes the DHCP option match criteria rule identified by the <1-16> keyword |
| dhcp-match-message-type | Removes the DHCP message type to match |

**Examples**

The following example shows the client identity 'test' settings before the 'no' commands are executed:

```
rfs4000-229D58(config-client-identity-test)#show context client-identity test
dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
dhcp 1 message-type request option 60 exact ascii MSFT5.0
dhcp-match-message-type all
```

```
rfs4000-229D58(config-client-identity-test)#no dhcp 2
rfs4000-229D58(config-client-identity-test)#no dhcp-match-message-type
```

The following example shows the client identity 'test' settings after the 'no' commands are executed:

```
rfs4000-229D58(config-client-identity-test)#show context client-identity test
dhcp 1 message-type request option 60 exact ascii MSFT5.0
```

**Related Commands**

| dhcp | Configures the DHCP option match criteria for device fingerprinting |
| dhcp-match-message-type | Configures the DHCP message type for device fingerprinting |
4.1.30 client-identity-group

The following table summarizes commands available to enter the client identity group configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-identity-group</td>
<td>Creates a new client identity group and enters its configuration mode</td>
<td>page 4-115</td>
</tr>
<tr>
<td>client-identity-group-mode commands</td>
<td>Invokes the client identity group configuration mode commands</td>
<td>page 4-116</td>
</tr>
<tr>
<td>client-identity</td>
<td>Creates new client identity policy and enters its configuration mode</td>
<td>page 4-106</td>
</tr>
</tbody>
</table>
4.1.30.1 client-identity-group

Configures a new client identity group

A client identity group is a collection of client identities. Each client identity included in a client identity group is set a priority value that indicates the priority for that identity when device fingerprinting.

Device Fingerprinting relies on specific information sent by a wireless client when acquiring IP address and other configuration information from a DHCP server. The feature uses the DHCP options sent by the wireless client in the DHCP request or discover packets to derive a unique signature specific to the class of devices. For example, Apple devices have a different signature than Android devices. This unique signature can then be used to classify the devices and assign permissions and restrictions on each device class.

A client identity group can be attached to a profile or device, enabling device fingerprinting on them.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9800

Syntax

```plaintext
client-identity-group <CLIENT-IDENTITY-GROUP-NAME>
```

Parameters

- `<client-identity-group <CLIENT-IDENTITY-GROUP-NAME>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;CLIENT-IDENTITY-GROUP-NAME&gt;</code></td>
<td>Creates a new client identity group and enters its configuration mode</td>
</tr>
<tr>
<td>no</td>
<td>Negate a command or set its defaults</td>
</tr>
</tbody>
</table>

Examples

```plaintext
rfs4000-229D58(config)#client-identity-group test
rfs4000-229D58(config-client-identity-group-test)#
```

Client Identity group Mode commands:

- `client-identity` Client identity (DHCP Device Fingerprinting)
- `no` Negate a command or set its defaults
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```plaintext
rfs4000-229D58(config-client-identity-group-test)#
```
4.1.30.2 client-identity-group-mode commands

The following table summarizes client identity group configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-identity</td>
<td>Associates an existing and configured client identity (device fingerprint) with this client identity group</td>
<td>page 4-117</td>
</tr>
<tr>
<td>no</td>
<td>Removes the client identity associated with this client identity group</td>
<td>page 4-113</td>
</tr>
</tbody>
</table>
4.1.30.2.1 client-identity

client-identity-group-mode commands

Associates an existing and configured client identity (device fingerprint) with this client identity group

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
client-identity <CLIENT-IDENTITY-NAME> precedence <1-10000>
```

Parameters

- `client-identity <CLIENT-IDENTITY-NAME>` — Specify a client identity name (should be existing and configured)

- `<CLIENT-IDENTITY-NAME>`

- `precedence <1-10000>` — Specify this client identity precedence from `<1-10000>.

**Note:** The client identity rule is applied based on its precedence value. Lower the value, higher is the precedence. Therefore, a client identity with precedence 5 gets precedence over a client identity having precedence 20.

### Examples

The following example shows two client identities created and configured:

```
rfs4000-229D58(config)#show context
  !
  ! Configuration of RFS4000 version 5.8.0.0-021D
  !
  ! version 2.1
  !
  ! client-identity TestClientIdentity
  dhcp 1 message-type request option-codes exact hexstring 5e4d36780b3a7f
  !
  ! client-identity test
  dhcp 2 message-type discover option 2 exact hexstring 012456c22c44
  dhcp 1 message-type request option 60 exact ascii MSFT5.0
  dhcp-match-message-type all
  !
  client-identity-group ClientIdentityGroup
  client-identity TestClientIdentity precedence 1
  !
  client-identity-group test
  !
  ip access-list BROADCAST-MULTICAST-CONTROL
  permit tcp any any rule-precedence 10 rule-description "permit all TCP traffic"
  --More--
rfs4000-229D58(config)#
```
The following example associates client identity 'test' with the client identity group 'test':

```
rfs4000-229D58 (config-client-identity-group-test)#client-identity test precedence 1
```

The following example shows the client identity group 'test' with two associated client identities having precedence 1 and 2:

```
rfs4000-229D58 (config-client-identity-group-test)#client-identity test precedence 2
rfs4000-229D58 (config-client-identity-group-test)#show context
```

```
client-identity test precedence 1
client-identity TestClientIdentity precedence 2
```

```
rfs4000-229D58 (config-client-identity-group-test)#
```

The following example shows the possible client identities:

```
rfs4000-229D58 (config)#show context

! Configuration of RFS4000 version 5.8.0.0-021D

Related Commands

no

Removes the client identity associated with the client identity group
4.1.30.2.2 no

*client-identity-group-mode commands*

Removes the client identity associated with the client identity group

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
no client-identity <CLIENT-IDENTITY-NAME>
```

**Parameters**

- `no client-identity <CLIENT-IDENTITY-NAME>`

<table>
<thead>
<tr>
<th>no client-identity &lt;CLIENT-IDENTITY-NAME&gt;</th>
<th>Disassociates a specified client identity from this client identity group</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;CLIENT-IDENTITY-NAME&gt; – Specify the client identity name.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config-client-identity-group-test)#show context
client-identity-group test
rfs4000-229D58(config-client-identity-group-test)#
rfs4000-229D58(config-client-identity-group-test)#no client-identity test
rfs4000-229D58(config)#
```

**Related Commands**

<thead>
<tr>
<th>client-identity</th>
<th>Associates an existing and configured client identity (device fingerprinting) with this client identity group</th>
</tr>
</thead>
</table>
4.1.31 clone

**Global Configuration Commands**

Creates a replica of an existing object or device. The configuration of the new object or device is an exact copy of the existing object or device configuration. Use this command to copy existing configurations and then modifying only the required parameters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

clone [TLO|device]

- clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>
- clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>

**Parameters**

- **clone TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>**
  
  TLO <EXISTING-OBJECT-NAME> <NEW-OBJECT-NAME>

  Creates a new TLO by cloning an existing top-level object. The new object has the same configuration as the cloned object.
  
  - <EXISTING-OBJECT-NAME> — Specify the existing object’s (to be cloned) name
  - <NEW-OBJECT-NAME> — Provide the new object’s name.
  
  **Note:** Enter `clone` and press Tab to list objects available for cloning.

- **clone device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>**
  
  device <EXISTING-DEVICE-MAC/NAME> <NEW-DEVICE-MAC>

  Configures a new device based on an existing device configuration
  
  - <EXISTING-DEVICE-MAC/NAME> — Specify the existing device’s name or MAC address (the device to be cloned)
  - <NEW-DEVICE-MAC> — Provide the new device’s MAC address.
  
  **Note:** Enter `clone > device` and press Tab to list devices available for cloning.

**Examples**

```bash
nx9500-6C8809(config)#clone rf_domain TechPubs Cloned_TechPubs2
nx9500-6C8809(config)#show context
!
! Configuration of NX9500 version 5.8.0.0-028D
!
!
version 2.3
!
rf-domain TechPubs
  location SanJose
  timezone America/Los_Angeles
  country-code us
  !
rf-domain Cloned_TechPubs2
  location SanJose
--More--
nx9500-6C8809(config)#
```
4.1.32 crypto-cmp-policy

Creates a crypto Certificate Management Protocol (CMP) policy and enters its configuration mode

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>

Parameters

- crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>

| <CRYPTO-CMP-POLICY-NAME> | Specify the crypto CMP policy name. If the policy does not exist, it is created. |

Examples

```
nx9500-6C8809(config)#crypto-cmp-policy CMP
nx9500-6C8809(config-cmp-policy-CMP)#?

CMP Policy Mode commands:
  ca-server       CMP CA Server configuration commands
  cert-key-size   Set key size for certificate request
  cert-renewal-timeout Trigger a cert renewal request on timeout
  cross-cert-validate Validate cross-cert using factory-cert
  no              Negate a command or set its defaults
  subjectAltName Configure subjectAltName value
  trustpoint     Trustpoint for CMP
  use             Set setting to use
  clrscr          Clears the display screen
  commit          Commit all changes made in this session
  do              Run commands from Exec mode
  end             End current mode and change to EXEC mode
  exit            End current mode and down to previous mode
  help            Description of the interactive help system
  revert          Revert changes
  service         Service Commands
  show            Show running system information
  write           Write running configuration to memory or terminal
```

```
nx9500-6C8809(config-cmp-policy-CMP)#
```

Related Commands

```
no    Resets values or disables commands
```

NOTE: For more information on the crypto CMP policy, see Chapter 29, CRYPTO-CMP-POLICY.
4.1.33 customize

Global Configuration Commands

Customizes the output of the summary CLI commands. Use this command to define the data displayed as a result of various show commands.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

customize [cdp-lldp-info-column-width|hostname-column-width|show-adoption-status|
show-wireless-meshpoint|show-wireless-meshpoint-accelerated-multicast|

customize show-wireless-radio-stats-rf (average-retry-number, error-rate, noise, q-index, radio-alias <3-67>, radio-id, radio-mac, rx-rate, signal, snr, t-index, tx-rate)

Parameters

- customize [cdp-lldp-info-column-width|hostname-column-width] <1-64>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname-column-width &lt;1-64&gt;</td>
<td>Configures default width of the hostname column in all show command outputs.</td>
</tr>
<tr>
<td>cdp-lldp-info-column-width &lt;1-64&gt;</td>
<td>Configures the column width in the show &gt; cdp/lldp &gt; [neighbor</td>
</tr>
</tbody>
</table>

- customize show-adoption-status (adopted-by, ap-name <1-64>, cdp-lldp-info, config-status, last-adoption, msgs, uptime, version)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show-adoption-status</td>
<td>Configures the information displayed in the show &gt; adoption &gt; status command output. Select the columns (information) displayed from the following options: adopted-by, ap-name, cdp-lldp-info, config-status, last-adoption, msgs, uptime, and version. These are recursive parameters and you can select multiple options at a time.</td>
</tr>
</tbody>
</table>

**Note:** The columns displayed by default are: Device-Name, Version, Config-Status, MSGS, Adopted-By, Last-Adoption, and Uptime.

**Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- customize show-wireless-client (ap-name <1-64>, auth, client-identity <1-32>, bss, enc, hostname <1-64>, ip, last-active, location <1-64>, mac, radio-alias <3-67>, radio-id, radio-type, role <1-32>, state, username <1-64>, vendor, vlan, wlan)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show-wireless-client</td>
<td>Customizes the show &gt; wireless &gt; client command output.</td>
</tr>
</tbody>
</table>

**Note:** The columns displayed by default are: MAC, IPv4, Vendor, Radio-ID, WLAN. VLAN, and State.

- ap-name <1-64> | Includes the ap-name column, which displays the name of the AP with which this client associates. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth</td>
<td>Includes the auth column, which displays the authorization protocol used by the wireless client.</td>
</tr>
</tbody>
</table>

- client-identity <1-32> | Includes the client-identity (device type) column, which displays details gathered from DHCP device fingerprinting feature (when enabled). For more information, see client-identity. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bss</td>
<td>Includes the BSS column, which displays the BSS ID the wireless client is associated with.</td>
</tr>
</tbody>
</table>
Includes the enc column, which displays the encryption suite used by the wireless client

Includes the hostname column, which displays the wireless client’s hostname

- <1-64> – Sets the hostname column width from 1 - 64 characters

Includes the IP column, which displays the wireless client’s current IP address

Includes the last-active column, which displays the time of last activity seen from the wireless client

Includes the location column, which displays the location of the client’s associated access points

- <1-64> – Sets the location column width from 1 - 64 characters

Includes the MAC column, which displays the wireless client’s MAC address

Includes the radio-alias column, which displays the radio alias with the AP’s hostname and radio interface number in the “HOSTNAME:RX” format

- <3-64> – Sets the radio-alias column width from 3 - 67 characters

Includes the radio-id column, which displays the radio ID with the AP’s MAC address and radio interface number in the “AA-BB-CC-DD-EE-FF:RX” format

Includes the radio-type column, which displays the wireless client’s radio type

Includes the role column, which displays the client’s role

- <1-32> – Sets the role column width from 1 - 32 characters

Includes the state column, which displays the wireless client’s current availability state

Includes the username column, which displays the wireless client’s username

- <1-64> – Specify the username column width from 1 - 64 characters.

Includes the VLAN column, which displays the wireless client’s assigned VLAN

Includes the WLAN column, which displays the wireless client’s assigned WLAN

- customize show-wireless-client-stats (hostname <1-64>, mac, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput)

Customizes the show > wireless > client > statistics command output

Note: The columns displayed by default are: MAC, Tx bytes, RX bytes, Tx pkts, Rx pkts, and Tx bps, RX bps, T-Index, and Dropped pkts.

Includes the hostname column, which displays the wireless client’s hostname

- <1-64> – Sets the hostname column width from 1 - 64 characters

Includes the MAC column, which displays the wireless client’s MAC address

Includes the rx-bytes column, which displays the total number of bytes received by the wireless client

Includes the rx-error column, which displays the total number of errors received by the wireless client
<table>
<thead>
<tr>
<th>Customization</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rx-packets</td>
<td>Includes the rx-packets column, which displays the total number of packets received by the wireless client</td>
</tr>
<tr>
<td>rx-throughput</td>
<td>Includes the rx-throughput column, which displays the receive throughput at the wireless client</td>
</tr>
<tr>
<td>t-index</td>
<td>Includes the t-index column, which displays the traffic utilization index at the particular wireless client</td>
</tr>
<tr>
<td>tx-bytes</td>
<td>Includes the tx-bytes column, which displays the total number of bytes transmitted by the wireless client</td>
</tr>
<tr>
<td>tx-dropped</td>
<td>Includes the tx-dropped column, which displays the total number of dropped packets by the wireless client</td>
</tr>
<tr>
<td>tx-packets</td>
<td>Includes the tx-packets column, which displays the total number of packets transmitted by the wireless client</td>
</tr>
<tr>
<td>tx-throughput</td>
<td>Includes the tx-throughput column, which displays the transmission throughput at the wireless client</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Higher values indicate better RF quality.</td>
</tr>
</tbody>
</table>

**custom show-wireless-client-stats-rf (average-retry-number, error-rate, host-name <1-64>, mac, noise, q-index, rx-rate, signal, snr, tx-rate)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>average-retry-number</td>
<td>Includes the average-retry-number column, which displays the average number of retransmissions made per packet</td>
</tr>
<tr>
<td>error-rate</td>
<td>Includes the error-rate column, which displays the rate of error for the wireless client</td>
</tr>
<tr>
<td>hostname &lt;1-64&gt;</td>
<td>Includes the hostname column, which displays the wireless client's hostname</td>
</tr>
<tr>
<td></td>
<td>• &lt;1-64&gt; – Sets the hostname column width from 1 - 64 characters</td>
</tr>
<tr>
<td>mac</td>
<td>Includes the MAC column, which displays the wireless client’s MAC address</td>
</tr>
<tr>
<td>noise</td>
<td>Includes the noise column, which displays the noise (in dBm) as detected by the wireless client</td>
</tr>
<tr>
<td>q-index</td>
<td>Includes the q-index column, which displays the RF quality index</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Higher values indicate better RF quality.</td>
</tr>
<tr>
<td>rx-rate</td>
<td>Includes the rx-rate column, which displays the receive rate at the particular wireless client</td>
</tr>
<tr>
<td>signal</td>
<td>Includes the signal column, which displays the signal strength (in dBm) at the particular wireless client</td>
</tr>
<tr>
<td>snr</td>
<td>Includes the snr column, which displays the signal to noise (SNR) ratio (in dB) at the particular wireless client</td>
</tr>
<tr>
<td>tx-rate</td>
<td>Includes the tx-rate column, which displays the packet transmission rate at the particular wireless client</td>

</table>
show-wireless-meshpoint-accelerated-multicast (ap-hostname, group-addr, mesh-name, neighbor-hostname, neighbor-ifid, radio-alias, radio-id, radio-mac, subscriptions)

Configures the information displayed in the `show > wireless > meshpoint > accelerated multicast` command output. Select the columns (information) displayed from the following options: ap-hostname, group-addr, mesh-name, neighbor-hostname, neighbor-ifid, radio-alias, radio-id, radio-mac, subscriptions. These are recursive parameters and you can select multiple options at a time.

**Note:** The columns displayed by default are: Mesh, Radio, Neighbor-IFID, Neighbor-Hostname, Group-MAC, and Subscriptions.

show-wireless-meshpoint (ap-mac, cfg-as-root, hops, hostname <1-64>, interface-ids, is-root, mesh-name <1-64>, mpid, next-hop-hostname <1-64>, next-hop-ifid, next-hop-use-time, path-metric, root-bound-time, root-hostname <1-64>, root-mpid)

Customizes the `show > wireless > meshpoint` command output

**Note:** The columns displayed by default are: Mesh, Hostname, Hops, Is-Root, Config-As-Root, Root-Hostname, Root-Bound-Time, Path-Metric, Next-Hop-Hostname, and Next-Hop-Use-Time.

<table>

**customise show-wireless-mint-client (client-alias <1-64>,client-bss, portal-alias <1-64>,portal-bss,up-time)**

**show-wireless-mint-client** | Configures the information displayed in the `show > wireless > mint > client` command output. Select the columns (information) displayed from the following options: client-alias, client-bss, portal-alias, portal-bss, and up-time. These are recursive parameters and you can select multiple options at a time.  
  **Note:** The columns displayed by default are: Portal, Portal-Radio-MAC, Client, Client-Radio-MAC, and Up-Time. |

**customise show-wireless-mint-client-stats (client-alias <1-64>,portal-alias <1-64>, portal-bss,rx-bytes,rx-errors,rx-packets,rx-throughput,t-index,tx-bytes,tx-dropped,tx-packets,tx-throughput)**

**show-wireless-mint-client-stats** | Configures the information displayed in the `show > wireless > mint > client > statistics` command output. Select the columns (information) displayed from the following options: client-alias, portal-alias, portal-bss, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput. These are recursive parameters and you can select multiple options at a time.  
  **Note:** The columns displayed by default are: Portal, Portal-Radio-MAC, Client, Tx bytes, Rx bytes, Tx pkts, Rx pkts, TX (bps), Rx (bps), T-Index (%), and Dropped pkts.  
  **Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width. |

**customise show-wireless-mint-client-stats-rf (average-retry-number, client-alias <1-64>,error-rate,noise,portal-alias <1-64>,portal-bss,q-index,rx-rate,signal,snr,tx-rate)**

**show-wireless-mint-client-stats-rf** | Configures the information displayed in the `show > wireless > mint > client > statistics > rf` command output. Select the columns (information) displayed from the following options: average-retry-number, client-alias, error-rate, noise, portal-alias, portal-bss, q-index, rx-rate, signal, snr, and tx-rate. These are recursive parameters and you can select multiple options at a time.  
  **Note:** The columns displayed by default are: MAC, Signal (dBm), Noise (dBm), SNR (dB), Tx-Rate (Mbps), Rx-rate (Mbps), Retry Avg, Errors (pps), and Q-Index (%).  
  **Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.
- customize `show-wireless-mint-portal` *(client-alias <1-64>,client-bss, portal-alias <1-64>,portal-bss,up-time)*

  Configures the information displayed in the `show > wireless > mint > portal` command output. Select the columns (information) displayed from the following options: client-alias, client-bss, portal-alias, portal-bss, and up-time. These are recursive parameters and you can select multiple options at a time.

  **Note:** The columns displayed by default are: Client, Client-Radio-MAC, Portal, Portal-Radio-MAC, and Up-Time.

  **Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- customize `show-wireless-mint-portal-stats` *(client-alias <1-64>,client-bss,portal-alias <1-64>,rx-bytes,rx-errors,rx-packets,rx-throughput,t-index,tx-bytes,tx-dropped,tx-packets,tx-throughput)*

  Configures the information displayed in the `show > wireless > mint > portal > statistics` command output. Select the columns (information) displayed from the following options: client-alias, client-bss, portal-alias, rx-bytes, rx-errors, rx-packets, rx-throughput, t-index, tx-bytes, tx-dropped, tx-packets, tx-throughput. These are recursive parameters and you can select multiple options at a time.

  **Note:** The columns displayed by default are: Client, Client-Radio-MAC, Portal, Tx bytes, Rx bytes, TX pkts, Rx pkts, TX (bps), Rx (bps), T-Index (%), and Dropped pkts.

  **Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- customize `show-wireless-mint-portal-stats-rf` *(average-retry-number, client-alias <1-64>,client-bss,error-rate,noise,portal-alias <1-64>,q-index,rx-rate,signal,snr,tx-rate)*

  Configures the information displayed in the `show > wireless > mint > portal > statistics > rf` command output. Select the columns (information) displayed from the following options: average-retry-number, client-alias, client-bss, error-rate, noise, portal-alias, q-index, rx-rate, signal, snr, tx-rate. These are recursive parameters and you can select multiple options at a time.

  **Note:** The columns displayed by default are: Client, Client-Radio-MAC, Portal, Signal (dBm), Nosie (dBm), SNR (dB), Tx-Rate (Mbps), Rx-rate (Mbps), Retry Avg, Errors (pps), and Q-Indes (%).

  **Note:** Where ever available, you can optionally use the <1-64> parameter to set the column width.

- customize `show-wireless-radio` *(adopt-to,ap-name <1-64>,channel,location <1-64>,num-clients,power,radio-alias <3-67>,radio-id,radio-mac,rf-mode,state)*

  Customizes the show wireless radio command output

- `adopt-to` Includes the adopt-to column, which displays information about the wireless controller adopting this AP

- `ap-name <1-64>` Includes the ap-name column, which displays information about the AP this radio belongs

- `<1-64>` – Sets the ap-name column width from 1 - 64 characters

- `channel` Includes the channel column, which displays information about the configured and current channel for this radio
GLOBAL CONFIGURATION COMMANDS  4 - 131

- location <1-64>  Includes the location column, which displays the location of the AP this radio belongs
  •  <1-64>  – Sets the location column width from 1 - 64 characters

- num-clients  Includes the num-clients column, which displays the number of clients associated with this radio

- power  Includes the power column, which displays the radio's configured and current transmit power

- radio-alias <3-67>  Includes the radio-alias column, which displays the radio's alias (combination of AP’s hostname and radio interface number in the “HOSTNAME:RX” format)
  •  <3-67>  – Sets the radio-alias column width from 3 - 67 characters

- radio-id  Includes the radio-id column, which displays the radio’s ID (combination of AP’s MAC address and radio interface number in the “AA-BB-CC-DD-EE-FF:RX” format)

- radio-mac  Includes the radio-mac column, which displays the radio’s base MAC address

- rf-mode  Includes the rf-mode column, which displays the radio’s operating mode. The radio mode can be 2.4 GHz, 5.0 GHz, or sensor.

- state  Includes the state column, which displays the radio’s current operational state

•  customize show-wireless-radio-stats (radio-alias <3-67>,radio-id,radio-mac,
  rx-bytes,rx-errors,rx-packets,rx-throughput,tx-bytes,tx-dropped,tx-packets,
  tx-throughput)  

- show-wireless-radio-stats  Customizes the show wireless radio statistics command output

- radio-alias <3-67>  Includes the radio-alias column, which displays the radio’s alias (combination of AP’s hostname and radio interface number in the “HOSTNAME:RX” format)
  •  <3-67>  – Sets the radio-alias column width from 3 - 67 characters

- radio-id  Includes the radio-id column, which displays the radio’s ID (combination of AP’s MAC address and radio interface number in the “AA-BB-CC-DD-EE-FF:RX” format)

- radio-mac  Includes the radio-mac column, which displays the radio’s base MAC address

- rx-bytes  Includes the rx-bytes column, which displays the total number of bytes received by the radio

- rx-errors  Includes the rx-error column, which displays the total number of errors received by the radio

- rx-packets  Includes the rx-packets column, which displays the total number of packets received by the radio

- rx-throughput  Includes the rx-throughput column, which displays the receive throughput at the radio

- tx-bytes  Includes the tx-bytes column, which displays the total number of bytes transmitted by the radio

- tx-dropped  Includes the tx-dropped column, which displays the total number of packets dropped by the radio

- tx-packets  Includes the tx-packets column, which displays the total number of packets transmitted by the radio

- tx-throughput  Includes the tx-throughput column, which displays the transmission throughput at the radio
customize show-wireless-radio-stats-rf (average-retry-number, error-rate, noise, q-index, radio-alias <3-67>, radio-id, radio-mac, rx-rate, signal, snr, t-index, tx-rate)

<table>

4.1.34 device

Global Configuration Commands

Enables simultaneous configuration of multiple devices

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

device {containing|filter}

device {containing <STRING>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|t5|vX9000]}

device {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|t5|vX9000]}

Parameters

- device {containing <STRING>} {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|t5|vX9000]}

- device containing <STRING>
  
  Enters a device’s configuration mode. Use this command to simultaneously configure devices having similar configuration.

  containing <STRING>
  
  Optional. Configures the string to search for in the device’s hostname. All devices having hostnames containing the string specified here are filtered, and can be configured simultaneously.
  - <STRING> – Specify the string to search for in the device’s hostname.

- filter type <DEVICE-TYPE>
  
  Optional. Filters out a specific device type. After specifying the hostname string, select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600, t5, and VX9000 (V-WLC).
  
  Note: The t5 option is applicable only on the RFS7000, NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, and NX9600 platforms.
  
  Note: The VX9000 option is applicable only to the NX9000, NX9500, NX9510, and NX9600 platforms.

- device {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|t5|vX9000]}

- device
  
  Configures a basic device profile
GLOBAL CONFIGURATION COMMANDS

GLOBAL CONFIGURATION COMMANDS

Examples

rfs7000-6DCD4B(config)#device filter type ap81xx

Related Commands

no

Removes multiple devices from the network
4.1.35 device-categorization

Global Configuration Commands

Categorizes devices as sanctioned or neighboring. Categorization of devices enables quick identification and blocking of unsanctioned devices in the network.

The following table summarizes the device categorization mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>device-categorization</td>
<td>Creates a device categorization list and enters its configuration mode</td>
<td>page 4-137</td>
</tr>
<tr>
<td>device-categorization-mode commands</td>
<td>Summarizes device categorization list configuration mode commands</td>
<td>page 4-138</td>
</tr>
</tbody>
</table>
4.1.35.1 device-categorization

Configures a device categorization list

Proper classification and categorization of devices (access points, clients etc.) helps suppress unnecessary unauthorized access point alarms, allowing network administrators to focus on alarms on devices actually behaving in a suspicious manner. An intruder with a device erroneously authorized could potentially perform activities that harm your organization.

Authorized access points and clients are generally known to you and conform with your organization’s security policies. Unauthorized devices are those detected as interoperating within the network, but are not approved. These devices should be filtered to avoid jeopardizing the data within a managed network. Use this command to apply the neighboring and sanctioned (approved) filters on peer devices operating within a wireless controller or access point’s radio coverage area. Detected client MAC addresses can also be filtered based on their classification.

If a device categorization list does not exist, it is created.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>

Parameters

- device-categorization <DEVICE-CATEGORIZATION-LIST-NAME>

| <DEVICE-CATEGORIZATION-LIST-NAME> | Specify the device categorization list name. If a list with the same name does not exist, it is created. |

Examples

rfs7000-37FABE(config)#device-categorization rfs7000
rfs7000-37FABE(config-device-categorization-rfs7000)#?
Device Category Mode commands:
  - mark-device: Add a device
  - no: Negate a command or set its defaults
  - clrscr: Clears the display screen
  - commit: Commit all changes made in this session
  - do: Run commands from Exec mode
  - end: End current mode and change to EXEC mode
  - exit: End current mode and down to previous mode
  - help: Description of the interactive help system
  - revert: Revert changes
  - service: Service Commands
  - show: Show running system information
  - write: Write running configuration to memory or terminal

rfs7000-37FABE(config-device-categorization-rfs7000)#

</tr>
</tbody>
</table>
4.1.35.2.1 mark-device

device-categorization-mode commands

Adds a device to the device categorization list as sanctioned or neighboring. Devices are further classified as AP or client.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

mark-device <1-1000> [sanctioned|neighboring] [ap|client]
mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}
mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}

Parameters

- mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC>|ssid <SSID> {mac <MAC>}}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-1000&gt;</td>

</tr>
<tr>
<td>sanctioned</td>
<td>Marks a device as sanctioned. A sanctioned device is authorized to use network resources.</td>
</tr>
<tr>
<td>neighboring</td>
<td>Marks a device as neighboring. A neighboring device is a neighbor in the same network as this device.</td>
</tr>
</tbody>
</table>
| ap {mac <MAC>|ssid <SSID>} | Marks a specified AP as sanctioned or neighboring based on its MAC address or SSID  
  - mac <MAC> – Optional. Specify the AP's MAC address  
  - ssid <SSID> – Optional. Specify the AP's SSID. After specifying the SSID, you can optionally specify its MAC SSID.  
  Note: All APs are marked if no specific MAC address or SSID is provided. |
| client {mac <MAC>} | Marks a specified wireless client as sanctioned or neighboring based on its MAC address  
  - mac <MAC> – Optional. Specify the wireless client's MAC address. |

Examples

rfs7000-37FABE(config-device-categorization-rfs7000)#mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#show context
device-categorization rfs7000  
mark-device 1 sanctioned ap mac 11-22-33-44-55-66

4.1.35.2.2 no

device-categorization-mode commands

Removes a device from the device categorization list

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9600

Syntax

no mark-device <1-1000> [neighboring|sanctioned] [ap|client]  
no mark-device <1-1000> [sanctioned|neighboring] client {mac <MAC>}  
no mark-device <1-1000> [sanctioned|neighboring] ap {mac <MAC> | ssid <SSID> {mac <MAC>}}

Parameters

- no <PARAMETERS>

Examples

The following example shows the device categorization list ‘rfs7000’ settings before the ‘no’ command is executed:

```plaintext
rfs7000-37FABE(config-device-categorization-rfs7000)#show context device-categorization rfs7000
mark-device 1 sanctioned ap mac 11-22-33-44-55-66
rfs7000-37FABE(config-device-categorization-rfs7000)#
```

The following example shows the device categorization list ‘rfs7000’ settings after the ‘no’ command is executed:

```plaintext
rfs7000-37FABE(config-device-categorization-rfs7000)#show context device-categorization rfs7000
rfs7000-37FABE(config-device-categorization-rfs7000)#no mark-device 1 sanctioned ap mac 11-22-33-44-55-66
```

Related Commands

- **mark-device** Adds a device to a list of sanctioned or neighboring devices
4.1.36 dhcp-server-policy

Configures DHCPv4 server policy parameters, such as class, address range, and options. A new policy is created if it does not exist.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dhcp-server-policy <DHCP-SERVER-POLICY-NAME>

**Parameters**

- dhcp-server-policy <DHCP-SERVER-POLICY-NAME>

**Examples**

rfs7000-37FABE(config)#dhcp-server-policy test
rfs7000-37FABE(config-dhcp-policy-test)#?

DHCP policy Mode commands:

- bootp: BOOTP specific configuration
- dhcp-class: Configure DHCP class (for address allocation using DHCP user-class options)
- dhcp-pool: Configure DHCP server address pool
- dhcp-server: Activating dhcp server based on criteria
- no: Negate a command or set its defaults
- option: Define DHCP server option
- ping: Specify ping parameters used by DHCP Server
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

rfs7000-37FABE(config-dhcp-policy-test)#

**Related Commands**

| no | Removes an existing DHCP server policy |

**NOTE:** For more information on DHCP policy, see *Chapter 12, DHCP-SERVER-POLICY.*
4.1.37 **dhcpv6-server-policy**

**Global Configuration Commands**

Creates a DHCPv6 server policy and enters its configuration mode.

DHCPv6 is a networking protocol for configuring IPv6 hosts with IP addresses, IP prefixes, or other configuration attributes required on an IPv6 network.

DHCPv6 servers pass IPv6 network addresses to IPv6 clients. The DHCPv6 address assignment feature manages non-duplicate addresses in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple pools. Additional options, such as the default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface or on multiple interfaces, or the server can automatically find the appropriate pool.

When configured and applied to a device, the DHCPv6 server policy enables the device to function as a stateless DHCPv6 server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>
```

**Parameters**

- `dhcpv6-server-policy <DHCPv6-SERVER-POLICY-NAME>`

**Examples**

```
rfs7000-6DCD4B(config)#dhcpv6-server-policy test
rfs7000-6DCD4B(config-dhcpv6-server-policy-test)##
dhcpv6-pool Configures DHCPV6 server address pool
no Negate a command or set its defaults
option Define DHCPv6 server option
restrict-vendor-options Restrict vendor specific options to be sent in server reply
server-preference Server preference value sent in the reply, by the server to client
rfs7000-6DCD4B(config-dhcpv6-server-policy-test)##
```

**Related Commands**

- `no` Removes an existing DHCPv6 server policy
NOTE: For more information on DHCP policy, see *Chapter 12, DHCP-SERVER-POLICY*. 
4.1.38 **dns-whitelist**

*Global Configuration Commands*

Configures a DNS whitelist. A DNS whitelist is a list of domains allowed access to the network.

The following table lists DNS Whitelist configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>dns-whitelist</td>
<td>Creates a DNS whitelist and enters its configuration mode</td>
<td>page 4-146</td>
</tr>
<tr>
<td>dns-whitelist-mode</td>
<td>Summarizes DNS whitelist configuration mode commands</td>
<td>page 4-147</td>
</tr>
</tbody>
</table>
4.1.38.1 dns-whitelist

`dns-whitelist` Configures a DNS whitelist. A DNS whitelist is a list of allowed DNS destination IP addresses pre-approved to access a controller, service platform, or access point managed captive portal.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dns-whitelist <DNS-WHITELIST-NAME>

**Parameters**

- `dns-whitelist <DNS-WHITELIST-NAME>`

<table>
<thead>
<tr>
<th>&lt;DNS-WHITELIST-NAME&gt;</th>
<th>Specify the DNS whitelist name. If the whitelist does not exist, it is created.</th>
</tr>
</thead>
</table>

**Examples**

rfs7000-37FABE(config)#dns-whitelist test
rfs7000-37FABE(config-dns-whitelist-test)#?

DNS Whitelist Mode commands:
- `no` Negate a command or set its defaults
- `permit` Match a host
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

rfs7000-37FABE(config-dns-whitelist-test)#

**Related Commands**

- `no` Removes an existing DNS Whitelist
4.1.38.2 dns-whitelist-mode commands

The following table summarizes DNS Whitelist configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>permit</td>
<td>Permits a host, existing on a DNS whitelist, access to the network or captive portal</td>
<td>page 4-148</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts to default</td>
<td>page 4-149</td>
</tr>
</tbody>
</table>
### 4.1.38.2.1 permit

**dns-whitelist-mode commands**

A whitelist is a list of host names and IP addresses permitted access to the network or captive portal. This command adds a host or destination IP address to the DNS whitelist.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
permit <IPv4/IPv6/HOSTNAME> {suffix}
```

**Parameters**

- `permit <IPv4/IPv6/HOSTNAME> {suffix}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IPv4/IPv6/HOSTNAME&gt;</code></td>
<td>Adds a device to the DNS whitelist</td>
</tr>
<tr>
<td><code>&lt;IPv4/IPv6/HOSTNAME&gt;</code></td>
<td>Provide a hostname or numerical IPv4 or IPv6 address for each destination IP address or host included in the whitelist.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>A maximum of 256 entries can be made.</td>
</tr>
<tr>
<td><code>suffix</code></td>
<td>Optional. Matches any hostname or domain name including the specified name as suffix</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-dns-whitelist-test)#permit example_company.com suffix
rfs7000-37FABE(config-dns-whitelist-test)#show context
dns-whitelist test
permit example_company.com suffix
rfs7000-37FABE(config-dns-whitelist-test)#
```

**Related Commands**

- `no` Removes a DNS whitelist entry
4.1.38.2.2 no
dns-whitelist-mode commands

Removes a specified host or IP address from the DNS whitelist, and prevents it from accessing network resources

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no permit <IPv4/IPv6/HOSTNAME>

Parameters

- no permit <IPv4/IPv6/HOSTNAME>

<table>
<thead>
<tr>
<th>&lt;IPv4/IPv6/HOSTNAME&gt;</th>
<th>Removes a device from the DNS whitelist (identifies the device by its IP address or hostname)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IPv4/IPv6/HOSTNAME&gt;</td>
<td>Specify the device’s IPv4/IPv6 address or hostname.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FAEBE(config-dns-whitelist-test)#show context
dns-whitelist test
permi example company.com suffix
rfs7000-37FAEBE(config-dns-whitelist-test)#
```

```
rfs7000-37FAEBE(config-dns-whitelist-test)#no permit example_company.com
```

```
rfs7000-37FAEBE(config-dns-whitelist-test)#show context
dns-whitelist test
rfs7000-37FAEBE(config-dns-whitelist-test)#
```

Related Commands

| permit | Adds a device to the DNS whitelist |
4.1.39  **end**

- **Global Configuration Commands**

Ends and exits the current mode and moves to the PRIV EXEC mode.

The prompt changes to the PRIV EXEC mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`end`

**Parameters**

None

**Examples**

```
rfs7000-37FABE#end
rfs7000-37FABE#
```
4.1.40 event-system-policy

- **Global Configuration Commands**

Configures how events are supported. Each event can be configured individually to perform an action such as sending an e-mail or forwarding a notification.

The following table lists event system configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>event-system-policy</td>
<td>Creates an event system policy and enters its configuration mode</td>
<td>page 4-152</td>
</tr>
<tr>
<td>event-system-policy-mode</td>
<td>Summarizes event system policy configuration mode commands</td>
<td>page 4-153</td>
</tr>
</tbody>
</table>
4.1.40.1 event-system-policy

Configures a system wide events handling policy

Event system policies enable administrators to create notification mechanisms using one, some, or all of the SNMP, syslog, controller forwarding, or email notification options available to the controller or service platform. Each listed event can have customized notification settings defined and saved as part of an event policy. Thus, policies can be configured and administrated in respect to specific sets of client association, authentication or encryption, and performance events. Once policies are defined, they can be mapped to device profiles strategically as the likelihood of an event applies to particular devices.

To view an existing event system policy configuration details, use the `show > event-system-policy` command.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6522, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`event-system-policy <EVENT-SYSTEM-POLICY-NAME>`

**Parameters**

- `event-system-policy <EVENT-SYSTEM-POLICY-NAME>`

**Examples**

```
> rfs7000-37FABE(config)#event-system-policy event-testpolicy
> rfs7000-37FABE(config-event-system-policy-event-testpolicy)#?
Event System Policy Mode commands:
  event    Configure an event
  no       Negate a command or set its defaults
  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal
> rfs7000-37FABE(config-event-system-policy-event-testpolicy)#
```

**Related Commands**

`no` Removes an event system policy
4.1.40.2 event-system-policy-mode commands

The following table summarizes event system policy configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>event</td>
<td>Configures an event</td>
<td>page 4-154</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts to default</td>
<td>page 4-166</td>
</tr>
</tbody>
</table>
4.1.40.2.1 event

> event-system-policy-mode commands

Configures an event and sets the action performed when the event happens

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

event <EVENT-TYPE> <EVENT-NAME> (email,forward-to-switch,snmp,syslog) [default|on|off]

The event types are:

- aaa AAA/Radius module
- adopt-service Adoption Service
- adv-wips Adv-wips module
- ap Access Point module
- captive-portal Captive Portal
- certmgr Certificate Manager (Not valid for NCAP/MCN)
- certmgr-lite Lite version of certificate manager (NCAP & MCN) only
- cfgd Cfgd module
- cluster Cluster module
- crm Critical Resource Monitoring
- device Device module
- dhcpsvr DHCP Configuration Daemon
- diag Diag module
- dot11 802.11 management module
- dot1x 802.1X Authentication
- fwu Firmware update module
- isdn Isdn module
- l2tpv3 Layer 2 Tunneling Protocol Version 3
- licmgr License module
- mesh Mesh module
- mgmt Management Services
- nsm Network Services Module
- pm Process-monitor module
- radconf Radius Configuration Daemon
- rasst Roaming-Assist module
- radio Radio module
- smrt Smart-rf module
- smtpnot Smtpnot module
- system System module
- test Test module
- vrrp Virtual Router Redundancy Protocol
- wips Wireless IPS module

rfs7000-37FABE(config-event-system-policy-testpolicy)#

NOTE: The parameter values for <EVENT-TYPE> and <EVENT-NAME> are summarized in the table under the Parameters section.
Parameters

- `event <EVENT-TYPE> <EVENT-NAME>` (email, forward-to-switch, snmp, syslog) [default|on|off]

<table>
<thead>
<tr>
<th>&lt;event-type&gt;</th>
<th>&lt;event-name&gt;</th>
</tr>
</thead>
</table>
| aaa          | Enables and configures the logging of authentication, authorization, and accounting related event messages  
  - radius-discon-msg – RADIUS disconnection message  
  - radius-session-expired – RADIUS session expired message  
  - radius-session-not-started – RADIUS session not started message  
  - radius-vlan-update – RADIUS VLAN update message  
| adopt-services | Enables and configures the logging of adopted services related events  
| adv-wips      | Enables and configures the logging of advanced WIPS related events  
| ap            | Enables and configures the logging of AP related event messages  
  - adopted – Event AP adopted message  
  - adopted-to-controller – Event AP adopted to wireless controller message  
  - ap-adopted – Event access port adopted message  
  - ap-autoup-done – Event AP autoup done message  
  - ap-autoup-fail – Event AP autoup fail message  
  - ap-autoup-needed – Event AP autoup needed message

### 4.1.40.2.2 no

**event-system-policy-mode commands**

Negates an event monitoring configuration

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
no event <EVENT-TYPE> <EVENT-NAME> [email|forward-to-switch|snmp|syslog] [default|on|off]
```

**Parameters**

- `no <PARAMETERS>`

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes event monitoring and message forwarding activity based on the parameters passed</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>The system stops network monitoring for the occurrence of the specified event and no notification is sent if the event occurs.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config-event-system-policy-TestPolicy)#event ap adopted syslog default
rfs7000-37FABE(config-event-system-policy-TestPolicy)#no event ap adopted syslog
```

</tbody>
</table>
4.1.41.1 ex3500

Creates an EX3500 time range list and enters its configuration mode

An EX3500 time range list consists of a set of periodic and absolute time range rules. Periodic time ranges recur periodically at specified time periods, such as daily, weekly, weekends, weekdays, and on specific week days, for example on every successive Mondays. Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period (the starting and ending days and time are fixed).

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four Small Form Factor Pluggable (SFP) transceiver slots for fiber connectivity. The EX3500 series switch can adopt to a WiNG NoC controller and be managed by it. The EX3500 time range values configured here are used in EX3500 MAC ACL firewall rules that filters an EX3500’s incoming and outgoing traffic. For more information on creating EX3500 MAC ACL rules, see ex3500 and access-group.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

ex3500 time-range <TIME-RANGE-NAME>

Parameters

- ex3500 time-range <TIME-RANGE-NAME>

</tbody>
</table>
4.1.41.2.1 absolute

ex3500-time-range-config-mode commands

Configures an absolute time range rule for this EX3500 time range list

Absolute time ranges are not periodic and do not recur. They consist of a range of days during a particular time period.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037> \{end <0-23> <0-59> <1-31> \\<MONTH> \<2013-2037>\}
```

Parameters

- `absolute start <0-23> <0-59> <1-31> <MONTH> <2013-2037>`

  Configures the start day and time settings
  - `<0-23>` – Specify the start time from 0 - 23 hours.
  - `<0-59>` – Specify the start time from 0 - 59 minutes.

**Note:** For example, if the values provided are 12 hours and 30 minutes, the start time is 12:30 A.M on the specified day.
- `<1-31>` – Specify the day of month from 1 - 31 when the time range starts.
- `<MONTH>` – Specify the month. The options are: April, August, December, February, January, July, June, March, May, November, October, September.
- `<2013-2037>` – Specify the year from 2013 - 2037.

- `end <0-23> <0-59> <1-31> <MONTH> <2013-2037>`

  Optional. Configures the end day and time settings
  - `<0-23>` – Specify the end time from 0 - 23 hours.
  - `<0-59>` – Specify the end time from 0 - 59 minutes.
  - `<1-31>` – Specify the day of month from 1 - 31 when the time range ends.
  - `<MONTH>` – Specify the month. The options are: April, August, December, February, January, July, June, March, May, November, October, September.
  - `<2013-2037>` – Specify the year from 2013 - 2037.

Examples

```
nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#absolute start 1 0 1 june 2015 end 1 0 30 june 2016
```

```

```

```
absolute start 1 0 1 june 2015 end 1 0 30 june 2016
```

```
nx9500-6C8809(config-ex3500-time-range-EX3500-TimeRange-01)#
```

Related Commands

- `no`

Removes this absolute time range rule from the EX3500 time range list
### 4.1.41.2.2 periodic

**Ex3500-time-range-config-mode commands**

Configures a periodic time range rule for this EX3500 time range list.

Periodic time ranges are configured to recur based on periodicity such as daily, weekly, weekends, weekdays, and on specific week days, such as on every successive Sundays.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
periodic [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend] <0-23> <0-59> to [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend] <0-23> <0-59> rule-precedence <1-7>
```

**Parameters**

- `periodic [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend] <0-23> <0-59> to [daily|friday|monday|saturday|sunday|thursday|tuesday|wednesday|weekdays|weekend] <0-23> <0-59> rule-precedence <1-7>`

</tr>
</tbody>
</table>
4.1.42.1 ex3500-management-policy

Creates an EX3500 management policy and enters its configuration mode. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP.

The EX3500 management policy is either applied:

- Individually on an adopted EX3500 series switch (in the device configuration mode), or
- To a EX3524 and/or EX3548 profile, which is then applied to an adopted EX3500 series switch.

EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP Web agent and CLI, which in spite of being different from that of the WiNG operating system provides WiNG controllers PoE and port management resources.

Going forward NX9500, NX7500, NX6500, NX4500 WiNG managed series service platforms and WiNG VMs can discover, adopt, and partially manage EX3500 series Ethernet switches without modifying the proprietary operating system running the EX3500 switches. The WiNG service platforms utilize standardized WiNG interfaces to push configuration files to the EX3500 switches, and maintain a translation layer, understood by the EX3500 switch, for statistics retrieval.

WiNG can partially manage an EX3500 without using DHCP option 193, provided the EX3500 is directly configured to specify the IPv4 addresses of potential WiNG adopters. To identify the potential WiNG adopter, in the EX3500's device configuration mode specify the adopter’s IPv4 address using the `controller > host > <IP-ADDRESS>` command. WiNG service platforms leave the proprietary operating system running the EX3500 switches unmodified, and partially manage them utilizing standardized WiNG interfaces. WiNG service platforms use a translation layer to communicate with the EX3500.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX9500

**Syntax**

```
ex3500-management-policy <POLICY-NAME>
```

**Parameters**

- `ex3500-management-policy <POLICY-NAME>`

**Examples**

```
nx9500-6C8809(config-ex3500-management-policy-test)#?
```

EX3500 Management Mode commands:

- `enable` Modifies enable password parameters
- `http` Hyper Text Terminal Protocol (HTTP)
- `memory` Memory utilization
- `no` Negate a command or set its defaults
- `process-cpu` Process-cpu utilization
- `snmp-server` Enable SNMP server configuration
- `ssh` Secure Shell server connections
- `username` Login TACACS server port

- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
write
Write running configuration to memory or terminal

</table>
4.1.42.2.1 enable

Configures an executive password for this EX3500 management policy

Each EX3500 management policy can have a unique executive password with its own privilege level assigned. Utilize these passwords as specific EX3500 management sessions require priority over others.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
enable password [0|7|level]
```

```
enable password [0|7] <PASSWORD>
```

```
enable password level <0-15> [0 <PASSWORD>|7 <PASSWORD>]
```

Parameters

- `enable password [0|7] <PASSWORD>`
  - Creates a new executive password for this EX3500 management policy. The password could be in clear text or encrypted
    - `0` – Configures a clear text password using ASCII characters (should be 1 - 32 characters long)
    - `7` – Configures an encrypted password using HEX characters (should be 32 characters long)
    - `<PASSWORD>` – Specify the password.

- `enable password level <0-15> [0 <PASSWORD>|7 <PASSWORD>]`
  - Creates a new executive password for this EX3500 management policy and sets its privilege level
    - `<0-15>` – Specify the privilege level for this executive password from 0 - 15. Lower values have higher priority, to slot and prioritize executive passwords and EX3500 management sessions.
    - `0` – Configures a clear text password using ASCII characters (should be 1 - 32 characters long)
    - `7` – Configures an encrypted password using HEX characters (should be 32 characters long)
    - `<PASSWORD>` – Specify the password.

Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#enable password level 3 7
12345678901020304050607080929291
```

```
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
  enable password level 3 7 12345678901020304050607080929291
  snmp-server notify-filter 1 remote 127.0.0.1
```

```
nx9500-6C8809(config-ex3500-management-policy-test)#
```

Related Commands

```
no
```

Removes a executive password from this EX3500 management policy
4.1.42.2.2 http

Configures the HTTP server settings used to authenticate HTTP connection to a EX3500 switch.

Management access to an EX3500 switch can be enabled/disabled as required using separate interfaces and protocols (HTTP, SSH). Disabling un-used and insecure interfaces and unused management services can dramatically reduce an attack footprint and free resources within an EX3500 management policy.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
http [port <1-65535>|secure-port <1-65535>|secure-server|server]
```

Parameters

- **http [port <1-65535>|secure-port <1-65535>|secure-server|server**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port &lt;1-65535&gt;</td>
<td>Configures the HTTP port number. This is the port used to connect to the HTTP server.</td>
</tr>
<tr>
<td>secure-port &lt;1-65535&gt;</td>
<td>Enables secure HTTP connection over a designated secure port. Ensure that the HTTP secure server is enabled before specifying the secure-server port.</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#http secure-server
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
http secure-server
enable password level 3 7 123456789012304050607080929291
snmp-server notify-filter 1 remote 127.0.0.1
nx9500-6C8809(config-ex3500-management-policy-test)#
```

Related Commands

```
no
```

Reverts to default HTTP server settings (HTTP server enabled, HTTP port 80)
4.1.42.2.3 memory

By customizing an EX3500's memory and CPU utilization's upper and lower thresholds, you can avoid over utilization of the EX3500’s processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax
memory [falling-threshold|rising-threshold] <1-100>

Parameters
- memory [falling-threshold|rising-threshold] <1-100>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>memory falling-threshold &lt;1-100&gt;</td>
<td>Configures the falling threshold for the EX3500 memory utilization.</td>
</tr>
<tr>
<td>rising-threshold &lt;1-100&gt;</td>
<td>Configures the rising threshold for the EX3500 memory utilization.</td>
</tr>
</tbody>
</table>

Examples
nx9500-6C8809(config-ex3500-management-policy-test)#memory falling-threshold 50
nx9500-6C8809(config-ex3500-management-policy-test)#memory rising-threshold 95

Related Commands
no
Reverts the memory utilization’s falling-threshold and/or rising threshold to 70% and 90% respectively.
4.1.42.2.4 process-cpu

• ex3500-management-policy config commands

Configures the EX3500’s CPU (processor) utilization rising (upper) and falling (lower) threshold values. Once configured, the system sends a notification when the CPU utilization exceeds the specified rising limit or falls below the specified falling limit.

By customizing an EX3500’s memory and CPU utilization’s upper and lower thresholds, you can avoid over utilization of the EX3500’s processor capacity when sharing network resources with an NX series service platform or a WiNG VM.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
process-cpu [falling-threshold|rising-threshold] <1-100>
```

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>process-cpu</td>
<td>Configures the EX3500’s CPU utilization rising and falling threshold values. The system generates a notification when either of these limits is exceeded.</td>
</tr>
<tr>
<td>falling-threshold</td>
<td>Configures the falling threshold for the EX3500’s CPU utilization</td>
</tr>
<tr>
<td>&lt;1-100&gt;</td>
<td>• &lt;1-100&gt; – Specify the falling threshold as a percentage from 1 to 100. The default is 70%.</td>
</tr>
<tr>
<td>rising-threshold</td>
<td>Configures the rising threshold for the EX3500’s CPU utilization</td>
</tr>
<tr>
<td>&lt;1-100&gt;</td>
<td>• &lt;1-100&gt; – Specify the rising threshold as a percentage from 1 to 100. The default is 90%.</td>
</tr>
</tbody>
</table>

Examples

```
x9500-6C8809(config-ex3500-management-policy-test)#process-cpu falling-threshold 60
nx9500-6C8809(config-ex3500-management-policy-test)#process-cpu rising-threshold 80
nx9500-6C8809(config-ex3500-management-policy-test)#show context
ex3500-management-policy test
http secure-server
enable password level 3 7 1234567890123045067809289291

memory falling-threshold 50
memory rising-threshold 95
process-cpu falling-threshold 60
process-cpu rising-threshold 80
nx9500-6C8809(config-ex3500-management-policy-test)#
```

Related Commands

```
no
```

Reverts the CPU utilization’s falling-threshold and/or rising threshold to 70% and 90% respectively.
4.1.42.2.5 snmp-server

Configures Simple Network Management Protocol (SNMP) server settings. Once configured and applied on a EX3500 switch, the management policy controls access to the switch from management stations using SNMP.

SNMP is an application layer protocol that facilitates the exchange of management information between the management stations and a managed EX3500 switch. SNMP-enabled devices listen on port 162 (by default) for SNMP packets from the management server. SNMP uses read-only and read-write community strings as an authentication mechanism to monitor and configure supported devices. The read-only community string is used to gather statistics and configuration parameters from a supported wireless device. The read-write community string is used by a management server to set device parameters. SNMP is generally used to monitor a system's performance and other parameters.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
snmp-server {community|contact|enable|engine-id|group|host|location|notify-filter|
  user|view}

snmp-server {community <STRING> {ro|rw}}

snmp-server {contact <NAME>}

snmp-server {enable traps {authentication|link-up-down}}

snmp-server {engine-id [local <WORD>|remote <IP> <WORD>]}

snmp-server {group <GROUP-NAME> [v1|v2c|v3 [auth|noauth|priv]] {notify <WORD>|read <WORD>|write <WORD>}}

snmp-server {host <IP> [<STRING>|inform]}

snmp-server {host <IP> <STRING> version [v1|v2c|v3 [auth|noauth|priv]]
  {udp-port <1-65535>}}

snmp-server {host <IP> inform [retry <0-255>|timeout <0-2147483647>]<STRING>
  version [v2c|v3 [auth|noauth|priv]] {udp-port <1-65535>}}

snmp-server {location <WORD>}

snmp-server {notify-filter <WORD> remote <IP>}

snmp-server {user <USER-NAME> <GROUP-NAME> [remote-host|v1|v2c|v3]}

snmp-server {user <USER-NAME> <GROUP-NAME> remote-host <IP> v3 [auth|encrypted auth]
  [md5|sha] <WORD> [priv [3des|aes128|aes192|aes256|des56] <WORD>]

snmp-server {user <USER-NAME> <GROUP-NAME> v1|v2c|v3]

snmp-server {view <VIEW-NAME> <OID-TREE-STRING> [excluded|included]}
```

Parameters

- `snmp-server {community <STRING> {ro|rw}}` Optional. Configures an SNMP community access string used to authorize management access by clients using SNMP v1, v2c, or v3
- `<STRING>` — Specify the SNMP community access string (should not exceed 32 characters).
  Contd..
After specifying the string, optionally specify the access type associated with it.

- **ro** – Optional. Provides read-only access with this SNMP community string. Allows authorized clients to only retrieve *Management Information Base* (MIB) objects. This is the default setting.
- **rw** – Optional. Provides read-write access with this SNMP community string. Allows authorized clients to retrieve as well as modify MIB objects.

**Note:** You can configure a maximum of five (5) community strings per EX3500 management policy.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `snmp-server contact <NAME>` | Optional. Configures the system’s contact information.  
  - `<NAME>` – Specify the contact person’s name (should not exceed 255 characters). |
| `snmp-server enable traps {authentication|link-up-down}` | Optional. Enables/disables the EX3500 switch to send following SNMP traps or notifications:  
  - **authentication** – Optional. Enables SNMP authentication trap. This option is disabled by default.  
  - **link-up-down** – Optional. Enables SNMP link up and link down traps. This option is disabled by default.  
  **Note:** If the command is executed without either of the above mentioned trap options, the system enables both authentication and link-up-down traps.  
  **Note:** If enabling SNMP traps, use the `snmp-server > host` command to specify the host(s) receiving the SNMP notifications. |
| `snmp-server engine-id [local <WORD>|remote <IP> <WORD>]` | Optional. Configures an identification string for the SNMPv3 engine. The SNMP engine is an independent SNMP agent residing either on the logged switch or on a remote device. It prevents message replay, delay, and redirection. In SNMPv3, the engine ID in combination with user passwords generates the security keys that is used for SNMPv3 packet authentication and encryption.  
  - **local** – Configures the SNMP engine on the logged switch  
    - `<WORD>` – Specify the hexadecimal engine ID string identifying the SNMP engine (should be 9 - 64 characters in length).  
  - **remote <IP> <WORD>** – Configures a remote device as the SNMP engine  
    - `<IP>` – Specify the remote device’s IP address.  
    - `<WORD>` – Specify the hexadecimal engine ID string identifying the SNMP engine (should be 9 - 64 characters in length).  
  Configure the remote engine ID when using SNMPv3 informs. The remote ID configured here is used to generate the security digest for authentication and encryption of packets exchanged between the switch and the and the remote host user. SNMP passwords are localized using the engine ID of the authoritative agent. For informs, the authoritative SNMP agent is the remote agent. You therefore need to configure the remote agent’s SNMP engine ID before you can send proxy requests or informs to it. |
| `snmp-server group <GROUP-NAME>` | Optional. Configures an SNMP user group, mapping SNMP users to SNMP views  
  - `<GROUP-NAME>` – Specify the SNMP group name (should not exceed 32 characters). |
<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp-server {host &lt;IP&gt; &lt;STRING&gt; version [v1</td>
<td>v2c</td>
</tr>
<tr>
<td>notify &lt;WORD&gt;</td>
<td>Optional. Configures the notification view string.</td>
</tr>
<tr>
<td>read &lt;WORD&gt;</td>
<td>Optional. Configures the read view string.</td>
</tr>
<tr>
<td>write &lt;WORD&gt;</td>
<td>Optional. Configures the write view string.</td>
</tr>
<tr>
<td>snmp-server host &lt;IP&gt;</td>
<td>Configures the host(s) receiving the SNMP notifications. At least one SNMP server host should be configured in order to configure the switch to send notifications.</td>
</tr>
<tr>
<td>&lt;STRING&gt;</td>
<td>Configures the SNMP community string. You can configure the SNMP community string here, or else use the string configured using the `snmp-server &gt; community &lt;STRING&gt; &gt; {ro</td>
</tr>
<tr>
<td>udp-port &lt;1-65535&gt;</td>
<td>Optional. After specifying the SNMP version, optionally specify the host UDP port.</td>
</tr>
</tbody>
</table>

- **notify <WORD>**
  - Optional. Configures the notification view string.
  - `<WORD>` – Specify the string (should not exceed 32 characters).

- **read <WORD>**
  - Optional. Configures the read view string.
  - `<WORD>` – Specify the string (should not exceed 32 characters).

- **write <WORD>**
  - Optional. Configures the write view string.
  - `<WORD>` – Specify the string (should not exceed 32 characters).

- **snmp-server host <IP>**
  - Optional. Configures the host(s) receiving the SNMP notifications. At least one SNMP server host should be configured in order to configure the switch to send notifications.
  - `<IP>` – Specify the SNMP host’s IP address.
  - **Note:** You can configure a maximum of five (5) SNMP trap recipients per EX3500 management policy.

- **<STRING>**
  - Configures the SNMP community string. You can configure the SNMP community string here, or else use the string configured using the `snmp-server > community <STRING> > {ro|rw}` command. It is recommended that you configure the SNMP community string prior to configuring the SNMP host.
  - `<STRING>` – Specify the community string. The string configured here is sent in the SNMP traps to the SNMPv1 or SNMPv2c hosts.

- **udp-port <1-65535>**
  - Optional. After specifying the SNMP version, optionally specify the host UDP port.
  - `<1-65535>` – Specify the UDP port. The default is 162.
**snmp-server {host <IP> inform [retry <0-255>][timeout <0-2147483647>][version [v2c|v3 [auth|noauth|priv]] [udp-port <1-65535>]]}

<table>

<td>noauth</td>
</tr>
<tr>
<td>udp-port &lt;1-65535&gt;</td>
<td>Optional. After specifying the SNMP version, optionally specify the host UDP port.</td>
</tr>
<tr>
<td>snmp-server location &lt;WORD&gt;</td>
<td>Optional. Configures the EX3500's location string.</td>
</tr>
</tbody>
</table>

**Note:**
- You can configure a maximum of five (5) SNMP trap recipients per EX3500 management policy.
- Ensure that SNMP trap notification is enabled.
- SNMP inform messages are not supported on SNMP v1.
- snmp-server {notify-filter <WORD> remote <IP>}
  
  snmp-server notify-filter <WORD>
  - Optional. Modifies the SNMP server's notify filter
    - <WORD> – Specify the SNMP notify-filter name.

  remote <IP>
  - Optional. Configures the remote host's IP address
    - <IP> – Specify the IP address in the A.B.C.D format.

- snmp-server {user <USER-NAME> <GROUP-NAME> remote <IP> v3 {auth|encrypted auth} [md5|sha] <WORD> {priv [3des|aes128|aes192|aes256|aes56] <WORD>}

  snmp-server user <USER-NAME> <GROUP-NAME>
  - Optional. Configures the name of the SNMP user (connecting to the SNMP agent) and adds the user to an existing SNMP group. It also specifies the SNMP version type used. In case of SNMP version 3, this command also configures the remote host's IP address and the authentication type used.
    - <USER-NAME> – Specify the user's name (should not exceed 32 characters).
    - <GROUP-NAME> – Specify the SNMP group name to which this user is assigned.

  remote <IP> v3
  - Configures the remote host on which the SNMPv3 engine is running
    - <IP> – Specify the remote host's IP address.

  Note: This option is available only for SNMPv3 engine.
  After configuring the remote host, optionally configure the authentication type and the corresponding authentication password used.

  {auth|encrypted auth} [md5|sha] <WORD> {priv [3des|aes128|aes192|aes256|aes56] <WORD>}
  - Optional. Configures authentication and encryption settings
    - auth – Specifies the authentication type used and configures the authentication password
    - encrypted – Enables encryption. When enabled all communications between the user and the SNMP engine are encrypted. After enabling encryption, specify the authentication type and configure the authentication password.

  The following parameters are common to the 'auth' and 'encrypted' keywords:
  - md5 – Uses MD5 to authenticate the user
  - sha – Uses SHA to authenticate the user

  The following parameter is common to the 'md5' and 'sha' keywords:
  - <WORD> – Specify the authentication password.

  Note: If the ‘encrypted’ option is not being used, enter an 8 - 40 characters ASCII password. Whereas, in case of an encrypted password enter a HEX characters password of 32 characters.
  - priv – Optional. Uses SNMPv3 with privacy. Select one of the privacy options: des, aes128, aes192, aes256, des56
    - <WORD> – Configures the privacy password. If the ‘encrypted’ option is not being used, enter an 8 - 40 characters long ASCII password. Whereas, the encrypted password should be 32 HEX characters.

- snmp-server {user <USER-NAME> <GROUP-NAME> [v1|v2c|v3]}
  - Optional. Configures the name of the SNMP user (connecting to the SNMP agent) and adds the user to an existing SNMP group. It also specifies the SNMP version type used. In case of SNMPv3, this command also configures the authentication type used and the enables encryption.
    - <USER-NAME> – Specify the user's name (should not exceed 32 characters).
    - <GROUP-NAME> – Specify the SNMP group name to which this user is assigned.

Contd..
### snmp-server {view <VIEW-NAME> <OID-TREE-STRING> [excluded|included]}

- Optional. Creates an SNMP view. SNMP views are used to control user access to the MIB.
- `<VIEW-NAME>` – Provide a name for this SNMP view (should not exceed 32 characters).

This command configures the object identifier (OID) of a branch within the MIB tree.

- ***excluded*** – Specifies an excluded view
- ***included*** – Specifies an included view

### Examples

4.1.42.2.6 ssh

ex3500-management-policy config commands

Configures the SSH server settings used to authenticate Secure Shell (SSH) connection to a EX3500 switch.

Management access to an EX3500 switch can be enabled/disabled as required using separate interfaces and protocols (HTTP, SSH). Disabling un-used and insecure interfaces and unused management services can dramatically reduce an attack footprint and free resources within an EX3500 management policy.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

ssh [authentication-retries <1-5>|server|server-key size <512-1024>|timeout <1-120>]

Parameters

- ssh [authentication-retries <1-5]|server|server-key size <512-1024]|timeout <1-120>]

Related Commands

- no

Disables SSH management access to an EX3500 switch.
4.1.42.2.7 username

Configures a EX3500 switch user settings

The EX3500 switch user details are stored in a local database on the NX9500, NX7500, NX6500, NX4500 or WiNG VM. You can configure multiple users, each having a unique name, access level, and password.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

username <USER-NAME> [access-level <0-15>|nopassword|password [0|7] <PASSWORD>]

Parameters

- **username <USER-NAME> [access-level <0-15>|nopassword|password [0|7] <PASSWORD>**
  - **username** <USER-NAME> — Specify the user name (should not exceed 32 characters)
  - **access-level <0-15>** — Specify the access level from 0 - 15. The default is 0.
  - **nopassword** — Allows user to login without a password
  - **password [0|7] <PASSWORD>** — Configures the password for this user
    - 0 — Configures a plain text password
    - 7 — Configures an encrypted password (should be 32 characters in length)

Examples

```
nx9500-6C8809(config-ex3500-management-policy-test)#username user1 access-level 5
nx9500-6C8809(config-ex3500-management-policy-test)#username user1 password 0 user1@1234
nx9500-nx9500-6C8809(config-ex3500-management-policy-test)#show context
```

</tbody>
</table>
4.1.43.1 ex3500-qos-class-map-policy

Creates a EX3500 Quality of Service (QoS) class map policy and enters its configuration mode

A QoS class map policy contains a set of Differentiated Services (DiffServ) classification criteria that are used to classify incoming traffic into different category and provide differentiated service based on this classification. Each policy defines a set match criteria rules that use objects, such as access lists, IP precedence or DSCP values, and VLANs. When configured and applied, the policy classifies traffic based on layer 2, layer 3, or layer 4 information contained in each incoming packet.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

`ex3500-qos-class-map-policy <POLICY-NAME>`

**Parameters**

- `ex3500-qos-class-map-policy <POLICY-NAME>`

| <POLICY-NAME> | Specify the EX3500 QoS class map policy name. If the policy does not exist, it is created. |

**Examples**

```
x9500-6C8809(config)#ex3500-qos-class-map-policy dscp
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#?
```

EX3500_Qos_class_map Mode commands:

- `description` Class-map description
- `match` Defines the match criteria to classify traffic
- `no` Negate a command or set its defaults
- `rename` Redefines the name of class-map
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
x9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#
```

**Related Commands**

- `no` Removes an existing EX3500 QoS class map policy
## 4.1.43.2 ex3500-qos-class-map-policy config commands

</tbody>
</table>
4.1.43.2.1 description

Configures this EX3500 QoS class map policy's description

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax
description <LINE>

Parameters
- description <LINE>

<table>
<thead>
<tr>
<th>description &lt;LINE&gt;</th>
<th>Configures this EX3500 QoS class map policy's description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;LINE&gt; — Enter a description that allows you to differentiate it from other policies with similar configuration (should not exceed 64 characters)</td>
</tr>
</tbody>
</table>

Examples
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#description "Matches packets marked for DSCP service 3"
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context
ex3500-qos-class-map-policy dscp
description "Matches packets marked for DSCP service 3"
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#

Related Commands

| no | Removes this EX3500 QoS class map policy's description |
4.1.43.2.2 match

Configures match criteria rules used to classify traffic.

Access lists, IP precedence, DSCP values, or VLANs are commonly used to classify traffic. Access lists select traffic based on layer 2, layer 3, or layer 4 information contained in each packet.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
match [access-list \[ex3500-ext-access-list|ex3500-std-access-list|mac-acl\] <ACL-NAME>|cos <0-7>|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]
```

Parameters

- **match** [access-list \[ex3500-ext-access-list|ex3500-std-access-list|mac-acl\] <ACL-NAME>|cos <0-7>|ip [dscp <0-63>|precedence <0-7>]|ipv6 dscp <0-63>|vlan <1-4094>]

  **Note:** Incoming packets matching the specified criteria are included in this QoS class map.

- access-list \[ex3500-ext-access-list|ex3500-std-access-list|mac-acl\] <ACL-NAME>
  - Uses access lists to provide the match criteria. You can use any one the following ACL types to classify traffic:
    - ex3500-ext-access-list – Uses an IPv4 EX3500 extended ACL
    - ex3500-std-access-list – Uses an IPv4 EX3500 standard ACL
    - mac-acl – Uses a MAC EX3500 ACL
  
  The following keyword is common to all of the above ACL types:
  - <ACL-NAME> – Specify the ACL name (should be existing and configured).

- cos <0-7>
  - Configures the class of service (CoS) value used to apply user priority. CoS is a form of QoS applicable only to layer 2 Ethernet frames. It uses 3-bits (8 values) of the 802.1Q tag to differentiate and shape network traffic.
  - <0-7> – Specify the CoS value from 0 - 7.

  Following are the 8 traffic classes based on the CoS value:
  - 000 (0) - Routine
  - 001 (1) - Priority
  - 010 (2) - Immediate
  - 011 (3) - Flash
  - 100 (4) - Flash Override
  - 101 (5) - Critical
  - 110 (6) - Internetwork Control
  - 111 (7) - Network Control

- ip [dscp <0-63>|precedence <0-7>]
  - Configures the IPv4 DSCP value to match and/or the IP precedence value to match.
    - <0-63> – Specify the DSCP value from 0 - 63. Use this option to specify the **type of service** (ToS) field values included in the IP header. The ToS field exists between the header length and the total length fields. The DSCP constitutes the first 6 bits of the ToS field.

Contd...
### Usage Guidelines

When configuring match entries, take into consideration the following points:

- Deny rules included in an ACL (associated with a EX3500 QoS class map policy) are ignored whenever an incoming packet matches the ACL.
- A class map policy cannot include both IP ACL or IP precedence rule and a VLAN rule.
- A class map policy containing a MAC ACL or VLAN rule cannot include either an IP ACL or a IP precedence rule.
- A class map policy can include a maximum of 16 match entries.

### Examples

```bash
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#match ip dscp 3
```

```bash
nx9500-6C8809(config-ex3500-qos-class-map-policy-dscp)#show context ex3500-qos-class-map-policy-dscp
description "Matches packets marked for DSCP service 3"
match ip dscp 3
```

```bash
nx9500-6C8809(config-ex3500-qos-class-map-policy-test2)#match ip precedence 1
```

</tr>
</tbody>
</table>
4.1.44.1 **ex3500-qos-policy-map**

![ex3500-qos-policy-map](image)

Creates a EX3500 policy map and enters its configuration mode

An EX3500 policy map contains one or more EX3500 QoS class mapstraffic classifications (existing and configured) and can be attached to multiple interfaces. Creates a EX3500 policy map, and then use the **class** parameter to configure policies for traffic that matches the criteria defined in the EX3500 QoS class map policy. For more information see, **match**.

Supported in the following platforms:

- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>
```

**Parameters**

- **ex3500-qos-policy-map <EX3500-QOS-POLICY-MAP-NAME>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specify the EX3500 policy map's name</td>
</tr>

4.1.44.2.1 class

*ex3500-qos-policy-map config commands*

Creates a policy map class and enters its configuration mode. The policy map class is a traffic classification upon which a policy can act.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

**Syntax**

```
class <EX3500-QoS-CLASS-MAP-POLICY-NAME>
```

**Parameters**
- `class <EX3500-QoS-CLASS-MAP-POLICY-NAME>`

**Examples**

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap)#class dscp
```

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#?
```

```
commands:
- no       Negate a command or set its defaults
- police   Defines a policer for classified traffic
- set      Classify IP traffic
- clrscr   Clears the display screen
- commit   Commit all changes made in this session
- do       Run commands from Exec mode
- end      End current mode and change to EXEC mode
- exit     End current mode and down to previous mode
- help     Description of the interactive help system
- revert   Revert changes
- service  Service Commands
- show     Show running system information
- write    Write running configuration to memory or terminal
```

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#
```

4.1.44.2.3 police

Ex3500-qos-policy-map-class-config commands

Configures an enforcer for classified traffic

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

police [flow|srtcm-color-aware|srtcm-color-blind|trtcm-color-aware|trtcm-color-blind]

police flow <0-1000000> <0-16000000> conform-action transmit violate-action [<0-63>|drop]

police [srtcm-color-aware|srtcm-color-blind] <0-1000000> <0-16000000> <0-16000000> conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]

police [trtcm-color-aware|trtcm-color-blind] <0-1000000> <0-16000000> <0-1000000> <0-16000000> conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]

Parameters

- police flow <0-1000000> <0-16000000> conform-action transmit violate-action [<0-63>|drop]

<table>
<thead>
<tr>
<th>command</th>
<th>Description</th>
</tr>
</thead>

</tr>
<tr>
<td>conform-action</td>
<td>Configures the committed information rate (CIR) from 0 -1000000 kilobits per second.</td>
</tr>
<tr>
<td>transmit</td>
<td>Transmits packets falling within the specified CIR and BC limits. This is subject to the fact that are enough tokens to service the packet, in which case the packet is set green.</td>
</tr>
<tr>
<td>[0-63]</td>
<td>drop</td>
</tr>
<tr>
<td>violate-action [0-63]</td>
<td>drop</td>
</tr>
</tbody>
</table>

Policing is based on a token bucket, where bucket depth (i.e., the maximum burst before the bucket overflows) is specified by the committed-burst field, and the average rate tokens are added to the bucket is specified by the committed-rate option. Note that the token bucket functions similar to that described in RFC 2697 and RFC 2698.

The behavior of the meter is specified in terms of one token bucket (C), the rate at which the tokens are incremented CIR and the maximum size of the token bucket BC.

The token bucket C is initially full, that is, the token count Tc(0) = BC. Thereafter, the token count Tc is updated CIR times per second as follows:

- If Tc is less than BC, Tc is incremented by one, else
- Tc is not incremented.

When a packet of size B bytes arrives at time t, the following happens:

- If Tc(t)-B > OR = 0, the packet is green and Tc is decremented by B down to the minimum value of 0, else
- The packet is red and Tc is not decremented.
police [srtcm-color-aware|srtcm-color-blind] <0-1000000> <0-16000000> <0-16000000>
conform-action transmit exceed-action [<0-63>|drop] violate-action [<0-63>|drop]

<table>
<thead>
<tr>
<th>police</th>
<th>Configures an enforcer for classified traffic</th>
</tr>
</thead>
<tbody>
<tr>
<td>[srtcm-color-aware</td>
<td>srtcm-color-blind] &lt;0-1000000&gt; &lt;0-16000000&gt; &lt;0-16000000&gt;</td>
</tr>
<tr>
<td>- srtcm-color-blind - Single rate three color meter in color-blind mode</td>
<td></td>
</tr>
<tr>
<td>- srtcm-color-aware - Single rate three color meter in color-aware mode</td>
<td></td>
</tr>
</tbody>
</table>

The meter operates in one of two modes. In the color-blind mode, the meter assumes that the packet stream is uncolored. In color-aware mode the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The marker (re)colors an IP packet according to the results of the meter. The color is coded in the DS field [RFC 2474] of the packet.

- `<0-1000000>` – Configures the CIR from 0 -1000000 kilobits per second.
- `<0-16000000>` – Configures the BC from 0 - 1600000 bytes.
- `<0-16000000>` – Configures the BE from 0 - 1600000 bytes.

The behavior of the meter is specified in terms of its mode and two token buckets, C and E, which both share the common rate CIR. The maximum size of the token bucket C is BC and the maximum size of the token bucket E is BE.

The token buckets C and E are initially full, that is, the token count Tc(0) = BC and the token count Te(0) = BE. Thereafter, the token counts Tc and Te are updated CIR times per second as follows:

- If Tc is less than BC, Tc is incremented by one, else
- If Te is less then BE, Te is incremented by one, else
- neither Tc nor Te is incremented.

When a packet of size B bytes arrives at time t, the following happens if srTCM is configured to operate in color-blind mode:

- If Tc(t)-B > OR = 0, the packet is green and Tc is decremented by B down to the minimum value of 0, else
- if Te(t)-B > OR = 0, the packets is yellow and Te is decremented by B down to the minimum value of 0,
- else the packet is red and neither Tc nor Te is decremented.

When a packet of size B bytes arrives at time t, the following happens if srTCM is configured to operate in color-aware mode:

- If the packet has been precolored as green and Tc(t)-B ? 0, the packet is green and Tc is decremented by B down to the minimum value of 0, else
- If the packet has been pre-colored as yellow or green and if
  - Te(t)-B > OR = 0, the packets is yellow and Te is decremented by B down to the minimum value of 0, else the packet is red and neither Tc nor Te is decremented.

The metering policy guarantees a deterministic behavior where the volume of green packets is never smaller than what has been determined by the CIR and BC, that is, tokens of a given color are always spent on packets of that color. Refer to RFC 2697 for more information on other aspects of srTCM.

- Configures an enforcer for classified traffic based on a two rate three color meter (trTCM) mode. The trTCM as defined in RFC 2698 meters a traffic stream and processes its packets based on two rates – Committed Information Rate (CIR) and Peak Information Rate (PIR), and their associated burst sizes - Committed Burst Size (BC) and Peak Burst Size (BP).

- trtcm-color-blind - Two rate three color meter in color-blind mode
- <0-1000000> - Configures the CIR from 0 - 1000000 kilobits per second
- <0-16000000> - Configures the BC from 0 - 16000000 bytes.

- trtcm-color-aware - Two rate three color meter in color-aware mode
- <0-1000000> - Configures the PIR from 0 - 1000000 kilobits per second
- <0-16000000> - Configures the BP from 0 - 16000000 bytes

The meter operates in one of two modes. In the color-blind mode, the meter assumes that the packet stream is uncolored. In color-aware mode the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The marker (re)colors an IP packet according to the results of the meter. The color is coded in the DS field [RFC 2474] of the packet.

The behavior of the meter is specified in terms of its mode and two token buckets, P and C, which are based on the rates PIR and CIR, respectively. The maximum size of the token bucket P is BP and the maximum size of the token bucket C is BC.

The token buckets P and C are initially (at time 0) full, that is, the token count Tp(0) = BP and the token count Tc(0) = BC. Thereafter, the token count Tp is incremented by one PIR times per second up to BP and the token count Tc is incremented by one CIR times per second up to BC.

When a packet of size B bytes arrives at time t, the following happens if trTCM is configured to operate in color-blind mode:

- If Tp(t)-B < 0, the packet is red, else
- if Tc(t)-B < 0, the packet is yellow and Tp is decremented by B, else
- The packet is green and both Tp and Tc are decremented by B.

Contd..
### Usage Guidelines

When configuring the traffic class enforcer parameters, take into consideration the following factors:

1. You can configure up to 200 enforcers/policers (i.e., class maps) for ingress ports.
2. The committed-rate cannot exceed the configured interface speed, and the committed-burst cannot exceed 16 Mbytes.

#### Examples

The following example uses the police trtc-color-blind command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

```plaintext
nx9500-6C8809(config-ex3500-gos-policy-map-testPolicyMap-pmap-class-dscp)#police trtc-color-blind 100000 4000 100000 6000 conform-action transmit exceed-action 0 violate-action drop
nx9500-6C8809(config-ex3500-gos-policy-map-testPolicyMap-pmap-class-dscp)#
```

#### Related Commands

<td><code>no</code></td>
<td>Removes the traffic enforcer settings</td>
</tr>
</tbody>
</table>
4.1.44.2.4 set

Sets class of service (CoS) value, per-hop behavior (PHB) value, and IP DSCP value in matching packets

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

```
set [cos <0-7>|ip dscp <0-63>|phb <0-7>]
```

Parameters

- `cos <0-7>`
  - Configures the CoS value for a matching packet (as specified by the match command) in the packet's VLAN tag
  - `<0-7>` – Specify a value from 0 - 7. The CoS is modified to the value specified here.

- `ip dscp <0-63>`
  - Modifies the IP DSCP value in a matching packet (as specified by the match command).
  - `<0-63>` – Specify a value from 0 - 63. The DSCP value is modified to the value specified here.

- `phb <0-7>`
  - Configures a PHB value for a matching packets
  - `<0-7>` – Specify a value from 0 - 7.

**Note:** The PHB label is composed of five bits, three bits for per-hop behavior, and two bits for the color scheme used to control queue congestion. A packet is marked green, yellow, or red as per the following:
- green if it does not exceed the CIR and BC limits
- yellow if it exceeds the CIR and BC limits, but not the BE limit, and
- red otherwise.

Examples

The following example uses the `set > phb` command to classify the service that incoming packets will receive, and then uses the `police > trtcm-color-blind` command to limit the average bandwidth to 100,000 Kbps, the committed burst rate to 4000 bytes, the peak information rate to 1,000,000 Kbps, the peak burst size to 6000 bytes, to remark any packets exceeding the committed burst size, and to drop any packets exceeding the peak information rate.

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)#set phb 3
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)#police trtcm-color-blind 100000 4000 1000000 6000 conform-action transmit exceed-action 0 violate-action drop
```

The following uses the `set > ip dscp` command to classify the service that incoming packets will receive, and then uses the `police > flow` command to limit the average bandwidth to 100,000 Kbps, the burst rate to 4000 bytes, and configure the response to drop any violating packets:

```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-test2)#set ip dscp 3
```
nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#police
flow 100000 4000 conform-action transmit violate-action drop

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#show context
class dscp
    set ip dscp 3
    police flow 100000 4000 conform-action transmit violate-action drop

nx9500-6C8809(config-ex3500-qos-policy-map-testPolicyMap-pmap-class-dscp)#

```

Removes this <EX3500> QoS policy map’s description
4.1.44.2.7 no

- ex3500-qos-policy-map config commands

Removes this EX3500 QoS policy map’s settings. Use this keyword to remove or modify the description and to remove the QoS traffic classification created.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

no [class <EX3500-QoS-POLICY-MAP-NAME>|description]

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes this EX3500 QoS policy map's settings based on the parameters passed |

Examples

The following example shows the EX3500 QoS policy map ‘test’ settings before the ‘no’ command are executed:

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
description "This is a test EX3500 QoS Policy Map"
class test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#
```

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#no description
```

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#no class test
```

The following example shows the EX3500 QoS policy map ‘test’ settings after the ‘no’ command are executed:

```
nx9500-6C8809(config-ex3500-qos-policy-map-test)#show context
ex3500-qos-policy-map test
nx9500-6C8809(config-ex3500-qos-policy-map-test)#
```
4.1.45 ex3524

Global Configuration Commands

Adds a EX3524 switch to the network

The EX3500 series switch is a Gigabit Ethernet layer 2 switch with either 24 or 48 10/100/1000-BASE-T ports, and four Small Form Factor Pluggable (SFP) transceiver slots for fiber connectivity.

To enable layer 3 adoption of the logged EX3524 switch to a NOC controller, navigate to the EX3524 switch’s device configuration mode and execute the following command: controller > host > <IP/HOSTANME>

EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP Web agent and CLI, which in spite of being different from that of the WiNG operating system provides WiNG controllers PoE and port management resources.

Going forward NX9500, NX7500, NX6500, NX4500 WiNG managed series service platforms and WiNG VMs can discover, adopt, and partially manage EX3500 series Ethernet switches without modifying the proprietary operating system running the EX3500 switches. The WiNG service platforms utilize standardized WiNG interfaces to push configuration files to the EX3500 switches, and maintain a translation layer, understood by the EX3500 switch, for statistics retrieval.

Supported in the following platforms:
- Wireless Controller — RFS7000
- Service Platforms — NX7500, NX9500

Syntax

ex3524 <DEVICE-EX3524-MAC>

Parameters

- ex3524 <DEVICE-EX3524-MAC>

<DEVICE-EX3524-MAC> Specifies the MAC address of a EX3524 switch

Examples

nx9500-6C8809(config)#ex3524 A1-C4-33-6D-66-07

nx9500-6C8809(config-device-A1-C4-33-6D-66-07)#?

EX35xx Device Mode commands:
- hostname Set system's network name
- ip Internet Protocol (IP)
- power EX3500 Power over Ethernet Command
- remove-override Remove configuration item override from the device (so profile value takes effect)
- upgrade Configures upgrade option for ex3500 system
- use Set setting to use
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

Related Commands

- `no` Removes a EX3548 switch from the network
4.1.47 firewall-policy

Global Configuration Commands

Configures a firewall policy. This policy defines a set of rules for managing network traffic and prevents unauthorized access to the network behind the firewall.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```text
firewall-policy <FIREWALL-POLICY-NAME>
```

Parameters

- `firewall-policy <FIREWALL-POLICY-NAME>`

<table>
<thead>
<tr>
<th>&lt;FIREWALL-POLICY-NAME&gt;</th>
<th>Specify the firewall policy name. If a firewall policy does not exist, it is created.</th>
</tr>
</thead>
</table>

Examples

```text
rfs7000-37FABE(config)#firewall-policy test
rfs7000-37FABE(config-fw-policy-test)#?
```

Firewall policy Mode commands:

- `acl-logging` Log on flow creating traffic
- `alg` Enable ALG
- `clamp` Clamp value
- `dhcp-offer-convert` Enable conversion of broadcast dhcp offers to unicast
- `dns-snoop` DNS Snooping
- `firewall` Wireless firewall
- `flow` Firewall flow
- `ip` Internet Protocol (IP)
- `ip-mac` Action based on ip-mac table
- `ipv6` Internet Protocol version 6 (IPv6)
- `ipv6-mac` Action based on ipv6-mac table
- `logging` Firewall enhanced logging
- `no` Negate a command or set its defaults
- `proxy-arp` Enable generation of ARP responses on behalf of another device
- `proxy-nd` Enable generation of ND responses (for IPv6) on behalf of another device
- `stateful-packet-inspection-l2` Enable stateful packet inspection in layer2 firewall
- `storm-control` Storm-control
- `virtual-defragmentation` Enable virtual defragmentation for IPv4 packets (recommended for proper functioning of firewall)

```text
rfs7000-37FABE(config-fw-policy-test)#
```

**NOTE:** For more information on Firewall policy, see Chapter 13, `FIREWALL-POLICY`. 
4.1.48 global-association-list

Global Configuration Commands

Configures a global list of client MAC addresses. Based on the deny or permit rules specified, clients are either allowed or denied access to the managed network.

The global association list serves the same purpose as an Association Access Control List (ACL). However, the Association ACL allows a limited number of entries, a few thousand only, and does not suffice the requirements of a large deployment. This gap is filled by a global association list, which is much larger (with tens of thousands of entries). Both lists co-exist in the system. When an access request comes in, the association ACL is looked up first and if the requesting MAC address is listed in one of the deny ACLs, the association is denied. But, if the requesting client is permitted access, or if in case none of the ACLs list the client’s MAC address, the global association ACL is checked. Once authenticated, the client’s credentials are cached on the access point, and subsequent requests are not referenced to the controller. An entry in an APs credential cache means a pass in the global association list.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

global-association-list <GLOBAL-ASSOC-LIST-NAME>

Parameters

- global-association-list <GLOBAL-ASSOC-LIST-NAME>

<GLOBAL-ASSOC-LIST-NAME>

Specify the global association list name. If a list with the same name does not exist, it is created.

**Note:** Map this global association list to a device (controller) or a controller profile. Once associated, the controller applies this association list to requests received from all adopted APs. For more information, see `use`.

**Note:** The global association list can also be mapped to a WLAN. The usage of global access lists is controlled on a per-WLAN basis. For more information, see `association-list`.

Examples

rfs4000-229D58 (config)#global-association-list my-clients
rfs4000-229D58 (config-global-assoc-list-my-clients)#?

Global Association List Mode commands:

default-action Configure the default action when the client MAC does not match any rule
deny Specify MAC addresses to be denied
no Negate a command or set its defaults

<td>Summarizes guest management policy configuration mode commands</td>
<td>page 4-223</td>
</tr>
<tr>
<td>policy-mode commands</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
4.1.49.1 guest-management

Configures a guest management policy that redirects guest users to a registration portal upon association to a captive portal SSID. Guest users are redirected to an internally (or) externally hosted registration page (registration.html) where previously, not-registered guest users can register. The internally hosted captive portal registration page can be customized based on business requirements. For more information, see webpage.

Use the guest management policy commands to configure parameters, such as E-mail host and SMS gateway along with the credentials required for sending pass code to guest via e-mail and SMS. You can configure up to 32 different guest management policies. Each guest management policy allows you to configure the SMS gateway, SMS message body, E-mail SMTP server, E-mail subject contents, and E-mail message body. Although, at any point-in-time, multiple guest management policies may exist, only one guest management policy can be active per device.

Guest registration is supported only on the NX9000 and NX7500 series service platforms as an adopting controller. But the number of user identity entries supported on each varies. It is 2 million and 1 million user identity entries for the NX9000 and NX7500 model service platforms respectively. Guest management and registration is not supported on any of the other WiNG supported platforms.

Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

\[
guest-management <POLICY-NAME>
\]

Parameters

- guest-management <POLICY-NAME>

| <POLICY-NAME> | Specify the guest management policy name. If the policy does not exist, it is created. |

Examples

```
nx9500-6C8809(config-guest-management-guest)#?
Guest Management Mode commands:
  email                Email guest-notification configuration
  guest-database-backup Configure guest-database-backup parameters
  no                   Negate a command or set its defaults
  sms                  SMS guest-notification configuration
  sms-over-smtp        Sms-over-smtp configuration to email sms gateway address
  commit                Commit all changes made in this session
  do                    Run commands from Exec mode
  end                   End current mode and change to EXEC mode
  exit                  End current mode and down to previous mode
  help                  Description of the interactive help system
  revert                Revert changes
  service               Service Commands
  show                  Show running system information
  write                 Write running configuration to memory or terminal
nx9500-6C8809(config-guest-management-guest)#
```

Related Commands

4.1.49.2.1 email

*guest-management-policy-mode commands*

Configures guest user e-mail notification settings.

Guest users can register themselves with their e-mail credentials as a primary key for authentication. The captive portal system provides the pass code for their registration. Guest users need to use their registered e-mail, mobile, or member ID and the received pass code for further login to the captive portal.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
email [host|message|subject]

email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>
  security [none|ssl|starttls] username <USER-NAME> password <PASSWORD>

email message <LINE>
email subject <LINE>
```

**Parameters**

- email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS> security [none|ssl|starttls] username <USER-NAME> password <PASSWORD>

| email host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] | Configures the SMTP server resource’s IPv4 address or hostname used for guest management email traffic, guest user credential validation, and pass code reception. Optionally you can use an existing host alias to identify the SMTP server resource. |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| • <IP/HOSTNAME> – Specify the SMTP server resource’s IP address or hostname.  
• <HOST-ALIAS-NAME> – Specify the host alias name (should be existing and configured). Consider providing the host as an alias. A host alias is a configuration item that maps the alias to a hostname. Once created, it can be used across different configuration modes. Where ever used the alias is replaced by the associated hostname. |

| sender <EMAIL-ADDRESS> | Configures the sender’s e-mail address. The sender here is the guest user receiving the pass code. Guest users require this pass code for registering their guest e-mail credentials.  
• <EMAIL-SENDER> – Specify the e-mail address (should not exceed 100 characters). |

| security [none|ssl|starttls] | Configures the encryption protocol used by the SMTP server when communicating the pass code  
• none – No encryption used. Use if no additional user authentication is needed beyond the required username and password combination.  
• SSL – Uses SSL encryption. This is the default setting.  
• STARTTLS – Uses STARTTLS encryption |

| username <USER-NAME> | Configures a username unique to this SMS guest management configuration. After configuring the username, specify the associated password. Ensure that the password is correctly provided to receive the pass code required for registering guest user credentials with SMS.  
• <USER-NAME> – Specify the username (should not exceed 100 characters). |

| password <PASSWORD> | Configures the password associated with the specified SMTP user name  
• <PASSWORD> – Specify the password (should not exceed 63 characters). |
### email message <LINE>

<table>
<thead>
<tr>
<th>email message &lt;LINE&gt;</th>
<th>Configures guest user e-mail notification content</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>message</strong> &lt;LINE&gt;</td>
<td>Configures the content of the e-mail sent to the guest user notifying the pass code (should not exceed 1024 characters)</td>
</tr>
<tr>
<td></td>
<td>• &lt;LINE&gt; — Specify the message content. When entering the message, use the following tags: GM-NAME — for the guest user’s name GM_PASSCODE — for the pass code CR-NL — to enter a new line</td>
</tr>
<tr>
<td></td>
<td>For example: Dear GM_NAME, CR-NL your internet access pass code is GM_PASSCODE. CR-NL Use this for internet access.</td>
</tr>
</tbody>
</table>

### email subject <LINE>

<table>

4.1.49.2.2 guest-database-backup

Enables periodic backup of a captive portal’s guest registration user database. This option is enabled by default.

Supported in the following platforms:

- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

guest-database-backup enable <TIME>

**Parameters**

- guest-database-backup enable <TIME>

| guest-database-backup enable <TIME> | Enables periodic backup of a captive portal’s guest registration user database. This command also allows you to configure the time at which the system starts backing up the database. The default backup-start time is ‘00:00’ (midnight every day).
| <TIME> – Optional. Resets the periodic database backup-start time to a user-defined value in the HH:MM format. When specified, the system starts periodic backup of the database, every day, at the specified time. |

**Examples**

nx9500-6C8809(config-guest-management-test)#guest-database-backup enable 12:30

vx9500-6C8809(config-guest-management-test)#show context
guest-management test
guest-database-backup enable 12:30

nx9500-6C8809(config-guest-management-test)#

**Related Commands**

| no | Disables periodic backup of a captive portal’s guest registration user database |
4.1.49.2.3 sms

**guest-management-policy-mode commands**

Configures guest user SMS notification settings

SMS enables guest users to register themselves with their e-mail or mobile device ID as the primary key for authentication. The captive portal provides the pass code for registration. Guest users use their registered e-mail or mobile device ID and the received pass code for future login to the captive portal.

**NOTE:** When using SMS, ensure that the WLAN's mode of authentication is set to *none* and the mode of registration is set to *user*. In other words, captive portal authentication must always enforce guest registration.

SMS is similar to MAC address-based self registration, but in addition the captive portal sends an SMS message, containing an access code, to the user's mobile phone number provided at the time of registration. The captive portal verifies the code, returns the *Welcome* page and provides access. This allows the administrator to verify the phone number provided and can be traced back to a specific individual should the need arise.

The default gateway used with SMS is *Clickatell*. A pass code can be sent with SMS to the guest user directly using Clickatell, or the pass code can be sent via e-mail to the SMS Clickatell gateway server, and Clickatell sends the pass code SMS to the guest user.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
sms [host|message]

sms host clickatell username <USER-NAME> password <PASSWORD> api-id <ID> user-agent <PYCLICKATELL>
{source-number <WORD>}

sms message <LINE>
```

**Parameters**

- **sms host clickatell username <USER-NAME> password <PASSWORD> api-id <ID> user-agent <PYCLICKATELL>**
  - `{source-number <WORD>}`

- **sms message <LINE>

</tbody>
</table>
4.1.49.2.4 sms-over-smtp

Configures an e-mail host server (for example: smtp.gmail.com) along with sender related credentials and the recipient gateway e-mail address to which the message is E-mailed. The gateway server converts the e-mail into SMS and sends the message to the guest user’s mobile device.

When sending an e-mail, the e-mail client interacts with a SMTP server to handle the content transmission. The SMTP server on the host may have conversations with other SMTP servers to deliver the e-mail.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
sms-over-smtp [host|message|subject]

sms-over-smtp  host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>] sender <EMAIL-ADDRESS>
security [none|ssl|starttls] username <USER-NAME> password <PASSWORD> recipient <EMAIL-ADDRESS>

sms-over-smtp  message <LINE>

sms-over-smtp  subject <LINE>
```

**Parameters**

- **sms-over-smtp**
  - **host [<IP/HOSTNAME>|<HOST-ALIAS-NAME>]**
    - Configures the SMS gateway server resource’s IPv4 address or hostname used for guest management SMS over SMTP traffic, guest user credential validation and pass code reception. Optionally you can use an existing host alias to identify the SMS gateway server resource.
    - `<IP/HOSTNAME>` — Specify the SMTP gateway server resource’s IP address or hostname.
    - `<HOST-ALIAS-NAME>` — Specify the host alias name (should existing and configured). Consider providing the host as an alias. A host alias is a configuration item that maps the alias to a hostname. Once created, it can be used across different configuration modes. Where ever used the alias is replaced by the associated hostname.
  - **sender <EMAIL-ADDRESS>**
    - Configures the sender’s e-mail address. The sender here is the guest user receiving the pass code. Guest users require this pass code for registering their guest e-mail credentials using SMTP.
    - `<EMAIL-ADDRESS>` — Specify the e-mail address (should not exceed 64 characters).
  - **security [none|ssl|starttls]**
    - Configures the encryption protocol used by the SMTP server when communicating the pass code
    - **none** — No encryption used. Use if no additional user authentication is needed beyond the required username and password combination.
    - **SSL** — Uses SSL encryption. This is the default setting.
    - **STARTTLS** — Uses STARTTLS encryption
  - **username <USER-NAME>**
    - Configures a username unique to this SMTP guest management configuration. After configuring the username, specify the associated password. Ensure that the correct password is provided to receive the pass code required for registering guest user credentials with SMTP.
    - `<USER-NAME>` — Specify the username (should not exceed 64 characters).
### password

**<PASSWORD>**

Configures the password associated with the specified SMTP user name
- **<PASSWORD>** – Specify the password (should not exceed 64 characters).

### recipient

**<EMAIL-ADDRESS>**

Configures the e-mail recipient's e-mail address
- **<EMAIL-ADDRESS>** – Specify the recipient's e-mail address (should not exceed 64 characters in length).

- **sms-over-smtp message <LINE>**

Configures guest user SMS over SMTP notification message content

- **sms-over-smtp subject <LINE>**

Configures guest user e-mail notification subject line content

- **subject <LINE>**

Configures the subject line of the SMS over SMTP sent to the guest user notifying the pass code (should not exceed 100 characters)
- **<LINE>** – Specify the subject line content. When entering the subject line, use the following tag:
  - **GM-NAME** – for the guest user's name
  - **GM_PASSCODE** – for the pass code
  - **CR-NL** – to enter a new line

For example: Dear *GM_NAME*, your internet access pass code is *GM_PASSCODE*. CR-NL Use this access code for internet access.

- **sms-over-smtp**

Configures guest user SMS over SMTP notification message content

#### Examples

```bash
nx9500-6C8809(config-guest-management-test3)#sms-over-smtp host test sender bob@zebra.com security ssl username bob password bob@123 recipient bob@zebra.com
```

```bash
nx9500-6C8809(config-guest-management-test3)#show context
guest-management test3
  sms-over-smtp host test sender bob@zebra.com security ssl username bob password bob@123 recipient bob@zebra.com
```

```bash
nx9500-6C8809(config-guest-management-test3)#
```

*Global Configuration Commands*

Enters the configuration context of a remote device using its hostname

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
host <DEVICE-NAME>
```

**Parameters**

- `host <DEVICE-NAME>`

| <DEVICE-NAME> | Specify the device’s hostname. All discovered devices are displayed when ‘Tab’ is pressed to auto complete this command. |

**Examples**

```
rfs4000-229D58(config)#host rfs4000-229D58
rfs4000-229D58(config-device-00-23-68-22-9D-58)#
```
4.1.51 inline-password-encryption

Global Configuration Commands

Stores the encryption key in the startup configuration file.

By default, the encryption key is not stored in the startup-config file. Use the inline-password-encryption command to move the encrypted key to the startup-config file. This command uses the master key to encrypt the password, then moves it to the startup-config file.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

inline-password-encryption

Parameters

None

Usage Guidelines

When the configuration file is imported to a different device, it first decrypts the encryption key using the default key and then decrypts the rest of the configuration using the administrator configured encryption key.

Examples

rfs7000-37FABE(config)#password-encryption secret 2 12345678
rfs7000-37FABE(config)#
rfs7000-37FABE(config)#commit wr mem
rfs7000-37FABE(config)#

This command uses the specified password for encryption key and stores it outside of startup-config.

rfs7000-37FABE(config)#inline-password-encryption
rfs7000-37FABE(config)#

This command moves the same password to the startup-config and encrypts it with the master key.

<td>no</td>
<td>Disables storing of the encryption key in the startup configuration file</td>
</tr>
</tbody>
</table>
### 4.1.52 ip

**Global Configuration Commands**

Creates a IP access control list (ACL) and/or a SNMP IP ACL.

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
ip [access-list|snmp-access-list]

ip access-list <IP-ACL-NAME>
ip snmp-access-list <IP-SNMP-ACL-NAME>
```

#### Parameters

- **`ip access-list <IP-ACL-NAME>`**
  - Creates an IP ACL and enters its configuration mode
  - `<IP-ACL-NAME>` — Specify the ACL name. If the access list does not exist, it is created.

- **`ip snmp-access-list <IP-SNMP-ACL-NAME>`**
  - Creates a SNMP IP ACL and enters its configuration mode. An SNMP IP ACL is an access control mechanism that uses a combination of IP ACL and SNMP community string.
  - SNMP performs network management functions using a data structure called a *Management Information Base* (MIB). SNMP is widely implemented but not very secure, since it uses only text community strings for accessing controller or service platform configuration files.
  - Use SNMP ACLs (firewalls) to help reduce SNMP’s vulnerabilities, as SNMP traffic can be easily exploited to produce a denial of service (DoS).
  - `<IP-SNMP-ACL-NAME>` — Specify the SNMP IP ACL name. If the access list does not exist, it is created. After creating the SNMP ACL, define the deny/permit rules based on the network and/or host IP addresses. Once created and configured, link this SNMP IP ACL with a SNMP community string.

**Note:** To link the SNMP community string with the SNMP IP ACL, in the management-policy-config-mode, use the following command: `snmp-server > community <COMMUNITY-STRING> > [ro|rw] > ip-snmp-access-list <IP-SNMP-ACL-NAME>`.
Examples

rfs7000-37FABE(config)#ip access-list test
rfs7000-37FABE(config-ip-acl-test)#?

ACL Configuration commands:
  deny      Specify packets to reject
  disable   Disable rule if not needed
  no        Negate a command or set its defaults
  permit    Specify packets to forward
  clrscr    Clears the display screen
  commit    Commit all changes made in this session
  end       End current mode and change to EXEC mode
  exit      End current mode and down to previous mode
  help      Description of the interactive help system
  revert    Revert changes
  service   Service Commands
  show      Show running system information
  write     Write running configuration to memory or terminal

rfs7000-37FABE(config-ip-acl-test)#

rfs7000-37FABE(config)#ip snmp-access-list SNMPAcl
rfs7000-37FABE(config-ip-snmp-acl-SNMPAcl)#?

SNMP ACL Configuration commands:
  deny      Specify packets to reject
  no        Negate a command or set its defaults
  permit    Specify packets to forward
  clrscr    Clears the display screen
  commit    Commit all changes made in this session
  do        Run commands from Exec mode
  end       End current mode and change to EXEC mode
  exit      End current mode and down to previous mode
  help      Description of the interactive help system
  revert    Revert changes
  service   Service Commands
  show      Show running system information

4.1.53 ipv6

**Global Configuration Commands**

Creates an IPv6 ACL

An IPv6 ACL defines a set of rules that filter IPv6 packets flowing through a port or interface. Each rule specifies the action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ipv6 access-list <IPv6-ACL-NAME>
```

**Parameters**

- `ipv6 access-list <IPv6-ACL-NAME>`

<table>
<thead>
<tr>
<th><strong>access-list</strong></th>
<th>Configures an IPv6 access list and enters its configuration mode</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IPv6-ACL-NAME&gt;</code></td>
<td>&lt;IPv6-ACL-NAME&gt; — Specify the IPv6 ACL name. If the access list does not exist, it is created.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config)#ipv6 access-list IPv6ACLTest
```

```
rfs4000-229D58(config-ipv6-acl-IPv6ACLTest)#?
IPv6 Access Control Mode commands:
  deny     Specify packets to reject
  no       Negate a command or set its defaults
  permit   Specify packets to forward
  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal
```

```
rfs4000-229D58(config-ipv6-acl-IPv6ACLTest)#
```

**NOTE:** For more information on access control lists, see Chapter 11, ACCESS-LIST.
4.1.54 ipv6-router-advertisement-policy

The following table lists the IPv6 router advertisement (RA) policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6-router-advertisement-policy</td>
<td>Creates a new IPv6 RA policy and enters its configuration mode</td>
<td>page 4-238</td>
</tr>
<tr>
<td>ipv6-router-advertisement-policy-mode commands</td>
<td>Summarizes the IPv6 RA policy configuration mode commands</td>
<td>page 4-240</td>
</tr>
</tbody>
</table>
ipv6-router-advertisement-policy

Creates an IPv6 router advertisement (RA) policy and enters its configuration mode.

An IPv6 router policy allows routers to advertise their presence in response to solicitation messages. After receiving a neighbor solicitation message, the destination node sends an advertisement message which includes the link layer address of the source node. After receiving the advertisement, the destination device replies with a neighbor advertisement message on the local link. After the source receives the advertisement it can communicate with other devices.

Advertisement messages are also sent to indicate a change in link layer address for a node on the local link. With such a change, the multicast address becomes the destination address for advertisement messages.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
ipv6-router-advertisement-policy <POLICY-NAME>

Parameters
- ipv6-router-advertisement-policy <POLICY-NAME>
  
  Specify an IPv6 RA policy name. If the policy does not exist, it is created.

Examples
rfs4000-229D58(config-ipv6-radv-policy-test)#?
IPv6 Router Advertisement Policy Mode commands:
advertise Option to advertise in router advertisement
assist-neighbor-discovery Send the Source Link Layer address option in Router Advertisement to assist in neighbor discovery
check-ra-consistency Check if the parameters advertised by other routers on the link are in conflict with those configured on this router. Conflicts are logged.
dns-server DNS Server
domain-name Configure domain-name
managed-config-flag Set the managed-address-configuration flag in Router Advertisements. When set, it indicates that the addresses are available via DHCPv6
nd-reachable-time Time that a node assumes a neighbor is reachable after having received a reachability confirmation
no Negate a command or set its defaults
ns-interval Time between retransmitted Neighbor Solicitation messages
other-config-flag Set the other-configuration flag in Router Advertisements. When set, it indicates that other configuration information is available via DHCPv6.
ra Router Advertisements
router-lifetime Lifetime associated with the default router
router-preference Preference of this router over other routers
unicast-solicited-advertisement Unicast the solicited Router Advertisements
clrscr                           Clears the display screen
commit                          Commit all changes made in this session
do                              Run commands from Exec mode
end                             End current mode and change to EXEC mode
exit                            End current mode and down to previous mode
help                            Description of the interactive help system
revert                          Revert changes
service                         Service Commands
show                            Show running system information
write                           Write running configuration to memory or terminal

4.1.54.2.2 assist-neighbor-discovery

*ipv6-router-advertisement-policy-mode commands*

Enables/disables advertisement of the source link layer address in RAs to facilitate neighbor discovery. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`assist-neighbor-discovery`

**Parameters**

None

**Examples**

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#assist-neighbor-discovery
```

4.1.54.2.3 check-ra-consistency

Enables/disables checking of consistency in RA values advertised by this router with those advertised by other routers, if any, on the same link. If the values advertised are inconsistent, a conflict is logged.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
check-ra-consistency

Parameters
None

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#check-ra-consistency
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test

</tr>
</tbody>
</table>

Examples

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#dns-server 2002::2 lifetime 3000
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
  advertise mtu
declare hop-limit
cncheck-ra-consistency
dns-server 2002::2 lifetime 3000
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

no

Removes the DNS server settings advertised in RAs. Once removed these values are not advertised in RAs.
### 4.1.54.2.5 domain-name

**ipv6-router-advertisement-policy-mode commands**

Configures the Domain name search label advertised in RAs

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
domain-name <WORD> {lifetime [<4-3600>|expired|infinite]}
```

**Parameters**

- `domain-name <WORD>`
  - `<WORD>` – Specify the Domain name search label. A maximum of four (4) entries can be made per policy.

- `lifetime [4-3600]|expired|infinite]`
  - `<4-3600>` – Configures a lifetime in seconds. Specify a value form 4 - 3600 seconds. The default is 600 seconds.
  - `expired` – Advertises that this Domain name search label’s lifetime has expired and should not be used
  - `infinite` – Advertises that this Domain name search label’s lifetime is infinite

**Examples**

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
  advertise mtu
  advertise hop-limit
  check-ra-consistency
  dns-server 2002::2 lifetime 3000
  domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```

</tr>
</tbody>
</table>
4.1.54.2.6 managed-config-flag

Sets/removes the managed address configuration flag in RAs. When set, it indicates that IPv6 addresses are available through DHCPv6. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

managed-config-flag

Parameters

None

Examples

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#managed-config-flag
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
managed-config-flag
advertise mtu
advertise hop-limit
check-ra-consistency
dns-server 2002::2 lifetime 3000

<tr>
<td>no</td>
<td>Removes the managed address configuration flag advertised in RAs</td>
</tr>
</tbody>
</table>
4.1.54.2.7 nd-reachable-time

Enables/disables advertisement of neighbor discovery reachable time in RAs. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
nd-reachable-time [<5000-3600000>|global]

Parameters
- nd-reachable-time [<5000-3600000>|global]

| nd-reachable-time [<5000-3600000>]| Configures the interval, in milliseconds, that a node assumes a neighbor is reachable after receiving a reachability confirmation from the neighbor. Therefore, a neighbor is reachable, after being discovered, for a period specified here. This value is advertised in RAs. Use one of the following options:
  - <5000-3600000> – Configures an interface-specific value. Specify a value from 5000 - 3600000 milliseconds. The default is 5000 milliseconds.
  - global – Advertises the neighbor reachable time configured for the system. This is the value configured at the device configuration mode. For more information, see ipv6.

Examples
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#nd-reachable-time 6000
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context ipv6-router-advertisement-policy test

Related Commands

no | Disables advertisement of neighbor reachable time in RAs
4.1.54.2.8 no

4.1.54.2.8 no ipv6-router-advertisement-policy-mode commands

Removes or reverts router advertisement policy settings. Use the no command to remove or revert the interface-specific parameters that are advertised by link router.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

Parameters

- no <PARAMETERS>

4.1.54.2.9 ns-interval

ipv6-router-advertisement-policy-mode commands

Configures the neighbor solicitation (NS) retransmit timer value advertised in RAs. This is the interval between two successive NS messages. When specified, it enables the sending of the specified value in RAs. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ns-interval [<1000-3600000> | global]

Parameters

- ns-interval [<1000-3600000> | global]

| ns-interval [<1000-3600000> | global] | Configures the NS interval advertised in RAs. Use one of the following options:
|-----------------|---------------------------------------------------------------|
| [<1000-3600000>] – Specify a value from 1000 - 3600000 milliseconds. The default is 1000 milliseconds.
| global – Advertises the NS interval configured for the system. This is configured on the device in the device configuration mode. For more information, see ipv6.

Examples

rfs7000-6DCD4B(config-ipv6-radv-policy-test)#ns-interval 3000
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context

domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

Related Commands

no | Disables advertisement of NS interval in RAs
### 4.1.54.2.10 other-config-flag

- **ipv6-router-advertisement-policy-mode commands**

Sets/removes the other-configuration flag in RAs. When set, it indicates that other configuration details, such as DNS-related information, are available through DHCPv6. This feature is enabled by default.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
other-config-flag
```

**Parameters**

None

**Examples**

```plaintext
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#other-config-flag
```

4.1.54.2.11 ra

*ipv6-router-advertisement-policy-mode commands*

Configures RA related parameters, such as the interval between two unsolicited successive RAs. It also allows suppression of RAs.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ra [interval <3-1800>|suppress]
```

**Parameters**

- ra [interval <3-1800>|suppress]

<table>

4.1.54.2.12 router-lifetime

Configures the default router's lifetime, in seconds, advertised in RAs

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
routerr-lifetime <0-9000>
```

Parameters

```
- routerr-lifetime <0-9000>
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routerr-lifetime</td>
<td>Configures the default router's lifetime</td>
</tr>
<tr>
<td>&lt;0-9000&gt;</td>
<td>- Specify a value from 0 - 9000 seconds. The default value is 1500 seconds.</td>
</tr>
</tbody>
</table>

**Note:** A value of “0” indicates that this router is not the default router.

Examples

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#router-lifetime 2000
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
no ra suppress
ra interval 200
managed-config-flag
nd-reachable-time global
router-lifetime 2000
advertise mtu
advertise hop-limit
check-ra-consistency
dns-server 2002::2 lifetime 3000
domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```

Related Commands

```
no
```

Removes the default router's lifetime.
4.1.54.2.13 router-preference

`ipv6-router-advertisement-policy-mode` commands

Configures the router preference field value advertised in RAs. The options are high, medium, and low. This value is used to prioritize and select the default router when multiple routers are discovered.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
router-preference [high|medium|low]
```

**Parameters**

- `router-preference [high|medium|low]`

| router-preference [high|medium|low] | Sets this router’s preference over other routers, in the link, to be the default router. The options are high, low, and medium. The default value is medium. |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| **Note:**                         | The following points should be taken into consideration when configuring router preference: |
|                                   | • For a router to be selected as a default router, the router’s lifetime should not be equal to “0”. |
|                                   | • To enable default router selection, using router information contained in RAs, configure default router selection on that interface. |

**Examples**

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#router-preference high
```

```
f7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
no ra suppress
ra interval 200
managed-config-flag
nd-reachable-time global
router-lifetime 2000
advertise mtu
advertise hop-limit
router-preference high
check-ra-consistency
dns-server 2002::2 lifetime 3000
domain-name TechPubs lifetime infinite
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#
```
4.1.54.2.14 unicast-solicited-advertisement

ipv6-router-advertisement-policy-mode commands

Enables/disables unicasting of solicited RAs. This feature is disabled by default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX

- **Wireless Controllers** — RFS4000, RFS6000, RFS7000

- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`unicast-solicited-advertisement`

**Parameters**

None

**Examples**

```
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#unicast-solicited-advertisement
rfs7000-6DCD4B(config-ipv6-radv-policy-test)#show context
ipv6-router-advertisement-policy test
    no ra suppress
    ra interval 200
    unicast-solicited-advertisement
    managed-config-flag
    nd-reachable-time global
    router-lifetime 2000
    advertise mtu
    advertise hop-limit
    router-preference high
    check-ra-consistency
    dns-server 2002::2 lifetime 3000
    domain-name TechPubs lifetime infinite
```rfs7000-6DCD4B(config-ipv6-radv-policy-test)#

4.1.55 l2tpv3

Global Configuration Commands

Configures a Layer 2 Tunnel Protocol Version 3 (L2TPv3) tunnel policy, used to create one or more L2TPv3 tunnels.

The L2TPv3 policy defines the control and encapsulation protocols needed for tunneling layer 2 frames between two IP nodes. This policy enables creation of L2TPv3 tunnels for transporting Ethernet frames between bridge VLANs and physical GE ports. L2TPv3 tunnels can be created between any vendor devices supporting L2TPv3 protocol.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
l2tpv3 policy <L2TPV3-POLICY-NAME>

Parameters
- l2tpv3 policy <L2TPV3-POLICY-NAME>

<table>
<thead>
<tr>
<th>l2tpv3 policy &lt;L2TPV3-POLICY-NAME&gt;</th>
<th>Configures an L2TPv3 tunnel policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;L2TPV3-POLICY-NAME&gt; – Specify a policy name. The policy is created if it does not exist. To modify an existing L2TPv3, specify its name.</td>
<td></td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config)#l2tpv3 policy L2TPV3Policy1
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#?

L2tpv3 Policy Mode commands:
cookie-size Size of the cookie field present in each l2tpv3 data message
failover-delay Time interval for re-establishing the tunnel after the failover (RF-Domain manager/VRRP-master/Cluster-master failover)
force-l2-path-recovery Enables force learning of servers, gateways etc., behind the l2tpv3 tunnel when the tunnel is established
hello-interval Configure the time interval (in seconds) between l2tpv3 Hello keep-alive messages exchanged in l2tpv3 control connection
no Negate a command or set its defaults
reconnect-attempts Maximum number of attempts to reestablish the tunnel.
reconnect-interval Time interval between the successive attempts to reestablish the l2tpv3 tunnel
retry-attempts Configure the maximum number of retransmissions for signaling message
retry-interval Time interval (in seconds) before the initiating a retransmission of any l2tpv3 signaling message
rx-window-size Number of signaling messages that can be received without sending the acknowledgement
tx-window-size Number of signaling messages that can be sent without receiving the acknowledgement
clrscr Clears the display screen
commit Commit all changes made in this session
end End current mode and change to EXEC mode
exit End current mode and down to previous mode

4.1.56 **mac**

**Global Configuration Commands**

Configures a MAC ACLs

Access lists define access permissions to the network using a set of rules. Each rule specifies an action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
mac access-list <MAC-ACL-NAME>
```

**Parameters**

- **mac access-list <MAC-ACL-NAME>**

<table>
<thead>
<tr>
<th>access-list &lt;MAC-ACL-NAME&gt;</th>
<th>Configures a MAC access control list</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;MAC-ACL-NAME&gt;</code> — Specify the MAC ACL name. If the access control list does not exist, it is created.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config)#mac access-list test
rfs7000-37FABE(config-mac-acl-test)#?
```

MAC Extended ACL Configuration commands:
- deny Specify packets to reject
- disable Disable rule if not needed
- no Negate a command or set its defaults
- permit Specify packets to forward
- clrscr Clears the display screen
- commit Commit all changes made in this session
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

```
rfs7000-37FABE(config-mac-acl-test)#
```

**Related Commands**

| no | Removes a MAC access control list |

**NOTE:** For more information on MAC access control lists, see *Chapter 11, ACCESS-LIST.*
4.1.57 **management-policy**

> **Global Configuration Commands**

Configures a management policy. Management policies include services that run on a device, welcome messages, banners etc.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

management-policy <MANAGEMENT-POLICY-NAME>

**Parameters**

- management-policy <MANAGEMENT-POLICY-NAME>

| <MANAGEMENT-POLICY-NAME> | Specify the management policy name. If the policy does not exist, it is created. |

**Examples**

<DEVICE>(config)#management-policy test  
<DEVICE>(config-management-policy-test)#?  
Management Mode commands:  
  aaa-login        Set authentication for logins  
  banner           Define a login banner  
  ftp              Enable FTP server  
  http             Hyper Text Terminal Protocol (HTTP)  
  https            Secure HTTP  
  idle-session-timeout  Configure idle timeout for a configuration session  
  ipv6             IPv6 Protocol  
  no               Negate a command or set its defaults  
  privilege-mode-password  Set the password for entering CLI privilege mode  
  restrict-access  Restrict management access to the device  
  snmp-server     SNMP  
  ssh              Enable ssh  
  t5               T5 configuration  
  telnet           Enable telnet  
  user             Add a user account  
  clrscr           Clears the display screen  
  commit           Commit all changes made in this session  
  do                Run commands from Exec mode  
  end               End current mode and change to EXEC mode  
  exit              End current mode and down to previous mode  
  help              Description of the interactive help system  
  revert           Revert changes  
  service          Service Commands  
  show             Show running system information  
  write            Write running configuration to memory or terminal  

<DEVICE>(config-management-policy-test)#

**Related Commands**

| no | Removes an existing management policy |
NOTE: For more information on Management policy configuration, see Chapter 15, MANAGEMENT-POLICY.
4.1.58 meshpoint

Global Configuration Commands

Creates a new meshpoint and enters its configuration mode. Use this command to select and configure existing meshpoints.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
meshpoint [<MESHPOINT-NAME>|containing <WORD>]
```

Parameters

- `meshpoint [<MESHPOINT-NAME>|containing <WORD>]`
  
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;MESHPOINT-NAME&gt;</code></td>
<td>Specify the meshpoint name. If the meshpoint does not exist, it is created.</td>
</tr>
<tr>
<td>containing &lt;WORD&gt;</td>
<td>Selects existing meshpoints containing the sub-string &lt;WORD&gt; in their names</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config)#meshpoint TestMeshpoint
rfs7000-37FABE(config-meshpoint-TestMeshpoint)#?

Mesh Point Mode commands:

- allowed-vlans Set the allowed VLANs
- beacon-format The beacon format of this meshpoint
- control-vlan VLAN for meshpoint control traffic
- data-rates Specify the 802.11 rates to be supported on this meshpoint
- description Configure a description of the usage of this meshpoint
- meshid Configure the Service Set Identifier for this meshpoint
- neighbor Configure neighbor specific parameters
- no Negate a command or set its defaults
- root Set this meshpoint as root
- security-mode The security mode of this meshpoint
- shutdown Shutdown this meshpoint
- use Set setting to use
- wpa2 Modify ccmp wpa2 related parameters
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- exit End current mode and change to EXEC mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-meshpoint-TestMeshpoint)#

Related Commands

- `no` Removes an existing meshpoint

NOTE: For more information on Meshpoint configuration, see Chapter 26, MESHPOINT.
4.1.59 meshpoint-qos-policy

Global Configuration Commands

Configures a set of parameters that defines the meshpoint quality of service (QoS) policy.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>

Parameters

- meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>

<table>
<thead>
<tr>
<th>&lt;MESHPOINT-QOS-POLICY-NAME&gt;</th>
<th>Specify the meshpoint QoS policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
</table>

Examples

rfs7000-37FABE(config)#meshpoint-qos-policy TestMeshpointQoS
rfs7000-37FABE(config-meshpoint-qos-TestMeshpointQoS)#?

Mesh Point QoS Mode commands:

- accelerated-multicast Configure accelerated multicast streams address and forwarding QoS classification
- no Negate a command or set its defaults
- rate-limit Configure traffic rate-limiting parameters on a per-meshpoint/per-neighbor basis
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

rfs7000-37FABE(config-meshpoint-qos-TestMeshpointQoS)#

Related Commands

- no Removes an existing meshpoint QoS policy

NOTE: For more information on Meshpoint QoS policy configuration, see Chapter 26, MESHPOINT.
4.1.60 mint-policy

Enables global MiNT policy configuration.

Supported Platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
mint-policy global-default

Parameters
- mint-policy global-default

Examples
```
rfs7000-37FABE(config)#mint-policy global-default
rfs7000-37FABE(config-mint-policy-global-default)#?
```

Mint Policy Mode commands:
- level Mint routing level
- mtu Configure the global Mint MTU
- no Negate a command or set its defaults
- router Mint router
- udp Configure mint UDP/IP encapsulation

```
clrscr Clear the display screen
do Commit all changes made in this session
exit End current mode and change to EXEC mode
help Describe the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal
```

rfs7000-37FABE(config-mint-policy-global-default)#

NOTE: For more information on MiNT policy configuration, see Chapter 14, MINT-POLICY.
4.1.61 nac-list

A Network Access Control (NAC) policy configures a list of devices that can access a network based on their MAC addresses. The following table lists NAC list configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>nac-list</td>
<td>Creates a NAC list and enters its configuration mode</td>
<td>page 4-264</td>
</tr>
<tr>
<td>nac-list-mode</td>
<td>Summarizes NAC list configuration mode commands</td>
<td>page 4-265</td>
</tr>
</tbody>
</table>
4.1.61.1 nac-list

Configures a NAC list that manages access to the network

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
nac-list <NAC-LIST-NAME>

Parameters
- nac-list <NAC-LIST-NAME>

Examples
rfs7000-37FABE(config)#nac-list test
rfs7000-37FABE(config-nac-list-test)#?
NAC List Mode commands:
  exclude Specify MAC addresses to be excluded from the NAC enforcement list
  include Specify MAC addresses to be included in the NAC enforcement list
  no Negate a command or set its defaults
  clrscr Clear the display screen
  commit Commit all changes made in this session
  do Run commands from Exec mode
  end End current mode and change to EXEC mode
  exit End current mode and down to previous mode
  help Description of the interactive help system
  revert Revert changes
  service Service Commands
  show Show running system information
  write Write running configuration to memory or terminal

rfs7000-37FABE(config-nac-list-test)#

Related Commands
- no Removes a NAC list
### 4.1.61.2 nac-list-mode commands

The following table summarizes NAC list configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude</td>
<td>Specifies the MAC addresses excluded from the NAC enforcement list</td>
<td>page 4-266</td>
</tr>
<tr>
<td>include</td>
<td>Specifies the MAC addresses included in the NAC enforcement list</td>
<td>page 4-267</td>
</tr>
<tr>
<td>no</td>
<td>Cancels an exclude or include NAC list rule</td>
<td>page 4-268</td>
</tr>
</tbody>
</table>
4.1.61.2.1 exclude

**nac-list-mode commands**

Specifies the MAC addresses excluded from the NAC enforcement list

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
exclude <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

**Parameters**

- **<START-MAC>**: Specifies a range of MAC addresses or a single MAC address to exclude from the NAC enforcement list
  - **<START-MAC>** – Specify the first MAC address in the range.
  - **Note**: Use this parameter to specify a single MAC address.

- **<END-MAC>**: Specifies the last MAC address in the range (optional if a single MAC is added to the list)
  - **<END-MAC>** – Specify the last MAC address in the range.

- **precedence <1-1000>**: Sets the rule precedence. Exclude entries are checked in the order of their rule precedence.
  - **<1-1000>** – Specify a value from 1 - 1000.

**Examples**

```
rfs7000-37FABE(config-nac-list-test)#exclude 00-40-96-B0-BA-2A precedence 1
rfs7000-37FABE(config-nac-list-test)#show context nac-list test
   exclude 00-40-96-B0-BA-2A 00-40-96-B0-BA-2A precedence 1
rfs7000-37FABE(config-nac-list-test)#
```
### 4.1.61.2.2 include

**nac-list-mode commands**

Specifies the MAC addresses included in the NAC enforcement list

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
include <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]
```

**Parameters**

- `include <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `<START-MAC>` | Specifies a range of MAC addresses or a single MAC address to include in the NAC enforcement list  
- `<START-MAC>` – Specify the first MAC address in the range.  
**Note:** Use this parameter to specify a single MAC address |
| `<END-MAC>` | Specifies the last MAC address in the range (optional if a single MAC is added to the list)  
- `<END-MAC>` – Specify the last MAC address in the range. |
| precedence `<1-1000>` | Sets the rule precedence. Include entries are checked in the order of their rule precedence.  
- `<1-1000>` – Specify a value from 1 - 1000. |

**Examples**

```
rfs7000-37FABE(config-nac-list-test)#include 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
  exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
  include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#
```
4.1.61.2.3 no

nac-list-mode commands

Cancels an exclude or include NAC list rule

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [exclude|include]

no [exclude|include] <START-MAC> [<END-MAC> precedence <1-1000>|precedence <1-1000>]

Parameters

- no <PARAMETERS>
  
  no <PARAMETERS> Removes or reverts this NAC list's settings based on the parameters passed

Examples

The following example shows the NAC list 'test' settings before the 'no' command is executed:

rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
  exclude 00-04-96-B0-BA-2A 00-04-96-B0-BA-2A precedence 1
  include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#

rfs7000-37FABE(config-nac-list-test)#no exclude 00-40-96-B0-BA-2A precedence 1

The following example shows the NAC list 'test' settings after the 'no' command is executed:

rfs7000-37FABE(config-nac-list-test)#show context
nac-list test
  include 00-15-70-38-06-49 00-15-70-38-06-49 precedence 2
rfs7000-37FABE(config-nac-list-test)#

Related Commands

| exclude | Specifies MAC addresses excluded from the NAC enforcement list |
| include | Specifies MAC addresses included in the NAC enforcement list |
4.1.62 no

Global Configuration Commands

Negates a command, or reverts configured settings to their default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [aaa-policy|aaa-tacacs-policy|alias|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9500|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9500|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9500|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9500|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9500|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9500|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9500|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9500

no alias [address-range <ADDRESS-RANGE-ALIAS-NAME>|host <HOST-ALIAS-NAME>|network <NETWORK-ALIAS-NAME>|network-group <NETWORK-GROUP-ALIAS-NAME>] [address-range host [network] [network-service <NETWORK-SERVICE-ALIAS-NAME>] [number <NUMBER-ALIAS-NAME>] [string <STRING-ALIAS-NAME>] [vlan <VLAN-ALIAS-NAME>]

no application <APPLICATION-NAME>

no [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600]

no client-identity <CLIENT-IDENTITY-NAME>

no client-identity-group <CLIENT-IDENTITY-GROUP-NAME>

no device {containing <WORD>} [(filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600]}

The following ‘no’ commands are specific to the RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, and NX9000 platforms:

- no password-encryption secret 2 <OLD-PASSPHRASE>
- no profile {ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ex3524|ex3548|containing|filter|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600|t5|vx9000} <PROFILE-NAME>

The following ‘no’ commands are specific to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 platforms:

- no wlan [<WLAN-NAME>|all|containing <WLAN-NAME-SUBSTRING>]
- no service set [command-history|reboot-history|upgrade-history] {on <DEVICE-NAME>}

The following ‘no’ commands are specific to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 platforms:

- no t5 <T5-DEVICE-MAC>

The following ‘no’ commands are specific to the RFS4000, RFS6000, NX45XX, NX65XX, and NX9000 platforms:

- no bgp [as-path-list|community-list|extcommunity-list|ip-access-list|ip-prefix-list] <LIST-NAME>

The following ‘no’ commands are specific to the NX45XX, NX65XX, NX9000 series service platforms:

- no smart-cache-policy <SMART-CACHE-POLICY-NAME>

The following ‘no’ commands are specific to the NX45XX, NX65XX, NX9000 series service platforms:

- no route-map <ROUTE-MAP-NAME>

The following ‘no’ commands are specific to the AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP8132, RFS4000, RFS6000, RFS7000, NX45XX and NX65XX platforms:

- no url-filter <URL-FILTER-NAME>
- no url-list <URL-LIST-NAME>
- no web-filter-name <WEB-FILTER-NAME>

The following ‘no’ command is specific to the NX9000 series service platforms:

- no vx9000 <VX9000-MAC>

### Parameters

- no <PARAMETERS>

  Removes or resets settings, configurable in the global configuration mode, based on the parameters passed

### Examples

```shell
<DEVICE>(config)#no ?
aaa-policy Delete a aaa policy
aaa-tacacs-policy Delete a aaa tacacs policy
alias Alias
ap621 Delete an AP621 access point
ap622 Delete an AP622 access point
ap650 Delete an AP650 access point
ap6511 Delete an AP6511 access point
ap6521 Delete an AP6521 access point
ap6522 Delete an AP6522 access point
ap6532 Delete an AP6532 access point
ap6562 Delete an AP6562 access point
ap71xx Delete an AP71XX access point
ap7502 Delete an AP7502 access point
ap7522 Delete an AP7522 access point
ap7532 Delete an AP7532 access point
ap7562 Delete an AP7562 access point
ap81xx Delete an AP81XX access point
ap82xx Delete an AP82XX access point
application Delete an application
application-policy Delete an application policy
association-acl-policy Delete an association-acl policy
```
**GLOBAL CONFIGURATION COMMANDS**

- **auto-provisioning-policy**: Delete an auto-provisioning policy
- **bgp**: BGP Configuration
- **bonjour-gw-discovery-policy**: Disable Bonjour Gateway discovery policy
- **bonjour-gw-forwarding-policy**: Disable Bonjour Gateway Forwarding policy
- **bonjour-gw-query-forwarding-policy**: Disable Bonjour Gateway Query Forwarding policy
- **captive-portal**: Delete a captive portal
- **client-identity**: Client identity (DHCP Device Fingerprinting)
- **client-identity-group**: Client identity group (DHCP Fingerprint Database)
- **crypto-cmp-policy**: CMP policy
- **customize**: Restore the custom cli commands to default
- **device**: Delete multiple devices
- **device-categorization**: Delete device categorization object
- **dhcp-server-policy**: DHCP server policy
- **dhcppv6-server-policy**: DHCPv6 server related configuration
- **dns-whitelist**: Delete a whitelist object
- **event-system-policy**: Delete a event system policy
- **ex3500**: Ex3500 device
- **ex3500-management-policy**: Delete a ex3500 management policy
- **ex3500-qos-class-map-policy**: Delete a ex3500 qos class-map policy
- **ex3500-qos-policy-map**: Delete a ex3500 qos policy-map
- **ex3524**: Delete an EX3524 wireless controller
- **ex3548**: Delete an EX3548 wireless controller
- **firewall-policy**: Configure firewall policy
- **global-association-list**: Delete a global association list
- **guest-management**: Delete a guest management policy
- **igmp-snoop-policy**: Remove device onboard igmp snoop policy
- **inline-password-encryption**: Disable storing encryption key in the startup configuration file
- **ip**: Internet Protocol (IP)
- **ipv6**: Internet Protocol version 6 (IPv6)
- **ipv6-router-advertisement-policy**: IPv6 Router Advertisement related configuration
- **l2tpv3**: Negate a command or set its defaults
- **mac**: MAC configuration
- **management-policy**: Delete a management policy
- **meshpoint**: Delete a meshpoint object
- **meshpoint-qos-policy**: Delete a mesh point QoS configuration policy
- **nac-list**: Delete an network access control list
- **nsight-policy**: Delete a nsight policy
- **nx45xx**: Delete an NX45XX integrated services platform
- **nx5500**: Delete an NX5500 wireless controller
- **nx65xx**: Delete an NX65XX integrated services platform
- **nx75xx**: Delete an NX75XX wireless controller
- **nx9000**: Delete an NX9000 wireless controller
- **passpoint-policy**: Delete a passpoint configuration policy
- **password-encryption**: Disable password encryption in configuration
- **profile**: Delete a profile and all its associated configuration
- **radio-qos-policy**: Delete a radio QoS configuration policy
- **radius-group**: Local radius server group configuration
- **radius-server-policy**: Remove device onboard radius policy
- **radius-user-pool-policy**: Configure Radius User Pool
- **rf-domain**: Delete one or more RF-domains and all their associated configurations
- **rfs4000**: Delete an RFS4000 wireless controller
- **rfs6000**: Delete an RFS6000 wireless controller
- **rfs7000**: Delete an RFS7000 wireless controller
- **roaming-assist-policy**: Delete a roaming-assist policy
- **role-policy**: Role based firewall policy
- **route-map**: Dynamic routing route map Configuration
- **routing-policy**: Policy Based Routing Configuration
smart-cache-policy           Delete a content caching
smart-rf-policy             Delete a smart-rf-policy
vx9000                      Delete an VX9000 wireless controller
url-filter                  Delete a url filter
url-list                    Delete a URL list

</tbody>
</table>
4.1.63.1 nsight-policy

Creates an NSight policy and enters its configuration mode

The NSight policy is an advance management, analytics, reporting, and troubleshooting tool, which when created and applied at the RF Domain level allows the RF Domain manager to send statistics (polled from devices within the RF Domain) to the NOC. The NOC, when enabled as the NSight server, stores this data in a locally or externally hosted MongoDB database. This large, complex data are collated and presented on the NOC's GUI in visual forms that are easy to understand and manage. For large networks, enabling NSight removes the inadequacies of the existing data collection, presentation, and analytics framework.

The WiNG NSight implementation consists of the following components:

- An NSight server hosted on the NOC
- A MongoDB database hosted on the NOC. This database consists of AP statistics gathered by RF Domain managers.
- An NSight UI application running on the NOC
- An NSight client hosted on the RF Domain manager. This is the SSM statistics module that periodically gathers statistics from adopted APs and forwards to the NSight server.

NOTE: NSight is a licensed option. To enable the NSight, navigate to the NSight server's device configuration mode and apply the NSight license.

To enable NSight, follow the steps given below:

1. Create an NSight policy to enable the NSight server.

   ```
   nx9500-6C8809 (config-nsight-policy-nsight-for-noc) #enable
   nx9500-6C8809 (config-nsight-policy-nsight-for-noc) #nsight-server
   nx9500-6C8809 (config-nsight-policy-nsight-for-noc) #show context
   nsight-policy nsight-for-noc
   nsight-server
   nx9500-6C8809 (config-nsight-policy-nsight-for-noc) #
   ```

2. Apply the policy configured in step 1 to the NOC. This enables the NOC to recognize itself as the NSight server.

   ```
   nx9500-6C8809 (config)#self
   nx9500-6C8809 (config-device-B4-C7-99-6C-88-09) #use nsight-policy nsight-for-noc
   ```

3. Create another NSight policy pointing to the NSight server host.

   ```
   nx9500-6C8809 (config-nsight-policy-nsight-for-rfdm) #enable
   nx9500-6C8809 (config-nsight-policy-nsight-for-rfdm) #server host 192.168.13.13
   nx9500-6C8809 (config-nsight-policy-nsight-for-rfdm) #show context
   nsight-policy nsight-for-rfdm
   server host 192.168.13.13 https
   nx9500-6C8809 (config-nsight-policy-nsight-for-rfdm)#
   ```

4. Apply the policy configured in step 3 to the RF Domain. This enables the domain manager to collect statistics from the access points and send to the NOC serving as the NSight server.

   ```
   nx9500-6C8809 (config)#rf-domain TechPubs
   nx9500-6C8809 (config-rf-domain-TechPubs)#use nsight-policy nsight-for-rfdm
   nx9500-6C8809 (config-rf-domain-TechPubs) #show context
   rf-domain TechPubs
   location SanJose
   timezone America/Los_Angeles
   country-code us
   ```
use nsight-policy nsight-for-rfdm

nx9500-6C8809(config-rf-domain-TechPubs)#

The NoC stores the statistical data, received from RF Domain managers, in the MongoDB database. This data contains following information:

- Operating parameters of devices – Fixed information of devices, such as IP addresses, wired interface status, radio operating parameters (channel, power etc.)
- SMART RF neighbor information – SMART RF neighbors’ data for every radio. This data is used to generate and display heat-maps on floor map. Any changes in the SMART RF data is reported to the MART server and stored in the database.
- Rogue AP information – Rogue AP list and rogue AP status. Any changes in the rouge AP list or status is reported to the MART server and stored in the database.
- Wireless client list – Details of wireless clients within the RF Domain
- Wireless access point statistics – Statistics of all the APs in the RF Domain. AP statistics includes details, such as number of bytes transferred since the last reporting interval, number of TX retries, signal-noise-ratio (SNR), noise, RF quality index, client count etc.
- Wireless client statistics – Statistics of all the wireless clients in the RF Domain. Wireless client statistics includes details, such as number of bytes transferred from last reporting interval, number of TX retries, SNR, RF quality index etc.
- Wired interface statistics – Statistics of wired interfaces of all APs. It includes details, such as interface status, number of bytes transferred from last reporting interval etc.
- Event history – Event details for all APs adopted by the NOC. These are events received by the Cfgd every 30 seconds and sent to the MART server. Each event consists of the RF Domain name, wireless client MAC if applicable, AP MAC, event mnemonic, event timestamp, and the event string itself.

Apart from the above mentioned data, the MongoDB database contains information that is reported to the NSight server by the Cfgd running on the NOC. These are:

- Device information – Information of all devices (APs and controllers) within the network, such as hostname, device type, firmware version, location, geo-coordinates etc. This information is collected and reported by the Cfgd running on the NOC.
- Configuration elements, such as RF Domains, RF Domain location hierarchy, WLANs.

NOTE: All network devices (APs and controllers) should be upgraded to the latest WiNG 5.8 build for NSight and MongoDB implementation.

Supported in the following platforms:

- Service Platforms — NX7500, NX9500, NX9510, NX9600

Syntax

nsight-policy <NSIGHT-POLICY-NAME>

Parameters

- nsight-policy <NSIGHT-POLICY-NAME>

<NSIGHT-POLICY-NAME> Specify the NSight policy name. If the policy does not exist, it is created.
Examples

nx9500-6C8809(config)#nsight-policy test
nx9500-6C8809(config-nsight-policy-test)#?

Nsight Policy Mode commands:

- **enable** - Enable this Nsight policy
- **no** - Negate a command or set its defaults
- **nsight-server** - Enable Nsight server functionality
- **server** - Configure Nsight server

- **clrscr** - Clears the display screen
- **commit** - Commit all changes made in this session
- **end** - End current mode and change to EXEC mode
- **exit** - End current mode and down to previous mode
- **help** - Description of the interactive help system
- **revert** - Revert changes
- **service** - Service Commands
- **show** - Show running system information
- **write** - Write running configuration to memory or terminal

nx9500-6C8809(config-nsight-policy-test)#

4.1.63.2.1 enable

nsight-policy commands

Enables/disables this NSight policy. The default setting is enabled.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

```
enable
```

Parameters

None

Examples

```
nx9510-6C8A5C(config-nsight-policy-test2)#enable
```

Related Commands

```
no
```

Disables this NSight policy
4.1.63.2.2 nsight-server

Enables NSight server functionality and configures the SMTP report delivery settings. When applied to a device (NOC), this policy enables the device to recognize itself as the NSight server.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

```
nsight-server {smtp-report-delivery host <WORD> sender <EMAIL-ADD> [port <1-65535>]
  security [none|ssl|starttls] [username <USER-NAME> password [0|2|<WORD>]]}
```

Parameters

- `nsight-server {smtp-report-delivery host <WORD> sender <EMAIL-ADD> [port <1-65535>]
  security [none|ssl|starttls] [username <USER-NAME> password [0|2|<WORD>]]}`

Related Commands

- `no` Disables NSight server functionality on this NSight policy
4.1.63.2.3 server

» nsight-policy commands

Configures the NSight server host. This configuration is used by the NSight client to identify the NSight server host.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax
server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}

Parameters
- server host [<IP>|<HOSTNAME>|<X:X::X:X>] {http|https}

| server host [<IP>|<HOSTNAME>|<X:X::X:X>] | Configures the NSight server host's address. Use one of the following options to identify the NSight server host:
| | • <IP> – Configures the NSight server’s IPv4 address
| | • <HOSTNAME> – Configures the NSight server’s hostname
| | • <X:X::X:X> – Configures the NSight server’s IPv6 address

| {http|https} | Optional. Configures the protocol used to communicate with the NSight server
| | • http – Optional. Uses HTTP to communicate
| | • https – Optional. Uses HTTPS to communicate (this is the default setting)

Examples
nx9510-6C8A5C(config-nsight-policy-test2)#server host 172.22.0.153 http
nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
server host 172.22.0.153 http
nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#

Related Commands
- no | Removes NSight server host settings from this NSight policy
4.1.63.2.4 no

nsight-policy commands

Removes this NSight policy settings

Supported in the following platforms:

- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

no [enable|nsight-server {smtp-report-delivery}|server host [<IP>|<HOSTNAME>|<X:X::X:X>]]

Parameters

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes this NSight policy settings based on the parameters passed</th>
</tr>
</thead>
</table>

Examples

The following example shows the NSight policy 'test2' settings before the 'no' command is executed:

nx9510-6C8A5C(config-nsight-policy-test2)#show context
nsight-policy test2
server host 172.22.0.153 http
nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#

nx9510-6C8A5C(config-nsight-policy-test2)#no server host 172.22.0.153

The following example shows the NSight policy 'test2' settings after the 'no' command is executed:

nx9500-6C8809(config-nsight-policy-test2)#show context
nsight-policy test2
nsight-server
nx9510-6C8A5C(config-nsight-policy-test2)#
4.1.64 passpoint-policy

Global Configuration Commands

Creates a new passpoint policy and enters its configuration mode

The passpoint policy implements the Hotspot 2.0 Wi-Fi Alliance standard, enabling interoperability between clients, infrastructure, and operators. It makes a portion of the IEEE 802.11u standard mandatory and adds Hotspot 2.0 extensions that allow clients to query a network before actually attempting to join it.

The passpoint policy allows a single or set of Hotspot 2.0 configurations to be global and referenced by the devices that use it. It is mapped to a WLAN. However, only primary WLANs on a BSSID will have their passpoint policy configuration used.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
passpoint-policy <POLICY-NAME>
```

Parameters

- `passpoint-policy <POLICY-NAME>` Specify the passpoint policy name. If a passpoint policy does not exist, it is created.

Examples

```bash
rfs4000-229D58(config)#passpoint-policy test
rfs4000-229D58(config-passpoint-policy-test)##
rfs4000-229D58(config-passpoint-policy-test)##
```

Passpoint Policy Mode commands:

- `3gpp` Configure a 3gpp plmn (public land mobile network) id
- `access-network-type` Set the access network type for the passpoint
- `connection-capability` Configure the connection capability for the passpoint
- `domain-name` Add a domain-name for the passpoint
- `hessid` Set a homogeneous ESSID value for the passpoint
- `internet` Advertise the passpoint having internet access
- `ip-address-type` Configure the advertised ip-address-type
- `nai-realm` Configure a NAI realm for the passpoint
- `net-auth-type` Add a network authentication type to the passpoint
- `no` Negate a command or set its defaults
- `operator` Add configuration related to the operator of the passpoint
- `osu` Online signup
- `roam-consortium` Add a roam consortium for the passpoint
- `venue` Set the venue parameters of the passpoint
- `wan-metrics` Set the wan-metrics of the passpoint
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```bash
rfs4000-229D58(config-passpoint-policy-test)##
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes an existing passpoint policy</td>

</tbody>
</table>

**NOTE:** For more information on passpoint policy, see Chapter 27, PASSPOINT POLICY.
4.1.65 password-encryption

Enables password encryption

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

password-encryption secret 2 <LINE>

Parameters

- password-encryption secret 2 <LINE>

<table>
<thead>
<tr>
<th>secret 2 &lt;LINE&gt;</th>
<th>Encrypts passwords with a secret phrase</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Specifies the encryption type as either SHA256 or AES256</td>
</tr>
<tr>
<td>&lt;LINE&gt;</td>
<td>Specify the encryption passphrase.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config)#password-encryption secret 2 example_company
nx6500-31FABE(config)#password-encryption secret 2 example_

Related Commands

no |

| Disables password encryption |
4.1.66 profile

Global Configuration Commands

Configures profile related commands. If no parameters are given, all profiles are selected.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

Syntax

profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|containing\filter|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}

profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|containing\filter|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}{anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|containing\filter|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}{<DEVICE-TYPE>}{<DEVICE-PROFILE-NAME>}

profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|containing\filter|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}{<DEVICE-TYPE>}{<DEVICE-PROFILE-NAME>}

Parameters

- profile {anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|containing\filter|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}{<DEVICE-TYPE>}{<DEVICE-PROFILE-NAME>}

Configures device profile commands. If no device profile is specified, the system configures all device profiles.

- <DEVICE-TYPE> — Select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, and NX9600. After specifying the device type, specify the profile name.

- <DEVICE-PROFILE-NAME> — Specify the profile name.

Note: Select 'anyap' to configure a profile applicable to any access point.

Note: The NX9600 profile option is only available on an NX9600 device.

- profile {containing \<DEVICE-PROFILE-NAME>\}{filter type \[ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx\]}{rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}

Configures profiles that contain a specified sub-string in the hostname.

- <DEVICE-PROFILE-NAME> — Specify a substring in the profile name to filter profiles.
filter type | Optional. An additional filter used to configure a specific type of device profile. If no device type is specified, the system configures all device profiles.
---|---
  • type – Filters profiles by the device type. Select a device type from the following options: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, and NX9600.
  
**Note:** The NX9600 profile option is only available on an NX9600 device.

```
profile {filter type [ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600]}
```

| filter type | Optional. An additional filter used to configure a specific type of device profile. If no device type is specified, the system configures all device profiles.
---|---
  • type – Filters profiles by the device type. Select a device type from the following options: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, and NX9600.
  
**Note:** The NX9600 profile option is only available on an NX9600 device.

---

**Examples**

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#?
```

Profile Mode commands:

- **adopter-auto-provisioning-policy-lookup** | Use centralized auto-provisioning policy when adopted by another controller
- **adoption** | Adoption configuration
- **alias** | Alias
- **application-policy** | Application Policy configuration
- **area** | Set name of area where the system is located
- **arp** | Address Resolution Protocol (ARP)
- **auto-learn-staging-config** | Enable learning network configuration of the devices that come for adoption
- **autogen-uniqueid** | Autogenerate a unique id
- **autoinstall** | Autoinstall settings
- **blueprint** | Detect Bluetooth devices using the Bluetooth USB module
- **bridge** | Ethernet bridge
- **captive-portal** | Captive portal
- **cdp** | Cisco Discovery Protocol
- **cluster** | Cluster configuration
- **configuration-persistence** | Enable persistence of configuration across reloads (startup config file)
- **controller** | WLAN controller configuration
- **critical-resource** | Critical Resource
- **crypto** | Encryption related commands
- **database-backup** | Scheduled Database Backup
- **device-upgrade** | Device firmware upgrade
- **dot1x** | 802.1X
- **dpi** | Enable Deep-Packet-Inspection (Application Assurance)
- **dscp-mapping** | Configure IP DSCP to 802.1p priority mapping for untagged frames
- **email-notification** | Email notification configuration

Check the firmware versions of devices before interoperating
Environmental Sensors Configuration
System event messages
Export a file
File sync between controller and adoptees
Set the floor within a area where the system is located
GRE protocol
Specify HTTP-Analysis configuration
Select an interface to configure
Internet Protocol (IP)
Internet Protocol version 6 (IPv6)
L2tpv3 protocol
L3e lite Table
Turn LEDs on/off on the device
Configure the time for the led to turn off after the last radio state change
Enable device firmware to auto downgrade when other legacy devices are detected
Auto upgrade of legacy devices
Link Layer Discovery Protocol
Configure load balancing parameter
Modify message logging facilities
MAC Address Table
802.1X Memory profile to be used on the device
Configure meshpoint device parameters
Configure meshpoint monitoring interval
Check controller connectivity after configuration is received
Check controller inactivity timeout
Configure neighbor information exchange interval
Negate a command or set its defaults
Configure the noc related setting
Ntp server WORD
Set duration for which a device remains unadopted before it generates offline event
Configure power mode
Controller group this system will prefer for adoption
Tunnel Controller Name this system will prefer for tunneling extended vlan traffic
Configure device-level radius authentication parameters
RAID
Remove configuration item override from the device (so profile value takes effect)
RF Domain Manager
Dynamic routing
PCI expansion Slot
Spanning tree
Configure IPv6 traffic class to 802.1p priority mapping for untagged frames
### Traffic Shaping Commands

4.1.67 radio-qos-policy

Configures a radio quality-of-service (QoS) policy

Supported in the following platforms:

- Wireless Controllers — RFS4011

Syntax

radio-qos-policy <RADIO-QOS-POLICY-NAME>

Parameters

- radio-qos-policy <RADIO-QOS-POLICY-NAME>

| <RADIO-QOS-POLICY-NAME> | Specify the radio QoS policy name. If the policy does not exist, it is created. |

Examples

rfs7000-37FABE(config)#radio-qos-policy test
rfs7000-37FABE(config-radio-qos-test)('#)

Radio QoS Mode commands:

- accelerated-multicast: Configure multicast streams for acceleration
- admission-control: Configure admission-control on this radio for one or more access categories
- no: Negate a command or set its defaults
- smart-aggregation: Configure smart aggregation parameters
- wmm: Configure 802.11e/Wireless MultiMedia parameters
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

rfs7000-37FABE(config-radio-qos-test)#

Related Commands

no

| Removes an existing Radio QoS policy |

**NOTE:** For more information on radio qos policy, see Chapter 17, RADIO-QOS-POLICY.
4.1.68 radius-group

- **Global Configuration Commands**

Configures RADIUS user group parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
radius-group <RADIUS-GROUP-NAME>
```

**Parameters**

- radius-group <RADIUS-GROUP-NAME>

<table>
<thead>
<tr>
<th>&lt;RADIUS-GROUP-NAME&gt;</th>
<th>Specify a RADIUS user group name. The name should not exceed 64 characters. If the RADIUS user group does not exist, it is created.</th>
</tr>
</thead>
</table>

**Examples**

```
rfs7000-37FABE(config)#radius-group testgroup
rfs7000-37FABE(config-radius-group-testgroup)#?
```

Radius user group configuration commands:

- **guest** Make this group a Guest group
- **no** Negate a command or set its defaults
- **policy** Radius group access policy configuration
- **rate-limit** Set rate limit for group

<table>
<thead>
<tr>
<th>clrscr</th>
<th>Clears the display screen</th>

</table>

```
rfs7000-37FABE(config-radius-group-testgroup)#
```

**Related Commands**

- `no` Removes an existing RADIUS group

**NOTE:** For more information on RADIUS user group commands, see Chapter 16, RADIUS-POLICY.
GLOBAL CONFIGURATION COMMANDS

4.1.69 radius-server-policy

Global Configuration Commands

Creates an onboard device RADIUS policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

radius-server-policy <RADIUS-SERVER-POLICY-NAME>

Parameters

- radius-server-policy <RADIUS-SERVER-POLICY-NAME>

<table>
<thead>
<tr>
<th>&lt;RADIUS-SERVER-POLICY-NAME&gt;</th>
<th>Specify the RADIUS server policy name. If the policy does not exist, it is created.</th>
</tr>
</thead>
</table>

Examples

rfs7000-37FABE(config)#radius-server-policy testpolicy
rfs7000-37FABE(config-radius-server-policy-testpolicy)#?

Radius Configuration commands:

- authentication
- bypass
- chase-referral
- ctrl-check
- ldap-agent
- ldap-group-verification
- ldap-server
- local
- nas
- no
- proxy
- session-resumption
- termination
- use
- clrscr
- commit
- do
- end
- exit
- help
- revert
- service
- show
- write

rfs7000-37FABE(config-radius-server-policy-testpolicy)#

Related Commands

- no
  - Removes an existing RADIUS server policy
NOTE: For more information on RADIUS server policy commands, see Chapter 16, RADIUS-POLICY.
4.1.70 radius-user-pool-policy

Configure a RADIUS user pool

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

radius-user-pool-policy <RADIUS-USER-POOL-POLICY-NAME>

**Parameters**

- radius-user-pool-policy <RADIUS-USER-POOL-POLICY-NAME>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;RADIUS-USER-POOL-POLICY-NAME&gt;</td>
<td>Specify the RADIUS user pool policy name. If the policy does not exist, it is created.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config)#radius-user-pool-policy testpool
rfs7000-37FABE(config-radius-user-pool-testpool)#?
Radius User Pool Mode commands:
duration Set a guest user's access duration
no Negate a command or set its defaults
user Radius user configuration
clrscr Clear the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal
```

rfs7000-37FABE(config-radius-user-pool-testpool)#

**Related Commands**

- `no` Removes an existing RADIUS user pool

**NOTE:** For more information on RADIUS user group commands, see Chapter 16, RADIUS-POLICY.
4.1.71 rename

> Global Configuration Commands

Renames and existing TLO

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

rename tlo <TLO-NAME>

Parameters

- rename tlo <TLO-NAME> <NEW-TLO-NAME>

<table>
<thead>
<tr>
<th>rename tlo &lt;TLO-NAME&gt;</th>
<th>Renames an existing TLO object</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;TLO-NAME&gt;</td>
<td>&lt;TLO-NAME&gt; – Specify the TLO's name. This is the TLO that is to be renamed.</td>
</tr>
<tr>
<td>&lt;NEW-TLO-NAME&gt;</td>
<td>&lt;NEW-TLO-NAME&gt; – Specify the new name for this TLO</td>
</tr>
</tbody>
</table>

Note: Enter rename and press Tab to list top level objects available for renaming.

Examples

The following example shows the top level objects available for renaming:

rfs4000-229D58(config)#rename
aaa_policy
address_range_alias
auto_provisioning_policy
bonjour_gw_forwarding_policy
bridging_policy
centro_policy
client_identity_group

4.1.72 rf-domain

Global Configuration Commands

An RF Domain groups devices that can logically belong to one network.

The following table lists the RF Domain configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>rf-domain</td>
<td>Creates a RF Domain policy and enters its configuration mode</td>
<td>page 4-298</td>
</tr>
<tr>
<td>rf-domain-mode</td>
<td>Invokes RF Domain configuration mode commands</td>
<td>page 4-300</td>
</tr>
</tbody>
</table>
4.1.72.1 rf-domain

rf-domain

Creates an RF Domain or enters the RF Domain configuration context for one or more RF Domains. If the RF Domain does not exist, it is created.

The configuration of controllers (wireless controllers, service platforms, and access points) comprises of RF Domains that define regulatory, location, and other relevant policies. At least one default RF Domain is assigned to each controller.

RF Domains allow administrators to assign configuration data to multiple devices deployed in a common coverage area, such as in a floor, building, or site. Each RF Domain contains policies that set the Smart RF or WIPS configuration.

RF Domains also enable administrators to override WLAN SSID name and VLAN assignments. This enables the deployment of a global WLAN across multiple sites and unique SSID name or VLAN assignments to groups of access points servicing the global WLAN. This WLAN override eliminates the need to define and manage a large number of individual WLANs and profiles.

A controller’s configuration contains:

- A default RF Domain - Each controller utilizes a default RF Domain. Access Points are assigned to this default RF Domain as they are discovered by the controller. A default RF Domain can be used for single-site and multi-site deployments.

- Single-site deployment – The default RF Domain can be used for single site deployments, where regional, regulatory, and RF policies are common between devices.

- Multi-site deployment – A default RF Domain can omit configuration parameters to prohibit regulatory configuration from automatically being inherited by devices as they are discovered. This is desirable in multi-site deployments with devices spanning multiple countries. Omitting specific configuration parameters eliminates the risk of an incorrect country code from being automatically assigned to a device.

- A user-defined RF Domain - Created by administrators. A user-defined RF Domain can be assigned to multiple devices manually or automatically.

- Manually assigned – Use the CLI or UI to manually assign a user-defined RF Domain to controllers and service platforms.

- Automatically assigned – Use a AP provisioning policy to automatically assign specific RF Domains to access points based on the access point’s model, serial number, VLAN, DHCP option, and IP address or MAC address. Automatic RF Domain assignments are useful in large deployments, as they enable plug-n-play access point deployments by automatically applying RF Domains to remote access points. For more information on auto provisioning policy, see Chapter 9, AUTO-PROVISIONING-POLICY.

Configure and deploy user-defined RF Domains for single or multiple sites where devices require unique regulatory and regional configurations, or unique Smart RF and WIPS policies. User-defined RF Domains can be used to:

- Assign unique Smart RF or WIPS policies to access points deployed on different floors or buildings within in a site.

- Assign unique regional or regulatory configurations to devices deployed in different states or countries.

- Assign unique WLAN SSIDs and/or VLAN IDs to sites assigned a common WLAN without having to define individual WLANs for each site.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX

- Wireless Controllers — RFS4000, RFS6000, RFS7000

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
### Syntax

```
rf-domain {<RF-DOMAIN-NAME>|containing <RF-DOMAIN-NAME>}
```

### Parameters

- **rf-domain {<RF-DOMAIN-NAME>|containing <RF-DOMAIN-NAME>}**
  - **<RF-DOMAIN-NAME>** Optional. Specify the RF Domain name (should not exceed 32 characters and should represent the intended purpose). Once created, the name cannot be edited.
  - **containing <RF-DOMAIN-NAME>** Optional. Identifies an existing RF Domain that contains a specified sub-string in the domain name

<table>

### Examples

```
rfs7000-37FABE(config)#rf-domain rfs7000
rfs7000-37FABE(config)#rf-domain rfs7000)?
rfs7000-37FABE(config-rf-domain-rfs7000)#
```

rf-domain Creates a new RF Domain or enters its configuration context

- `<RF-DOMAIN-NAME>` – Specify a sub-string of the RF Domain name.
### 4.1.72.2 rf-domain-mode commands

This section describes the default commands under RF Domain.

The following table summarizes RF Domain configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>Configures network, VLAN, and service aliases at the RF Domain level</td>
<td>page 4-301</td>
</tr>
<tr>
<td>channel-list</td>
<td>Configures the channel list advertised by radios</td>
<td>page 4-307</td>
</tr>
<tr>
<td>contact</td>
<td>Configures network administrator's contact information (needed in case of any problems impacting the RF Domain)</td>
<td>page 4-308</td>
</tr>
<tr>
<td>control-vlan</td>
<td>Configures VLAN for traffic control on a RF Domain</td>
<td>page 4-309</td>
</tr>
<tr>
<td>controller-managed</td>
<td>Configures the adopting controller or service platform as this RF Domain's manager</td>
<td>page 4-310</td>
</tr>
<tr>
<td>country-code</td>
<td>Configures the country of operation</td>
<td>page 4-311</td>
</tr>
<tr>
<td>layout</td>
<td>Configures layout information</td>
<td>page 4-312</td>
</tr>
<tr>
<td>location</td>
<td>Configures the physical location of a RF Domain</td>
<td>page 4-314</td>
</tr>
<tr>
<td>mac-name</td>
<td>Maps MAC addresses to names</td>
<td>page 4-315</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts configured settings to their default</td>
<td>page 4-316</td>
</tr>
<tr>
<td>override-smart-rf</td>
<td>Configures RF Domain level overrides for Smart RF</td>
<td>page 4-317</td>
</tr>
<tr>
<td>override-wlan</td>
<td>Configures RF Domain level overrides for a WLAN</td>
<td>page 4-318</td>
</tr>
<tr>
<td>sensor-server</td>
<td>Configures an AirDefense sensor server on this RF Domain</td>
<td>page 4-320</td>
</tr>

4.1.7 2.2.1 alias

rf-domain-mode commands

Configures network, VLAN, host, string, and network-service aliases at the RF Domain level.

This command also allows you to associate existing aliases, created in the global configuration mode, and apply overrides to customize for use at the domain level.

For information on aliases, see alias.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

alias [address-range|host|network|network-group|network-service|number|string|vlan]

alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

alias host <HOST-ALIAS-NAME> <HOST-IP>

alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network]

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP>]

alias number <NUMBER-ALIAS-NAME> <0-4294967295>

alias string <STRING-ALIAS-NAME> <LINE>

alias vlan <VLAN-ALIAS-NAME> <1-4094>

Parameters

- alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>
  
  address-range <ADDRESS-RANGE-ALIAS-NAME> Creates a new address-range alias for this RF Domain. Or associates an existing address-range alias with this RF Domain. An address-range alias maps a name to a range of IP addresses.
  
  Note: Alias name should begin with '$'.

  <STARTING-IP> to <ENDING-IP> Associates a range of IP addresses with this address range alias
  
  Note: If using an existing address-range alias, you can apply overrides to the alias at the RF Domain level.
### alias host <HOST-ALIAS-NAME> <HOST-IP>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host &lt;HOST-ALIAS-NAME&gt;</td>
<td>Creates a host alias for this RF Domain. Or associates an existing host alias with this RF Domain. A host alias maps a name to a single network host.</td>
</tr>
<tr>
<td></td>
<td>• &lt;HOST-ALIAS-NAME&gt; – Specify the host alias name.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Alias name should begin with <code>$</code>.</td>
</tr>
<tr>
<td>&lt;HOST-IP&gt;</td>
<td>Associates the network host’s IP address with this host alias.</td>
</tr>
<tr>
<td></td>
<td>• &lt;HOST-IP&gt; – Specify the network host’s IP address.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If using an existing host alias, you can apply overrides to the alias at the RF Domain level.</td>
</tr>
</tbody>
</table>

### alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>network &lt;NETWORK-ALIAS-NAME&gt;</td>
<td>Creates a network alias for this RF Domain. Or associates an existing network alias with this RF Domain. A network alias maps a name to a single network address.</td>
</tr>
<tr>
<td></td>
<td>• &lt;NETWORK-ALIAS-NAME&gt; – Specify the network alias name.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Alias name should begin with <code>$</code>.</td>
</tr>
<tr>
<td>&lt;NETWORK-ADDRESS/MASK&gt;</td>
<td>Associates a single network with this network alias.</td>
</tr>
<tr>
<td></td>
<td>• &lt;NETWORK-ADDRESS/MASK&gt; – Specify the network’s address and mask.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If using an existing network alias, you can apply overrides to the alias at the RF Domain level.</td>
</tr>
</tbody>
</table>

### alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range <STARTING-IP> to <ENDING-IP> | host <HOST-IP> | network <NETWORK-ADDRESS/MASK>]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>network &lt;NETWORK-GROUP-ALIAS-NAME&gt;</td>
<td>Creates a network-group alias for this RF Domain. Or associates an existing network-group alias with this RF Domain.</td>
</tr>
<tr>
<td></td>
<td>• &lt;NETWORK-GROUP-ALIAS-NAME&gt; – Specify the network-group alias name.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Alias name should begin with <code>$</code>.</td>
</tr>
<tr>
<td>address-range &lt;STARTING-IP&gt; to &lt;ENDING-IP&gt;</td>
<td>Associates a range of IP addresses with this network-group alias</td>
</tr>
<tr>
<td></td>
<td>• &lt;STARTING-IP&gt; – Specify the first IP address in the range.</td>
</tr>
<tr>
<td></td>
<td>• to &lt;ENDING-IP&gt; – Specify the last IP address in the range.</td>
</tr>
<tr>
<td></td>
<td>• &lt;STARTING-IP&gt; to &lt;ENDING-IP&gt; – Optional. Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured.</td>
</tr>
<tr>
<td>host &lt;HOST-IP&gt;</td>
<td>Associates a single or multiple hosts with this network-group alias</td>
</tr>
<tr>
<td></td>
<td>• &lt;HOST-IP&gt; – Specify the hosts’ IP address.</td>
</tr>
<tr>
<td></td>
<td>• &lt;HOST-IP&gt; – Optional. Specifies more than one host. A maximum of eight (8) hosts can be configured.</td>
</tr>
<tr>
<td>network &lt;NETWORK-ADDRESS/MASK&gt;</td>
<td>Associates a single or multiple networks with this network-group alias</td>
</tr>
<tr>
<td></td>
<td>• &lt;NETWORK-ADDRESS/MASK&gt; – Specify the network’s address and mask.</td>
</tr>
<tr>
<td></td>
<td>• &lt;NETWORK-ADDRESS/MASK&gt; – Optional. Specifies more than one network. A maximum of eight (8) networks can be configured.</td>
</tr>
</tbody>
</table>

Creates a network-service alias for this RF Domain. Or associates an existing network-service alias with this RF Domain. A network-service alias maps a name to network services and the corresponding source and destination software ports.

- `<NETWORK-SERVICE-ALIAS-NAME>` – Specify a network-service alias name.

**Note:** Alias name should begin with `$`.

**Note:** If using an existing network-service alias, you can apply overrides to the alias at the RF Domain level.

### proto [<0-254>|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp]

Use one of the following options to associate an Internet protocol with this network-service alias:

- `<0-254>` – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the `Protocol` field of the IPv4 header and the `Next Header` field of IPv6 header. For example, the `User Datagram Protocol's` (UDP) designated number is 17.
- `<WORD>` – Identifies the protocol by its name. Specify the protocol name.
- `gre` – Selects *Generic Routing Encapsulation* (GRE). The protocol number is 47.
- `ospf` – Selects *Open Shortest Path First* (OSPF). The protocol number is 89.
- `vrrp` – Selects *Virtual Router Redundancy Protocol* (VRRP). The protocol number is 112.

### {(<1-65535>|<WORD>|bgp|dns|ftp|ftp-data|gopher|https|ldap|ntp|pop3|proto|sip|smtp|sourceport [<1-65535>|<WORD>]|ssh|telnet|tftp|www)}

After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports.

- `<1-65535>` – Optional. Configures a destination port number from 1 - 65535
- `<WORD>` – Optional. Identifies the destination port by the service name provided. For example, the *secure shell* (SSH) service uses TCP port 22.
- `bgp` – Optional. Configures the default *Border Gateway Protocol* (BGP) services port (179)
- `dns` – Optional. Configures the default *Domain Name System* (DNS) services port (53)
- `ftp` – Optional. Configures the default *File Transfer Protocol* (FTP) control services port (21)
- `ftp-data` – Optional. Configures the default FTP data services port (20)
- `gopher` – Optional. Configures the default gopher services port (70)
- `https` – Optional. Configures the default HTTPS services port (443)
- `ntp` – Optional. Configures the default Newsgroup (NNTP) services port (119)
- `ntp` – Optional. Configures the default *Network Time Protocol* (NTP) services port (123)
- `POP3` – Optional. Configures the default *Post Office Protocol* (POP3) services port (110)
- `proto` – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step.

Contd..
### Command Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **alias number** `<NUMBER-ALIAS-NAME>` `<0-4294967295>` | Creates a new number alias or applies an existing number, identified by the `<NUMBER-ALIAS-NAME>` keyword.  
- `<NUMBER-ALIAS-NAME>` – Specify the number alias name.  
- `<0-4294967295>` – Specify the number, from 0 - 4294967295, assigned to the number alias created.  
  
**Note:** Number aliases map a name to a numeric value. For example, ‘alias number $NUMBER 100’.  
- The number alias name is: $NUMBER  
- The value assigned is: 100  
The value referenced by alias $NUMBER, wherever used, is 100. |
| **alias string** `<STRING-ALIAS-NAME>` `<LINE>` | Creates a string alias for this RF Domain. Or associates an existing string alias with this RF Domain. String aliases map a name to an arbitrary string value. For example, alias string `$DOMAIN test.example_company.com`. In this example, the string alias name is: `$DOMAIN` and the string value it is mapped to is: `test.example_company.com`. In this example, the string alias refers to a domain name.  
- `<STRING-ALIAS-NAME>` – Specify the string alias name.  
- `<LINE>` – Specify the string value.  
**Note:** Alias name should begin with `$`.  
**Note:** If using an existing string alias, you can apply overrides to the alias at the RF Domain level. |
| **alias vlan** `<VLAN-ALIAS-NAME>` `<1-4094>` | Creates a VLAN alias for this RF Domain. Or associates an existing VLAN alias with this RF Domain. A VLAN alias maps a name to a VLAN ID.  
- `<VLAN-ALIAS-NAME>` – Specify the VLAN alias name.  
**Note:** Alias name should begin with `$`.  
- `<1-4094>` – Specify the VLAN ID from 1 - 4094.  
**Note:** If using an existing VLAN alias, you can apply overrides to the alias at the RF Domain level. |

### Command Examples

- **alias number** `$NUMBER 100`  
  - The number alias name is: $NUMBER  
  - The value assigned is: 100  
The value referenced by alias $NUMBER, wherever used, is 100.  

- **alias string** `$DOMAIN test.example_company.com`  
  - The string alias name is: `$DOMAIN`  
  - The string value is: `test.example_company.com`  

- **alias vlan** `$VLAN 1000`  
  - The VLAN alias name is: `$VLAN`  
  - The VLAN ID is: 1000  

**Note:** If using an existing VLAN alias, you can apply overrides to the alias at the RF Domain level.
Examples

rfs4000-229D58(config)#show context

! Configuration of RFS4000 version 5.8.0.0-028D

!

version 2.3
!

alias network-group $TestNetGrpAlias network 192.168.13.0/24 192.168.16.0/24
alias network-group $TestNetGrpAlias address-range 192.168.13.7 to 192.168.13.16 192.168.13.20 to 192.168.13.25

! alias network $TestNetworkAlias 192.168.13.0/24
! alias host $TestHostAlias 192.168.13.10
! alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
!

alias network-service $NetworkServAlias proto udp
!

alias network-service $kerberos proto tcp 749 750 80 proto udp 68 sourceport 67
!

alias vlan $TestVLANAlias 1
--More--

rfs4000-229D58(config)#

In the following examples, the global aliases ‘$kerberos’ and ‘$TestVLANAlias’ are associated with the RF Domain ‘test’ and overrides applied:

rfs4000-229D58(config-rf-domain-test)#alias network-service $kerberos proto tcp 749 750 80
rfs4000-229D58(config-rf-domain-test)#alias vlan $TestVLANAlias 10
rfs4000-229D58(config-rf-domain-test)#

nx9500-6C8809(config-rf-domain-test)#alias string $test example_company.com

Example 1:

In the following examples, the network-group alias ‘$test’ is configured to include hosts 192.168.1.10 and 192.168.1.11, networks 192.168.2.0/24 and 192.168.3.0/24 and address-range 192.168.4.10 to 192.168.4.20.

rfs4000-229D58(config)#alias network-group $test host 192.168.1.10 192.168.1.11
rfs4000-229D58(config)#alias network-group $test network 192.168.2.0/24 192.168.3.0/24
rfs4000-229D58(config)#alias network-group $test address-range 192.168.4.10 to 192.168.4.20

nx9500-6C8809(config-rf-domain-test)#
Associate this network-group alias ‘$test’ to the RF Domain ‘test’ and override the ‘host’ element of the alias.

```
rfs4000-229D58(config-rf-domain-test)#alias network-group $test host 192.168.10.10
rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
  no country-code
  alias network-service $kerberos proto tcp 749 750 80
  alias network-group $test host 192.168.10.10
  alias network-group $test network 192.168.2.0/24 192.168.3.0/24
  alias network-group $test address-range 192.168.4.10 to 192.168.4.20
  alias vlan $TestVLANAlias 10
rfs4000-229D58(config-rf-domain-test)#
```

In the preceding example, the ‘host’ element of the network-group alias ‘$test’ has been overridden. But the ‘network’ and ‘address-range’ elements have been retained as is.

4.1.72.2.2 channel-list

rf-domain-mode commands

Configures the channel list advertised by radios. This command also enables a dynamic update of a channel list.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
channel-list [2.4GHz|5GHz|dynamic]
channel-list dynamic
channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

Parameters
- channel-list dynamic

<table>
<thead>
<tr>
<th>dynamic</th>
<th>Enables a dynamic update of a channel list</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel-list [2.4GHz</td>
<td>5GHz] &lt;CHANNEL-LIST&gt;</td>
</tr>
</tbody>
</table>

- 2.4GHz
  - <CHANNEL-LIST> Configures the channel list advertised by radios operating in the 2.4 GHz mode
    - <CHANNEL-LIST> – Specify the list of channels separated by commas or hyphens.

- 5GHz
  - <CHANNEL-LIST> Configures the channel list advertised by radios operating in the 5.0 GHz mode
    - <CHANNEL-LIST> – Specify the list of channels separated by commas or hyphens.

Examples
rfs7000-37FABE(config-rf-domain-default)#channel-list 2.4GHz 1-10
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  no country-code
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
rfs7000-37FABE(config-rf-domain-default)#

Related Commands
- no Removes the list of channels configured on the selected RF Domain for 2.4 GHz and 5.0 GHz bands. Also disables dynamic update of a channel list.
4.1.72.2.3 contact

- **rf-domain-mode commands**

  Configures the network administrator’s contact details. The network administrator is responsible for addressing problems impacting the network.

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
contact <WORD>
```

**Parameters**

- `contact <WORD>`

**Examples**

```
rfs7000-37FABE(config-rf-domain-default)#contact Bob+14082778691
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
  no country-code
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
rfs7000-37FABE(config-rf-domain-default)#
```

**Related Commands**

- `no` | Removes a network administrator’s contact details
4.1.72.2.4 control-vlan

rf-domain-mode commands

Configures the VLAN designated for traffic control in this RF Domain

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
control-vlan <1-4094>

Parameters
- control-vlan <1-4094>

| <1-4094> | Specify the VLAN ID from 1 - 4094. The default is 1. |

Examples

```
rfs7000-37FABE(config-rf-domain-default)#control-vlan 1
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
  no country-code
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
  control-vlan 1
rfs7000-37FABE(config-rf-domain-default)#
```

Related Commands

| no | Disables the VLAN designated for controlling RF Domain traffic |
4.1.72.2.5 controller-managed

rf-domain-mode commands

Configures the adopting controller (wireless controller, access point, or service platform) as this RF Domain’s manager. In other words, the RF Domain is controller managed, and the managing controller is the device managing the RF Domain.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
controller-managed

Parameters
None

Examples
rfs4000-229D58(config-rf-domain-test)#controller-managed
rfs4000-229D58(config-rf-domain-test)#commit
rfs4000-229D58(config-rf-domain-test)#show context
rf-domain test
country-code in
controller-managed
network-alias techPubs host 192.168.13.8
network-alias techPubs address-range 192.168.13.10 to 192.168.13.15
service-alias testing index 10 proto 9 destination-port range 21 21
rfs4000-229D58(config-rf-domain-test)#

Related Commands

no
Removes the adopting controller or service platform as this RF Domain’s manager
4.1.72.2.6 country-code

rf-domain-mode commands

Configures a RF Domain’s country of operation. Since device channels transmit in specific channels unique to the country of operation, it is essential to configure the country code correctly or risk using illegal operation.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

country-code <WORD>

Parameters

- country-code <WORD>

<table>
<thead>
<tr>
<th>country-code</th>
<th>Configures the RF Domain’s country of operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>Specify the two (2) letter ISO-3166 country code.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-rf-domain-default)#country-code us
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  contact Bob+14082778691
  country-code us
  channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
  control-vlan 1
rfs7000-37FABE(config-rf-domain-default)#

Related Commands

no Removes the country of operation configured on a RF Domain
### 4.1.72.2.7 layout

**rf-domain-mode commands**

Configures the RF Domain layout in terms of area, floor, and location on a map. It allows users to place APs across the deployment map. A maximum of 256 layouts is permitted.

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
layout [area|description|floor|map-location]
layout [area <AREA-NAME>|description <LINE>|floor <FLOOR-NAME>] {<1-4094>}
    {map-location}
layout map-location <URL> units [feet|meters] {(area <AREA-NAME>|description <LINE>|
    floor <FLOOR-NAME>)}
```

**Parameters**

- **layout [area|description|floor]**
  Configures the RF Domain’s layout in terms of area, floor, and location on a map
  These are recursive parameters and you can configure one or all of these parameters.

- **area <AREA-NAME>**
  Configures the RF Domain’s layout in terms of the area of location
  • <AREA-NAME> – Specify the area name.
  **Note:** After configuring the RF Domain’s area of functioning, optionally specify the floor name (and number), description, and/or the location on map.
  **Note:** Please see following table for map-location parameters and description.

- **description <LINE>**
  Configures a description for this RF Domain
  • <LINE> – Specify a description that enables you to identify the RF Domain. For a multi-worded string, use double quotes.

- **floor <FLOOR-NAME> <1-4094>**
  Configures the RF Domain’s layout in terms of the floor name and number
  • <FLOOR-NAME> – Specify the floor name.
  • <1-4094> – Optional. Specifies the floor number from 1 - 4094. The default floor number is 1.
  **Note:** After configuring the RF Domain’s floor name (and number), optionally specify the area name, description, and/or the location on map.
  **Note:** Please see following table for map-location parameters and description.

- **layout map-location <URL> units [feet|meters]**
  Configures the location of the RF Domain on the map
  • <URL> – Specify the URL to configure the map location.
  • units [feet|meters] – Configures the map units in terms of feet or meters

</tbody>
</table>
### area <AREA-NAME>
Optional. Configures the RF Domain's area name. Specify area name.

**Note:** After configuring the RF Domain's area name, optionally specify the floor name and number.

### description <LINE>
Optional. Configures a description for this RF Domain

- **<LINE>** – Specify a description that enables you to identify the RF Domain. For a multi-worded string, use double quotes.

### floor <FLOOR-NAME>
Optional. Configures the RF Domain's floor name. Specify floor name.

**Note:** After configuring the floor name (and number) for this RF Domain, optionally specify the area name.

### Examples

```
rfs7000-37FABE(config-rf-domain-default)#layout map-location www.firstfloor.com units meters area Ecospace floor Floor5

4.1.72.2.8 location

rf-domain-mode commands

Configures the RF Domain’s physical location. The location could be as specific as the building name or floor number. Or it could be generic and include an entire site. The location defines the physical area where a set of devices with common configurations are deployed and managed by a RF Domain policy.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

location <WORD>

**Parameters**

- location <WORD>
  - Configures the RF Domain location by specifying the area or building name
  - <WORD> – Specify the location.

**Examples**

```bash
rfs7000-37FABE(config-rf-domain-default)#location SanJose
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
location SanJose
contact Bob+14082778691
country-code us
channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
layout area Ecospace floor Floor5 map-location www.firstfloor.com units meters
control-vlan 1
rfs7000-37FABE(config-rf-domain-default)#
```

**Related Commands**

- `no` Removes the RF Domain location
4.1.72.2.9 mac-name

rf-domain-mode commands

Configures a relevant name for each MAC address. Use this command to associate client names to specific connected client MAC addresses for improved client management.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
mac-name <MAC> <NAME>
```

Parameters

- `mac-name <MAC> <NAME>`

<table>
<thead>
<tr>
<th>mac-name &lt;MAC&gt; &lt;NAME&gt;</th>
<th>Assigns a user-friendly name to this RF Domain's member access point's connected client to assist in its easy recognition</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;MAC&gt;</td>
<td>Specify the MAC address</td>
</tr>
<tr>
<td>&lt;NAME&gt;</td>
<td>Specify the client name for the specified MAC address. The name specified here will be used in events and statistics.</td>
</tr>
</tbody>
</table>

Examples

```plaintext
rfs7000-37FABE(config-rf-domain-default)#mac-name 11-22-33-44-55-66 TestDevice
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
  location SanJose

mac-name 11-22-33-44-55-66 TestDevice
  layout area Ecospace floor Floor5 map-location www.firstfloor.com units meters
  control-vlan 1
rfs7000-37FABE(config-rf-domain-default)#
```

Related Commands

```plaintext
no
```

Removes the MAC address to name mapping.
4.1.72.2.10 no

rf-domain-mode commands

Negates a command or reverts configured settings to their default. When used in the config RF Domain mode, the no command negates or reverts RF Domain settings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [alias|channel-list|contact|control-vlan|controller-managed|country-code|layout|location|mac-name|override-smartrf|override-wlan|sensor-server|stats|timezone|tree-node|use]

Parameters

- no <PARAMETERS>

Removes or reverts this RF Domain’s settings based on the parameters passed.

Examples

The following example shows the default RF Domain settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
location SanJose
contact Bob+14082778691
country-code us
channel-list 2.4GHz 1,2,3,4,5,6,7,8,9,10
mac-name 11-22-33-44-55-66 TestDevice
layout area Ecospace floor Floor5 map-location www.firstfloor.com units meters
control-vlan 1
```

```
rfs7000-37FABE(config-rf-domain-default)#no channel-list 2.4GHz 1-10
rfs7000-37FABE(config-rf-domain-default)#no mac-name 11-22-33-44-55-66
rfs7000-37FABE(config-rf-domain-default)#no location
rfs7000-37FABE(config-rf-domain-default)#no control-vlan
```

The following example shows the default RF Domain settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default
contact Bob+14082778691
country-code us
layout area Ecospace floor Floor5 map-location www.firstfloor.com units meters
```

```
rfs7000-37FABE(config-rf-domain-default)#
```
4.1.72.2.11 override-smart-rf

rf-domain-mode commands

Enables dynamic channel switching for Smart RF radios. This command allows you to configure an override list of channels that Smart RF can use for channel compensations on 2.4 GHz and 5.0 GHz radios.

When a radio fails or is faulty, a Smart RF policy provides automatic recovery by instructing neighboring access points to increase their transmit power to compensate for the coverage loss. Once correct access point placement has been established, Smart-RF can optionally be leveraged for automatic detector radio selection. Smart-RF uses detector radios to monitor RF events and can ensure availability of adequate detector coverage.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
override-smartrf channel-list [2.4GHz|5GHz] <CHANNEL-LIST>
```

Parameters

- `override-smartrf channel-list [2.4GHz|5GHz] <CHANNEL-LIST>`

<table>
<thead>
<tr>
<th>override-smartrf</th>
<th>Enables dynamic channel switching for Smart RF radios</th>
</tr>
</thead>
<tbody>

```

Related Commands

- `no` Removes the override-smartrf list of channels configured for 2.4 GHz and 5.0 GHz radios
4.1.72.2.12 override-wlan

rf-domain-mode commands

Configures RF Domain level overrides for a WLAN

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

Syntax

overrides-wlan <WLAN-NAME> [shutdown|ssid|vlan-pool|wep128|wpa-wpa2-psk]

overrides-wlan <WLAN-NAME> [shutdown|ssid <SSID>|vlan-pool <1-4094> {limit <0-8192>}|wpa-wpa2-psk <PASSPHRASE>]

overrides-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>] |transmit-key <1-4>]

Parameters

- overrides-wlan <WLAN-NAME> [shutdown|ssid <SSID>|vlan-pool <1-4094> {limit <0-8192>}|wpa-wpa2-psk <PASSPHRASE>]
- overrides-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>] |transmit-key <1-4>]

| <WLAN-NAME> | Configures the WLAN name
The name should not exceed 32 characters and should represent the WLAN coverage area. After creating the WLAN, configure its override parameters.

| shutdown | Shuts down WLAN operation on all mapped radios

| ssid <SSID> | Configures a override SSID associated with this WLAN
The SSID should not exceed 32 characters in length.

| vlan-pool <1-4094> {limit <0-8192>} | Configures the override VLANs available to this WLAN
- <1-4094> – Specify the VLAN ID from 1 - 4094.
- limit <0-8192> – Optional. Sets a limit to the number of users on this VLAN from 0 - 8192. The default is 0.

| wpa-wpa2-psk <PASSPHRASE> | Configures the WPA-WPA2 pre-shared key or passphrase for this WLAN
- <PASSPHRASE> – Specify a WPA-WPA2 key or passphrase.

| overrides-wlan <WLAN-NAME> wep128 [key <1-4> hex [0 <WORD>|2 <WORD>] |transmit-key <1-4>]

| <WLAN-NAME> | Configures the WLAN name
The name should not exceed 32 characters and should represent the WLAN coverage area. After creating the WLAN, configure its override parameters.

| wep128 | Configures WEP128/Keyguard key for this WLAN
### Examples

```
rfs7000-37FABE(config-rf-domain-default)#override-wlan test vlan-pool 2 limit 20
rfs7000-37FABE(config-rf-domain-default)#show context
rf-domain default

rf-domain-mode commands

Configures an AirDefense sensor server on this RF Domain. Sensor servers allow network administrators to monitor and download data from multiple sensors remote locations using Ethernet TCP/IP or serial communications. This enables administrators to respond quickly to interferences and coverage problems.

The Wireless Intrusion Protection System (WIPS) protects the controller managed network, wireless clients and access point radio traffic from attacks and unauthorized access. WIPS provides tools for standards compliance and around-the-clock wireless network security in a distributed environment. WIPS allows administrators to identify and accurately locate attacks, rogue devices and network vulnerabilities in real time and permits both a wired and wireless lockdown of wireless device connections upon acknowledgement of a threat.

In addition to dedicated AirDefense sensors, an access point radio can function as a sensor and upload information to a dedicated WIPS server (external to the controller). Unique WIPS server configurations can be used by RF Domains to ensure a WIPS server configuration is available to support the unique data protection needs of individual RF Domains.

WIPS is not supported on a WLAN basis, rather sensor functionality is supported on the access point radio(s) available to each controller managed WLAN. When an access point radio is functioning as a WIPS sensor, it is able to scan in sensor mode across all legal channels within the 2.4 and 5.0 GHz bands. Sensor support requires a AirDefense WIPS Server on the network. Sensor functionality is not provided by the access point alone. The access point works in conjunction with a dedicated WIPS server.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

sensor-server <1-3> ip <IP> {port [443]<1-65535>]

Parameters

- Sensor-server <1-3> Configures an AirDefense sensor server parameters
  - <1-3> – Select the server ID from 1 - 3. The server with the lowest defined ID is reached first. The default is 1.

- ip <IP> Configures the (non DNS) IP address of the sensor server
  - <IP> – Specify the IP address of the sensor server.

- port [443]<1-65535> Optional. Configures the sensor server port. The options are:
  - 443 – Configures port 443, the default port used by the AirDefense server
  - 1-65535 – Allows you to select a WIPS/AirDefense sensor server port from 1 - 65535
Examples

rfs7000-37FABE(config-rf-domain-default)#sensor-server 2 ip 172.16.10.3 port 443

4.1.72.2.15 timezone

rf-domain-mode commands

Configures the RF Domain’s geographic time zone. Configuring the time zone is essential for RF Domains deployed across different geographical locations.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
timezone <TIMEZONE>
```

Parameters

- `timezone <TIMEZONE>`

Examples

```
rfs7000-37FABE(config-rf-domain-default)#timezone America/Los_Angeles
rfs7000-37FABE(config-rf-domain-default)#show context

```

Removes a RF Domain’s time zone.
4.1.72.2.16 **tree-node**

**rf-domain-mode commands**

Configures the hierarchial (tree-node) structure under which this RF Domain is located

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

tree-node [campus|city|country|region] {(campus|city|country|region)}

**Parameters**

- **tree-node [campus|city|country|region] {(campus|city|country|region)}**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| tree-node   | Configures the hierarchial tree structure defining the RF Domain’s location. The tree node hierarchy can be configured in any order, but will always appear as: country > region > city > campus. Further, a higher node, such as country, cannot be defined under a lower node, such as region. An RF Domain can be placed under any one of the tree nodes. But, an RF Domain at the country level may have all four nodes defined. Where as, an RF Domain restricted to a campus, cannot have the country, city, and region nodes.  

**Note:** At least one of these four nodes must be defined. This feature is disabled by default. |
| campus      | Configures the campus name for this RF Domain |
| city        | Configures the city for this RF Domain       |
| country     | Configures the country for this RF Domain    |
| region      | Configures the region for this RF Domain     |

**Usage Guidelines**

The following points need to be taken into consideration when creating the tree-node structure:

- Adding a **country** first is a good idea since **region, city**, and **campus** can all be added as sub-nodes in the tree structure. However, the selected country is an invalid tree node until a RF Domain is mapped.

- A city and campus can be added in the tree structure as sub-nodes under a region. An RF Domain can be mapped anywhere down the hierarchy for a region and not just directly under a country. For example, a region can have city, campus, and one RF Domain mapped.

- Only a campus can be added as a sub-node under a city. The city is an invalid tree node until a RF Domain is mapped somewhere within the directory tree.

- A campus is the last node in the hierarchy before a RF Domain, and it is not valid unless it has a RF Domain mapped.

- After creating the tree structure do a **commit** and **save** for the tree configuration to take effect and persist across reboots.
Examples

rfs4000-229D58(config-rf-domain-test)#tree-node campus EcoSpace City Bangalore
country India region South
rfs4000-229D58(config-rf-domain-test)#

rfs4000-229D58(config-rf-domain-test)#show context

**4.1.72.2.17 use**

Enables the use of Smart RF and WIPS with this RF Domain

Assigns an existing *Wireless IPS* (WIPS) policy to the RF Domain

A WIPS policy provides protection against wireless threats and acts as a key layer of security complementing wireless VPNs, encryption and authentication. A WIPS policy uses a dedicated sensor for actively detecting and locating rogue AP devices. After detection, WIPS uses mitigation techniques to block the devices by manual termination, air lockdown, or port suppression.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

use [license|nsight-policy|smart-rf-policy|wips-policy]

use [license <WEB-FILTERING-LICENSE>|nsight-policy <POLICY-NAME>|smart-rf-policy <SMART-RF-POLICY-NAME>|wips-policy <WIPS-POLICY-NAME>]

**Parameters**

- use [license <LICENSE>|nsight-policy <POLICY-NAME>|smart-rf-policy <SMART-RF-POLICY-NAME>|wips-policy <WIPS-POLICY-NAME>]

4.1.73 rfs4000

Global Configuration Commands

Adds an RFS4000 wireless controller to the network

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

rfs4000 <DEVICE-RFS4000-MAC>

Parameters

- rfs4000 <DEVICE-RFS4000-MAC>

<table>
<thead>
<tr>
<th>&lt;DEVICE-RFS4000-MAC&gt;</th>
<th>Specify the RFS4000’s MAC address.</th>
</tr>
</thead>
</table>

Examples

rfs7000-37FABE(config)#rfs4000 10-20-30-40-50-60
rfs7000-37FABE(config-device-10-20-30-40-50-60)#

Related Commands

- no | Removes an RFS4000 wireless controller from the network
4.1.74 rfs6000

- Global Configuration Commands

Adds a RFS6000 wireless controller to the network

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
rfs6000 <DEVICE-RFS6000-MAC>
```

Parameters

- `rfs6000 <DEVICE-RFS6000-MAC>`

Examples

```
rfs7000-37FABE(config)#rfs6000 11-20-30-40-50-61
rfs7000-37FABE(config-device-11-20-30-40-50-61)#
```

Related Commands

4.1.76 `nx45xx`

Global Configuration Commands

Adds an integrated NX45XX series service platform to the network. If a profile for service platform is not available, a new profile is created.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**NOTE:** In this guide, NX4500 and NX4524 are collectively represented as a NX45XX series service platform.

---

**Syntax**

```
nx45xx <DEVICE-NX45XX-MAC>
```

**Parameters**

- `nx45xx <DEVICE-NX45XX-MAC>`

  - `<DEVICE-NX45XX-MAC>` Specifies the MAC address of a NX45XX series service platform.

**Examples**

```
nx9500-6C8809(config)#nx45xx B4-C7-99-5C-FA-8E
nx9500-6C8809(config-device-B4-C7-99-5C-FA-8E)#
```

**Related Commands**

4.1.81 roaming-assist-policy

**Global Configuration Commands**

Configures a roaming assist policy that enables access points to assist wireless clients in making roaming decisions, such as which access point to connect etc.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

roaming-assist-policy <POLICY-NAME>

**Parameters**

- roaming-assist-policy <POLICY-NAME>

| <POLICY-NAME> | Specify the roaming assist policy name. If the policy does not exist, it is created. |

**Examples**

rfs7000-37FABE(config)#roaming-assist-policy testPolicy
rfs7000-37FABE(config-roaming-assist-policy-testPolicy)#?

Roaming Assist Mode commands:

- action: Configure action - action is either to log / deauth
- aggressiveness: Configure the roaming aggressiveness for a wireless client
- detection-threshold: Configure the detection threshold - when exceeded, client monitoring starts
- disassoc-time: Configure the disassociation time - time after which a disassociation is sent
- handoff-count: Configure the handoff count - number of times client can exceed handoff threshold
- handoff-threshold: Configure the handoff threshold - when exceeds an action is taken.
- monitoring-interval: Configure the monitoring interval - interval at which client monitoring occurs
- no: Negate a command or set its defaults
- sampling-interval: Configure the sampling interval - interval at which client rssi values are checked

rfs7000-37FABE(config-roaming-assist-policy-testPolicy)#

**NOTE:** For more information on roaming assist policy commands, see *Chapter 30, ROAMING ASSIST POLICY.*

4.1.82 role-policy

- **Global Configuration Commands**

Configures a role-based firewall policy

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

role-policy <ROLE-POLICY-NAME>

**Parameters**

- role-policy <ROLE-POLICY-NAME>

| <ROLE-POLICY-NAME> | Specify the role policy name. If the policy does not exist, it is created. |

**Examples**

rfs7000-37FABE(config)#role-policy role1
rfs7000-37FABE(config-role-policy-role1)#?
Role Policy Mode commands:

default-role Configuration for Wireless Clients not matching any role
ldap-deadperiod Ldap dead period interval
ldap-query Set the ldap query mode
ldap-server Add a ldap server
ldap-timeout Ldap query timeout interval
no Negate a command or set its defaults
user-role Create a role
clrscr Clears the display screen
do Run commands from Exec mode
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal

rfs7000-37FABE(config-role-policy-role1)#

**Related Commands**

| no | Removes an existing role policy |
4.1.83 route-map

> Global Configuration Commands

Creates a dynamic BGP route map and enters its configuration mode

BGP route maps are used by network administrators to define rules controlling redistribution of routes between routers and routing processes. These route maps are also used to control and modify routing information.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

**Syntax**

```
route-map <ROUTE-MAP-NAME>
```

**Parameters**

- `route-map <ROUTE-MAP-NAME>`

**Examples**

```
nx9500-6C8809(config)#route-map test
nx9500-6C8809(config-dr-route-map-test)#
```

```
nx9500-6C8809(config-dr-route-map-test)#?
```

Route Map Mode commands:
- `deny` Add a deny route map rule to deny set operations
- `no` Negate a command or set its defaults
- `permit` Add a permit route map rule to permit set operations
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `exit` Exit current mode and return to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
nx9500-6C8809(config-dr-route-map-test)#
```

4.1.84 routing-policy

**Global Configuration Commands**

Configures a routing policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
role-policy <ROUTING-POLICY-NAME>
```

**Parameters**

- `role-policy <ROUTING-POLICY-NAME>`

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;ROUTING-POLICY-NAME&gt;</code></td>
<td>Specify the role policy name. If the policy does not exist, it is created.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config)#routing-policy TestRoutingPolicy
rfs7000-37FABE(config-routing-policy-TestRoutingPolicy)#?
```

Routing Policy Mode commands:

- `apply-to-local-packets`: Use Policy Based Routing for packets generated by the device
- `logging`: Enable logging for this Route Map
- `no`: Negate a command or set its defaults
- `route-map`: Create a Route Map
- `use`: Set setting to use
- `clrscr`: Clears the display screen
- `commit`: Commit all changes made in this session
- `do`: Run commands from Exec mode
- `end`: End current mode and change to EXEC mode
- `exit`: End current mode and down to previous mode
- `help`: Description of the interactive help system
- `revert`: Revert changes
- `service`: Service Commands
- `show`: Show running system information
- `write`: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-routing-policy-TestRoutingPolicy)#
```

**NOTE:** For more information on routing policy commands, see Chapter 24, ROUTING-POLICY.

**4.1.85 self**

*Global Configuration Commands*

Displays the logged device’s configuration context

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

self

**Parameters**

None

**Examples**

rfs7000-37FABE(config)#self
rfs7000-37FABE(config-device-00-15-70-37-FA-BE)#
4.1.86 **smart-rf-policy**

*Global Configuration Commands*

Configures a Smart RF policy

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
smart-rf-policy <SMART-RF-POLICY-NAME>
```

**Parameters**

- `smart-rf-policy <SMART-RF-POLICY-NAME>`

**Examples**

```
rfs7000-37FABE(config)#smart-rf-policy test
rfs7000-37FABE(config-smart-rf-policy-test)#?
Smart RF Mode commands:
area Specify channel list/ power for an area
assignable-power Specify the assignable power during power-assignment
avoidance-time Time to avoid a channel once dfs/adaptivity avoidance is necessary
channel-list Select channel list for smart-rf
channel-width Select channel width for smart-rf
coverage-hole-recovery Recover from coverage hole
enable Enable this smart-rf policy
group-by Configure grouping parameters
interference-recovery Recover issues due to excessive noise and interference
neighbor-recovery Recover issues due to faulty neighbor radios
no Negate a command or set its defaults
sensitivity Configure smart-rf sensitivity (Modifies various other smart-rf configuration items)
smart-ocs-monitoring Smart off channel scanning
clrscr Clears the display screen
commit Commit all changes made in this session
end End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or term
```

4.1.87 t5

Invokes the configuration mode of a t5 wireless controller

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices.

Supported in the following platforms:

- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
t5 <T5-DEVICE-MAC>
```

**Parameters**

- **t5 <T5-DEVICE-MAC>**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t5 &lt;T5-DEVICE-MAC&gt;</td>
<td>Specify the t5 device’s MAC address. The system enters the identified device’s configuration mode.</td>
</tr>
</tbody>
</table>

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The **Customer Premises Equipment** (CPEs) are the T5 controller managed radio devices using the IPX operating system. These CPEs use a **Digital Subscriber Line** (DSL) as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.

**Note:** After logging on to the T5 device, use the ‘cpe’ keyword and configure the following mandatory settings:

- **vlan** — Set a VLAN from 1 - 4,094 used as a virtual interface for connections between the T5 controller and its managed CPE devices.
- **start ip** — Set a starting IP address used in a range of addresses available to T5 controller connecting CPE devices.
- **end ip** — Set an end IP address used in a range of addresses available to T5 controller connecting CPE devices.

**Examples**

```
rfs7000-37FABE(config)#t5 B4:C7:99:ED:5C:2C
rfs7000-37FABE(config-device-B4:C7:99:ED:5C:2C)#?
```

**T5 Device Mode commands:**

- adsp-sensor-server
- bridge
- clock
- cpe
- hostname
- interface
- ip
- no
- ntp
- override-wlan
- password
- qos
- radius-server
- t5
- t5-logging

Configure WIPS server
Sets MAC address expiration time in the bridge address table
Configure clock options
T5 CPE configuration
Set system’s network name
Select an interface to configure
Internet Protocol (IP)
Negate a command or set its defaults
Configure NTP
Configure RF Domain level overrides for wlan
T5 password configuration
QOS settings
Radius server settings
T5 configuration
Modify message logging facilities
GLOBAL CONFIGURATION COMMANDS 4 - 345

use                 Set setting to use
clrscr              Clears the display screen
commit              Commit all changes made in this session
do                  Run commands from Exec mode
end                 End current mode and change to EXEC mode
exit                End current mode and down to previous mode
help                Description of the interactive help system
revert              Revert changes
service             Service Commands
show                Show running system information
write               Write running configuration to memory or terminal

rfs7000-37FABE(config-device-B4:C7:99:ED:5C:2C)#

Related Commands

| no                  | Removes the t5 wireless controller identified by the device’s MAC address |
### 4.1.88 web-filter-policy

*Global Configuration Commands*

The following table lists commands that enable you to enter the Web Filter policy configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>web-filter-policy</td>
<td>Creates a new Web Filter policy and enters its configuration mode</td>
<td>page 4-463</td>
</tr>
<tr>
<td>web-filter-policy-config-mode commands</td>
<td>Summarizes the Web Filter policy configuration mode commands</td>
<td>page 4-348</td>
</tr>
</tbody>
</table>

*Table 4.37 Commands Creating a Web-Filter-Policy*
4.1.88.1 web-filter-policy

Creates a Web Filtering policy and enters its configuration mode. This policy defines rules managing the local classification database and the cached data. When configured and applied, this policy also enables caching of URL classification records in a local database in a controller-based, hierarchically managed (HM) deployment. Use this option to specify the following: classification server details, size of the local database, time for which records are cached in the database, the action taken in case the classification server is unavailable etc.

The Web filter policy is applied at the profile or device level.

For more information on URL filtering, see `url-filter`.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

```
web-filter-policy <WEB-FILTER-POLICY-NAME>
```

Parameters

- `web-filter-policy <WEB-FILTER-POLICY-NAME>`

| <WEB-FILTER-POLICY-NAME> | Specify the Web filter policy name. If the policy does not exist, it is created. |

Examples

```
nx4500-5CFA2B(config)#web-filter-policy test
nx4500-5CFA2B(config-web-filter-policy-test)#?
```

Content Filter Mode commands:
- `cache-max-recs` Configure the maximum number of records in local cache
- `cache-save-interval` Configure the time a record is saved in local cache
- `logging` Select logging method
- `server-host` Configure URL classification server if it is not the adopted controller
- `server-unreachable` Permission to access website when classification server is unreachable (default is pass)
- `uncategorized-url` Permission to website when server fails to classify the URL request (default is pass)
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
nx4500-5CFA2B(config-web-filter-policy-test)#
```

Related Commands

- `no` Removes an existing Web filter policy
### web-filter-policy-config-mode commands

The following table summarizes Web Filter policy configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>cache-max-recs</td>
<td>Configures the maximum number of records (URLs and Web pages) cached in the local database</td>

<tr>
<td>uncategorized-url</td>
<td>Configures the action taken in case the classification server fails to classify a URL/Website</td>
<td>page 4-355</td>
</tr>
</tbody>
</table>
### 4.1.88.2.1 cache-max-recs

Contributes the maximum number of records (URL and Web page classification entries) cached in the local database.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
cache-max-recs <1-1000000>
```

**Parameters**
- `cache-max-recs <1-1000000>`

**Examples**

```bash
nx4500-5CFA2B(config-web-filter-policy-test)#cache-max-recs 9000
nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
nx4500-5CFA2B(config-web-filter-policy-test)#
```

**Related Commands**

- `no`
  Reverts the maximum number of stored records to default. Please see the parameter table for default values for the different device types.
4.1.88.2.2 cache-save-interval

**web-filter-policy-config-mode commands**

Configures the maximum time period, in seconds, for which a record (URL and Web page classification entry) is cached in the local database. Once the specified time has expired the record is removed from the cache.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

cache-save-interval <1-86400>

**Parameters**

- **cache-save-interval <1-86400>**

**Examples**

```
nx4500-5CFA2B(config-web-filter-policy-test)#cache-save-interval 1000

nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
nx4500-5CFA2B(config-web-filter-policy-test)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Reverts the maximum time period for which a record (URL and Web page classification entry) is cached in the local database to default (60)</td>
</tr>
</tbody>
</table>
**4.1.88.2.3 logging**

Configures the method used to log Web filtering events

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

logging [logfile|syslog]

**Parameters**
- logging [logfile|syslog]

| logging [logfile|syslog] | Selects the method used to log Web filtering events. The options are: |
|-------------------------|-------------------------------------------------------------------|
| logfile                 | Logs to a file.                                                   |
| syslog                  | Logs to the syslog server. This is the default setting.           |

**Examples**

nx9500-6C8809(config-web-filter-policy-test)#logging logfile

nx9500-6C8809(config-web-filter-policy-test)#show context web-filter-policy test

logging logfile

nx9500-6C8809(config-web-filter-policy-test)#
### 4.1.88.2.4 no

**web-filter-policy-config-mode commands**

Reverts the selected Web Filter policy settings to default, based on the parameters passed.

Supported in the following platforms:

- **Access Points** — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
no [cache-max-recs | cache-save-interval | server-host | server-unreachable | uncategories-url]
```

**Parameters**

- `no <PARAMETERS>`

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Reverts the selected Web Filter policy settings to default, based on the parameters passed. Specify the parameters to revert back to default value.</th>
</tr>
</thead>
</table>

**Examples**

The following example shows the Web Filter policy 'test' settings before the 'no' command is executed:

```
nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
    cache-max-recs 9000
    cache-save-interval 1000
    uncategories-url block
    server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#
```

```
nx4500-5CFA2B(config-web-filter-policy-test)#no cache-max-recs
nx4500-5CFA2B(config-web-filter-policy-test)#no server-unreachable
nx4500-5CFA2B(config-web-filter-policy-test)#no uncategories-url
```

The following example shows the Web Filter policy 'test' settings after the 'no' command has been executed:

```
nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
    cache-save-interval 1000
    server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#
```
4.1.88.2.5 server-host

> web-filter-policy-config-mode commands

Configures the URL classification server in case it is not the adopted controller

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]

Parameters

- server-host [host-name <SERVER-HOST-NAME>|ip-address <SERVER-IPv4>|mint-id <SERVER-MiNT-ID>]

Use one of the following options to identify the URL classification server:
- host-name <SERVER-HOST-NAME> – Identifies the classification server by its hostname.
- ip-address <SERVER-IPv4> – Identifies the classification server by its IP address.
- mint-id <SERVER-MiNT-ID> – Identifies the classification server by its MiNT ID.

Examples

nx4500-5CFA2B(config-web-filter-policy-test)#server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
  server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#

Related Commands

no

Removes the URL classification server’s configured details, such as hostname, ip-address, or MiNT ID.
4.1.88.2.6 server-unreachable

web-filter-policy-config-mode commands

Configures the action taken in case the classification server is unreachable. Based on the value configured the an end user’s request for a URL/Website is either blocked or passed.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax
server-unreachable [block|pass]

Parameters
- server-unreachable [block|pass]

<table>
<thead>
<tr>
<th>server-unreachable</th>
<th>Configures the action taken in case the classification server is unreachable. The options are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>[block</td>
<td>pass]</td>
</tr>
<tr>
<td></td>
<td>- pass – Allows access to the requested URL/Website. This is the default value.</td>
</tr>
</tbody>
</table>

Examples
nx4500-5CFA2B(config-web-filter-policy-test)#server-unreachable block

nx4500-5CFA2B(config-web-filter-policy-test)#show context
web-filter-policy test
    cache-max-recs 9000
    cache-save-interval 1000
    server-unreachable block
    server-host ip-address 192.168.13.13

nx4500-5CFA2B(config-web-filter-policy-test)#

Related Commands
- no
  Reverts the action taken in case the classification server is unreachable to default (pass)
4.1.88.2.7 uncategorized-url

Configures the action taken in case the classification server fails to classify a URL/Website. Based on the value configured the an end user’s request for a non-classified URL/Website is either blocked or passed.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax
uncategorized-url [block|pass]

Parameters
- uncategorized-url [block|pass]

| uncategorized-url [block|pass] | Configures the action taken in case the classification server fails to classify a URL/Website. The options are:
|--------------------------------|--------------------------------------------------|
|                               | block – Denies access to the requested non-classified URL/Website
|                               | pass – Allows access to the requested non-classified URL/Website. This is the default value.

Examples

nx4500-5CFA2B(config-web-filter-policy-test)# uncategorized-url block

nx4500-5CFA2B(config-web-filter-policy-test)# show context
web-filter-policy test
  cache-max-recs 9000
  cache-save-interval 1000
  uncategorized-url block
  server-unreachable block
  server-host ip-address 192.168.13.13
nx4500-5CFA2B(config-web-filter-policy-test)#

Related Commands

no Reverts the action taken in case the classification server fails to classify a URL/Website to default (pass)
### 4.1.89 wips-policy

**Global Configuration Commands**

Configures a WIPS policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
wips-policy <WIPS-POLICY-NAME>
```

**Parameters**

- `wips-policy <WIPS-POLICY-NAME>`

**Examples**

```plaintext
rfs7000-37FABE(config)#wips-policy test
rfs7000-37FABE(config-wips-policy-test)#?
```

Wips Policy Mode commands:

- `ap-detection` Rogue AP detection
- `enable` Enable this wips policy
- `event` Configure an event
- `history-throttle-duration` Configure the duration for which event duplicates are not stored in history
- `interference-event` Specify events which will contribute to smart-rf wifi interference calculations
- `no` Negate a command or set its defaults
- `signature` Signature to configure
- `use` Set setting to use
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```plaintext
rfs7000-37FABE(config-wips-policy-test)#
```

**NOTE:** For more information on WIPS policy commands, see Chapter 20, WIPS-POLICY.

**Related Commands**

- `no` Removes an existing WIPS policy
4.1.90 wlan

Global Configuration Commands

Configures a Wireless Local Area Network (WLAN)

The following table lists WLAN configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan</td>
<td>Creates a new wireless LAN and enters its configuration mode</td>
<td>page 4-358</td>
</tr>
<tr>
<td>wlan-mode commands</td>
<td>Summarizes WLAN configuration mode commands</td>
<td>page 4-361</td>
</tr>
</tbody>
</table>
4.1.90.1 wlan

- wlan

Configures a WLAN and enters its configuration mode. Use this command to modify an existing WLAN's settings.

A WLAN is a data-communications system that flexibly extends the functionality of a wired LAN. A WLAN links two or more computers or devices using spread-spectrum or OFDM modulation based technology. WLANs do not require lining up devices for line-of-sight transmission, and are thus, desirable for wireless networking. Roaming users can be handed off from one access point to another, like a cellular phone system. WLANs can therefore be configured around the needs of specific user groups, even when they are not in physical proximity.

WLANs can provide an abundance of services, including data communications (allowing mobile devices to access applications), e-mail, file, and print services or even specialty applications (such as guest access control and asset tracking).

Each WLAN configuration contains encryption, authentication and QoS policies and conditions for user connections. Connected access point radios transmit periodic beacons for each BSS. A beacon advertises the SSID, security requirements, supported data rates of the wireless network to enable clients to locate and connect to the WLAN.

WLANs are mapped to radios on each access point. A WLAN can be advertised from a single access point radio or can span multiple access points and radios. WLAN configurations can be defined to provide service to specific areas of a site. For example, a guest access WLAN may only be mapped to a 2.4 GHz radio in a lobby or conference room providing limited coverage, while a data WLAN is mapped to all 2.4 GHz and 5.0 GHz radios at the branch site to provide complete coverage.

The maximum number of WLANs supported by different devices is as follows:

- **RFS4000 and RFS6000 wireless controllers** – 32 WLANs
- **RFS7000 wireless controller** – 256 WLANs
- **NX4500 and NX6500 series service platforms** – 32 WLANs
- **NX9000 series service platforms** – 1000 WLANs
- **Access Points** – 16 WLANs

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

wlan {<WLAN-NAME>|containing <WLAN-NAME>}

**Parameters**

- wlan {<WLAN-NAME>|containing <WLAN-NAME>}

<table>
<thead>
<tr>
<th>wlan &lt;WLAN-NAME&gt;</th>
<th>Configures a new WLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>&lt;WLAN-NAME&gt;</code> – Optional. Specify the WLAN name.</td>
</tr>
<tr>
<td></td>
<td>The WLAN name could be a logical representation of its coverage area (for example, engineering, marketing etc.). The name cannot exceed 32 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>containing &lt;WLAN-NAME&gt;</th>
<th>Optional. Configures an existing WLAN's settings</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>&lt;WLAN-NAME&gt;</code> – Specify a sub-string in the WLAN name. Use this parameter to filter a WLAN.</td>
</tr>
<tr>
<td></td>
<td>This option allows you to select and enter the configuration mode of one or more WLANs.</td>
</tr>
</tbody>
</table>
Examples

```bash
rfs7000-37FABE(config)# wlan 1
rfs7000-37FABE(config-wlan-1)#

rfs7000-37FABE(config)# wlan containing wlan1
rfs7000-37FABE(config-wlan-{'containing': 'wlan1'})#
```

```bash
rfs7000-37FABE(config-wlan-1)#?
Wireless LAN Mode commands:
accounting                      Configure how accounting records are
created for this wlan
acl                             Actions taken based on ACL
configuration [packet drop being one
of them]
answer-broadcast-probes       Include this wlan when responding to
probe requests that do not specify an
SSID
assoc-response                Association response threshold
association-list             Configure the association list for
the wlan
authentication-type          The authentication type of this WLAN
bridging-mode                Configure how packets to/from this
wlan are bridged
broadcast-dhcp               Configure broadcast DHCP packet
handling
broadcast-ssid               Advertise the SSID of the WLAN in
beacons
captcha-portal-enforcement   Enable captive-portal enforcement on
the wlan
client-access               Enable client-access (normal data
operations) on this wlan
client-client-communication Allow switching of frames from one
wireless client to another on this
wlan
client-load-balancing        Configure load balancing of clients
on this wlan
controller-assisted-mobility Enable controller assisted mobility
to determine wireless clients' VLAN
assignment
data-rates                   Specify the 802.11 rates to be
supported on this wlan
description                  Configure a description of the usage
of this wlan
downstream-group-addressed-forwarding Enable downstream group
addressed forwarding of packets
dYNAMIC-vLAN-assignment      Dynamic VLAN assignment configuration
eap-types                     Configure client access based on
eap-type used for authentication
encryption-type              Configure the encryption to use on
this wlan
enforce-dhcp                 Drop packets from Wireless Clients
with static IP address
fast-bss-transition          Configure support for 802.11r Fast
BSS Transition
http-analyze                Enable HTTP URL analysis on the wlan
ip                           Internet Protocol (IP)
ipv6                         Internet Protocol version 6 (IPv6)
kerberos                    Configure kerberos authentication
parameters
mac-authentication          Configure mac-authentication related
parameters
no                           Negate a command or set its defaults
opendns                      OpenDNS related config for this wlan
protected-mgmt-frames       Protected Management Frames (IEEE
802.11w) related configuration (DEMO
FEATURE)
proxy-arp-mode              Configure handling of ARP requests
with proxy-arp is enabled
proxy-nd-mode               Configure handling of IPv6 ND
requests with proxy-nd is enabled

Support the 802.11u QoS map element and frame

Configure support for 802.11k Radio Resource Measurement

Configure RADIUS related parameters

Enable dynamic registration of device (or) user

Configure dhcp relay agent info

Shutdown this wlan

Configure the Service Set Identifier for this WLAN

Isolate traffic among clients

Configure encryption and authentication

Configure client access based on time

Set setting to use

Configure the vlan where traffic from this wlan is mapped

Add a member vlan to the pool of vlans for the wlan (Note: configuration of a vlan-pool overrides the 'vlan' configuration)

Configure WEP128 parameters

Configure WEP64 parameters

Enable support for WiNG-Specific extensions to 802.11

Configure wireless-client specific parameters

Modify tkip-ccmp (wpa/wpa2) related parameters

Clears the display screen

Commit all changes made in this session

Run commands from Exec mode

End current mode and change to EXEC mode

End current mode and down to previous mode

Description of the interactive help system

Revert changes

Service Commands

Show running system information

Write running configuration to memory or terminal

rfs7000-37FABE(config-wlan-1)#
4.1.90.2 wlan-mode commands

This section documents the WLAN configuration mode commands in detail.

Use the (config) instance to configure WLAN related parameters.

To navigate to this instance, use the following command:

<DEVICE>(config)#wlan <WLAN-NAME>

The following table summarizes WLAN configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>accounting</td>
<td>Defines a WLAN accounting configuration</td>
<td>page 4-364</td>

4.1.90.2.1 accounting

Defines the WLAN's accounting configuration

Accounting is the method of collecting user data, such as start and stop times, executed commands (for example, PPP), number of packets and number of bytes received and transmitted. This data is sent to the security server for billing, auditing, and reporting purposes. Accounting enables wireless network administrators to track the services and network resources accessed and consumed by users. When enabled, this feature allows the network access server to report and log user activity to a RADIUS security server in the form of accounting records. Each accounting record is comprised of AV pairs and is stored on the access control server. The data can be analyzed for network management, client billing, and/or auditing. Accounting methods must be defined through AAA policies.

Accounting can be enabled and applied to access point, wireless controller, or service platform managed WLANs. Once enabled, it uniquely logs accounting events specific to the managed WLAN. Accounting logs contain information about the use of remote access services by users. This information is of great assistance in partitioning local versus remote users and how to best accommodate each. Remote user information can be archived to a location outside of the access point for periodic network and user permission administration.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

Syntax

```plaintext
accounting [radius|syslog|wait-client-ip]
accounting [radius|wait-client-ip]
accounting syslog [host|mac-address-format]
accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}
accounting syslog mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot] case [lower|upper]
```

Parameters

- **accounting [radius|wait-client-ip]**
  - Enables support for WLAN RADIUS accounting messages. This option is disabled by default. When enabled, the WLAN uses an external RADIUS resource for accounting.
  - **Note:** Use the `use > aaa-policy > <AAA-POLICY-NAME>` command to associate an appropriate AAA policy with this WLAN. This AAA policy should be existing and should define the accounting, authentication, and authorization parameters.
- **accounting syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}**
  - Enables support for WLAN syslog accounting messages in standard syslog format (RFC 3164). This option is disabled by default.
### Global Configuration Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>host</strong></td>
<td>Configures a syslog destination hostname or IP address for accounting records</td>
</tr>
<tr>
<td><code>&lt;IP/HOSTNAME&gt;</code></td>
<td>• <code>&lt;IP/HOSTNAME&gt;</code> – Specify the IP address or name of the destination host.</td>
</tr>
<tr>
<td><strong>port</strong></td>
<td>Optional. Configures the syslog server's UDP port (this port is used to connect to the server)</td>
</tr>
<tr>
<td><code>&lt;1-65535&gt;</code></td>
<td>• <code>&lt;1-65535&gt;</code> – Specify the port from 1 - 65535. Default port is 514.</td>
</tr>
<tr>
<td><strong>proxy-mode</strong></td>
<td>Optional. Configures the request proxying mode</td>
</tr>
<tr>
<td>[none</td>
<td>through-controller</td>
</tr>
<tr>
<td></td>
<td>• through-controller – Proxies requests through the controller (access point, wireless controller, or service platform) configuring the device</td>
</tr>
<tr>
<td></td>
<td>• through-rf-domain-manager – Proxies requests through the local RF Domain manager</td>
</tr>
<tr>
<td><strong>accounting syslog</strong></td>
<td>Enables support for WLAN syslog accounting messages</td>
</tr>
<tr>
<td><strong>mac-address-format</strong></td>
<td>Configures the MAC address format used in syslog messages</td>
</tr>
<tr>
<td><strong>middle-hyphen</strong></td>
<td>Configures the MAC address format with middle hyphen (AABBCC-DDEEFF)</td>
</tr>
<tr>
<td><strong>no-delim</strong></td>
<td>Configures the MAC address format without delimiters (AABBCCDDEEFF)</td>
</tr>
<tr>
<td><strong>pair-colon</strong></td>
<td>Configures the MAC address format with pair-colon delimiters (AA:BB:CC:DD:EE:FF)</td>
</tr>
<tr>
<td><strong>pair-hyphen</strong></td>
<td>Configures the MAC address format with pair-hyphen delimiters (AA-BB-CC-DD-EE-FF). This is the default setting.</td>
</tr>
<tr>
<td><strong>quad-dot</strong></td>
<td>Configures the MAC address format with quad-dot delimiters (AABB.CCDD.EEFF)</td>
</tr>
<tr>
<td>**case [lower</td>
<td>upper]**</td>
</tr>
<tr>
<td></td>
<td>• case – Specifies MAC address case (upper or lower)</td>
</tr>
<tr>
<td></td>
<td>• lower – Specifies MAC address is filled in lower case (for example, aa-bb-cc-dd-ee-ff)</td>
</tr>
<tr>
<td></td>
<td>• upper – Specifies MAC address is filled in upper case (for example, AA-BB-CC-DD-EE-FF)</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config-wlan-test)#accounting syslog host 172.16.10.4 port 2 proxy-mode none
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  accounting syslog host 172.16.10.4 port 2
rfs7000-37FABE(config-wlan-test)#
```
4.1.90.2.2 acl

Defines the actions taken based on an ACL rule configuration

Use the command `ip-access-list <IP-ACCESS-LIST-NAME>` to associate an ACL with the WLAN. The ACL rule is determined by the associated ACL's configuration.

A firewall is a mechanism enforcing access control, and is considered a first line of defense in protecting proprietary information within the network. The means by which this is accomplished varies, but in principle, a firewall can be thought of as mechanisms allowing and denying data traffic in respect to administrator defined rules. For an overview of firewalls, see \textit{FIREWALL-POLICY}.

WLANs use firewalls like \textit{Access Control Lists} (ACLs) to filter/mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of \textit{Access Control Entries} (ACEs). Each ACE specifies an action and a set of conditions (rules) a packet must satisfy to match the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP based firewall rules are specific to source and destination IP addresses and the unique rules and precedence orders assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

Additionally, administrators can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC Firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

Syntax

```
acl exceed-rate wireless-client-denied-traffic <0-1000000> {blacklist <0-86400> | disassociate}
```

Parameters

- `acl exceed-rate wireless-client-denied-traffic <0-1000000>`
  - Sets the action taken based on an ACL rule configuration (for example, drop a packet)
  - exceed-rate – Action is taken when the rate exceeds a specified value
  - wireless-client-denied-traffic <0-1000000> – Sets the action to deny traffic to the wireless client when the rate exceeds the specified value
  - `<0-1000000>` – Specify a allowed rate threshold of disallowed traffic in packets/sec.
- blacklist <0-86400>
  - Optional. When enabled, sets the time interval to blacklist a wireless client
- disassociate
  - Optional. When enabled, disassociates a wireless client
Examples

rfs7000-37FABE(config-wlan-test)#acl exceed-rate wireless-client-denied-traffic 20 disassociate

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test)#
4.1.90.2.3 answer-broadcast-probes

- wlan-mode commands

Allows the WLAN to respond to probe requests that do not specify a SSID. These probes are for broadcast ESS. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
answer-broadcast-probes

Parameters
None

Examples
rfs7000-37FABE(config-wlan-1)#answer-broadcast-probes
rfs7000-37FABE(config-wlan-1)#
4.1.90.2.4 assoc-response

wlan-mode commands

Configures the deny-threshold and rssi-threshold values. These threshold values are considered when responding to a client’s association/authentication request.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]

Parameters

- assoc-response [deny-threshold <1-12>|rssi-threshold <-100--40>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assoc-response</td>
<td>Configures the association response thresholds</td>
</tr>
<tr>
<td>deny-threshold</td>
<td>Configures the number of times association/authentication request, from a client, is ignored if the RSSI is less than the configured RSSI threshold. This option is disabled by default.</td>
</tr>
<tr>
<td>rssi-threshold</td>
<td>Configures an association response RSSI threshold value. If the RSSI is below the configured threshold value, the client’s association/authentication request is ignored. This option is disabled by default.</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809(config-wlan-test)#assoc-response rssi-threshold -60
nx9500-6C8809(config-wlan-test)#assoc-response deny-threshold 4

nx9500-6C8809(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none
  assoc-response rssi-threshold -60
  assoc-response deny-threshold 4
  registration user group-name guest expiry-time 2000 agreement-refresh 14400
nx9500-6C8809(config-wlan-test)#
```
4.1.90.2.5 association-list

Attnes an existing global association list with this WLAN. For more information on global association lists, see global-association-list.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

association-list global <GLOBAL-ASSO-LIST-NAME>

Parameters

- association-list global <GLOBAL-ASSO-LIST-NAME>

  - <GLOBAL-ASSO-LIST-NAME> – Specify the global association list name (should be existing and configured).

Examples

rfs4000-229D58(config-wlan-test)#association-list global my-clients

rfs4000-229D58(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none

association-list global my-clients
rfs4000-229D58(config-wlan-test)#
### 4.1.90.2.6 authentication-type

Sets the WLAN’s authentication type

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none]
```

#### Parameters

- **authentication-type [eap|eap-mac|eap-psk|kerberos|mac|none]**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| eap      | Configures EAP authentication (802.1X)  
EAP is the de-facto standard authentication method used to provide secure authenticated access to controller managed WLANs. EAP provides mutual authentication, secured credential exchange, dynamic keying and strong encryption. 802.1X EAP can be deployed with WEP, WPA or WPA2 encryption schemes to further protect user information forwarded over controller managed WLANs.  
The EAP process begins when an unauthenticated supplicant (client device) tries to connect with an authenticator (in this case, the authentication server). An access point passes EAP packets from the client to an authentication server on the wired side of the access point. All other packet types are blocked until the authentication server (typically, a RADIUS server) verifies the client’s identity.  
If using EAP authentication ensure that a AAA policy is mapped to the WLAN. |
| eap-mac  | Configures EAP or MAC authentication depending on client. (This setting is valid only with the None encryption type.  
EAP-MAC is useful when in a hotspot environment, as some clients support EAP and an administrator may want to authenticate based on just the MAC address of the device. |
| eap-psk  | Configures EAP authentication or pre-shared keys depending on client (This setting is only valid with Temporal Key Integrity Protocol (TKIP) or Counter Mode with Cipher Block Chaining Message Authentication Code Protocol (CCMP) encryption types.  
When using PSK with EAP, the controller sends a packet requesting a secure link using a pre-shared key. The controller and authenticating device must use the same authenticating algorithm and pass code during authentication. EAP-PSK is useful when transitioning from a PSK network to one that supports EAP.  
If using eap-psk authentication ensure that a AAA policy is mapped to the WLAN. |
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| kerberos | Configures Kerberos authentication (encryption will change to WEP128 if it’s not already WEP128 or Keyguard)  
Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection.  
Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses *Network Time Protocol* (NTP) for synchronizing the clocks of its *Key Distribution Center* (KDC) server(s). |
| mac | Configures MAC authentication (RADIUS lookup of MAC address)  
MAC is a device level authentication method used to augment other security schemes when legacy devices are deployed using static WEP.  
MAC authentication can be used for device level authentication by permitting WLAN access based on device MAC address. MAC authentication is typically used to augment WLAN security options that do not use authentication (such as static WEP, WPA-PSK and WPA2-PSK) MAC authentication can also be used to assign VLAN memberships, Firewall policies and time and date restrictions.  
MAC authentication can only identify devices, not users.  
If using mac authentication ensure that a AAA policy is mapped to the WLAN. |
| none | No authentication is used or the client uses pre-shared keys |

**Examples**

```
rfs7000-37FABE(config-wlan-test)#authentication-type eap
rfs7000-37FABE(config-wlan-test)#show context wlan test
ssid test
bridging-mode tunnel
encryption-type none
authentication-type eap
accounting syslog host 172.16.10.4 port 2
acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test)#
```
4.1.90.2.7 bridging-mode

Configures how packets are bridged to and from a WLAN

Use this command to define which VLANs are bridged, and how local VLANs are bridged between the wired and wireless sides of the network.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`bridging-mode [local|tunnel]`

**Parameters**

<table>
<thead>
<tr>
<th>bridging-mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local</td>
<td>Bridges packets between WLAN and local ethernet ports</td>
</tr>
<tr>
<td>tunnel</td>
<td>Tunnels packets to other devices (typically a wireless controller or service platform). This is the default mode.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-wlan-test)#bridging-mode local
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type eap
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
rfs7000-37FABE(config-wlan-test)#
```
4.1.90.2.8 broadcast-dhcp

`: wlan-mode commands`

Configures broadcast DHCP packet parameters

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

broadcast-dhcp validate-offer

**Parameters**

- **broadcast-dhcp validate-offer**

  **validate-offer** Validates the broadcast DHCP packet destination (a wireless client associated to the radio) before forwarding over the air

**Examples**

rfs7000-37FABE(config-wlan-test)#broadcast-dhcp validate-offer

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type eap
  accounting syslog host 172.16.10.4 port 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
  broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#
4.1.90.2.9 broadcast-ssid

Advertises the WLAN SSID in beacons. If a hacker tries to isolate and hack a SSID from a client, the SSID will display since the ESSID is in the beacon. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

broadcast-ssid

Parameters

None

Examples

rfs7000-37FABE(config-wlan-1)#broadcast-ssid
rfs7000-37FABE(config-wlan-1)#
4.1.90.2.10 captive-portal-enforcement

> wlan-mode commands

Configures the WLAN's captive portal enforcement

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

captive-portal-enforcement {fall-back}

**Parameters**

- captive-portal-enforcement {fall-back}

<table>
<thead>
<tr>
<th>captive-portal-enforcement</th>
<th>Enables captive portal enforcement on a WLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>fall-back</td>
<td>Optional. Enforces captive portal validation if WLAN authentication fails (applicable to EAP or MAC authentication only)</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-wlan-test)#captive-portal-enforcement fall-back

rfs7000-37FABE(config-wlan-test)#show context
wlan test
ssid test
bridging-mode local
encryption-type none
authentication-type eap
accounting syslog host 172.16.10.4 port 2
captive-portal-enforcement fall-back
acl exceed-rate wireless-client-denied-traffic 20 disassociate
broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#
4.1.90.2.11 client-access

wlan-mode commands

Enables WLAN client access (for normal data operations)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
client-access

Parameters
None

Examples
rfs7000-37FABE(config-wlan-1)#client-access
rfs7000-37FABE(config-wlan-1)#
4.1.90.2.12 client-client-communication

* wlan-mode commands

Allows frame switching from one client to another on a WLAN

This option is enabled by default. It allows clients to exchange packets with other clients. It does not necessarily prevent clients on other WLANs from sending packets to this WLAN, but as long as this setting is also disabled on that WLAN, clients are not permitted to interoperate.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

client-client-communication

**Parameters**

None

**Examples**

```plaintext
rfs7000-37FABE(config-wlan-1)#client-client-communication
rfs7000-37FABE(config-wlan-1)#
```
4.1.90.2.13 client-load-balancing

**wlan-mode commands**

Enforces client load balancing on a WLAN's access point radios. AP6522, AP6532, AP6562, AP81XX, AP82XX and models can support 256 clients per access point. AP6511 and AP6521 models can support up to 128 clients per access point. Loads are balanced by ignoring association and probe requests. Probe and association requests are not responded to, forcing a client to associate with another access point radio.

This feature is disabled by default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
client-load-balancing {allow-single-band-clients|band-discovery-intvl|
capability-ageout-time|max-probe-req|probe-req-intvl}

client-load-balancing {allow-single-band-clients [2.4Ghz|5Ghz]| 
  band-discovery-intvl <0-10000>|capability-ageout-time <0-10000>}

client-load-balancing {max-probe-req|probe-req-intvl} [2.4Ghz|5Ghz] <0-10000>
```

**Parameters**

- **client-load-balancing**
  - `allow-single-band-clients [2.4Ghz|5Ghz]`
    - Optional. Allows single band clients to associate even during load balancing
      - 2.4GHz – Enables load balancing across 2.4 GHz channels
      - 5GHz – Enables load balancing across 5.0 GHz channels
      - This option is enabled by default for 2.4 and 5.0 GHz radios.
  - `band-discovery-intvl <0-10000>`
    - Optional. Configures the interval to discover a client’s band capability before connection
      - <0-10000> – Specify a value from 0 - 10000 seconds. The default is 10 seconds.
  - `capability-ageout-time <0-10000>`
    - Optional. Configures a client's capability ageout interval
      - <0-10000> – Specify a value from 0 - 10000 seconds. The default is 3600 seconds.
  - `max-probe-req [2.4Ghz|5Ghz] <0-10000>`
    - Optional. Configures client probe request interval limits for device association
      - 2.4GHz – Configures maximum client probe requests on 2.4 GHz radios
      - 5GHz – Configures maximum client probe requests on 5.0 GHz radios
      - <0-10000> – Specify a client probe request threshold from 0 - 100000. The default for both 2.4 and 5.0 GHz radios is 60.
### Examples

```bash
rfs7000-37FABE(config-wlan-test)#client-load-balancing band-discovery-intvl 2
rfs7000-37FABE(config-wlan-test)#client-load-balancing probe-req-intvl 5ghz 5

4.1.90.2.14 controller-assisted-mobility

wlan-mode commands

Enables controller or service platform assisted mobility to determine a wireless client’s VLAN assignment. When enabled, a controller or service platform’s mobility database is used to assist in roaming between RF Domains. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

### 4.1.90.2.15 data-rates

**wlan-mode commands**

Specifies the 802.11 rates supported on a WLAN.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
data-rates [2.4GHz|5GHz]
data-rates 2.4GHz [b-only|bg|bgn|default|g-only|gn]

### data-rates [2.4GHz|5GHz] custom [1|11|12|18|24|36|48|5.5|54|6|9|basic-1|basic-11|basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|basic-9|basic-mcs-1s|mcs-1s|mcs-2s|mcs-3s]

**data-rates**

- **2.4GHz|5GHz**

  Specifies the 802.11 rates supported when mapped to a 2.4 GHz or 5.0 GHz radio channel.

**custom**

- Configures a data rates list by specifying each rate individually. Use 'basic-' prefix before a rate to indicate it is used as a basic rate (For example, 'data-rates custom basic-1 basic-2 5.5 11').

  The data-rates for 2.4 GHz and 5.0 GHz channels are the same with a few exceptions. The 2.4 GHz channel has a few extra data rates: 1, 11, 2, and 5.5.

<table>

4.1.90.2.17 downstream-group-addressed-forwarding

* wlan-mode commands *

Enables/disables forwarding of downstream BCMC packets to a group on this WLAN. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

downstream-group-addressed-forwarding

**Parameters**

None

**Examples**

rfs4000-229D58 (config-wlan-test)#downstream-group-addressed-forwarding
rfs4000-229D58 (config-wlan-test)#
### 4.1.90.2.18 dynamic-vlan-assignment

**wlan-mode commands**

Configures dynamic VLAN assignment on this WLAN

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dynamic-vlan-assignment allowed-vlans <VLAN-ID>

**Parameters**
- dynamic-vlan-assignment allowed-vlans <VLAN-ID>

<table>
<thead>
<tr>
<th>dynamic-vlan-assignment</th>
<th>allowed-vlans</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures a list of VLAN IDs or VLAN alias allowed access to the WLAN</td>
<td></td>
</tr>
</tbody>
</table>

| <VLAN-ID> | Specify the list of VLAN IDs or the VLAN alias names. For example, 10-20, 25, 30-35, $guest. For information on VLAN aliases, see alias. |

**Examples**

rfs4000-229D58(config-wlan-test)#dynamic-vlan-assignment allowed-vlans 10-20

rfs4000-229D58(config-wlan-test)#show context
wlan test
ssid test
bridging-mode tunnel
encryption-type none
authentication-type none
dynamic-vlan-assignment allowed-vlans 10-20
rfs4000-229D58(config-wlan-test)#
4.1.90.2.19 eap-types

wlan-mode commands

Configures client access based on the EAP type used

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

eap-types [allow|deny] [aka|all|fast|peap|sim|tls|ttls]

Parameters
- allow — Configures a list of EAP types allowed for WLAN client authentication
- deny — Configures a list of EAP types not allowed for WLAN client authentication

| [aka|all|fast|peap|sim|tls|ttls] | The following EAP types are common to the ‘allow’ and ‘deny’ keywords: |
|---------------------------------|---------------------------------------------------------------------|
| aka – Configures EAP Authentication and Key Agreement (AKA) and EAP-AKA’ (AKA Prime). EAP-AKA is one of the methods in the EAP authentication framework. It uses Universal Mobile Telecommunications System (UMTS) and Universal Subscriber Identity Module (USIM) for client authentication and key distribution. |
| all – Allows or denies usage of all EAP types on the WLAN |
| peap – Configures Protected Extensible Authentication Protocol (PEAP). PEAP or Protected EAP uses encrypted and authenticated TLS tunnel to encapsulate EAP. |
| sim – Configures EAP Subscriber Identity Module (SIM). EAP-SIM uses Global System for Mobile Communications (GSM) SIM for client authentication and key distribution. |
| tls – Configures EAP Transport Layer Security (TLS). EAP-TLS is an EAP authentication method that uses PKI to communicate with a RADIUS server or any other authentication server. |
| ttls – Configures Tunneled Transport Layer Security (TTLS). EAP-TTLS is an extension of TLS. Unlike TLS, TTLS does not require every client to generate and install a CA-signed certificate. |

Note: These options are recursive, and more than one EAP type can be selected. The selected options are added to the allowed or denied EAP types list.
Examples

rfs7000-37FABE(config-wlan-test)#eap-types allow fast sim tls

rfs7000-37FABE(config-wlan-test)#show context
wlan test
ssid test
bridging-mode tunnel
encryption-type none
authentication-type none
eap-types allow fast sim tls
rfs7000-37FABE(config-wlan-test)#
### 4.1.90.2.20 encryption-type

Sets a WLAN's encryption type

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
encryption-type [ccmp|keyguard|none|tkip-ccmp|wep128|web128-keyguard|wep64]
```

**Parameters**

- `encryption-type [ccmp|keyguard|none|tkip-ccmp|wep128|web128-keyguard|wep64]`

<table>
<thead>
<tr>
<th>encryption-type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccmp</td>
<td>Configures Advanced Encryption Standard (AES) Counter Mode CBC-MAC Protocol</td>
</tr>
<tr>
<td></td>
<td>(AES-CCM/CCMP)</td>
</tr>
<tr>

<td>Configures Keyguard-MCM (Mobile Computing Mode)</td>
</tr>
<tr>
<td>tkip-ccmp</td>
<td>Configures the TKIP and AES-CCM/CCMP encryption modes</td>
</tr>
<tr>
<td>wep128</td>
<td>Configures WEP with 128 bit keys</td>
</tr>
<tr>
<td>web128-keyguard</td>
<td>Configures WEP128 as well as Keyguard-MCM encryption modes</td>
</tr>
<tr>
<td>wep64</td>
<td>Configures WEP with 64 bit keys. A WEP64 configuration is insecure when two</td>
</tr>
<tr>
<td></td>
<td>WLANs are mapped to the same VLAN, and one uses no encryption while the other</td>
</tr>
<tr>
<td></td>
<td>uses WEP.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-wlan-test)#encryption-type tkip-ccmp
rfs7000-37FABE(config-wlan-test)#show context
wlan test
description TestWLAN
ssid test
bridging-mode local
encryption-type tkip-ccmp
```

```
accounting syslog host 172.16.10.4 port 2
data-rates 2.4GHz gn

broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#
```
4.1.90.2.21 enforce-dhcp

Drops packets from clients with a static IP address

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
enforce-dhcp

Parameters
None

Examples
rfs7000-37FABE(config-wlan-test)#enforce-dhcp
rfs7000-37FABE(config-wlan-test)#show context wlan test
  description TestWLAN
  ssid test

  captive-portal-enforcement fall-back
  acl exceed-rate wireless-client-denied-traffic 20 disassociate enforce-dhcp
  broadcast-dhcp validate-offer
rfs7000-37FABE(config-wlan-test)#
4.1.90.2.22 fast-bss-transition

wlan-mode commands

Enables or disables support for 802.11r Fast-BSS Transition (FT) on the selected WLAN. This feature is disabled by default.

802.11r is an attempt to undo the burden that security and QoS added to the handoff process, and restore it back to an original four message exchange process. The central application for the 802.11r standard is VOIP using mobile phones within wireless Internet networks. 802.11r FT redefines the security key negotiation protocol, allowing parallel processing of negotiation and requests for wireless resources.

Enabling FT standards provides wireless clients fast, secure and seamless transfer from one base station to another, ensuring continuous connectivity.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`fast-bss-transition {over-ds}`

Parameters
- `fast-bss-transition {over-ds}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fast-bss-transition</code></td>
<td>Enables 802.11r FT support on this WLAN</td>
</tr>
<tr>
<td><code>over-ds</code></td>
<td>Optional. Enables 802.11r client roaming over the Distribution System (DS). When enabled, all client communication with the target AP is via the current AP. This communication, carried in FT action frames, is first sent by the client to the current AP, then forwarded to the target AP through the controller.</td>
</tr>
</tbody>
</table>

Examples

```bash
rfs7000-37FABE(config-wlan-test)#fast-bss-transition
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  vlan 1
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  fast-bss-transition
rfs7000-37FABE(config-wlan-test)#
```
**4.1.90.2.23 http-analyze**

* wlan-mode commands

Enables HTTP URL analysis on the WLAN

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
http-analyze [filter|syslog]
http-analyze filter [images|post|query-string]
http-analyze syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}
```

**Parameters**

- `http-analyze filter [images|post|query-string]`

<table>
<thead>
<tr>
<th>filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>images</td>
<td>Filters out URLs referring to images (does not forward URL requesting images)</td>
</tr>
<tr>
<td>post</td>
<td>Filters out URLs requesting POST (does not forward POST requests). This option is disabled by default.</td>
</tr>
<tr>
<td>query-string</td>
<td>Removes query strings from URLs before forwarding them (forwards requests and no data). This option is disabled by default.</td>
</tr>
</tbody>
</table>

- `http-analyze syslog host <IP/HOSTNAME> {port <1-65535>} {proxy-mode [none|through-controller|through-rf-domain-manager]}

<table>
<thead>
<tr>
<th>syslog</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host &lt;IP/HOSTNAME&gt;</td>
<td>Forwards client and URL information to a syslog server</td>
</tr>
<tr>
<td>port &lt;1-65535&gt;</td>
<td>Optional. Specifies the UDP port to connect to the syslog server from 1 - 65535</td>
</tr>
<tr>
<td>proxy-mode</td>
<td>Optional. Specifies if the request is to be proxied through another device</td>
</tr>
<tr>
<td>[none]</td>
<td>• none – Requests are sent directly to syslog server from device</td>
</tr>
<tr>
<td>through-controller</td>
<td>• through-controller – Proxies requests, to the syslog server, through the controller configuring the device</td>
</tr>
<tr>
<td>through-rf-domain-manager</td>
<td>• through-rf-domain-manager – Proxies requests, to the syslog server, through the local RF Domain manager</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config-wlan-test)#http-analyze syslog host 192.168.13.10 port 21 proxy-mode through-controller
rfs4000-229D58(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  http-analyze syslog host 192.168.13.10 port 21 proxy-mode through-controller
rfs4000-229D58(config-wlan-test)#
```
4.1.90.2.24 ip

wlan-mode commands

Configures Internet Protocol (IP) settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ip [arp|dhcp]

ip arp [header-mismatch-validation|trust]

ip dhcp trust

Parameters

- ip arp [header-mismatch-validation|trust]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip arp</td>
<td>Configures the IP settings for ARP packets</td>
</tr>
<tr>
<td>header-mismatch-validation</td>
<td>Verifies mismatch of source MAC address in the ARP and Ethernet headers</td>
</tr>
<tr>
<td>trust</td>
<td>Sets ARP responses as trusted for a WLAN/range</td>
</tr>
</tbody>
</table>

- ip dhcp trust

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip dhcp</td>
<td>Configures the IP settings for DHCP packets</td>
</tr>
<tr>
<td>trust</td>
<td>Sets DHCP responses as trusted for a WLAN/range</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-wlan-test)#ip dhcp trust

rfs7000-37FABE(config-wlan-test)#show context

wlan test
  description TestWLAN
  ssid test

  enforce-dhcp
  broadcast-dhcp validate-offer
  http-analyze controller
rfs7000-37FABE(config-wlan-test)#
4.1.90.2.25 ipv6

Sets the DHCPv6 and ICMPv6 neighbor discovery (ND) components for this WLAN

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

ipv6 [dhcpv6|nd]
ipv6 dhcpv6 trust
ipv6 nd [header-mismatch-validation|raguard|trust]

Parameters

- ipv6 dhcpv6 trust
  Enables DHCPv6 trust state for DHCPv6 responses on this WLAN. When enabled, all DHCPv6 responses received on this WLAN are trusted and forwarded. This option is disabled by default.

- ipv6 nd [header-mismatch-validation|raguard|trust]

<table>
<thead>
<tr>
<th>ipv6 nd</th>
<th>Sets the IPv6 ND settings for this WLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>header-mismatch-validation</td>
<td>Checks for mismatch of source MAC address in the ICMPv6 ND message and Ethernet header (link layer option). This option is enabled by default.</td>
</tr>
<tr>
<td>raguard</td>
<td>Allows redirection of router advertisements (RAs) and ICMPv6 packets originating on this WLAN. This option is disabled by default.</td>
</tr>
<tr>
<td>trust</td>
<td>Enables trust state for ND requests received on this WLAN. When enabled, all ND requests on an IPv6 firewall, on this WLAN, are trusted. This option is disabled by default.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-wlan-test)#ipv6 dhcpv6 trust
rfs7000-37FABE(config-wlan-test)#ipv6 nd trust
rfs7000-37FABE(config-wlan-test)#show context wlan test

encryption-type none
authentication-type none
ipv6 dhcpv6 trust
ipv6 nd trust
rfs7000-37FABE(config-wlan-test)#
4.1.90.2.26 kerberos

Configure Kerberos authentication parameters on a WLAN.

Kerberos (designed and developed by MIT) provides strong authentication for client/server applications using secret-key cryptography. Using Kerberos, a client must prove its identity to a server (and vice versa) across an insecure network connection.

Once a client and server use Kerberos to validate their identity, they encrypt all communications to assure privacy and data integrity. Kerberos can only be used on the access point with 802.11b clients. Kerberos uses Network Time Protocol (NTP) for synchronizing the clocks of its Key Distribution Center (KDC) server(s).

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
kerberos [password|realm|server]
kerberos password [0 <LINE>|2 <LINE>|<LINE>]
kerberos realm <REALM>
kerberos server [primary|secondary|timeout]
kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}
kerberos server timeout <1-60>
```

Parameters

- `kerberos password [0 <LINE>|2 <LINE>|<LINE>]`
  - Configures a WLAN's Kerberos authentication parameters.
  - The parameters are: password, realm, and server.
  - The password options are:
    - `0 <LINE>` – Configures a clear text password
    - `2 <LINE>` – Configures an encrypted password
    - `<LINE>` – Specify the password.

- `kerberos realm <REALM>`
  - Configures a WLAN's Kerberos authentication parameters.
  - The parameters are: password, realm, and server.

- `kerberos server [primary|secondary] host <IP/HOSTNAME> {port <1-65535>}`
  - Configures a WLAN's Kerberos authentication parameters.
  - The parameters are: password, realm, and server.
GLOBAL CONFIGURATION COMMANDS

### GLOBAL CONFIGURATION COMMANDS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| server [primary|secondary] | Configures the primary and secondary KDC server parameters  
  • primary – Configures the primary KDC server parameters  
  • secondary – Configures the secondary KDC server parameters |
| host <IP/HOSTNAME> | Sets the primary or secondary KDC server address  
  • <IP/HOSTNAME> – Specify the IP address or name of the KDC server. |
| port <1-65535> | Optional. Configures the UDP port used to connect to the KDC server  
  • <1-65535> – Specify the port from 1 - 65535. The default is 88. |
| kerberos | Configures a WLAN's Kerberos authentication parameters  
  The parameters are: password, realm, and server. |
| timeout <1-60> | Modifies the Kerberos KDC server’s timeout parameters  
  • <1-60> – Specifies the wait time for a response from the Kerberos KDC server before retrying. Specify a value from 1 - 60 seconds. |

### Examples

```plaintext
rfs7000-37FABE(config-wlan-test)#kerberos server timeout 12
rfs7000-37FABE(config-wlan-test)#kerberos server primary host 172.16.10.2 port 88

rfs7000-37FABE(config-wlan-test)#
```
4.1.90.2.27 mac-authentication

Enables MAC authentication. When enabled, the system uses cached credentials (RADIUS server lookups are skipped) to authenticate clients.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
mac-authentication [cached-credentials|enforce-always]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-authentication</td>
<td>Enables MAC authentication on this WLAN and configures related parameters.</td>
</tr>
<tr>
<td>cached-credentials</td>
<td>Uses cached credentials to skip RADIUS lookups. This option is disabled by default.</td>
</tr>
<tr>
<td>enforce-always</td>
<td>Enforces MAC authentication on this WLAN. When enabled, MAC authentication is enforced, each time a client logs in, even when the authentication type specified (using the authentication-type command) is not MAC authentication. This option is disabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config-wlan-test)#mac-authentication cached-credentials
rfs4000-229D58(config-wlan-test)#
```
4.1.90.2.28 no

## wlan-mode commands

Negates WLAN mode commands and reverts values to their default.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9511,NX9600

### Parameters

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes or reverts this WLAN's settings based on the parameters passed</th>
</tr>
</thead>
</table>

**Usage Guidelines**

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

```bash
rfs7000-37FABE(config-wlan-test)#no ?
accounting Configure how accounting records are created for this wlan
acl Actions taken based on ACL configuration [ packet drop being one of them]
answer-broadcast-probes Do not Include this wlan when responding to probe requests that do not specify an SSID
association-list Configure the association list for the wlan
authentication-type Reset the authentication to use on this wlan to default (none/Pre-shared keys)
broadcast-dhcp Configure broadcast DHCP packet handling
broadcast-ssid Do not advertise the SSID of the WLAN in beacons
captive-portal-enforcement Configure how captive-portal is enforced on the wlan
client-access Disallow client access on this wlan (no data operations)
client-client-communication Disallow switching of frames from one wireless client to another on this wlan
client-load-balancing Disable load-balancing of clients on this wlan
downstream-group-addressed-forwarding Disable downstream group addressed forwarding of packets
dynamic-vlan-assignment Dynamic VLAN assignment configuration```

rfs7000-37FABE(config-wlan-test)#
4.1.90.2.29 opendns

**wlan-mode commands**

Enables integration of access points, wireless controllers, and service platforms with OpenDNS. When configured, DNS queries from wireless clients are redirected to OpenDNS (208.67.220.220 OR 208.67.222.222). These OpenDNS resolvers act as proxy DNS servers that provide additional functionalities, such as Web filtering, reporting, and performance enhancement.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
opendns device-id <DEVICE-ID>
```

**Parameters**

- `opendns device-id <DEVICE-ID>`

<table>
<thead>
<tr>
<th><code>opendns device-id &lt;DEVICE-ID&gt;</code></th>
<th>Configures the device ID sent to OpenDNS</th>
</tr>
</thead>
</table>
| **<DEVICE-ID>** | Specify the device ID. The device-id entered here is obtained from the OpenDns site by executing the following command in the Privi Exec Mode: `opendns > username <WORD>` `password <WORD> label <WORD>`. For more information, see `opendns`.
| **note** | To enable redirection of DNS query to OpenDNS it is necessary that the DNS server’s IP address provided in the DHCP Server policy (used by the client) should point to the OpenDNS IP address (208.67.220.220 OR 208.67.222.222). For more information, see `dns-server`.
| For example: `rfs7000-37FABE(config-dhcp-policy-dhcppolicy-pool-dhcppool)#show context
dhcp-pool dhcppool
    network 192.168.13.0/24
    address range 192.168.13.160 192.168.13.200
default-router 192.168.13.105
dns-server 208.67.220.220 208.67.222.222
rfs7000-37FABE(config-dhcp-policy-dhcppolicy-pool-dhcppool)#`, Contd... |
Examples

Following examples show all configurations required to integrate access points and controllers with the OpenDNS service:

Step 1. In the Privilege Executable Mode:

```plaintext
ap7131-E6D512#opendns username bob@examplecompany.com password opendns label company_name
Connecting to OpenDNS server...
device_id = 0014AADF8EDC6C59
ap7131-E6D512#
```

Step 2: To enable OpenDNS on a WLAN, apply the device-id, obtained in the preceding step, to the WLAN:

```plaintext
ap7131-E6D512(config)#wlan opendns
ap7131-E6D512(config-wlan-opendns)#opendns device-id 0014AADF8EDC6C59
ap7131-E6D512(config-wlan-opendns)#commit
ap7131-E6D512(config-wlan-opendns)#show context
wlan opendns
ssid opendns
vlan 1
bridging-mode local
encryption-type none
authentication-type none
opendns device-id 0014AADF8EDC6C59
ap7131-E6D512(config-wlan-opendns)#
```

The following examples show the other mandatory configurations needed to redirect wireless client DNS queries to the OpenDNS server:

```plaintext
ap7131-E6D512(config)#self
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#
```

Step 3: To enable DNS resolution on the access point or controller, execute the following commands:

```plaintext
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#ip name-server 144.189.100.51
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#ip dns-server-forward
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#show context
ap7131-00-15-70-E6-D5-12
use profile default-ap71xx
use rf-domain default
hostname ap7131-E6D512
country-code us
no mint mlcp vlan
ip name-server 144.189.100.51
no ip domain-lookup
ip default-gateway 144.190.204.222
no device-upgrade auto
interface radio1
wlan opendns bss 1 primary
```

**Note:** To prevent wireless clients from bypassing the OpenDNS resolver by adding their own DNS servers, configure and apply an IP ACL on the access point, wireless controller, or service platform containing the following firewall rules:

```plaintext
rfs7000-37FABE(config-ip-acl-dns-list)#show context
ip access-list dns-list
permit udp any host 208.67.222.222 eq dns rule-precedence 1 rule-description "allow dns queries only to OpenDNS"
deny udp any any eq dns rule-precedence 10 rule-description "block all other dns queries"
permit ip any any rule-precedence 100 rule-description "allow all other ip packets"
rfs7000-37FABE(config-ip-acl-dns-list)#
```
interface radio2
    wlan opendns bss 1 primary
interface ge1
    switchport mode access
    switchport access vlan 10
interface vlan1
    ip address 192.168.1.105/24
    ip dhcp client request options all
    ip nat inside
    no ipv6 enable
    no ipv6 request-dhcpv6-options
interface vlan10
    ip address 144.190.204.218/24
    no ipv6 enable
    no ipv6 request-dhcpv6-options
use dhcp-server-policy dhcppolicy

**ip dns-server-forward**
logging on
logging console debugging
logging buffered warnings
ip nat inside source list my_list precedence 10 interface vlan10 overload
enforce-version adoption none

```
interface vlan1
    ip address 192.168.1.105/24
    ip dhcp client request options all
    ip nat inside
    no ipv6 enable
    no ipv6 request-dhcpv6-options
use dhcp-server-policy dhcppolicy
```

Step 4: To ensure that the OpenDNS-enabled WLAN's client's DNS queries are redirected to the OpenDNS server, execute the following commands:

```
ap7131-E6D512(config)#dhcp-server-policy dhcppolicy
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#dhcp-pool opendns
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#show context
dhcp-server-policy dhcppolicy
dhcp-pool dhcppool
    network 192.168.1.0/24
    address range 192.168.1.160 192.168.1.200
    default-router 192.168.1.105
dns-server 208.67.222.222
ap7131-E6D512(config-dhcp-policy-dhcppolicy)#
ap7131-E6D512(config)#dhcp-server-policy dhcppolicy
```

```
ap7131-E6D512(config-device-00-15-70-E6-D5-12)#
ap7131-E6D512(config)#dhcp-server-policy dhcppolicy
```

4.1.90.2.30 protected-mgmt-frames

Configures the WLAN’s frame protection mode and security association

802.11w provides protection for both unicast management frames and broadcast/multicast management frames. The ‘robust management frames’ are action, disassociation, and deauthentication frames. The standard provides one security protocol CCMP for protection of unicast robust management frames. Protected management frames (PMF) protocol only applies to robust management frames after establishment of RSNA PTK. Robust management frame protection is achieved by using CCMP for unicast management frames, broadcast/multicast integrity protocol (BIP) for broadcast/multicast management frames and SA query protocol for protection against (re)association attacks.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|
timeout <100-1000>]]
```

Parameters

- protected-mgmt-frames [mandatory|optional|sa-query [attempts <1-10>|
timeout <100-1000>]]

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>protected-mgmt-frames</td>
<td>Enables and configures WLAN’s frame protection mode and security association. Use this command to specify whether management frames are continually or optionally protected.</td>
</tr>
<tr>
<td>mandatory</td>
<td>Enforces protected management frames (PMF) on this WLAN (management frames are continually optionally protected)</td>
</tr>
<tr>
<td>optional</td>
<td>Provides PMF only for those clients that support PMF (management frames are optionally protected)</td>
</tr>
<tr>
<td>sa-query [attempts &lt;1-10&gt;</td>
<td></td>
</tr>
</tbody>
</table>
timeout <100-1000>] | Configures the following security association (SA) parameters: |
| attempts <1-10> | — Configures the number of SA query attempts from 1 - 10. The default is 5. |
| timeout <100-1000> | — Configures the interval, in milliseconds, used to timeout association requests that exceed the defined interval. Specify a value from 100 - 1000 milliseconds. The default value is 201 milliseconds. |

Examples

```
rfs7000-37FABE(config-wlan-test)#protected-mgmt-frames mandatory
rfs7000-37FABE(config-wlan-test)#show context
wlan test
ssid test
bridging-mode tunnel
encryption-type none
authentication-type none
protected-mgmt-frames mandatory
rfs7000-37FABE(config-wlan-test)#
```
4.1.90.2.31 proxy-arp-mode

Enables proxy ARP mode for handling ARP requests

Proxy ARP is the technique used to answer ARP requests intended for another system. By faking its identity, the access point accepts responsibility for routing packets to the actual destination.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
proxy-arp-mode [dynamic|strict]
```

Parameters

- **proxy-arp-mode [dynamic|strict]**
  - **proxy-arp-mode** Enables proxy ARP mode for handling ARP requests. The options available are dynamic and strict.
  - **dynamic** Forwards ARP requests to the wireless side (for which a response could not be proxied). This is the default setting.
  - **strict** Does not forward ARP requests to the wireless side

Examples

```
rfs7000-37FABE(config-wlan-test)#proxy-arp-mode strict
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode local
  encryption-type none
  authentication-type none
  protected-mgmt-frames mandatory
  wing-extensions wmm-load-information
  client-load-balancing probe-req-intvl 5ghz 5
  client-load-balancing band-discovery-intvl 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
  proxy-arp-mode strict
  broadcast-dhcp validate-offer
  http-analyze controller
rfs7000-37FABE(config-wlan-test)#
```
4.1.90.2.32 proxy-nd-mode

* wlan-mode commands

- Configures the proxy ND mode for this WLAN member clients as either strict or dynamic.

  ND proxy is used in IPv6 to provide reachability by allowing a client to act as proxy. Proxy certificate signing can be done either dynamically (requiring exchanges of identity and authorization information) or statically when the network topology is defined.

- Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`proxy-nd-mode [dynamic|strict]`

**Parameters**

- `proxy-nd-mode [dynamic|strict]`

  - **proxy-nd-mode [dynamic|strict]**
    - Configures the proxy ND mode for this WLAN member clients. The options are: dynamic and strict.
    - **dynamic** — Forwards ND request to wireless for which a response could not be proxied. This is the default value.
    - **strict** — Does not forward ND requests to the wireless side.

**Examples**

```
rfs7000-37FABE(config-wlan-test)#proxy-nd-mode strict
rfs7000-37FABE(config-wlan-test)#show context
  wlan test
    ssid test
    bridging-mode tunnel
    encryption-type none
    authentication-type none
    wpa-wpa2 server-only-authentication
    proxy-nd-mode strict
    opendns device-id 44-55-66
rfs7000-37FABE(config-wlan-test)#
```
4.1.90.2.33 qos-map

- wlan-mode commands

Enables support for 802.11u QoS map element and frames

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

qos-map

Parameters

None

Examples

rfs7000-37FABE(config-wlan-test)#qos-map

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  qos-map
  wpa-wpa2 server-only-authentication
  proxy-nd-mode strict
  opendns device-id 44-55-66
rfs7000-37FABE(config-wlan-test)#
4.1.90.2.34 radio-resource-measurement

wlan-mode commands

Enables support for 802.11k radio resource measurement capabilities (IEEE 802.11k) on this WLAN.

802.11k improves how traffic is distributed. In a WLAN, devices normally connect to the access point with the strongest signal. Depending on the number and location of clients, this arrangement can lead to excessive demand on one access point and under utilization of others, resulting in degradation of overall network performance. With 802.11k, if the access point with the strongest signal is loaded to its capacity, a client connects to a under-utilized access point. Even if the signal is weaker, the overall throughput is greater since it’s an efficient use of the network’s resources. This feature is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

radio-resource-measurement \{channel-report|neighbor-report \{hybrid\}\}

Parameters

- radio-resource-measurement \{channel-report|neighbor-report \{hybrid\}\}

<table>
<thead>
<tr>
<th>radio-resource-measurement</th>
<th>Enables support for 802.11k radio resource measurement capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel-report</td>
<td>Optional. Includes the channel-report element in beacons and probe responses</td>
</tr>
<tr>
<td>neighbor-report {hybrid}</td>
<td>Optional. Enables responding to neighbor-report requests</td>
</tr>
<tr>
<td></td>
<td>• hybrid – Optional. Uses the hybrid model of smart-rf neighbors and roaming frequency to neighbors</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58(config-wlan-test)#radio-resource-measurement

rfs4000-229D58(config-wlan-test)#show context
wlan test
  ssid test
  vlan 1
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  radio-resource-measurement
  controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#
4.1.90.2.35 radius

Configures RADIUS related parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
radius [dynamic-authorization|nas-identifier|nas-port-id|vlan-assignment]
radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|vlan-assignment]

Parameters
- **radius [dynamic-authorization|nas-identifier <NAS-ID>|nas-port-id <NAS-PORT-ID>|vlan-assignment]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic-authorization</td>
<td>Enables support for disconnect and change of authorization messages (RFC5176)</td>
</tr>
<tr>
<td>nas-identifier &lt;NAS-ID&gt;</td>
<td>Configures the WLAN NAS identifier sent to the RADIUS server. The NAS identifier should not exceed 256 characters.</td>
</tr>
<tr>
<td>nas-port-id &lt;NAS-PORT-ID&gt;</td>
<td>Configures the WLAN NAS port ID sent to the RADIUS server. The NAS port identifier should not exceed 256 characters.</td>
</tr>
<tr>
<td>vlan-assignment</td>
<td>Configures the VLAN assignment of a WLAN</td>
</tr>
</tbody>
</table>

When enabled, this option assigns clients to the RADIUS server specified VLANs, overriding the WLAN configuration. This option is disabled by default. If, as part of the authentication process, the RADIUS server returns a client’s VLAN-ID in a RADIUS access-accept packet, and this feature is enabled, all client traffic is forwarded on that VLAN. If disabled, the RADIUS server returned VLAN-ID is ignored and the VLAN specified using the `vlan/vlan-pool-member` options (in the WLAN config mode) is used.

**Note:** If both the RADIUS VLAN assignment and the post authentication VLAN options are enabled, then RADIUS VLAN assignment takes priority over post authentication VLAN configuration.

Examples
rfs7000-37FABE(config-wlan-test)#radius vlan-assignment
rfs7000-37FABE(config-wlan-test)#show context
wlan test
ssid test
bridging-mode local
encryption-type none

rfs7000-37FABE(config-wlan-test)#
4.1.90.2.36 registration

**wlan-mode commands**

Configures settings enabling dynamic validation of devices by MAC address to continue the authentication process. When enabled, this option registers a device’s MAC address, and allows direct access to a previously registered device.

Supported in the following platforms:
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
registration [device|device-OTP|external|user]
registration [device|device-OTP|user] group-name <RAD-GROUP-NAME> 
  {agreement-refresh <0-144000>|expiry-time <1-43800>}
registration external host <IP/HOSTNAME> {proxy-mode [none|through-controller|
  through-rf-domain-manager]}
```

**Parameters**

- **registration external host <IP/HOSTNAME> {proxy-mode [none|through-controller|
  through-rf-domain-manager]}**

<table>
<thead>
<tr>
<th>registration</th>
<th>Enables dynamic user registration</th>
</tr>
</thead>
<tbody>
<tr>
<td>external</td>
<td>Forwards user information to an external device (i.e. WLAN authentication is handled by an external controller or access point). Use this option to specify the external controller or access point’s details. This option is disabled by default.</td>
</tr>
<tr>
<td>host &lt;IP/HOSTNAME&gt;</td>
<td>Specifies the external controller or access point’s IP address or hostname</td>
</tr>
<tr>
<td>proxy-mode {none</td>
<td>through-controller</td>
</tr>
<tr>
<td>device</td>
<td>device-OTP</td>
</tr>
<tr>
<td>device-OTP</td>
<td>Use this option for MAC registration of users and provision of a one-time-passcode (OTP). If using this option, set the WLAN authentication type as <strong>MAC authentication</strong>. In this scenario, captive-portal guest users authenticate using their User ID (e-mail address, mobile number, or member id) and the received OTP in order to complete registration.</td>
</tr>
<tr>
<td>device</td>
<td>Use this option when captive portal device registration is through social media. When using this option, ensure that the captive portal is configured for guest user social authentication. For more information, see <strong>oauth</strong>.</td>
</tr>
<tr>
<td>user</td>
<td>Use this option for guest users using one of the following options as their user ID during registration: e-mail address, mobile-number, or member-id.</td>
</tr>
<tr>
<td>group-name &lt;RAD-GROUP-NAME&gt;</td>
<td>Configures the RADIUS group name to which registered are user associated. When left blank, users are not associated with a RADIUS group.</td>
</tr>
<tr>
<td>&lt;RAD-GROUP-NAME&gt;</td>
<td>Specify the RADIUS group name (should not exceed 64 characters).</td>
</tr>
</tbody>
</table>
expiry-time <1-43800>

Optional. Configures the amount of time, in hours, before registered addresses expire and must be re-entered

- <1-43800> – Specify a value from 1 - 43800 hrs. The default is 1500 hrs.

agreement-refresh <0-144000>

Optional. Sets the time (in minutes), after which an inactive user has to refresh the WLAN’s terms of agreement. For example, if the agreement refresh period is set to 1440 minutes, a user, who has been inactive for more than 1440 minutes (1 day) is served the agreement page, and is allowed access only after refreshing the terms of agreement.

- <0-100> – Specify a value from 0 - 144000. The default is 0 minutes.

Examples

```bash
nx9500-6C8809(config-wlan-test)#registration user group-name guest agreement-refresh 14400 expiry-time 2000

nx9500-6C8809(config-wlan-test)#show context
wlan test
ssid test
bridging-mode local
encryption-type none
authentication-type none
registration user group-name guest expiry-time 2000 agreement-refresh 14400
```

```bash
nx9500-6C8809(config-wlan-test)#
```
4.1.90.2.37 relay-agent

Enables support for DHCP/DHCPv6 relay agent information (option 82 and DHCPv6-LDRA) feature on this WLAN

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
relay-agent [dhcp-option82|dhcpv6-ldra]
```

**Parameters**

- `relay-agent [dhcp-option82|dhcpv6-ldra]`

| relay-agent | Enables support for the following DHCP and DHCPv6 options: option 82 and Lightweight DHCPv6 Relay Agent (LDAR) respectively. When enabled, this feature allows the DHCP/DHCPv6 relay agent to insert the relay agent information option (option 82, LDRA) in client requests forwarded to the DHCP/DHCPv6 server.
| dhcp-option82 | Enables DHCP option 82. DHCP option 82 provides client physical attachment information. This option is disabled by default.
| dhcpv6-ldra | Enables the DHCPv6 relay agent. The DHCPv6 LDRA allows DHCPv6 messages to be transmitted on existing networks that do not currently support IPv6 or DHCPv6. This option is disabled by default.

**Examples**

```
rfs4000-229D58(config-wlan-test)#relay-agent dhcp-option82
rfs4000-229D58(config-wlan-test)#show context
wlan test
ssid test
vlan 1
bridging-mode tunnel
encryption-type none
authentication-type none
radio-resource-measurement
relay-agent dhcp-option82

bridging-mode tunnel
encryption-type none
authentication-type none
relay-agent dhcpv6-ldra
rfs6000-81701D(config-wlan-test)#
```
4.1.90.2.38 shutdown

wlan-mode commands

Auto shuts down a WLAN

The auto shutdown mechanism helps regulate the availability of a WLAN based on an administrator defined access period. Use this feature to shut down a WLAN on specific days and hours and restrict periods when the WLAN traffic is either not desired or cannot be properly administrated. The normal practice is to shut down WLANs when there are no users on the network, such as after hours, weekends or holidays. This allows administrators more time to manage mission critical tasks since the WLAN’s availability is automated.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

shutdown {on-critical-resource|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}

Parameters

- shutdown {on-critical-resource|on-meshpoint-loss|on-primary-port-link-loss|on-unadoption}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shutdown</td>
<td>Auto shuts down the WLAN when specified events occur. Disabled by default.</td>
</tr>
<tr>
<td>on-critical-resource</td>
<td>Optional. Auto shuts down the WLAN when critical resource failure occurs. Disabled by default.</td>
</tr>
<tr>
<td>on-meshpoint-loss</td>
<td>Optional. Auto shuts down the WLAN when the root meshpoint link fails (is unreachable). Disabled by default.</td>
</tr>
<tr>
<td>on-primary-port-link-loss</td>
<td>Optional. Auto shuts down the WLAN when a device losses its primary Ethernet port (ge1/up1) link. Disabled by default.</td>
</tr>
<tr>
<td>on-unadoption</td>
<td>Optional. Auto shuts down the WLAN when an adopted device becomes unadopted. Disabled by default.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If the shutdown on-meshpoint-loss feature is enabled, the WLAN status changes only if the meshpoint and the WLAN are mapped to the same VLAN. If the meshpoint is mapped to VLAN 1 and the WLAN is mapped to VLAN 2, then the WLAN status does not change on loss of the meshpoint.

Examples

rfs7000-37FABE(config-wlan-test)#shutdown on-unadoption
rfs7000-37FABE(config-wlan-test)#show context
wlan test
ssid test
bridging-mode local

http-analyze controller
rfs7000-37FABE(config-wlan-test)#
4.1.90.2.39 ssid

Configure a WLAN’s SSID

Supported in the following platforms:
  • Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  • Wireless Controllers — RFS4000, RFS6000, RFS7000
  • Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ssid <SSID>

Parameters

- ssid <SSID>

<SSID> Specify the WLAN’s SSID. The WLAN SSID is case sensitive and alphanumeric. Its length should not exceed 32 characters.

Examples

rfs7000-37FABE(config-wlan-test)#ssid testWLAN1

rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid testWLAN1
  bridging-mode local
  encryption-type none
  authentication-type none
  protected-mgmt-frames mandatory
  radius vlan-assignment
  wing-extensions wmm-load-information
  client-load-balancing probe-req-intvl 5ghz 5
  client-load-balancing band-discovery-intvl 2
  acl exceed-rate wireless-client-denied-traffic 20 disassociate
  proxy-arp-mode strict
  broadcast-dhcp validate-offer
  shutdown on-unadoption
  http-analyze controller
rfs7000-37FABE(config-wlan-test)#
**4.1.90.2.40 t5-client-isolation**

This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

Disallows clients connecting to the WLAN to communicate with one another. This setting applies exclusively to CPE devices managed by a T5 controller and is disabled by default.

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating system used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use a DSL as their high speed Internet access mechanism using the CPE's physical wallplate connection and phone jack.

**Supported in the following platforms:**

- Wireless Controllers — RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

t5-client-isolation

**Parameters**

None

**Examples**

```bash
nx9500-6C8809(config-wlan-test)#t5-client-isolation

nx9500-6C8809(config-wlan-test)#show context
wireless test
ssid test
bridging-mode local
encryption-type none
authentication-type none
t5-client-isolation
nx9500-6C8809(config-wlan-test)#
```
### 4.1.90.2.41 t5-security

Configures T5 PowerBroadband security settings

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use DSL as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.

**NOTE:** This setting is applicable only when this WLAN supports T5 controllers and their connected CPEs.

---

**Supported in the following platforms:**

- Wireless Controllers — RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

- `t5-security [static-wep|wpa-enterprise|wpa-personal]`
- `t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]`
- `t5-security [wpa-enterprise|wpa-personal] encryption-type [ccmp|tkip|tkip-ccmp] version [mixed|wpa|wpa2]`

**Parameters**

- **t5-security static-wep encryption-type [wep128|wep64] [hex <STRING>|passphrase <STRING>]**
  
<table>
<thead>
<tr>
<th>t5-security static-wep</th>
<th>Configures the T5 WLAN security type as static-wep</th>

    bridging-mode local
    encryption-type none
    authentication-type none

nx9500-6C8809(config-wlan-test)#
```
4.1.90.2.42 time-based-access

wlan-mode commands

Configures time-based client access to the network resources

Administrators can use this feature to assign fixed days and time of WLAN access for wireless clients

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
time-based-access days [sunday|monday|tuesday|wednesday|thursday|friday|saturday|all|weekends|weekdays] {start <START-TIME>} [end <END-TIME>]
```

Parameters

- **day <option>** Specifies the day or days on which the client can access the WLAN
  - sunday – Allows access on Sundays only
  - monday – Allows access on Mondays only
  - tuesday – Allows access on Tuesdays only
  - wednesday – Allows access on Wednesdays only
  - thursday – Allows access on Thursdays only
  - friday – Allows access on Fridays only
  - saturday – Allows access on Saturdays only
  - weekends – Allows access on weekends only
  - weekdays – Allows access on weekdays only
  - all – Allows access on all days

- **start <START-TIME>** Optional. Specifies the access start time in hours and minutes (HH:MM)
- **end <END-TIME>** Specifies the access end time in hours and minutes (HH:MM)

Usage Guidelines

Ensure the system clock is configured correctly.

Examples

```
rfs7000-37FABE(config-wlan-test)#time-based-access days weekdays start 10:00 end 16:30
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid testWLAN1
  bridging-mode local
  encryption-type none
  authentication-type none
  protected-mgmt-frames mandatory
  radius vlan-assignment
  time-based-access days weekdays start 10:00 end 16:30
  --More--
rfs7000-37FABE(config-wlan-test)#
```
4.1.90.2.43 use

This command associates an existing captive portal with a WLAN.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

use [aaa-policy|application-policy|association-acl-policy|bonjour-gw-discovery-policy|captive-portal|ip-access-list|ipv6-access-list|mac-access-list|passpoint-policy|roaming-assist-policy|url-list|wlan-qos-policy]

use ip-access-list [in|out] <IP-ACCESS-LIST-NAME>
use ipv6-access-list [in|out] <IPv6-ACCESS-LIST-NAME>
use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME>

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa-policy &lt;AAA-POLICY-NAME&gt;</td>
<td>Uses an existing AAA policy with a WLAN</td>
</tr>
<tr>
<td></td>
<td>• &lt;AAA-POLICY-NAME&gt; – Specify the AAA policy name.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>application-policy &lt;POLICY-NAME&gt;</td>
<td>Uses an existing application policy with a WLAN. An application policy defines actions to perform on a packet when it matches a specified set of pre-defined applications or application categorie. For more information, see application-policy.</td>
</tr>
<tr>
<td></td>
<td>• &lt;POLICY-NAME&gt; – Specify the policy name.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>association-acl-policy &lt;ASSOCIATION-POLICY-NAME&gt;</td>
<td>Uses an existing association ACL policy with a WLAN</td>
</tr>
<tr>
<td></td>
<td>• &lt;ASSOCIATION-POLICY-NAME&gt; – Specify the association ACL policy name.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>bonjour-gw-discovery-policy &lt;POLICY-NAME&gt;</td>
<td>Uses an existing Bonjour GW Discovery policy with a WLAN. When associated, the Bonjour GW Discovery policy defines a list of services clients can discover across subnets. Bonjour enables discovery of services on a LAN. Bonjour allows the setting up a network (without any configuration) in which services such as printers, scanners and file-sharing servers can be found using Bonjour. Bonjour only works within a single broadcast domain. However, with a special DNS configuration, it can be extended to find services across broadcast domains.</td>
</tr>
<tr>
<td></td>
<td>• &lt;POLICY-NAME&gt; – Specify the Bonjour GW Discovery policy name (should be existing and configured).</td>
</tr>
</tbody>
</table>

Note: For more information on Bonjour GW Discovery policy, see bonjour-gw-discovery-policy.
### Captive Portal

<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal</td>
<td>Enables a WLAN's captive portal authentication</td>
</tr>
<tr>
<td><code>&lt;CAPTIVE-PORTAL-NAME&gt;</code></td>
<td>• <code>&lt;CAPTIVE-PORTAL-NAME&gt;</code> – Specify the captive portal name.</td>
</tr>
</tbody>
</table>

### Passpoint Policy

<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>passpoint-policy</td>
<td>Associates a passpoint policy (Hotspot2 configuration) with this WLAN</td>
</tr>
<tr>
<td><code>&lt;PASSPOINT-POLICY-NAME&gt;</code></td>
<td>• <code>&lt;PASSPOINT-POLICY-NAME&gt;</code> – Specify the Hotspot 2.0 policy name.</td>
</tr>
</tbody>
</table>

**Note:** For more information on passpoint policy, see *passpoint-policy*.

Map a passpoint policy to a WLAN. Since the configuration gets applied to the radio by BSS, only the Hotspot 2.0 configuration of primary WLANs on a BSSID is used. Incoming Hotspot 2.0 GAQ/ANQP requests from clients are identified by their destination MAC addresses and are handled by the passpoint policy from the primary WLAN on that BSS.

Define one passpoint policy for every WLAN configured.

### Roaming Assist Policy

<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>roaming-assist-policy</td>
<td>Associates an existing roaming assist policy with this WLAN</td>
</tr>
<tr>
<td><code>&lt;POLICY-NAME&gt;</code></td>
<td>• <code>&lt;POLICY-NAME&gt;</code> – Specify the Roaming Assist policy name.</td>
</tr>
</tbody>
</table>

**Note:** For more information on roaming assist policy, see *roaming-assist-policy*.

### URL Filter

<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>url-filter</td>
<td>Associates an existing URL list with this WLAN</td>
</tr>
<tr>
<td><code>&lt;URL-FILTER-NAME&gt;</code></td>
<td>• <code>&lt;URL-FILTER-NAME&gt;</code> – Specify the URL filter name.</td>
</tr>
</tbody>
</table>

**Note:** For more information on configuring a URL list, see *url-list*.

### WLAN QoS Policy

<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan-qos-policy</td>
<td>Uses an existing WLAN QoS policy with a WLAN</td>
</tr>
<tr>
<td><code>&lt;WLAN-QOS-POLICY-NAME&gt;</code></td>
<td>• <code>&lt;wlan-qos-policy-name&gt;</code> – Specify the WLAN QoS policy name.</td>
</tr>
</tbody>
</table>

### IP Access List

<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>use ip-access-list</td>
<td>Specifies the IP access list for incoming and outgoing packets</td>
</tr>
</tbody>
</table>
| `[in|out]` `<IP-ACCESS-LIST-NAME>` | • in – Applies the IP ACL to incoming packets  
  • out – Applies IP ACL to outgoing packets  
  • `<IP-ACCESS-LIST-NAME>` – Specify the IP access list name. |

### IPv6 Access List

<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>use ipv6-access-list</td>
<td>Specifies the IPv6 access list for incoming and outgoing packets</td>
</tr>
</tbody>
</table>
| `[in|out]` `<IPv6-ACCESS-LIST-NAME>` | • in – Applies the IPv6 ACL to incoming packets  
  • out – Applies IPv6 ACL to outgoing packets  
  • `<IPv6-ACCESS-LIST-NAME>` – Specify the IPv6 access list name. |

### MAC Access List

<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>use mac-access-list</td>
<td>Specifies the MAC access list for incoming and outgoing packets</td>
</tr>
</tbody>
</table>
| `[in|out]` `<MAC-ACCESS-LIST-NAME>` | • in – Applies the MAC ACL to incoming packets  
  • out – Applies MAC ACL to outgoing packets  
  • `<MAC-ACCESS-LIST-NAME>` – Specify the MAC access list name. |
Usage Guidelines

IP and MAC ACLs act as firewalls within a WLAN. WLANs use ACLs as firewalls to filter or mark packets based on the WLAN from which they arrive, as opposed to filtering packets on layer 2 ports. An ACL contains an ordered list of Access Control Entries (ACEs). Each ACE specifies a set of conditions (rules) and the action taken in case of a match. The action can be permit, deny, or mark. Therefore, when a packet matches an ACE’s conditions, it is either forwarded, dropped, or marked depending on the action specified in the ACE. The order of conditions in the list is critical since filtering is stopped after the first match.

IP ACLs contain deny and permit rules specifying source and destination IP addresses. Each rule has a precedence order assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC. Additionally, you can filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny, or mark designation to WLAN packet traffic.

Keep in mind IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC ACL to the interface.

Examples

```bash
rfs7000-37FABE(config-wlan-test)#use aaa-policy test

use bonjour-gw-discovery-policy generic
rfs7000-37FABE(config-wlan-ipadClients)#
```
4.1.90.2.44 vlan

Sets the VLAN where traffic from a WLAN is mapped

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5650, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

vlan [<1-4094>|<VLAN-ALIAS-NAME>]

Parameters

- **<1-4094>**
  - Sets a WLAN's VLAN ID. This command starts a new VLAN assignment for a WLAN index. All prior VLAN settings are erased. Use this command to assign just one VLAN to the WLAN. Utilizing a single VLAN per WLAN is a more typical deployment scenario than using a VLAN pool.

- **<VLAN-ALIAS-NAME>**
  - Assigns a VLAN alias to the WLAN. The VLAN alias should exist and be configured.
    - **Note:** A VLAN alias maps a name to a VLAN ID. When applied to ports (for example GE ports) using the trunk mode, a VLAN alias denies or permits traffic, on the port, to and from the VLANs specified in the alias. For more information on aliases, see *alias*.

Examples

```
rfs7000-37FABE(config-wlan-test)#vlan 4
rfs7000-37FABE(config-wlan-test)#show context wlan test
vlan 4
bridging-mode local
encryption-type none

client-load-balancing band-discovery-intvl 2
use aaa-policy test
use association-acl-policy test
acl exceed-rate wireless-client-denied-traffic 20 disassociate
proxy-arp-mode strict
broadcast-dhcp validate-offer
shutdown on-unadoption
http-analyze controller
rfs7000-37FABE(config-wlan-test)#
```
4.1.90.2.45 vlan-pool-member

Adds a member VLAN to a WLAN’s VLAN pool. Use this option to define the VLANs available to this WLAN. Additionally, define the number of wireless clients supported by each VLAN.

**NOTE:** Configuration of a VLAN pool overrides the 'vlan' configuration.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
vlan-pool-member <WORD> {limit <0-8192>}
```

**Parameters**

- **vlan-pool-member <WORD>**
  
  Adds a member VLAN to a WLAN’s VLAN pool
  
  **Note:** Since users belonging to separate VLANs can share the same WLAN, it is not necessary to create a new WLAN for every VLAN in the network.

- **<WORD>**
  
  Define the VLANs available to this WLAN. It is either a single index, or a list of VLAN IDs (for example, 1,3,7), or a range (for example, 1-10)

- **limit <0-8192>**
  
  Optional. Is ignored if the number of clients are limited and well within the limits of the DHCP pool on the VLAN
  
  - `<0-8192>` – Specifies the number of users allowed

**Examples**

```
rfs7000-37FABE(config-wlan-test)#vlan-pool-member 1-10 limit 1
rfs7000-37FABE(config-wlan-test)#show context
wlan test
  ssid testWLAN1
  vlan-pool-member 1 limit 1
  vlan-pool-member 2 limit 1
  vlan-pool-member 3 limit 1
  vlan-pool-member 4 limit 1
  vlan-pool-member 5 limit 1
  vlan-pool-member 6 limit 1
  vlan-pool-member 7 limit 1
  vlan-pool-member 8 limit 1
  vlan-pool-member 9 limit 1
  vlan-pool-member 10 limit 1
  bridging-mode local
  encryption-type none
  authentication-type none
  protected-mgmt-frames mandatory
  radius vlan-assignment
  time-based-access days weekdays start 10:00 end 16:30
  wing-extensions wmm-load-information
  --More--
rfs7000-37FABE(config-wlan-test)#
```
### 4.1.90.2.46 wep128

**wlan-mode commands**

Configures WEP128 parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```
wep128 [key|keys-from-passkey|transmit-key]
wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
wep128 keys-from-passkey <WORD>
wep128 transmit-key <1-4>
```

### Parameters

- **wep128 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]**
  - Configures pre-shared hex keys
  - `<1-4>` — Configures a maximum of four key indexes. Select the key index from 1 - 4.
  - **ascii**
    - `[0 <WORD>|2 <WORD>|<WORD>]` — Sets keys as ASCII characters (5 characters for WEP64, 13 for WEP128)
    - `0 <WORD>` — Configures a clear text key
    - `2 <WORD>` — Configures an encrypted key
    - `<WORD>` — Configures keys as 13 ASCII characters converted to hex, or 26 hexadecimal characters
  - **hex**
    - `[0 <WORD>|2 <WORD>|<WORD>]` — Sets keys as hexadecimal characters (10 characters for WEP64, 26 for WEP128)
    - `0 <WORD>` — Configures a clear text key
    - `2 <WORD>` — Configures an encrypted key
    - `<WORD>` — Configures keys as 13 ASCII characters converted to hex, or 26 hexadecimal characters

- **wep128 keys-from-passkey <WORD>**
  - Specifies a passphrase from which keys are derived
  - `<WORD>` — Specify a passphrase from 4 - 32 characters.

- **wep128 transmit-key <1-4>**
  - Configures the key index used for transmission from an AP to a wireless client or service platform
  - `<1-4>` — Specify a key index from 1 - 4.
Examples

rfs7000-37FABE(config-wlan-test)#wep128 keys-from-passkey example@123

rfs7000-37FABE(config-wlan-test)#
## 4.1.90.2.47 wep64

Configures WEP64 parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```plaintext
wep64 [key|keys-from-passkey|transmit-key]
wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]
wep64 keys-from-passkey <WORD>
wep64 transmit-key <1-4>
```

### Parameters

- **wep64 key <1-4> [ascii|hex] [0 <WORD>|2 <WORD>|<WORD>]**
  
  Configures WEP64 parameters

  The parameters are: key, key-from-passkey, and transmit-key.

  - **key <1-4>** Configures a maximum of four key indexes. Select a key index from 1 - 4.
  - **ascii [0 <WORD>|2 <WORD>|<WORD>]**
    
    Sets keys as ASCII characters (5 characters for WEP64, 13 for WEP128)
    - 0 <WORD> – Configures a clear text key
    - 2 <WORD> – Configures an encrypted key
    - <WORD> – Configures key (10 hex or 5 ASCII characters for WEP64, 26 hex or 13 ASCII characters for WEP128).
  - **hex [0 <WORD>|2 <WORD>|<WORD>]**
    
    Sets keys as hexadecimal characters (10 characters for WEP64, 26 for WEP128)
    - 0 <WORD> – Configures a clear text key
    - 2 <WORD> – Configures an encrypted key
    - <WORD> – Configures the key (10 hex or 5 ASCII characters for WEP64, 26 hex or 13 ASCII characters for WEP128).

- **wep64 keys-from-passkey <WORD>**

  Specifies a passphrase from which keys are derived
  
  - <WORD> – Specify a passphrase from 4 - 32 characters.

- **wep64 transmit-key <1-4>**

  Configures the key index used for transmission from an AP to a wireless client or service platform
  
  - <1-4> – Specify a key index from 1 - 4.
Examples

rfs7000-37FABE(config-wlan-test)#
4.1.90.2.48 wing-extensions

- wlan-mode commands

Enables support for WiNG-specific client extensions to the IEEE 802.11x WLAN standards that potentially increase client roaming reliability and handshake speed

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
wing-extensions [ap-attributes-information {include-hostname}]
coverage-hole-detection {11k-clients|offset <5-20>|threshold <-80--60}]
ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}]
smart-scan|wing-load-information|wmm-load-information]
```

Parameters

- wing-extensions [ap-attributes-information {include-hostname}]
- coverage-hole-detection {11k-clients|offset <5-20>|threshold <-80--60}]
- ft-over-ds-aggregate|move-command|scan-assist {channel-info-interval <6-9>}]
- smart-scan|wing-load-information|wmm-load-information

<table>
<thead>
<tr>
<th>wing-extensions</th>
<th>Enables support for inclusion of WiNG-specific client extensions in radio transmissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap-attributes-information {include-hostname}</td>
<td>Enables support for AP attributes information element (IE)</td>
</tr>
<tr>
<td>include-hostname – Optional. When enabled, includes AP’s hostname, as a sub-element, in the AP attributes IE. The AP attributes IE is vendor-specific and, when enabled, is added to beacons and probe responses. Inclusion of AP attributes IE allows Zebra terminals to:</td>
<td></td>
</tr>
<tr>
<td>- Recognize Zebra APs</td>
<td></td>
</tr>
<tr>
<td>- Determine if the AP supports PAN BU features, irrespective of whether these features are enabled or not. Note: AP attributes IE is not added to beacons and probe responses by default.</td>
<td></td>
</tr>
</tbody>
</table>

| coverage-hole-detection {11k-clients|offset <5-20>|threshold <-80--60}> | Enables coverage hole detection (CHD) and configures CHD parameters. When enabled, allows clients (MUs) to inform an access point when it experiences a coverage hole. A coverage hole is an area of poor wireless coverage not supported by a WiNG managed access point radio. Enable radio resource measurement prior to enabling CHD. For enabling radio resource measurement, see radio-resource-measurement. CHD is disabled by default. After enabling CHD, optionally configure the following parameters: |
| - 11k-clients – Optional. Provides coverage hole detection to 802.11k-only-capable clients. This is a reduced set of coverage hole detection capabilities (standard 11k messages and behaviors). This option is disabled by default. |
| - offset <5-20> – Optional. Configures the offset added to the threshold to obtain the access point’s signal strength (as seen by the client) considered adequate. |
| <5-20> – Specify the offset value from 5 - 20. The default is 5. |

Contd..
Examples

rfs7000-37FABE(config-wlan-test)#wing-extensions wmm-load-information

rfs7000-37FABE(config-wlan-test)#show context
wlan test
description TestWLAN
ssid test
bridging-mode local
encryption-type tkip-ccmp
authentication-type eap

kerberos server primary host 172.16.10.2
accounting syslog host 172.16.10.4 port 2
data-rates 2.4GHz gn
wing-extensions wmm-load-information
client-load-balancing probe-req-intvl 5ghz 5
--More--
rfs7000-37FABE(config-wlan-test)#

- **threshold** – Optional. Configures the access point's signal strength threshold. When Radio Resource Measurement and CVG Hole are enabled, specify a threshold for the AP's signal strength (as seen by the client) below which a coverage hole incident is reported by the client.
  - `<80–60>` – Specify the threshold from -80 - -60 dBm. The default is -70 dBm.

- **ft-over-ds-aggregate** Enables fast-transition (FT) aggregation of action frames. When enabled, increases roaming speed by eliminating separate key exchange handshake frames with potential roam candidates. Enable fast transition to complete an initial FT over distribution system (DS) handshake with multiple roam candidates (up to 6) at once, eliminating the need to send separate FT over DS handshakes to each roam candidate. This option is disabled by default.

- **move-command** Enables use of Hyper Fast Secure Roaming (HFSR) for clients on this WLAN. This feature applies only to certain client devices. This option is disabled by default.

- **scan-assist** Enables support for scanning assist. When enabled, allows faster roams on Dynamic Frequency Selection (DFS) channels by eliminating passive scans. Clients get channel information directly from possible roam candidates. This option is disabled by default.
  - **channel-info-interval <6-9>** – Optional. Configures the interval at which channel information is periodically retrieved from potential roam candidates without requesting scan assist.
  - **<6-9>** – Specify the interval from 6 - 9 seconds. When enabled, the default value is 8 seconds.

- **smart-scan** Enables a smart scan to refine a clients channel scans to just a few channels as opposed to all available channels. This option is disabled by default.

- **wing-load-information** Enables support for WiNG Wi-Fi MultiMedia (WMM) Load Information Element in radio transmissions with legacy clients. This option is disabled by default.

- **wmm-load-information** Enables support for WiNG Load Information Element (Element ID 173) with legacy clients, making them optimally interoperable with the latest Zebra access points. This option is enabled by default.
**4.1.90.2.49 wireless-client**

* wlan-mode commands

Configures the transmit power indicated to clients

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

**Syntax**

```
wireless-client [count-per-radio|cred-cache-ageout|hold-time|inactivity-timeout|
max-firewall-sessions|reauthentication|t5-inactivity-timeout|tx-power|vlan-cache-ageout]
```

```
wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|
hold-time <1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|
reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|
vlan-cache-ageout <60-86400>]
```

```
wireless-client roam-notification [after-association|after-data-ready|auto]
```

**Parameters**

- **wireless-client [count-per-radio <0-256>|cred-cache-ageout <60-86400>|
  hold-time <1-86400>|inactivity-timeout <60-86400>|max-firewall-sessions <10-10000>|
  reauthentication <30-86400>|t5-inactivity-timeout <60-86400>|tx-power <0-20>|
  vlan-cache-ageout <60-86400>]**

4.1.90.2.50 wpa-wpa2

- wlan-mode commands

Modifies TKIP-CCMP (WPA/WPA2) related parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

wpa-wpa2 [exclude-wpa2-tkip|handshake|key-rotation|opp-pmk-caching|pmk-caching|preauthentication|server-only-authentication|psk|tkip-countermeasures|use-sha256-akm]

wpa-wpa2 handshake [attempts|init-wait|priority|timeout]

wpa-wpa2 key-rotation [broadcast|unicast] <30-86400>

wpa-wpa2 psk [0 <LINE>|2 <LINE>|<LINE>]

wpa-wpa2 tkip-countermeasures holdtime <0-65535>

Parameters

- wpa-wpa2 [exclude-wpa2-tkip|opp-pmk-caching|pmk-caching|preauthentication|server-only-authentication|use-sha256-akm]

<table>
<thead>
<tr>
<th>wpa-wpa2</th>
<th>Modifies TKIP-CCMP (WPA/WPA2) related parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude-wpa2-tkip</td>
<td>Excludes the <em>Wi-Fi Protected Access II</em> (WPA2) version of TKIP. It supports the WPA version of TKIP only. This option is disabled by default.</td>
</tr>
<tr>
<td>opp-pmk-caching</td>
<td>Uses opportunistic key caching (same <em>Pairwise Master Key</em> (PMK) across APs for fast roaming with EAP/802.1x). This option is enabled by default.</td>
</tr>
<tr>
<td>pmk-caching</td>
<td>Uses cached pair-wise master keys (fast roaming with eap/802.1x). This option is enabled by default.</td>
</tr>
<tr>
<td>preauthentication</td>
<td>Uses pre-authentication mode (WPA2 fast roaming)</td>
</tr>
<tr>
<td>server-only-authentication</td>
<td>Uses online sign up server-only-authenticated encryption network. This option is disabled by default.</td>
</tr>
<tr>
<td>use-sha256-akm</td>
<td>Uses sha256 authentication key management suite. This option is disabled by default.</td>
</tr>
</tbody>

rfs7000-37FABE(config-wlan-test)#
4.1.90.2.51 service

Invokes service commands applicable in the WLAN configuration mode

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
service [allow-ht-only|allow-open-passpoint|cred-cache|eap-mac-mode|eap-mac-multicopy|
        eap-mac-multikeys|eap-throttle|enforce-pmkid-validation|key-index|monitor|
        radio-crypto|reauthentication|session-timeout|tx-deauth-on-roam-detection|
        unresponsive-client|wpa-wpa2|show]

service [allow-ht-only|allow-open-passpoint|cred-cache clear-on-disconnect|
        eap-mac-multicopy|eap-mac-multikeys|enforce-pmkid-validation|radio-crypto|
        reauthentication seamless|session-timeout mac|tx-deauth-on-roam-detection|show cli]

service eap-mac-mode [mac-always|normal]

service eap-throttle <0-254>

service key-index eap-wep-unicast <1-4>

service monitor [aaa-server|adoption|captive-portal|dhcp|dns]

service monitor [aaa-server|adoption vlan <1-4094>|captive-portal external-server]

service [dhcp|dns] crm <RESOURCE-NAME> vlan <1-4094>

service unresponsive-client [attempts <1-1000>|timeout <1-60>]

service wpa-wpa2 exclude-ccmp
```

Parameters

- `service [allow-ht-only|allow-open-passpoint|cred-cache clear-on-disconnect|
  eap-mac-multicopy|eap-mac-multikeys|enforce-pmkid-validation|radio-crypto|
  reauthentication seamless|session-timeout mac|tx-deauth-on-roam-detection|show cli]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow-ht-only</td>
<td>Only allows clients capable of High Throughput (802.11n) data rates to associate</td>
</tr>
<tr>
<td>allow-open-passpoint</td>
<td>Enables non-WPA2 security for passpoint WLANs. For more information on passpoint policy and configuration, see PASSPOINT POLICY.</td>
</tr>
<tr>
<td>clear-on-disconnect</td>
<td>Clears credential cache after a client has disconnected from the network</td>
</tr>
<tr>
<td>eap-mac-multicopy</td>
<td>Enables sending of multiple copies of broadcast and unicast messages</td>
</tr>
<tr>
<td>eap-mac-multikeys</td>
<td>Enables configuration of different key indices for MAC authentication</td>
</tr>
<tr>
<td>command</td>
<td>description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>enforce-pmkid-validation</td>
<td>Validates the Predictive real-time pairwise master key identifier (PMKID) contained in a client’s association request against the one present in the wpa-wpa2 handshake. This functionality is based on the Proactive Key Caching (PKC) extension of the 802.11i EEEE standard. Whenever a wireless client successfully authenticates with a AP it receives a pairwise master key (PMK). PKC allows clients to cache this PMK and reuse it for future re-authentications with the same AP. The PMK is unique for every client and is identified by the PMKID. The PMKID is a combination of the hash of the PMK, a string, the station and the MAC addresses of the AP.</td>
</tr>
<tr>
<td>radio-crypto</td>
<td>Uses radio hardware for encryption and decryption. This is applicable only for devices using Counter Cipher Mode with Block Chaining Message Authentication Code Protocol (CCMP) encryption mode.</td>
</tr>
<tr>
<td>reauthentication seamless</td>
<td>Enables seamless EAP client reauthentication without disconnecting client after the session has timed out.</td>
</tr>
<tr>
<td>session-timeout mac</td>
<td>Enables reauthentication of MAC authenticated clients without disconnecting client after the session has timed out.</td>
</tr>
<tr>
<td>tx-deauth-on-roam-detection</td>
<td>Transmits a deauthentication on the air while disassociating a client because its roam is detected on the wired side.</td>
</tr>
<tr>
<td>show cli</td>
<td>Displays the CLI tree of the current mode. When used in the WLAN mode, this command displays the WLAN CLI structure.</td>
</tr>
<tr>
<td>eap-mac-mode</td>
<td>Configures the EAP and/or MAC authentication mode used with this WLAN.</td>
</tr>
<tr>
<td>mac-always</td>
<td>Enables both EAP and MAC authentication. MAC authentication is performed first, followed by EAP authentication. Clients are granted access based on the EAP authentication result. If a client does not have EAP, the MAC authentication result is used to grant access.</td>
</tr>
<tr>
<td>normal</td>
<td>Grants client access if the client clears either EAP or MAC authentication.</td>
</tr>
</tbody>
</table>
| eap-throttle <0-254> | Enables EAP request throttling. Use this command to specify the maximum number of parallel EAP sessions allowed on this WLAN. Once this specified value is exceeded, all incoming EAP session requests are throttled.  
  - <0-254> – Specify a value from 0 - 254. |
| key-index eap-wep-unicast <1-4> | Configures an index with each key during EAP authentication with WEP.  
  - <1-4> – Select a index from 1 - 4. |
| wpa-wpa2 exclude-ccmp | Configures exclusion of CCMP requests when the authentication mode is set to tkip-ccmp. When enabled, it provides compatibility for client devices not compliant with tkip-ccmp. |
### Service Monitor

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`service monitor [aaa-server</td>
<td>adoption vlan &lt;1-4094&gt;</td>
</tr>
<tr>
<td><code>monitor</code></td>
<td>Enables external AAA server failure monitoring. When enabled monitors an external RADIUS server resource’s AAA activity and ensures its adoption and availability. This feature is disabled by default.</td>
</tr>
</tbody>
</table>
| `adoption vlan <1-4094>` | Enables adoption failure monitoring on an adopted AP. Also configures a adoption failover VLAN. This feature is disabled by default.  
  - **Note:** Configure a DHCP pool and gateway for the failover VLAN. Ensure the DHCP server is running on the AP. Also ensure that the DHCP pool is configured to have less lease time.  
  When this feature is enabled on a WLAN, it allows adopted APs to monitor their connectivity with the controller. If and when this connectivity is lost, all new clients are placed in the configured adoption failover VLAN. They are served an IP by the DHCP server running on the AP. In this situation if a client tries to access a Web URL, the AP redirects the client to a page stating that the service is down.  
  **Note:** When the AAP’s link to the switch is restored, clients are placed back in the WLAN’s configured VLAN, and are served an IP from the corresponding configured DHCP server (external or on the AP/controller). |
| `captive-portal external-server` | Enables external captive portal server failure monitoring. When enabled, monitors externally hosted captive portal activity, and user access to the controller or service platform managed network. This feature is disabled by default.  
  **Note:** When enabled, this feature enables APs to display, to an externally located captive portal’s user, the no-service page when the captive portal’s server is not reachable. |
| `monitor [dhcp|dns] crm <RESOURCE-NAME> vlan <1-4094>` | Enables DHCP and/or DNS server monitoring on this WLAN. |
| `dhcp` | Enables monitoring of a specified DHCP server. When the connection to the DHCP server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default.  
  **Note:** Use the `crm` keyword to specify the DHCP server to monitor. |
| `dns` | Enables monitoring of a specified DNS server. When the connection to the DNS server is lost, captive portal users automatically migrate to a pre-defined VLAN. The feature is disabled by default.  
  **Note:** Use the `crm` keyword to specify the DNS server to monitor. |
GLOBAL CONFIGURATION COMMANDS 4 - 441

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| service unresponsive-client [attempts <1-1000>|timeout <1-60>] | This keyword is common to the ‘dhcp’ and ‘dns’ parameters.  
  - *attempts* <1-1000> – Specify a value from 1 - 1000.  
  - *timeout* <1-60> – Specify a value from 1 - 60 seconds.  

**Examples**

```
rfs4000-229D58(config-wlan-test)#service allow-ht-only
rfs4000-229D58(config-wlan-test)#service monitor aaa-server
rfs4000-229D58(config-wlan-test)#show context
wlan test
  ssid test
  bridging-mode tunnel
  encryption-type none
  authentication-type none
  service monitor aaa-server
  service allow-ht-only
  controller-assisted-mobility
rfs4000-229D58(config-wlan-test)#
```
### 4.1.91 wlan-qos-policy

**Global Configuration Commands**

Configures a WLAN QoS policy

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`wlan-qos-policy <WLAN-QOS-POLICY-NAME>`

**Parameters**

- `wlan-qos-policy <WLAN-QOS-POLICY-NAME>`

| <WLAN-QOS-POLICY-NAME> | Specify the WLAN QoS policy name. If the policy does not exist, it is created. |

**Examples**

```
rfs7000-37FABE(config)#wlan-qos-policy test
rfs7000-37FABE(config-wlan-qos-test)#?
WLAN QoS Mode commands:
accelerated-multicast Configure accelerated multicast streams address asnd
classification Select how traffic on this WLAN must be classified
forwarding QoS classification
(relative prioritization on the radio)
multicast-mask Egress multicast mask (frames that match bypass the
PSPqueue. This permits intercom mode operation
without delay even in the presence of PSP clients)
negate a command or set its defaults
qos Quality of service
rate-limit Configure traffic rate-limiting parameters on a
per-wlan/per-client basis
svp-prioritization Enable spectralink voice protocol support on this
wlan
voice-prioritization Prioritize voice client over other client (for
non-WMM clients)
wmm Configure 802.11e/Wireless MultiMedia parameters
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
der End current mode and change to EXEC mode
exit End current mode and down to previous mode
help Help command
revert Revert changes
show Show running system information
write Write running configuration to memory or terminal
```

---

**NOTE:** For more information on WLAN QoS policy commands, see *Chapter 21, WLAN-QOS-POLICY.*
<table>
<thead>
<tr>
<th>Command</th>

</tr>
</tbody>
</table>
4.1.92 smart-cache-policy

Global Configuration Commands

The following table lists the smart cache policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>smart-cache-policy</td>
<td>Creates a new smart cache policy and enters its configuration mode</td>
<td>page 4-445</td>
</tr>
<tr>
<td>smart-cache-policy-mode commands</td>
<td>Summarizes the smart cache policy configuration mode commands</td>
<td>page 4-447</td>
</tr>
</tbody>
</table>
4.1.92.1 smart-cache-policy

`smart-cache-policy` creates a new smart cache policy and enters its configuration mode.

Content caching is a mechanism that allows temporary caching of frequently accessed content on intermediate network devices. When enabled, subsequent requests for the same content are serviced from the cache locally and not fetched from originating servers, resulting in reduced bandwidth usage, lower latency, and reduced data transfers from originating servers. The WiNG smart cache policy supports both forward caching and transparent caching.

Forward content caching stores content temporarily on the local network. This locally stored content can be retrieved, when required, without routing a request to an external server on the Internet.

Transparent content caching, on the other hand, acts as an intermediary for the originating servers and returns cached content to clients as if the data originated from the associated servers. Transparent caching proxies perform server load-balancing and compression to regulate load on the originating servers and reduce bandwidth usage.

The smart cache policy also supports dynamic content caching, allowing caching of content from popular video content sharing sites, such as youtube.com, cnn.com, msn.com etc.

Enabling content caching improves Web browsing (for data and video content) for consumers using Kiosks, tablets, and smart phones. A smart cache policy is enabled by associating it with a device or a profile.

Configure the policy’s forward proxy, transparent proxy and several additional settings before actual HTML pages can be defined for the smart caching configuration.

---

**NOTE:** Content caching is a licensed feature, supported only on the NX45XX and NX65XX series service platforms. To enable content caching on a device, use the license command (in the device-config mode) and provide the SMART-CACHE license key. For more information, see `license`.

**NOTE:** Though the NX9000 series service platforms do not support content caching, they support the configuration of smart-content caching policies that can be applied to the NX45XX and NX65XX series service platforms. The NX9000 series service platforms are capable of adopting and configuring NX45XX and NX65XX series service platforms.

---

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
smart-cache-policy <SMART-CACHE-POLICY-NAME>
```

**Parameters**

- `smart-cache-policy <SMART-CACHE-POLICY-NAME>`

  * <SMART-CACHE-POLICY-NAME> Creates a new smart content cache policy. Specify the policy name. If the policy does not exist, it is created.

**Examples**

```
nx4500-5CFA2B(config)#smart-cache-policy ?
SMART-CACHE-POLICY Name of the content caching to be configured ( will be created if it does not exist )
nx4500-5CFA2B(config)#smart-cache-policy test
nx4500-5CFA2B(config-smart-cache-policy-test)#
```
nx4500-5CFA2B(config-smart-cache-policy-test)#?
Content Cache Policy Mode commands:
  access-log         Log all client requests
  aging              Configure the refresh pattern
  cache              Configure cache management
  forward-proxy      Configure address and port for forward caching proxy
  service
  http-access        Configure http filter
  no                 Negate a command or set its defaults
  parent-proxy       Configure parent proxy
  pre-fetch          Enable pre fetching of a URL list
  smart-cache        Content cache
  transparent-proxy  Transparent caching proxy

  clrscr             Clears the display screen
  commit            Commit all changes made in this session
  do                Run commands from Exec mode
  exit              End current mode and change to EXEC mode
  help              Description of the interactive help system
  revert            Revert changes
  service           Service Commands
  show              Show running system information
  write             Write running configuration to memory or terminal

nx4500-5CFA2B(config-smart-cache-policy-test)#
4.1.92.2 smart-cache-policy-mode commands

</tbody>
</table>
4.1.92.2.1 access-log

Enables or disables client request logging. When enabled, this feature logs client access details to the `/var/log/smart-cache.log`. This feature is enabled by default.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```bash
access-log {rotate <0-10> rotate-type [duration <1-100> day|size <1-100> MB]}
```

Parameters

- `access-log {rotate <0-10> rotate-type [duration <1-100> day|size <1-100> MB]}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotate &lt;0-10&gt;</td>
<td>Optional. Enables log file rotation, and configures the number of rotation. This is the number of log files retained (stored locally) out of the total generated.</td>
</tr>
<tr>
<td>rotate-type</td>
<td>Optional. Configures access log file rotation conditions, such as duration and size</td>
</tr>
<tr>
<td>[duration &lt;1-100&gt; day</td>
<td>Rotates log files by time. Specify the time from 1 - 100 days. The default is 1 day.</td>
</tr>
<tr>
<td>size &lt;1-100&gt; MB]</td>
<td>Rotates log files by file size. Specify the size from 1 - 100 MB.</td>
</tr>
</tbody>
</table>

Examples

```bash
nx4500-5CFA2B(config-smart-cache-policy-test)#access-log rotate 10 rotate-type duration 10 day
```

```bash
nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
```

```bash
access-log rotate 10 rotate-type duration 10 day
```

```bash
nx4500-5CFA2B(config-smart-cache-policy-test)#
```

### 4.1.92.2.2 aging

**smart-cache-policy-mode commands**

Configures the aging rule (refresh pattern) for specific content types. The aging parameters configured are the maximum and minimum age, freshness factor, and the URL regular expressions. These parameters enable the content caching engine to determine if a given request can be processed and the content loaded from the cache or not.

**Supported in the following platforms:**
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
aging precedence <1-100> [<WORD>|ignore-case <WORD>] min-age <0-525600>
  freshness-factor <0-100> max-age <0-525600> {(override-expire|override-lastmod|
  reload-into-ims)}
```

**Parameters**

- **aging precedence <1-100>**
  - Configures content cache aging rules and assigns a precedence to each rule
  - `precedence <1-100>` — Specify a precedence for this aging rule.

- **<WORD>**
  - Specifies the regular expression to match. This option is case sensitive, and is the default setting.

- **ignore-case <WORD>**
  - Specifies the regular expression to match. This option is not case sensitive.

- **min-age <0-525600>**
  - Configures the minimum age, in minutes, of matched objects. This value specifies the lower limit on the staleness of a response. A response is not considered stale unless its time in the cache exceeds the specified minimum value.
  - `<0-525600>` — Specify a value from 0 - 525600 minutes. The default is 1 minute.

- **freshness-factor <0-100>**
  - Configures the freshness factor of matched objects as a percentage value. Freshness is an expression of how long Web content resides on the service platform's local cache before being updated or removed.
  - `<0-100>` — Specify a value from 0 - 100%. The default is 100%.

- **max-age <0-525600>**
  - Configures the maximum age, in minutes, of matched objects. This value specifies the upper limit on the freshness of a response. A response is not considered fresh unless its time in the cache is less than the specified maximum value.
  - `<0-525600>` — Specify a value from 0 - 525600 minutes. The default is 525600.
Examples

```
nx4500-5CFA2B(config-smart-cache-policy-test)#aging precedence 1 ignore-case \\.jgp$ min-age 100 freshness-factor 75 max-age 200 reload-into-ims

nx4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
  aging precedence 1 ignore-case \\.jgp$ min-age 100 freshness-factor 75 max-age 200 reload-into-ims
  access-log rotate 10 rotate-type duration 10 day
  nx4500-5CFA2B(config-smart-cache-policy-test)#
```

Related Commands

```
no

Removes an existing aging rule (refresh pattern)
```

(override-expire| override-lastmod| reload-into-ims)

Applies overrides. The options are:

- override-expire – Optional. When selected, this option overrides the server sent explicit expiry time by the configured minimum age value. This option causes the content cache engine to check the min value before checking the Expires header. Thus, a non-zero min time makes the engine return an un-validated cache hit even if the response is pre-expired.

- override-lastmod – Optional. When selected, this option enforces minimum age even on objects that were modified recently to force the minimum age period on recently modified cached content. This option causes the content cache engine to check the min value before the LM-factor percentage.

- reload-into-ims – Optional. When selected, this option makes the content cache engine to transform a request with a no-cache directive into a validation (If-Modified-Since) request. In other words, the engine adds an If-Modified-Since header to the request before forwarding. Note: This works only for objects that have a Last-Modified timestamp. The outbound request retains the nocache directive, so that it reaches the originating server.
### 4.1.92.2.3 cache

**smart-cache-policy-mode commands**

Configures cache management settings

This command specifies content cache rules that determine if a content is cached or not. Use this feature to filter content before caching. By default content is not cached.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
cache [media|precedence|size]
cache media { (all|aol|bing|break|cnn|daily-motion|metacafe|vimeo|youtube) }
cache precedence <1-100> [deny|permit] {destination-domain <DOMAIN-NAME> |
  destination-domain-regex <WORD>|destination-ip [<IP/M]|any]|source-ip <IP/M> |
  url-regex <URL> }
cache size <1-32>
```

**Parameters**

- **cache media**
  - `(all|aol|bing|break|cnn|daily-motion|metacafe|vimeo|youtube)`
  - Enables content caching from the following video content sharing sites. The sites currently supported are:
    - aol.com
    - bing.com
    - break.com
    - dailymotion.com
    - metacafe.com
    - vimeo.com
    - cnn.com
    - youtube.com
  - **Note:** Select All to include the entire list of supported sites. Selected sites have their video content cached locally on the service platform and made available to clients that request the video content.

- **cache precedence <1-100> [deny|permit]**
  - `destination-domain <DOMAIN-NAME> |
    destination-domain-regex <WORD>|destination-ip [<IP/M]|any]|source-ip <IP/M> |
    url-regex <URL>`
  - Configures cache filtering rules that determine if a content received from the originating server is to be cached or not. You can create multiple cache filtering rules and assign precedence values to each. These rules are applied in order of their precedence.
  - `<1-100>` – Specify a precedence rule from 1 - 100.
  - **[deny|permit]**
    - **permits** – Caches content if it matches the defined permit parameters
    - **deny** – Does not cache content if it matches the defined deny parameters
destination-domain <DOMAIN-NAME> | Optional. Specifies the destination domain’s hostname to match. The domain name can be an FQDN. The specified value is matched against the hostname part of the HTTP request URL.  
  • <DOMAIN-NAME> – Specify the domain name.  
  A leading asterisk or period in the domain name is treated as a wild card. For example, www.example-company.com, example-company.com, *.example-company.com and .com are all valid values.  
  **Note:** The destination domain parameter will NOT match against URLs that have an IP address instead of a hostname.

destination-domain-regex <WORD> | Optional. Specifies a regular expression matching on originating server names  
  • <WORD> – Specify the regular expression.  
  The destination domain regex is the same as the destination domain, but the destination domain regex allows you to use standard expression matching on originating server names.

destination-ip [<IP/M>] [any] | Optional. Specifies the originating server’s IP address, obtained from the HTTP request URL  
  • <IP/M> – Specify the destination IP address and mask to match.  
  • any – Select to specify any destination IP address as the match criteria.  
  **Note:** Provide the IP address in the A.B.C.D/M format.  
  **Note:** Specify *any* to consider all originating servers.

source-ip [<IP/M>] [any] | Optional. Specifies the source IP address (client’s IP address) that is sent out as part of the HTTP request.  
  • <IP/M> – Specify the source IP address and mask to match.  
  • any – Select to specify any source IP address as the match criteria.  
  **Note:** Provide the IP address in the A.B.C.D/M format.  
  **Note:** Specify *any* to consider all client requests.

url-regex <URL> | Optional. Specifies regular expressions used to match any part of a requested URL, including the transfer protocol and origin server hostname  
  • <URL> – Specify the regular expression to match.

**Examples**

nx4500-5CFA2B (config-smart-cache-policy-test) #cache size 30

nx4500-5CFA2B (config-smart-cache-policy-test) #show context smart-cache-policy test

    cache size 30
    aging precedence 1 ignore-case \.jgp$ min-age 100 freshness-factor 75 max-age 200
    reload-into-ims
    access-log rotate 10 rotate-type duration 10 day

nx4500-5CFA2B (config-smart-cache-policy-test) #

**Related Commands**

no | Resets or removes cache management settings

---

**cache size <1-32>**

Configures the maximum caching storage size. This is upper limit on the disk space used for storing cached contents.

• <1-32> – Specify a value from 1 - 32 GB. The default is 32 GB.
4.1.92.2.4 forward-proxy

Enables or disables forward proxy mode on this smart cache policy. This option is disabled by default.

Devices using this smart-cache policy act as a forward proxy on specified VLANs.

This command configures the IP address and port on which the forward proxy server listens for incoming HTTP requests.

Forward content caching stores content temporarily on the local network. This locally stored content can be retrieved, when required, without routing a request to an external server on the Internet.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
forward-proxy {ip|protocol|vlan}
forward-proxy {ip <IP> port <1-32768>}
forward-proxy {protocol [all|ftp|gopher|https]}
forward-proxy {vlan <VLAN-ID>}
```

Parameters

- `forward-proxy {ip <IP> port <1-32768>}`
  - Optional. Configures the IP address and TCP port for forward proxying. If no IP address is provided, the system uses the default smart caching proxy server’s IP (127.0.1.1).
  - This is the IP address where the forward smart caching proxy server is listening.
  - The default port is 3128.

- `forward-proxy {protocol [all|ftp|gopher|https]}`
  - Optional. Selects the additional forward proxy resource protocol for smart caching. The options are:
    - `ftp` — Selects FTP as the forward proxy resource protocol
    - `gopher` — Selects Gopher as the forward proxy resource protocol
    - `https` — Selects HTTPS as the forward proxy resource protocol
    - `all` — Selects all protocols (this is the default setting)

- `forward-proxy {vlan <VLAN-ID>}`
  - Optional. Configures the VLAN(s) for which forward proxy mode (content caching) is enabled. By default, content caching is disabled on all VLANs. This option is disabled by default.
  - `<VLAN-ID>` — Specify the list of VLANs.

Examples

```
nx4500-5CFA2B(config-smart-cache-policy-test)#forward-proxy vlan 10-20
nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
  forward-proxy vlan 10-20
  cache size 30
  aging precedence 1 ignore-case \..jgp$ min-age 100 freshness-factor 75 max-age 200
  reload-into-ims
  access-log rotate 10 rotate-type duration 10 day
nx4500-5CFA2B(config-smart-cache-policy-test)#
```
| **no** | Reverts address and port for forward caching proxy service |
4.1.92.2.5 http-access

Configures HTTP filters. This command configures rules to deny or permit HTTP access. A deny rule specifies the destination domains and source and destination IPs to deny content access. A permit rule specifies the destination domains and source and destination IPs to permit content access.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
http-access precedence <1-100> [deny|permit] {destination-domain <DOMAIN-NAME>|destination-domain-regex <WORD>|destination-ip <IP/M>|mimetype-regex <WORD>|source-ip <IP/M>|url-regex <URL>}
```

Parameters

- **http-access precedence <1-100> [deny|permit]**
  - Configures HTTP access rules that determine if a IP address is to be accessed or not. You can create multiple HTTP access rules and assign precedence values to each. These rules are applied in order of their precedence.
  - `<1-100>` — Specify a precedence rule from 1 - 100.
  - **Note**: Lower the precedence, higher is the rule priority.

- **[deny|permit]**
  - Configures the deny or permit access parameters for this rule
  - **permits** — Permits access if the specified parameters are matched
  - **deny** — Denies access if the specified parameters are matched

- **destination-domain <DOMAIN-NAME>**
  - Optional. Specifies the destination domain to match against the hostname in the HTTP request URL
  - `<DOMAIN-NAME>` — Specify the domain name.

- **destination-domain-regex <WORD>**
  - Optional. Specifies a regular expression matching on originating server names
  - `<WORD>` — Specify the regular expression.
  - The destination domain regex is the same as the destination domain, but the destination domain regex allows your to use standard expression matching on originating server names.

- **destination-ip <IP/M>|any**
  - Optional. Specifies the destination server's IP address, obtained from the HTTP request URL
  - `<IP/M>` — Specify the destination server's IP address and mask. This is used as the match criteria.
  - **any** — Select to specify any destination IP address as the match criteria.
  - **Note**: Provide the IP address in the A.B.C.D/M format.
  - **Note**: Specify `any` to consider all servers.

- **mimetype-regex <WORD>**
  - Optional. Specifies the regular expression used to match the mimetype of a HTTP request
<table>

4.1.92.2.6 no

smart-cache-policy-mode commands

Removes or resets smart cache policy settings

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no \[access-log|aging|cache|forward-proxy|http-access|parent-proxy|pre-fetch|smart-cache|transparent-proxy\]

Parameters

- no \<PARAMETERS>

no <PARAMETERS> Removes or reverts this Smart Cache policy's settings based on the parameters passed

Examples

The following example displays the content cache policy 'test' settings before the no commands are executed:

```
x4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
forward-proxy vlan 10-20
  cache size 30
  aging precedence 1 ignore-case \\.jgp$\ min-age 100 freshness-factor 75 max-age 200 reload-into-ims
  http-access precedence 4 deny destination-domain .TechPubs
access-log rotate 10 rotate-type duration 10 day
```

```
x4500-5CFA2B(config-smart-cache-policy-test)#no forward-proxy vlan 10-20
nx4500-5CFA2B(config-smart-cache-policy-test)#no aging precedence 1
nx4500-5CFA2B(config-smart-cache-policy-test)#no access-log rotate
```

The following example displays the content cache policy 'test' settings after the no commands are executed:

```
x4500-5CFA2B(config-smart-cache-policy-test)#show context smart-cache-policy test
  cache size 30
  http-access precedence 4 deny destination-domain .TechPubs
```

```
x4500-5CFA2B(config-smart-cache-policy-test)#
4.1.92.2.7 pre-fetch

Pre-fetches a specified list of URLs (whose credentials can be stored in the local cache)

This command allows the content cache engine to pre-fetch URLs specified in a URL list. The pre-fetch function is performed immediately or at a scheduled time, based on configuration.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
pre-fetch <URL-LIST-NAME> schedule <TIME>

Parameters
- pre-fetch <URL-LIST-NAME> schedule <TIME>

| <URL-LIST-NAME> | Pre-fetches a list of URLs identified by the <URL-LIST-NAME> keyword. URL lists are used to select highly utilized URLs for smart caching. The selected URLs are monitored and routed according to existing cache content policies. The URL list should be existing and configured. For more information on configuring URL lists, see url-list. |
| schedule <TIME> | Pre-fetches the specified URL list at a specified time |
| <TIME> | Specify the time in the HH:MM format. |

Examples
nx4500-5CFA2B(config-content-cache-policy-test)#pre-fetch test schedule 12:30
nx4500-5CFA2B(config-content-cache-policy-test)#show context
content-cache-policy test
  forward-proxy vlan 10-20
  cache media all
  cache size 30
  http-access precedence 100 deny destination-domain test destination-domain-regex test
  access-log rotate 10 every 50 day
  pre-fetch test schedule 12:30
nx4500-5CFA2B(config-content-cache-policy-test)#

Related Commands
- no Removes an ACL
4.1.92.2.8 parent-proxy

**smart-cache-policy-mode commands**

Enables or disables upper-layer parent proxy on this smart cache policy.

The parent proxy server requires users to authenticate to access Web sites like WinRoute. This setting is disabled by default.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
parent-proxy [enable|host <IP/HOST-NAME> port <1-32768>]
```

**Parameters**

- ```parent-proxy [enable|host <IP/HOST-NAME> port <1-32768>]```  
  - **enable**  
    - Enables parent proxy on this smart cache policy
  - **host <IP/HOST-NAME> port <1-32768>**  
    - Configures the hostname or IP address of the parent proxy server
    - `<IP/HOST-NAME>` — Specify the parent proxy server’s IP address or hostname.
    - `port <1-32768>` — Specify the TCP port number for the parent proxy server. The default port is 8080.

**Examples**

```
nx4500-5CFA2B(config-smart-cache-policy-test)#parent-proxy host 192.168.13.8 port 21
nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
  parent-proxy host 192.168.13.8 port 21
  cache size 30
  http-access precedence 4 deny destination-domain .TechPubs
nx4500-5CFA2B(config-smart-cache-policy-test)#
```

**Related Commands**

- ```no```  
  - Disables parent proxy on this smart cache policy
4.1.92.2.9 smart-cache

smart-cache-policy-mode commands

Enables smart content caching

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
smart-cache enable

Parameters
- smart-cache enable

| smart-cache enable | Enables smart content caching. When enabled, devices using this smart-cache policy act as forward proxy. |

Examples

nx4500-5CFA2B(config-smart-cache-policy-test)#smart-cache enable
nx4500-5CFA2B(config-smart-cache-policy-test)#

Related Commands

no

Disables smart content caching
4.1.92.2.10 transparent-proxy

Enables or disables the transparent proxy mode on a device. This is the default mode of proxying.

When enabled, all packets are automatically routed to the port on which the content cache engine listens (3128) by default. The advantage of the transparent proxy mode is that clients need not be configured with an explicit proxy.

Transparent content caching, on the other hand, acts as an intermediary for the originating servers and returns cached content to clients as if the data originated from the associated servers. Transparent caching proxies perform server load-balancing and compression to regulate load on the originating servers and reduce bandwidth usage.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
transparent-proxy {protocol|vlan}
transparent-proxy {protocol {all|https}}
transparent-proxy {vlan <VLAN-ID>}
```

Parameters

- `transparent-proxy {protocol {all|https}}`
  - `protocol {all|https}`: Optional. Selects the protocols used for transparent proxy mode
    - `https`: Optional. Enables HTTPS for transparent proxy
    - `all`: Optional. Enables all protocols for transparent proxy

- `transparent-proxy {vlan <VLAN-ID>}`
  - `vlan <VLAN-ID>`: Optional. Configures the VLAN(s) for which transparent proxy mode (content caching) is enabled. By default content caching is disabled on all VLANs.
    - `<VLAN-ID>`: Specify the list of VLANs.

Examples

```plaintext
nx4500-5CFA2B(config-smart-cache-policy-test)#transparent-proxy vlan 10-20

nx4500-5CFA2B(config-smart-cache-policy-test)#show context
smart-cache-policy test
parent-proxy host 192.168.13.8 port 21
transparent-proxy vlan 10-20

http-access precedence 4 deny destination-domain .TechPubs
```

Related Commands

```plaintext

<td>page 4-466</td>
</tr>
</tbody>
</table>
4.1.93.1 url-filter

> url-filter

Creates a new URL filter (Web filter) and enters its configuration mode. URL filtering is a licensed feature. When applied to a WiNG device the license allows you to enable URL filtering on the device, create and apply a URL filter defining the banned and/or allowed URLs. When enabled, the URL filter is applied to all user-initiated URL requests to determine if the requested URL is banned or allowed. Only if allowed is the user’s request (in the form of a HTTP request packet) forwarded to the Web server.

URL filters can be applied at any of the following points: the user’s application (browser/email reader), the network’s gateway, at the Internet service provider’s (ISP) end, and also on a Web portal. For wireless clients, the WLAN infrastructure is the best place to implement these filters.

A URL filter is a set of whitelist and/or blacklist rules. The whitelist allows access only to those Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the whitelist, are banned. On the other hand, the blacklist bans all Websites and URLs specified in it. All other Websites and URLs, apart from those specified in the blacklist, are allowed.

To simplify URL filter configuration, Websites have been classified into pre-defined category-types and categories. The system provides 12 category-types and 64 categories. To further simplify configuration, these 12 category-types have been grouped into five (5) pre-defined levels. (See Usage Guidelines section for the list of category-types, categories, and levels). The actual classification of URLs (on the basis of the pre-defined factors mentioned above) is done by the classification server. A local database also helps by caching URL records for a user-defined time period. The classification server host is specified in the Web filter policy. The Web filter policy also defines the URL database parameters. For more information, see web-filter-policy.

The WiNG software also allows you to create URL lists. Each URL list contains a list of user-defined URLs. Use the URL list in a URL filter (whitelist or blacklist rule) to identify the URLs to ban or allow. For example, a URL list named SocialNetworking is created listing the following three sites: Facebook, Twitter, and LinkedIn. When applied to a URL filter’s blacklist these three sites are banned. Where as, when applied to a whitelist only these three sites are allowed. For more information on configuring a URL list, see url-list.

---

**NOTE:** URL filtering is a licensed feature. Procure and install the license in the device configuration mode. For more information, see license.

---

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
url-filter <URL-FILTER-NAME>
```

**Parameters**

- **<URL-FILTER-NAME>**

  Creates a new URL filter and enters its configuration mode. Specify the URL filter name. If the filter does not exist, it is created.

</tr>
</tbody>
</table>
4.1.93.2.1 blacklist

url-filter-config-mode commands

Creates a blacklist rule. A blacklist is a list of Websites and URLs denied access by clients. Clients requesting blacklisted URLs are presented with a page displaying the 'Web page blocked' message. Parameters relating to this page are configured using the 'blockpage' option.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category types and categories cannot be modified.

Use the available options to identify the URL category-types and categories to include in the blacklist.

In addition to identifying URLs by the categories and category-types they are classified into, the system also provides five levels of Web filtering (basic, high, low, medium, and medium-high). Each level identifies a specific set of URL categories to blacklist. For more information on category-types, categories, and URL filtering levels, see url-filter.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

blacklist [category-type|level|url-list]
blacklist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
blacklist level [basic|high|low|medium|medium-high] precedence <1-500>
{description <LINE>}
blacklist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}

Parameters
- blacklist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}

blacklist category-type <SELECT-CATEGORY-TYPE> Selects the category-type to blacklist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can be created with the URL List and added to the database.

Websites have been classified into the following 12 category types:
- adult-content, business, communication, entertainment, file-sharing-backup, gaming,
- news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates

Select ‘all’ to blacklist all category-types. Some of the category-types are further classified into categories. For example, the ‘adult-content’ category-type is differentiated into the following categories:
- alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit,
- sex-education, and weapons.

The system blocks all categories (URLs falling within their limits) within the selected category-type.

precedence <1-500> Configures the precedence value for this blacklist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first.
### blacklist level

| blacklist level  | [basic|high|low|medium|medium-high] precedence <1-500> |
|-----------------|---------------------------------------------|
| Description     | Configures the Web filtering level as basic, high, low, medium, or medium-high. Each of these filter-levels are pre-configured to use a set of category types and this mapping cannot be modified. |

### blacklist url-list

<table>
<thead>
<tr>
<th>blacklist url-list</th>

</tr>
</tbody>
</table>

### Examples

```plaintext
rfs7000-6DCD4B(config-url-filter-test)#blacklist level medium-high precedence 10
rfs7000-6DCD4B(config-url-filter-test)#blacklist category-type adult-content category alcohol-tobacco precedence 1
rfs7000-6DCD4B(config-url-filter-test)#blacklist category-type security-risk category botnets precedence 3
rfs7000-6DCD4B(config-url-filter-test)#show context
url-filter test
     blacklist level medium-high precedence 10
     blacklist category-type security-risk category botnets precedence 3
     blacklist category-type adult-content category alcohol-tobacco precedence 1
```

### Related Commands

- no
  - Removes a blacklist rule from this URL filter. Specify the category-type, category, and precedence to identify the blacklist rule. The identified rule is removed from the URL filter.
4.1.93.2.2 blockpage

url-filter-config-mode commands

Configures the parameters that retrieve the page or content displayed by the client’s browser when a requested URL is blocked and cannot be viewed

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

blockpage [external|internal|path]
blockpage path [external|internal]
bblockpage external url <URL>
blockpage internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title] <LINE/IMAGE-URL

Parameters
- blockpage path [external|internal]

  blockpage path [external|internal] Specifies if the location of the page displayed, to the client when a requested URL is blocked, is external or internal
  - external – Indicates the page displayed is hosted on an external Web server resource. If selecting this option, use the blockpage > external > url <URL> command to provide the path to the external Web server hosting the page.
  - internal – Indicates the page displayed is hosted internally. This is the default setting. If selecting this option, use the blockpage > internal > <SELECT-PAGE-TYPE> > <LINE/IMAGE-URL> command to define the page configuration.

- blockpage external url <URL>

  blockpage external url <URL> Configures the URL of the external Web server hosting the page (displayed to the client when a requested URL is blocked).
  - url <URL> – Specify the URL of the Web server and the blocking page name
    Valid URLs should begin with http:// or https://
    The URL can contain query strings.
    Use '&' or '?' character to separate field-value pair.
    Enter 'ctrl-v' followed by '?' to configure query strings

- blockpage internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title] <LINE/IMAGE-URL>

  blockpage internal [content|footer|header|main-logo|org-name|org-signature|small-logo|title] <LINE/IMAGE-URL> Configures the internally hosted blocking page parameters, such as the content displayed, page footer and header, organization (the organization enforcing the Web page blocking) details (name, signature, and logo), and page title
  - content – Configures the text (message) displayed on the blocking page
  Contd...
Examples
rfs7000-6DCD4B(config-url-filter-test)#blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#

</table>
4.1.93.2.3 description

url-filter-config-mode commands

Configures a description for this URL filter. Provide a description that enables you to identify the purpose of this URL filter.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

description <LINE>

Parameters

- description <LINE>

| description <LINE> Enter an appropriate description for this URL filter. The description should identify the URL filter’s purpose and should not exceed 80 characters in length. |

Examples

rfs7000-6DCD4B(config-url-filter-test)#description "Blacklists sites inappropriate for children and are security risks"

rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test
description "Blacklists\ sites\ inappropriate\ for\ children\ and\ are\ security\ risks"
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#

Related Commands

no Removes this URL filter’s description
4.1.93.2.4 no

url-filter-config-mode commands

Use the no command to remove this URL filter's configured parameters.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes this URL filter's configured parameters based on the values passed here</th>
</tr>
</thead>
<tbody>
<tr>
<td>no blacklist [category-type</td>
<td>level</td>
</tr>
<tr>
<td>no blacklist [category-type &lt;SELECT-CATEGORY-TYPE&gt;</td>
<td>level &lt;SELECT-LEVEL&gt;</td>
</tr>
<tr>
<td>no blockpage [external</td>
<td>internal [content</td>
</tr>
<tr>
<td>no description</td>
<td></td>
</tr>
<tr>
<td>no whitelist [category-type</td>
<td>url-list]</td>
</tr>
<tr>
<td>no whitelist [category-type &lt;SELECT-CATEGORY-TYPE&gt;</td>
<td>url-list &lt;URL-LIST-NAME&gt;] precedence &lt;1-500&gt;</td>
</tr>
</tbody>
</table>

Parameters
- no <PARAMETERS>

Examples

The following example displays the URL filter 'test' settings before the 'no' is executed:

rfs7000-6DCD4B(config-url-filter-test)#show context
url-filter test
description "Blacklists sites\ in inappropriate for children\ and\ are\ security risks"
blacklist level medium-high precedence 10
whitelist category-type communication category chat precedence 7
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#

rfs7000-6DCD4B(config-url-filter-test)#no description
rfs7000-6DCD4B(config-url-filter-test)#no blacklist category-type adult-content category alcohol-tobacco precedence 1
rfs7000-6DCD4B(config-url-filter-test)#no whitelist category-type communication category chat precedence 7

The following example displays the URL filter 'test' settings after the 'no' is executed:

rfs7000-6DCD4B(config-url-filter-test)#show context
url-filter test
blacklist level medium-high precedence 10
blacklist category-type security-risk category botnets precedence 3
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#
4.1.93.2.5 whitelist

Creates a whitelist rule. A whitelist is a list of Websites and URLs allowed access by clients.

URL filtering is based on the classification of Websites into pre-defined category-types. Some of the category-types are further divided into multiple categories. Currently available are 12 built-in category types, and 64 categories. These built-in category-types and categories cannot be modified.

Use the available options to identify the category-types and categories to include in the whitelist.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

```
whitelist [category-type|url-list]
whitelist category-type [adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates] precedence <1-500> {description <LINE>}
whitelist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}
```

Parameters

- `whitelist category-type {adult-content|all|business|communication|entertainment|
file-sharing-backup|gaming|news-sports-general|p2p|questionable|security-risk|
social-photo-sharing|software-updates} precedence <1-500> {description <LINE>}`

- `whitelist url-list <URL-LIST-NAME> precedence <1-500> {description <LINE>}`

| whitelist category-type <SELECT-CATEGORY-TYPE> | Selects the category-type to add to this whitelist. A category is a pre-defined URL list available in the WiNG software. Categories are based on an external database, and cannot be modified or removed. Custom categories can be created with the URL List and added to the database. Websites have been classified into the following 12 category types: adult-content, business, communication, entertainment, file-sharing-backup, gaming, news-sports-general, p2p, questionable, security-risk, social-photo-sharing, and software-updates. Select ‘all’ to whitelist all category-types. Some of the category-types are further classified into categories. For example, the ‘adult-content’ category-type is differentiated into the following categories: • alcohol-tobacco, dating-personals, gambling, nudity, pornography-sexually-explicit, sex-education, and weapons. The system allows all categories (URLs falling within their limits) within the selected category-type. |
| **precedence <1-500>** | Configures the precedence value for this whitelist rule. Rules are applied in the increasing order of their precedence. Therefore, rules with lower precedence are applied first. |
| **description <LINE>** | Optional. Configures a description (not exceeding 80 characters) for this whitelist rule. Enter a description that allows you to identify the purpose of the rule. |
whitelist url-list <URL-LIST-NAME> precedence <1-500>  

 Associates a URL list with this URL filter. When associated with a whitelist rule, all URLs listed in the specified URL list are allowed access. URL lists are customized categories included in the custom filter-level setting. URL lists enable an administrator to blacklist or whitelist URLs in addition to the built-in categories. For more information on configuring a URL list, see url-list.

•  <URL-LIST-NAME> – Enter URL list name (should be existing and configured)

<table>
<thead>
<tr>
<th>precedence &lt;1-500&gt;</th>

rfs7000-6DCD4B(config-url-filter-test)#show context url-filter test
description "Blacklists sites inappropriate for children and are security risks"
blacklist level medium-high precedence 10
whitelist category-type communication category chat precedence 7
blacklist category-type security-risk category botnets precedence 3
blacklist category-type adult-content category alcohol-tobacco precedence 1
blockpage internal content "The requested Web page is blocked and cannot be displayed for viewing"
rfs7000-6DCD4B(config-url-filter-test)#

Related Commands

| no | Removes a whitelist rule from this URL filter. Specify the category-type, category, and precedence to identify the blacklist rule. The identified rule is removed form the URL filter. |
4.1.94 url-list

The following table lists the commands that allow you to enter the URL list configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>url-list</td>
<td>Creates a new URL list and enters its configuration mode</td>
<td>page 4-476</td>
</tr>
<tr>
<td>url-list-config-mode</td>
<td>Summarizes the URL list configuration mode commands</td>
<td>page 4-477</td>
</tr>
</tbody>
</table>
4.1.94.1 url-list

url-list

Creates a URL list and enters its configuration mode. After creating the URL list, add URL entries to the list.

URL lists are used to pre-fetch content from the listed URLs. URL Lists are used to select highly utilized URLs for smart caching. The selected URLs are monitored and routed according to existing cache content policies. To enable pre-fetching of cached content, use the `smart-cache > pre-fetch-immediate > <URL-LIST-NAME>` command. For more information, see `smart-cache`.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

url-list <URL-LIST-NAME>

Parameters

- url-list <URL-LIST-NAME>

| <URL-LIST-NAME> | Specify the URL list name. The URL list is created if another list with the same name does not exist. |

Examples

```
x4500-5CFA2B(config)#url-list URLlist1
nx4500-5CFA2B(config-url-list-URLlist1)#?
  description  Description of the category
  no           Negate a command or set its defaults
  url          Add a URL entry
  clrscr       Clears the display screen
  commit       Commit all changes made in this session
  do           Run commands from Exec mode
  end          End current mode and change to EXEC mode
  exit         End current mode and down to previous mode
  help         Description of the interactive help system
  revert       Revert changes
  service      Service Commands
  show         Show running system information
  write        Write running configuration to memory or terminal
```

```
x4500-5CFA2B(config-url-list-URLlist1)#url http://www.example_company.com depth 10
nx4500-5CFA2B(config-url-list-test)#show context
url-list test
  url http://www.example_company.com depth 10
```

```
x4500-5CFA2B(config-url-list-URLlist1)#
x4500-5CFA2B(config-url-list-URLlist1)#url http://www.example_company.com depth 10
```

```
x4500-5CFA2B(config-url-list-test)#show context
url-list test
  url http://www.example_company.com depth 10
```
4.1.94.2 url-list-config-mode commands

The following table summarizes URL list configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>

</table>
4.1.94.2.1 description

**url-list-config-mode commands**

Configures a description for this URL list. The description should be unique and enable you to identify the type of URLs listed in the URL list.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

description <LINE>

**Parameters**

- description <LINE>

  Provide a unique description for this URL list (should not exceed 500 characters in length)

**Examples**

```bash
nx4500-5CFA2B(config-url-list-test)#description This URL list contains social media URLs
```

```bash
nx4500-5CFA2B(config-url-list-test)#show context
```

```
url-list test
description This URL list contains social media URLs
```

```
nx4500-5CFA2B(config-url-list-test)#
```

**Related Commands**

- `no` Removes this URL list’s description
4.1.94.2.2 url

url-list-config-mode commands

Adds URL entries to this URL list

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

url <WORD> {depth <1-10>}

Parameters

- url <WORD> {depth <1-10>}

url <WORD> {depth <1-10>} | Adds a URL entry
---|---
- <WORD> – Specify the URL to add.
- depth – Optional. Sets number of levels to be cached. Since Web sites have different parameters to uniquely identify specific content, the same content may be stored on multiple origin servers. Smart caching uses subsets of these parameters to recognize that the content is the same and serves it from cache.
- <1-10> – Specify the depth from 1 - 10.

Examples

nx4500-5CFA2B(config-url-list-test)#url http://www.facebook.com
nx4500-5CFA2B(config-url-list-test)#show context
url-list test
description This URL list contains social communication URLs
url https://www.facebook.com depth 5
nx4500-5CFA2B(config-url-list-test)#

Related Commands

no | Removes a URL entry from this URL list
4.1.94.2.3 no

*url-list-config-mode commands*

Removes this URL list’s settings

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

no [description|url]

no description

no url <WORD>

**Parameters**

- no <PARAMETERS>

  no <PARAMETERS> Removes this URL’s settings based on the parameters passed

**Examples**

The following example displays the URL list ‘test’ settings before the ‘no’ command is executed:

```
nx4500-5CFA2B(config-url-list-test)#show context
url-list test
  description This URL list contains social communication URLs
  url https://www.facebook.com depth 5
```

```
nx4500-5CFA2B(config-url-list-test)#no url www.facebook.com
```

The following example displays the URL list ‘test’ settings after the ‘no’ command is executed:

```
nx4500-5CFA2B(config-url-list-test)#show context
url-list test
  description This URL list contains social communication URLs
```

```
nx4500-5CFA2B(config-url-list-test)#
```
4.1.95 vx9000

Global Configuration Commands

Configures a Virtual WLAN Controller (V-WLC) in a virtual machine (VM) environment. V-WLC can be deployed on a shared, third-party server hardware, thereby reducing overhead costs of procuring and maintaining dedicated appliances. The external, third-party hardware needs to have installed hypervisors, such as VmWare, Xen, VirtualBox, KVM, Amazon EC2 or Hyper-V, enabling it to communicate with V-WLC software.

The V-WLC controls and manages access points and other controllers (at NOC or as a site-controller) in the network. The traffic between the access points and the V-WLC is over the layer-3 MINT protocol.

V-WLC is a licensed feature, and the WiNG software provides the following two new licenses:

- **VX** – When installed, this license activates VM controller instance, and enables the V-WLC to trigger adoption process allowing access points to adopt to the V-WLC. The adoption capacity of the V-WLC is determined by the number of licenses installed on it.

- **VX-DEMO** – This is a 60 day trial license. This license also activates VM controller instance, and enables the V-WLC to adopt access points. But, the access point adoption capacity is limited to 16. Having installed this license on a device, the only other license that you can install on it is the VX license. All existing installed licenses will continue to work as before. Since this license has a limited validity period, ensure that the system clock on the license generating tool and the device are in sync. preferably through NTP.

To install the VX or VX-DEMO license on an existing V-WLC instance, use the license command. For more information, see the examples provided in this section.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

vx9000 <MAC>

**Parameters**
- vx9000 <MAC>

<table>
<thead>
<tr>
<th>vx &lt;MAC&gt;</th>
<th>Configures a V-WLC and enters its configuration mode</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> The V-WLC configuration is the same as that of a normal controller.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C8809(config)#vx 11-22-33-44-55-66
nx9500-6C8809(config-device-11-22-33-44-55-66)#?

Device Mode commands:

- **adopter-auto-provisioning-policy-lookup**
  - Use centralized auto-provisioning policy when adopted by another controller
- **adoption**
  - Adoption configuration
- **adoption-site**
  - Set system's adoption site
- **alias**
  - Alias
- **application-policy**
  - Application Policy configuration
- **area**
  - Set name of area where the system is located
- **arp**
  - Address Resolution Protocol (ARP)
- **auto-learn-staging-config**
  - Enable learning network configuration of the devices that come for adoption
- **autogen-uniqueid**
  - Autogenerate a unique id
- **autoinstall**
  - Autoinstall settings
- **bridge**
  - Ethernet bridge
- **captive-portal**
  - Captive portal
- **cdp**
  - Cisco Discovery Protocol
- **channel-list**
  - Configure channel list to be
advertised to wireless clients
Cluster configuration
Enable persistence of configuration across reloads (startup config file)
Configure the contact
WLAN controller configuration
Configure the country of operation
Critical Resource
Encryption related commands
Scheduled Database Backup
Device firmware upgrade
802.1X
Enable Deep-Packet-Inspection (Application Assurance)
Configure IP DSCP to 802.1p priority mapping for untagged frames
Check the firmware versions of devices before interoperating
File sync between controller and adoptees
Set the floor within a area where the system is located
Configure geo coordinates for this device
GRE protocol
Set system's network name
Specify HTTP-Analysis configuration
Select an interface to configure
Internet Protocol (IP)
Internet Protocol version 6 (IPv6)
L2tpv3 protocol
L3e lite Table
Configure layout coordinates for this device
Turn LEDs on/off on the device
Configure the time for the led to turn off after the last radio state change
Enable device firmware to auto downgrade when other legacy devices are detected
Auto upgrade of legacy devices
License management command
Link Layer Discovery Protocol
Configure load balancing parameter
Configure the location
Modify message logging facilities
MAC Address Table
802.1X
Configure MAC address to name mappings
Memory profile to be used on the device
Configure meshpoint device parameters
Configure meshpoint monitoring interval
Check controller connectivity after configuration is received
MiNT protocol
Mirroring
Check controller connectivity after configuration is received
Configure neighbor inactivity
GLOBAL CONFIGURATION COMMANDS

neighbor-info-interval

timeout

no

Negate a command or set its
defaults

noc

Configure the noc related setting

ntp

Ntp server WORD

offline-duration

Set duration for which a device
remains unadopted before it
generates offline event

override-wlan

Configure RF Domain level overrides
for wlan

power-config

Configure power mode

preferred-controller-group

Controller group this system will
prefer for adoption

preferred-tunnel-controller

Tunnel Controller Name this system
will prefer for tunneling extended
vlan traffic

radius

Configure device-level radius
authentication parameters

raid

RAID

reevaluate-everytime

Set the flag to reevaluate
autoprovisioning policy everytime

remove-override

Remove configuration item override
from the device (so profile value
takes effect)

rf-domain-manager

RF Domain Manager

router

Dynamic routing

rsa-key

Assign a RSA key to a service

sensor-server

AirDefense sensor server

configuration

slot

PCI expansion Slot

spanning-tree

Spanning tree

timezone

Configure the timezone

traffic-class-mapping

Configure IPv6 traffic class to
802.1p priority mapping for
untagged frames

tunnel-controller

Tunnel Controller group this
controller belongs to

use

Set setting to use

vrrp

VRRP configuration

vrrp-state-check

Publish interface via OSPF/BGP only
if the interface VRRP state is not
BACKUP

wep-shared-key-auth

Enable support for 802.11 WEP
shared key authentication

clrscr

Clears the display screen

commit

Commit all changes made in this
session

do

Run commands from Exec mode

derror

End current mode and change to EXEC
mode

exit

End current mode and down to
previous mode

help

Description of the interactive help
system

revert

Revert changes

show

Service Commands

write

Write running configuration to
memory or terminal

This chapter describes the CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes. The PRIV EXEC command set contains commands available within the USER EXEC mode. Some commands can be entered in either mode. Commands entered in either the USER EXEC or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.
## 5.1 Common Commands

### COMMON COMMANDS

The following table summarizes commands common to the User Exec, Priv Exec, and Global Config modes:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>clrscr</td>
<td>Clears the display screen</td>
<td>page 5-3</td>
</tr>
<tr>
<td>commit</td>
<td>Commits (saves) changes made in the current session</td>
<td>page 5-4</td>
</tr>
<tr>
<td>exit</td>
<td>Ends and exits the current mode and moves to the PRIV EXEC mode</td>
<td>page 5-5</td>
</tr>
<tr>
<td>help</td>
<td>Displays the interactive help system</td>
<td>page 5-6</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts values to their default settings</td>
<td>page 5-9</td>
</tr>
<tr>
<td>revert</td>
<td>Reverts changes to their last saved configuration</td>
<td>page 5-12</td>
</tr>
<tr>
<td>service</td>
<td>Invokes service commands to troubleshoot or debug (config-if) instance configurations</td>
<td>page 5-13</td>
</tr>
<tr>
<td>show</td>
<td>Displays running system information</td>
<td>page 5-49</td>
</tr>
<tr>
<td>write</td>
<td>Writes the system's running configuration to memory or terminal</td>
<td>page 5-51</td>
</tr>
</tbody>
</table>

**NOTE:** The input parameter `<HOSTNAME>` cannot include an underscore character. In other words, a device’s hostname cannot contain an underscore.
5.1.1 clrscr

Clears the screen and refreshes the prompt, irrespective of the mode

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
clrscr

Parameters
None

Examples
The terminal window or screen before the clrscr command is executed:

```
rfs4000-229D58#device-upgrade ?
DEVICE-NAME     Name/MAC address of device
all             Upgrade all devices
ap621           Upgrade AP621 Device
ap622           Upgrade AP622 Device
ap650           Upgrade AP650 Device
ap6511          Upgrade AP6511 Device
ap6521          Upgrade AP6521 Device
ap6522          Upgrade AP6522 Device
ap6532          Upgrade AP6532 Device
ap6562          Upgrade AP6562 Device
ap71xx          Upgrade AP71XX Device
ap7502          Upgrade AP7502 Device
ap7522          Upgrade AP7522 Device
ap7532          Upgrade AP7532 Device
ap7562          Upgrade AP7562 Device
ap81xx          Upgrade AP81XX Device
ap82xx          Upgrade AP82XX Device
cancel-upgrade  Cancel upgrading the device
load-image      Load the device images to controller for device-upgrades
rf-domain       Upgrade all devices belonging to an RF Domain
rfs4000         Upgrade RFS4000 Device
```

The terminal window or screen after the clrscr command is executed:

```
rfs4000-229D58#
```
5.1.2 commit

Common Commands

Commits changes made in the active session. Use the commit command to save and invoke settings entered during the current transaction.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

commit {write}{memory}

Parameters

- commit {write}{memory}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>write</td>
<td>Optional. Commits changes made in the current session</td>
</tr>
<tr>
<td>memory</td>
<td>Optional. Writes to memory. This option ensures current changes persist across reboots.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE#commit write memory
[OK]
rfs7000-37FABE#
5.1.3 exit

Common Commands

The exit command works differently in the User Exec, Priv Exec, and Global Config modes. In the Global Config mode, it ends the current mode and moves to the previous mode, which is Priv Exec mode. The prompt changes from (config)# to #. When used in the Priv Exec and User Exec modes, the exit command ends the current session, and connection to the terminal device is terminated. If the current session has changes that have not been committed, the system prompts you to either do a commit or a revert before terminating the session.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
exit

Parameters
None

Examples
rfs7000-37FABE(config)#exit
rfs7000-37FABE#
5.1.4 help

Describes the interactive help system

Use this command to access the advanced help feature. Use “?” anytime at the command prompt to access the help topic

Two kinds of help are provided:

- Full help is available when ready to enter a command argument
- Partial help is provided when an abbreviated argument is entered and you want to know what arguments match the input (for example ‘show ve?’).

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

help {search}

help {search <WORD>} {detailed|only-show|skip-no|skip-show}

Parameters

- help {search <WORD>} {detailed|only-show|skip-no|skip-show}

<table>
<thead>
<tr>
<th>search &lt;WORD&gt;</th>
<th>Optional. Searches for CLI commands related to a specified target term</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt; – Specify a target term (for example, a feature or a configuration parameter). After specifying the term, select one of the following options: detailed, only-show, skip-no, or skip-show. The system displays information based on the option selected.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>detailed</th>
<th>Optional. Searches and displays help strings in addition to mode and commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>only-show</td>
<td>Optional. Displays only “show” commands. Does not display configuration commands</td>
</tr>
<tr>
<td>skip-no</td>
<td>Optional. Displays only configuration commands. Does not display “no” commands</td>
</tr>
<tr>
<td>skip-show</td>
<td>Optional. Displays only configuration commands. Does not display “show” commands</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE>help search crypto detailed
found more than 64 references, showing the first 64

### 5.1.5 no

**Common Commands**

Negates a command or sets its default. Though the `no` command is common to the User Exec, Priv Exec, and Global Config modes, it negates a different set of commands in each mode.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no <PARAMETERS>
```

**Parameters**

- `no <PARAMETERS>`

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>aaa-policy</code></td>
<td>Delete a aaa policy</td>

<td><code>captive-portal</code></td>
<td>Delete a captive portal</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

Global Config mode: No command options

Enter configuration commands, one per line. End with CNTL/Z.

```
rfs7000-37FABE(config)#no ?
```

- `aaa-policy`    | Delete a aaa policy |
- `aaa-tacacs-policy` | Delete a aaa tacacs policy |
- `alias`         | Alias |
- `ap621`         | Delete an AP621 access point |
- `ap622`         | Delete an AP622 access point |
- `ap650`         | Delete an AP650 access point |
- `ap6511`        | Delete an AP6511 access point |
- `ap6521`        | Delete an AP6521 access point |
- `ap6522`        | Delete an AP6522 access point |
- `ap6532`        | Delete an AP6532 access point |
- `ap6562`        | Delete an AP6562 access point |
- `ap71xx`        | Delete an AP71XX access point |
- `ap7502`        | Delete an AP7502 access point |
- `ap7522`        | Delete an AP7522 access point |
- `ap7532`        | Delete an AP7532 access point |
- `ap7562`        | Delete an AP7562 access point |
- `ap81xx`        | Delete an AP81XX access point |
- `ap82xx`        | Delete an AP82XX access point |
- `application`   | Delete an application |
- `application-policy` | Delete an application policy |
- `association-acl-policy` | Delete an association-acl policy |
- `auto-provisioning-policy` | Delete an auto-provisioning policy |
- `bonjour-gw-discovery-policy` | Disable Bonjour Gateway discovery policy |
- `bonjour-gw-forwarding-policy` | Disable Bonjour Gateway Forwarding policy |
- `bonjour-gw-query-forwarding-policy` | Disable Bonjour Gateway Query Forwarding policy |
- `captive-portal` | Delete a captive portal |
client-identity                     Client identity (DHCP Device Fingerprinting)
client-identity-group              Client identity group (DHCP Fingerprint Database)
crypto-cmp-policy                  CMP policy
customize                           Restore the custom cli commands to default
device                              Delete multiple devices
device-categorization              Delete device categorization object
dhcp-server-policy                 DHCP server policy
dhcpv6-server-policy                DHCPv6 server related configuration
dns-whitelist                      Delete a whitelist object
event-system-policy                Delete a event system policy
ex3500                             Ex3500 device
ex3500-management-policy           Delete a ex3500 management policy
ex3500-gos-class-map-policy        Delete a ex3500 qos class-map policy
ex3500-gos-policy-map              Delete an ex3500 qos policy-map
ex3524                             Delete an EX3524 wireless controller
ex3548                             Delete an EX3548 wireless controller
firewall-policy                    Configure firewall policy
global-association-list           Delete a global association list
igmp-snoop-policy                  Remove device onboard igmp snoop policy
inline-password-encryption         Disable storing encryption key in the startup configuration file
ip                                  Internet Protocol (IP)
ipv6                                Internet Protocol version 6 (IPv6)
ipv6-router-advertisement-policy   IPv6 Router Advertisement related configuration
l2tpv3                              Negate a command or set its defaults
mac                                 MAC configuration
management-policy                  Delete a management policy
meshpoint                          Delete a meshpoint object
meshpoint-qos-policy                Delete a meshpoint QoS configuration policy
nac-list                            Delete an network access control list
nsight-policy                       Delete a nsight policy
passpoint-policy                    Delete a passpoint configuration policy
password-encryption                Disable password encryption in configuration
profile                             Delete a profile and all its associated configuration
radio-qos-policy                    Delete a radio QoS configuration policy
radius-group                        Local radius server group configuration
radius-server-policy                Remove device onboard radius policy
radius-user-pool-policy             Configure Radius User Pool
rf-domain                           Delete one or more RF-domains and all their associated configurations
rfs4000                             Delete an RFS4000 wireless controller
rfs6000                             Delete an RFS6000 wireless controller
rfs7000                             Delete an RFS7000 wireless controller
roaming-assist-policy              Delete a roaming-assist policy
role-policy                         Role based firewall policy
routing-policy                      Policy Based Routing Configuratio
smart-rf-policy                     Delete a smart-rf-policy
t5                                  Delete an T5 wireless controller
url-filter                          Delete a url filter
url-list                            Delete a URL list
web-filter-policy                   Delete a web filter policy
wips-policy                         Delete a wips policy
wlan                                Delete a wlan object
wlan-qos-policy                     Delete a wireless lan QoS configuration policy

service                              Service Commands
rfs7000-37FABE(config)#
Common Commands 5 - 11

Priv Exec mode: No command options

```
rfs7000-37FABE#no ?
adoption        Reset adoption state of the device (& all devices adopted to it)
captive-portal  Captive portal commands
cpe             T5 CPE configuration
crypto          Encryption related commands
debug           Debugging functions
logging         Modify message logging facilities
page            Toggle paging
service         Service Commands
terminal        Set terminal line parameters
upgrade         Remove a patch
wireless        Wireless Configuration/Statistics commands
```

user Exec mode: No command options

```
rfs7000-37FABE>no ?
adoption        Reset adoption state of the device (& all devices adopted to it)
captive-portal  Captive portal commands
crypto          Encryption related commands
debug           Debugging functions
logging         Modify message logging facilities
page            Toggle paging
service         Service Commands
terminal        Set terminal line parameters
wireless        Wireless Configuration/Statistics commands
```

5.1.6 revert

Common Commands
Reverts changes made, in the current session, to their last saved configuration.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
revert

Parameters
None

Examples
rfs7000-37FABE>revert
rfs7000-37FABE>
5.1.7 service

Common Commands

Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode. The User Exec mode and Priv Exec mode commands provide same functionalities with a few minor changes. The Global Config service command sets the size of history files. It also enables viewing the current mode’s CLI tree.

This section consists of the following sub-sections:

- Syntax (User Exec Mode)
- Syntax (Privilege Exec Mode)
- Syntax (Privilege Exec Mode: NX9000, NX9500, and NX9510)
- Syntax (Global Config Mode)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax (User Exec Mode)**

```
service [block-adopter-config-update|clear|cli-tables-skin|cluster|delete-offline-aps|
force-send-config|force-update-vm-stats|guest-registration|load-balancing|
locator|radio|radius|request-full-config-from-adopter|set|show|smart-rf|ssm|snmp|
syslog|wireless]

service [block-adopter-config-update|request-full-config-from-adopter]
```

```
service clear [adoption|captive-portal-page-upload|command-history|device-upgrade|dpi|

- **service wireless wips clear-event-history** {on <DEVICE-OR-DOMAIN-NAME>}

### Parameters (User Exec Mode)

- **service** [block-adopter-config-update|request-full-config-from-adopter]

<table>
<thead>
<tr>
<th>block-adopter-config-update</th>
<th>Blocks the configuration updates sent from the NOC server</th>
</tr>
</thead>
<tbody>
<tr>
<td>request-full-config-from-adopter</td>
<td>Configures a request for full configuration updates from the adopter device</td>
</tr>
<tr>
<td></td>
<td>In an hierarchically managed (HM) network devices are deployed in two levels. The first level consists of the Network Operations Center (NOC) controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (access points and site controllers) are referred to as the adoptee. The devices adopting the adoptee are the 'adopters'.</td>
</tr>
</tbody>
</table>

- **service clear adoption history** {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>clear adoption history</th>
<th>Clears adoption history on this device and its adopted access points</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Clears adoption history on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>
### service clear device-upgrade history {on <DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear device-upgrade history</td>
<td>Clears device upgrade history.</td>
</tr>
<tr>
<td>on &lt;DOMAIN-NAME&gt;</td>
<td>Optional. Clears all firmware upgrade history in a specified RF Domain</td>
</tr>
<tr>
<td></td>
<td>&lt;DOMAIN-NAME&gt; – Specify the RF Domain name.</td>
</tr>
</tbody>
</table>

### service clear dpi [all|app|app-category] stats {on <DEVICE-OR-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear dpi</td>
<td>Clears Deep Packet Inspection (DPI) statistics</td>
</tr>
<tr>
<td>[all</td>
<td>app</td>
</tr>
<tr>
<td></td>
<td>• all – Clears all DPI related (application and app-category) statistics</td>
</tr>
<tr>
<td></td>
<td>• app – Clears only application related statistics</td>
</tr>
<tr>
<td></td>
<td>• app-category – Clears only app-category related statistics</td>
</tr>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>Optional. Clears DPI statistics based on the parameters passed on a specified</td>
</tr>
<tr>
<td></td>
<td>device or RF Domain</td>
</tr>
<tr>
<td></td>
<td>&lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the access point, controller,</td>
</tr>
<tr>
<td></td>
<td>service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

### service clear file-sync history {on <DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear file-sync history</td>
<td>Clears client-bridge certificate synchronization statistics</td>

<tr>
<td>on &lt;DOMAIN-NAME&gt;</td>
<td>Optional. Clears file synchronization history on all devices within a</td>
</tr>
<tr>
<td></td>
<td>specified RF Domain</td>
</tr>
<tr>
<td></td>
<td>&lt;DOMAIN-NAME&gt; – Specify the RF Domain name.</td>
</tr>
</tbody>
</table>

### service clear captive-portal-page-upload history {on <DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear captive-portal-page-upload history</td>
<td>Clears captive portal page upload history</td>
</tr>
<tr>
<td>on &lt;DOMAIN-NAME&gt;</td>
<td>Optional. Clears captive portal page upload history on a specified RF Domain</td>
</tr>
<tr>
<td></td>
<td>&lt;DOMAIN-NAME&gt; – Specify the RF Domain name.</td>
</tr>
</tbody>
</table>

### service clear [command-history|reboot-history|upgrade-history|virtual-machine-history] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear [command-history</td>
<td>reboot-history</td>
</tr>
<tr>
<td>clear virtual-machine-history</td>
<td>Clears virtual-machine history on the logged device or a specified device</td>
</tr>
<tr>
<td></td>
<td>Note: This command is applicable only on the NX45XX, NX65XX, NX9500, and</td>
</tr>
<tr>
<td></td>
<td>NX9510 series service platforms.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>service clear noc statistics</strong></td>
<td>Optional. Clears history on a specified device&lt;br&gt;• <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the AP, wireless controller, or service platform. &lt;br&gt;&lt;br&gt;Note: When executing the clear virtual-machine-history command, provide the name of the service platform running the VMs.</td>
</tr>
<tr>
<td><strong>clear noc statistics</strong></td>
<td>Clears Network Operations Center (NOC) applicable statistics counters</td>
</tr>
<tr>
<td><strong>service clear unsanctioned aps</strong> <code>{on &lt;DEVICE-OR-DOMAIN-NAME&gt;}</code></td>
<td>Optional. Clears the unsanctioned APs list&lt;br&gt;• <code>&lt;DEVICE-OR-DOMAIN-NAME&gt;</code> – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
<tr>
<td>**clear wireless [ap</td>
<td>client] statistics** <code>{&lt;MAC&gt;}</code> <code>{(on &lt;DEVICE-OR-DOMAIN-NAME&gt;)}</code>&lt;br&gt;<code>&lt;MAC&gt;</code>&lt;br&gt;<code>&lt;DEVICE-OR-DOMAIN-NAME&gt;</code></td>
</tr>
<tr>
<td><strong>service clear wireless controller-mobility-database</strong></td>
<td>clears the controller assisted mobility database</td>
</tr>
<tr>
<td><strong>clear web-filter cache</strong> <code>{on &lt;DEVICE-NAME&gt;}</code>&lt;br&gt;<code>&lt;DEVICE-NAME&gt;</code></td>
<td>clears the cache used for Web filtering&lt;br&gt;• <code>&lt;DEVICE-NAME&gt;</code> – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
<tr>
<td><strong>service clear wireless radio statistics</strong> <code>&lt;MAC/HOSTNAME&gt;</code> <code>{&lt;1-3&gt;}</code> <code>{(on &lt;DEVICE-OR-DOMAIN-NAME&gt;)}</code>&lt;br&gt;<code>&lt;MAC&gt;</code>&lt;br&gt;<code>&lt;DEVICE-OR-DOMAIN-NAME&gt;</code>&lt;br&gt;<code>&lt;1-3&gt;</code></td>
<td>clears applicable wireless radio statistics counters&lt;br&gt;• <code>&lt;MAC/HOSTNAME&gt;</code> – Optional. Specify the MAC address or hostname of the radio, or append the interface number to form the radio ID in the AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX format.&lt;br&gt;• <code>&lt;1-3&gt;</code> – Optional. Specify the radio interface index, if not specified as part of the radio ID.</td>
</tr>
</tbody>
</table>
on <DEVICE-OR-DOMAIN-NAME> | Optional. This is a recursive parameter, which clears wireless radio statistics on a specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain.

• service clear wireless wlan statistics {<WLAN-NAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}

| clear wireless wlan statistics | Clears WLAN statistics counters |
| <WLAN-NAME> | Optional. Clears statistics counters on a specified WLAN. Specify the WLAN name. |
| on <DEVICE-OR-DOMAIN-NAME> | Optional. This is a recursive parameter, which clears WLAN statistics on a specified device or RF Domain. Specify the name of the AP, wireless controller, service platform, or RF Domain. |

• service clear xpath requests {<1-100000>}

| clear xpath | Clears XPATH related information |
| requests | Clears pending XPATH get requests |
| <1-100000> | Optional. Specifies the session number (cookie from show sessions) |

• cli-tables-skin {ansi|hashes|minimal|none|percent|stars|thick|thin|utf-8} {grid}

| cli-tables-skin | Selects a formatting layout or skin for CLI tabular outputs |
| {ansi|hashes|minimal|none|percent|stars|thick|thin|utf-8} | • ansi – Uses ANSI characters for borders |
| | • hashes – Uses hashes (#) for borders |
| | • minimal – Uses one horizontal line between title and data rows |
| | • none – Displays space separated items with no decoration |
| | • percent – Uses the percent sign (%) for borders |
| | • stars – Uses asterisks (*) for borders |
| | • thick – Uses thick lines for borders |
| | • thin – Uses thin lines for borders |
| | • utf-8 – Uses UTF-8 characters for borders |
| grid | Optional. Uses a complete grid instead of just title lines |

• service cluster force {active|configured-state|standby}

<p>| cluster | Enables cluster protocol management |
| force | Forces action commands on a cluster (active, configured-state, and standby) |
| active | Changes the cluster run status to active |
| configured-state | Restores a cluster to the configured state |
| standby | Changes the cluster run status to standby |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service delete-offline-aps all</td>
<td>Deletes all off-line access points</td>
</tr>
<tr>
<td>delete-offline-aps offline-for days &lt;0-999&gt; {time &lt;TIME&gt;}</td>
<td>Deletes off-line access points for a specified interval</td>
</tr>
<tr>
<td>day &lt;0-999&gt;</td>
<td>Deletes off-line access points for a specified number of days</td>
</tr>
<tr>
<td>time &lt;TIME&gt;</td>
<td>Optional. Deletes off-line access points for a specified time</td>
</tr>
<tr>
<td>service force-send-config</td>
<td>Sends configuration to device(s)</td>
</tr>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>Optional. Sends configuration to a specified device or all devices in a specified RF Domain</td>
</tr>
<tr>
<td>service force-update-vm-stats</td>
<td>forcefully pushes VM statistics on to the NOC</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Executes the command on a specified device</td>

<td>restore]</td>
</tr>
<tr>
<td>service guest-registration delete [all</td>
<td>email &lt;EMAIL-ADD&gt;</td>
</tr>
</tbody>
</table>

Note: To view the status of the restore process, use the service > show > guest-registration > restore-status command.

Contd..
service guest-registration export format [cvs|json] <DEST-URL> {rfdomain <DOMAIN-NAME>|time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]|wlan <WLAN-NAME>}

Exports guest registration user data files in the *Comma-Separated Values (CSV)* or *JavaScript Object Notation (JSON)* format.

Use the ‘rfdomain’, ‘wlan’, and ‘time’ options to filter users for a specified RF Domain, WLAN, and/or time period. These are recursive parameters and you can apply all or any of these three filters.

**<DEST-URL>** Configures the destination URL. The files are exported to the specified location. Both IPv4 and IPv6 address formats are supported.

**IPv4 URLs:**
- `tftp://<hostname|IP>[:port]/path/file`
- `ftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`
- `sftp://<user>:<passwd>@<hostname|IP>[:port]/path/file`

**IPv6 URLs:**
- `tftp://<hostname|[IPv6]>[:port]/path/file`
- `ftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file`
- `sftp://<user>:<passwd>@<hostname|[IPv6]>[:port]/path/file`

**rfdomain <DOMAIN-NAME>** Optional. Filters user data based on RF Domain name. Only the filtered data are exported.  
- `<DOMAIN-NAME>` – Specify the RF Domain name.

**wlan <WLAN-NAME>** Optional. Filters user data based on WLAN name. Only the filtered data are exported.  
- `<WLAN-NAME>` – Specify the WLAN name.

**time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all]** Optional. Filters user data for a specified time period. Only the filtered data are exported.  
- 1-Day – Filters and exports previous day’s data  
- 1-Month – Filters and exports previous month’s data  
- 1-Week – Filters and exports previous week’s data  
- 2-Hours – Filters and exports last 2 hours data  
- 30-Mins – Filters and exports last 30 minutes data  
- 5-Hours – Filters and exports last 5 hours data  
- all – Exports the entire database

---

- mobile <MOBILE-NUMBER> – Identifies user by the registered mobile number
- <MOBILE-NUMBER> – Provide the user’s mobile number.
- name <CLIENT-FULL-NAME> – Identifies user by the registered full name
- <CLIENT-FULL-NAME> – Provide the user’s full name.

---

**service guest-registration import format json <SOURCE-URL>**

Imports user data from a specified location.
<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
</table>
| format json | Specifies the file format  
  - json – Imports user data files in the JSON format |
| **<SOURCE-URL>** | Configures the Source URL. The files are imported from the specified location. Both IPv4 and IPv6 address formats are supported.  
  **IPv4 URLs:**  
  - tftp://<hostname>|IP>[:port]/path/file  
  - ftp://<user>:@<hostname>|IP>[:port]/path/file  
  - sftp://<user>:@<hostname>|IP>[:port]/path/file  
  **IPv6 URLs:**  
  - tftp://<hostname>[IPv6]][:port]/path/file  
  - ftp://<user>:@<hostname>[IPv6]][:port]/path/file  
  - sftp://<user>:@<hostname>[IPv6]][:port]/path/file |

| dhcp-lease <INTERFACE-NAME> | Displays DHCP lease information received from the server                                           |
|                          | Optional. Displays DHCP lease information for a specified router interface                         |
|                          | • <INTERFACE-NAME> – Specify the router interface name.                                            |
| on                       | Optional. Displays DHCP lease information for a specified device                                   |
### COMMON COMMANDS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service show diag</td>
<td>Displays diagnostic statistics, such as LED status, fan speed, and sensor temperature.</td>
</tr>
<tr>
<td>service show guest-registration</td>
<td>Displays status of the guest-registration database snapshot related processes (export, import, and restore).</td>
</tr>
<tr>
<td>service show fast-switching</td>
<td>Displays fast switching state (enabled or disabled).</td>
</tr>
<tr>
<td>show</td>
<td>Displays running system statistics based on the parameters passed.</td>
</tr>
<tr>
<td>guest-registration</td>
<td>Displays status of the guest-registration database snapshot related processes (export, import, and restore).</td>
</tr>
<tr>
<td>import-status</td>
<td>Displays the status of the latest import process initiated.</td>
</tr>
<tr>
<td>export-status</td>
<td>Displays the status of the latest export process initiated.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays DHCP lease information for a specified device. If no device is specified, the system displays information for the logged device.</td>
</tr>
</tbody>
</table>

#### Notes:

- To export, import, or restore a guest-registration database, use the `service > guest-registration > [backup|export|import]` command.
- `on <DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

### WiNG 4.X Sysoids
- **RFS4000** – 1.3.6.1.4.1.388.18
- **RFS6000** – 1.3.6.1.4.1.388.16
- **RFS7000** – 1.3.6.1.4.1.388.15

### WiNG 5.X Sysoids
- **RFS4000** – 1.3.6.1.4.1.388.50.1.1.35
- **RFS6000** – 1.3.6.1.4.1.388.50.1.1.36
- **RFS7000** – 1.3.6.1.4.1.388.50.1.1.37

### Command Descriptions

- **service snmp sysoid wing5**
  
  Configures a new `sysObjectID` (sysoid), in the MIB, for devices running WiNG 5.X devices.
  
  When configured, the SNMP manager returns sysoid for WiNG 5.X OS. Hardwares running the WiNG 4.X and WiNG 5.X images have different sysoids. For example, the sysoid for a RFS4000 using the WiNG 4.X image differs from another RFS4000 running the WiNG 5.X image.
  
  This command is applicable only to RFS4000, RFS6000, and RFS7000 platforms, since they have the same sysoid supported in WiNG 4.X and WiNG 5.X.
  
  The WiNG 4.X sysoids are:
  - **RFS4000** – 1.3.6.1.4.1.388.18
  - **RFS6000** – 1.3.6.1.4.1.388.16
  - **RFS7000** – 1.3.6.1.4.1.388.15
  
  The WiNG 5.X sysoids are:
  - **RFS4000** – 1.3.6.1.4.1.388.50.1.1.35
  - **RFS6000** – 1.3.6.1.4.1.388.50.1.1.36
  - **RFS7000** – 1.3.6.1.4.1.388.50.1.1.37

- **service ssm dump-core-snapshot**
  
  Triggers a debug core dump of the SSM module.

- **service syslog test** `{level [{<0-7>|alerts|critical|debugging|emergencies|errors|informational|notifications|warnings}] {on <DEVICE-NAME>}}`  
  
  Sends a test message to the syslog server to confirm server availability.
  
  - **level**
    
    Optional. Sets the logging level. In case syslog server is unreachable, an event is logged based on the logging level defined. This is an optional parameter, and the system configures default settings, if no logging severity level is specified.
    
    - `<0-7>` – Optional. Specify the logging severity level from 0-7. The various levels and their implications are as follows:
      
      - `alerts` – Optional. Immediate action needed (severity=1)
      - `critical` – Optional. Critical conditions (severity=2)
      - `debugging` – Optional. Debugging messages (severity=7)
      - `emergencies` – Optional. System is unusable (severity=0)
      - `errors` – Optional. Error conditions (severity=3)
      - `informational` – Optional. Informational messages (severity=6)
      - `notifications` – Optional. Normal but significant conditions (severity=5)
      - `warnings` – Optional. Warning conditions (severity=4). This is the default setting.

  - **on <DEVICE-NAME>**
    
    Optional. Executes the command on a specified device.
    
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- **service ssm trace pattern <WORD> {on <DEVICE-NAME>}}**
  
  Displays the SSM module trace based on parameters passed.
  
  - **pattern <WORD>**
    
    Configures the pattern to match:
    
    - `<WORD>` – Specify the pattern to match.

- **service wireless client quiet-element [start|stop]**

- **service wireless client trigger-bss-transition mac `<MAC>`**
  **timeout `<0-65535>`**
  **(on `<DEVICE-OR-DOMAIN-NAME>`)**

- **wireless client trigger-bss-transition**
  Sends a 80211v-Wireless Network Management BSS transition request to a client.

- **mac `<MAC>`**
  Specifies the wireless client’s MAC address.

- **timeout `<0-65535>`**
  Specifies the time remaining, for this client, before BSS transition is initiated. In other words on completion of the specified time period, BSS transition is triggered.
  - `<0-65535>` – Specify a time from 0 - 65535 seconds.

- **url `<URL>`**
  Optional. Specifies session termination URL.

### Syntax (Privilege Exec Mode)

```
NOTE: The “service” command of the Priv Exec Mode is the same as the service command in the User Exec Mode. There are a few modifications that have been documented in this section. For the syntax and parameters of the other commands refer to the (User Exec Mode) syntax and parameters sections of this chapter.
```

```
service [block-adopter-config-updates|clear|cli-tables-skin|cluster|copy|
delete|delete-offline-aps|force-send-config|force-update-vm-stats|
guest-registration|load-balancing|locator|mint|pktcap|pm|radio|radius|
request-full-config-from-adopter|restore|set|show|signal|smart-rf|snmp|ssm|
start-shell|syslog|trace|wireless]

service clear crash-info {on <DEVICE-NAME>}

service copy [stats-report|tech-support]
service copy stats-report [global|rf-domain <DOMAIN-NAME>] {<FILE>|<URL>}
service copy tech-support {<FILE>|<URL>}

service delete sessions <SESSION-COOKIES>

service mint [clear|debug-log|expire|flood]
```
service mint [clear [lsp-db|mlcp]|debug-log [flash-and-syslog|flash-only]|
   expire [lsp|spf]|flood [cspn|lsp]]

service pktcap on [bridge|deny|drop|ext-vlan|interface|radio|rim|router|vpn|wireless]
   {acl-name <ACL>, count <1-1000000>, direction [any|inbound|outbound], filter <LINE>,
    hex, rate <1-100>, snap <1-2048>, tcpdump, verbose, write [file|url|tzsp [IP/TZSP-HOSTNAME]]}

service pktcap on interface \(<INTERFACE-NAME>|ge <1-4>|me1|port-channel <1-2-|www1\)
   {acl-name <ACL>, count <1-1000000>,

</tbody>
</table>

- **service clear crash-info** *(on `<DEVICE-NAME>`)*
  - Clears all crash files
  - Optional. Clears crash files on a specified device. These crash files are core, panic, and AP dump
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- **service delete sessions** `<SESSION-COOKIES>`
  - Deletes session cookies
  - `<SESSION-COOKIES>` – Provide a list of cookies to delete.

- **service mint** `[clear [lsp-dp|mlcp]] [debug-log [flash-and-syslog|flash-only]] [expire [lsp|spf]] [flood [csnp|lsp]]`
  - Enables MiNT protocol management (clears LSP database, enables debug logging, enables running silence etc.)

- **clear [lsp-dp|mlcp]**
  - Clears LSP database and MiNT Link Control Protocol (MLCP) links
  - `<lsp-dp>` – Clears MiNT Label Switched Path (LSP) database
  - `<mlcp>` – Clears MLCP links

- **debug-log [flash-and-syslog|flash-only]**
  - Enables debug message logging
  - `<flash-and-syslog>` – Logs debug messages to the flash and syslog files
  - `<flash-only>` – Logs debug messages to the flash file only

- **expire [lsp|spf]**
  - Forces expiration of LSP and recalculation of Shortest Path First (SPF)
  - `<lsp>` – Forces expiration of LSP
  - `<spf>` – Forces recalculation of SPF

- **flood [csnp|lsp]**
  - Floods control packets
  - `<csnp>` – Floods our Complete Sequence Number Packets (CSNP)
  - `<lsp>` – Floods our LSP

- **service pm stop** *(on `<DEVICE-NAME>`)*
  - Stops the Process Monitor (PM)
  - Optional. Stops the PM on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.
<table>
<thead>
<tr>

</table>
  icmp6|i|j|l|ldp|m|mint|not|port|priority|radio|rssi|src|stp|tcp|tcp6|udp|udp6|vlan|wlan]` | Optional. Filters packets based on the option selected (must be used as a last option) |
  - `<LINE>` – Defines user defined packet capture filter |
  - `arp` – Matches ARP packets |
  - `capwap` – Matches CAPWAP packets |
  - `cdp` – Matches CDP packets |
  - `dot11` – Matches 802.11 packets |
  - `dropreason` – Matches packet drop reason |
  - `dst` – Matches IP destination |
  - `ether` – Matches Ethernet packets |
  - `failed` – Matches failed 802.11 transmitted frames |
  - `host` – Matches host destination |
  - `icmp` – Matches ICMP packets |
  - `icmp6` – Matches ICMPv6 frames |
  - `ip` – Matches IPV4 packets |
  - `ipv6` – Matches IPV6 packets |
  - `l2` – Matches L2 header |
  - `l3` – Matches L3 header |
  - `l4` – Matches L4 header |
  - `lldp` – Matches LLDP packets |
  - `rssi` – Matches Rssi packets |
  - `src` – Matches source |
  - `stp` – Matches STP packets |
  - `tcp` – Matches TCP packets |
  - `tcp6` – Matches TCPv6 packets |
  - `udp` – Matches UDP packets |
  - `udp6` – Matches UDPv6 packets |
  - `vlan` – Matches VLAN packets |
  - `wlan` – Matches WLAN packets |

Contd..
- mint – Matches MiNT packets
- net – Matches IP in subnet
- not – Filters out any packet that matches the filter criteria (For example, if not TCP is used, all tcp packets are filtered out)
- port – Matches TCP or UDP port
- priority – Matches packet priority
- radio – Matches radio
- rssi – Matches Received Signal Strength Indication (RSSI) of received radio signals
- src – Matches IP source
- stp – Matches STP packets
- tcp – Matches TCP packets
- tcp6 – Matches TCP over IPv6 packets
- udp – Matches UDP packets
- udp6 – Matches UDP over IPv6 packets
- vlan – Matches VLAN
- wlan – Matches WLAN

- `last-passwd` | Displays the last password used to enter shell |
service signal [abort <PROCESS-NAME>|kill <PROCESS-NAME>]

**signal** Sends a signal to a process
- tech-support – Copies extensive system information useful for troubleshooting

**abort** Sends an abort signal to a process, and forces it to dump to core
- <PROCESS-NAME> – Specify the process name.

**kill** Sends a kill signal to a process, and forces it to terminate without a core
- <PROCESS-NAME> – Specify the process name.

**service start-shell**

**start-shell** Provides shell access

**service trace <PROCESS-NAME> {summary}**

**trace** Traces a process for system calls and signals

**<PROCESS-NAME>** Specifies the process name

**summary** Optional. Generates summary report of the specified process

**Syntax (Privilege Exec Mode: NX9000, NX9500, and NX9510)**

```
service
```

The following service commands are specific to the NX9000, NX9500, and NX9510 series service platforms:

```
service copy analytics-support [<FILE>|<URL>]
```

**Parameters (Privilege Exec Mode: NX9000, NX9500, and NX9510)**

```
service
```

- service copy analytics-support [<FILE>|<URL>]

**copy analytics-support** Enables copying of analytics information to a specified. Use one of the following options to specify the file:

**Note:** This information is useful to troubleshoot issues by the Technical Support team.

**<FILE>** Specify the file name and location using one of the following formats:
- usb1:/path/file
- usb2:/path/file

**<URL>** Specify the location URL to copy file. Both IPv4 and IPv6 formats are supported.
- tftp://<hostname|IPv4/IPv6>[:port]/path/file
- ftp://<user>:<passwd>@<hostname|IPv4/IPv6>[:port]/path/file
- sftp://<user>:<passwd>@<hostname|IPv4/IPv6>[:port]/path/file
Usage Guidelines
The NX9500 and NX9510 model service platforms (NOC) provide granular and robust analytic reporting for a RFS4000, RFS6000, RFS7000, NX45XX, or NX65XX device managed network. The data analyzed is collected at intervals specified by the administrator.

To enable data analytics, procure and apply a separate hot spare analytics license at the NOC. The license restricts the number of access point streams processed at the NOC or forwarded to partner systems for further processing. The analytics feature can be turned on at select APs by enabling them in configuration. This way the customer can enable analytics on a select set of APs and not the entire system as long as the number of APs on which it is enabled is less than or equal to the total number of AP analytics licenses available at the NOC controller.

In an NOC managed network, the analytics engine parses and processes Smart RF events as they are received. The analytics engine parses the new channel and power information from the Smart RF event, as opposed to retrieving the event from the devices themselves.

Syntax (Global Config Mode)
```
service
service [set|show cli]
```
```
service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100]|virtual-machine-history <10-200>] {on <DEVICE-NAME>}
```
```
service show cli
```

Parameters (Global Config Mode)
- service set [command-history <10-300>|upgrade-history <10-100>|reboot-history <10-100]|virtual-machine-history <10-200>] {on <DEVICE-NAME>}
- service show cli

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>set</td>
<td>Sets the size of history files</td>
</tr>
<tr>
<td>command-history &lt;10-300&gt;</td>
<td>Sets the size of the command history file</td>
</tr>
<tr>
<td>upgrade-history &lt;10-100&gt;</td>
<td>Sets the size of the upgrade history file</td>
</tr>
<tr>
<td>reboot-history &lt;10-100&gt;</td>
<td>Sets the size of the reboot history file</td>
</tr>
<tr>
<td>virtual-machine-history &lt;10-200&gt;</td>
<td>Sets the size of the virtual-machine history file</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Sets the size of history files on a specified device</td>
</tr>
<tr>
<td></td>
<td>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

Note: This command is applicable only to the NX45XX, NX65XX, NX9500, and NX9510 series service platforms. Use the no > service > set > virtual-machine-history > {on <DEVICE-NAME>} to revert the history file size to 100.

| GEN |
| 16-L2P |
| 0 |
```
In the preceding example,

- The meshpoint name is **mesh_root**
- The device on which the command is executed is **ROOT1-ap81xx-71174C**
- The vertical ZONE column represents meshpoint modules. For example, **3-ND** presents the Neighbor Discovery module.
- The SUBZONE 0 to 7 represents the available processes for each of the zonal modules.
- Debugging is disabled for all modules for the mesh-root meshpoint. A value of 0 (Zero) represents debugging disabled.

To enable meshpoint module debugging, specify the module number and the process number separated by a period (.). And then specify the debugging level from 0 - 7.

ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 3.2 7

In the preceding command,

- The meshpoint module number provided is **3** (ND)
- The process number provided is **2** (RX - Received signals from neighbors)
- The debugging level provided is **7** (highest level - warning)

ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C

</table>

In the preceding example, level 7 debugging has been enabled only for the ND module’s received signals. Note that debugging for all other modules and processes are still disabled.

To disable debugging for all modules, specify 0 (zero) in the command. For example:

ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 0
To enable debugging for all modules, specify the debugging level number. For example:

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C 5
```

```
ROOT1-ap81xx-71174C#service wireless meshpoint zl mesh_root on ROOT1-ap81xx-71174C
```

ROOT1-ap81xx-71174C#
5.1.8 show

Common Commands

Displays specified system component settings. There are a number of ways to invoke the show command:

- When invoked without any arguments, it displays information about the current context. If the current context contains instances, the show command (usually) displays a list of these instances.
- When invoked with the display parameter, it displays information about that component.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show <PARAMETERS>
```

Parameters

- `show <PARAMETERS>`

Examples

```
rfs7000-37FABE#show ?
  adoption                    Display information related to adoption to wireless controller
  bonjour                    Bonjour Gateway related commands
  boot                       Display boot configuration.
  captive-portal            Captive portal commands
  captive-portal-page-upload Capture portal advanced page upload
  cdp                        Cisco Discovery Protocol
  classify-url               Query the category of an URL
  clock                      Display system clock
  cluster                    Cluster Protocol
  cmp-factory-certs          Display the CMP certificate status
  commands                   Show command lists
  context                    Information about current context
  critical-resources         Critical Resources
  crypto                     Encryption related commands
  debug                      Debugging functions
  debugging                  Debugging functions
  device-upgrade             Device Upgrade
  dot1x                      802.1X
  dpi                        Deep Packet Inspection
  environmental-sensor       Display Environmental Sensor Module status
  event-history              Display event history
  event-system-policy        Display event system policy
  ex3500                     EX3500 device details
  extdev                     External device (T5, Ex3500..)
  file                       Display filesystem information
  file-sync                  File sync between controller and adoptees
  firewall                   Wireless Firewall
  global                     Global-level information
  gre                        Show gre tunnel info
  interface                  Interface Configuration/Statistics commands
  ip                         Internet Protocol (IP)
  ip-access-list             IP ACL
```
ipv6                        Internet Protocol version 6 (IPv6)
ipv6-access-list            IPV6 ACL
l2tpv3                      L2TPv3 information
ldap-agent                  LDAP Agent Configuration
licenses                    Show installed licenses and usage
lldp                        Link Layer Discovery Protocol
logging                     Show logging information
mac-access-list             MAC Access list
mac-address-table          Display MAC address table
mac-auth                    MAC authentication
mac-auth-clients            MAC authenticated clients
mint                        MiNT protocol
ntp                         Network time protocol
password-encryption        Password encryption
pppoe-client                PPP Over Ethernet client
privilege                   Show current privilege level
radius                      RADIUS statistics commands
reload                      Scheduled reload information
remote-debug                Show details of remote debug sessions
rf-domain-manager           Show RF Domain Manager selection details
role                        Role based firewall
route-maps                  Display Route Map Statistics
rtls                        RTLS Statistics
running-config             Current operating configuration
session-changes            Configuration changes made in this session
session-config             This session configuration
sessions                    Display CLI sessions
site-config-diff            Difference between site configuration on the NOC
                            and actual site configuration
smart-rf                    Smart-RF Management Commands
spanning-tree               Display spanning tree information
startup-config              Startup configuration
t5                          T5 details
terminal                    Display terminal configuration parameters
timezone                    The timezone
traffic-shape               Display traffic shaping
upgrade-status              Display last image upgrade status
version                     Display software & hardware version
vrrp                        VRRP protocol
web-filter                  Web filter
what                        Perform global search
wireless                    Wireless commands
wwan                        Display wireless WAN Status

NOTE: For more information on the show command, see
Chapter 6, SHOW COMMANDS.
5.1.9 write

Common Commands

Writes the system running configuration to memory or terminal

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
write [memory|terminal]

Parameters
- write [memory|terminal]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>memory</td>
<td>Writes to the <em>non-volatile</em> (NV) memory</td>
</tr>
<tr>
<td>terminal</td>
<td>Writes to the terminal</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE>write memory
[OK]
rfs7000-37FABE>
Show commands display configuration settings or statistical information. Use this command to view the current running configuration as well as the start-up configuration. The show command also displays the current context’s configuration.

This chapter describes the ‘show’ CLI commands used in the USER EXEC, PRIV EXEC, and GLOBAL CONFIG modes. Commands entered in either USER EXEC mode or PRIV EXEC mode are referred to as EXEC mode commands. If a user or privilege is not specified, the referenced command can be entered in either mode.

This chapter also describes the ‘show’ commands in the ‘GLOBAL CONFIG’ mode. The commands can be entered in all three modes, except commands like file, IP access list statistics, MAC access list statistics, and upgrade statistics, which cannot be entered in the USER EXEC mode.

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
6.1 show commands

The following table summarizes show commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>show</td>
<td>Displays settings for the specified system component</td>
<td>page 6-6</td>
</tr>
<tr>
<td>adoption</td>
<td>Displays information related to adoption</td>
<td>page 6-12</td>
</tr>
<tr>
<td>boot</td>
<td>Displays a device boot configuration</td>
<td>page 6-15</td>
</tr>
<tr>
<td>bonjour</td>
<td>Displays the configured Bonjour services available on local and remote sites</td>
<td>page 6-16</td>
</tr>
<tr>
<td>captive-portal</td>
<td>Displays WLAN hotspot functions</td>
<td>page 6-17</td>
</tr>
<tr>
<td>captive-portal-page-upload</td>
<td>Displays captive portal page related information</td>
<td>page 6-19</td>
</tr>
<tr>
<td>cdp</td>
<td>Displays a Cisco Discovery Protocol (CDP) neighbor table</td>
<td>page 6-20</td>
</tr>
<tr>
<td>classify-url</td>
<td>Queries a specified global data center or a pre-configured classification server for the category of a specified URL.</td>
<td>page 6-22</td>
</tr>
<tr>
<td>clock</td>
<td>Displays the software system clock</td>
<td>page 6-23</td>
</tr>
<tr>
<td>cluster</td>
<td>Displays cluster commands</td>
<td>page 6-24</td>
</tr>
<tr>
<td>cmp-factory-certs</td>
<td>Displays factory installed CMP certificates</td>
<td>page 6-25</td>
</tr>
<tr>
<td>commands</td>
<td>Displays command list</td>
<td>page 6-26</td>
</tr>
<tr>
<td>context</td>
<td>Displays information about the current context</td>
<td>page 6-27</td>
</tr>
<tr>
<td>critical-resources</td>
<td>Displays critical resource information</td>
<td>page 6-28</td>

<tr>
<td>crypto</td>
<td>Displays encryption mode information</td>
<td>page 6-29</td>
</tr>
<tr>
<td>database</td>
<td>Displays database-related statistics and status</td>
<td>page 6-32</td>
</tr>
<tr>
<td>device-upgrade</td>
<td>Displays device firmware upgradation information for devices adopted by a wireless controller or access point</td>
<td>page 6-33</td>
</tr>
<tr>
<td>dot1x</td>
<td>Displays dot1x information on interfaces</td>
<td>page 6-36</td>
</tr>
<tr>
<td>dpi</td>
<td>Displays statistics for all configured and canned applications</td>
<td>page 6-38</td>
</tr>
<tr>
<td>environmental-sensor</td>
<td>Displays environmental sensor's historical data (applicable only to AP8132)</td>
<td>page 6-41</td>
</tr>
<tr>
<td>event-history</td>
<td>Displays event history</td>
<td>page 6-44</td>
</tr>
<tr>
<td>event-system-policy</td>
<td>Displays event system policy configuration information</td>
<td>page 6-45</td>
</tr>
<tr>
<td>ex3500</td>
<td>Displays EX3500-related statistical data</td>
<td>page 6-46</td>
</tr>
<tr>
<td>extdev</td>
<td>Displays external device (T5 or EX3500) configuration error history</td>
<td>page 6-49</td>
</tr>
</tbody>
</table>
### Table 6.1 Show Commands

6.1.1 show

show commands

The show command displays following information:

- A device's current configuration
- A device's start-up configuration
- A device's current context configuration, such as profiles and policies

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show <PARAMETERS>

Parameters

- show <PARAMETERS>

<table>
<thead>
<tr>
<th>show &lt;PARAMETERS&gt;</th>
<th>The show command displays configuration details based on the configuration mode, in which the command is executed, and the parameters passed. For example, when executed in the AAA policy configuration mode, it displays the logged AAA policy’s current settings. The examples below show the configuration parameters that can be viewed in the User Executable, Priv Executable, and Global Configurable modes.</th>
</tr>
</thead>
</table>

Examples

The following examples list the show commands in the User Exec, Priv Exec, and Global Config modes:

**GLOBAL CONFIG Mode**

<DEVICE>(config)#show ?

- adoption Display information related to adoption to wireless controller
- bonjour Bonjour Gateway related commands
- boot Display boot configuration.
- captive-portal Captive portal commands
- captive-portal-page-upload Captive portal advanced page upload
- cdp Cisco Discovery Protocol
- classify-url Query the category of an URL
- clock Display system clock
- cluster Cluster Protocol
- cmp-factory-certs Display the CMP certificate status
- commands Show command lists
- context Information about current context
- critical-resources Critical Resources
- crypto Encryption related commands
- database Database
- debug Debugging functions
- debugging Debugging functions
- device-upgrade Device Upgrade
- dot1x 802.1X
- dpi Deep Packet Inspection
- environmental-sensor Display Environmental Sensor Module status
- event-history Display event history
- event-system-policy Display event system policy
- ex3500 EX3500 device details
- extdev External device (T5, EX3500..)
- file Display filesystem information
file-sync                   File sync between controller and adoptees
firewall                    Wireless Firewall
global                      Global-level information
gre                         Displays gre related information
guest-registration         Guest registration commands
interface                  Interface Configuration/Statistics commands
ip                          Internet Protocol (IP)
ip-access-list             IP ACL
ipv6                       Internet Protocol version 6 (IPv6)
ipv6-access-list           IPv6 ACL
l2tpv3                      L2TPv3 information
ldap-agent                  LDAP Agent Configuration
licenses                   Show installed licenses and usage
lldp                        Link Layer Discovery Protocol
logging                    Show logging information
mac-address-table          Display MAC address table
mac-auth                    MAC authentication
mac-auth-clients            MAC authenticated clients
mint                        MiNT protocol
mirroring                   Show mirroring sessions
ntp                         Network time protocol
password-encryption        Password encryption
pppoe-client                PPP Over Ethernet client
privilege                   Show current privilege level
radius                      RADIUS statistics commands
raid                        Show RAID status
reload                      Scheduled reload information
remote-debug                Show details of remote debug sessions
rf-domain-manager          Show RF Domain Manager selection details
role                        Role based firewall
route-maps                  Display Route Map Statistics
rtl5                       RTLS Statistics
running-config             Current operating configuration
session-changes            Configuration changes made in this session
session-config             This session configuration
sessions                   Display CLI sessions
site-config-diff           Difference between site configuration on the NOC and actual site configuration
slot                        Expansion slots stats
smart-cache                 Content caching
smart-rf                    Smart-RF Management Commands
spanning-tree               Display spanning tree information
startup-config             Startup configuration
t5                          T5 details
terminal                   Display terminal configuration parameters
timezone                   The timezone
traffic-shape              Display traffic shaping
upgrade-status             Display last image upgrade status
version                    Display software & hardware version
virtual-machine            Virtual Machine
vrrp                       VRRP protocol
web-filter                 Web filter
what                       Perform global search
wireless                   Wireless commands
wwan                       Display wireless WAN Status

SHOW COMMANDS 6 - 11
6.1.2 adoption

Displays adoption related information, and is common to the User Exec, Priv Exec, and Global Config modes.

In an hierarchically managed (HM) network devices are deployed in two levels. The first level consists of the Network Operations Center (NOC) controllers. The second level consists of the site controllers that can be grouped to form clusters. The NOC controllers adopt and manage the site controllers. Access points within the network are adopted and managed by the site controllers. The adopted devices (access points and second-level controllers) are referred to as the adoptee. The devices adopting the adoptee are the ‘adopters’.

Use this command to confirm if a device is an adoptee or an adopter. This command also allows you to determine the devices adopted by an adopter device.

NOTE: A NOC controller’s capacity is equal to or higher than a site controller’s capacity. The following devices can be deployed at NOC and sites:

- NOC controller — RFS6000, RFS7000, NX65XX, NX9000, NX9510, or NX9600.
- Site controller — NX45XX, NX65XX, RFS7000, RFS6000, or RFS4000.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show adoption [config-errors|controllers|history|info|log|offline|pending|status|timeline]
show adoption offline
show adoption config-errors <DEVICE-NAME>
show adoption log [adoptee|adopter {<MAC>}] {on <DEVICE-NAME>}
show adoption [controllers|history|info|pending|status|timeline] {on <DEVICE-NAME>}
```

Parameters

- **show adoption offline**
  - Displays adoption related information. It also displays configuration errors.
- **show adoption config-errors <DEVICE-NAME>**
  - Displays configuration errors for a specified adopted device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.
- **show adoption log [adoptee|adopter {<MAC>}] {on <DEVICE-NAME>]**
  - Displays adoption related information. It also displays configuration errors.
<table>
<thead>
<tr>
<th><strong>LOG COMMAND</strong></th>
<th><strong>DESCRIPTION</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>show adoption [history</td>
<td>controllers</td>
</tr>
<tr>
<td>adoption</td>
<td>Displays adoption history of the logged device and its adopted access points</td>
</tr>
<tr>
<td>controllers</td>
<td>Displays information about adopted controllers. This is applicable in a Hierarchically managed network, where site controllers are adopted by the NOC controllers.</td>
</tr>
<tr>
<td>info</td>
<td>Displays adopted device information</td>
</tr>
<tr>
<td>pending</td>
<td>Displays information for devices pending adoption</td>
</tr>
<tr>
<td>status</td>
<td>Displays adoption status for logged devices</td>
</tr>
<tr>
<td>timeline</td>
<td>Displays the logged device’s adoption timeline. It also shows the adoption time for logged device’s adopted APs. To view the adoption timeline of a specific device, use the on &lt;device-name&gt; option to specify the device.</td>
</tr>
</tbody>
</table>

**on <DEVICE-NAME>**

The following keywords are common to all of the above parameters:

- **on <DEVICE-NAME>** – Optional. Displays a device’s adoption information, based on the parameter passed.
- **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

**Note:** A wireless controller or service platform cannot be configured as an adoptee and an adopter simultaneously. In other words, an adopted wireless controller or service platform cannot be configured to adopt another device and vice versa.
Examples

### 6.1.3 `boot`

*show commands*

Displays a device’s boot configuration. Use this command to view the primary and secondary image details, such as Build Date, Install Date, and Version. This command also displays the current boot and next boot information.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
show boot {on <DEVICE-NAME>}
```

#### Parameters

- **show boot {on <DEVICE-NAME>}**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boot</td>
<td>Displays primary and secondary image boot configuration details (build date, install date, version, and the image used to boot the current session)</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays a specified device’s boot configuration</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Note:** Use the `on <DEVICE-NAME>` option to view a remote device’s boot configuration.

#### Examples

```
rfs4000-229D58(config)#show boot
--------------------------------------------------------------------------------
<table>
<thead>
<tr>
<th>IMAGE</th>
<th>BUILD DATE</th>
<th>INSTALL DATE</th>
<th>VERSION</th>

rfs4000-229D58(config)#
```
6.1.4 bonjour

Displays the configured Bonjour services available on local and remote sites

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show bonjour services {on <DEVICE-NAME>}
```

**Parameters**

- **show bonjour services {on <DEVICE-NAME>}
  
  - **on <DEVICE-NAME>** Optional. Displays Bonjour services available on a specified device
  
  - **<DEVICE-NAME>** — Specify the name of the AP, wireless controller, or service platform.

**Examples**

```
rfs7000-37FABE#show bonjour services on ap7131-11E6C4
---------------------------------------------------------------------------------------

---------------------------------------------------------------------------------------
rfs7000-37FABE#```

### 6.1.5 captive-portal

Display WLAN captive portal information. Use this command to view a configured captive portal’s client information.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
show captive-portal sessions {include-ipv6|on <DEVICE-OR-DOMAIN-NAME>|statistics}
```

#### Parameters
- **include-ipv6**
  - Optional. Includes IPv6 address (if known) of captive portal clients
  - **Note:** By default the system only displays IPv4 addresses. The include-ipv6 parameter includes IPv6 address (if known) of each client.

- **statistics**
  - Optional. Displays statistical information regarding client sessions

- **on <DEVICE-OR-DOMAIN-NAME>**
  - Optional. Displays active captive portal session details on a specified device or RF Domain.
  - **<DEVICE-OR-DOMAIN-NAME>** – Specify the name of the AP, wireless controller, service platform, or RF Domain.

- **filter**
  - Optional. Defines additional filters. Use one of the following options: captive-portal, ip, ipv6, state, vlan, or wlan.

- **captive-portal [CAPTIVE-PORTAL]|not <CAPTIVE-PORTAL>**
  - Optional. Displays captive portal client and client session information, based on the captive portal name passed
  - **<CAPTIVE-PORTAL>** – Specify the captive portal name. Displays client details for the specified captive portal.
  - **not <CAPTIVE-PORTAL>** – Inverts the match selection. Displays client details for all captive portals other than the specified captive portal.

- **ip [IPv4]|not <IPv4>**
  - Optional. Displays captive portal client/client sessions information, based on the IPv4 address passed
  - **<IPv4>** – Specify the client’s IPv4 address. Displays information of the client identified by the <IPv4> parameter
  - **not <IPv4>** – Inverts the match selection. Displays client details for all clients other than the one identified by the <IPv4> parameter.
### Examples

```
rfs4000-229D58#show captive-portal sessions
CLIENT               IPv4     CAPTIVE-PORTAL   WLAN/PORT    VLAN  STATE SESSION  TIME
---------------------------------------------------------------------------------------
00-26-55-F4-5F-79  192.168.3.99 cappo     rfs4000-229D58:ge2    400     Success     23:58:35
---------------------------------------------------------------------------------------
```

Total number of captive portal sessions displayed: 1

```
rfs4000-229D58#
```
6.1.6 captive-portal-page-upload

Displays captive portal page information, such as upload history, upload status, and page file download status

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show captive-portal-page-upload [history|load-image-status|status]
show captive-portal-page-upload load-image-status
show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}
show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>|<RF-DOMAIN-MANAGER>]} 

Parameters

- show captive-portal-page-upload load-image-status

<table>
<thead>
<tr>
<th>load-image-status</th>
<th>Displays captive portal advanced page file download status on the logged device</th>
</tr>
</thead>
</table>

- show captive-portal-page-upload history {on <RF-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>history {on &lt;RF-DOMAIN-NAME&gt;}</th>
<th>Displays captive portal page upload history</th>
</tr>
</thead>
<tbody>
<tr>
<td>{on &lt;RF-DOMAIN-NAME&gt;}</td>
<td>on &lt;RF-DOMAIN-NAME&gt; – Optional. Displays captive portal page upload history within a specified RF Domain. Specify the RF Domain name.</td>
</tr>
</tbody>
</table>

- show captive-portal-page-upload status {on [<RF-DOMAIN-NAME>|<RF-DOMAIN-MANAGER>]}

| status {on <RF-DOMAIN-NAME>|<RF-DOMAIN-MANAGER>} | Displays captive portal page upload status |
|-------------------------------------------------|------------------------------------------|
| {on <RF-DOMAIN-NAME>} | on <RF-DOMAIN-NAME> – Optional. Displays captive portal page upload status within a specified RF Domain. Specify the RF Domain name. |
| on <RF-DOMAIN-MANAGER> | on <RF-DOMAIN-MANAGER> – Optional. Displays captive portal page upload status for a specified RF Domain Manager. Specify the RF Domain Manager name. |

Examples

rfs7000-37FABE>show captive-portal-page-upload status
Number of APs currently being uploaded : 0
Number of APs waiting in queue to be uploaded : 0

rfs7000-37FABE>show captive-portal-page-upload load-image-status
No captive portal advanced page file download is in progress

rfs7000-37FABE>show captive-portal-page-upload history
No upload history is present
rfs7000-37FABE>
6.1.7 cdp

show commands

Displays the Cisco Discovery Protocol (CDP) neighbor table

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522,
  AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000,
  NX9500, NX9510, NX9600

Syntax

show cdp [neighbors/report] {detail {on <DEVICE-NAME>}|on <DEVICE-NAME>}

Parameters

- show cdp [neighbors/report] {detail {on <DEVICE-NAME>}|on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdp [neighbors/report]</td>
<td>Displays CDP neighbors table or aggregated CDP neighbors table</td>
</tr>
<tr>
<td>detail {on &lt;DEVICE-NAME&gt;}</td>
<td>Optional. Displays detailed CDP neighbors table or aggregated CDP neighbors table</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays table details on a specified device</td>
</tr>
</tbody>
</table>

Examples

The following example shows detailed CDP neighbors table:

```

6.1.8 classify-url

show commands

Displays a specified URL's category. Use this command to query the category of a specific URL. The query is sent to a configured classification server. This option is available only if a valid URL filter license is available.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]

Parameters
- show classify-url [<URL-TO-QUERY>|datacenter <URL-TO-QUERY>]

<table>
<thead>
<tr>
<th>classify-url</th>
<th>Queries the category of a specified URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;URL-TO-QUERY&gt;</td>
<td>Specify the URL to query. The query is sent to the configured classification server.</td>
</tr>
<tr>
<td>datacenter &lt;URL-TO-QUERY&gt;</td>

nx4500-5CFA2B#
6.1.9 clock

Displays a selected system's clock

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
show clock {on <DEVICE-NAME>}

Parameters

- show clock {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>on &lt;DEVICE-NAME&gt;</th>
<th>Optional. Displays system clock on a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config)#show clock
2015-06-05 05:48:46 UTC
rfs7000-37FABE(config)#
6.1.10 cluster

> show commands

Displays cluster information (cluster configuration parameters, members, status etc.)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show cluster [configuration|members|status]
show cluster [configuration|members {detail}|status]

Parameters

- show cluster [configuration|members {detail}|status]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Displays cluster configuration parameters</td>
</tr>
<tr>
<td>members (detail)</td>
<td>Displays cluster members configured on the logged device</td>
</tr>
<tr>
<td>status</td>
<td>Displays cluster status</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config)#show cluster configuration

Name    : TechPubsLan
Configured Mode : Active
Master Priority  : 128
Force configured state : Disabled
Force configured state delay : 5 minutes
Handle STP       : Disabled
Radius Counter DB Sync Time : 5 minutes

rfs7000-37FABE(config)#show cluster members detail

<table>
<thead>
<tr>
<th>ID</th>
<th>MAC</th>
<th>MODE</th>
<th>AP COUNT</th>
<th>AAP COUNT</th>
<th>AP LICENSE</th>
<th>AAP LICENSE</th>
<th>VERSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>19.6D.CD.4B</td>
<td>B4-C7-99-C6-CD-4B</td>
<td>Active</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>5.8.0.0-034B</td>
</tr>
</tbody>
</table>

rfs7000-37FABE(config)#show cluster status

Cluster Runtime Information
Protocol version : 1
Cluster operational state : active
AP license       : 0
AAP license      : 0
AP count         : 0
AAP count        : 0
Max AP adoption capacity : 1024
Number of connected member(s) : 0
rfs7000-37FABE(config)#
6.1.11  **cmp-factory-certs**

*show commands*

Displays factory installed CMP certificates

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show cmp-factory-certs {all}
```

**Parameters**

- **show cmp-factory-certs {all}**

| show cmp-factory-certs {all} | Displays factory installed CMP certificates on the logged device. Optionally use the 'all' keyword to view certificate details. |

**Examples**

nx9500-6C8809>show cmp-factory-certs
No CMP factory certificate exist
nx9500-6C8809>
### 6.1.12 commands

**Show Commands**

Displays commands available for the current mode

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show commands
```

**Parameters**

None

**Examples**

```bash
rfs4000-229D58(config)#show commands
   help
   help search WORD (|detailed|only-show|skip-show|skip-no)
   show commands
   show adoption log adoptee (| (on DEVICE-NAME))
   show adoption log adopter (| mac AA-BB-CC-DD-EE-FF) (| (on DEVICE-NAME))
   show adoption info (| (on DEVICE-NAME))
   show adoption status (| (on DEVICE-NAME))
   show adoption config-errors DEVICE-NAME
   show adoption offline
   show adoption pending (| (on DEVICE-NAME))
   show adoption history (| (on DEVICE-NAME))
   show debugging (| (on DEVICE-OR-DOMAIN-NAME))
   show debugging cfdg
   show debugging fib (| (on DEVICE-NAME))
   show debugging adoption (| (on DEVICE-OR-DOMAIN-NAME))
   show debugging wireless (| (on DEVICE-OR-DOMAIN-NAME))
   show debugging snmp (| (on DEVICE-NAME))
   show debugging ssm (| (on DEVICE-NAME))
   show debugging voice (| (on DEVICE-OR-DOMAIN-NAME))
   show debugging captive-portal (| (on DEVICE-OR-DOMAIN-NAME))
   show debugging dhcpsvr (| (on DEVICE-NAME))
   show debugging role (| (on DEVICE-OR-DOMAIN-NAME))
   show debugging dot1x (| (on DEVICE-NAME))
   --More--
```

```bash
nx4500-5CFA2B(config)#show commands
   help
   help search WORD (|detailed|only-show|skip-show|skip-no)
   show commands
   show adoption log adoptee (| (on DEVICE-NAME))
   show adoption log adopter (| mac AA-BB-CC-DD-EE-FF) (| (on DEVICE-NAME))

   show adoption history (| (on DEVICE-NAME))
   show debugging (| (on DEVICE-OR-DOMAIN-NAME))
   show debugging cfdg
   --More--
nx4500-5CFA2B(config)#
```
6.1.13 context

- **show commands**

Displays the current context details

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show context {include-factory|session-config {include-factory}}
```

**Parameters**

- **show context {include-factory|session-config {include-factory}}**

<table>
<thead>
<tr>
<th>include-factory</th>
<th>Optional. Includes factory defaults</th>
</tr>
</thead>
<tbody>
<tr>
<td>session-config</td>
<td>Optional. Displays running system information in the current context</td>
</tr>
<tr>
<td>{include-factory}</td>
<td>• include-factory – Optional. Includes factory defaults</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config)#show context
!

--More--
rfs4000-229D58(config)#
```
6.1.14 **critical-resources**

- **show commands**

Displays critical resource information. Critical resources are resources vital to the network.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show critical-resources {on <DEVICE-NAME>}
```

**Parameters**

- **show critical-resources {on <DEVICE-NAME>}**

<table>
<thead>
<tr>
<th>critical-resources</th>
<th>Displays critical resources information</th>
</tr>
</thead>
<tbody>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays critical resource information on a specified device</td>
</tr>
<tr>
<td></td>
<td>&lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config)#show critical-resources

CRITICAL RESOURCE IP        VLAN          PING-MODE            STATE
------------------------------------------------------------------------
172.168.1.103                1             arp-icmp             up
------------------------------------------------------------------------
rfs4000-229D58(config)#
```
6.1.15 crypto

show commands

Displays encryption mode information

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show crypto [cmp|ike|ipsec|key|pki]
show crypto cmp request status
show crypto ike sa {detail|on|peer|version} {on <DEVICE-NAME>}
show crypto ike sa {detail|peer <IP>} {on <DEVICE-NAME>}
show crypto ike sa {version [1|2]} {peer <IP>} {(on <DEVICE-NAME>)}
show crypto ipsec sa {detail|on|peer} {on <DEVICE-NAME>}
show crypto ipsec sa {detail|peer <IP>} {on <DEVICE-NAME>}
show crypto ipsec sa {version [1|2]} {peer <IP>} {(on <DEVICE-NAME>)}
show crypto key rsa {on|public-key-detail} {on <DEVICE-NAME>}
show crypto key rsa {public-key-detail} {(on <DEVICE-NAME>)}
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all|on} {on <DEVICE-NAME>}
show crypto pki trustpoints {<TRUSTPOINT-NAME>|all} {(on <DEVICE-NAME>)}
```

**Parameters**

- **show crypto cmp request status**

```
crypto cmp request status Displays current status of in-progress certificate management protocol (CMP) requests

Note: For more information, see Chapter 29, CRYPTO-CMP-POLICY.
```

- **show crypto ike sa {detail|on|peer <IP>} {on <DEVICE-NAME>}**

```
crypto ike sa Displays Internet Key Exchange (IKE) security association (SA) statistics

peer <IP> Optional. Displays IKE SA statistics for a specified peer

on <DEVICE-NAME> Optional. Displays IKE SA statistics on a specified device
```

- **show crypto ike sa {version [1|2]} {peer <IP>} {(on <DEVICE-NAME>)}**

```
crypto ike sa Displays IKE SA details

version [1|2] Optional. Displays IKE SA version statistics

- 1 – Displays IKEv1 statistics

- 2 – Displays IKEv2 statistics
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show crypto ipsec sa {detail} {on &lt;DEVICE-NAME&gt;}</td>
<td>Displays IPSec SA statistics. The IPSec encryption authenticates and encrypts each IP packet in a communication session.</td>
</tr>
<tr>
<td>crypto ipsec sa</td>
<td>Optional. Displays IPSec SA statistics. The IPSec encryption authenticates and encrypts each IP packet in a communication session.</td>

nx9510-6C8A5C#
6.1.17 device-upgrade

Displays device firmware upgradation information for devices adopted by a wireless controller or access point

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show device-upgrade [history|load-image-status|status|versions]

show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status]
    versions {on <DEVICE-OR-DOMAIN-NAME>}

show device-upgrade status {on [<DOMAIN-NAME>|rf-domain-manager]}
    summary {on <DOMAIN-NAME>}

Parameters

- show device-upgrade [history {on <DOMAIN-NAME>}|load-image-status|
    versions {on <DEVICE-OR-DOMAIN-NAME>}]
Examples

rfs7000-37FABE#
6.1.18 dot1x

Show commands

Displays dot1x information on interfaces

Dot1x (or 802.1x) is an IEEE standard for network authentication. Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

Supported in the following platforms:

- Access Points — AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524

NOTE: Dot1x supplicant configuration is supported on the following platforms:

- Access Points – AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX4524

NOTE: Dot1x authenticator configuration is supported on the following platforms:

- Access Points – ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP81XX
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX4524, NX6500, NX6524

Syntax

```
show dot1x {all|interface|on}
show dot1x {all {on <DEVICE-NAME>}}
show dot1x {interface <INTERFACE-NAME>|ge <1-4>|port-channel <1-2>}
{
  on <DEVICE-NAME>
}
```

Parameters

- **show dot1x {all|interface|on}**
  - Optional. Displays dot1x information for all interfaces
  - on <DEVICE-NAME> – Optional. Displays dot1x information for all interfaces on a specified device
    - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

- **show dot1x interface <INTERFACE-NAME>**
  - Optional. Displays dot1x information for interfaces on a specified device
  - <INTERFACE-NAME> – Specify the name of AP, wireless controller, or service platform.

- **show dot1x interface {<INTERFACE-NAME>|ge <1-4>|port-channel <1-2>} {on <DEVICE-NAME>}**
  - Optional. Displays dot1x information for a specified interface or interface type
  - <INTERFACE-NAME> – Displays dot1x information for the layer 2 (Ethernet port) interface specified by the
  - ge <1-4> – Displays dot1x information for a specified GigabitEthernet interface
  - <1-4> – Select the interface index from 1 - 4.
**Examples**

```
rfs7000-37FABE(config)#show dot1x all
SysAuthControl is disabled
Guest-Vlan is disabled
AAA-Policy is none

Dot1x info for interface GE1
-----------------------------------
Supplicant MAC N/A
Auth SM State = FORCE AUTHORIZED
Bend SM State = REQUEST
Port Status   = AUTHORIZED
Host Mode     = SINGLE
Auth Vlan     = None
Guest Vlan    = None

Dot1x info for interface GE2
-----------------------------------
Supplicant MAC N/A
Auth SM State = FORCE AUTHORIZED
Bend SM State = REQUEST
Port Status   = AUTHORIZED
Host Mode     = SINGLE
Auth Vlan     = None
Guest Vlan    = None
--More--
rfs7000-37FABE(config)#
```

```
rfs7000-37FABE(config)#show dot1x interface ge 3
Dot1x info for interface GE3
-----------------------------------
Supplicant MAC N/A
Auth SM State = FORCE AUTHORIZED
Bend SM State = REQUEST
Port Status   = AUTHORIZED
Host Mode     = SINGLE
Auth Vlan     = None
Guest Vlan    = None
```

- `port-channel <1-2>`: Displays dot1x for a specified port channel interface
  - `<1-2>` – Select the interface index from 1 - 2.

- `on <DEVICE-NAME>`: The following keywords are common to all of the above parameters:
  - `<DEVICE-NAME>` – Optional. Displays dot1x interface information on a specified device
  - `<DEVICE-NAME>` – Specify the name of AP, wireless controller, or service platform.
## 6.1.19 dpi

Display commands

Displays statistics for all configured and canned applications.

RF Domain member devices inspect every byte of each application header packet allowed to pass through the WiNG managed network. When an application is recognized and classified by the WiNG application recognition engine, administrator-defined actions can be applied to that specific application.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

- `show dpi [app|app-category|application|per-category]`
- `show dpi app wireless-clients stats <MAC> {on <DEVICE-OR-DOMAIN-NAME>}`
- `show dpi [app|app-category] stats [<APPLICATION/APP-CATEGORY-NAME>|all] {on <DEVICE-OR-DOMAIN-NAME>}`
- `show dpi application brief`
- `show dpi per-category stats <APP-CATEGORIES> [bytes-in|bytes-out|total-bytes] {on <DEVICE-OR-DOMAIN-NAME>}`

### Parameters

- `show dpi app wireless-clients stats <MAC> {<DEVICE-OR-DOMAIN-NAME>}`
  - Displays application-related statistics for all or a specified wireless client.
  - `<MAC>` — Displays statistics for a specified wireless client. Specify the client’s MAC address.
  - `on <DEVICE-OR-DOMAIN-NAME>` — Optional. Displays statistical data on a specified device or RF Domain.
  - `<DEVICE-OR-DOMAIN-NAME>` — Specify the name of the access point, wireless controller, service platform, or RF Domain.

- `show dpi [app|app-category] stats [<APPLICATION/APP-CATEGORY-NAME>|all] {on <DEVICE-OR-DOMAIN-NAME>}`
  - Displays statistics for a specified application or application category.
  - `<APPLICATION/APP-CATEGORY-NAME>` — Displays statistics for a specified application or application category, depending on the option selected in the previous step. Specify the application name or application category name.
  - `<ALL>` — Displays statistics for all applications or application categories, depending on the option selected in the previous step.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show dpi app wireless-clients</code></td>
<td>Displays application-related statistics for all or a specified wireless client. Specify the client’s MAC address.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</code></td>
<td>Optional. Displays statistical data on a specified device or RF Domain.</td>
</tr>
<tr>
<td><code>&lt;DEVICE-OR-DOMAIN-NAME&gt;</code></td>
<td>Specify the name of the access point, wireless controller, service platform, or RF Domain.</td>
</tr>
<tr>
<td><code>&lt;APPLICATION/APP-CATEGORY-NAME&gt;</code></td>
<td>Displays statistics for a specified application or application category, depending on the option selected in the previous step. Specify the application name or application category name.</td>
</tr>
<tr>
<td><code>&lt;ALL&gt;</code></td>
<td>Displays statistics for all applications or application categories, depending on the option selected in the previous step.</td>
</tr>
</tbody>
</table>

**Note:** The applications are the RF Domain member allowed applications whose data (bytes) are passing through the WiNG managed network. And, the application categories are existing WiNG or user-defined application groups (video, streaming, mobile, audio, etc.) that assist administrators to permit or deny forwarding of application data.
### SHOW dpi application brief

Displays a brief summary of applications their status and configuration.

**Examples**

nx9500-6C8809>show dpi application brief

- **1-clickshare-com**
  - This application recognizes DirectDownloadLink 1-clickshare traffic
  - Application Category : filetransfer
  - Predefined Application : Yes

- **1-upload-com**
  - This application recognizes DirectDownloadLink 1-upload-com traffic
  - Application Category : filetransfer
  - Predefined Application : Yes

- **1-upload-to**
  - This application recognizes DirectDownloadLink 1-upload-to traffic
  - Application Category : filetransfer
  - Predefined Application : Yes

- **10upload-com**
  - This application recognizes DirectDownloadLink 10upload-com traffic
  - Application Category : filetransfer
  - Predefined Application : Yes

### show dpi per-category stats<br>\(<\text{APP-CATEGORIES}>\) [\(\text{bytes-in}|\text{bytes-out}|\text{total-bytes}\)]<br>(on \(<\text{DEVICE-OR-DOMAIN-NAME}>\))

Displays statistics for the top ten applications based on the application category and the Sort ID specified. The Sort ID options are: bytes-in, bytes-out or total-bytes.

**Examples**

nx9500-6C8809>show dpi per-category stats application

- **filetransfer**
  - Application Category : filetransfer
  - Predefined Application : Yes

### Optional. Displays statistical data on a specified device or RF Domain

- **on \(<\text{DEVICE-OR-DOMAIN-NAME}>\)**
  - Specify the name of the access point, wireless controller, service platform, or RF Domain.
123upload-pl
This application recognizes DirectDownloadLink 123upload-pl traffic

nx9500-6C8809>
6.1.20 environmental-sensor

Displays environmental sensor's recorded data. The environmental sensor has to be enabled and configured in order to collect data related to humidity, light, motion, and temperature.

For more information on enabling and configuring environmental sensor settings, see environmental-sensor.

**NOTE:** The environmental sensor is supported only on an AP8132. When executed on any controller (other than an AP8132), the `show > environmental-sensor > <parameters>` command displays environmental-sensor details for adopted AP8132s (if any).

Supported in the following platforms:
- Access Points — AP8132

**Syntax**

```
show environmental-sensor [history|humidity|light|motion|summary|temperature|version]

show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}
show environmental-sensor [humidity|light|motion|summary|temperature|version]
```

**Parameters**

- `show environmental-sensor history {<1-HOUR>|<20-MINUTE>|<24-HOUR>}`

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show environmental-sensor</td>
<td>Displays environmental sensor's recorded data, based on the parameters passed. The system displays the specified recorded data.</td>
</tr>
<tr>
<td>history</td>
<td>History includes the humidity, light, motion, and temperature data recorded by the sensor at specified time interval.</td>
</tr>
</tbody>
</table>

- `show environmental-sensor [humidity|light|motion|summary|temperature|version]`

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>environmental-sensor history</td>
<td>Displays environmental sensor history once in every hour, 20 minutes, or 24 hours</td>
</tr>
</tbody>
</table>

- `humidity`                  | Displays the minimum, average, and maximum humidity recorded                 |

- `light`                     | Displays the minimum, average, and maximum light recorded                    |

- `motion`                    | Displays the minimum, average, and maximum motion recorded                   |

- `temperature`               | Displays the minimum, average, and maximum temperature recorded             |

- `version`                   | Displays the hardware and firmware versions                                 |

- `summary`                   | Displays a summary of the data recorded at following intervals:             |
Examples

```

<DEVICE-NAME>#
### 6.1.21 event-history

#### show commands

Displays event history report

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
show event-history {on <DEVICE-OR-DOMAIN-NAME>}
```

#### Parameters

- `show event-history {on <DEVICE-OR-DOMAIN-NAME>}`
  - **on <DEVICE-OR-DOMAIN-NAME>**
    - Optional. Displays event history report on a device or RF Domain
    - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

#### Examples

```
rfs7000-6DCD4B(config)#show event-history

6.1.22 event-system-policy

Displays detailed event system policy configuration

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>

Parameters

- show event-system-policy [config|detail] <EVENT-SYSTEM-POLICY-NAME>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event-system-policy</td>
<td>Displays event system policy configuration</td>
</tr>
<tr>
<td>config</td>
<td>Displays configuration for a specified policy</td>
</tr>
<tr>

### 6.1.23 ex3500

#### show commands

Displays EX3500-related statistical data

Supported in the following platforms:

- Wireless Controllers — RFS7000
- Service Platforms — NX7500, NX9500

#### Syntax

```
show ex3500 [dir|interfaces|system|upgrade|version|whichboot]
show ex3500 dir {boot-rom|config|on|opcode} {<FILE-NAME>} {on <EX3500-DEVICE-NAME>}
show ex3500 interfaces counters [ether-like stats|ethernet <1-1> <1-52>|ext-if-table stats|if-table stats|portUtil stats|rmon stats] {on <EX3500-DEVICE-NAME>}
show ex3500 [system|upgrade|version|whichboot] {on <EX3500-DEVICE-NAME>}
```

#### Parameters

- `show ex3500 dir {boot-rom|config|on|opcode} {<FILE-NAME>} {on <EX3500-DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>show ex3500 dir</th>
<th>Displays EX3500 directory information based on the option selected. The options are: boot-rom, config, opcode</th>
</tr>
</thead>
<tbody>
<tr>
<td>boot-rom</td>
<td>Optional. Displays only the Boot-ROM information</td>
</tr>
<tr>
<td>config</td>
<td>Optional. Displays only the configuration file</td>
</tr>
<tr>
<td>opcode</td>
<td>Optional. Displays only the run-time operation code</td>
</tr>
<tr>
<td>&lt;FILE-NAME&gt;</td>
<td>Displays the contents of a specified file identified by the <code>&lt;FILE-NAME&gt;</code> keyword. This is the name of configuration file or code image.</td>
</tr>
<tr>
<td>on &lt;EX3500-DEVICE-NAME&gt;</td>
<td>Optional. Executes the command on a specified EX3500 device</td>
</tr>
</tbody>
</table>

- `show ex3500 interfaces counters [ether-like stats|ethernet <1-1> <1-52>|ext-if-table stats|if-table stats|portUtil stats|rmon stats] {on <EX3500-DEVICE-NAME>}

<table>
<thead>
<tr>
<th>show ex3500 interfaces counters</th>
<th>Displays EX3500 interface counter information based on the option selected. The options are: ether-like, ethernet, ext-if-table, if-table, portUtil, rmon</th>
</tr>
</thead>
<tbody>
<tr>
<td>ether-like stats</td>
<td>Displays Managed Information Base (MIB) object statistics for Ethernet-like interfaces</td>
</tr>
</tbody>
</table>
| ethernet <1-1> <1-52>            | Displays the Ethernet port statistics based on the unit identifier and port number selected
|                                 |  • `<1-1>` – Specify the EX3500 unit's identifier from 1 - 1.                                                               |
|                                 |  • `<1-52>` – Specify the port number from 1 - 52. This range varies for the EX3524 (1-28) and EX35248 (1-52) devices.   |
|                                 | **Note:** This option displays the following for the selected Ethernet interface: extended interface table stats, interface table stats, port utilization information, and remote monitoring stats. |
| ext-if-table stats               | Displays only the extended interface table statistics                                                                   |

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

6.1.24 extdev

show commands

Displays external device (T5 or EX3500) configuration error history

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX9000, NX9500, NX9510

Syntax
show extdev error history {on <T5/EX3500-DEVICE-NAME>}

Parameters
- show extdev error history {on <T5/EX3500DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show extdev error history</td>
<td>Displays external device error history. This command is applicable only to the external devices T5, and EX3500 series switches. Use this command to view configuration error history for all or a specified external device adopted and managed by a WiNG NX9500 series service platform,</td>
</tr>
<tr>
<td>on &lt;T5/EX3500-DEVICE-NAME&gt;</td>
<td>Optional. Displays configuration error history on a specified T5 or EX3500 device</td>
</tr>
<tr>
<td></td>
<td>• &lt;T5/EX3500-DEVICE-NAME&gt; – Specify the name of the device.</td>

### SHOW COMMANDS

#### SHOW COMMANDS 6 - 51

### 6.1.26 file-sync

**show commands**

Displays file synchronization settings and status on a controller

The `file-sync` command syncs EAP-TLS X.509 (PKCS#12) certificate between the staging-controller and adoptee AP6522/ AP6562 client-bridge access points. The `show > file-sync` command displays information related to this process.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

### Syntax

```
show file-sync [configuration|history|load-file-status|status]
   {on <DEVICE-OR-DOMAIN-NAME>}
```

### Parameters

- **show file-sync configuration**
  - Displays the following file-synchronization settings:
    - automatic file-syncing enabled or disabled. The default setting is disabled.
    - **Note:** The X.509 certificate needs synchronization only if the access point’s radio2, the client-bridge radio, is configured to use EAP-TLS authentication. In which case PKCS#12 certificate needs to be pushed on AP adoption. To enable automatic file syncing, in the controller’s device/profile configuration mode, execute the `file-sync > auto` command. For more information, see `file-sync`.
    - Number of access points the certificate can be simultaneously uploaded. The default is 10.
    - **Note:** To modify the number of simultaneous uploads, in the controller’s device/profile configuration mode, execute the `file-sync > count <1-20>` command. For more information, see `file-sync`.
    - Scheduled certificate upload, if any, details, such time and date of upload.
    - **Note:** To schedule certificate upload, use the `file-sync > wireless-certificate` command. For more information, see `file-sync`.

- **show file-sync history**
  - Displays file synchronization history. Use this option to view statistical data relating to client-bridge certificate synchronization between staging controller and adoptee access points. when executed, a list of all certificate transfers made to the client-bridge is displayed, with the latest transfer listed at the top.

- **show file-sync load-file-status**
  - Displays the status of PKCS#12 certificate upload to the controller. Use this command to view the status of an in-progress certificate upload.
  - **Note:** For more information on initiating a PKCS#12 certificate upload, see `file-sync`.

- **show file-sync status**
  - Displays status of the PKCS#12 certificate synchronization between the controller and the client-bridge access point.

- **on <DEVICE-OR-DOMAIN-NAME>**
  - Displays file synchronization settings and status on a specified device or RF Domain
    - **on <DEVICE-OR-DOMAIN-NAME>** – Specify the name of the controller, service platform, or RF Domain.
Examples

nx9500-6C8809# show file-sync configuration

nx9500-6C8809#
### 6.1.27 firewall

Displays wireless firewall information, such as *Dynamic Host Configuration Protocol* (DHCP) snoop table entries, denial of service statistics, active session summaries etc.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show firewall</code> [dhcp</td>
<td>dos</td>
</tr>
<tr>
<td>`show firewall [dhcp snoop-table</td>
<td>dos stats] {on &lt;DEVICE-NAME&gt;}`</td>
</tr>
<tr>
<td>`show firewall flows {filter</td>
<td>management</td>
</tr>
<tr>
<td>`show firewall flows {filter} {(dir</td>
<td>dst</td>
</tr>
<tr>
<td>`show firewall flows {management {on &lt;DEVICE-NAME&gt;}</td>
<td>stats {on &lt;DEVICE-NAME&gt;}</td>
</tr>
<tr>
<td><code>show firewall neighbors snoop-table {on &lt;DEVICE-NAME&gt;}</code></td>
<td></td>
</tr>
</tbody>
</table>

#### Parameters

- `show firewall [dhcp snoop-table|dos stats] {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| dhcp snoop-table | Displays DHCP snoop table entries
  - snoop-table — Displays DHCP snoop table entries
  - DHCP snooping acts as a firewall between non-trusted hosts and the DHCP server. Snoop table entries contain MAC address, IP address, lease time, binding type, and interface information of non-trusted interfaces. |
| dos stats | Displays *Denial of Service* (DoS) statistics
  - Note: This option is not available in the User Exec mode. |
| on <DEVICE-NAME> | The following keyword is common to the ‘DHCP snoop table’ and ‘DoS stats’ parameters:
  - on <DEVICE-NAME> — Optional. Displays snoop table entries, or DoS stats on a specified device
  - <DEVICE-NAME> — Specify the name of the AP, wireless controller, or service platform. |
<p>| firewall flows | Notifies a session has been established |
| filter | Optional. Defines additional firewall flow filter parameters |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst port</td>
<td><code>&lt;1-65535&gt;</code>&lt;br&gt;Optional. Matches the destination port with the specified port&lt;br&gt;• port <code>&lt;1-65535&gt;</code> – Specifies the destination port number from 1 - 65535</td>
</tr>
<tr>
<td>ether</td>
<td>`ether [dst &lt;MAC&gt;</td>
</tr>
<tr>
<td>flow-type</td>
<td>`[bridged</td>
</tr>
<tr>
<td>icmp</td>
<td>`{code</td>
</tr>
<tr>
<td>icmpv6</td>
<td>`{code</td>
</tr>
<tr>
<td>igmp</td>
<td>Optional. Matches Internet Group Management Protocol (IGMP) flows</td>
</tr>
<tr>
<td>ip</td>
<td>`[dst &lt;IP&gt;</td>
</tr>
<tr>
<td>ipv6</td>
<td>`[dst &lt;IPv6&gt;</td>
</tr>
<tr>
<td>max-idle</td>
<td><code>&lt;1-4294967295&gt;</code>&lt;br&gt;Optional. Filters firewall flows idle for at least the specified duration. Specify a max-idle value from 1 - 4294967295 bytes.</td>
</tr>
</tbody>
</table>
### show firewall flows

**management** `on <DEVICE-NAME>`
- Optional. Displays management traffic firewall flows

**stats** `on <DEVICE-NAME>`
- Optional. Displays active session summary

**wireless-client** `<MAC>`
- Optional. Displays wireless clients firewall flows

**on <DEVICE-NAME>**
- Optional. Displays all firewall flows on a specified device

### show firewall neighbors snoop-table

`on <DEVICE-NAME>`
- Displays IPv6 neighbors snoop table entries

### Examples

```

6.1.28 global

show commands

Displays global information for network devices based on the parameters passed

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show global [device-list|domain]

show global device-list {filter {offline|online|rf-domain}}
show global device-list {filter {offline|online}}
show global device-list {filter rf-domain [<DOMAIN-NAME>|not <DOMAIN-NAME>]}  

show global domain managers

Parameters

- show global device-list {filter {offline|online}}

<table>
<thead>
<tr>
<th>global device-list</th>
<th>Displays global information for all network devices. Use the following keywords to specify additional filters: offline, online, and rf-domain.</th>
</tr>
</thead>
<tbody>
<tr>

rfs7000-6DCD4B(config)#
6.1.29 gre

Displays layer 2 *Generic Routing Encapsulation* (GRE) tunnel traffic flow information.

GRE is one of the available tunneling mechanisms which uses IP as the transport protocol and can be used for carrying many different passenger protocols. The tunnels behave as virtual point-to-point links that have two endpoints identified by the tunnel source and tunnel destination addresses at each endpoint.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show gre info {detail} {(on <DEVICE-NAME>)}
```

**Parameters**

- **show gre info**
  - **detail** Optional. Displays GRE tunnel information in detail, such as tunnel state, tunnel’s remote-end peer device’s IP address, session ID of an operational tunnel, total number of packets received and transmitted through the tunnel, and the number of dropped packets during tunneled exchanges between access point and a peer at the remote end of the tunnel.

- **on <DEVICE-NAME>** Optional. Executes the command on a specified device
  - `<DEVICE-NAME>` – Specify the name of the access point, controller, or service platform.

**Examples**

```
nx4500-5CFA2B>show gre info
Gre Tunnel info:
    {'No tunnel found': 0}
nx4500-5CFA2B>
```
6.1.30 guest-registration

Displays guest registration statistics based on the option and time entered

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

show guest-registration [age-range|backup-snapshots|browsers|client|devices|gender|notification-status|os|social|user-trends|visitors] {on <DEVICE-NAME>}

show guest-registration backup-snapshots

show guest-registration [age-range|browsers|devices|gender|os|user-trends|visitors] time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] {(rfdomain <DOMAIN-NAME>)/wlan <WLAN-NAME>}

show guest-registration client [email|mac|member|mobile|name|time]

show guest-registration client [email <EMAIL-ADDRESS>|mac <MAC>|member <MEMBER-ID>|mobile <MOBILE-NUMBER>|name <NAME>]

show guest-registration client time [1-Hour|10-Mins|15-Mins|2-Mins|30-Mins|30-Secs|5-Mins] {(rfdomain <DOMAIN-NAME>)/wlan <WLAN-NAME>}

show guest-registration notification-status

show guest-registration social time [1-Day|1-Month|1-Week|2-Hours|30-Mins|5-Hours|all] {(facebook|rfdomain <DOMAIN-NAME>)/wlan <WLAN-NAME>/google}

Parameters

- show guest-registration backup-snapshots

<table>
<thead>
<tr>
<th>show guest-registration</th>
<th>Displays guest registration statistics based on the parameters passed</th>
</tr>
</thead>
<tbody>
<tr>
<td>backup-snapshots</td>
<td>Displays a list of periodically backed up snapshots of the database. By default, the system maintains a snapshot of the database on a daily basis. <strong>Note:</strong> Use the `service &gt; guest-registration &gt; backup [delete</td>
</tr>
<tr>
<td>age-range</td>
<td>Displays the age ranges of logged guest users for a selected time period</td>
</tr>
<tr>
<td>browsers</td>
<td>Displays the browsers used by guest users logged in within a selected time period</td>
</tr>
<tr>
<td>devices</td>
<td>Displays the device types used by guest users logged in within a selected time period</td>
</tr>
<tr>
<td>gender</td>
<td>Displays the gender of guest users logged in within a selected time period</td>
</tr>
<tr>
<td>os</td>
<td>Displays the operating system (OS) of devices logged in within a selected time period</td>
</tr>
<tr>
<td>user-trends</td>
<td>Displays guest user login trends for a selected time period. It displays statistical data, such as number of new users, number of return users, and total number of users.</td>
</tr>
<tr>
<td>show guest-registration client [email &lt;EMAIL-ADDRESS&gt;</td>

### 6.1.31 interface

- **show commands**

Displays configured system interfaces and their status

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX

- **Wireless Controllers** — RFS4000, RFS6000, RFS7000

- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

show interface {<INTERFACE-NAME>|brief|counters|ge |me1|on|port-channel|pppoe1|switchport|vlan|wwan1}

show interface {<INTERFACE-NAME>|brief|counters|ge <1-4>|me1|port-channel <1-2>|pppoe1|switchport|vlan <1-4094>|wwan1} {on <DEVICE-NAME>}

#### Parameters

- **show interface {<INTERFACE-NAME>|brief|counters|ge <1-4>|me1|port-channel <1-2>|pppoe1|switchport|vlan <1-4094>|wwan1} {on <DEVICE-NAME>}

<tr>
<td>brief</td>
<td>Optional. Displays a brief summary of the interface status and configuration</td>
</tr>
</tbody>
</table>
| ge <1-4> | Optional. Displays Gigabit Ethernet interface status and configuration  
  - <1-4> – Select the Gigabit Ethernet interface index from 1 - 4.  
  **Note:** For the NX45XX and NX65XX service platforms the index range is <1 - 24>. |
| port-channel <1-2> | Optional. Displays port channel interface status and configuration  
  - <1-2> – Specify the port channel index from 1 - 2. |
| pppoe1 | Optional. Displays PPP over Ethernet interface status and configuration |
| switchport | Optional. Displays layer 2 interface status |
| vlan <1-4094> | Optional. Displays VLAN interface status and configuration  
  - <1-4094> – Specify the **Switch Virtual Interface** (SVI) VLAN ID from 1 - 4094. |
| wwan1 | Optional. Displays Wireless WAN interface status, configuration, and counters |
| on <DEVICE-NAME> | The following keywords are common to all of the above interfaces:  
  - on <DEVICE-NAME> – Optional. Displays interface related information on a specified device  
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform. |
Examples

Following interfaces are available on a RFS7000 controller:

```bash
rfs7000-6DCD4B(config)#show interface ?
WORD          Interface name
brief         Brief summary of interface status and configuration
counters      Interface tx/rx counters
ge            GigabitEthernet interface
mel           FastEthernet interface
on            On AP/Controller
port-channel  Port-Channel interface
ppoe1         PPP Over Ethernet interface
switchport    Status of Layer2 interfaces
vlan          Switch VLAN interface
|             Output modifiers
>             Output redirection
>>            Output redirection appending
<cr>
```

rfs7000-6DCD4B(config)#

Following interfaces are available on a NX45XX and NX65XX series service platform:

```bash
nx4500-5CFA2B(config)#show interface ?
WORD        Interface name
brief       Brief summary of interface status and configuration
counters    Interface tx/rx counters
ge          GigabitEthernet interface
on          On AP/Controller
ppoe1       PPP Over Ethernet interface
serial      Serial interface
switchport  Status of Layer2 interfaces
t1e1        T1/E1 interface
up          WAN Ethernet interface
vlan        Switch VLAN interface
vmif        Virtual Machine interface
wwan1       Wireless WAN interface
|           Output modifiers
>           Output redirection
>>          Output redirection appending
<cr>
```

nx4500-5CFA2B(config)#

```bash
rfs7000-6DCD4B(config)#show interface switchport
---------------------------------------------------------------------
INTERFACE | STATUS | MODE   | VLAN(S)
---------------------------------------------------------------------

--More--

nx4500-5CFA8E(config)#
### 6.1.32 ip

#### show commands

Displays IP related information

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```bash
show ip {arp|bgp|ddns|default-gateways|dhcp|dhcp-vendor-options|domain-name|
    extcommunity-list|igmp|interface|name-server|nat|ospf|route|routing}

show ip arp \{<VLAN-NAME>\} {(on <DEVICE-NAME>)}
show ip bgp \{<IP>|<IP/M>|community|community-list|filter-list|neighbors|on|paths|
    prefix-list|regexp|route-map|state|summary\}
show ip ddns bindings \{on <DEVICE-NAME>\}
show ip dhcp \{binding|networks|status\}
show ip dhcp binding \{manual\} {(on <DEVICE-NAME>)}
show ip dhcp \{networks|status\} {(on <DEVICE-NAME>)}
show ip [default-gateways|dhcp-vendor-options|domain-name|name-server|routing]
    \{on <DEVICE-NAME>\}
show ip extcommunity-list \{<1-500>|<NAME>\}
show ip igmp snooping \{mrouter|querier|vlan\}
show ip igmp snooping \{mrouter|querier\} vlan <1-4095> \{on <DEVICE-NAME>\}
show ip igmp snooping vlan <1-4095> \{<IP>\} {(on <DEVICE-NAME>)}

show ip interface \{<INTERFACE-NAME>|brief|on\}
show ip interface \{<INTERFACE-NAME>|brief\} {(on <DEVICE-NAME>)}
show ip nat translations verbose \{on <DEVICE-NAME>\}
show ip route \{<INTERFACE-NAME>|ge|mel|on|port-channel|pppoel|vlan|wwan1\}
show ip route \{<INTERFACE-NAME>|ge <1-4>|mel|port-channel <1-2>|vlan <1-4094>|
    pppoe1|wwan1\} {(on <DEVICE-NAME>)}
show ip ospf \{border-router|interface|neighbor|on|route|state\}
show ip ospf \{border-router|neighbor\} route|on|state\} {(on <DEVICE-NAME>)}
show ip ospf \{interface\} \{vlan|on\}
show ip ospf \{interface\} \{vlan <1-4094>\} {(on <DEVICE-NAME>)}
```

**NOTE:** The show ip ospf command is also available under the 'profile' and 'device' modes.

### Parameters

- **show ip arp \{<VLAN-NAME>\} \{(on <DEVICE-NAME>)}**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip arp</code></td>
<td>Displays <em>Address Resolution Protocol</em> (ARP) mappings</td>
</tr>
<tr>
<td><code>&lt;VLAN-NAME&gt;</code></td>
<td>Optional. Displays ARP mapping on a specified VLAN. Specify the VLAN name.</td>
</tr>
</tbody>
</table>
### show ip bgp

Displays BGP routing table statistics based on the match criteria specified here. Routes matching the specified criteria are filtered. Use available options to filter the information displayed.

**Note:** This command is applicable to the RFS4000, RFS6000, NX45XX, NX65XX, NX9XXX model devices.

#### on <DEVICE-NAME>
Optional. Displays ARP configuration details on a specified device
- **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

#### <IP>
Optional. Filters routes matching the specified IP address

#### <IP/M>
Optional. Filters routes matching the specified network

#### community
Optional. Filters routes based on the community attribute specified. The options are:
- **AA:NN** – Filters routes based on the community number (AA: is the autonomous system number (ASN), NN: is the community number within the specified ASN)
- **local-as** – Filters routes carrying the local-as attribute (these routes are not sent outside the local AS)
- **no-advertise** – Filters routes carrying the no-advertise attribute (these routes are not advertised to any peers)
- **no-export** – Filters routes carrying no-export attribute (these routes are not exported to next AS)

#### community-list
Optional. Displays routes that are members of communities included in the specified BGP community-list
- **<1-500>** – Specify the community-list number.
- **<WORD>** – Specify the community-list name.

#### filter-list
Optional. Displays routes having AS-path matching the specified AS-path access list. Specify the AS-path ACL name.

#### neighbors
Optional. Displays BGP neighbor details. Specify the IP address, to view a specific neighbor details. Use one of the following options to filter information:
- **advertised-routes** – Displays route information for routes advertised to the selected neighbor device
- **received-routes** – Displays route information for routes received from the selected neighbor device
- **routes** – Displays the route information for routes learned from the selected neighbor device

**Note:** If no neighbor IP address is specified, the system displays all neighbor-related routes on the logged device.

#### on <DEVICE-NAME>
Optional. Displays BGP routing table statistics on a specified device
- **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

#### paths
Optional. Displays BGP path details

#### prefix-list
Optional. Displays routes confirming to the specified prefix-list
- **<PREFIX-LIST-NAME>** – Specify the prefix list name.

### show ip igmp snooping [mrouter|querier] vlan <1-4095> {on <DEVICE-NAME>}

- **ip igmp snooping**
  - Displays the IGMP snooping configuration

- **vlan <1-4095>**
  - Displays the IGMP snooping multicast router configuration for a VLAN
    - `<1-4095>` – Specify the VLAN ID from 1 - 4095.
    - `on <DEVICE-NAME>` – Optional. Displays the IGMP snooping mrouter configuration on a specified device

- **on <DEVICE-NAME>**
  - The following keywords are common to all of the above parameters:
    - `on <DEVICE-NAME>` – Optional. Displays IP related information, based on the parameters passed, on a specified device
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

### show ip igmp snooping vlan <1-4095> {<IP>} {(on <DEVICE-NAME>)}

- **<IP>**
  - Optional. Specifies the multicast group IP address

### show ip interface {<INTERFACE-NAME>|brief} {(on <DEVICE-NAME>)}

- **ip interface**
  - Displays an administrative and operational status of all layer 3 interfaces or a specified layer 3 interface

- **<INTERFACE-NAME>**
  - Optional. Displays a specified interface status. Specify the interface name.

- **brief**
  - Optional. Displays a brief summary of all interface status and configuration

- **on <DEVICE-NAME>**
  - The following keyword is recursive and common to the ‘interface-name’ and ‘brief’ parameters:
    - `on <DEVICE-NAME>` – Optional. Displays interface status and summary, based on the parameters passed, on a specified device
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

### show ip nat translations verbose {on <DEVICE-NAME>}

- **ip nat translations**
  - Displays Network Address Translation (NAT) translations

---

- **ip domain-name**
  - Displays the DNS default domain

- **ip name-server**
  - Displays the DNS name server details

- **ip routing**
  - Displays routing status
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| verbose | Displays detailed NAT translations  
  • on `<DEVICE-NAME>` – Optional. Displays NAT translations on a specified device  
  • `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| show ip route | Displays route table details. The route tables use flags to distinguish between routes. The different flags are:  
  • C – Connected  
  • G – Gateway  
  • O – OSPF route  
  • S – Static route  
  **Note:** Flags ‘S’ and ‘O’ identify static learned routes and dynamic learned routes respectively.  
  `<INTERFACE-NAME>` Optional. Displays route table details for a specified interface. Specify the interface name  
  `ge <1-4>` Optional. Displays GigabitEthernet interface route table details  
  • `<1-4>` – Specify the GigabitEthernet interface index from 1 - 4.  
  `me1` Optional. Displays FastEthernet interface route table details  
  `port-channel <1-2>` Optional. Displays port channel interface route table details. Specify the port channel index from 1 - 2.  
  `vlan <1-4094>` Optional. Displays VLAN interface route table details. Select the VLAN interface ID from 1 - 4094.  
  `pppoe1` Optional. Displays `Point-to-point Protocol over Ethernet` (PPPoE) interface route table details  
  `wwan1` Optional. Displays Wireless WAN route table details  
  `on <DEVICE-NAME>` The following keywords are recursive and common to all of the above parameters:  
  • on `<DEVICE-NAME>` – Displays route table details, based on the parameters passed, on a specified device  
  • `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| show ip ospf | Displays overall OSPF information  
  `{border-router|interface|neighbor|route|on|state}` {on `<DEVICE-NAME>`}  
  `border-router` Optional. Displays details of all the border routers connected  
  `interface {on|vlan <1-4094>} {on `<DEVICE-NAME>`}` Optional. Displays details of all the interfaces with OSPF enabled  
  • on `<DEVICE-NAME>` – Optional. Displays specified device details  
  • vlan `<1-4094>` – Displays VLAN interface details  
  • `<DEVICE-NAME>` – Specify the name of the AP or wireless controller.  
  `neighbor` Optional. Displays an OSPF neighbors list  
  `route` Optional. Displays all OSPF routes information  
  `on `<DEVICE-NAME>` Optional. Displays overall OSPF information on a specified device  
  • `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |

6.1.33  **ip-access-list**

*SHOW COMMANDS*

Displays IP access list statistics

---

NOTE: This command is not available in the USER EXEC Mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail|on}

show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>}

{on <DEVICE-NAME>}

**Parameters**

- show ip-access-list stats {<IP-ACCESS-LIST-NAME>|detail <IP-ACCESS-LIST-NAME>}

<table>
<thead>
<tr>
<th>on &lt;DEVICE-NAME&gt;</th>
<th>The following keyword is recursive and common to the ‘IP-ACCESS-LIST-NAME’ and ‘detail’ parameters:</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays all or a specified IP access list statistics on a specified device.</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Optional. Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config)#show ip-access-list stats
IP Access-list: # Restrict Management ACL #
   permit tcp any any eq ftp rule-precedence 1  Hitcount: 0
   permit tcp any any eq www rule-precedence 2  Hitcount: 4
   permit tcp any any eq ssh rule-precedence 3  Hitcount: 448
   permit tcp any any eq https rule-precedence 4  Hitcount: 0
   permit udp any any eq snmp rule-precedence 5  Hitcount: 0
   permit tcp any any eq telnet rule-precedence 6  Hitcount: 4
rfs7000-37FABE(config)#
The following example displays the 'auto-tunnel-acl' IP ACL configuration:

```bash
rfs4000-229D58(config)#ip access-list auto-tunnel-acl
rfs4000-229D58(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2
permit ip host 200.200.200.99 any rule-precedence 3
rfs4000-229D58(config-ip-acl-auto-tunnel-acl)#
```

The following example displays the statistics for the 'auto-tunnel-acl' ACL:

```bash
rfs4000-229D58#show ip-access-list stats
IP Access-list: auto-tunnel-acl
  permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2  Hitcount: 0
  permit ip host 200.200.200.99 any rule-precedence 3  Hitcount: 0
rfs4000-229D58#
```

```bash
nx6524-5483B0#show ip-access-list stats scaleacl | i 125
  permit ip host 125.1.1.1 any rule-precedence 125  Hitcount: 893  Hardware Hitcount: 3120
  permit ip host 125.2.1.1 any rule-precedence 346  Hitcount: 0  Hardware Hitcount: 0
nx6524-5483B0#
```
6.1.34 ipv6

show commands

Displays IPv6 related information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show ipv6 [default-gateways|delegated-prefix|dhcp|hop-limit|interface|mld|name-server|neighbors|route]

show ipv6 dhcp [client received-options|relay status|status] {on <DEVICE-NAME>}

show ipv6 interface {<IF-NAME>|brief} {(on <DEVICE-NAME>)}

show ipv6 mld snooping {mrouter vlan <1-4095>|querier vlan <1-4095>|vlan <1-4095>} {on <DEVICE-NAME>}

show ipv6 neighbors <VLAN-NAME> {(on <DEVICE-NAME>)}

show ipv6 route {<IF-NAME>|ge <1-X>|me1|port-channel <1-2>|pppoe1|serial <1-4>|t1e1 <1-4> <1-1>|up|vlan <1-4095>|vmif <1-X>|wwan1|xge} {on <DEVICE-NAME>}

Parameters

- show ipv6 [default-gateways|delegated-prefix|hop-limit|name-server] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>ipv6</th>
<th>Displays IPv6 related information</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-gateways</td>

<td>Displays the DHCPv6 relay agent’s running status</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>status</code></td>
<td>Displays the DHCPv6 stateless server daemon's status. In case the DHCPv6 server is up and running, it also displays interface names.</td>
</tr>
</tbody>
</table>
| `on <DEVICE-NAME>` | This parameter is common to all of the above keywords.  
  - on `<DEVICE-NAME>` – Optional. Displays the specified information on a device (access point, wireless controller, or service platform)  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| `show ipv6 interface {<IF-NAME>|brief} {(on <DEVICE-NAME>)}` | Displays IPv6 related information  
  - `<IF-NAME>` – Optional. Specify the interface name.  
  - `brief` – Optional. Displays a brief summary of IPv6 status and configuration on the specified interface |
| `on <DEVICE-NAME>` | This parameter is common to all of the above keywords.  
  - on `<DEVICE-NAME>` – Optional. Displays the specified information on a device (access point, wireless controller, or service platform)  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| `show ipv6 mld snooping [mrouter vlan <1-4095>|querier vlan <1-4095>|vlan <1-4095>] {on <DEVICE-NAME>}` | Displays IPv6 related information  
  - `mld snooping` Displays Multicast Listener Discovery Protocol (MLD) snooping related information  
  - `mrouter vlan <1-4095>` Displays IPv6 multicast router information on the specified VLAN  
  - `querier vlan <1-4095>` Displays IPv6 multicast querier information on the specified VLAN  
  - `vlan <1-4095>` Displays MLD snooping related information on the specified VLAN |
| `on <DEVICE-NAME>` | This parameter is common to all of the above keywords.  
  - on `<DEVICE-NAME>` – Optional. Displays the specified information on a device (access point, wireless controller, or service platform)  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| `show ipv6 neighbors <VLAN-NAME> {(on <DEVICE-NAME>))}` | Displays IPv6 related information  
  - `neighbors` Displays IPv6 neighbors on the specified VLAN |
| `on <DEVICE-NAME>` | Optional. Displays IPv6 neighbors on a specified device (access point, wireless controller, or service platform)  
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform. |
| `show ipv6 route {<IF-NAME>|ge <1-X>|me1|port-channel <1-2>|pppoe1|serial <1-4>|t1e1 <1-4> <1-1>|up|vlan <1-4095>|vmif|wwan1|xge} {(on <DEVICE-NAME>))}` | Displays IPv6 related information |
| `ipv6` | Displays IPv6 related information |

### 6.1.35 ipv6-access-list

*show commands*

Displays IPv6 access list statistics

---

**NOTE:** This command is not available in the USER EXEC Mode.

---

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5524, NX5532, NX5560, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show ipv6-access-list stats <IPv6-ACCESS-LIST-NAME> { (on <DEVICE-NAME>) }
```

**Parameters**
- `<IPv6-ACCESS-LIST-NAME>`:
  - Optional. Displays statistics for a specified IPv6 access list. Specify the IPv6 access list name.
  - **Note:** If IPv6 ACL name is not provided, the system displays statistics for all ACLs configured and applied.
- `on <DEVICE-NAME>`:
  - Optional. Displays all or a specified IPv6 access list statistics on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

**Examples**

```
rfs6000-6DB5D4# show ipv6-access-list stats
IPv6 Access-list: test
deny ipv6 any any rule-precedence 20    Hitcount: 4
rfs6000-6DB5D4#
```
### 6.1.36 l2tpv3

*show commands*

Displays a *Layer 2 Tunnel Protocol Version 3 (L2TPV3)* session information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

---

**NOTE:** This command is not available in the USER EXEC mode.

### Syntax

```
l2tpv3 {on|tunnel|tunnel-summary}
l2tpv3 {on <DEVICE-NAME>}
l2tpv3 {tunnel <L2TPV3-TUNNEL-NAME>} {session <L2TPV3-SESSION-NAME>}
   {on <DEVICE-NAME>}
l2tpv3 {tunnel-summary} {down|on|up}
l2tpv3 {tunnel-summary} {on <DEVICE-NAME>}
l2tpv3 {tunnel-summary} {down|up} {on <DEVICE-NAME>}
```

### Parameters

- **l2tpv3 {on <DEVICE-NAME>}**
  
  Displays a L2TPv3 tunnel and session details or summary
  
  - **on <DEVICE-NAME>** — Optional. Displays L2TPv3 information on a specified access point or wireless controller.
  
- **l2tpv3 {tunnel <L2TPV3-TUNNEL-NAME>} {session <L2TPV3-SESSION-NAME>} {on <DEVICE-NAME>])**
  
  Displays a L2TPv3 tunnel and session details or summary
  
  - **<L2TPV3-TUNNEL-NAME>** — Specify the L2TPv3 tunnel name.
  
  - **<L2TPV3-SESSION-NAME>** — Specify the session name.

- **l2tpv3 {tunnel-summary} {down|on|up} {on <DEVICE-NAME>}}**
  
  Displays a L2TPv3 tunnel and session details or summary
  
  - **on <DEVICE-NAME>** — Optional. Displays a L2TPv3 tunnel and session details, based on the parameters passed, on a specified device.

- **l2tpv3 {tunnel-summary} {down|up} {on <DEVICE-NAME>}}**
  
  Displays a L2TPv3 tunnel and session details or summary
  
  - **on <DEVICE-NAME>** — Optional. Displays a L2TPv3 tunnel and session details, based on the parameters passed, on a specified device.
- `l2tpv3 {tunnel-summary} {on <DEVICE-NAME>}`
  
  Displays L2TPv3 tunnel and session details or summary

  **Note:** For an L2TPv3 tunnel over Auto IPSec, the tunnel status is displayed as: Established (secured by ipsec)

  **tunnel-summary {on <DEVICE-NAME>}**
  
  Optional. Displays L2TPv3 tunnel summary
  - `{on <DEVICE-NAME>}` — Optional. Displays a L2TPv3 tunnel summary on a specified device
  - `<DEVICE-NAME>` — Specify the name of AP, wireless controller, or service platform.

- `l2tpv3 {tunnel-summary} {down|up} {on <DEVICE-NAME>}`
  
  Displays a L2TPv3 tunnel and session details or summary

  **tunnel-summary**
  
  Optional. Displays a L2TPv3 tunnel summary, based on the parameters passed

  **down**
  
  Optional. Displays un-established tunnels summary

  **up**
  
  Optional. Displays established tunnels summary

  **on <DEVICE-NAME>**
  
  The following keyword is common to the ‘down’ and ‘up’ parameters:
  - `{on <DEVICE-NAME>}` — Optional. Displays summary, for un-established or established tunnels, on a specified device
  - `<DEVICE-NAME>` — Specify the name of AP, wireless controller, or service platform.

---

**Examples**

```
ap7131-11E6C4#show l2tpv3 tunnel-summary
---------------------------------------------------------------------------------------

ap7131-11B6C4#
6.1.37 ldap-agent

Displays an LDAP agent’s join status (join status to a LDAP server domain)

Use this command When LDAP is specified the external resource (as opposed to local RADIUS resources) to validate PEAP-MS-CHAP v2 authentication requests, user credentials, and password information needs to be made available locally to successfully connect to the external LDAP server. Up to two LDAP Agents (primary and secondary external resources) can be defined as external resources for PEAP-MS-CHAP v2 authentication requests.

**NOTE:** This command is not available in the USER EXEC Mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
show ldap-agent join-status {on <DEVICE-NAME>}
```

**Parameters**
- `show ldap-agent join-status {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ldap-agent</td>
<td>Displays LDAP agent related configuration</td>
</tr>
<tr>
<td>join-status</td>
<td>Displays if the LDAP agent has successfully joined a LDAP server’s domain</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays if the LDAP agent has successfully joined a specified LDAP server’s domain.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs6000-81701D#show ldap-agent join-status
Primary LDAP Server's agent join-status : Joined domain TEST.
Secondary LDAP Server's agent join-status : Not Configured
rfs6000-81701D#
```
### 6.1.38 licenses

**show commands**

Displays installed licenses and usage information

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`show licenses {borrowed|lent}`

**Parameters**

- `show licenses {borrowed|lent}`

| licenses {borrowed|lent} | Displays installed licenses and usage information |
|--------------------------|--------------------------------------------------|
| borrowed                 | Optional. Displays information on licenses borrowed |
| lent                      | Optional. Displays information on licenses lent   |

**Usage Guidelines**

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single *Network Operations Center* (NOC) controller. The NOC and the site controllers constitute the first and second tiers of the hierarchy respectively. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy. The site controllers may or may not be grouped to form clusters.

At the time of adoption, access points and adaptive access points are provided license by the adopting controller. These license packs can be installed on both the NOC and site controllers. When a AP/AAP is adopted by a controller, the controller pushes a license on to the device. At this point the various possible scenarios are:

- **AP/AAP license packs installed on the NOC controller only.**
  
  The NOC controller provides the site controllers with the AP licenses, ensuring that per platform limits are not exceeded.

- **AP/AAP license packs installed on the NOC and site controllers.**
  
  The site controller uses its installed licenses and, in case of a shortage, the site controller borrows additional licenses from the NOC. If the NoC controller is unable to allocate sufficient licenses, the site controller unadopts some of the AP/AAPs.

- **AP/AAP license packs installed on one controller within a cluster.**
  
  The site controller shares its installed and borrowed licenses with other cluster controllers.

**Examples**

```
rfs4000-229D58#show licenses
Serial Number : 9184521800027

Device Licenses:
  AP-LICENSE
    String     : DEFAULT-6AP-LICENSE
    Value      : 6
    Borrowed   : 0
    Total      : 6
    Used       : 0
  AAP-LICENSE
    String : 
    Value  : 0
    Borrowed : 0
```
The following example shows the show > licenses command output on a NOC controller:

```
nx4500-5CFA2B#show licenses
Serial Number: 6283529900127

Device Licenses:
  AP-LICENSE
    String: 41a5a30ee9bb0bd78e943db0a36ac34d3c66c956ef1f449d89f1c28beb032ac9747a8f0c9f98f
    Value: 1
  AAP-LICENSE
    String: 41a5a30ee9bb0bd7f8d421c001f7c9cbed3c66c956ef1f41960aa2a030abb41ac9747a8f0c9f98f
    Value: 1

Total Licenses:
  AP-LICENSE
    Value: 263
    Used: 0
  AAP-LICENSE
    Value: 329
    Used: 3

Cluster Licenses:
  AP-LICENSE
    Value: 257
    Used: 0
  AAP-LICENSE
    Value: 257
    Used: 2

Active Members:

<table>
<thead>
<tr>
<th>MEMBER</th>
<th>SERIAL</th>
<th>LIC TYPE</th>
<th>VALUE</th>
<th>LENT</th>
<th>TOTAL</th>
<th>NO.APS</th>
<th>NO.AAPS</th>
</tr>
</thead>
<tbody>
<tr>
<td>00-15-70-5C-FA-3B</td>
<td>6283529900127</td>
<td>AP</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>2</td>
</tr>
<tr>
<td>00-15-70-5C-FA-3B</td>
<td>6283529900127</td>
<td>AAP</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Non-Active Members:

<table>
<thead>
<tr>
<th>MEMBER</th>
<th>SERIAL</th>
<th>LIC TYPE</th>
<th>VALUE</th>
<th>LENT</th>
<th>TOTAL</th>
<th>VALIDITY(HRS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>00-15-70-81-70-1D</td>
<td>7295520400017</td>
<td>AP</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>93 days, 5 hours</td>
</tr>
<tr>
<td>00-15-70-81-70-1D</td>
<td>7295520400017</td>
<td>AAP</td>
<td>51</td>
<td>0</td>
<td>51</td>
<td>93 days, 5 hours</td>
</tr>
</tbody>
</table>
```

In the following example, the 'VALIDITY(HRS)' column specifies the validity period, in days and hours, of a lent license. On a NOC controller, a 'VALIDITY(HRS)' value of ‘current’ implies that the site controller is currently adopted. Whereas, a numerical ‘VALIDITY(HRS)’ value indicates the days and hours the lent license is valid for a site controller that is not reachable.
```bash
rfs7000-37FABE#show licenses lent

### 6.1.39 lldp

Displays Link Layer Discovery Protocol (LLDP) information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

- show lldp [neighbors|report]
- show lldp neighbors {on <DEVICE-NAME>}
- show lldp report {detail|on}
- show lldp report {detail} {on <DEVICE-OR-DOMAIN-NAME>}

#### Parameters

- **show lldp neighbors {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lldp</td>
<td>Displays an LLDP neighbors table or aggregated LLDP neighbors table</td>
</tr>
<tr>
<td>neighbors</td>
<td>Displays an LLDP neighbors table</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays an LLDP neighbors table on a specified device</td>
</tr>
</tbody>
</table>

- **show lldp report {detail} {on <DEVICE-OR-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lldp</td>
<td>Displays an LLDP neighbors table or aggregated LLDP neighbors table</td>
</tr>
<tr>
<td>report</td>
<td>Displays an aggregated LLDP neighbors table</td>
</tr>
<tr>
<td>detail</td>
<td>Displays detailed aggregated LLDP neighbors table</td>
</tr>
<tr>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</td>
<td>The following keyword is recursive and common to the 'report detail' parameter:</td>
</tr>
<tr>
<td></td>
<td>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; — Displays an aggregated LLDP neighbors table on a specified device or RF Domain</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; — Specify the name of the AP, wireless controller, service platform, or RF Domain</td>
</tr>
</tbody>
</table>

#### Examples

```
rfs7000-37FABE(config)#show lldp neighbors
-------------------------
Chassis ID: 00-23-68-22-9D-58
System Name: L3-Router
Platform: RFS-4010-00010-WR, Version 5.8.0.0-022D
Capabilities: Bridge  Router
EnabledCapabilities: Bridge  Router
Local Interface: ge1, Port ID (outgoing port): ge2
TTL: 148 sec
Management Addresses: 10.2.0.1,172.18.0.1
rfs7000-37FABE(config)#
```
6.1.40 logging

Displays the network’s activity log

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show logging {on <DEVICE-NAME>}
```

Parameters

- `show logging {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>logging {on &lt;DEVICE-NAME&gt;}</th>
<th>Displays logging information on a specified device</th>
</tr>
</thead>
</table>

Examples

```
nx9500-6C8809#show logging

Logging module: enabled
Aggregation time: disabled
Console logging: level debugging
Monitor logging: disabled
Buffered logging: level warnings
Syslog logging: level warnings
Facility: local7

## 6.1.41 mac-access-list

Displays MAC access list statistics

### NOTE: This command is not present in USER EXEC mode.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```
show mac-access-list stats {<MAC-ACCESS-LIST-NAME>|on} 
show mac-access-list stats {<MAC-ACCESS-LIST-NAME>} {(on <DEVICE-NAME>)}
```

### Parameters

- **mac-access-list stats** Displays MAC access list statistics
- **<MAC-ACCESS-LIST-NAME>** Optional. Displays statistics for a specified MAC access list. Specify the MAC access list name. **Note:** The system displays all configured ACL statistics if no ACL name is specified.
- **on <DEVICE-NAME>** Optional. Displays all or a specified MAC access list statistics on a specified device
  - **<DEVICE-NAME>** – Specify the name of the AP, wireless controller, or service platform.

### Examples

```
nx6524-5483B0#show mac-access-list stats scalemac acl | i 311  
permit D0-67-E5-3F-C0-00 FF-FF-FF-FF-F0-00 host 00-1E-EC-F2-0A-76 rule-precedence 311  
Hitcount: 0        Hardware Hitcount: 0  
nx6524-5483B0# 
```
6.1.42 mac-address-table

Displays MAC address table entries

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show mac-address-table {on <DEVICE-NAME>}
```

Parameters

- `show mac-address-table {on <DEVICE-NAME>}`
  - `mac-address-table` Displays MAC address table entries
  - `on <DEVICE-NAME>` Optional. Displays MAC address table entries on a specified device
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

Examples

```
rfs7000-6DCD4B(config)#show mac-address-table

Total number of MACs displayed: 20

rfs7000-6DCD4B(config)#
6.1.43 **mac-auth**

Displays details of wired ports that have MAC address authentication enabled.

Use this command to view MAC authentication configuration and authentication state. The command displays the current authentication state of the wired host, the authorization state of the Ge1 port, and the wired hosts’ MAC address. The port status displays as **Authorized** if the wired host has successfully authenticated and **Not Authorized** if the wired host has not authenticated or has failed MAC authentication.

For more information on enabling MAC address authentication on a wired port, see **mac-auth**.

Supported in the following platforms:
- Access Points — AP6511
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

```
show mac-auth {all|interface|on}
```

```
show mac-auth {all|interface [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|t1e1 <1-4>|up <1-2>|vmif <1-X>|xge <1-4>]} {on <DEVICE-NAME>}
```

**Parameters**

- `show mac-auth {all|interface [<INTERFACE-NAME>|ge <1-5>|port-channel <1-3>|t1e1 <1-4>|up <1-2>|vmif <1-X>|xge <1-4>]} {on <DEVICE-NAME>}`

<tr>
<td>[INTERFACE-NAME]</td>
<td>Selects the interface identified by the <code>&lt;INTERFACE-NAME&gt;</code> keyword</td>
</tr>
<tr>
<td>ge &lt;1-5&gt;</td>
<td>Selects the GigabitEthernet interface identified by the index number</td>
</tr>
<tr>
<td>port-channel &lt;1-3&gt;</td>
<td>Selects the port channel interface identified by the index number</td>
</tr>
<tr>
<td>t1e1 &lt;1-4&gt;</td>
<td>Selects the layer 2 interface (Ethernet port)</td>
</tr>
<tr>
<td>up &lt;1-2&gt;</td>
<td>Selects the WAN Ethernet interface identified by the index number</td>
</tr>
<tr>
<td>vmif &lt;1-X&gt;</td>
<td>Selects the <em>virtual machine interface</em> (VMIF) identified by the index number</td>
</tr>
<tr>
<td>xge &lt;1-4&gt;</td>
<td>Selects the TenGigabitEthernet interface identified by the index number</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>The following keywords are common to the ‘all’ and ‘interface’ parameters:</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays MAC authentication related information on a specified device</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Note:** When the ‘on’ keyword is used exclusively, without the ‘all’ and ‘interface’ options, the system displays MAC authentication related information for interfaces configured on the specified device.
Examples
rfs4000-229D58(config)#show mac-auth all
AAA-Policy is none

Mac Auth info for interface GE1

Mac Auth Enabled
Mac Auth Not Authorized

Mac Auth info for interface GE2
-----------------------------------
Mac Auth Disabled
Mac Auth Not Authorized

Mac Auth info for interface GE3
-----------------------------------
Mac Auth Disabled
Mac Auth Not Authorized

Mac Auth info for interface GE4
-----------------------------------
Mac Auth Disabled
Mac Auth Authorized

Mac Auth info for interface UP1
-----------------------------------
Mac Auth Disabled
Mac Auth Not Authorized
rfs4000-229D58(config)#
## 6.1.44 mac-auth-clients

>$\text{show commands}$

Displays MAC authenticated clients

Supported in the following platforms:
- Access Points — AP6511
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

show mac-auth-clients [all|interface]

show mac-auth-clients all {on <DEVICE-NAME>}

show mac-auth-clients interface {<INF-NAME>|ge <1-X>|port-channel <1-2>|vmif <1-8>|xge <1-4>}

**Parameters**

- show mac-auth-clients {all|interface}

<table>
<thead>
<tr>
<th>show mac-auth-clients</th>
<th>Displays MAC authenticated clients based on the parameters passed. The options are: all and interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays MAC authenticated clients for all interfaces</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays MAC authenticated clients for all interfaces on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
<tr>
<td>show mac-auth-clients interface {&lt;INF-NAME&gt;</td>
<td>ge &lt;1-X&gt;</td>
</tr>
<tr>
<td></td>
<td>• &lt;INF-NAME&gt; – Optional. Displays MAC authenticated clients for the interface identified by the &lt;INF-NAME&gt; keyword. Specify the layer 2 (ethernet port) interface name.</td>
</tr>
<tr>
<td></td>
<td>• ge &lt;1-X&gt; – Optional. Displays MAC authenticated clients for the selected GigabitEthernet interface. Specify the GE interface index from 1 - X. This will vary for different device types.</td>
</tr>
<tr>
<td></td>
<td>• port-channel &lt;1-2&gt; – Optional. Displays MAC authenticated clients for the selected port channel interface. Specify the port channel interface index from 1 - 2.</td>
</tr>
<tr>
<td></td>
<td>• vmif &lt;1-8&gt; – Optional. Displays MAC authenticated clients for the selected virtual machine (VM) interface. Specify the VM interface index from 1 - 8.</td>
</tr>
<tr>
<td></td>
<td>• xge &lt;1-4&gt; – Optional. Displays MAC authenticated clients for the selected TenGigabitEthernet interface. Specify the interface index from 1 - 4.</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays MAC authenticated clients for the specified interface on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>
Examples

### 6.1.45 mint

Show MiNT protocol configuration commands

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
show mint [config|id|info|known-adopters|links|lsp|lsp-db|mlcp|neighbors|route|
          stats|tunnel-controller|tunneled-vlans]
          (on <DEVICE-NAME>)
show mint [dis|links|neighbors|tunnel-controller] {details} {on <DEVICE-NAME>}
show mint lsp
show mint lsp-db {details <MINT-ADDRESS>} {(on <DEVICE-NAME>)}
show mint mlcp {history} {(on <DEVICE-NAME>)}
```

#### Parameters

- **mint** Displays MiNT protocol information based on the parameters passed
- **config** Displays MiNT configuration
- **id** Displays local MiNT ID
- **info** Displays MiNT status
- **known-adopters** Displays known, possible, or reachable adopters
- **route** Displays MiNT route table details
- **stats** Displays MiNT related statistics
- **tunneled-vlans** Displays MiNT tunneled VLAN details
- **on <DEVICE-NAME>** The following keywords are common to all of the above parameters:
  - **on <DEVICE-NAME>** — Optional. Displays MiNT protocol details on a specified device
  - **<DEVICE-NAME>** — Specify the name of the AP, wireless controller, or service platform.
- **dis** Displays MiNT network *Designated Intermediate Systems* (DISes) and *Ethernet Virtualization Interconnects* (EVISes)
- **links** Displays MiNT networking link details
<table>

6.1.46 ntp

Displays Network Time Protocol (NTP) information. NTP enables clock synchronization within a network.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7530, NX7520, NX9000, NX9500, NX9510, NX9600

**Syntax**

show ntp [associations|status]
show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]  

**Parameters**

- show ntp [associations {detail|on}|status {on <DEVICE-NAME>}]  

| ntp associations {detail|on} | Displays existing NTP associations. The interaction between the controller or service platform and a SNTP server constitutes an association. SNTP associations are of two kinds: |
|-----------------------------|---------------------------------------------------------------------------------------------------------------|
|                            | - peer associations - where a controller or service platform synchronizes to another system or allows another system to synchronize to it, or |
|                            | - server associations - where only the controller or service platform synchronizes to the SNTP resource, not the other way around. |

- detail – Optional. Displays detailed NTP associations
- on <DEVICE-NAME> – Optional. Displays NTP associations on a specified device
- <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.

**Note:** If the ‘on’ keyword is used without the ‘detail’ keyword, the system displays a summary of existing NTP associations on the specified device or RF Domain.

<table>
<thead>
<tr>
<th>ntp status {on &lt;DEVICE-NAME&gt;}</th>
<th>Displays the performance (status) information relative to the NTP association status. Use this command to view the access point, controller, or service platform’s current NTP resource.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- on &lt;DEVICE-NAME&gt; – Optional. Displays NTP association status on a specified device</td>
</tr>
<tr>
<td></td>
<td>- &lt;DEVICE-NAME&gt; – Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Examples**

```
x9500-6C8809#show ntp associations
---------------------------------------------------------------------------------------
----------------------------

nx9500-6C8809#
### 6.1.47 password-encryption

Displays password encryption status (enabled/disabled)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
show password-encryption status
```

**Parameters**

- `show password-encryption status`

**Examples**

```
rfs7000-37FABE(config)#show password-encryption status
Password encryption is enabled
rfs7000-37FABE(config)#
```
6.1.48 **pppoe-client**

Displays *Point-to-Point Protocol over Ethernet* (PPPoE) client information.

Use this command to view PPPoE statistics derived from access to high-speed data and broadband networks. PPPoE uses standard encryption, authentication, and compression methods as specified by the PPPoE protocol. PPPoE enables point-to-points connection to an ISP over existing Ethernet interface.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```
show pppoe-client [configuration|status] [on <DEVICE-NAME>]
```

### Parameters

- **show pppoe-client [configuration|status] [on <DEVICE-NAME>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pppoe-client</td>
<td>Displays PPPoE client information (configuration and status)</td>
</tr>
<tr>
<td>configuration</td>
<td>Displays detailed PPPoE client configuration</td>
</tr>
<tr>
<td>status</td>
<td>Displays detailed PPPoE client status</td>
</tr>
</tbody>
</table>

**on <DEVICE-NAME>**

The following keywords are common to ‘configuration’ and ‘status’ parameters:

- `on <DEVICE-NAME>` — Optional. Displays detailed PPPoE client status or configuration on a specified device
- `<DEVICE-NAME>` — Specify the name of the AP, wireless controller, or service platform.

### Examples

```
rfs7000-37FABE(config)#show pppoe-client configuration
PPPoE Client Configuration:
+-------------------------------------------
|  Mode          : Disabled                     |
|  Service Name  :                             |
|  Auth Type     : pap                         |
|  Username      :                             |
|  Password      :                             |
|  Idle Time     : 600                         |
|  Keepalive     : Disabled                    |
|  Local n/w     : vlan1                       |
|  Static IP     : 0.0.0.0                     |
|  MTU           : 1492                        |
+-------------------------------------------
```

```
rfs7000-37FABE(config)#
```
### 6.1.49 privilege

**show commands**

Displays a device’s existing privilege level

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
show privilege
```

**Parameters**

None

**Examples**

```plaintext
rfs7000-37FABE(config)#show privilege
Current user privilege: superuser
rfs7000-37FABE(config)#
```
6.1.50 radius

> show commands

Displays the amount of access time consumed and the amount of access time remaining for all guest users configured on a RADIUS server.

Every captive portal guest user can access the captive portal for a specified duration. This results in following three scenarios:

- **Scenario 1:** Access duration not specified (in this case the default of 1440 minutes is applied)
- **Scenario 2:** Access duration is specified and is greater than 0
- **Scenario 3:** Access duration is specified and equals to 0 (in this case the guest user has unlimited access)

In all the three scenarios the access time consumed is the duration for which the guest user has logged.

But the access time remaining varies. It is calculated as follows:

- **Scenario 1 & 2:** It is the lesser of the following two values: difference between the configured access duration and the time consumed AND the time until user account expiration.
- **Scenario 3:** It is the time until user account expiration

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`show radius guest-users {<GUEST-USER-NAME>}`

**Parameters**

- `show radius guest-users {<GUEST-USER-NAME>}`

<table>
<thead>
<tr>
<th>radius guest-users <code>&lt;GUEST-USER-NAME&gt;</code></th>
<th>Displays RADIUS server’s guest user’s access details: total time for which the user has logged in, and the amount of access time remaining.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;GUEST-USER-NAME&gt;</code> — Optional. Provide the name of the guest user (whose access details are to be viewed). If no name is provided, the system displays details of all guest users who have successfully logged in at least once.</td>
<td></td>
</tr>
</tbody>
</table>

Use this command in the captive-portal context to view time and data statistics for guest user(s) having bandwidth-based or time-based vouchers configured. In such a scenario, the system displays the following information: data configured, data remaining, configured and current bandwidths (for both downlink and uplink), time configured, and time remaining. If bandwidth-based voucher is not applicable to a guest user, the data configured and data remaining values are displayed as ‘unlimited’. The bandwidth columns are blank. If time-based voucher is not applicable to a guest user, the only value displayed is the time remaining (which is the time till the expiration of the guest user’s account).

**Note:** For more information on configuring bandwidth-based and time-based vouchers, see `user`.  ```
Examples

rfs4000-229D58#show radius guest-users

<table>
<thead>
<tr>
<th>TIME (min:sec)</th>
<th>USED</th>
<th>REMAINING</th>
<th>GUEST USER</th>
</tr>
</thead>
<tbody>

rfs4000-229D58(config-captive-portal-wdws)#
6.1.51  reload

Displays scheduled reload information for a specific device

NOTE: This command is not present in the USER EXEC mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
show reload {on <DEVICE-OR-DOMAIN-NAME>}

Parameters
- show reload {on <DEVICE-OR-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>reload {on &lt;DEVICE-OR-DOMAIN-NAME&gt;}</th>
<th>Displays scheduled reload information for a specified device</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; – Optional. Displays configuration on a specified device</td>
</tr>
<tr>
<td></td>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config)#show reload
No reload is scheduled.
rfs7000-37FABE(config)#
6.1.52 rf-domain-manager

- `show commands`

Displays RF Domain manager selection details

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

- `show rf-domain-manager {on <DEVICE-OR-DOMAIN-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rf-domain-manager</code></td>
<td>Displays RF Domain manager selection details</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</code></td>
<td>Optional. Displays RF Domain manager selection details on a specified device or domain</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config)#show rf-domain-manager
RF Domain RFDOMAIN_TechPubsLabLan
RF Domain Manager:
  ID: 70.37.FA.BE
  Priority: 180
  Has IP MiNT link
  Has wired MiNT links
Device under query:
  Priority: 180
  Has IP MiNT links
  Has wired MiNT links
rfs7000-37FABE(config)#
```
6.1.53 role

show commands

Displays role based firewall information

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show role [ldap-stats|wireless-clients]
show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}

Parameters

- show role [ldap-stats|wireless-clients] {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>role ldap-stats</th>
<th>Displays LDAP server status and statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays LDAP server status on a specified device</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>role wireless-clients</th>
<th>Displays clients associated with roles</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• on &lt;DEVICE-NAME&gt; – Optional. Displays clients associated with roles on a specified device</td>
</tr>
</tbody>
</table>

Examples

```bash
rfs7000-37FABE(config)#show role wireless-clients
No ROLE statistics found.
rfs7000-37FABE(config)#
```
6.1.54 route-maps

> show commands

Displays route map statistics for defined device routes

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show route-maps {on <DEVICE-NAME>}

Parameters

- show route-maps {on <DEVICE-NAME>}

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>route-maps</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
</tr>
</tbody>
</table>

Note: For more information on route maps, see route-map on page 24-6.

Examples

rfs7000-37FABE(config)#show route-maps
rfs7000-37FABE(config)#
6.1.55 **rtls**

Display Real Time Location Service (RTLS) statistics for access points contributing locationing information.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
show rtls [aeroscout|ekahau] {<MAC/HOSTNAME>} {(on <DEVICE-OR-DOMAIN-NAME>)}
```

**Parameters**
- **rtls** Displays access point RTLS statistics
- **aeroscout** Displays access point Aeroscout statistics
- **ekahau** Displays access point Ekahau statistics
- `<MAC/HOSTNAME>` Optional. Displays Aeroscout or Ekahau statistics for a specified access point. Specify the MAC address or hostname of the access point.
- `<DEVICE-OR-DOMAIN-NAME>` The following keyword is recursive and common to ‘Aeroscout’ and ‘Ekahau’ parameters:
  - **on <DEVICE-OR-DOMAIN-NAME>** – Optional. Displays Aeroscout or Ekahau statistics on a specified device or domain.
  - `<DEVICE-OR-DOMAIN-NAME>` – Specify the name of the AP, wireless controller, service platform, or RF Domain.

**Examples**

rfs4000-229D58(config)#show rtls aeroscout

Aeroscout Engine IP: 0.0.0.0 Port: 0
Send Count : 0
Recv Count : 0
Tag Reports : 0
Nacks : 0
Acks : 0
Lbs : 0
AP Status : 0
AP Notif : 0
Send Err : 0
Errmsg Count : 0

Total number of APs displayed: 1

rfs4000-229D58(config)#
6.1.56 running-config

Displays configuration files (where all configured MAC and IP access lists are applied to an interface)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show running-config {aaa-policy|application-policy|association-acl-policy|
  auto-provisioning-policy|captive-portal-policy|device|device-overrides|
  dhcp-server-policy|dhcpv6-server-policy|ex3500-management-policy|
  ex3500-qos-class-map-policy|ex3500-qos-policy-map|firewall-policy|
  guest-management-policy|include-factory|interface|ip-access-list|ipv6-access-list|
  mac-access-list|management-policy|meshpoint|nsight-policy|profile|radio-qos-policy|
  rf-domain|roaming-assist-policy|smart-cache-policy|smart-rf-policy|url-filter|
  url-list|web-filter-policy|wlan|wlan-qos-policy}
```

```
show running-config {aaa-policy|application-policy|association-acl-policy|
  auto-provisioning-policy|captive-portal-policy|device|device-overrides|
  dhcp-server-policy|dhcpv6-server-policy|ex3500-management-policy|
  ex3500-qos-class-map-policy|ex3500-qos-policy-map|firewall-policy|
  guest-management-policy|include-factory|interface|ip-access-list|ipv6-access-list|
  mac-access-list|management-policy|meshpoint|nsight-policy|profile|radio-qos-policy|
  rf-domain|roaming-assist-policy|smart-cache-policy|smart-rf-policy|url-filter|
  url-list|web-filter-policy|wlan|wlan-qos-policy}{<POLICY-NAME>}{include-factory}
```

```
show application <APPLICATION-NAME>
```

```
show running-config {device [<MAC>|self]} {include-factory}
```

```
show running-config {device-overrides {brief}}
```

```
show running-config {include-factory}
```

```
show running-config {interface} {<INTERFACE-NAME>|ge|include-factory|me|port-channel|
  pppoe1|vlan|wwan1}
```

```
show running-config {interface} {<INTERFACE-NAME>|ge <1-4>|include-factory|
  me1|port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1}{include-factory}
```

```
show running-config {ip-access-list <IP-ACCESS-LIST-NAME>|
  ipv6-access-list <IPv6-ACCESS-LIST-NAME>|mac-access-list <MAC-ACCESS-LIST-NAME>{include-factory}
```

```
show running-config {meshpoint <MESHPOINT-NAME>}{include-factory}
```

```
show running-config {profile [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|
  ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rf54000|rfs6000|rfs7000|
  nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600} {<PROFILE-NAME>}{include-factory}
```

```
show running-config {rf-domain <DOMAIN-NAME>}{include-factory}
```

```
show running-config {wlan <WLAN-NAME>}{include-factory}
```

```
show running-config url-filter <URL-FILTER-NAME>
```

```
show running-config url-list <URL-LIST-NAME> {include-factory}
```
### Parameters

- `show running-config {device [<MAC>|self]} {include-factory}`

- `show running-config {device-overrides {brief}}`

- `show running-config {include-factory}`

- `show running-config {interface} {<INTERFACE-NAME>|ge <1-4>|include-factory|me1|port-channel <1-2>|pppoel|vlan <1-4094>|wwan1} {include-factory}`

<table>
<thead>
<tr>
<th>Description</th>
<th>Optional/Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>running-config</td>
<td>Optional. Displays current running configuration</td>
<td></td>
</tr>
<tr>
<td>device [&lt;MAC&gt;</td>
<td>self]</td>
<td>Optional. Displays device configuration</td>
</tr>
<tr>
<td>include-factory</td>
<td>Optional. Includes factory defaults</td>
<td></td>
</tr>
<tr>
<td>device-overrides {brief}</td>
<td>Optional. Displays overrides applied at the device’s configuration</td>
<td></td>
</tr>
<tr>
<td>interface</td>
<td>Optional. Displays interface configuration</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** If the command is executed without a keyword, the system displays the entire running configuration.

- `<POLICY-TYPE>`
- `<POLICY-NAME>`

  Optional. Select the policy type, for example, aaa-policy, auto-provisioning-policy, captive-portal-policy etc., and then specify the policy name. The system displays the selected policy’s configuration.

  - `<POLICY-NAME>` – Specify the name of the policy (should be existing and configured).

- `<POLICY-TYPE>`

  Optional. Select the policy type, for example, aaa-policy, auto-provisioning-policy, captive-portal-policy etc., and then specify the policy name. The system displays the selected policy’s configuration.

  - `<POLICY-NAME>` – Specify the name of the policy (should be existing and configured).

- `include-factory`

  The following keyword is common to all policies:
  - include-factory – Optional. Includes factory defaults

- `include-factory`

  The following keyword is common to the `<MAC>` and `self` parameters:
  - include-factory – Optional. Includes factory defaults

- `device-overrides {brief}`

  Optional. Displays overrides applied at the device’s configuration

  - brief – Optional. Displays a brief summary of device overrides

- `include-factory`

  Optional. Includes factory defaults

- `interface {<INTERFACE-NAME>|ge <1-4>|include-factory|me1|port-channel <1-2>|pppoel|vlan <1-4094>|wwan1} {include-factory}`

  Optional. Displays a specified interface configuration. Specify the interface name.
<table>
<thead>

</tbody>
</table>

**Profile `<DEVICE-TYPE> <PROFILE-NAME>`**

Optional. Displays current configuration for a specified profile. Select the device type, and then specify the profile name.

- `<DEVICE-TYPE>` – Select the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600.
- `<PROFILE-NAME>` – Specify the profile name for the selected `<DEVICE-TYPE>`.

**Note:** Select the ‘anyap’ option to view the running configuration of any type of device.

- `include-factory` Optional. This parameter is common to all profiles. When selected, it includes factory defaults in the output.

6.1.57 **session-changes**

- **show commands**

Displays configuration changes made in the current session

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show session-changes
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config)#show session-changes
No changes in this session
rfs7000-37FABE(config)#
```
### 6.1.58 session-config

 Commands

- **show commands**

Lists active open sessions on a device

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show session-config {include-factory}
```

**Parameters**

- **show session-config {include-factory}**

  | session-config | Displays current session configuration |
  | include-factory | • include-factory – Optional. Includes factory defaults |

**Examples**

```
nx4500-5CFA2B(config)#show session-config
! Configuration of NX4500 version 5.8.0.0-037B
!
! version 2.3
!
url-list AllowedShopping

nx4500-5CFA2B(config)#
```
6.1.59 sessions

Displays CLI sessions initiated on a device

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

show sessions \{on <DEVICE-NAME>\}

**Parameters**

- show sessions \{on <DEVICE-NAME>\}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sessions</td>
<td>Displays CLI sessions initiated on a device</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays CLI sessions on a specified device</td>
</tr>
</tbody>
</table>

**Examples**

nx4500-5CFA2B>show sessions

<table>
<thead>

nx4500-5CFA2B>
6.1.60 site-config-diff

Displays the difference in site configuration available on the NOC and a site.

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single Network Operations Center (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

NOC controllers possess default site configuration details. Overrides applied at the site level result in a mismatch of configuration at the site and the default site configuration available on the NOC controller. Use this command to view this difference.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

NOTE: This command returns an output only when executed on a NOC controller.

Syntax
show site-config-diff <SITE-NAME>

Parameters
- show site-config-diff <SITE-NAME>

<table>
<thead>
<tr>
<th>site-config-diff &lt;SITE-NAME&gt;</th>
<th>Displays the configuration difference for the specified site</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;SITE-NAME&gt;</td>
<td>&lt;SITE-NAME&gt; – Specify the site name.</td>
</tr>
</tbody>
</table>

Examples
nx9500-6C874D#show site-config-diff 5C-0E-8B-18-06-F4
---- Config diff for switch 5C-0E-8B-18-06-F4 ----
rfs6000 5C-0E-8B-18-06-F4
interface pppoe1
  no shutdown
nx9500-6C874D#
### 6.1.61 smart-rf

#### show commands

Displays Self-Monitoring At Run Time (Smart RF) statistical history to assess adjustments made to device configurations to compensate for detected coverage holes or device failures.

When invoked by an administrator, Smart RF instructs access point radios to change to a specific channel and begin beaconing using the maximum available transmit power. Within a well-planned deployment, any RF Domain member access point radio should be reachable by at least one other radio. Smart RF records signals received from its neighbors as well as signals from external, un-managed radios. AP-to-AP distance is recorded in terms of signal attenuation. The information from external radios is used during channel assignment to minimize interference.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

- `show smart-rf [ap|channel-distribution|history|history-timeline|interfering-ap|interfering-neighbors|radio]
- `show smart-rf ap {<MAC>|<DEVICE-NAME>} {activity|energy|neighbors} {on <DOMAIN-NAME>}
- `show smart-rf ap {<MAC>|<DEVICE-NAME>} {on <DOMAIN-NAME}]
- `show smart-rf radio {<MAC>|<DEVICE-NAME}|all-11an|all-11bgn|channel|energy|neighbors} {on <DOMAIN-NAME>}
- `show smart-rf radio {<MAC>|channel|energy|neighbors} {on <DOMAIN-NAME>}
- `show smart-rf interfering-ap {<MAC}|<DEVICE-NAME>} {on <DOMAIN-NAME>}
- `show smart-rf interfering-neighbors {<MAC}|<DEVICE-NAME>} {on <DOMAIN-NAME}|threshold <50-100>

#### Parameters

- **ap**
  - Displays access point related Smart RF information
- **<MAC>**
  - Optional. Uses MAC addresses to identify access points. Displays all access points, if no MAC address is specified.
- **<DEVICE-NAME>**
  - Optional. Uses an administrator defined name to identify an access point
- **on <DOMAIN-NAME>**
  - Optional. Displays access point details on a specified RF Domain. Specify the domain name.
- **show smart-rf interfering-ap {<MAC}|<DEVICE-NAME>} {on <DOMAIN-NAME>}
  - Displays interfering access points
- **show smart-rf interfering-neighbors {<MAC}|<DEVICE-NAME>} {on <DOMAIN-NAME}|threshold <50-100>
  - Displays interfering neighbors with a threshold
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| activity | Optional. Displays Smart RF activity related information Use this option to view the following:  
  - Time-period – Lists the frequency Smart RF activity is trended for the RF Domain. Trending periods include the current hour, last 24 hours, or the last seven days. Comparing Smart RF adjustments versus the last seven days enables an administrator to assess whether periods of interference and poor performance were relegated to just specific periods.  
  - Power changes – Displays the number of Smart RF initiated power level changes needed for RF Domain member devices during each of the three trending periods. Determine whether power compensations were relegated to known device outages or if compensations were consistent over the course of a day or week.  
  - Channel changes – Lists the number of Smart RF initiated channel changes needed for RF Domain member devices during each of the three trending periods. Determine if channel adjustments were relegated to known device count increases or decreases over the course of a day or week.  
  - Coverage changes – Displays the number of Smart RF initiated coverage changes needed for RF Domain member devices during each of the three trending periods. Determine if coverage changes were relegated to known device failures or known periods of interference over the course of a day or week. |
| energy | Optional. Displays AP energy for a specified AP or all APs Use this option to view an RF Domain member access point’s operating channels, noise level and neighbor count. This information helps assess whether Smart RF neighbor recovery is needed in respect to poorly performing access points. |
| neighbors | Optional. Displays AP neighbors Use this option to view attributes of neighbor radio resources available for Smart RF radio compensations for other RF Domain member device radios.  
  The following keywords are common to all of the above parameters:  
  - `<MAC>` – Displays all of the above mentioned information for a specified AP, identified by its MAC address. Specify the AP’s MAC address.  
  - `<DEVICE-NAME>` – Displays all of the above mentioned information for a specified AP, identified by its hostname. Specify the AP’s hostname. |
| on `<DOMAIN-NAME>` | Optional. Displays access point details on a specified RF Domain. Specify the domain name. |
| channel-distribution | Displays Smart RF channel distribution information. This provides an overview of how RF Domain member devices are utilizing different channels to optimally support connect devices and avoid congestion and interference with neighboring devices. Assess whether the channel spectrum is being effectively utilized and whether channel changes are warranted to improve RF Domain member device performance. |
| history | Displays Smart RF calibration history Use this option to view description and types of Smart RF events impacting RF Domain member devices. |

- `show smart-rf [channel-distribution|history|history-timeline] {on `<DOMAIN-NAME>`} `
<table>

6.1.62 spanning-tree

Displays spanning tree utilization information

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show spanning-tree mst {configuration|detail|instance|on <DEVICE-NAME>}
show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}
show spanning-tree mst {detail} {interface|on}
show spanning-tree mst {detail} interface {<INTERFACE-NAME>|ge <1-4>|me1|
  port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {(on <DEVICE-NAME>)}
show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>}
  {(on <DEVICE-NAME>)}
```

Parameters

- `show spanning-tree mst {configuration|detail|instance|on <DEVICE-NAME>}`
- `show spanning-tree mst {configuration} {(on <DEVICE-NAME>)}`
- `show spanning-tree mst {detail} {interface|on}`
- `show spanning-tree mst {detail} interface {<INTERFACE-NAME>|ge <1-4>|me1|
  port-channel <1-2>|pppoe1|vlan <1-4094>|wwan1} {(on <DEVICE-NAME>)}`
- `show spanning-tree mst {instance <1-15>} {interface <INTERFACE-NAME>}
  {(on <DEVICE-NAME>)}`

<table>
<thead>
<tr>
<th>spanning-tree</th>
<th>Displays spanning tree utilization information</th>
</tr>
</thead>
<tbody>
<tr>

| cpe     | Displays the following details for T5 controller managed CPEs:  
- address — Displays each CPE's current IP address used as its network identifier  
- boot — Displays the primary and secondary firmware versions available to each CPE, along with status of the most recent upgrade operation.  
- ether port status — Displays Ethernet port status  
- led — Displays whether the CPEs currently have their LEDs enabled or disabled. In places like hospitals, its not uncommon for access points to be operational, but their LEDs off as to not disturb patients.  
- reset — Displays the number times a CPE has been reset  
- system — Displays device hardware and SKU information for each CPE. Use this information to assess whether a controller is managing the correct CPE devices out of the total number of CPEs available.  
- uptime — Displays the time each CPE device has been actively deployed and operational  
- version — Displays the application and boot versions utilized by the CPE devices  

Note: Use this screen to verify each CPE address credentials and whether currently disconnected or ready for radio coverage area support.
SHOW COMMANDS 6 - 135

interface Displays T5 interface-related statistics. The interface options are:
- dsl – Displays DSL interface related information
- fe – Displays FE interface related information
- ge – Displays GE interface related information
- radio – Displays radio interface related information

The system displays the following information for the DSL, GE, and FE ports:
- counters – Displays the following:
  - Number of octets (bytes) received and transmitted on this port
  - Number of data packets received and transmitted on this port
  - Number of flow control (layer 2) packets received and transmitted on this port
- description – Displays the following:
  - The selected port’s name
  - The numeric index assignable to each port
  - The 64 character maximum, unique, administrator-assigned description to each port
- status – Displays the following:
  - The selected port’s name
  - Whether the port is currently up or down as a T5 controller transmit and receive resource
  - The port’s current speed in MB
  - Whether pause packet utilization is currently off or on for the port
  - Whether each listed port is enabled or disabled by the administrator
- utilization – Displays the following:
  - The selected port’s name
  - The port’s receive and transmit data rates (in Kbps)
  - A packet per second port receive and transmit rate (p/s)
  - Each port’s receive and transmit direction utilization as a percentage of transmit bandwidth available

The system displays the following information specific to the DSL port:
- custom – Displays the following DSL-related data:
  - Lists each DSL’s average response time in microseconds.
  - Lists each DSL’s maximum (best to date since last refresh) response time in microseconds.
  - Lists the number of seconds downstream DSL transmissions were negatively impacted by code violations.
  - Lists the number of seconds downstream DSL transmissions were severely negatively impacted by code violations.
  - Lists the number of seconds upstream DSL transmissions were negatively impacted by code violations.
  - Lists the number of seconds upstream DSL transmissions were severely negatively impacted by code violations.

Contd..
errors – Displays the following DSL-related errors:
- The name of the DSL utilized by each T5 controller connected CPE device.
- The number of Fecs detected in the downstream direction. *Forward Error Correction* (FEC) or channel coding is used for controlling errors over unreliable or noisy communication channels
- The number of CPE DSL coding violations (badly coded packets) detected in the downstream direction.
- The number of Fecs detected in the upstream direction.
- The number of CPE DSL coding violations (badly coded packets) detected in the upstream direction.

The system displays the following information for each listed radio interface:

- Administrator assigned name of each listed CPE radio as its unique identifier
- Whether the selected radio is currently up or down in its ability be a radio coverage resource for its managing T5 controller
- The factory encoded MAC address
- The configured transmit power
- The current transmit channel

statistics – Displays the following:
- The radio’s receive and transmit data rate (in Kbps). Use this information to assess RF activity versus other T5 managed CPE radios in the same radio coverage area.
- The number of octets (bytes) received and transmitted with no errors by the CPE radio
- The number of data packets received or transmitted by the CPE radio

WLAN map – Displays the following:
- The managed WLAN(s) to which each listed radio has been mapped

6.1.65 **terminal**

- **show commands**

Displays terminal configuration parameters

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show terminal
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config)#show terminal
Terminal Type: xterm
Length: 24     Width: 200
rfs7000-37FABE(config)#
```
6.1.66 timezone

Displays a device’s timezone

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show timezone

Parameters

None

Examples

rfs7000-37FABE(config)#show timezone
Timezone is America/Los_Angeles
rfs7000-37FABE(config)#
6.1.67 **traffic-shape**

> **show commands**

Displays traffic-shaping related configuration details and statistics

Traffic shaping regulates network data transfers to ensure a specific performance level. Traffic shaping delays the flow of packets defined as less important than prioritized traffic streams. Traffic shaping enables traffic control out an interface to match its flow to the speed of a remote target’s interface and ensure traffic conforms applied policies. Traffic can be shaped to meet downstream requirements and eliminate network congestion when data rates are in conflict.

Apply traffic shaping to specific applications to apply application categories. When application and ACL rules are conflicting, ACL rules take precedence for the traffic shaping class. Using traffic shaping, an application takes precedence over an application category.

Supported in the following platforms:

- Access Points — AP622, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530

**Syntax**

```
show traffic-shape [priority-map|statistics {class <1-4>]|status] {on <DEVICE-NAME>}
```

**Parameters**

- **show traffic-shape {priority-map|statistics {class <1-4>]|status} {on <DEVICE-NAME>**

6.1.68 upgrade-status

Show commands

Displays the last image upgrade status

NOTE: This command is not available in the USER EXEC Mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

show upgrade-status \{detail|on\}
show upgrade-status \{detail\} \{(on <DEVICE-NAME>)\}

Parameters

- show upgrade-status \{detail\} \{(on <DEVICE-NAME>)\}

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>upgrade-status</td>
<td>Displays last image upgrade status and log</td>
</tr>
<tr>
<td>detail</td>
<td>Optional. Displays last image upgrade status in detail</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>The following keyword is recursive and common to the &quot;detail&quot; parameter:</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Displays last image upgrade status on a specified device</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, wireless controller, or service platform.</td>
</tr>
</tbody>
</table>

**Note:** If the 'on' keyword is used without the 'detail' keyword, the system displays a summary of upgrade status and log on the specified device.

Examples

rfs4000-229D58(config)#
6.1.69 version

Displays a device’s software and hardware version

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
show version {on <DEVICE-NAME>}
```

Parameters

- show version
- on <DEVICE-NAME> — Optional. Displays software and hardware versions on a specified device
  - <DEVICE-NAME> — Specify the name of the AP, wireless controller, or service platform.

Examples

```
rfs4000-229D58(config)#show version
RFS4000 version 5.8.0.0-037B
Copyright (c) 2004-2015 Symbol Technologies, Inc. All rights reserved.

rfs4000-229D58(config)#
```
### 6.1.70 vrrp

Displays the following *Virtual Router Redundancy Protocol* (VRRP) related statistics: configuration error, router redundancy information in brief and detail. VRRP configuration errors include mismatch of authentication credentials, invalid packet checksums, invalid packet types, invalid virtual route IDs, TTL errors, packet length errors and invalid (non matching) VRRP versions.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

- `show vrrp [brief|details|statss|error-stats] {<1-255>} {on <DEVICE-NAME>}`
- `show vrrp error-stats {on <DEVICE-NAME>}`

### Parameters

- **brief** Displays virtual router information in brief
- **details** Displays virtual router information in detail
- **stats** Displays virtual router statistics
- **<1-255>** The following keyword is common to all of the above parameters:
  - `<1-255>` – Optional. Displays information for a specified Virtual Router. Specify the router’s ID from 1 - 255.
- **on <DEVICE-NAME>** The following keyword is recursive and common to the ‘<1-255>’ parameter:
  - `on <DEVICE-NAME>` – Optional. Displays specified router information on a specified device
  - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

- **error-stats**
  - **{on <DEVICE-NAME>}** Displays global error statistics
    - `<DEVICE-NAME>` – Specify the name of the AP, wireless controller, or service platform.

### Examples

```bash
rfs7000-37FABE(config)#show vrrp error-stats
Last protocol error reason: none
IP TTL errors: 0
Version mismatch: 0
Packet Length error: 0
Checksum error: 0
Invalid virtual router id: 0
Authentication mismatch: 0
Invalid packet type: 0
rfs7000-37FABE(config)#
```
rfs7000-37FABE(config)#show vrrp details
VRRP Group 1:
  version 2
  interface none
  configured priority 1
  advertisement interval 1 sec
  preempt enable, preempt-delay 0
  virtual mac address 00-00-5E-00-01-01
  sync group disable
rfs7000-37FABE(config)#
6.1.71 web-filter

Displays Web filtering related information

Use this command to view information on Web requests for content and whether the requests were blocked or approved based on URL filter settings defined for the selected controller or service platform. A URL filter is comprised of several filter rules. A whitelist bans all sites except the categories and URL lists defined in the whitelist. The blacklist allows all sites except the categories and URL lists defined in the blacklist.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP7131, AP7502, AP7522, AP7532, AP7562, AP8132
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

```
show web-filter [category|category-type|config|filter-level [basic|high|low|medium|medium-high]|statistics {on <DEVICE-NAME>]|status]
```

Parameters

- `show web-filter [category|category-type|config|filter-level [basic|high|low|medium|medium-high]|statistics {on <DEVICE-NAME>}|status]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>web-filter</td>
<td>Displays an existing and configured Web filter details</td>
</tr>
<tr>
<td>category</td>
<td>Displays Web filter categories. A category is a pre-defined URL list available in the WiNG software.</td>
</tr>
<tr>
<td>category-type</td>
<td>Displays the Web filter category types. This is a pre-configured list of categories and sub-categories in which commonly accessed URLs have been classified.</td>
</tr>
<tr>
<td>config</td>
<td>Displays all existing Web filters and their configuration details</td>
</tr>
<tr>
<td>filter-level [basic</td>
<td>high</td>
</tr>
<tr>
<td>statistics {on &lt;DEVICE-NAME&gt;}]</td>
<td>Displays Web filter statistics on a specified device</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Optional. Specifies the device name</td>
</tr>
<tr>
<td>&lt;DEVICE-NAME&gt;</td>
<td>Specify the name of the AP, controller, or service platform.</td>
</tr>
</tbody>
</table>

Note: Web filtering is a licensed feature, and only when enforced can the system display Web filtering statistics.
Examples

nx9500-6C8809#show web-filter category
advertisement-popups
  Sites that provide advertising graphics or other ad content
  files such as banners and pop-ups.
alcohol-tobacco
  Sites that promote or sell alcohol- or tobacco-related
  products or services.
anonymizers
  Sites and proxies that act as an intermediary for surfing to
  other websites in an anonymous fashion, whether to
  circumvent web filtering or for other reasons.
arts
  Sites with artistic content or relating to artistic
  institutions such as theaters, museums, galleries, dance
  companies, photography, and digital graphic resources.
botnets
  Sites that use bots (zombies) including command-and-control
  sites.

### 6.1.72 what

**show commands**

Displays details of a specified search phrase (performs global search)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
show what [contain|is] <WORD> {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

- show what [contain|is] <WORD> {on <DEVICE-OR-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>contain &lt;WORD&gt;</th>
<th>Searches on all the items that contain a specified word</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;WORD&gt; – Specify a word to search (for example, MAC address, hostname etc.).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>is &lt;WORD&gt;</th>
<th>Searches on an exact match</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;WORD&gt; – Specify a word to search (for example, MAC address, hostname etc.).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</th>
<th>Optional. Performs global search on a specified device or RF Domain</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the name of the AP, wireless controller, service platform, or RF Domain.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs4000-229D58#show what contain default
---------------------------------------------------------------------------------------
-------------------------------------------------------------
NO. CATEGORY       MATCHED                        OTHER KEY INFO (1)             OTHER KEY INFO (2)             OTHER KEY INFO (3)             OTHER KEY INFO (4)
NAME/VALUE                     NAME/VALUE                     NAME/VALUE                     NAME/VALUE                     NAME/VALUE                     NAME/VALUE
---------------------------------------------------------------------------------------
-------------------------------------------------------------
1   device-cfg            default-trustpoint             rfs4000                        00-23-68-22-9D-58              default
2   firewall_policy      default                        default                       __obj_name__                   name                           https
3   management_policy    default                        default                        True                          idle_session_timeout

Parameters
• show wireless ap {configured}

<table>
<thead>
<tr>
<th>wireless</th>
<th>Displays wireless configuration parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap</td>
<td>Displays managed access point information</td>
</tr>
<tr>
<td>configured</td>
<td>Optional. Displays configured AP information, such as name, MAC address, profile, RF Domain and adoption status</td>
</tr>
</tbody>
</table>

• show wireless ap {detail} {<MAC/HOST-NAME>} {on <DEVICE-OR-DOMAIN-NAME>}

<table>
<thead>
<tr>
<th>wireless</th>
<th>Displays wireless configuration parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap</td>
<td>Displays managed access point information</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>detail &lt;MAC/HOST-NAME&gt;</th>
<th>Optional. Displays detailed information for all APs or a specified AP</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;MAC/HOST-NAME&gt; – Optional. Displays information for a specified AP. Specify the AP’s MAC address.</td>
<td></td>
</tr>
</tbody>
</table>

on <DEVICE-OR-DOMAIN-NAME> The following keyword is recursive and common to the ‘detail <MAC/HOST-NAME>’ parameter:
• on <DEVICE-OR-DOMAIN-NAME> – Optional. Displays information on a specified device or RF Domain
  • <DEVICE-OR-DOMAIN-NAME> – Specify the name of the AP, wireless controller, service platform, or RF Domain.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show wireless ap</code></td>
<td>Displays wireless configuration parameters</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>Displays managed access point information</td>
</tr>
<tr>
<td>`load-balancing {client-capability</td>
<td>events</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>The following keyword is recursive and common to the 'client-capability', 'events', and 'neighbors' parameters:</td>

<td>• neighbors – Optional. Displays neighboring clients</td>
</tr>
<tr>
<td><code>show wireless bridge</code></td>
<td>Displays wireless configuration statistics</td>
</tr>
<tr>
<td><code>candidate-ap</code></td>
<td>Optional. Displays information about the candidate infrastructure access points as well as the infrastructure access point that the client-bridge radio has selected</td>
</tr>
<tr>
<td><code>&lt;MAC/HOSTNAME&gt; {&lt;1-3&gt;}</code></td>
<td>Note: When enabled, the client-bridge radio scans its defined channels to locate the best candidate access point servicing the infrastructure WLAN.</td>
</tr>
<tr>
<td><code>&lt;RADIO-MAC&gt;</code></td>
<td>Optional. Specify the client-bridge access point’s hostname or MAC address. Optionally append the radio interface’s number to form client-bridge in the form of AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX.</td>
</tr>
<tr>
<td><code>filter radio-mac &lt;RADIO-MAC&gt;</code></td>
<td>• &lt;1-3&gt; – Optional. Radio interface index if not specified as part of mesh ID.</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-OR-DOMAIN-NAME&gt;</code></td>
<td>This is a recursive parameter and common to all of the above options.</td>
</tr>
<tr>
<td><code>certificate status</code></td>
<td>• on &lt;DEVICE-OR-DOMAIN-NAME&gt; – Optional. Executes the command on a specified device or devices within a specified RF Domain</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>• &lt;DEVICE-OR-DOMAIN-NAME&gt; – Specify the AP, controller, service platform, or Domain name.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

*Note:* By default the system only displays the IPv4 address of clients. The include-ipv6 parameter includes the known IPv6 address of each client.

---

A mesh network is where one where each node is able to communicate with other nodes and maintain more than one path to the other mesh nodes within the mesh network. A mesh network provides robust, reliable and redundant connectivity to all the members of the mesh network. When one member of the mesh network becomes unavailable, the other mesh nodes are still able to communicate with one another either directly or indirectly through intermediate nodes.

</tr>
<tr>
<td>show wireless radio {filter &lt;RADIO-MAC&gt;} {on &lt;DEVICE-OR-DOMAIN-NAME&gt;}</td>
<td>Displays wireless configuration parameters</td>
</tr>
</tbody>
</table>

**Usage:**

- `usage-mappings`: Optional. Lists all devices and profiles using the meshpoint
- `on <DEVICE-OR-DOMAIN-NAME>`: Optional. Displays meshpoint applied to a specified device or RF Domain
- `show wireless`: Displays wireless configuration parameters
- `mobility-database`: Displays controller-assisted mobility database
- `on <DEVICE-OR-DOMAIN-NAME>`: The following keyword is recursive and common to the `filter <RADIO-MAC>` parameter:
  - `on <DEVICE-OR-DOMAIN-NAME>`: Optional. Displays detailed radio operation status for all or a specified radio on a specified device or RF Domain.

**Parameters:**

- `radio`: Displays radio operation status and other related information. Use this option to view radio association data, including radio ID, connected APs, radio type, quality index and `Signal to Noise Ratio` (SNR). This data is reported to the managing controller or service platform from connected access point radios and should be refreshed periodically.
  
  A radio’s RF Mode displays as:
  - `2.4GHz-wlan`: If it is configured to provide 2.4 GHz WLAN service
  - `5GHz-wlan`: If it is configured to provide 5.0 GHz WLAN service
  - `bridge`: If it is configured to provide client-bridge operation

- `detail`: Optional. Displays detailed radio operation status
- `<DEVICE-NAME>`: Optional. Displays detailed information for a specified radio. Specify the MAC address or hostname, or append the interface number to form the radio ID in the AA-BB-CC-DD-EE-FF:RX or HOSTNAME:RX format.
- `<1-3>`: Optional. Specify the radio interface index from 1 - 3 (if not specified as part of the radio ID)
- `filter <RADIO-MAC>`: Optional. Provides additional filters
  - `<RADIO-MAC>`: Optional. Filters based on the radio MAC address
- `on <DEVICE-OR-DOMAIN-NAME>`: Optional. After specifying the radio MAC address, further refine the search by specifying a device or RF Domain.
  - `on <DEVICE-OR-DOMAIN-NAME>`: Specify the name of the AP, wireless controller, service platform, or RF Domain.

</tbody>
</table>
- `show wireless unsanctioned aps {detailed|statistics} {(on <DEVICE-OR-DOMAIN-NAME>)}
  - **wireless**: Displays wireless configuration parameters
  - **unsanctioned aps**: Displays unauthorized APs. Use additional filters to view specific details.
  - **detailed**: Optional. Displays detailed unauthorized APs information
  - **statistics**: Optional. Displays channel statistics
  - **on <DEVICE-OR-DOMAIN-NAME>**: The following keyword is common to the ‘detailed’ and ‘statistics’ parameters:
    - **on <DEVICE-OR-DOMAIN-NAME>**: Optional. Specify the name of the AP, wireless controller, service platform, or RF Domain.

- `show wireless wips [client-blacklist|event-history] {on <DEVICE-OR-DOMAIN-NAME>}
  - **wips [client-blacklist|event-history]**: Displays the WIPS details
    - **client-blacklist**: Displays blacklisted clients
    - **event-history**: Displays event history
  - **on <DEVICE-OR-DOMAIN-NAME>**: Optional. Specify the name of the AP, wireless controller, service platform, or RF Domain.

- `show wlan {detail <WLAN>|on <DEVICE-OR-DOMAIN-NAME>|policy-mappings|usage-mappings}
  - **wireless**: Displays wireless configuration parameters
  - **wlan**: Displays WLAN related information based on the parameters passed
    - **detail <WLAN>**: Optional. Displays WLAN configuration
      - **<WLAN>**: Specify the WLAN name.
    - **on <DEVICE-OR-DOMAIN-NAME>**: Optional. Displays WLAN configuration on a specified device or RF Domain
      - **<DEVICE-OR-DOMAIN-NAME>**: Specify the name of the AP, wireless controller, service platform, or RF Domain.
    - **policy-mappings**: Optional. Displays WLAN policy mappings
    - **usage-mappings**: Optional. Lists all devices and profiles using the WLAN
  - **config filter**: Optional. Filters WLAN information based on the device name or RF Domain
    - **device <DEVICE-NAME>**: Optional. Filters WLAN information based on the device name
      - **<DEVICE-NAME>**: Specify the device name.
    - **rf-domain <DOMAIN-NAME>**: Optional. Filters WLAN information based on the RF Domain
      - **<DOMAIN-NAME>**: Specify the RF Domain name.
### Usage Guidelines

The `customize` command enables you to customize the `show > wireless` command output.

```
rfs7000-37FABE(config)#customize ?
  hostname-column-width                          Customize hostname column width
  show-adoption-status                           Customize the output of (show adoption status) command
  show-wireless-client                          Customize the output of (show wireless client) command
  show-wireless-client-stats                    Customize the output of (show wireless client stats) command
  show-wireless-client-stats-rf                 Customize the output of (show wireless client stats rf) command
  show-wireless-legacy-mesh-client-stats        Customize the output of (show wireless mint client stats) command
  show-wireless-legacy-mesh-client-stats-detail Customize the output of (show wireless mint client stats detail) command
  show-wireless-legacy-mesh-client-stats-rf      Customize the output of (show wireless mint client stats rf) command
  show-wireless-meshpoint                       Customize the output of (show wireless meshpoint) command
  show-wireless-meshpoint-accelerated-multicast Customize the output of (show wireless meshpoint accelerated-multicast) command
  show-wireless-meshpoint-neighbor-stats        Customize the output of (show wireless meshpoint neighbor stats) command
  show-wireless-meshpoint-neighbor-stats-rf     Customize the output of (show wireless meshpoint neighbor stats rf) command
  show-wireless-radio                           Customize the output of (show wireless radio) command
  show-wireless-radio-stats                     Customize the output of (show wireless radio stats) command
  show-wireless-radio-stats-rf                  Customize the output of (show wireless radio stats rf) command
```

```bash
rfs7000-37FABE(config)#
```
The default setting for the show > wireless > client command is as follows:

```bash
rfs7000-37FABE(config)#show wireless client
----------------------------------------
MAC           IPv4    VENDOR             RADIO-ID             WLAN                 VLAN         STATE
----------------------------------------
----------------------------------------
Total number of wireless clients displayed: 0
rfs7000-37FABE(config)#
```

The above output can be customized, using the customize > show-wireless-client command, as follows:

```bash
rfs7000-37FABE(config)#customize show-wireless-client mac ip vendor vlan radio-id state wlan location radio-alias radio-type
rfs7000-37FABE(config)#commit
```

```bash
rfs7000-37FABE(config)#show wireless client
----------------------------------------
MAC                IP    VENDOR             VLAN  RADIO-ID             STATE WLAN
AP-LOCATION     RADIO                RADIO-TYPE
----------------------------------------
----------------------------------------
----------------------------------------
Total number of wireless clients displayed: 0
rfs7000-37FABE(config)#
```

For more information on the customize command, see.

### Examples

```bash
nx9500-6C8809(config)#show wireless wlan config
----------------------------------------
NAME   ENABLE   SSID   ENCRYPTION   AUTHENTICATION   VLAN     BRIDGING MODE
----------------------------------------
test   Y        test   wep64        none             1      local
----------------------------------------
nx9500-6C8809(config)#
```

```bash
nx9500-6C8809(config)#show wireless wips client-blacklist
No wireless clients blacklisted
nx9500-6C8809(config)#
```

```bash
rfs7000-37FABE(config)#show wireless regulatory channel-info 1
Center frequency for channel 1 is 2412MHz
rfs7000-37FABE(config)#
```

```bash
nx9500-6C8809(config)#show wireless regulatory country-code
----------------------------------------

NX9500(config)#
6.1.74  **wwan**

Displays wireless WAN status

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}
```

**Parameters**

- **show wwan [configuration|status] {on <DEVICE-OR-DOMAIN-NAME>}
  
<table>
<thead>
<tr>
<th>wwan</th>
<th>Displays wireless WAN configuration and status details</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Displays wireless WAN configuration information</td>
</tr>
<tr>
<td>status</td>

</tr>
<tr>
<td></td>
<td>on &lt;DEVICE-OR-DOMAIN-NAME&gt; — Optional. Displays configuration or status details on a specified device or RF Domain</td>
</tr>
</tbody>
</table>

**Examples**

```
> rfs4000-229D58(config-device-00-23-68-22-9D-58)#show wwan configuration
>>> WWAN Configuration:
| Access Port Name | isp.cingular |
| User Name        | testuser     |
| Cryptomap        | map1         |

> rfs4000-229D58(config-device-00-23-68-22-9D-58)#show wwan status
>>> WWAN Status:
| State : ACTIVE |
| DNS1 : 209.183.54.151 |
| DNS2 : 209.183.54.151 |

> rfs4000-229D58(config-device-00-23-68-22-9D-58)#show wwan configuration
>>> WWAN Configuration:
| Access Port Name | None      |
| User Name        | None      |

> rfs7000-37FABE(config)#show wwan configuration
>>> WWAN Configuration:
| Access Port Name | None      |
| User Name        | None      |
```

**wwan** Displays wireless WAN configuration and status details

**configuration** Displays wireless WAN configuration information

**status** Displays wireless WAN status information

**on <DEVICE-OR-DOMAIN-NAME>** The following keyword is common to the ‘configuration’ and ‘status’ parameters:

| on <DEVICE-OR-DOMAIN-NAME> | — Optional. Displays configuration or status details on a specified device or RF Domain |
6.1.75 **slot**

*show commands*

Displays *Peripheral Component Interconnect* (PCI) express slot statistics. Use this command to view if the slots have been used for Team-Centro VM or WiNG support.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

`show slot`

**Parameters**

- `show slot`

**Examples**

```
nx4500-5CFA2B>show slot
----------------------------
SLOT  TYPE  MODULE   STATUS
----------------------------
  1    [ ]  wing   Enabled
  2    [ ]  wing   Enabled
  3    [ ]  wing   Enabled
  4    [ ]  wing   Enabled
----------------------------
nx4500-5CFA2B>
```

`show slot` Shows PCI express card statistics
### 6.1.76 smart-cache

*show commands*

Displays details on the cached entry for a specific URL or all URLs

> **NOTE:** Smart content caching is a licensed feature and can be enabled only if a license is procured and applied to the device. For more information, see `smart-cache-policy`.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
show smart-cache [active-requests|clients|purge-requests|statistics content-type|storage] {on <DEVICE-NAME>}
```

#### Parameters

- `show smart-cache [active-requests|clients|purge-requests|statistics content-type|storage] {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>smart-cache</td>
<td>Displays smart-cache related information</td>
</tr>
<tr>
<td>active-requests</td>
<td>Displays all current in-progress requests</td>
</tr>
<tr>
<td>clients</td>
<td>Displays all clients since the boot-up</td>
</tr>
<tr>
<td>purge-requests</td>
<td>Displays all requests that have been purged (cleared)</td>
</tr>
<tr>
<td>statistics content-type</td>
<td>Displays detailed cached content statistics</td>
</tr>
<tr>
<td>storage</td>
<td>Displays storage statistics in KB</td>
</tr>
<tr>
<td>on &lt;DEVICE-NAME&gt;</td>
<td>Displays smart-cache related information on a specified device</td>
</tr>
</tbody>
</table>

> **NOTE:** `<DEVICE-NAME>` – Specify the name of the access point, wireless controller, or service platform.

#### Examples

```
nx4500-5CFA2B> show smart-cache statistics
Warning: no smart-cache license installed, smart-cache is not running.
Warning: name-server not configured, smart-cache may not work!
```

nx4500-5CFA2B#
6.1.77 virtual-machine

show commands

Displays the virtual-machine (VM) configuration, logs, and statistics

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510

Syntax

show virtual-machine [configuration|debugging|export|statistics]

show virtual-machine [configuration|statistics] {<VM-NAME>|team-urc|team-rls|team-vowlan} {(on <DEVICE-NAME>)}

show virtual-machine debugging {level|on}

show virtual-machine debugging {level [debug|error|info|warning]} {on <DEVICE-NAME>}

show virtual-machine export <VM-NAME> {on <DEVICE-NAME>}

The NX9500 and NX9510 series service platforms support ADSP and TEAM-CMT virtual machines only. The following show commands are specific to the NX9500 and NX9510 devices:

show virtual-machine [configuration|statistics] {<VM-NAME>|adsp|team-cmt}

Parameters

- show virtual-machine [configuration|statistics] {<VM-NAME>|team-urc|team-rls|team-vowlan} {(on <DEVICE-NAME>)}

<table>
<thead>
<tr>

</tbody>
</table>

The following keywords are common to the ‘configuration’ and ‘statistics’ parameters:

- <VM-NAME> – Optional. Displays VM configuration or statistics for the virtual machine identified by the <VM-NAME> keyword. Specify the VM name.
- team-urc – Optional. Displays TEAM-URC (IP-PBX) VM configuration/statistics
- team-rls – Optional. Displays TEAM-RLS (Radio Link Server) VM configuration/statistics
- team-vowlan – Optional. Displays TEAM-VoWLAN (Voice over WLAN) VM configuration/statistics

Note: These keywords are specific to the NX45XX and NX65XX series service platforms.

6.1.78 mirroring

`show commands`

Displays the port mirroring sessions

For more information on configuring port mirroring sessions, see `mirror`.

Supported in the following platforms:

- Service Platforms — NX4524, NX6524

**Syntax**

`show mirroring`

**Parameters**

- `show mirroring`

**Examples**

```
nx4524-470984# show mirroring
--------------------------------------------------
Session  Source  Destination  Direction
--------------------------------------------------
1        ge3     ge24        any
2        ge7     ge24        inbound
3        ge5     ge24        outbound
--------------------------------------------------
nx4524-470984#
```
6.1.79 raid

> show commands

Displays Redundant Array of Independent Disks (RAID) related information, such as array status, consistency check status, and RAID log.

Use this command to assess the RAID array's drive utilization and whether the drives are currently online. Since there is only one RAID array controller reporting status to the service platform, it is important to know if other drives house hot spare drives as additional resources should one of the dedicated drives fail. This command also displays whether a physical within the RAID array has a drive installed, and whether the drive is currently online.

For more information on configuring RAID, see `raid`.

Supported in the following platforms:
- Service Platforms — NX9500

Syntax

```
show raid {on <DEVICE-NAME>}
```

Parameters

- `show raid {on <DEVICE-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show raid</code></td>
<td>Displays the RAID array status and statistics</td>
</tr>
<tr>
<td><code>on &lt;DEVICE-NAME&gt;</code></td>
<td>Optional. Displays RAID status and statistics on a specified device</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C874D(config)#show raid
Logical drive info:
  Size 930 GB, State optimal
  Alarm enabled
  Last check: Sat Aug 10 02:56:54 2013
  Last check result: ending

Physical drive info:
  Drive  0: online
  Drive  1: online
  Drive  2: not-installed
  Drive  3: not-installed
  Drive  4: not-installed
```

nx9500-6C874D(config)#
Profiles enable administrators to assign a common set of configuration parameters, policies, WLANs, wireless parameters, and security parameters to service platforms, wireless controllers, and access points across a large, multi segment, site. The configuration parameters within a profile are based on the hardware model the profile was created to support.

The service platforms, wireless controllers, and access points support both default and user-defined profiles. Each default and user-defined profile contains policies and configurations that are applied to devices assigned to the profile. Changes made to these configurations are automatically inherited by the assigned devices. Therefore, the central benefit of a profile is its ability to update devices collectively without having to modify individual device configurations.

Default profiles are system maintained and are automatically applied to service platforms and wireless controllers. The default AP profile is automatically applied to a AP (discovered by a wireless controller or service platform) unless an AP auto provisioning policy is defined specifically assigning the AP to a user-defined profile. After adoption, changes made to a profile’s parameters are reflected across all devices using the profile. Default profiles are ideal for single site deployments where service platforms, wireless controllers, and access points share a common configuration.

User-defined profiles, on the other hand, are manually created for each supported service platform, wireless controller, and access point model. The use of user-defined profiles is recommended in larger deployments when groups of devices (on different floors, buildings or sites) share a common configuration. These user-defined profiles can be manually or automatically assigned to access points using an AP auto provisioning policy. An AP auto provisioning policy provides the means to assign profiles to access points based on model, serial number, VLAN ID, DHCP options, IP address (subnet) and MAC address. For more information, see *Chapter 9, AUTO-PROVISIONING-POLICY*.

A user defined profile can be created for each of the following device type:

- AP621 – Adds an AP621 access point profile
- AP622 – Adds an AP622 access point profile
- AP650 – Adds an AP650 access point profile
- AP6511 – Adds an AP6511 access point profile
- AP6521 – Adds an AP6521 access point profile
- AP6522 – Adds an AP6522 access point profile
- AP6532 – Adds an AP6532 access point profile
- AP6562 – Adds an AP6562 access point profile
- AP71XX – Adds an AP71XX access point profile supporting the AP7131, AP7161, and AP7181 models
- AP7502 – Adds an AP7502 access point profile
- AP7522 – Adds an AP7522 access point profile
- AP7532 – Adds an AP7532 access point profile
- AP7562 – Adds an AP7562 access point profile
- AP81XX – Adds an AP81XX access point profile supporting the AP8122, AP8132, and AP8163 models
- AP82XX – Adds an AP82XX access point profile supporting the AP8222 and AP8232 models
- EX3524 – Adds an EX3524 wireless controller profile
- EX3548 – Adds an EX3548 wireless controller profile
- RFS4000 – Adds an RFS4000 wireless controller profile
- RFS6000 – Adds an RFS6000 wireless controller profile
- RFS7000 – Adds an RFS7000 wireless controller profile
- NX45XX – Adds an NX45XX series service platform profile supporting the NX4500 and NX4524 models
- NX5500 – Adds an NX5500 wireless controller profile
- NX65XX – Adds an NX65XX series service platform profile supporting the NX6500 and NX6524 models
- NX7500 – Adds an NX75XX series service platform profile supporting the NX7510, NX7520, and NX7530 models
- NX9XXX – Adds an NX9XXX series service platform profile supporting the NX9000, NX9500, and NX9510 models
- NX9600 – Adds an NX9600 service platform profile. Supported only on a NX9600 model device.
- T5 – Adds a T5 controller profile
- vx9000 – Adds a VX9000 profile

**NOTE:** A T5 profile can be created only on the following platforms: RFS4000, RFS6000, RFS7000, NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, and NX9510.

**NOTE:** A VX9000 profile can be created only on the NX9000 series service platforms.

Although profiles assign a common set of configuration parameters across devices, individual devices can still be assigned unique configuration parameters that follow the flat configuration model. As individual device updates are made, these devices no longer share the profile based configuration they originally supported. Therefore, changes made to a profile are not automatically inherited by devices who have had their configuration customized. These devices require careful administration, as they cannot be tracked as profile members. Their customized configurations overwrite their profile configurations until the profile is re-applied.

**NOTE:** The commands present under ‘Profiles’ are also available under the ‘Device mode’. The additional commands specific to the ‘Device mode’ are listed separately.

This chapter is organized into the following topics:
- Profile Config Commands
- Device Config Commands
- T5 Profile Config Commands
- EX3524 & EX3548 Profile/Device Config Commands
To view the list of device profiles supported, use the following command:

```
<DEVICE>(config)#profile ?
```

```
anyap       Any access point profile
ap621       AP621 access point profile
ap622       AP622 access point profile

<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#

<DEVICE>(config-profile-<PROFILE-NAME>)#?
Profile Mode commands:
- adopter-auto-provisioning-policy-lookup: Use centralized auto-provisioning policy when adopted by another controller
- adoption: Adoption configuration
- alias: Alias
- application-policy: Application Policy configuration
- area: Set name of area where the system is located
- arp: Address Resolution Protocol (ARP)
- auto-learn-staging-config: Enable learning network configuration of the devices that come for adoption
- autogen-uniqueid: Autogenerate a unique id
- autoinstall: Autoinstall settings
- bluetooth-detection: Detect Bluetooth devices using the Bluetooth USB module
- bridge: Ethernet bridge
- captive-portal: Captive portal
- cdp: Cisco Discovery Protocol
- cluster: Cluster configuration
- configuration-persistence: Enable persistence of configuration across reloads (startup config file)
- controller: WLAN controller configuration
- critical-resource: Critical Resources
- database-backup: Scheduled Database Backup
- crypto: Encryption related commands
- device-upgrade: Device firmware upgrade
- dot1x: 802.1X
- dpi: Enable Deep-Packet-Inspection (Application Assurance)
- dscp-mapping: Configure IP DSCP to 802.1p priority mapping for untagged frames
- email-notification: Email notification configuration
- enforce-version: Check the firmware versions of devices before interoperating
- environmental-sensor: Environmental Sensors Configuration
- events: System event messages
- export: Export a file
- file-sync: File sync between controller and adoptees
- floor: Set the floor within a area where the system is located
- gre: GRE protocol
- http-analyze: Specify HTTP-Analysis configuration
- interface: Select an interface to configure
- ipv6: Internet Protocol version 6 (IPv6)
- l2tpv3: L2tpv3 protocol
- l3e-lite-table: L3e lite Table
- led: Turn LEDs on/off on the device
- led-timeout: Configure the time for the led to turn off after the last radio state change
- legacy-auto-downgrade: Enable device firmware to auto downgrade when other legacy devices are detected
- legacy-auto-update: Auto upgrade of legacy devices

no                                            Negate a command or set its defaults
power                                         Ex3500 Power over Ethernet Command
upgrade                                       Configures upgrade option for ex3500 system
use                                           Set setting to use

clrscr                                        Clears the display screen
commit                                        Commit all changes made in this session
do                                             Run commands from Exec mode
end                                           End current mode and change to EXEC mode
exit                                          End current mode and down to previous mode
help                                          Description of the interactive help system
revert                                        Revert changes
service                                       Service Commands
show                                          Show running system information
write                                         Write running configuration to memory or terminal

NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
## 7.1 Profile Config Commands

The following table summarizes profile configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>adopter-auto-provisioning-policy-lookup</td>
<td>Enables the use of a centralized auto provisioning policy on this profile</td>
<td>page 7-11</td>
</tr>
<tr>
<td>adoption</td>
<td>Configures a minimum and maximum delay time in the initiation of the device adoption process</td>
<td>page 7-12</td>
</tr>
<tr>
<td>alias</td>
<td>Configures network, network-group, network-service, VLAN, and string aliases on this profile</td>
<td>page 7-13</td>
</tr>
<tr>
<td>application-policy</td>
<td>Associates a RADIUS server provided application policy with this profile. When associated, the application policy allows wireless clients (MUs) to always find the RADIUS-supplied application policy in the dataplane.</td>
<td>page 7-19</td>
</tr>
<tr>
<td>area</td>
<td>Sets the system’s area of location (the area name)</td>
<td>page 7-20</td>
</tr>
<tr>
<td>arp</td>
<td>Configures static address resolution protocol</td>
<td>page 7-21</td>
</tr>
<tr>
<td>auto-learn-staging-config</td>
<td>Enables network configuration learning of devices</td>
<td>page 7-23</td>
</tr>
<tr>
<td>autogen-uniqueid</td>
<td>Autogenerates a unique local ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device.</td>
<td>page 7-24</td>
</tr>
<tr>
<td>autoinstall</td>
<td>Configures the automatic install feature</td>
<td>page 7-26</td>
</tr>
<tr>
<td>bluetooth-detection</td>
<td>Enables detection of Bluetooth devices. These are devices using the Bluetooth USB module.</td>
<td>page 7-27</td>
</tr>
<tr>
<td>captive-portal</td>
<td>Configures captive portal advanced Web page upload on a device profile</td>
<td>page 7-55</td>
</tr>
<tr>
<td>cdp</td>
<td>Enables <em>Cisco Discovery Protocol</em> (CDP) on a device</td>
<td>page 7-56</td>
</tr>
<tr>
<td>cluster</td>
<td>Configures a cluster name</td>
<td>page 7-57</td>
</tr>
<tr>
<td>configuration-persistence</td>
<td>Enables persistence of configuration across reloads</td>
<td>page 7-60</td>
</tr>
<tr>
<td>controller</td>
<td>Configures a wireless controller or service platform</td>
<td>page 7-61</td>
</tr>
<tr>
<td>critical-resource</td>
<td>Monitors resources that are critical to the health of the service platform, wireless controller, or access point managed network. These critical resources are identified by their configured IP addresses.</td>
<td>page 7-66</td>
</tr>
<tr>
<td>crypto</td>
<td>Configures data encryption related protocols and settings</td>
<td>page 7-69</td>
</tr>
</tbody>
</table>
### Table 7.1 Profile-Config Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>database-backup</td>
<td>Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server. When applied to devices, this profile will enable the back up of the specified database.</td>
<td>page 7-132</td>
</tr>
<tr>
<td>device-upgrade</td>
<td>Configures device firmware upgrade settings on this profile</td>
<td>page 7-133</td>
</tr>
<tr>
<td>dot1x</td>
<td>Configures 802.1x standard authentication controls</td>
<td>page 7-135</td>
</tr>
<tr>
<td>dpi</td>
<td>Enables Deep Packet Inspection (DPI) on this profile</td>
<td>page 7-137</td>
</tr>
<tr>
<td>dscp-mapping</td>
<td>Configures an IP DSCP to 802.1p priority mapping for untagged frames</td>
<td>page 7-139</td>
</tr>
<tr>
<td>email-notification</td>
<td>Configures e-mail notification settings</td>
<td>page 7-140</td>
</tr>
<tr>
<td>enforce-version</td>
<td>Enables checking of a device’s firmware version before attempting adoption or clustering</td>
<td>page 7-142</td>
</tr>
<tr>
<td>environmental-sensor</td>
<td>Configures the environmental sensor settings on this profile (applicable to AP8132 model access point only)</td>
<td>page 7-144</td>
</tr>
<tr>
<td>events</td>
<td>Enables system event logging and message generation. This command also configures event message forwarding settings.</td>
<td>page 7-146</td>
</tr>
<tr>
<td>export</td>
<td>Enables export of startup.log file after every boot</td>
<td>page 7-147</td>
</tr>
<tr>
<td>file-sync</td>
<td>Configures parameters enabling synching of PKCS#12 certificate between the staging-controller and adoptee AP6522/AP6562 client bridges</td>
<td>page 7-148</td>
</tr>
<tr>
<td>floor</td>
<td>Sets the floor name where the system is located</td>
<td>page 7-149</td>
</tr>
<tr>
<td>gre</td>
<td>Enables Generic Routing Encapsulation (GRE) tunneling on this profile</td>
<td>page 7-150</td>
</tr>
<tr>
<td>http-analyze</td>
<td>Configures HTTP analysis settings</td>
<td>page 7-162</td>
</tr>
<tr>
<td>http-analyze (NX45XX, NX65XX, and NX9000)</td>
<td>Configures HTTP analysis settings on a NX series service platform</td>
<td>page 7-163</td>
</tr>
<tr>
<td>interface</td>
<td>Configures an interface (VLAN, radio, GE etc.)</td>
<td>page 7-166</td>
</tr>
<tr>
<td>ip</td>
<td>Configures IPv4 components</td>
<td>page 7-348</td>
</tr>
<tr>
<td>ipv6</td>
<td>Configures IPv6 components</td>
<td>page 7-357</td>
</tr>
<tr>
<td>l2tpv3</td>
<td>Defines the Layer 2 Tunnel Protocol (L2TP) protocol for tunneling layer 2 payloads using Virtual Private Networks (VPNs)</td>
<td>page 7-361</td>
</tr>
<tr>
<td>l3e-lite-table</td>
<td>Configures L3e Lite Table with this profile</td>
<td>page 7-363</td>
</tr>
<tr>
<td>led</td>
<td>Turns device LEDs on or off</td>
<td>page 7-364</td>
</tr>
<tr>
<td>led-timeout</td>
<td>Configures LED-timeout timer. This command is specific to the NX9000 series service platforms.</td>
<td>page 7-365</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>

<td>Auto downgrades a legacy device firmware</td>
<td>page 7-367</td>
</tr>
<tr>
<td>legacy-auto-update</td>
<td>Auto upgrades a legacy device firmware</td>
<td>page 7-368</td>
</tr>
<tr>
<td>ldtp</td>
<td>Configures Link Layer Discovery Protocol (LLDP)</td>
<td>page 7-369</td>
</tr>
<tr>
<td>load-balancing</td>
<td>Configures load balancing parameters</td>
<td>page 7-371</td>
</tr>
<tr>
<td>logging</td>
<td>Modifies message logging settings</td>
<td>page 7-376</td>
</tr>
<tr>
<td>mac-address-table</td>
<td>Configures the MAC address table</td>
<td>page 7-378</td>
</tr>
<tr>
<td>mac-auth</td>
<td>Enables 802.1x user authentication protocol on this profile</td>
<td>page 7-380</td>
</tr>
<tr>
<td>memory-profile</td>
<td>Configures the memory profile used on the device</td>
<td>page 7-383</td>
</tr>
<tr>
<td>meshpoint-device</td>
<td>Configures a meshpoint device parameters</td>
<td>page 7-384</td>
</tr>
<tr>
<td>meshpoint-monitor-interval</td>
<td>Configures meshpoint monitoring interval</td>
<td>page 7-385</td>
</tr>
<tr>
<td>min-misconfiguration-</td>
<td>Configures the minimum device connectivity verification time</td>
<td>page 7-386</td>
</tr>
<tr>
<td>recovery-time</td>
<td></td>
<td></td>
</tr>
<tr>
<td>mint</td>
<td>Configures MiNT protocol settings</td>
<td>page 7-387</td>

</tr>
<tr>
<td></td>
<td>system to tunnel extended VLAN traffic</td>
<td></td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>radius</td>
<td>Configures device-level RADIUS authentication parameters</td>
<td>page 7-408</td>
</tr>
<tr>
<td>raid</td>
<td>Enables alarm on the array. This command is supported only on the NX9500 and NX9510 series service platform profile/device config modes.</td>
<td>page 7-478</td>
</tr>
<tr>
<td>remove-override</td>
<td>Removes device-specific overrides. This command specifically removes the overrides applied on a device relating to the blue-tooth-detection and offline-duration options.</td>
<td>page 7-409</td>
</tr>
<tr>
<td>rf-domain-manager</td>
<td>Enables devices using this profile to be elected as RF Domain manager. Also sets the priority value for devices using this profile in the RF Domain manager election process.</td>
<td>page 7-410</td>
</tr>
<tr>
<td>router</td>
<td>Configures dynamic router protocol settings</td>
<td>page 7-411</td>
</tr>
<tr>
<td>spanning-tree</td>
<td>Configures spanning tree related settings</td>
<td>page 7-413</td>
</tr>
<tr>
<td>traffic-class-mapping</td>
<td>Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority</td>
<td>page 7-416</td>
</tr>
<tr>
<td>traffic-shape</td>
<td>Enables traffic shaping and configures traffic shaping parameters</td>
<td>page 7-418</td>
</tr>
<tr>
<td>trustpoint (profile-config-mode)</td>
<td>Configures the trustpoint assigned for validating a CMP auth Operator</td>
<td>page 7-423</td>
</tr>
<tr>
<td>trustpoint (device-config-mode)</td>
<td>Assigns trustpoints to validate various services, such as HTTPS, RADIUS CA, RADIUS server, external LDAP server etc.</td>
<td>page 7-425</td>
</tr>
<tr>
<td>tunnel-controller</td>
<td>Configures the name of tunneled WLAN (extended VLAN) wireless controller or service platform</td>
<td>page 7-427</td>
</tr>
<tr>
<td>use</td>
<td>Uses pre configured policies with this profile</td>
<td>page 7-428</td>
</tr>
<tr>
<td>vrrp</td>
<td>Configures Virtual Router Redundancy Protocol (VRRP) group settings</td>
<td>page 7-433</td>
</tr>
<tr>
<td>vrrp-state-check</td>
<td>Publishes interface via OSPF or BGP based on VRRP status</td>
<td>page 7-437</td>
</tr>
<tr>
<td>wep-shared-key-auth</td>
<td>Enables support for 802.11 WEP shared key authentication</td>
<td>page 7-438</td>
</tr>
<tr>
<td>service</td>
<td>Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode</td>
<td>page 7-439</td>
</tr>
<tr>
<td>slot</td>
<td>Assigns a physical slot for running Team-Centro VM on this profile/device. This feature is support only on the NX45XX and NX65XX series service platforms.</td>
<td>page 7-409</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
7.1.1 adopter-auto-provisioning-policy-lookup

Profile Config Commands

Enables the use of a centralized auto provisioning policy on this profile or device. This option is applicable in an hierarchically managed (HM) network. When enabled, the auto-provisioning policy applied on the NOC gets precedence over the one applied at the site controller level. Optionally, use the 'evaluate-always' option to set flag to run centralized auto-provisioning policy every time a device (access point/controller) is adopted. The device's previous adoption status is not taken into consideration.

When applied on devices adopted by a controller, this profile allows the devices to use a centralized auto provisioning policy.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

adopter-auto-provisioning-policy-lookup {evaluate-always}

Parameters

- adopter-auto-provisioning-policy-lookup {evaluate-always}

adopter-auto-provisioning-policy-lookup
{evaluate-always}

<table>
<thead>
<tr>
<th>adopter-auto-provisioning-policy-lookup {evaluate-always}</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables the use of a centralized auto provisioning policy on this profile or device.</td>
</tr>
<tr>
<td>• evaluate-always – Optional. Sets flag to run centralized auto-provisioning policy every time a device (access point/controller) is adopted.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
7.1.2 adoption

Profile Config Commands

Configures a minimum and maximum delay time in the initiation of the device adoption process. When configured, devices do not attempt adoption immediately on coming up. The process is initiated after the lapse of a specified period of time (configured using this command as the start-delay command).

Once configured and applied, this setting is applicable on all devices using this profile. This option is also available in the device-configuration mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

adoption start-delay min <0-30> max <0-30>

Parameters

- adoption start-delay min <0-30> max <0-30> Delays start of device adoption process
  - min <0-30> — Configures the minimum time to lapse before a device attempts adoption. Specify a value from 0 - 30 seconds. A device, on coming up, attempts adoption only after the lapse of the time specified here. The default is 5 seconds.
  - max <0-30> — Configures the maximum time to lapse before a device attempts adoption. Specify a value from 0 - 30 seconds. The default is 20 seconds.

Examples

rfs7000-6DCD4B(config-profile-default-rfs7000)# adoption start-delay min 10 max 30
rfs7000-6DCD4B(config-profile-default-rfs7000)#
profile rfs7000 default-rfs7000
  autoinstall configuration
  autoinstall firmware
  crypto ikev1 policy ikev1-default
  isakmp-proposal default encryption aes-256 group 2 hash sha
  ........................................
  interface ge2
  interface ge3
  interface ge4
  interface pppoe1
  use firewall-policy default
  service pm sys-restart
  adopter-auto-provisioning-policy-lookup evaluate-always
  router ospf
  adoption start-delay min 10 max 30
rfs7000-6DCD4B(config-profile-default-rfs7000)#

Related Commands

no Removes the configured minimum start-delay value. When removed, devices attempt adoption immediately on coming up.
7.1.3 alias

Profile Config Commands

Configures network, VLAN, and service aliases. The aliases defined on this profile applies to all devices using this profile. Aliases can be also defined at the device level.

NOTE: You can apply overrides to aliases at the device level. For more information on aliases, see alias. Overrides applied at the device level take precedence.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX9000, NX9500, NX9510, NX9600

Syntax

alias [address-range|host|network|network-group|network-service|number|string|vlan]

alias address-range <ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>

alias host <HOST-ALIAS-NAME> <HOST-IP>

alias network <NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>

alias network-group <NETWORK-GROUP-ALIAS-NAME> [address-range|host|network] <ENDING-IP> [host <HOST-IP>]

alias network-service <NETWORK-SERVICE-ALIAS-NAME> proto [0-254]|<WORD>|eigrp|gre|igmp|igp|ospf|vrrp

alias number <NUMBER-ALIAS-NAME> <0-4294967295>

alias string <STRING-ALIAS-NAME> <LINE>

alias vlan <VLAN-ALIAS-NAME> <1-4094>
### Parameters

- **alias address-range** `<ADDRESS-RANGE-ALIAS-NAME> <STARTING-IP> to <ENDING-IP>`

  Creates a new address-range alias for this profile. Or associates an existing address-range alias with this profile. An address-range alias maps a name to a range of IP addresses. Use this option to create unique address-range aliases for different deployment scenarios. For example, if an ACL defines a pool of network addresses as 192.168.10.10 through 192.168.10.100 for an entire network, and a remote location’s network range is 172.16.13.20 through 172.16.13.110, the remote location’s ACL can be overridden using an alias. At the remote location, the ACL works with the 172.16.13.20-110 address range. A new ACL need not be created specifically for the remote deployment location.

  - `<ADDRESS-RANGE-ALIAS-NAME>` – Specify the address range alias name.
  
  Note: Alias name should begin with `$`.

- **<STARTING-IP> to <ENDING-IP>`

  Associates a range of IP addresses with this address range alias

  - `<STARTING-IP>` – Specify the first IP address in the range.
  - `to <ENDING-IP>` – Specify the last IP address in the range.

  Note: If using an existing address-range alias, you can apply overrides to the alias at the profile level.

- **alias host** `<HOST-ALIAS-NAME> <HOST-IP>`

  Creates a new host alias for this profile. Or associates an existing host alias with this profile. A host alias configuration is for a particular host device’s IP address. Use this option to create unique host aliases for different deployment scenarios. For example, if a central network DNS server is set a static IP address, and a remote location’s local DNS server is defined, this host can be overridden at the remote location. At the remote location, the network is functional with a local DNS server, but uses the name set at the central network. A new host need not be created at the remote location. This simplifies creating and managing hosts and allows an administrator to better manage specific local requirements.

  - `<HOST-ALIAS-NAME>` – Specify the host alias name.
  
  Note: Alias name should begin with `$`.

- **<HOST-IP>`

  Associates the network host’s IP address with this host alias

  - `<HOST-IP>` – Specify the network host’s IP address.

  Note: If using an existing host alias, you can apply overrides to the alias at the profile level

- **alias network** `<NETWORK-ALIAS-NAME> <NETWORK-ADDRESS/MASK>`

  Creates a new network alias for this profile. Or associates an existing network alias with this profile. A network alias configuration is utilized for an IP address on a particular network. Use this option to create unique Network aliases for different deployment scenarios. For example, if a central network ACL defines a network as 192.168.10.0/24, and a remote location’s network range is 172.16.10.0/24, the ACL can be overridden at the remote location to suit their local (but remote) requirement. At the remote location, the ACL functions with the 172.16.10.0/24 network. A new ACL need not be created specifically for the remote deployment. This simplifies ACL definition and allows an administrator to better manage specific local requirements.

  - `<NETWORK-ALIAS-NAME>` – Specify the network alias name.
  
  Note: Alias name should begin with `$`. 

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>network &lt;NETWORK-GROUP-ALIAS-NAME&gt;</td>
<td>Creates a new network-group alias for this profile. Or associates an existing network-group alias with this profile.</td>

<td>• &lt;NETWORK-GROUP-ALIAS-NAME&gt; – Specify the network-group alias name.</td>
</tr>
</tbody>
</table>
|                               | **Note:** Alias name should begin with "$".
|                               | **Note:** The network-group aliases are used in ACLs, to define the network-specific components. ACLs using aliases can be used across sites by re-defining the network-group alias elements at the device or profile level. |
|                               | After specifying the name, specify the following: a range of IP addresses, host addresses, or a range of network addresses.                                                                                |
|                               | **Note:** If using an existing network-group alias, you can apply overrides to the alias at the profile level.                                                                                            |
| address-range <STARTING-IP> to <ENDING-IP> | Associates a range of IP addresses with this network-group alias                                                                                                                                           |
|                               | • <STARTING-IP> – Specify the first IP address in the range.                                                                                                                                                   |
|                               | • to <ENDING-IP> – Specify the last IP address in the range.                                                                                                                                                   |
|                               | • <STARTING-IP> to <ENDING-IP> – Optional. Specifies more than one range of IP addresses. A maximum of eight (8) IP address ranges can be configured.                                                      |
| host <HOST-IP> <HOST-IP>      | Associates a single or multiple hosts with this network-group alias                                                                                                                                          |
|                               | • <HOST-IP> – Specify the hosts’ IP address.                                                                                                                                                                  |
|                               | • <HOST-IP> – Optional. Specifies more than one host. A maximum of eight (8) hosts can be configured.                                                                                                       |
| network <NETWORK-ADDRESS/MASK> <NETWORK-ADDRESS/MASK> | Associates a single or multiple networks with this network-group alias                                                                                                                                       |
|                               | • <NETWORK-ADDRESS/MASK> – Specify the network’s address and mask.                                                                                                                                             |
|                               | • <NETWORK-ADDRESS/MASK> – Optional. Specifies more than one network. A maximum of eight (8) networks can be configured.                                                                                     |
| alias network-service <NETWORK-SERVICE-ALIAS-NAME> | Creates a new network-service alias for this profile. Or associates an existing network-service alias with this profile. A network service alias is a set of configurations that consist of protocol and port mappings. Both source and destination ports are configurable. For each protocol, up to 2 source port ranges and up to 2 destination port ranges can be configured. A maximum of 4 protocol entries can be configured per network service alias. |
|                               | • <NETWORK-SERVICE-ALIAS-NAME> – Specify a network-service alias name.                                                                                                                                        |
|                               | **Note:** Alias name should begin with "$".
|                               | Contd..
**Note:** The network-service aliases are used in ACLs, to define the service-specific components. ACLs using aliases can be used across sites by re-defining the network-service alias elements at the device or profile level.

**Note:** If using an existing network-service alias, you can apply overrides to the alias at the profile level.

| proto [0-254]| <WORD>| eigrp|gre| igmp|igp|ospf|vrrp | Use one of the following options to associate an Internet protocol with this network-service alias:
- **0-254** – Identifies the protocol by its number. Specify the protocol number from 0 - 254. This is the number by which the protocol is identified in the Protocol field of the IPv4 header and the Next Header field of IPv6 header. For example, the User Datagram Protocol's (UDP) designated number is 17.
- **<WORD>** – Identifies the protocol by its name. Specify the protocol name.
- **gre** – Selects Generic Routing Encapsulation (GRE). The protocol number is 47.
- **igmp** – Selects Internet Group Management Protocol (IGMP). The protocol number is 2.
- **igp** – Selects Interior Gateway Protocol (IGP). The protocol number is 9.
- **ospf** – Selects Open Shortest Path First (OSPF). The protocol number is 89.
- **vrrp** – Selects Virtual Router Redundancy Protocol (VRRP). The protocol number is 112.

| {<1-65535>|<WORD>| bgp|dns|ftp|ftp-data| gopher|https|ldap|nntp| ntp|pop3|proto|sip|smtp| sourceport [<1-65535>]| ssh|telnet| tftp|www} | After specifying the protocol, you may configure a destination port for this service. These keywords are recursive and you can configure multiple protocols and associate multiple destination and source ports.
- **<1-65535>** – Optional. Configures a destination port number from 1 - 65535
- **<WORD>** – Optional. Identifies the destination port by the service name provided. For example, the secure shell (SSH) service uses TCP port 22.
- **bgp** – Optional. Configures the default Border Gateway Protocol (BGP) services port (179)
- **dns** – Optional. Configures the default Domain Name System (DNS) services port (53)
- **ftp** – Optional. Configures the default File Transfer Protocol (FTP) control services port (21)
- **ldap** – Optional. Configures the default Lightweight Directory Access Protocol (LDAP) services port (389)
- **ftp-data** – Optional. Configures the default FTP data services port (20)
- **gopher** – Optional. Configures the default gopher services port (70)
- **https** – Optional. Configures the default HTTPS services port (443)
- **nntp** – Optional. Configures the default Newgroup (Nntp) services port (119)
- **ntp** – Optional. Configures the default Network Time Protocol (NTP) services port (123)
- **proto** – Optional. Use this option to select another Internet protocol in addition to the one selected in the previous step.
- **POP3** – Optional. Configures the default Post Office Protocol (POP3) services port (110)
- **sip** – Optional. Configures the default Session Initiation Protocol (SIP) services port (5060)
- **smtp** – Optional. Configures the default Simple Mail Transfer Protocol (SMTP) services port (25)

Contd..
- **sourceport** `<1-65535>|<WORD>` – Optional. After specifying the destination port, you may specify a single or range of source ports.
  - `<1-65535>` – Specify the source port from 1 - 65535.
  - `<WORD>` – Specify the source port range, for example 1-10.
- **ssh** – Optional. Configures the default SSH services port (22)
- **telnet** – Optional. Configures the default Telnet services port (23)
- **tftp** – Optional. Configures the default *Trivial File Transfer Protocol* (TFTP) services port (69)
- **www** – Optional. Configures the default HTTP services port (80)

- **alias number** `<NUMBER-ALIAS-NAME>` `<0-4294967295>`
  - Creates a number alias identified by the `<NUMBER-ALIAS-NAME>` keyword. Number aliases map a name to a numeric value. For example, ‘alias number $NUMBER 100’
  - The number alias name is: `$NUMBER`
  - The value assigned is: 100
  - The value referenced by alias `$NUMBER`, wherever used, is 100.
  - `<NUMBER-ALIAS-NAME>` – Specify the number alias name.
  - `<0-4294967295>` – Specify the number, from 0 - 4294967295, assigned to the number alias created.
  - **Note:** Alias name should begin with `$`.

- **alias string** `<STRING-ALIAS-NAME>` `<LINE>`
  - Creates a new string alias for this profile. Or associates an existing string alias with this profile. String aliases map a name to an arbitrary string value. Use this option to create unique string aliases for different deployment scenarios. For example, if the main domain at a remote location is called loc1.domain.com and at another deployment location it is called loc2.domain.com, the alias can be overridden at the remote location to suit the local (but remote) requirement. At one remote location, the alias functions with the loc1.domain.com domain and at the other with the loc2.domain.com domain.
  - `<STRING-ALIAS-NAME>` – Specify the string alias name.
  - `<LINE>` – Specify the string value.
  - **Note:** If using an existing string alias, you can apply overrides to the alias at the RF Domain level.

- **alias vlan** `<VLAN-ALIAS-NAME>` `<1-4094>`
  - Creates a new VLAN alias for this profile. Or associates an existing VLAN alias with this profile. A VLAN alias maps a name to a VLAN ID. A VLAN alias is a configuration for optimal VLAN re-use and management for local and remote deployments. Use this option to create unique VLANs aliases for different deployment scenarios. For example, if a VLAN ID is set as 10 for the central network, and the VLAN is set as 26 at a remote location, the VLAN can be overridden at the remote location using an alias. At the remote location, the network is functional with an ID of 26, but utilizes the name defined at the central local network. A new VLAN need not be created specifically at the remote location.
  - `<VLAN-ALIAS-NAME>` – Specify the VLAN alias name.
  - **Note:** Alias name should begin with `$`.
Examples

The following example shows the global aliases configured. Note the network-service alias ‘$kerberos’ settings.

```
rfs4000-229D58(config)#show context

! Configuration of RFS4000 version 5.8.0.0-025D
!
! version 2.3
!
alias network-group $TestNetGrpAlias network 192.168.13.0/24 192.168.16.0/24
alias network-group $TestNetGrpAlias address-range 192.168.13.7 to 192.168.13.16
192.168.13.20 to 192.168.13.25
!
alias network $TestNetworkAlias 192.168.13.0/24
!
alias host $TestHostAlias 192.168.13.10
!
alias address-range $TestAddRanAlias 192.168.13.10 to 192.168.13.13
!
alias network-service $NetworkServAlias proto udp
!
alias network-service $kerberos proto tcp 749 750 80 proto udp 68 sourceport 67
!
alias vlan $TestVLANAlias 1
```

The following examples show the overrides applied to the network-service alias ‘$kerberos’ at the profile level:

```
rfs4000-229D58(config-profile-TestRFS4000)#alias network-service $kerberos proto tcp 88 proto udp 80
rfs4000-229D58(config-profile-TestRFS4000)#
```

The following example shows the overrides applied to the network-service alias ‘$kerberos’ at the profile level:

```
rfs4000-229D58(config-profile-TestRFS4000)#profile rfs4000 TestRFS4000
no autoinstall configuration
no autoinstall firmware

.............................

     service pm sys-restart
     router ospf
     alias network-service $kerberos proto tcp 88 proto udp 80
rfs4000-229D58(config-profile-TestRFS4000)#
```

Related Commands

| no | Removes the use of centralized auto provisioning policy on this profile or device |
### 7.1.4 `application-policy`

**Profile Config Commands**

Associates a RADIUS server provided application policy with this profile. This command is also applicable to the device configuration mode. When associated, the application policy allows wireless clients (MUs) to always find the RADIUS-supplied application policy in the dataplane.

Supported in the following platforms:
- Access Points — AP7522, AP7532, AP7562
- Service Platforms — NX9000, NX9500, NX9510, NX9600

**Syntax**

```
application-policy radius <APP-POLICY-NAME>
```

**Parameters**
- `application-policy radius <APP-POLICY-NAME>`

<table>
<thead>
<tr>
<th>syntax</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application-policy radius &lt;APP-POLICY-NAME&gt;</td>
<td>Associates a RADIUS server provided application policy with this profile</td>
</tr>
<tr>
<td>&lt;APP-POLICY-NAME&gt;</td>
<td>- &lt;APP-POLICY-NAME&gt; — Specify the application policy name (should be existing and configured).</td>
</tr>
</tbody>
</table>

**Examples**

```bash
nx9500-6C8809(config)#show context include-factory | include application-policy
```

```bash
application-policy Bing
no use application-policy
no use application-policy
no use application-policy
no use application-policy
no use application-policy
no use application-policy
no use application-policy
no use application-policy
```

```bash
nx9500-6C8809(config)#application-policy radius Bing
```

```bash
nx9500-6C8809(config-profile-testNX9000)#show context include-factory | include application-policy
```

```bash
application-policy Bing
```

```bash
nx9500-6C8809(config)#show context include-factory | include application-policy
```

```bash
application Bing
```

```bash
app-category streaming
```

```bash
use url-list Bing
```

```bash
```

**Related Commands**

```bash
no
```

Removes the RADIUS-server provided application policy associated with this profile
7.1.5 area

Profile Config Commands

Sets the system’s area of location (the physical area of deployment)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

area <WORD>

Parameters

- area <WORD>

  Sets the system’s area of location
  - <WORD> – Specify the area name (should not exceed 64 characters).

Examples

rfs7000-37FABE(config-profile-default-rfs7000)#area Ecospace

rfs7000-37FABE(config-profile-default-rfs7000)#show context
profile rfs7000 default-rfs7000
  bridge vlan 1
  ip igmp snooping
  ip igmp snooping querier

7.1.6 *arp*

Profile Config Commands

Adds a static *Address Resolution Protocol* (ARP) IP address in the ARP cache.

The ARP protocol maps an IP address to a hardware MAC address recognized on the network. ARP provides protocol rules for making this correlation and providing address conversion in both directions.

When an incoming packet destined for a host arrives, ARP finds a physical host or MAC address that matches the IP address. ARP looks in its ARP cache and, if it finds the address, provides it so the packet can be converted to the right packet length, formatted, and sent to its destination. If no entry is found for the IP address, ARP broadcasts a request packet in a special format on the LAN to locate a device that recognizes the IP address. A device that recognizes the IP address as its own returns a reply indicating it. ARP updates the ARP cache for future reference and then sends the packet to the MAC address that replied.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
arp [<IP>|timeout]
```

```
arp <IP> <MAC> arpa [<L3-INTERFACE-NAME]|pppoe1|vlan <1-4094>|wwan1|serial <1-4> <1-1> <1-1> {dhcp-server|router}
```

```
arps timeout <15-86400>
```

Parameters

- `arp <IP> <MAC> arpa [<L3-INTERFACE-NAME]|pppoe1|vlan <1-4094>|wwan1|serial <1-4> <1-1> <1-1> {dhcp-server|router}`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>arp &lt;IP&gt;</code></td>
<td>Adds a static ARP IPv4 address in the ARP cache</td>
</tr>
<tr>
<td><code>&lt;IP&gt;</code></td>
<td>Specify the static IP address.</td>
</tr>
<tr>
<td><code>&lt;MAC&gt;</code></td>
<td>Specify the MAC address associated with the IP and the <em>Switch Virtual Interface</em> (SVI).</td>
</tr>
<tr>
<td><code>arpa</code></td>
<td>Sets ARP encapsulation type to ARPA</td>
</tr>
<tr>
<td><code>&lt;L3-INTERFACE-NAME&gt;</code></td>
<td>Configures static ARP entry for a specified router interface</td>
</tr>
<tr>
<td><code>pppoe1</code></td>
<td>Configures static ARP entry for PPP over Ethernet interface</td>
</tr>
<tr>
<td><code>vlan &lt;1-4094&gt;</code></td>
<td>Configures static ARP entry for a VLAN interface</td>
</tr>
<tr>
<td><code>wwan1</code></td>
<td>Configures static ARP entry for Wireless WAN interface</td>
</tr>
<tr>
<td><code>serial &lt;1-4&gt;</code></td>
<td>Configures the static ARP entry for serial interface</td>
</tr>
<tr>
<td><code>&lt;1-1&gt;</code></td>
<td>Specify the Slot ID</td>

<tr>
<td><code>&lt;1-1&gt;</code></td>
<td>Specify the port ID</td>
</tr>
<tr>
<td><code>&lt;1-1&gt;</code></td>
<td>Specify the Channel group ID.</td>
</tr>
</tbody>
</table>

The serial interface is applicable for the NX45XX and NX65XX series service platforms only.
The following keywords are common to all off the above interface types:

- `dhcp-server` – Optional. Sets ARP entries for a DHCP server
- `router` – Optional. Sets ARP entries for a router

**arp timeout**

Sets ARP entry timeout

- `<TIME>` – Sets the ARP entry timeout in seconds. Specify a value from 15 - 86400 seconds. The default is 3600 seconds.

**Examples**

```bash
rfs7000-37FABE(config-profile-default-rfs7000)#arp timeout 2000
rfs7000-37FABE(config-profile-default-rfs7000)#show context

7.1.7 auto-learn-staging-config

Profile Config Commands

Enables controllers or service platforms to maintain a local configuration record of devices requesting adoption and provisioning. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

auto-learn-staging-config

Parameters

None

Examples

rfs7000-37FABE(config-profile-default-rfs7000)#auto-learn-staging-config
rfs7000-37FABE(config-profile-default-rfs7000)#

### 7.1.8 autogen-uniqueid

**Profile Config Commands**

Autogenerates a unique ID for devices using this profile. When executed in the device configuration mode, this command generates a unique ID for the logged device.

A device’s unique ID is a combination of a user-defined string (prefix, suffix, or both) and a substitution token. The WiNG implementation provides two built-in substitution tokens: $SN and $MiNT-ID that represent the device’s serial number and MiNT-ID respectively. The value referenced by these substitution tokens are internally retrieved and combined with the user-defined string to auto generate a unique identity for the device.

The general format of this command is: `<PREFIX><SUBSTITUTION-TOKEN><SUFFIX>`. You can provide both (prefix and suffix) or just a prefix or suffix.

For example, given the following set of inputs:

- user-defined prefix – TestAP6522
- substitution token – $SN

The unique ID is generated using `TestAP6522$SN`, where $SN is replaced with the device’s serial number.

When executed on an AP6522 (having serial number B4C7996C8809), the autogen-uniqueid `TestAP6522$SN` command generates the unique ID: `TestAP6522B4C7996C8809`. When configured on an AP6522 profile, all AP6522s using the profile autogenerate a unique ID in which the device’s serial number is preceded by the string ‘TestAP6522’.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`autogen-uniqueid <WORD>`

**Parameters**

- `autogen-uniqueid <WORD>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>autogen-uniqueid &lt;WORD&gt;</code></td>
<td>Autogenerates a device’s unique ID (not exceeding 64 characters in length) The ID generated is a combination of the text provided and the value referenced through the substitution token $SN or $MiNT-ID. Where ever the autogen-uniqueid is used the device’s serial number OR MiNT-ID is referenced depending on the substitution token used.</td>
</tr>
</tbody>
</table>

- `<WORD>` – Specify a auto generate unique ID format using one of the following substitution tokens:

  - `$SN` - references SERIAL NUMBER of the device
  - `$MiNT-ID` - references MiNT-ID of the device

For example, Test-$SN-TechPubs. In this example ‘Test’ and ‘TechPubs’ represent the user-defined prefix and suffix respectively. And $SN is the substitution token.
**Examples**

nx4500-5CFA2B (config-profile-testAP6522)# autogen-uniqueid TestAP6522$SN

nx4500-5CFA2B (config-profile-testAP6522)# show context

### 7.1.9 autoinstall

Profile Config Commands

Automatically installs firmware image and startup configuration parameters on to the selected device.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
autoinstall [configuration|firmware|start-interval <WORD>]
```

**Parameters**

- **autoinstall [configuration|firmware|start-interval <WORD>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Autoinstalls startup configuration. Setup parameters are automatically configured on devices using this profile. This option is disabled by default.</td>
</tr>
<tr>
<td>firmware</td>
<td>Autoinstalls firmware image. Firmware images are automatically installed on devices using this profile. This option is disabled by default.</td>
</tr>
<tr>
<td>start-interval</td>
<td>Configures the interval between system boot and start of autoinstall process (this is the time, from system boot, after which autoinstall should start)</td>
</tr>
<tr>
<td>&lt;WORD&gt;</td>
<td>Specify the interval in minutes. The default is 10.</td>
</tr>
</tbody>
</table>

**Note:** Zero (0) implies firmware or startup configuration installation can start any time.

**Examples**

```plaintext

<td>Summarizes bridge VLAN configuration mode commands</td>
<td>page 7-32</td>
</tr>
</tbody>
</table>
7.1.11.1 bridge

Configures VLAN Ethernet bridging parameters. Use this command to configure a Bridge NAT or Bridge VLAN settings.

Configuring bridge Network Address Translation (NAT) parameters, allows management of Internet traffic originating at a remote site. In addition to traditional NAT functionality, bridge NAT provides a means of configuring NAT for bridged traffic through an access point. NAT rules are applied to bridged traffic through the access point, and matching packets are NATed to the WAN link instead of being bridged on their way to the router. Using bridge NAT, a tunneled VLAN (extended VLAN) is created between the NoC and a remote location. When a remote client needs to access the Internet, Internet traffic is routed to the NoC, and from there routed to the Internet. This increases the access time for the end user on the client. To resolve latency issues, bridge NAT identifies and segregates traffic heading towards the NoC and outwards towards the Internet. Traffic towards the NoC is allowed over the secure tunnel. Traffic towards the Internet is switched to a local WLAN link with access to the Internet.

A Virtual LAN (VLAN) is a separately administrated virtual network within the same physical managed network. VLANs are broadcast domains defined within wireless controllers or service platforms to allow control of broadcast, multicast, unicast, and unknown unicast within a layer 2 device. For example, say several computers are used in conference room X and some in conference Y. The systems in conference room X can communicate with one another, but not with the systems in conference room Y. The VLAN enables the systems in conference rooms X and Y to communicate with one another even though they are on separate physical subnets. The systems in conference rooms X and Y are managed by the same single wireless controller or service platform, but ignore the systems that are not using the same VLAN ID. Administrators often need to route traffic between different VLANs. Bridging VLANs are only for non-routable traffic, like tagged VLAN frames destined to some other device, which will untag it. When a data frame is received on a port, the VLAN bridge determines the associated VLAN based on the port of reception. Using forwarding database information, the bridge VLAN forwards the data frame on the appropriate port(s). VLANs are useful to set separate networks to isolate some computers from others, without actually having to have separate cabling and Ethernet switches. Controllers can do this on their own, without need for the computer or other gear to know itself what VLAN it is on (this is called port-based VLAN, since it is assigned by port of the switch). Another common use is to put specialized devices like VoIP Phones on a separate network for easier configuration, administration, security, or quality of service.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

---

**Switch Note:** For more information on the interface types and the devices supporting them, see `interface`.

---

**Syntax**

```
bridge [nat|vlan]

bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500> interface
    [<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [(address|interface|overload|pool <NAT-POOL-NAME>)]

bridge vlan [<1-4094>|<VLAN-ALIAS-NAME>]
```
Parameters

- bridge nat source list <IP-ACCESS-LIST-NAME> precedence <1-500> interface 
  [<LAYER3-INTERFACE-NAME>|pppoe1|vlan <1-4094>|wwan1] [(address|interface|overload|pool <NAT-POOL-NAME>)]

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td>- overload – Enables use of one global address for multiple local addresses (terminates command)</td>
</tr>
<tr>
<td></td>
<td>- pool &lt;NAT-POOLNAME&gt; – Configures the NAT pool used with this bridge NAT policy. Specify the NAT pool name. For more information on configuring a NAT pool, see nat-pool-config-instance.</td>
</tr>
<tr>
<td>vlan &lt;1-4094&gt;</td>
<td>Configures the numerical identifier for the Bridge VLAN when it was initially created.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;1-4094&gt;</code> – Specify a VLAN index from 1 - 4094.</td>
</tr>
<tr>
<td>vlan &lt;VLAN-ALIAS-NAME&gt;</td>
<td>Configures the VLAN alias (should be existing and configured) identifying the bridge VLAN</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;VLAN-ALIAS-NAME&gt;</code> – Specify a VLAN alias name.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Creating customized filter schemes for bridged networks limits the amount of unnecessary traffic processed and distributed by the bridging equipment.

If a bridge does not hear Bridge Protocol Data Units (BPDUs) from the root bridge within the specified interval, defined in the max-age (seconds) parameter, assume the network has changed and recomputed the spanning-tree topology.
Examples

rfs7000-37FABE(config-profile-default-rfs7000)#bridge vlan 1
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#?

Bridge VLAN Mode commands:

- **bridging-mode**: Configure how packets on this VLAN are bridged.
- **captive-portal**: Captive Portal.
- **description**: Vlan description.
- **edge-vlan**: Enable edge-VLAN mode.
- **firewall**: Enable vlan firewall (IPv4).
- **http-analyze**: Forward URL and Data to controller.
- **ip**: Internet Protocol (IP).
- **ipv6**: Internet Protocol version 6 (IPv6).
- **l2-tunnel-broadcast-optimization**: Enable broadcast optimization.
- **no**: Negate a command or set its defaults.
- **stateful-packet-inspection-l2**: Enable stateful packet inspection in layer2 firewall.
- **tunnel**: Vlan tunneling settings.
- **tunnel-over-level2**: Tunnel extended VLAN traffic over level 2 MiNT links.
- **use**: Set setting to use.
- **clrscr**: Clears the display screen.
- **commit**: Commit all changes made in this session.
- **do**: Run commands from Exec mode.
- **end**: End current mode and change to EXEC mode.
- **exit**: End current mode and down to previous mode.
- **help**: Description of the interactive help system.
- **revert**: Revert changes.
- **service**: Service Commands.
- **show**: Show running system information.
- **write**: Write running configuration to memory or terminal.

<td>page 7-53</td>
</tr>
</tbody>
</table>
7.1.11.2.1 bridging-mode

> **bridge-vlan-mode commands**

Configures how packets are bridged on the selected VLAN

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
bridging-mode [auto|isolated-tunnel|local|tunnel]
```

**Parameters**

- `bridging-mode [auto|isolated-tunnel|local|tunnel]`

<table>
<thead>
<tr>
<th>bridging-mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Automatically selects the bridging mode to match the WLAN, VLAN and bridging mode configurations. When selected, the controller or access point determines the best bridging mode for the VLAN. (default setting)</td>
</tr>
<tr>
<td>isolated-tunnel</td>
<td>Bridges packets between local Ethernet ports and local radios, and passes tunneled packets through without de-tunneling. Select this option for a dedicated tunnel for bridging VLAN traffic.</td>
</tr>
<tr>
<td>local</td>
<td>Bridges packets normally between local Ethernet ports and local radios (if any). Local mode is typically configured in remote branch offices where traffic on remote private LAN segments need to be bridged locally. Local mode implies that traffic, wired and wireless, is to be bridged locally.</td>
</tr>
<tr>
<td>tunnel</td>
<td>Bridges packets between local Ethernet ports, local radios, and tunnels to other APs, wireless controllers, or service platforms. Select this option to use a shared tunnel for bridging VLAN traffic. In tunnel mode, the traffic at the AP is always forwarded through the best path. The APs decide the best path to reach the destination and forward packets accordingly. Setting the VLAN to tunnel mode ensures packets are bridged between local Ethernet ports, any local radios, and tunnels to other APs, wireless controllers, and service platforms.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

ACLs can only be used with tunnel or isolated-tunnel modes. They do not work with the local and automatic modes.

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#bridging-mode isolated-tunnel
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#show context
bridge vlan 1
bridging-mode isolated-tunnel
ip igmp snooping
ip igmp snooping querier
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#
```
## Related Commands

</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Resets bridging mode to auto</td>
</tr>
</tbody>
</table>
### 7.1.11.2.2 captive-portal

**bridge-vlan-mode commands**

Enables IP packet snooping on wired captive portals, and also configures the subnet to snoop. When enabled, IP packets received from wired captive portal clients, on the specified subnet, are snooped to learn IP to MAC mapping.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controller**
- **Access Points** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M> {excluded-address <IPv4|IPv6>}
```

**Parameters**

- **captive-portal [ipv4-snooping|ipv6-snooping] subnet <IPv4/M|IPv6/M> {excluded-address <IPv4|IPv6>}**

| captive-portal [ipv4-snooping|ipv6-snooping] | Enables snooping of IPv4 or IPv6 packets (based on the option selected) for wired captive portal clients |
| subnet <IPv4/M|IPv6/M> | Enables IPv4 or IPv6 packet snooping on a specified subnet |
| <IPv4/M|IPv6/M> | Specify the subnet address in the A.B.C.D/M or X:X::X:X/M format to identify an IPv4 or IPv6 subnet respectively. |

| excluded-address <IPv4|IPv6> | Optional. Configures the IPv4 or IPv6 address excluded from snooping |
| <IPv4|IPv6> | Specify the IPv4 or IPv6 address. Use this parameter to configure the gateway's address. |

**Examples**

```plaintext
nx9500-6C8809(config-profile NX9000Test-bridge-vlan-4)#captive-portal ip-snooping subnet 192.168.13.0/24 excluded-address 192.168.13.7
```

```plaintext
nx9500-6C8809(config-profile NX9000Test-bridge-vlan-4)#show context bridge vlan 4
captive-portal ip-snooping subnet 192.168.13.0/24 excluded-address 192.168.13.7
ip igmp snooping
ip igmp snooping querier
ipv6 mld snooping
ipv6 mld snooping querier
nx9500-6C8809(config-profile NX9000Test-bridge-vlan-4)#
```

**Related Commands**

- **no** Disables IP packet snooping on wired captive portals
### 7.1.11.2.3 description

**bridge-vlan-mode commands**

Configures VLAN bridge description

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
description <WORD>
```

**Parameters**

- `description <WORD>`

<table>
<thead>
<tr>
<th>description &lt;WORD&gt;</th>
<th>Configures a description for this VLAN bridge</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>- Enter a description. The description should be unique to the VLAN's specific configuration to help differentiate it from other VLANs with similar configurations.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#description "This is a description for the bridged VLAN"
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#show context
bridge vlan 1
description This\ is\ a\ description\ for\ the\ bridged\ VLAN
bridging-mode isolated-tunnel

```

**Related Commands**

```
no
```

Removes VLAN bridge description
7.1.11.2.4 edge-vlan

▶ bridge-vlan-mode commands

Enables the edge VLAN mode. In the edge VLAN mode, a protected port does not forward traffic to another protected port on the same wireless controller or service platform. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
edge-vlan

Parameters
None

Examples
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#edge-vlan
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#

7.1.11.2.5 firewall

*bridge-vlan-mode commands*

Enables IPv4 firewall on this bridge VLAN interface. This feature is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
firewall
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#firewall
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#
```

7.11.2.6 http-analyze

*bridge-vlan-mode commands*

Enables the analysis of URLs and data traffic on this Bridge VLAN. When enabled, URLs and data are forwarded to the controller running the HTTP analytics engine.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
http-analyze {filter [images|post|query-string]}
```

**Parameters**

- `http-analyze {filter [images|post|query-string]}`

| http-analyze filter [images|post|query-string] | Enables URL and HTTP data analysis. Optionally use the filter keyword to filter out specific URLs  |
|------------------------------------------------|
| filter – Optional. Filters out specific URLs    |
| images – Filters out URLs referring to images   |
| post – Filters out URLs referring to POSTs     |
| query-string – Filters out query strings received from URLs |

**Examples**

```plaintext
rfs4000-229D58 (config-device 00-23-68-22-9D-58-bridge-vlan-4)#http-analyze filter images
```

```plaintext
rfs4000-229D58 (config-device 00-23-68-22-9D-58-bridge-vlan-4)#show context bridge vlan 4
```

```plaintext
http-analyze filter images
rfs4000-229D58 (config-device 00-23-68-22-9D-58-bridge-vlan-4)#
```

**Related Commands**

| `no` | Disables forwarding of URLs and data to the controller running the HTTP analytics engine |
7.1.11.2.7 ip

*bridge-vlan-mode commands*

Configures VLAN bridge IP components

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
ip [arp|dhcp|igmp]

ip [arp|dhcp] trust

ip igmp snooping {forward-unknown-multicast|mrouter|querier}

ip igmp snooping {forward-unknown-multicast}

ip igmp snooping {mrouter [interface|learn]}

ip igmp snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}

ip igmp snooping {querier} {address|max-response-time|timer|version}

ip igmp snooping {querier} {address <IP>|max-response-time <1-25>|
timer expiry <60-300>|version <1-3>}
```

**Parameters**

- **ip [arp|dhcp] trust**
  - Configures the VLAN bridge IP parameters
  - **arp trust**
    - Configures the ARP trust parameter. Trusted ARP packets are used to update the DHCP snoop table to prevent IP spoof and arp-cache poisoning attacks. This option is disabled by default.
    - Trust — Trusts ARP responses on the VLAN bridge
  - **dhcp trust**
    - Configures the DHCP trust parameter. Uses DHCP packets, from a DHCP server, as trusted and permissible within the access point, wireless controller, or service platform managed network. DHCP packets are used to update the DHCP snoop table to prevent IP spoof attacks. This feature is enabled by default.
    - Trust — Trusts DHCP responses on the VLAN bridge

- **ip igmp snooping {forward-unknown-multicast}**
  - Configures the VLAN bridge IP parameters
  - **igmp snooping**
    - Configures Internet Group Management Protocol (IGMP) snooping parameters. IGMP snooping is enabled by default.
    - IGMP establishes and maintains multicast group memberships for interested members. Multicasting allows a networked device to listen to IGMP network traffic and forward IGMP multicast packets to radios on which the interested hosts are connected. The device also maintains a map of the links that require multicast streams, thereby reducing unnecessary flooding of the network with multicast traffic.
forward-unknown-multicast | Optional. Enables forwarding of multicast packets from unregistered multicast groups. If disabled, the unknown multicast forward feature is also disabled for individual VLANs. This option is enabled by default.

| ip igmp snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]} |
|---------------------------------------------------------------|
| ip | Configures the VLAN bridge IP parameters |
| igmp snooping | Configures the IGMP snooping parameters |
| mrouter | Optional. Configures the multicast router parameters |
| interface <INTERFACE-LIST> | Configures the multicast router interfaces. This option is disabled by default. |
| | • <INTERFACE-LIST> – Specify a comma-separated list of interface names. |
| learn pim-dvmrp | Configures the multicast router learning protocols. This option is disabled by default. |
| | • pim-dvmrp – Enables Protocol-Independent Multicast (PIM) and Distance-Vector Multicast Routing Protocol (DVMRP) snooping of packets |

| ip igmp snooping {querier} {address <IP>|max-response-time <1-25>|timer expiry <60-300>|version <1-3>} |
|---------------------------------------------------------------|
| ip | Configures the VLAN bridge IP parameters |
| igmp snooping | Configures the IGMP snooping parameters |
| querier | Optional. Configures the IGMP querier parameters. This option is disabled by default. |
| | Enables IGMP querier. IGMP snoop querier keeps host memberships alive. It is primarily used in a network where there is a multicast streaming server and hosts subscribed to the server and no IGMP querier present. The access point, wireless controller, or service platform performs the IGMP querier role. An IGMP querier sends out periodic IGMP query packets. Interested hosts reply with an IGMP report packet. IGMP snooping is only conducted on wireless radios. IGMP multicast packets are flooded on wired ports. IGMP multicast packet are not flooded on the wired port. IGMP membership is also learnt on it and only if present, then it is forwarded on that port. |
| | • <IP> – Specify the IGMP querier source IP address. |
| max-response-time <1-25> | Optional. Configures the IGMP querier maximum response time. This option is disabled by default. |
| | • <1-25> – Specify the maximum response time from 1 - 25 seconds. |
| | The access point, wireless controller, or service platform forwards multicast packets only to radios present in the snooping table. IGMP reports from wired ports are forwarded to the multicast router ports. |
| | If no reports are received from a radio, it is removed from the snooping table. The radio then stops receiving multicast packets. |
| timer expiry <60-300> | Optional. Configures the IGMP querier expiry time. The value specified is used as the timeout interval for other querier resources. This option is disabled by default. |
| | • expiry – Configures the IGMP querier timeout |
| | • <60-300> – Specify the IGMP querier timeout from 60 - 300 seconds. |
version <1-3>  Optional. Configures the IGMP version. This option is disabled by default.
  • <1-3> – Specify the IGMP version. The versions are 1-3.

**Examples**

```bash
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#ip arp trust
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#ip dhcp trust

7.11.2.8 ipv6

**bridge-vlan-mode commands**

Configures this VLAN bridge's IPv6 components

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9600

**Syntax**

```
ipv6 [dhcpv6|firewall|mld|nd]
ipv6 dhcpv6 trust
ipv6 firewall
ipv6 mld snooping {forward-unknown-multicast|mrouter|querier}
ipv6 mld snooping {forward-unknown-multicast}
ipv6 mld snooping {mrouter [interface|learn]}
ipv6 mld snooping {mrouter [interface <INTERFACE-LIST>|learn pim-dvmrp]}
ipv6 mld snooping {querier} {max-response-time|timer|version}
ipv6 mld snooping {querier} {max-response-time <1-25000>|timer expiry <60-300>}
ipv6 nd raguard
```

**Parameters**
- **ipv6 dhcpv6 trust**
  - Configures the VLAN bridge IPv6 parameters
  - dhcpv6 trust Enables the DHCPv6 trust option. When enabled all DHCPv6 responses are trusted on this bridge VLAN. This option is enabled by default.
    - trust — Trusts DHCPv6 responses on this bridge VLAN

- **ipv6 firewall**
  - Configures the VLAN bridge IPv6 parameters
  - firewall Enables IPv6 firewall on this bridge VLAN. This option is enabled by default.
    - Devices utilizing IPv6 addressing require firewall protection unique to IPv6 traffic.
    - IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons.
    - IPv6 hosts can configure themselves automatically when connected to an IPv6 network using the *neighbor discovery* (ND) protocol via ICMPv6 router discovery messages. When first connected to a network, a host sends a link-local router solicitation multicast request for its configuration parameters. Routers respond to such a request with a *router advertisement* (RA) packet that contains Internet layer configuration parameters.
MLD snooping enables a access point, wireless controller, or service platform to examine MLD packets and make forwarding decisions based on the content. MLD is used by IPv6 devices to discover devices wanting to receive multicast packets destined for specific multicast addresses. MLD uses multicast listener queries and multicast listener reports to identify which multicast addresses have listeners and join multicast groups.

MLD snooping caps the flooding of IPv6 multicast traffic on controller, service platform or access point VLANs. When enabled, MLD messages between hosts and multicast routers are examined to identify the hosts receiving multicast group traffic. The access point, wireless controller, or service platform forward multicast traffic only to those interfaces connected to interested receivers instead of flooding traffic to all interfaces. This option is enabled by default.

**ipv6 nd raguard**

- ipv6 nd raguard
  - Configures the VLAN bridge IPv6 parameters

**nd raguard**

- nd raguard
  - Allows router advertisement (RA) or ICMPv6 redirects on this VLAN bridge. This option is enabled by default.

### Examples

```

7.11.2.9 l2-tunnel-broadcast-optimization

Enables broadcast optimization on this bridge VLAN. Enabling this feature aids in the identification of each incoming packet. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

l2-tunnel-broadcast-optimization

Parameters

None

Examples

```

**Parameters**

- **no** `<PARAMETERS>`

  Resets or reverts this bridge VLAN's settings based on the parameters passed

**Examples**

The following example displays bridge VLAN 20 settings before the 'no' commands are executed:

```
nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20)#show context
bridge vlan 20
  ip igmp snooping
  ip igmp snooping querier
  ipv6 mld snooping
  ipv6 mld snooping querier

nx4500-5CFA2B(config-profile default-nx45xx-bridge-vlan-20),'#
```
nx4500-5CFA2B (config-profile default-nx45xx-bridge-vlan-20)#no ip igmp snooping
nx4500-5CFA2B (config-profile default-nx45xx-bridge-vlan-20)#no ipv6 mld snooping querier

The following example displays bridge VLAN 20 settings after the 'no' commands are executed:

nx4500-5CFA2B (config-profile default-nx45xx-bridge-vlan-20)#show context
bridge vlan 20
    no ip igmp snooping
    ip igmp snooping querier
    ipv6 mld snooping
    no ipv6 mld snooping querier

nx4500-5CFA2B (config-profile default-nx45xx-bridge-vlan-20)#
7.1.11.2.11 stateful-packet-inspection-l2

*bridge-vlan-mode commands*

Enables a stateful packet inspection at the layer 2 firewall

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
stateful-packet-inspection-l2
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#stateful-packet-inspection-l2
rfs7000-37FABE(config-profile default-rfs7000-bridge-vlan-1)#

7.1.11.2.12 tunnel

*bridge-vlan-mode commands*

Enables tunneling of unicast messages, to unknown MAC destinations, on the selected VLAN bridge

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

tunnel [rate-limit|unknown-unicast]

tunnel rate-limit level2 rate <50-1000000> max-burst-size <2-1024> 
   {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}

tunnel unknown-unicast

**Parameters**

- **tunnel rate-limit level2 rate** <50-1000000> max-burst-size <2-1024> 
  {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}  
  Configures a rate-limit parameters (max-burst-size and rate) for tunneled VLAN traffic over level 2 MiNT links
  - rate – Optional. Configures the data rate, in kilobits per second, for the incoming and outgoing extended VLAN traffic tunneled over MiNT level 2 links
    - <50-1000000> – Specify a value from 50 - 1000000 Kbps. The default is 5000 Kbps.
    - max-burst-size – Optional. Configures the maximum burst size
      - <2-1024> – Specify the maximum burst size from 2 - 1024 kbytes. The default is 320 kbytes.
    After specifying the max-burst-size, optionally specify the red-threshold value for the different traffic class. The red-threshold is configured as a % of the specified max-burst-size.
  - red-threshold – Optional. Configures the random early detection threshold for the different traffic class
    - background – Configures the red-threshold for low priority traffic from 0 -100. The default is 50% of the specified max-burst-size.
    - best-effort – Configures the red-threshold for normal priority traffic from 0 -100. The default is 50% of the specified max-burst-size.
    - video – Configures the red-threshold for video traffic from 0 -100. The default is 25% of the specified max-burst-size.
    - voice – Configures the red-threshold for voice traffic from 0 -100. The default is 0% of the specified max-burst-size.

- **tunnel unknown-unicast**
  Enables tunneling of unicast packets destined for unknown MAC addresses
Examples

rfs7000-37FABE(config-profile TestAP81xx-bridge-vlan-1)#tunnel unknown-unicast
rfs7000-37FABE(config-profile TestAP81xx-bridge-vlan-1)#no tunnel unknown-unicast

7.11.2.13 tunnel-over-level2

*bridge-vlan-mode commands*

Enables extended VLAN (tunneled VLAN) traffic over level 2 MiNT links. This option is disabled by default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

tunnel-over-level2

**Parameters**

None

**Examples**

rfs4000-229D58(config-profile testRFS4000-bridge-vlan-1)#tunnel-over-level2
rfs4000-229D58(config-profile testRFS4000-bridge-vlan-1)#commit

### 7.1.11.2.14 use

**bridge-vlan-mode commands**

Associates a captive-portal, access control list (IPv4, IPv6, or MAC), and/or a URL filter with this bridge VLAN

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

use [application-policy|captive-portal|ip-access-list|ipv6-access-list|mac-access-list|url-filter]

use application-policy <APP-POLICY-NAME>

use captive-portal <CAPTIVE-PORTAL-NAME>

use [ip-access-list|ipv6-access-list|mac-access-list] tunnel out <IP/IPv6/MAC-ACCESS-LIST-NAME>

use url-filter <URL-FILTER-NAME>

**Parameters**

- **use application-policy <APP-POLICY-NAME>**

  - **Enforces application detection on this VLAN bridge**
  - **<APP-POLICY-NAME>** – Specify the application policy name (should be existing and configured).

  **Note:** For more information on application definitions and application policies, see application and application-policy.

- **use captive-portal <CAPTIVE-PORTAL-NAME>**

  - Applies an existing captive portal configuration to restrict access to the bridge VLAN configuration
  - **<CAPTIVE-PORTAL-NAME>** – Specify the captive portal name.

- **use [ip-access-list|ipv6-access-list|mac-access-list] tunnel out <IP/IPv6/MAC-ACCESS-LIST-NAME>**

  - **Sets this VLAN bridge policy to use an IPv4/IPv6 access list or a MAC access list**
  - **ip-access-list** Associates a pre-configured IPv4 access list with this VLAN-bridge interface
  - **ipv6-access-list** Associates a pre-configured IPv6 access list with this VLAN-bridge interface

7.1.12 captive-portal

Profile Config Commands

Configures captive portal advanced Web page uploads on this profile. These Web pages are uploaded to access points supporting the captive portal.

A captive portal is a means of providing guests temporary and restrictive access to the controller managed wireless network. A captive portal provides secure authenticated controller access by capturing and re-directing a wireless user’s Web browser session to a captive portal login page, where the user must enter valid credentials. Once the user is authenticated and logged into the controller managed network, additional agreement, welcome, and fail pages provide the administrator with options to control the captive portal’s screen flow and user appearance.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

captive-portal page-upload count <1-20>

Parameters

- captive-portal page-upload count <1-20>

<table>
<thead>
<tr>
<th>page-upload</th>
<th>Enables captive portal advanced Web page upload</th>
</tr>

7.1.13 cdp

Profile Config Commands

Enables Cisco Discovery Protocol (CDP), a proprietary data link layer network protocol implemented in Cisco networking equipment and used to share network information amongst different vendor wireless devices.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

cdp [holdtime|run|timer]

cdp [holdtime <10-1800>|run|timer <5-900>]

### 7.1.14 cluster

> Profile Config Commands

Sets the cluster configuration

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```bash
cluster [force-configured-state|force-configured-state-delay <3-1800>|handle-stp|master-priority <1-255>]
color member [ip|vlan]
color member [ip <IP> {level [1|2]}|vlan <1-4094>]
color mode [active|standby]
color name <CLUSTER-NAME>
color radius-counter-db-sync-time <1-1440>
```

#### Parameters

- `force-configured-state`: Forces adopted APs to auto revert when a failed wireless controller or service platform (in a cluster) restarts
  - When an active controller (wireless controller, or service platform) fails, a standby controller in the cluster takes over APs adopted by the failed active controller. If the failed active controller were to restart, it starts a timer based on the ‘force-configured-state-delay’ interval specified. At the expiration of this interval, the standby controller releases all adopted APs and goes back to a monitoring mode. If the active controller fails during this interval, the ‘force-configured-state-delay’ timer is stopped. The timer restarts as soon as the active controller comes back up. This feature is disabled by default.

- `force-configured-state-delay <3-1800>`: Forces cluster transition to the configured state after a specified interval
  - `<3-1800>` – Specify a delay from 3 - 1800 minutes. The default is 5 minutes.
  - This is the interval a standby controller waits before releasing adopted APs when a failed primary controller becomes active again.

- `handle-stp`: Enables/disables Spanning Tree Protocol (STP) convergence handling. This feature is disabled by default.
  - In layer 2 networks, this protocol is enabled to prevent network looping. If enabled, the network forwards data only after STP convergence. Enabling STP convergence delays the redundancy state machine execution until the STP convergence is completed (the standard protocol value for STP convergence is 50 seconds). Delaying the state machine is important to load balance APs at startup.
### cluster member [ip <IP> {level [1|2]}|vlan <1-4094>]

- **member**: Adds a member to the cluster. It also configures the cluster VLAN where members can be reached.

- **ip <IP> level [1|2]**: Adds IP address of the new cluster member
  - **<IP>**: Specify the IP address.
  - **level**: Optional. Configures routing level for the new member. Select one of the following routing levels:
    - 1 – Level 1, local routing
    - 2 – Level 2, In-site routing

- **vlan <1-4094>**: Configures the cluster VLAN where members can be reached
  - **<1-4094>**: Specify the VLAN ID from 1-4094.

### master-priority <1-255>

- **master-priority <1-255>**: Configures cluster master priority
  - **<1-255>**: Specifies cluster master election priority. Assign a value from 1 - 255. Higher the value higher is the precedence. The default is 128.

In a cluster environment one device from the cluster is elected as the cluster master. A device’s master priority value decides the device’s priority to become cluster master.

### cluster mode [active|standby]

- **mode [active|standby]**: Configures cluster member’s mode as active or standby
  - **active**: Configures cluster mode as active. This is the default setting.
  - **standby**: Configures cluster mode as standby

A member can be in either an Active or Standby mode. All active member controllers can adopt access points. Standby members only adopt access points when an active member has failed or sees an access point not adopted by a controller.

### name <CLUSTER-NAME>

- **name <CLUSTER-NAME>**: Configures the cluster name
  - **<CLUSTER-NAME>**: Specify the cluster name.

### cluster radius-counter-db-sync-time <1-1440>

- **radius-counter-db-sync-time <1-1440>**: Configures the interval, in minutes, at which the RADIUS counter database is synchronized with the dedicated NTP server resource.
  - **<1-1440>**: Specify a value from 1 - 1440 minutes. The default is 5 minutes.

**Note**: Use the `show > cluster > configuration` command to view RADIUS counter DB sync time.

### Examples

```
rfs7000-37FABE(config-profile-default-rfs7000)#cluster name cluster1
rfs7000-37FABE(config-profile-default-rfs7000)#cluster member ip 172.16.10.3
rfs7000-37FABE(config-profile-default-rfs7000)#cluster mode active
```

7.1.16 controller

Profile Config Commands

Configures the WiNG controller (wireless controller or service platform) adoption settings.

Adoption is the process a controller or service platform uses to discover available access points and/or peer controllers/service platforms, establish an association and provision the adopted device. Adoption settings are configurable and supported within a profile and applied to all devices supported by the profile.

Use this command to add a controller to a pool and group. This command also enables and disables adoption on controllers, and specifies the device types that can be adopted by a controller.

In an hierarchically managed (HM) network, devices (controllers and access points) are deployed across three levels. This results in devices that are either adoptee or adopters. For more information on HM network, see device-upgrade.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

controller [adopted-devices|adoption|group|hello-interval|vlan|host]

controller adopted-devices [aps {controllers}|controllers {aps}|external-devices|external-devices-monitoring-only]

controller adoption

controller [group <CONTROLLER-GROUP-NAME>|vlan <1-4094>]

controller hello-interval <1-120> adjacency-hold-time <2-600>

controller host [<IPv4>|<IPv6>|<HOSTNAME>] {ipsec-secure|level|pool|remote-vpn-client}
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {ipsec-secure} {gw [<IP>|<HOSTNAME>]}{level [1/2]|pool <1-2> level [1/2]}
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {ipsec-secure [gw [<IP>|<HOSTNAME>]]|remote-vpn-client}
controller host [<IPv4>|<IPv6>|<HOSTNAME>] {remote-vpn-client}

Parameters

- **controller adopted-devices [aps {controllers}|controllers {aps}|external-devices|external-devices-monitoring-only]**
  - controller — Configures the WLAN's controller adoption settings
  - adopted-devices — Enables the adoption of network access points by this controller. This option is enabled by default.
  - controllers — Optional. Enables the adoption of peer controllers by this controller
  - All adopted devices (referred to as adoptee) receive complete configuration from the adopting controller (referred to as adopter).
<table>

<td>vlan &lt;1-4094&gt;</td>
<td>Configures the wireless controller or service platform VLAN</td>
<td>• &lt;1-4094&gt; – Specify the VLAN ID from 1 - 4094.</td>
</tr>
<tr>
<td>*controller hello-interval &lt;1-120&gt; adjacency-hold-time &lt;2-600&gt;</td>
<td>Configures the hello-interval in seconds. This is the interval between consecutive hello packets exchanged between AP and wireless controller or service platform. • &lt;1-120&gt; – Specify a value from 1 - 120 seconds.</td>
<td>Configures the adjacency hold time in seconds. This is the time since the last received hello packet, after which the adjacency between wireless controller or service platform and AP is lost, and the link is re-established. • &lt;2-600&gt; – Specify a value from 2 - 600 seconds.</td>
</tr>
<tr>
<td>controller</td>
<td>Configures the WLAN's controller settings</td>
<td>hello-interval &lt;1-120&gt; adjacency-hold-time &lt;2-600&gt;</td>
</tr>
</tbody>
</table>
- **controller host [<IPv4>|<IPv6>|<HOSTNAME>]} {ipsec-secure} {gw [<IP>|<HOSTNAME>]}**

  - **host [<IPv4>|<IPv6>|<HOSTNAME>]**
    - Configures wireless controller or service platform’s IPv4/IPv6 address or hostname
      - `<IPv4>` – Configures wireless controller or service platform’s IPv4 address
      - `<IPv6>` – Configures wireless controller or service platform’s IPv6 address
      - `<HOSTNAME>` – Configures wireless controller or service platform’s hostname

  - **ipsec-secure {gw [<IP>|<HOSTNAME>]}}**
    - Optional. Enables *Internet Protocol Security* (IPSec) peer authentication on the connection (link) between the adopting devices. This option is disabled by default.
      - `gw` – Optional. Specifies a IPSec gateway other than the wireless controller or service platform
        - `<IP>` – Use this option to specify the IPSec gateway’s IP address.
        - `<HOSTNAME>` – Use this option to specify the IPSec gateway’s hostname.

  - **level [1|2] | pool <1-2> level [1|2]} {ipsec-secure {gw [<IP>|<HOSTNAME>]}|remote-vpn-client}**

  - **level [1|2]**
    - The following keywords are common to the ’IP’, ’IPv6’, and ’hostname’ parameters:
      - Optional. After providing the wireless controller or service platform’s address, optionally select one of the following routing levels:
        - 1 – Optional. Level 1, local routing
        - 2 – Optional. Level 2, inter-site routing

  - **pool <1-2> level [1|2]**
    - The following keywords are common to the ’IP’, ’IPv6’, and ’hostname’ parameters:
      - Optional. Sets the wireless controller or service platform’s pool
        - <1-2> – Select either 1 or 2 as the pool. The default is 1. After selecting the pool, optionally select one of the following two routing levels:
          - 1 – Optional. Level 1, local routing
          - 2 – Optional. Level 2, inter-site routing

  - **{ipsec-secure {gw [<IP>|<HOSTNAME>]}|remote-vpn-client}**
    - After specifying the routing level and or device’s pool, you can optionally specify the following:
      - ipsec-secure – Optional. Enables IPSec peer authentication on the connection (link) between the adopting devices. This option is disabled by default.

Contd..
controller host \[<IPv4>|<IPv6>|<HOSTNAME>\] \{remote-vpn-client\}

- **gw** – Optional. Specifies an IPSec gateway other than the wireless controller or service platform
  - \(<IP>\) – Use this option to specify the IPSec gateway’s IP address.
  - \(<HOSTNAME>\) – Use this option to specify the IPSec gateway’s hostname.

**Note:** If the gateway’s IP address or hostname is not specified, the system assumes the logged controller as the IPSec gateway.

- **remote-vpn-client** – Forces MiNT link creation protocol (MLCP) to use remote VPN connection on the controller

The controller uses remote VPN tunnel for this traffic. If multiple controller hosts are configured, either all the hosts should use remote-vpn-client or none.

**Note:** When enabled, an MLCP connection is not initiated until remote VPN connection is UP and virtual IP, DNS server, source route etc. are installed on the AP.

7.1.17 *critical-resource*

Profile Config Commands

Enables monitoring of resources critical to the health of the service platform, wireless controller, or access point managed network. These critical resources are identified by their configured IP addresses. When enabled, the system monitors these devices regularly and logs their status. Use this command to create a *critical resource monitoring* (CRM) policy.

A critical resource can be a gateway, AAA server, WAN interface, any hardware, or a service on which the stability of the network depends. Monitoring these resources is therefore essential. When enabled, this feature pings critical resources regularly to ascertain their status. If there is a connectivity issue, an event is generated stating a critical resource is unavailable. By default, there is no enabled critical resource policy and one needs to be created and implemented.

Critical resources can be monitored directly through the interfaces on which they are discovered. For example, a critical resource on the same subnet as an AP8132 access point can be monitored by its IP address. However, a critical resource located on a VLAN must continue to be monitored on that VLAN.

Critical resource monitoring can be enabled on service platforms, wireless controllers, and access points through their respective device profiles.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
critical-resource [<CRM-POLICY-NAME>|monitor]
critical-resource <CRM-POLICY-NAME> monitor [direct|via]
critical-resource <CRM-POLICY-NAME> monitor direct [all|any] [<IP>|sync-adoptees]
   {<IP>|arp-only vlan <1-4094> {<IP>|port [<LAYER2-IF-NAME>|ge <1-4>|port-channel <1-2>]
   }
   }
critical-resource <CRM-POLICY-NAME> monitor via [<IP]|<LAYER3-INTERFACE-NAME>|
pppoel|vlan|wwan

</tbody>
</table>
| **direct [all|any] [sync-adoptees]** | Monitors critical resources using the default routing engine  
- **all** – Monitors all resources that are going down (generates an event when all specified critical resources are unreachable)  
- **any** – Monitors any resource that is going down (generates an event when any one of the specified critical resource is unreachable)  
- **<IP>** – Configures the IP address of the critical resource being monitored (for example, the DHCP or DNS server). Specify the IP address in the A.B.C.D format.  
- **sync-adoptees** – Syncs adopted access points with the controller. In the stand-alone AP scenario, where the CRM policy is running on the AP, the AP is directly intimated in case a critical resource goes down. On the other hand, when an AP is adopted to a controller (running the CRM policy), it is essential to enable the sync-adoptees option in order to sync the AP with the controller regarding the latest CRM status. |
| **arp-only vlan <1-4094> [<IP>] port [LAYER2-IFNAME] ge|port-channel]** | The following keywords are common to the ‘all’ and ‘any’ parameters:  
- **arp-only vlan <1-4094>** – Optional. Uses ARP to determine if the IP address is reachable (use this option to monitor resources that do not have IP addresses). ARP is used to resolve hardware addresses when only the network layer address is known.  
- **vlan <1-4094>** – Specifies the VLAN ID on which to send the probing ARP requests. Specify the VLAN ID from 1 - 4094.  
- **<IP>** – Optional. Limits ARP to a device specified by the <IP> parameter  
- **port [LAYER2-IFNAME] ge|port-channel** – Optional. Limits ARP to a specified port |

| **<CRITICAL-RESRC-NAME>** | Creates a critical resource monitoring policy, identified by the <CRM-POLICY-NAME> keyword. Provide the CRM policy name. |
| **monitor** | Enables critical resource(s) monitoring |
| **via** | Specifies the interface or next-hop via which the ICMP pings should be sent. Configures the interface or next-hop via which ICMP pings are sent. This does not apply to IP addresses configured for arp-only. For interfaces which learn the default-gateway dynamically (like DHCP clients and PPP interfaces), use an interface name for VIA, or use an IP address. |
| **<IP>** | Specify the IP address of the next-hop via which the critical resource(s) are monitored. Configures up to four IP addresses for monitoring. All the four IP addresses constitute critical resources. |
| **<LAYER3-INTERFACE-NAME>** | Specify the layer 3 Interface name (router interface) |
| **pppoe1** | Specifies PPP over Ethernet interface |
| **vlan <1-4094>** | Specifies the wireless controller or service platform’s VLAN interface. Specify VLAN ID from 1 - 4094. |
| **wwan1** | Specifies Wireless WAN interface |
| [all|any] | [<IP>|sync-adoptees] | Monitors critical resources using the default routing engine |
|--------|---------------------|----------------------------------------------------------|
|        |                     | • all – Monitors all resources that are going down (generates an event when all specified critical resource IP addresses are unreachable) |

</tbody>
</table>
7.1.18.1 crypto

Use the crypto command to define a system-level local ID for ISAKMP negotiation and enter the ISAKMP policy, ISAKMP client, or ISAKMP peer configuration mode.

A crypto map entry is a single policy that describes how certain traffic is secured. There are two types of crypto map entries: ipsec-manual and ipsec-ike entries. Each entry is given an index (used to sort the ordered list).

When a non-secured packet arrives on an interface, the crypto map associated with that interface is processed (in order). If a crypto map entry matches the non-secured traffic, the traffic is discarded.

When a packet is transmitted on an interface, the crypto map associated with that interface is processed. The first crypto map entry that matches the packet is used to secure the packet. If a suitable Security Association (SA) exists, it is used for transmission. Otherwise, IKE is used to establish a SA with the peer. If no SA exists (and the crypto map entry is "respond only"), the packet is discarded.

When a secured packet arrives on an interface, its Security Parameter Index (SPI) is used to look up a SA. If a SA does not exist (or if the packet fails any of the security checks), it is discarded. If all checks pass, the packet is forwarded normally.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

</tbody>
</table>

- `crypto ipsec df-bit [clear|copy|set]`

- `crypto ipsec security-association lifetime [kilobytes <500-2147483646> | seconds <120-86400>]`

- `ipsec lifetime [kilobyte |seconds]` Defines the IPSec SAs lifetime (in kilobytes and/or seconds). Values can be entered in both kilobytes and seconds, which ever limit is reached first, ends the SA. When the SA lifetime ends it is renegotiated as a security measure.
  - kilobytes – Specifies a volume-based key duration (minimum is 500 KB and maximum is 2147483646 KB)
  - <500-2147483646> – Specify a value from 500 - 2147483646 KB. The default is 4608000 KB.
  - seconds – Specifies a time-based key duration (minimum is 120 seconds and maximum is 86400 seconds)
  - <120-86400> – Specify a value from 120 - 86400 seconds. The default is 3600 seconds.

- `ipsec transform-set <TRANSFORM-SET-TAG>` Defines the transform set configuration (authentication and encryption) for securing data. A transform set is a combination of security protocols, algorithms and other settings applied to IPSec protected traffic.
  - <TRANSFORM-SET-TAG> – Specify the transform set name.

...
After specifying the transform set used by the IPsec transport connection, set the encryption method and the authentication scheme used with the transform set. The encryption methods available are: DES, 3DES, AES, AES-192 and AES-256. The authentication schemes available are: esp-md5-hmac and esp-sha-hmac.

<table>
<thead>
<tr>
<th>Transform Set</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp-3des</td>
<td>Configures the ESP transform using 3DES cipher (168 bits). The transform set is assigned to a crypto map using the map's <code>set &gt; transform-set</code> command.</td>
</tr>
<tr>
<td>esp-aes</td>
<td>Configures the ESP transform using Advanced Encryption Standard (AES) cipher. The transform set is assigned to a crypto map using the map's <code>set &gt; transform-set</code> command.</td>
</tr>
<tr>
<td>esp-aes-192</td>
<td>Configures the ESP transform using AES cipher (192 bits). The transform set is assigned to a crypto map using the map's <code>set &gt; transform-set</code> command. This is the default setting.</td>
</tr>
<tr>
<td>esp-aes-256</td>
<td>Configures the ESP transform using Data Encryption Standard (DES) cipher (56 bits). The transform set is assigned to a crypto map using the map's <code>set &gt; transform-set</code> command.</td>
</tr>
<tr>
<td>esp-null</td>
<td>Configures the ESP transform with no encryption</td>
</tr>
</tbody>
</table>

The following keywords are common to all of the above listed transform sets. After specifying the transform set type, configure the authentication scheme used to validate identity credentials. The options are:

- esp-aes-xcbc-mac – Configures ESP transform using AES-XCBC authorization
- esp-md5-hmac – Configures ESP transform using HMAC-MD5 authorization
- esp-sha-hmac – Configures ESP transform using HMAC-SHA authorization. This is the default setting.
- esp-sha256-hmac – Configures ESP transform using HMAC-SHA256 authorization

<table>
<thead>

- `crypto pki import crl <TRUSTPOINT-NAME> <URL> <1-168>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pki</strong></td>
<td>Configures certificate parameters. The Public Key Infrastructure (PKI) protocol creates encrypted public keys using digital certificates from certificate authorities.</td>
</tr>
</tbody>
</table>
  | **crl** <TRUSTPOINT-NAME> | Imports a Certificate Revocation List (CRL). Imports a trustpoint including either a private key and server certificate or a certificate authority (CA) certificate or both. A CRL is a list of revoked certificates that are no longer valid. A certificate can be revoked if the CA had improperly issued a certificate, or if a private-key is compromised. The most common reason for revocation is the user no longer being in sole possession of the private key.  
  | **<URL>**             | Specify the CRL source address in the following format. Both IPv4 and IPv6 address formats are supported.  
  | **<1-168>**           | Sets command replay duration from 1 - 168 hours. This is the interval (in hours) after which devices using this profile copy a CRL file from an external server and associate it with a trustpoint.  

- `crypto plain-text-deny-acl-scope [global | interface]`

<table>
