7.1.18.2  crypto-auto-ipsec-tunnel commands

crypto

Creates an auto IPSec VPN tunnel and changes the mode to auto-ipsec-secure mode for further configuration.

Auto IPSec tunneling provides a secure tunnel between two networked peer controllers or service platforms and associated access points that are within a range of valid IP addresses. You can define which packets are sent within the tunnel, and how they are protected. When a tunneled peer sees a sensitive packet, it creates a secure tunnel and sends the packet through the tunnel to its remote peer destination or associated access point.

Tunnels are sets of SA between two peers. SAs define the protocols and algorithms applied to sensitive packets and specify the keying mechanisms used by tunnelled peers. SAs are unidirectional and exist in both the inbound and outbound direction. SAs are established per the rules and conditions of defined security protocols (AH or ESP).

The IKE protocol is a key management protocol used in conjunction with IPSec. IKE enhances IPSec by providing additional features, flexibility, and configuration simplicity for the IPSec standard. IKE enables secure communications without time consuming manual pre-configuration for auto IPSec tunneling.

7.1.18.2.1 groupid

**crypto-auto-ipsec-tunnel commands**

Specifies the identity string used for IKE authentication

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

groupid <WORD> [psk|rsa]
groupid <WORD> [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]

**Parameters**

- **groupid <WORD> [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]**

  <WORD>
  
  Specify a string not exceeding 64 characters. This is the group identity used for IKE exchange for auto IPSec secure peers. After providing a group ID, specify the authentication method used to authenticate peers on the auto IPSec secure tunnel. The options are: psk and rsa.

  | psk [0 <WORD>|2 <WORD>]<WORD> |
  |--------------------------------|
  | Configures the pre-shared key (PSK) as the authentication type for secure peer authentication on the auto IPSec secure tunnel |
  | • 0 <WORD> – Configures a clear text key |
  | • 2 <WORD> – Configures an encrypted key |
  | • <WORD> – Specify a string value from 8 - 21 characters. |

- **rsa**

  Configures the Rivest-Shamir-Adleman (RSA) key.
  
  RSA is an algorithm for public key cryptography. It is the first algorithm known to be suitable for signing, as well as encryption. This is the default setting.

**NOTE:** Only one group ID is supported on the controller or service platform. All APs, controllers, and service platform must use the same group ID.

**Examples**

rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#groupid
testgroup@123 rsa

rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#show context
crypto auto-ipsec-secure
groupid testgroup@123 rsa

rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#
7.1.18.2.2 ip

**crypto-auto-ipsec-tunnel commands**

Enables the controller to uniquely identify APs and the hosts present in the AP's subnet. This allows the controller to correctly identify the destination host and create a dynamic site-to-site VPN tunnel between the host and the private network behind the controller.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ip nat crypto
```

**Parameters**

- `ip nat crypto`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip nat crypto</code></td>
<td>Enables unique identification of APs and the hosts present in each AP's subnet</td>
</tr>
</tbody>
</table>

Providing a unique ID enables the access point, wireless controller, or service platform to uniquely identify the destination device. This is essential in networks where there are multiple APs behind a router, or when two (or more) APs behind two (or more) different routers have the same IP address. Further, the same subnet exists behind these APs.

For example, let us consider a scenario where there are two APs (A and B) behind two routers (1 and 2). AP 'A' is behind router '1'. And AP 'B' is behind router '2'. Both these APs have the same IP address (192.168.13.8). The subnet behind APs A and B is also the same (100.1.1.0/24). In such a scenario the controller fails to uniquely identify the hosts present in either AP's subnet.

For more information, see `remotegw` and `crypto`.

**Examples**

```
rfs4000-229D58(config-profile-test)RFS4000-crypto-auto-ipsec-secure)#ip nat crypto
rfs4000-229D58(config-profile-test)RFS4000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
remotegw ike-version ikev2 uniqueid
ip nat crypto
rfs4000-229D58(config-profile-test)RFS4000-crypto-auto-ipsec-secure)#
```
### 7.1.18.2.3 ike-lifetime

**crypto-auto-ipsec-tunnel commands**

Configures the IKE SA's key lifetime in seconds

The lifetime defines how long a connection (encryption/authentication keys) should last, from successful key negotiation to expiration. Two peers need not exactly agree on the lifetime, though if they do not, there is some clutter for a superseded connection on the peer defining the lifetime as longer.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

ike-lifetime <600-86400>

**Parameters**

- ike-lifetime <600-86400>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ike-lifetime &lt;600-86400&gt;</td>
<td>Sets the IKE SA's key lifetime in seconds</td>
</tr>
</tbody>
</table>

**Examples**

```
**rfs4000-229D58(config-profile-testRFS4000-crypto-auto-ipsec-secure)#**
ike-lifetime 800
rfs4000-229D58(config-profile-testRFS4000-crypto-auto-ipsec-secure)#
```

**rfs4000-229D58(config-profile-testRFS4000-crypto-auto-ipsec-secure)#**
show context crypto auto-ipsec-secure

ike-lifetime 800
7.1.18.2.4 ikev2

crypto-auto-ipsec-tunnel commands

Enables/disables the forced IKEv2 peer re-authentication. This option is disabled by default.

In most IPSec tunnel configurations, the lifetime of IKE SAs between peers is limited. Once the IKE SA key expires it is renegotiated. In such a scenario, the IKEv2 tunnel peers may or may not re-authenticate themselves. When enabled, IKE tunnel peers have to re-authenticate each time the IKE SA is renegotiated.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
ikev2 peer reauth

Parameters
- ikev2 peer reauth

ikev2 peer reauth Enables IKEv2 peer re-authentication. When enabled, IKE tunnel peers are forced to re-authenticate each time the IKE key is renegotiated.

Examples
rfs4000-229D58 (config-profile-testRFS4000-crypto-auto-ipsec-secure)#ikev2 peer reauth
### 7.1.18.2.5 remotegw

**crypto-auto-ipsec-tunnel commands**

Defines the IKE version used for auto IPSEC tunnel negotiation with the IPSec remote gateway other than the controller.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
remotegw ike-version [ikev1-aggr|ikev1-main|ikev2] {uniqueid}
```

**Parameters**

- `remotegw ike-version [ikev1-aggr|ikev1-main|ikev2] {uniqueid}`
  - `remotegw ike-version` Configures the IKE version used for initiating auto IPSec tunnel with secure gateways other than the controller.
  - `ikev1-aggr` Aggregation mode is used by the auto IPSec tunnel initiator to set up the connection.
  - `ikev1-main` Main mode is used by the auto IPSec tunnel initiator to establish the connection.
  - `ikev2` IKEv2 is the preferred method when wireless controller/AP only is used.
  - `uniqueid` This keyword is common to all of the above parameters.

- `uniqueid` — Optional. Enables the assigning of a unique ID to APs (using this profile) behind a router by prefixing the MAC address to the group ID.

Providing a unique ID enables the access point, wireless controller, or service platform to uniquely identify the destination device. This is essential in networks where there are multiple APs behind a router, or when two (or more) APs behind two (or more) different routers have the same IP address. For example, let us consider a scenario where there are two APs (A and B) behind two routers (1 and 2). AP ‘A’ is behind router ‘1’. And AP ‘B’ is behind router ‘2’. Both these APs have the same IP address (192.168.13.8). In such a scenario, the controller fails to establish an Auto IPSec VPN tunnel to either APs, because it is unable to uniquely identify them. After enabling unique ID assignment, enable IKE unique ID check. For more information, see `crypto`.

**Examples**

```plaintext
rfs7000-37FABE (config-profile-default-rfs7000-crypto-auto-ipsec-secure)#remotegw
ike-version ikev2 uniqu eid

rfs7000-37FABE (config-profile-default-rfs7000-crypto-auto-ipsec-secure)#show context
```

```plaintext
crypto auto-ipsec-secure
remotegw ike-version ikev2 uniqu eid
rfs7000-37FABE (config-profile-default-rfs7000-crypto-auto-ipsec-secure)#
```
### 7.1.18.2.6 no

**crypto-auto-ipsec-tunnel commands**

Removes or resets this auto IPSec tunnel settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no [groupid|ike-lifetime|ikev2 peer reauth|ip nat crypto]
```

**Parameters**

- `no <PARAMETERS>`

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes or resets this auto IPSec tunnel's settings based on the parameters passed</th>
</tr>
</thead>
</table>

**Examples**

The following example shows the Auto IPSec VLAN bridge settings before the `no` command is executed:

```
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
groupid testpassword@123 rsa
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#no groupid
```

The following example shows the Auto IPSec VLAN bridge settings after the `no` command is executed:

```
rfs7000-37FABE(config-profile-default-rfs7000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
```

```
nx4500-5CFA2B(config-profile-testRFS4000-crypto-auto-ipsec-secure)#no ikev2 peer reauth
nx4500-5CFA2B(config-profile-testRFS4000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
```

```
nx4500-5CFA2B(config-profile-testRFS4000-crypto-auto-ipsec-secure)#no ike-lifetime
nx4500-5CFA2B(config-profile-testRFS4000-crypto-auto-ipsec-secure)#show context crypto auto-ipsec-secure
```
7.1.18.3 crypto-ikev1/ikev2-policy commands

Defines crypto-IKEv1/IKEv2 commands in detail

IKE protocol is a key management protocol standard used in conjunction with IPSec. IKE enhances IPSec by providing additional features, flexibility, and configuration simplicity for the IPSec standard. IKE automatically negotiates IPSec SAs and enables secure communications without time consuming manual pre-configuration.

Use the (config) instance to configure IKEv1/IKEv2 policy configuration commands.

To navigate to the IKEv1/IKEv2 policy config instance, use the following commands:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto ikev1/ikev2 policy
<IKEV1/IKEV2-POLICY-NAME>
```

```
rfs7000-37FABE(config-profile-default-rfs7000)#crypto ikev1 policy ikev1-testpolicy
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)#?
```

Crypto IKEv1 Policy Configuration commands:

- `dpd-keepalive` Set Dead Peer Detection interval in seconds
- `dpd-retries` Set Dead Peer Detection retries count
- `isakmp-proposal` Configure ISAKMP Proposals
- `lifetime` Set lifetime for ISAKMP security association
- `mode` IKEv1 mode (main/aggressive)
- `no` Negate a command or set its defaults
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)#
```

```
rfs7000-37FABE(config-profile-test-ikev2-policy-ikev2-testpolicy)#?
```

Crypto IKEv2 Policy Configuration commands:

- `dpd-keepalive` Set Dead Peer Detection interval in seconds
- `isakmp-proposal` Configure ISAKMP Proposals
- `lifetime` Set lifetime for ISAKMP security association
- `no` Negate a command or set its defaults
- `sa-per-acl` Setup single SA for all rules in the ACL (ONLY APPLICABLE FOR SITE-TO-SITE VPN)
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-profile-test-ikev2-policy-ikev2-testpolicy)#
```

---

**NOTE:** IKEv2 being an improved version of the original IKEv1 design, is recommended in most deployments. IKEv2 provides enhanced cryptographic mechanisms, NAT and firewall traversal, attack resistance etc.
The following table summarizes crypto IKEv1/iKEv2 configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>

### 7.1.18.3.1 dpd-keepalive

**crypto-ikev1/ikev2-policy commands**

Sets the DPD keep-alive packet interval

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dpd-keepalive <10-3600>

**Parameters**

- **dpd-keepalive <10-3600>**

| <10-3600> | Specifies the interval, in seconds, between successive DPD keep alive packets. The IKE keep alive message is used to detect a dead peer on the remote end of the IPSec VPN tunnel. Specify the time from 10 - 3600 seconds. The default is 30 seconds. |

**Examples**

```
[rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)]#
dpd-keepalive 11

[rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)]# show context crypto ikev1 policy testpolicy
dpd-keepalive 11

[rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-ikev1-testpolicy)]#
```

```
7.18.3.2 dpd-retries

Sets the maximum number of times DPD keep-alive packets sent to a peer. Once this value is exceeded, without a response from the peer, the VPN tunnel connection is declared dead. This option is available only for the IKEv1 policy.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dpd-retries <1-100>

**Parameters**
- dpd-retries <1-100>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-100&gt;</td>
<td>Declares a peer dead after the specified number of retries. Specify a value from 1 - 100. The default is 5.</td>
</tr>
</tbody>
</table>

**Examples**

```bash
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#dpd-retries 10
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#show context crypto ikev1 policy testpolicy
dpd-keepalive 11
dpd-retries 10
isakmp-proposal default encryption aes-256 group 2 hash sha
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#
```
### 7.1.18.3.3 isakmp-proposal

**crypto-ikev1/ikev2-policy commands**

Configures ISAKMP proposals and their parameters

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
isakmp-proposal <WORD> encryption [3des|aes|aes-192|aes-256] group [14|2|5]
   hash [aes-xcbc-mac|md5|sha|sha256]
```

**Parameters**

- **<WORD>**
  - Assigns the target peer (tunnel destination) a 32 character maximum name to distinguish it from others with a similar configuration.

- **encryption [3des|aes|aes-192|aes-256]**
  - Configures the encryption method used by the tunneled peers to securely interoperate
    - **3des** — Configures triple data encryption standard
    - **aes** — Configures AES (128 bit keys)
    - **aes-192** — Configures AES (192 bit keys)
    - **aes-256** — Configures AES (256 bit keys). This is the default setting.

- **group [14|2|5]**
  - Specifies the Diffie-Hellman (DH) group identifier used by VPN peers to derive a shared secret password without having to transmit. DH groups determine the strength of the key used in key exchanges. The higher the group number, the stronger and more secure the key. Options include 2, 5 and 14.
    - **14** — Configures DH group 14
    - **2** — Configures DH group 2. This is the default setting.
    - **5** — Configures DH group 5

- **hash [aes-xcbc-mac|md5|sha|sha256]**
  - Specifies the hash algorithm used to authenticate data transmitted over the IKE SA. The hash algorithm specified here is used by VPN peers to exchange credential information.
    - **aes-xcbc-mac** — Uses AES XCBC Auth hash algorithm. This option is applicable only to the IKEv2 policy configuration context.
    - **md5** — Uses Message Digest 5 (MD5) hash algorithm
    - **sha** — Uses Secure Hash Authentication (SHA) hash algorithm. This is the default setting.
    - **sha256** — Uses Secure Hash Standard 2 algorithm
Examples

rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#
7.1.18.3.4 lifetime

crypto-ikev1/ikev2-policy commands

Specifies how long an IKE SA (encryption/authentication keys) is valid. The value specified is the validity period of the IKE SA from successful key negotiation to expiration.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

lifetime <600-86400>

Parameters

- lifetime <600-86400> Specifies how many seconds an IKE SA lasts before it expires. Set a time stamp from 600 - 86400 seconds.
- <600-86400> — Specify a value from 600 - 86400 seconds. The default is 86400 seconds.

Examples

rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-test-ikev1policy)#lifetime 655
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#show context
  crypto ikev1 policy testpolicy
  dpd-keepalive 11
  dpd-retries 10
  lifetime 655
  isakmp-proposal default encryption aes-256 group 2 hash sha
  isakmp-proposal testpraposal encryption aes group 2 hash sha
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#
### 7.1.18.3.5 mode

*crypto-ikev1/ikev2-policy commands*

Configures the IPSec mode of operation for the IKEv1 policy. This option is not available for IKEv2 policy.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
mode [aggresive|main]
```

**Parameters**

- `mode [aggresive|main]`

| mode [aggresive|main] | Sets the mode of the tunnels |
|-----------------------|-----------------------------|
|                        | • aggressive – Initiates the aggressive mode |
|                        | • main – Initiates the main mode |

**Note:** If configuring the IKEv1 IPSec policy, define the IKE mode as either `main` or `aggressive`. In the aggressive mode, 3 messages are exchanged between the IPSec peers to setup the SA. On the other hand, in the main mode, 6 messages are exchanged. The default setting is main.

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#mode aggressive
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#show context crypto ikev1 policy testpolicy
dpd-keepalive 11
dpd-retries 10
lifetime 655
isakmp-proposal default encryption aes-256 group 2 hash sha
isakmp-proposal testpraposal encryption aes group 2 hash sha
mode aggressive
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#
```
7.1.18.3.6 no

- **crypto-ikev1/ikev2-policy commands**

Removes or reverts IKEv1/IKEv2 policy settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

no [dpd-keepalive|dpd-retries|isakmp-proposal <WORD>|lifetime|mode]

**Parameters**

- no <PARAMETERS>

The following example shows the IKEV1 Policy settings before the ‘no’ commands are executed:

```bash
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#show context crypto ikev1 policy testpolicy
dpd-keepalive 11
dpd-retries 10
lifetime 655
isakmp-proposal default encryption aes-256 group 2 hash sha
isakmp-proposal testproposal encryption aes group 2 hash sha
mode aggressive
```

```bash
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#no mode
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#no dpd-keepalive
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#no dpd-retries
```

The following example shows the IKEV1 Policy settings after the ‘no’ commands are executed:

```bash
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#show context crypto ikev1 policy testpolicy
lifetime 655
isakmp-proposal default encryption aes-256 group 2 hash sha
isakmp-proposal testproposal encryption aes group 2 hash sha
```

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-policy-testpolicy)#
```
7.1.18.4 crypto-ikev1/ikev2-peer commands

Use the (config) instance to configure IKEv1/IKEv2 peer configuration commands. To navigate to the IKEv1/IKEv2 peer config instance, use the following commands:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto ikev1/ikev2 peer <IKEV1/IKEV2-PEER-NAME>
```

Crypto IKEV1 Peer Configuration commands:
- `authentication` Configure Authentication credentials
- `ip` Configure peer address/fqdn
- `localid` Set local identity
- `no` Negate a command or set its defaults
- `remoteid` Configure remote peer identity
- `use` Set setting to use

```
crtr
commit
end
exit
help
revert
service

7.1.18.4.1 authentication

- crypto-ikev1/ikev2-peer commands

Configures IKEv1/IKEv2 peer’s authentication mode and the pre-shared key

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
authentication [psk|rsa]
```

```
authentication psk [0 <WORD>|2 <WORD>|<WORD>] {local|remote}
```

```
authentication rsa
```

Parameters

- **authentication psk [0 <WORD>|2 <WORD>|<WORD>] {local|remote}**

  psk[0 <WORD>|2 <WORD>|<WORD>] {local/remote} Configures the authentication mode as pre-shared key (PSK). The PSK is a string, 8 - 12 characters long. It is shared by both ends of the VPN tunnel connection. If using IKEv2, both a local and remote string must be specified for handshake validation at both ends (local and remote) of the VPN connection.

  - 0 <WORD> – Configures a clear text key
  - 2 <WORD> – Configures an encrypted key
  - <WORD> – Configures the pre-shared key

  The following keywords are available only in the IKEv2 peer configuration mode:

  - local – Optional. Uses the specified key for local peer authentication only
  - remote – Optional. Uses the specified key for remote peer authentication only

  **Note:** In case the peer type is not specified, this string is used for authenticating both local and remote peers.

- authentication rsa

  rsa Configures the authentication mode as Rivest, Shamir, and Adleman (RSA) This is the default setting (for both IKEv1 and IKEv2).

  RSA is the first known public-key cryptography algorithm designed signing and encryption. If configuring the IKEv2 peer, the ‘rsa’ option allows you to enable authentication at both ends of the VPN connection (local and remote).

Examples

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#authentication rsa
```

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#authentication
psk 0 key@123456
```

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#show context
crypto ikev2 peer peer1
  authentication psk 0 key@123456 local
  authentication psk 0 key@123456 remote
```

```
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#
```
7.1.18.4.2 ip

crypto-ikev1/ikev2-peer commands

Sets the IP address or Fully Qualified Domain Name (FQDN) of the IPSec VPN peer used in the tunnel setup

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```bash
ip [address <IP>|fqdn <WORD>]
```

Parameters

- `ip [address <IP>|fqdn <WORD>]`

| address <IP> | Specify the peer device’s IP address. |
| fqdn <WORD> | Specify the peer device’s FQDN hostname. |

Examples

```bash
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#ip address 172.16.10.12
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#ip address 192.168.10.6
```

```bash
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#show context
crypto ikev1 peer peer1
ip address 172.16.10.12
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#ip address 192.168.10.6
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#show context
crypto ikev2 peer peer1
ip address 192.168.10.6
authentication psk 0 test@123456 local
authentication psk 0 test@123456 remote
```
7.1.18.4.3 localid

- crypto-ikev1/ikev2-peer commands

Sets a IKEv1/IKEv2 peer’s local identity. This local identifier is used with this peer configuration for an IKE exchange with the target VPN IPSec peer.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
localid [address|autogen-uniqueid|dn|email|fqdn|string]

localid [address <IP>|autogen-uniqueid <WORD>|dn <WORD>|email <WORD>|fqdn <WORD>|string <WORD>]

Parameters
- localid [address <IP>|dn <WORD>|email <WORD>|fqdn <WORD>|string <WORD>]

<table>
<thead>
<tr>
<th>address &lt;IP&gt;</th>
<th>Configures the peer’s IP address. The IP address is used as local identity.</th>
</tr>
</thead>
<tbody>
<tr>
<td>autogen-uniqueid &lt;WORD&gt;</td>
<td>Generates a localid using the device’s unique identity. The system prefixes the device’s unique identity to the string provided here. The device’s unique identity should be existing and configured. For more information on configuring a device’s unique identity, see autogen-uniqueid.</td>
</tr>
<tr>
<td></td>
<td>• &lt;WORD&gt; – Provide the string.</td>
</tr>
<tr>
<td>dn &lt;WORD&gt;</td>
<td>Configures the peer’s distinguished name. (for example, “C=us ST=&lt;state&gt; L=&lt;location&gt; O=&lt;organization&gt; OU=&lt;org unit&gt;”. The maximum length is 128 characters.</td>
</tr>
<tr>
<td>email &lt;WORD&gt;</td>
<td>Configures the peer’s e-mail address. The maximum length is 128 characters.</td>
</tr>
<tr>
<td>fqdn &lt;WORD&gt;</td>
<td>Configures the peer’s FQDN. The maximum length is 128 characters.</td>
</tr>
<tr>
<td>string &lt;WORD&gt;</td>
<td>Configures the peer’s identity string. The maximum length is 128 characters. This is the default setting.</td>
</tr>
</tbody>
</table>

Examples

7.1.18.4.4 remoteid

crypto-ikev1/ikev2-peer commands

Configures a IKEv1/IKEV2 peer’s remote identity. This remote identifier is used with this peer configuration for an IKE exchange with the target VPN IPSec peer.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
remoteid [address <IP>|dn <WORD>|email <WORD>|fqdn <WORD>|string <WORD>]

Parameters
- address <IP> Configures the remote IKEv1/IKEV2 peer’s IP address. The IP address is used as the peer’s remote identity.
- dn <WORD> Configures the remote peer’s distinguished name. For example, "C=us ST=<state> L=<location> O=<organization> OU=<org unit>". The maximum length is 128 characters.
- email <WORD> Configures the remote peer’s e-mail address. The maximum length is 128 characters.
- fqdn <WORD> Configures a peer’s FQDN. The maximum length is 128 characters.
- string <WORD> Configures a peer’s identity string. The maximum length is 128 characters.

7.1.18.4.5 use

- crypto-ikev1/ikev2-peer commands

Associates IKEv1/IKEv2 policy with the IKEv1/IKEv2 peer respectively

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

use ikev1-policy <IKEV1-POLICY-NAME>
use ikev2-policy <IKEV2-POLICY-NAME>

Parameters

- use ikev1-policy <IKEV1-POLICY-NAME>

  Specify the IKEv1 policy name.
  The local IKEv1 policy and the peer IKEv1 policy must have matching group settings for successful negotiations.

- use ikev2-policy <IKEV2-POLICY-NAME>

  Specify the IKEv2 policy name.
  The local IKEv2 policy and the peer IKEv2 policy must have matching group settings for successful negotiations.

Examples

rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#use ikev1-policy test-ikev1policy

7.1.18.4.6 no

- **crypto-ikev1/ikev2-peer commands**

Removes or reverts IKEv1/IKEv2 peer settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

no [authentication|ip|localid|remoteid|use <IKEV1/IKEV2-POLICY-NAME>]

**Parameters**
- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes or reverts IKEV1/IKEV2 peer settings based on the parameters passed</th>
</tr>
</thead>
</table>

**Examples**

The following example shows the Crypto IKEV1 peer1 settings before the 'no' commands are executed:

```bash
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#show context
crypto ikev1 peer peer1
    ip address 172.16.10.12
    remoteid dn SanJose
    localid email bob@examplecompany.com
    use ikev1-policy test-ikev1policy
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#no localid
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#no remoteid
```

The following example shows the Crypto IKEV1 peer1 settings after the 'no' commands are executed:

```bash
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#show context
crypto ikev1 peer peer1
    ip address 172.16.10.12
    use ikev1-policy test-ikev1policy
rfs7000-37FABE(config-profile-default-rfs7000-ikev1-peer-peer1)#
```

The following example shows the Crypto IKEV2 peer1 settings before the 'no' commands are executed:

```bash
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#show context
crypto ikev2 peer peer1
    remoteid address 157.235.209.63
    use ikev2-policy test
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#
```

The following example shows the Crypto IKEV2 peer1 settings after the 'no' commands are executed:

```bash
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#no use ikev2-policy
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#show context
crypto ikev2 peer peer1
    remoteid address 157.235.209.63
rfs7000-37FABE(config-profile-default-rfs7000-ikev2-peer-peer1)#
```
7.1.18.5 crypto-map-config-commands

This section explains crypto map configuration mode commands in detail.

A crypto map entry is a single policy that describes how certain traffic is secured. There are two types of crypto map entries: ipsec-manual and ipsec-ike. Each entry is given an index (used to sort the ordered list).

IPSec VPN provides a secure tunnel between two networked peers. Administrators can define which packets are sent within the tunnel, and how they’re protected. When a tunneled peer sees a sensitive packet, it creates a secure tunnel and sends the packet through the tunnel to its remote peer destination.

Tunnels are sets of SA between two peers. SAs define the protocols and algorithms applied to sensitive packets and specify the keying mechanisms used by tunneled peers. SAs are unidirectional and exist in both the inbound and outbound direction. SAs are established per the rules and conditions of defined security protocols (AH or ESP).

IKE is a key management protocol standard used in conjunction with IPSec. IKE enhances IPSec by providing additional features, flexibility, and configuration simplicity for the IPSec standard. IKE automatically negotiates IPSec SAs, and enables secure communications without time consuming manual pre-configuration.

Use crypto maps to configure IPSec VPN SAs. Crypto maps combine the elements comprising IPSec SAs. Crypto maps also include transform sets. A transform set is a combination of security protocols, algorithms and other settings applied to IPSec protected traffic. One crypto map is utilized for each IPSec peer, however for remote VPN deployments one crypto map is used for all the remote IPSec peers.

Use the (config) instance to enter the crypto map configuration mode. To navigate to the crypto-map configuration instance, use the following commands:

In the device-config mode:
```bash
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000>
   [ipsec-isakmp {dynamic}|ipsec-manual]
```

In the profile-config mode:
```bash
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000>
   [ipsec-isakmp {dynamic}|ipsec-manual]
```

There are three different configurations defined for each listed crypto map: site-to-site manual (ipsec-manual), site-to-site-auto tunnel (ipsec-isakmp), and remote VPN client (ipsec-isakmp dynamic). With site-to-site deployments, an IPSEC tunnel is deployed between two gateways, each at the edge of two different remote networks. With remote VPN, an access point located at remote branch defines a tunnel with a security gateway. This facilitates the end points in the branch office to communicate with the destination endpoints (behind the security gateway) in a secure manner.

Each crypto map entry is given an index (used to sort the ordered list).

```
rfs7000-37FABE(config-profile-default-rfs7000)#crypto map map1 1 ipsec-manual
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#?
```

Manual Crypto Map Configuration commands:
- local-endpoint-ip: Use this IP as local tunnel endpoint address, instead of the interface IP (Advanced Configuration)
- mode: Set the tunnel mode
- no: Negate a command or set its defaults
- peer: Set peer
- security-association: Set security association parameters
- session-key: Set security session key parameters
- use: Set setting to use
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
write                 Write running configuration to memory or terminal

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#

The following table summarizes crypto map configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto-map auto-vpn-tunnel/</td>
<td>Configures an auto site-to-site VPN or remote</td>
<td>page 7-102</td>
</tr>
<tr>
<td>remote-vpn-client instance</td>
<td>VPN client</td>
<td></td>
</tr>
<tr>
<td>crypto-map-ipsec-manual-instance</td>
<td>Configures a manual site-to-site VPN</td>
<td>page 7-116</td>
</tr>
</tbody>
</table>
7.1.18.5.1 crypto-map auto-vpn-tunnel/remote-vpn-client instance

To navigate to the auto site-to-site VPN tunnel configuration instance, use the following command:

In the device-config mode:

```bash
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-isakmp
```

In the profile-config mode:

```bash
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-isakmp
```

Site to Site Crypto Map Configuration commands:
- `ip` Internet Protocol config commands
- `local-endpoint-ip` Use this IP as local tunnel endpoint address, instead of the interface IP (Advanced Configuration)
- `no` Negate a command or set its defaults
- `peer` Add a remote peer
- `pfs` Specify Perfect Forward Secrecy
- `security-association` Security association parameters
- `transform-set` Specify IPSec transform to use
- `use` Set setting to use

```
rfs4000-229D58(config-device-00-23-68-22-9D-58)#crypto map test1 1 ipsec-isakmp
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#?
```

Dynamic Crypto Map Configuration commands:
- `local-endpoint-ip` Use this IP as local tunnel endpoint address, instead of the interface IP (Advanced Configuration)
- `modeconfig` Set the mode config method
- `no` Negate a command or set its defaults
- `peer` Add a remote peer
- `pfs` Specify Perfect Forward Secrecy
- `remote-type` Set the remote VPN client type
- `security-association` Security association parameters
- `transform-set` Specify IPSec transform to use
- `use` Set setting to use

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

To navigate to the remote VPN client configuration instance, use the following command:

In the device-config mode:

```bash
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-isakmp dynamic
```

In the profile-config mode:

```bash
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-isakmp dynamic
```

Dynamic Crypto Map Configuration commands:
- `local-endpoint-ip` Use this IP as local tunnel endpoint address, instead of the interface IP (Advanced Configuration)
- `modeconfig` Set the mode config method
- `no` Negate a command or set its defaults
- `peer` Add a remote peer
- `pfs` Specify Perfect Forward Secrecy
- `remote-type` Set the remote VPN client type
- `security-association` Security association parameters
- `transform-set` Specify IPSec transform to use
- `use` Set setting to use

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#?
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```
The following table lists the IPSec-Auto-VPN/Remote-VPN tunnel configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>Enables this setting to utilize IP/Port NAT on the VPN tunnel. This command is applicable only to the site-to-site VPN tunnel.</td>
<td>page 7-104</td>
</tr>
<tr>
<td>local-endpoint-ip</td>
<td>Uses the configured IP as local tunnel endpoint address, instead of the interface IP. This command is applicable to the site-to-site VPN tunnel and remote VPN client.</td>
<td>page 7-105</td>
</tr>
<tr>
<td>modeconfig</td>
<td>Configures the mode config method (pull or push) associated with the remote VPN client. This command is applicable only to the remote VPN client.</td>
<td>page 7-106</td>

<td>Configures the remote VPN client type as either None or XAuth. This command is applicable only to the remote VPN client.</td>
<td>page 7-109</td>
</tr>
<tr>
<td>security-association</td>
<td>Defines this automatic VPN tunnel’s IPSec SA settings. This command is applicable to the site-to-site VPN tunnel and remote VPN client.</td>
<td>page 7-110</td>
</tr>
<tr>
<td>transform-set</td>
<td>Applies a transform set (encryption and hash algorithms) to the VPN tunnel. This command is applicable to the site-to-site VPN tunnel and remote VPN client.</td>
<td>page 7-112</td>
</tr>
<tr>
<td>use</td>
<td>Applies an existing and configured IP access list to the VPN tunnel. This command is applicable to the site-to-site VPN tunnel and remote VPN client.</td>
<td>page 7-113</td>
</tr>
<tr>
<td>no</td>
<td>Removes or reverts site-to-site VPN tunnel or remote VPN client settings</td>
<td>page 7-114</td>
</tr>
</tbody>
</table>
7.1.18.5.2 ip

- **crypto-map auto-vpn-tunnel/remote-vpn-client instance**

Enables this setting to utilize IP/Port NAT on this auto site-to-site VPN tunnel. This option is disabled by default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ip nat crypto
```

**Parameters**

- **ip nat crypto**

```
| ip nat crypto | Enables this setting to utilize IP/Port NAT on the site-to-site VPN tunnel. This setting is disabled by default. |
```

**Examples**

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#ip nat crypto
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
   ip nat crypto
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```
7.18.5.3 local-endpoint-ip

Uses the configured IP as local tunnel endpoint address, instead of the interface IP

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`local-endpoint-ip <IP>`

**Parameters**

- `local-endpoint-ip <IP>`

  Configures the local VPN tunnel’s (site-to-site VPN tunnel or remote VPN client) endpoint IP address

  - `<IP>` – Specify the IP address. The specified IP address must be available on the interface.

**Examples**

Site-to-site VPN tunnel:

```
192.168.13.10
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#local-endpoint-ip 192.168.13.10
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
  local-endpoint-ip 192.168.13.10
  ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

Remote VPN client:

```
157.235.204.62
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#local-endpoint-ip 157.235.204.62
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
  local-endpoint-ip 157.235.204.62
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```
7.18.5.4 modeconfig

- `crypto-map auto-vpn-tunnel/remote-vpn-client instance`

Configures the mode config method (pull or push) associated with the remote VPN client

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`modeconfig [pull|push]`

**Parameters**

- `modeconfig [pull|push]`

| modeconfig [pull|push] | Configures the mode config method associated with a remote VPN client. The options are: pull and push. The mode (pull or push) defines the method used to assign a virtual IP. This setting is relevant for IKEv1 only, since IKEv2 always uses the configuration payload in pull mode. The default setting is push. |

**Examples**

Remote VPN client:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#modeconfig pull
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context crypto map test 2 ipsec-isakmp dynamic
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)
```
7.1.18.5.5 peer

**crypto-map auto-vpn-tunnel/remote-vpn-client instance**

Configures the IKEv1 or IKEv2 peer for the auto site-to-site VPN tunnel or remote VPN client. The peer device can be specified either by its hostname or by its IP address. A maximum of three peers can be configured.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
peer <1-3> [ikev1|ikev2] <IKEv1/IKEv2-PEER-NAME>
```

**Parameters**

- peer <1-3> [ikev1|ikev2] <IKEv1/IKEv2-PEER-NAME>
  - Creates a new peer and configures the peer's priority level. Peer '1' is the primary peer, and peer '3' is redundant.
  - ikev1 <IKEv1-PEER-NAME> — Configures an IKEv1 peer
    - <IKEv1-PEER-NAME> – Specify the IKEv1 peer’s name.
  - ikev2 <IKEv2-PEER-NAME> — Configures an IKEv2 peer
    - <IKEv2-PEER-NAME> – Specify the IKEv2 peer’s name.

**Examples**

**Site-to-site tunnel:**

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#peer 1 ikev2 ikev2Peer1
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
  peer 1 ikev2 ikev2Peer1
  local-endpoint-ip 192.168.13.10
  ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

**Remote VPN client:**

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#peer 1 ikev1 RemoteIKEv1Peer1
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
  peer 1 ikev1 RemoteIKEv1Peer1
  local-endpoint-ip 157.235.204.62
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```
7.1.18.5.6 pfs

Configures Perfect Forward Secrecy (PFS) for the auto site-to-site VPN tunnel or remote VPN client.

PFS is the key-establishment protocol, used to secure VPN communications. If one encryption key is compromised, only data encrypted by that specific key is compromised. For PFS to exist, the key used to protect data transmissions must not be used to derive any additional keys. Options include 2, 5 and 14. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

\[ \text{pfs \{14|2|5\}} \]

Parameters

- \( \text{pfs \{14|2|5\}} \)

| pfs \{14|2|5\} | Configures PFS |
|-----------------|----------------|
| \( \text{14} \) | Configures D-H Group14 (2048-bit modp) |
| \( \text{2} \)   | Configures D-H Group2 (1024-bit modp)  |
| \( \text{5} \)   | Configures D-H Group5 (1536-bit modp)  |

Examples

Site-to-site VPN tunnel:

```
    rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#pfs 5
    rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
    peer 1 ikev2 ikev2Peer1
    local-endpoint-ip 192.168.13.10
    pfs 5
    ip nat crypto
    rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

Remote VPN client:

```
    rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#pfs 14
    rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
    peer 1 ikev1 RemoteIKEv1Peer1
    local-endpoint-ip 157.235.204.62
    pfs 14
    rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```
7.1.18.5.7 remote-type

`crypto-map auto-vpn-tunnel/remote-vpn-client instance`

Configures the remote VPN client type as either None or XAuth

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`remote-type [none|xauth]`

**Parameters**

- `remote-type [none|xauth]`
  
| remote-type [none|xauth] | Specify the remote VPN’s client type |
|--------------------------|-------------------------------------|
| none                    | Configures remote VPN client with No XAUTH |
| xauth                   | Configures remote VPN client as using XAUTH (applicable only for IKEv1). This is the default setting. |

**Note:** XAuth (extended authentication) provides additional authentication validation by permitting an edge device to request extended authentication information from an IPSec host. This forces the host to respond with additional authentication credentials. The edge device respond with a failed or passed message.

**Examples**

Remote VPN client:

```plaintext
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#remote-type none
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
   crypto map test 2 ipsec-isakmp dynamic
       peer 1 ikev1 RemoteIKEv1Peer1
       local-endpoint-ip 157.235.204.62
       pfs 14
   remote-type none
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```

```
7.1.18.5.8 security-association

Defines the IPSec SAs (created by this auto site-to-site VPN tunnel or remote VPN client) settings

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
security-association [inactivity-timeout|level|lifetime]
security-association [inactivity-timeout <120-86400>|level perhost]
security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]
```

**Parameters**

- **security-association [inactivity-timeout <120-86400>|level perhost]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inactivity-timeout</td>
<td>Specifies an inactivity period, in seconds, for this IPSec VPN SA. Once the set value is exceeded, the association is timed out.</td>
</tr>
<tr>
<td>&lt;120-86400&gt;</td>
<td>- &lt;120-86400&gt; – Specify a value from 120 - 86400 seconds. The default is 900 seconds.</td>
</tr>
<tr>
<td>level perhost</td>
<td>Specifies the granularity level for this IPSec VPN SA</td>
</tr>
<tr>
<td></td>
<td>- perhost – Sets the IPSec VPN SA's granularity to the host level</td>
</tr>
</tbody>
</table>

- **security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lifetime</td>
<td>Defines the IPSec SA's lifetime (in kilobytes and/or seconds). Values can be entered in both kilobytes and seconds. Which ever limit is reached first, ends the security association.</td>
</tr>
<tr>
<td>kilobytes &lt;500-2147483646&gt;</td>
<td>- Defines volume based key duration. Specify a value from 500 - 2147483646 kilobytes. Select this option to define a connection volume lifetime (in kilobytes) for the duration of the IPSec VPN SA. Once the set volume is exceeded, the association is timed out. This option is disabled by default.</td>
</tr>
<tr>
<td>seconds &lt;120-86400&gt;</td>
<td>- Defines time based key duration. Specify the time frame from 120 - 86400 seconds. Select this option to define a lifetime (in seconds) for the duration of the IPSec VPN SA. Once the set value is exceeded, the association is timed out. This option is disabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

**Site-to-site tunnel:**

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#security-association
inactivity-timeout 200
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#security-association
level perhost
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#security-association
lifetime kilobytes 250000
```
show context

**crypto map test 1 ipsec-isakmp**
- **security-association level perhost**
  - peer 1 ikev2 ikev2Peer1
  - local-endpoint-ip 192.168.13.10
  - pfs 5
- **security-association lifetime kilobytes 250000**
- **security-association inactivity-timeout 200**
- ip nat crypto

Remote VPN client:

security-association lifetime seconds 10000

show context

**crypto map test 2 ipsec-isakmp dynamic**
- peer 1 ikev1 RemoteIKEv1Peer1
  - local-endpoint-ip 157.235.204.62
  - pfs 14
- **security-association lifetime seconds 10000**
- remote-type none
7.1.18.5.9 transform-set

Applies a transform set (encryption and hash algorithms) to site-to-site VPN tunnel or remote VPN client. This command allows you to provide customized data protection for each crypto map can be customized with its own data protection and peer authentication schemes.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
transform-set <TRANSFORM-SET-TAG> {<TRANSFORM-SET-TAG>}
```

Parameters

- `transform-set <TRANSFORM-SET-TAG>` – Applies a transform set. The transform set should be existing and configured.
- `<TRANSFORM-SET-TAG>` – Specify the transform set’s name.
- `<TRANSFORM-SET-TAG>` – Optional. Specify a second transform set. You can provide multiple, space-separated, transform set tags.

Examples

**Site-to-site VPN tunnel:**

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#transform-set AutoVPN
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
security-association level perhost
peer 1 ikev2 ikev2Peer1
local-endpoint-ip 192.168.13.10
pfs 5
security-association lifetime kilobytes 250000
security-association inactivity-timeout 200
transform-set AutoVPN
ip nat crypto
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

**Remote VPN client:**

```
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#transform-set RemoteVPN
rsfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
peer 1 ikev1 RemoteIKEv1Peer1
local-endpoint-ip 157.235.204.62
pfs 14
security-association lifetime seconds 10000
transform-set RemoteVPN
remote-type none
rfs4000-229D58 (config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```
7.1.18.5.10 use

**crypto-map auto-vpn-tunnel/remote-vpn-client instance**

Applies an existing and configured IP access list to the auto site-to-site VPN tunnel or remote VPN client. Based on the IP access list’s settings traffic is permitted or denied across the VPN tunnel.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
use ip-access-list <IP-ACCESS-LIST-NAME>
```

**Parameters**

- **ip-access-list <IP-ACCESS-LIST-NAME>**

  Specify the IP access list name.

**Examples**

**Site-to-site VPN tunnel:**

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
  use ip-access-list test
  security-association level perhost
  peer 1 ikev2 ikev2Peer1
  local-endpoint-ip 192.168.13.10
  pfs 5
  security-association lifetime kilobytes 250000
  security-association inactivity-timeout 200
  transform-set AutoVPN
  ip nat crypto
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```

**Remote VPN client:**

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
' crypto map test 2 ipsec-isakmp dynamic
  use ip-access-list test1
  peer 1 ikev1 RemoteIKEv1Peer1
  local-endpoint-ip 157.235.204.62
  pfs 14
  security-association lifetime seconds 10000
  transform-set RemoteVPN
  remote-type none
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```
7.18.5.11 no

- **crypto-map auto-vpn-tunnel/remote-vpn-client instance**

Removes or reverts the auto site-to-site VPN tunnel or remote VPN client settings

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX5650, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no [ip|local-endpoint-ip|modeconfig|peer|pfs|remote-type|security-association|transform-set|use]
```

**Parameters**

- **no <PARAMETERS>**

Removes or resets this auto site-to-site/remote VPN settings based on the parameters passed

---

**Examples**

The following example shows the IPSec site-to-site VPN tunnel ‘test’ settings before the ‘no’ commands are executed:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
crypto map test 1 ipsec-isakmp
  use ip-access-list test
  security-association level perhost
  peer 1 ikev2 ikev2Peer1
  local-endpoint-ip 192.168.13.10
  pfs 5
  security-association lifetime kilobytes 250000
  security-association inactivity-timeout 200
  transform-set AutoVPN
  ip nat crypto
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#no use ip-access-list
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#no security-association level perhost
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#no ip nat crypto
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#no pfs
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#no local-endpoint-ip
```

The following example shows the IPSec site-to-site VPN tunnel ‘test’ settings after the ‘no’ commands are executed:

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#show context
  crypto map test 1 ipsec-isakmp
  peer 1 ikev2 ikev2Peer1
  security-association lifetime kilobytes 250000
  security-association inactivity-timeout 200
  transform-set AutoVPN
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#1)#
```
The following example shows the IPSec remote VPN client 'test' settings before the 'no' commands are executed:

```plaintext
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
  use ip-access-list test2
  peer 1 ikev1 RemoteIKEv1Peer1
  local-endpoint-ip 157.235.204.62
  pfs 14
  security-association lifetime seconds 10000
  transform-set RemoteVPN
  remote-type none
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```

The following example shows the IPSec remote VPN client 'test' settings after the 'no' commands are executed:

```plaintext
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#no use ip-access-list
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#no peer 1
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#no transform-set
```

```plaintext
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#show context
crypto map test 2 ipsec-isakmp dynamic
  local-endpoint-ip 157.235.204.62
  pfs 14
  security-association lifetime seconds 10000
  remote-type none
rfs4000-229D58(config-device-00-23-68-22-9D-58-cryptomap-test#2)#
```
7.1.18.5.12 crypto-map-ipsec-manual-instance

To navigate to the automatic IPSec manual VPN tunnel configuration instance, use the following command:

In the device-config mode:

```bash
<DEVICE>(config-device-<DEVICE-MAC>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-manual
```

In the profile-config mode:

```bash
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto map <CRYPTO-MAP-TAG> <1-1000> ipsec-manual
```

```
rfs4000-229D58(config-device-00-23-68-22-9D-58)#crypto map test 3 ipsec-manual
```

7.1.18.5.13 local-endpoint-ip

*crypto-map-ipsec-manual-instance*

Uses the configured IP as local tunnel endpoint address, instead of the interface IP (Advanced Configuration)

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`local-endpoint-ip <IP>`

**Parameters**

- `local-endpoint-ip <IP>`

<table>
<thead>
<tr>
<th>local-endpoint-ip &lt;IP&gt;</th>
<th>Uses the configured IP as local tunnel's endpoint address</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>- Specify the IP address. The specified IP address must be available on the interface.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#local-endpoint-ip 172.16.10.3
7.1.18.5.14 mode

Sets the crypto map tunnel mode

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

mode [transport|tunnel]

Parameters

- mode [transport|tunnel]

| mode [transport|tunnel] | Sets the mode of the tunnel for this crypto map |
|-------------------------|-----------------------------------------------|
|                         | • transport – Initiates transport mode         |
|                         | • tunnel – Initiates tunnel mode (default setting) |

Examples

```bash
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#mode transport
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context crypto map map1 1 ipsec-manual
mode transport
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#
```
7.1.18.5.15 peer

Sets the peer device’s IP address. This can be set for multiple remote peers. The remote peer can be an IP address.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
peer <IP>

Parameters
- peer <IP>

| peer <IP> | Enter the peer device’s IP address. If not configured, it implies respond to any peer. |

Examples
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#peer 172.16.10.12
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context
crypto map map1 1 ipsec-manual
    peer 172.16.10.12
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#
7.1.18.5.16 security-association

**crypto-map-ipsec-manual-instance**

Defines the lifetime (in kilobytes and/or seconds) of IPSec SAs created by this crypto map

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]
```

**Parameters**

- `security-association lifetime [kilobytes <500-2147483646>|seconds <120-86400>]`

| lifetime [kilobytes <500-2147483646>|seconds <120-86400>] | Values can be entered in both kilobytes and seconds. Which ever limit is reached first, ends the security association. |
|---|---|
| kilobytes <500-2147483646> — Defines volume based key duration. Specify a value from 500 - 2147483646 bytes. |
| seconds <120-86400> — Defines time based key duration. Specify the time frame from 120 - 86400 seconds. |

---

**NOTE:** This command is not applicable to the ipsec-manual crypto map.

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map2#2)#security-association lifetime seconds 123
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map2#2)#show context
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map2#2)#
```
### 7.18.5.17 session-key

**crypto-map-ipsec-manual-instance**

Defines encryption and authentication keys for this crypto map

**Supported in the following platforms:**

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7510, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

| session-key [inbound|outbound] ah <256-4294967295> | Defines the manual inbound and outbound security association key parameters |
| ah <256-4294967295> | Configures authentication header (AH) as the security protocol for the security session |
| - <256-4294967295> – Sets the SPI for the security association from 256 - 4294967295 |
| The SPI (in combination with the destination IP address and security protocol) identifies the security association. |

**Parameters**

- **ah** <256-4294967295> | Specifies the key type |
  - 0 – Sets a clear text key |
  - 2 – Sets an encrypted key |
  - authenticator – Sets AH authenticator details |
    - md5 <WORD> – AH with MD5 authentication |
    - sha <WORD> – AH with SHA authentication |
    - <WORD> – Sets security association key value. The following key lengths (in hex characters) are required (w/o leading 0x). AH-MD5: 32, AH-SHA: 40 |

  - Configures Encapsulating Security Payloads (ESP) as the security protocol for the security session. This is the default setting. |
  - <256-4294967295> – Sets the SPI for the security association from 256 - 4294967295 |
  - The SPI (in combination with the destination IP address and security protocol) identifies the security association. |
Examples

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#session-key inbound esp 273 cipher esp-null authenticator sha 58768979

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context crypto map map1 1 ipsec-manual
peer 172.16.10.2
mode transport
  session-key inbound esp 273 0 cipher esp-null authenticator sha 58768979
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#

- 0 – Sets a clear text key
- 2 – Sets an encrypted key
- cipher – Sets encryption/decryption key details
  - 3des – ESP with 3DES encryption
  - aes – ESP with AES encryption
  - aes-192 – ESP with AES-192 encryption
  - aes-256 – ESP with AES-256 encryption
  - des – ESP with DES encryption
  - esp-null – ESP with no encryption
  - authenticator – Specify ESP authenticator details
    - md5 <WORD> – ESP with MD5 authentication
    - sha <WORD> – ESP with SHA authentication
  - <WORD> – Sets security association key value. The following key lengths (in hex characters) are required (w/o leading 0x). AH-MD5: 32, AH-SHA: 40
7.1.18.5.18 use

crypto-map-ipsec-manual-instance

Associates an existing IP access list with this crypto map. The ACL protects the VPN traffic.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

use ip-access-list <IP-ACCESS-LIST-NAME>

Parameters

- use ip-access-list <IP-ACCESS-LIST-NAME>

| ip-access-list <IP-ACCESS-LIST-NAME> | Specify the IP access list name. |

Examples

rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#use ip-access-list test
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context
    crypto map map1 1 ipsec-manual
        use ip-access-list test
    peer 172.16.10.12
        mode transport
        session-key inbound esp 273 0 cipher esp-null authenticator sha 5876897
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#
7.1.18.5.19 no

`crypto-map-ipsec-manual-instance`

Removes or resets this crypto map's settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
no [local-endpoint-ip|mode|peer|security-association|session-key|use]
```

Parameters

- `no <PARAMETERS>`

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes or resets this crypto map settings based on the parameters passed</th>
</tr>
</thead>
</table>

Examples

```
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context
crypto map map1 1 ipsec-manual
  use ip-access-list test
  peer 172.16.10.12
  mode transport
  session-key inbound esp 273 0 cipher esp-null authenticator sha 5876897
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#no use ip-access-list
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#no peer
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#no mode
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#show context
crypto map map1 1 ipsec-manual
  session-key inbound esp 273 0 cipher esp-null authenticator sha 58768979
rfs7000-37FABE(config-profile-default-rfs7000-cryptomap-map1#1)#
```
7.1.18.6  crypto-remote-vpn-client commands

This section documents the IKEV2 remote VPN client configuration settings. Use this command to define the server resources used to secure (authenticate) a remote VPN connection with a target peer.

Use the profile-config instance to configure remote VPN client settings. To navigate to the remote-vpn-client configuration instance, use the following commands:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile-<PROFILE-NAME>)#crypto remote-vpn-client
<DEVICE>(config-profile-<PROFILE-NAME>-crypto-ikev2-remote-vpn-client)#
```

**NOTE:** To configure remote VPN client settings on a device, on the device's configuration mode, use the `crypto > remote-vpn-client` command.

For example:
```
rfs4000-229D58 (config-device-00-23-68-22-9D-58)#crypto remote-vpn-client
```

**NOTE:** The following configuration enables a access point to adopt to a controller over the remote VPN link:

On a profile:
```
rfs4000-229D58 (config-profile-testRFS4000)#controller host <HOST-IP> remote-vpn-client
```

On a device:
```
rfs4000-229D58 (config-00-23-68-22-9D-58)#controller host <HOST-IP> remote-vpn-client
```

Crypto IKEV2 Remote Vpn Client Config commands:

```
dhcp-peer      Configure parameters for peers received via DHCP option
no             Negate a command or set its defaults
peer           Add a remote peer
shutdown       Disable remote vpn client
transform-set  Specify IPSec transform to use
clrscr         Clears the display screen
commit         Commit all changes made in this session
do             Run commands from Exec mode
end            End current mode and change to EXEC mode
exit           End current mode and down to previous mode
help           Description of the interactive help system
revert         Revert changes
service        Service Commands
show           Show running system information
write          Write running configuration to memory or terminal
```

The following table summarizes crypto remote VPN client configuration mode commands:

7.1.18.6.1 dhcp-peer

crypto-remote-vpn-client commands

Configures DHCP peer’s local ID and authentication settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dhcp-peer [authentication|localid]

dhcp-peer authentication [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]

dhcp-peer localid [autogen-uniqueid <WORD>|string <WORD>]

Parameters

- dhcp-peer authentication [psk [0 <WORD>|2 <WORD>|<WORD>]|rsa]

  dhcp-peer authentication psk [0 <WORD>|2 <WORD>|<WORD>]
  
  Configures the DHCP peer’s authentication type as PSK
  - 0 <WORD> – Configures a clear text authentication key
  - 2 <WORD> – Configures an encrypted authentication key
  - <WORD> – Provide a 8 - 21 character shared key password for DHCP peer authentication

  dhcp-peer authentication rsa
  
  Configures the DHCP peer’s authentication type as RSA. This is the default setting.

- dhcp-peer localid [autogen-uniqueid <WORD>|string <WORD>]

  dhcp-peer localid [autogen-uniqueid <WORD>|string <WORD>]
  
  Configures the DHCP peer’s localid using one of the following options:
  - autogen-uniqueid - Generates a localid using the device’s unique identity. The system prefixes
    the device’s unique identity to the string provided here. The device’s unique identity should
    be existing and configured. For more information on configuring a device’s unique identity, see
    autogen-uniqueid.
  - <WORD> – Provide the string.
  - string - Uses the value provided here as the DHCP peer’s localid.
  - <WORD> - Provide the string.

Examples

rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#dhcp-peer authentication psk 0 @123testing

rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#show context crypto remote-vpn-client
dhcp-peer authentication psk 0 @123testing
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
7.1.18.6.2 peer

configuredikev2 peers and assigns them priorities for utilization with remote VPN client connections. A maximum of three (3) peers can be added to support redundancy.

IKEv2 uses an initial handshake in which VPN peers negotiate cryptographic algorithms, mutually authenticate, and establish a session key, creating an IKE-SA. Additionally, a first IPSec SA is established during the initial SA creation. All IKEv2 messages are request/response pairs. It is the responsibility of the side sending the request to retransmit if it does not receive a timely response.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
peer <1-3> ikev2 <IKEV2-PEER-NAME>
```

**Parameters**

- `peer <1-3> ikev2 <IKEV2-PEER-NAME>`

<table>
<thead>
<tr>
<th>peer &lt;1-3&gt;</th>
<th>Adds a IKEV2 peer. You can add maximum of three (3) peers to achieve redundancy.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;1-3&gt; — Specify a priority level for the peer from 1 - 3 (1 = primary, 2, and 3 = redundant).</td>
</tr>
</tbody>
</table>

**Examples**

```bash
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#peer 1 ikev2 ikev2Peer1
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#peer 2 ikev2 ikev2Peer2
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#show context crypto remote-vpn-client
peer 1 ikev2 ikev2Peer1
peer 2 ikev2 ikev2Peer2
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
```
7.1.18.6.3 shutdown

crypto-remote-vpn-client commands

Disables remote-vpn-client on this profile or device. Remote VPN client feature is enabled by default.

To enable a disabled remote VPN client execute the ***no > shutdown*** command.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

shutdown

**Parameters**

None

**Examples**

rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)# shutdown
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
7.1.18.6.4 transform-set

crypto-remote-vpn-client commands

Specifies the IPSec Transform set to use with this remote VPN client. A transform set is a combination of security protocols, algorithms, and other settings applied to IPSec protected client traffic.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

transform-set <IPSEC-XFORM-TAG> {<IPSEC-XFORM-TAG>}

Parameters

- transform-set <IPSEC-XFORM-TAG> {<IPSEC-XFORM-TAG>}

| transform-set <IPSEC-XFORM-TAG> <IPSEC-XFORM-TAG> | Associates an IPSec Transform (should be existing and configured) set with this remote VPN client. You can optionally associate more than one transform set with this remote VPN client configuration. List the transform set tags separated by a space. |
| Note: To configure a transform-set, use the `crypto > ipsec > transform-set` command in the profile or device configuration mode. |

Examples

```
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#transform-set TransformSet1
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#show context
crypto remote-vpn-client
  peer 1 ikev2 ikev2Peer1
transform-set TransformSet1
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
```
7.1.18.6.5 no

crypto-remote-vpn-client commands

Removes the remote VPN client settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [dhcp-peer|peer <1-3>|shutdown|transform-set]

no dhcp-peer [authentication|localid]

no peer <1-3>

no shutdown

no transform-set

Parameters

- no <PARAMETERS>

no <PARAMETERS> Removes or resets this remote VPN client settings based on the parameters passed

Examples

rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)# show context
crypto remote-vpn-client
peer 1 ikev2 peer5
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)# no peer 1

rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)# show context
crypto remote-vpn-client
rfs4000-229D58 (config-profile-testRFS4000-crypto-ikev2-remote-vpn-client)#
7.1.19 database-backup

Profile Config Commands
Backs up captive-portal and/or NSight database to a specified location and file on an FTP or SFTP server. When applied to devices, this profile will enable the back up of the specified database.

Supported in the following platforms:
- Service Platforms — NX9000, NX9500, NX9510, NX9600

Syntax

```
database-backup database [captive-portal|nsight] <URL>
```

Parameters
- `database-backup` database [captive-portal|nsight] <URL>

| <URL> | Backs up captive portal and/or NSight database to a specified location and file. Select the database to backup:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>captive-portal</td>
<td>Backs up captive portal database</td>
</tr>
<tr>
<td>nsight</td>
<td>Backs up NSight database</td>
</tr>
</tbody>
</table>

After specifying the database type, configure the destination location and file name.

Examples

```
nx9500-6C8809(config-profile-testNX9000) database-backup database nsight ftp://anonymous:anonymous@192.168.13.10/backups/nsight/nsight.tar.gz
```

Related Commands

```
no
```
Removes database backup configurations
7.1.20 device-upgrade

Profile Config Commands

Configures device firmware upgrade settings on this profile.

Administrators can customize profiles with unique device configuration file and firmware upgrade support. In a clustered environment, operations performed on one device are propagated to each member of the cluster and then onwards to devices managed by each cluster member. The number of concurrent device upgrades and their start times can be customized to ensure a sufficient number of devices remain in duty while upgrades are administered to others.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

device-upgrade [add-auto|auto|count|persist-images]

device-upgrade add-auto 

[ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600]

device-upgrade auto 

{ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600}

device-upgrade count <1-128>

device-upgrade persist-images

Parameters

- **device-upgrade add-auto**

  Configures a list of devices types for automatic firmware upgrade.

  This command specifies the types of devices that can be automatically upgraded (if enabled). To enable automatic device firmware upgrade, use the `auto` command. When enabled, access points, wireless controllers, and service platforms, using this profile, will automatically upgrade firmware on adopted devices that match the specified device types.

  **[ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600]**

- **device-upgrade auto**

  Adds selected devices to the device type list. Specify the device type. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600.

  **Note:** Multiple device types can be added to the add-auto list.

  **Note:** The NX9600 option is available only on a NX9600 model service platform.
- **device-upgrade auto** `{(ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx75xx|nx9000|nx9600)}`

  Enables automatic firmware upgrade on specified device types. When used along with the `add-auto` command, the auto command allows access points, wireless controllers, and service platforms to automatically upgrade firmware on adopted devices matching the specified device types.

  Optional. Selects the device types for automatic firmware upgrade. The options are: AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, NX9600.

  **Note:** Multiple device types can be added to the auto list.

  **Note:** The NX9600 option is available only on a NX9600 model service platform.

- **device-upgrade count <1-128>**

  Configures the maximum number of concurrent upgrades possible

  - `<1-128 – specify a value from 1 - 128. The default is 10.`

- **device-upgrade persist-images**

  Enables RF Domain manager to retain AP firmware image after upgrade, subject to availability of space. This option is enabled by default.

  This option is enabled for all controllers and service platforms RF Domain managers with the flash memory capacity to store firmware images for the selected access point models they provision. This feature is disabled for access point RF Domain managers that do not typically have the flash memory capacity needed.

**Examples**

```
rfs4000-229D58(config-profile-default-rfs4000)#device-upgrade auto ap71xx
rfs4000-229D58(config-profile-default-rfs4000)#show context profile rfs4000 default-rfs4000  
  autoinstall configuration
  autoinstall firmware
  device-upgrade auto ap71xx
  device-upgrade persist-ap-image
  crypto ikev1 policy ikev1-default
  qos trust 802.1p
--More--
rfs4000-229D58(config-profile-default-rfs4000)#
```

**Related Commands**

- **no**

  Removes device firmware upgrade settings on this profile

- **device-upgrade**

  Displays device upgrade details
**7.1.21 dot1x**

> **Profile Config Commands**

Configures 802.1x standard authentication controls

Dot1x (or 802.1x) is an IEEE standard for network authentication. It enables media-level (layer 2) access control, providing the capability to permit or deny connectivity based on user or device identity. Dot1x allows port-based access using authentication. An dot1x enabled port can be dynamically enabled or disabled depending on user identity or device connection.

Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

Before authentication, the endpoint is unknown, and traffic is blocked. Upon authentication, the endpoint is known and traffic is allowed. The controller or service platform uses source MAC filtering to ensure only the authenticated endpoint is allowed to send traffic.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dot1x [guest-vlan|holdtime|system-auth-control|use]

dot1x holdtime <0-600>
dot1x system-auth-control
dot1x guest-vlan supplicant
dot1x use aaa-policy <AAA-POLICY-NAME>

**Parameters**

7.1.22 dpi

Profile Config Commands

Enables Deep Packet Inspection (DPI) on this profile or device.

DPI is an advanced packet filtering technique functioning at the application layer. Use DPI to find, identify, classify, reroute or block packets containing specific data or codes that other packet filtering techniques (examining only packet headers) cannot detect.

Enable DPI to scan data packets passing through the WiNG managed network. DPI inspects every byte of each application header packet passing through the controller or service platform, and logs, blocks, or routes the packets to their destination. The level of granularity that DPI provides in terms of packet inspection helps block the spread of viruses, illegal downloads, and prioritizes data transmitted by bandwidth-heavy applications (video and VoIP applications), resulting in reduced congestion and enhanced security within the WiNG managed network.

This command is also available in the device configuration mode.

Supported in the following platforms:

- Access Points — AP7522, AP7532
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dpi {custom-app <CUSTOM-APP-NAME>|logging [level|on]}

Parameters

- dpi {custom-app <CUSTOM-APP-NAME>|logging [level|on]}

<table>
<thead>
<tr>
<th>dpi</th>
<th>Enables DPI (application assurance) on this profile and configures DPI settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>custom-app &lt;CUSTOM-APP-NAME&gt;</td>
<td>Optional. Adds custom application to this profile</td>
</tr>
<tr>
<td></td>
<td>• &lt;CUSTOM-APP-NAME&gt; – Specify custom application name (should be existing and configured)</td>
</tr>
<tr>
<td></td>
<td>If no custom application is specified, the system detects the Protocol and Application Classification Engine (PACE), a third-party DPI engine from IPOQUE, built-in applications. PACE has approximately 700 built-in applications that are grouped into twenty two (22) application categories.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For more information application categories and application detection, see <a href="#">application</a>.</td>
</tr>
</tbody>
</table>

7.1.23 dscp-mapping

Profile Config Commands

Configures IP Differentiated Services Code Point (DSCP) to 802.1p priority mapping for untagged frames

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dscp-mapping <WORD> priority <0-7>

Parameters

- dscp-mapping <word> priority <0-7>

<table>
<thead>
<tr>
<th>&lt;WORD&gt;</th>
<th>Specifies the DSCP value of a received IP packet. This could be a single value or a list. For example, 10-20, 25, 30-35.</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority &lt;0-7&gt;</td>
<td>Specifies the 802.1p priority to use for a packet if untagged. The priority is set on a scale of 0 - 7. The priority values are:</td>
</tr>
<tr>
<td></td>
<td>0 – Best effort</td>
</tr>
<tr>
<td></td>
<td>1 – Background</td>
</tr>
<tr>
<td></td>
<td>2 – Spare</td>
</tr>
<tr>
<td></td>
<td>3 – Excellent effort</td>
</tr>
<tr>
<td></td>
<td>4 – Controlled load</td>
</tr>
<tr>
<td></td>
<td>5 – Video</td>
</tr>
<tr>
<td></td>
<td>6 – Voice</td>
</tr>
<tr>
<td></td>
<td>7 – Network control</td>
</tr>
</tbody>
</table>

Note: The specified 802.1p priority value is added as a 3-bit IP precedence value in the Type of Service (ToS) field of the IP header used to set the priority. Up to 64 entries are permitted.

Examples

rfs7000-37FABE(config-profile-default-rfs7000)#dscp-mapping 20 priority 7

### 7.1.24 email-notification

**Profile Config Commands**

Configures e-mail notification settings. When a system event occurs e-mail notifications are sent (provided message logging is enabled) based on the settings configured here. Use this option to configure the outgoing SMTP server settings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
email-notification [host|recipient]
email-notification recipient <RECIPIENT-NAME>
email-notification host <SMTP-SERVER-IP/HOSTNAME> sender <SENDER-EMAIL>
    [port|security|username]
email-notification host <SMTP-SERVER-IP/HOSTNAME> sender <SENDER-EMAIL>
    [(port <1-65535>, security [none|ssl|starttls], username <SMTP-USERNAME>
      password [2 <WORD>|<WORD>]])
```

**Parameters**

- **email-notification recipient <RECIPIENT-EMAIL>**
  - Defines the recipient's e-mail address. A maximum of 6 (six) e-mail addresses can be configured.
  - **<RECIPIENT-EMAIL>** – Specify the recipient's e-mail address (should not exceed 64 characters in length).

- **email-notification host <SMTP-SERVER-IP/HOSTNAME> sender <SENDER-EMAIL>**
  - Configures the host SMTP server's IP address or hostname.
  - **<SMTP-SERVER-IP/HOSTNAME>** – Specify the SMTP server's IP address or hostname.
  - **<SENDER-EMAIL>** – Specify the sender's e-mail address (should not exceed 64 characters in length). Use the `email-notification > recipient > <EMAIL-ADDRESS>` command to configure the recipient's address.

- **port <1-65535>**
  - Defines the SMTP server port. Use this option to configure a non-standard SMTP port on the outgoing SMTP server. The standard SMTP port is 25.
  - **<1-65535>** – Specify the port from 1 - 65535.
Examples

rfs7000-37FABE(config-profile-default-rfs7000)#email-notification recipient test@examplecompany.com
rfs7000-37FABE(config-profile-default-rfs7000)#show context

Related Commands

no Disables or reverts settings to their default
7.1.25 enforce-version

Profile Config Commands

Enables checking of a device’s firmware version before attempting adoption or clustering

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

enforce-version [adoption|cluster] [full|major|minor|none|strict]

Parameters

- **adoption**
  - Verifies firmware versions before adopting. This option is enabled by default.

- **cluster**
  - Verifies firmware versions before clustering. This option is enabled by default.

- **full**
  - Allows adoption or clustering when the first four octets of the firmware versions match (for example 5.8.0.0)

- **major**
  - Allows adoption or clustering when the first two octets of the firmware versions match (for example 5.8)

- **minor**
  - Allows adoption or clustering when the first three octets of the firmware versions match (for example 5.8.0)

- **none**
  - Allows adoption or clustering between any firmware versions

- **strict**
  - Allows adoption or clustering only when firmware versions exactly match (for example 5.8.0.0-028D). This is the default setting for both ‘adoption’ and ‘cluster’ options.

Examples

```
nx4500-5CFA2B(config-profile-testNX45XX)#enforce-version cluster full
nx4500-5CFA2B(config-profile-testNX45XX)#enforce-version adoption major

nx4500-5CFA2B(config-profile-testNX45XX)#show context

### 7.1.26 environmental-sensor

**Profile Config Commands**

Configures the environmental sensor settings

An AP8132 sensor module is a USB environmental sensor extension to an AP8132 model access point. It provides a variety of sensing mechanisms, allowing the monitoring and reporting of the AP8132’s radio coverage area.

Supported in the following platforms:
- Access Points — AP8132

**Syntax**

```plaintext
environmental-sensor [humidity|light|motion|polling-interval|temperature]

environmental-sensor [humidity|motion|polling-interval <1-100>|temperature]

environmental-sensor light {holdtime|radio-shutdown|threshold}

environmental-sensor light {holdtime <10-201>|radio-shutdown [all|radio-1|radio-2]}

environmental-sensor light {threshold [high <100-10000>|low <0-1000>]
```

**Parameters**

- **environmental-sensor [humidity|light|motion|polling-interval <1-100>|temperature]**

<table>
<thead>
<tr>
<th>environmental-sensor</th>
<th>Configures environmental sensor settings on this profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>humidity</td>
<td>Enables (turns on) humidity sensors. This setting is enabled by default.</td>
</tr>
<tr>
<td>motion</td>
<td>Enables (turns on) motion sensors. This setting is enabled by default.</td>
</tr>
<tr>
<td>polling-interval 1-100</td>
<td>Configures polling interval, in seconds, on all sensors. This is the interval after which the sensor module polls its environment to assess the various parameters, such as light intensity.</td>
</tr>
<tr>
<td>temperature</td>
<td>Enables (turns on) temperature sensors. This setting is enabled by default.</td>
</tr>
</tbody>
</table>

- **environmental-sensor light {holdtime <10-201>|radio-shutdown [all|radio-1|radio-2]}

<table>
<thead>
<tr>
<th>light</th>
<th>Enables (turns on) light sensors and specifies its settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>When enabled, the sensor module polls the environment to determine the light intensity. Based on the reading, the system determines whether the AP8132’s deployment location has lights on or off. Light intensity also helps determine whether the access point’s deployment location is currently populated with clients.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>holdtime &lt;10-201&gt;</th>
<th>Optional. Configures a holdtime, in seconds, for the light sensor</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;10-201&gt; – Specify a value from 10 - 201 seconds. The default value is 11 seconds.</td>
<td></td>
</tr>
</tbody>
</table>

| radio-shutdown [all|radio1|radio2] | Optional. Shuts down the sensor’s radios |
|------------------------------------------|-----------------------------------------|
| • all – Shuts down all radios. This is the default setting. |
| • radio1 – Shuts down radio 1 |

Contd..
### environmental-sensor light \{threshold \{high <100-10000>|low <0-1000>\}\}

<table>
<thead>
<tr>
<th>environmental-sensor</th>
<th>Configures environmental sensor settings on this profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>light</td>
<td>Enables (turns on) light sensors and specifies its settings</td>
</tr>
<tr>
<td>threshold</td>
<td>Optional. Configures the upper and lower thresholds for the amount of light in the environment</td>
</tr>
<tr>
<td>high &lt;100-10000&gt;</td>
<td>Specifies the upper threshold from 100 - 10000 lumens. This value determines whether lighting is on in the AP8132's deployment location. The radios are turned off if the average reading value is lower than the value set here. The default is 400 lux. <strong>Note:</strong> The light sensor triggers an event if the amount of light exceeds the specified value.</td>
</tr>
<tr>
<td>low &lt;0-1000&gt;</td>
<td>Specifies the lower threshold from 0 - 1000 lumens. This value determines whether lighting is off in the AP8132's deployment location. The radios are turned on when the average value is higher than the value set here. The default is 200 lux. <strong>Note:</strong> The light sensor triggers an event if the amount of light drops below the specified value.</td>
</tr>
</tbody>
</table>

  Disables export of startup.log file
7.1.29 file-sync

Profile Config Commands

Configures parameters enabling auto syncing of PKCS#12 certificate between the staging-controller and adoptee AP6522/ AP6562 client bridges

This command is applicable to the access point’s profile as well as device configuration modes.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

file-sync [auto|count <1-20>]

Parameters
- file-sync [auto|count <1-20>]

file-sync [auto|count <1-20>]

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Enables the staging controller to autoinstall PKCS#12 certificate on a new layer 2 AP6522/AP6562 client bridge, when it comes up for the first time and adopts to the controller. The PKCS#12 certificate is installed only if the client bridge is using EAP-TLS authentication. Prior to enabling file syncing, ensure that the PKCS#12 certificate is present on the staging controller. To upload the certificate on the controller, in the user or privilege executable modes, execute the following command: <code>file-sync &gt; load-file &gt; &lt;URL&gt;</code>. For more information, see <code>file-sync</code>.</td>
</tr>
<tr>
<td>count &lt;1-20&gt;</td>
<td>Configures the maximum number of access points that can be concurrently autoinstalled.</td>
</tr>
<tr>
<td>&lt;1-20&gt;</td>
<td>Specify a value from 1 - 20. The default is 10 access points.</td>
</tr>

7.1.30 floor

Profile Config Commands

Sets the floor name where the target device (access point, wireless controller, or service platform using this profile) is physically located. Assigning a building floor name helps in grouping devices within the same general coverage area.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
floor <WORD> {<1-4094>}
```

Parameters
- `floor <WORD> {<1-4094>}`

<table>
<thead>
<tr>
<th>floor &lt;WORD&gt; {&lt;1-4094&gt;}</th>
<th>Sets the floor name where the target device is located</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>Specify the floor name (should not exceed 64 characters in length).</td>
</tr>
<tr>
<td>&lt;1-4094&gt;</td>
<td>Optional. Configures the floor number from 1 - 4094. The default is 1.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-profile-default-rfs7000)#floor fifth

7.1.31.1 gre

Enables Generic Routing Encapsulation (GRE) tunneling on this profile, and creates a new GRE tunnel or modifies an existing GRE tunnel.

The GRE protocol allows encapsulation of one protocol over another. It is a tunneling protocol that transports any layer 3 protocol over an IP network. When enabled, a payload packet is first encapsulated in the GRE protocol. The GRE encapsulated payload is then encapsulated in another IP packet before being forwarded to the destination.

GRE tunneling can be configured to bridge Ethernet packets between WLANs and a remote WLAN gateway over an IPv4 GRE tunnel. The tunneling of 802.3 packets using GRE is an alternative to MiNT or L2TPv3. Related features like ACLs for extended VLANs are still available using layer 2 tunneling over GRE.

Using GRE, access points map one or more VLANs to a tunnel. The remote end point is a user-configured WLAN gateway IP address, with an optional secondary IP address should connectivity to the primary GRE peer be lost. VLAN traffic is expected in both directions in the GRE tunnel. A WLAN mapped to these VLANs can be either open or secure. Secure WLANs require authentication to a remote RADIUS server available within your deployment using standard RADIUS protocols. Access Points can reach both the GRE peer as well as the RADIUS server using IPv4.

The WiNG software now supports for both IPv4 or IPv6 tunnel endpoints. However, a tunnel needs to contain either IPv4 or IPv6 formatted device addresses and cannot be mixed. With the new IPv6 tunnel implementation, all outbound packets are encapsulated with the GRE header, then the IPv6 header. The header source IP address is the local address of the IPv6 address of tunnel interface, and the destination address peer address of the tunnel. All inbound packets are de-capsulated by removing the IPv6 and GRE header before sending it over to the IP stack.

**NOTE:** Only one GRE tunnel can be created for every profile.

### Syntax

```
gre tunnel <GRE-TUNNEL-NAME>
```

### Parameters

- **gre tunnel <GRE-TUNNEL-NAME>**
  - Creates a new GRE tunnel or modifies an existing GRE tunnel
  - `<GRE-TUNNEL-NAME>` – If creating a new tunnel, specify a unique name for it. If modifying an existing tunnel, specify its name.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
Examples

</tr>
</tbody>
</table>
7.1.31.2.1 dscp

Sets the GRE tunnel’s DSCP / 802.1q priority value from encapsulated packets to the outer packet IPv4 header.

This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
dscp [<0-63>|reflect]
```

Parameters

- `dscp [<0-63>|reflect]`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dscp &lt;0-63&gt;</code></td>
<td>Specifies the DSCP 802.1q priority value for outer packets from 0 - 63. The default is 1.</td>
</tr>
<tr>
<td><code>dscp reflect</code></td>
<td>Copies the DSCP 802.1q value from inner packets</td>
</tr>
</tbody>
</table>

Examples

```
rfs4000-229D58 (config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#dscp 20
rfs4000-229D58 (config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#show context gre tunnel testGRETunnel
dscp 20
rfs4000-229D58 (config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#
```

The following example configures a GRE tunnel on a profile:

```
nx4500-5CFA2B (config-profile testNX45XX-gre-tunnel-testGRETunnel)#dscp 20
nx4500-5CFA2B (config-profile testNX45XX-gre-tunnel-testGRETunnel)#show context gre tunnel testGRETunnel
dscp 20

```

Related Commands

```
no
```

Removes the GRE tunnel settings based on the parameters passed
7.1.31.2.2 establishment-criteria

*gre-config-instance*

Configures the GRE tunnel establishment criteria

In a multi-controller RF domain, it is always the master node that establishes the tunnel. The tunnel is created only if the tunnel device is designated as one of the following: vrrp-master, cluster-master, or rf-domain-manager.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]

**Parameters**

- establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]

| establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>] | Configures the GRE tunnel establishment criteria. The options are: |
|---|---|
| always – Always automatically establishes tunnel (default setting). The tunnel device need not be a cluster master, RF Domain manager, or VRRP master to establish the GRE tunnel. This is the default setting. |
| cluster-master – Establishes tunnel only if the tunnel device is designated as the cluster master |
| rf-domain-manager – Establishes tunnel only if the tunnel device is designated as the RF Domain manager |
| vrrp-master <1-255> – Establishes tunnel only if the tunnel device is designated as the Virtual Router Redundancy (VRRP) master |

**Examples**

nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#establishment-criteria rf-domain-manager

nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#show context
gre tunnel testGREtunnel

establishment-criteria rf-domain-manager

nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#
7.1.31.2.3 failover

Enables periodic pinging of the primary gateway to assess its availability. When enabled, the system continues pinging, an unreachable gateway, for a specified number of times and at the specified interval.

This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
failover interval <1-250> retry <0-10>
```

**Parameters**

- `failover interval <1-250> retry <0-10>`

<table>
<thead>
<tr>
<th>failover interval &lt;1-250&gt; retry &lt;0-10&gt;</th>
<th>Specifies the interval, in seconds, between two successive pings to the primary gateway. If the primary gateway is unreachable, the system pings it at intervals specified here.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-250&gt;</td>
<td>Specify a value from 1 - 250 seconds.</td>
</tr>
<tr>
<td>retry</td>
<td>Specifies the maximum number attempts made to ping the primary gateway before the session is terminated.</td>
</tr>
<tr>
<td>&lt;0-10&gt;</td>
<td>Specify a value from 0 - 10.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#failover interval 200 retry 5
gre tunnel testGRETunnel
dscp 20
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#show context
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#
```

**Related Commands**

- `no` Removes the GRE tunnel settings based on the parameters passed
7.1.31.2.4 mtu

`gre-config-instance`

Configures the *maximum transmission unit* (MTU) for IPv4/IPv6 L2GRE tunnel endpoints

The MTU is the largest physical packet size (in bytes) transmittable within the tunnel. Any messages larger than the configured MTU are divided into smaller packets before transmission. Larger the MTU greater is the efficiency because each packet carries more user data, while protocol overheads, such as headers or underlying per-packet delays remain fixed; the resulting higher efficiency means a slight improvement in bulk protocol throughput. A larger MTU results in the processing of fewer packets for the same amount of data.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
mtu [ipv4 <900-1476>|ipv6 <1236-1456>]
```

**Parameters**

- `mtu [ipv4 <900-1476>|ipv6 <1236-1456>]`

<table>
<thead>
<tr>
<th>MTU Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtu [ipv4 &lt;900-1476&gt;</td>
<td>Configures the MTU for L2GRE tunnel endpoints</td>
</tr>
<tr>
<td>ipv6 &lt;1236-1456&gt;</td>
<td></td>
</tr>
<tr>
<td>ipv4 &lt;900-1476&gt;</td>
<td>Configures IPv4 L2GRE tunnel endpoint MTU from 900 - 1476. The default is 1476.</td>
</tr>
<tr>
<td>ipv6 &lt;1236-1456&gt;</td>
<td>Configures IPv6 L2GRE tunnel endpoint MTU from 1236 - 1456. The default is 1456.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#mtu ipv4 1200
nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#mtu ipv6 1300
nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#show context gre tunnel testGREtunnel
  mtu ipv4 1200
  mtu ipv6 1300
  establishment-criteria rf-domain-manager
nx9500-6C8809(config-profile testNX9000-gre-tunnel-testGREtunnel)#
```
7.31.2.5 native

`gre-config-instance`

Configures native trunking settings for this GRE tunnel.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX56524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
native [tagged|vlan <1-4094>]
```

**Parameters**

- `native [tagged|vlan <1-4094>]`

<table>
<thead>
<tr>
<th>native tagged</th>
<th>Enables/disables native VLAN tagging</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The IEEE 802.1Q specification is supported for tagging frames and coordinating VLANs between devices. IEEE 802.1Q adds four bytes to each frame identifying the VLAN ID for upstream devices that the frame belongs. If the upstream Ethernet device does not support IEEE 802.1Q tagging, it does not interpret the tagged frames. When VLAN tagging is required between devices, both devices must support tagging and be configured to accept tagged VLANs. When a frame is tagged, the 12 bit frame VLAN ID is added to the 802.1Q header so upstream Ethernet devices know which VLAN ID the frame belongs to. The device reads the 12 bit VLAN ID and forwards the frame to the appropriate VLAN. When a frame is received with no 802.1Q header, the upstream device classifies the frame using the default or native VLAN assigned to the Trunk port. The native VLAN allows an Ethernet device to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. This feature is disabled by default.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>native vlan &lt;1-4094&gt;</th>
<th>Specifies a numerical VLAN ID (1 - 4094) for the native VLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The native VLAN allows an Ethernet device to associate untagged frames to a VLAN, when no 802.1q frame is included in the frame. Additionally, the native VLAN is the VLAN untagged traffic is directed over when using a port in trunk mode.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809 (config-profile testNX9000-gre-tunnel-testGREtunnel)#native tagged

rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#no tunneled-vlan
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#no failover
```

The following example shows the GRE tunnel ‘testGRETunnel’ settings after the no commands are executed:

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#show context
gre tunnel testGRETunnel
peer 1 ip 192.168.13.6
    native tagged
```

```
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#no dscp
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#no native vlan
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#no tunneled-vlan
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#no failover
```
7.1.31.2.7 peer

*gre-config-instance*

Adds the GRE tunnel's end-point peers. A maximum of two peers, representing the tunnel's end points, can be added for each GRE tunnel.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

peer <1-2> ip <IPv4/IPv6>

**Parameters**

- peer <1-2> ip <IPv4/IPv6>

<table>
<thead>
<tr>
<th>peer &lt;1-2&gt; ip &lt;IPv4/IPv6&gt;</th>
<th>Configures the tunnel's end-point peers</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. peer &lt;1-2&gt; – Specify a numeric index for each peer to help differentiate the tunnel end points.</td>
<td></td>
</tr>
<tr>
<td>2. ip – Specify the IP address (IPv4/IPv6) of the added GRE peer to serve as a network address identifier.</td>
<td></td>
</tr>
<tr>
<td>3. &lt;IPv4/IPv6&gt; – Specify the peer's IPv4 or IPv6 address.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
hydrangea-02102(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#peer 1
ip 192.168.13.6
hydrangea-02102(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#show context
gre tunnel testGRETunnel
    peer 1 ip 192.168.13.6
    native tagged
dscp 20
    failover interval 200 retry 5
hydrangea-02102(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#
```

**Related Commands**

- no

Removes the GRE tunnel settings based on the parameters passed
7.1.31.2.8 tunneled-vlan

Defines the VLAN that connected clients use to route GRE tunneled traffic within their respective WLANs.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

tunneled-vlan <VLAN-ID>

Parameters

- tunneled-vlan <VLAN-ID>

  tunneled-vlan <VLAN-ID> Specifies the VLANs associated with this GRE tunnel

    - <VLAN-ID> – Specify the VLAN IDs. Specify a comma-separated list of IDs, to specify multiple VLANs. For example, 1,10,12,16-20.

Examples

rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#tunneled-vlan 10

rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#show context

gre tunnel testGRETunnel

  native vlan 1
  tunneled-vlan 1,10
  native tagged
dscp 20
  failover interval 200 retry 5
rfs4000-229D58(config-device 00-23-68-22-9D-58-gre-tunnel-testGRETunnel)#

Related Commands

no Removes the GRE tunnel settings based on the parameters passed
### 7.1.32 http-analyze

**Profile Config Commands**

Enables HTTP analysis on this profile. Use this command to configure the mode and interval at which data is sent to the controller (running the HTTP analytics engine).

In a hierarchically organized network, HTTP analytics data forwarding is a simple and transparent process. The site controllers (RFS4000, RFS6000, RFS7000, NX45XX, and NX65XX) receive the HTTP data from adopted APs. This data is compressed and forwarded to the *Network Operations Center* (NOC) controller. The NOC controller caches, formats, and uploads this information to the external analytics engine. There is no need for a separate configuration to enable this feature.

For more information on the hierarchical network, see *device-upgrade*.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000

**Syntax**

```
http-analyze [compress|update-interval <1-3600>]
```

**Parameters**

- `http-analyze [compress|update-interval <1-3600>]`

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000)#http-analyze compress
rfs7000-37FABE(config-profile-default-rfs7000)#http-analyze update-interval 200

  rfs7000-37FABE(config-profile-default-rfs7000)#
```

**Related Commands**

- `no` Disables HTTP analyze settings
7.1.33 http-analyze (NX45XX, NX65XX, and NX9000)

Profile Config Commands

Enables forwarding of HTTP request related data to the HTTP analytics engine.

Wireless clients (MUs) connect to APs and route their HTTP requests through the APs. These APs extract and forward HTTP request packets, through MiNT, to the NX series controller. The NX series controller uses a new analytic daemon to cache, format, and forward information to the analytics engine. Currently the analytics daemon is supported only on the NX series service platform. Therefore, it is essential that all APs should use an NX series service platform as controller.

In a hierarchically organized network, HTTP analytics data forwarding is a simple and transparent process. The site controllers (RFS4000, RFS6000, RFS7000, NX45XX, and NX65XX) receive the HTTP data from adopted APs adopted. This data is compressed and forwarded to the Network Operations Center (NOC) controller. There is no need for a separate configuration to enable this feature.

Use this command to configure the mode and interval at which data is sent to the controller and the external analytics engine. This command also configures the external engine’s details, such as URL, credentials etc.

A NX9500 and NX9510 model service platforms (NOC) can provide granular and robust analytic reporting for a RFS4000, RFS6000 or RFS7000 controller managed network or a NX45XX/NX65XX service platform managed network. You can use the analytics feature. Using analytics, data is collected at administrator defined intervals.

Analytics can parse and process Smart RF events within the NOC managed network as events are received. When a Smart RF event occurs, the analytics engine parses the new channel and power information from the Smart RF event, as opposed to retrieving the event from the devices themselves.

The analytics user interface populates information within a data store, with multiple displays partitioned by performance function. The data store is a customizable display managed with just the content the administrator wants viewed. The data store is purged after 90 days if no administration is conducted sooner.

A separate hot spare analytics license is enforced at the NOC. The license restricts the number of Access Point streams processed at the NOC or forwarded to partner systems for further processing. The analytics feature can be turned on at select APs by enabling them in configuration. This way the customer can enable analytics on a select set of APs and not the entire system as long as the number of APs on which it is enabled is less than or equal to the total number of AP analytics licenses available at the NOC controller.

---

**NOTE:** The Analytics module helps gather data about customer behavior such as web sites visited, search terms used, mobile device types, number of new users vs. repeat users. This data provides a better understanding of pricing strategies and promotions being run by competitors.

---

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
http-analyze [compress|controller|external-server|update-interval]
```

```
http-analyze [compress|controller|update-interval <1-3600>]
```

```
http-analyze external-server [password|proxy|update-interval|url|user-name|validate-server-certificate]
```

```
http-analyze external-server [password <WORD>|proxy <URL>|update-interval <1-3600>|url <URL>|username <WORD>|validate-server-certificate]
```
## Parameters

- **http-analyze [compress|controller|update-interval <1-3600>]**
  
  - **compress**
    - Compresses update files before forwarding to the controller. This option is disabled by default.
  
  - **controller**
    - Sends the collected analytics data to the controller (data is forwarded to a local analytics engines on the NX series service platform)
  
  - **update-interval <1-3600>**
    - Configures the interval, in seconds, at which buffered packets are pushed to the controller
      - `<1-3600>` – Specify the interval from 1 - 3600 seconds. The default is 60 seconds.

- **http-analyze external-server [password <WORD>|proxy <URL>|update-interval|url username|validate-server-certificate]**

  - **http-analyze external-server**
    - Configures the external HTTP analytics engine’s parameters
  
  - **password <WORD>**
    - Configures the external analytics engine’s password
      - `<WORD>` – Provide the login password. This is the password associated with the user name needed to access the external analytics engine.
  
  - **proxy <URL>**
    - Configures the proxy server’s [uniform resource locator (URL)]
      - `<URL>` – Specify the proxy server’s URL in the following format:
        - `http://username:password@proxy-server:port`
        - For example, `http://mot:sym@wwwgate0.mot.com:1080`
  
  - **update-interval <1-36000>**
    - Configures the interval, in seconds, at which buffered packets are pushed to the external analytics engine
      - `<1-3600>` – Specify the interval from 1 - 3600 seconds. The default is 60 seconds.
  
  - **url <URL>**
    - Configures the external analytics engine’s IP address or URL
      - `<URL>` – Provide the IP address or URL.
  
  - **username <WORD>**
    - Configures the user name needed to access the external analytics engine
      - `<WORD>` – Provide the user name.
  
  - **validate-server-certificate**
    - Validates the external analytics engine’s certificate, if it is using HTTPS as the mode of access

7.1.34.1 interface

Selects an interface to configure

A profile’s interface configuration can be defined to support separate physical Ethernet configurations both unique and specific to RFS4000, RFS6000, RFS7000 controllers and NX4500, NX6500, NX7500 and NX9000 series service platforms. Ports vary depending on the platform, but controller or service platform models do have some of the same physical interfaces.

A controller or service platform requires its virtual interface be configured for layer 3 (IP) access or layer 3 service on a VLAN. A virtual interface defines which IP address is associated with each VLAN ID the controller or service platform is connected to.

If the profile is configured to support an access point radio, an additional radio interface is available, unique to the access point’s radio configuration.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax Service Platforms**

```
interface [INTERFACE-NAME]|fe <1-4>|ge <1-24>|me1|port-channel <1-4>|pppoe1|
radio [1|2|3]|serial <1-4>|t1e1 <1-4>|up <1-2>|vlan <1-4094>|vmif <1-12>|wwan1|xge <1-4>
```

**Syntax Access Points and Wireless Controllers**

```
interface [INTERFACE-NAME]|fe <1-4>|ge <1-8>|me1|port-channel <1-4>|pppoe1|
radio [1|2|3]|up1|vlan <1-4094>|wwan1|xge <1-4>
```

### Usage Guidelines

The ports available on a device vary depending on the model. The following ports are available on RFS4000, RFS6000 and RFS7000 model wireless controllers:

- **RFS4000** - ge1, ge2, ge3, ge4, ge5, up1
- **RFS6000** - ge1, ge2, ge3, ge4, ge5, ge6, ge7, ge8, me1, up1
- **RFS7000** - ge1, ge2, ge3, me1

GE ports on are RJ-45 supporting 10/100/1000Mbps. GE ports on the RFS7000 can be RJ-45 or fiber ports supporting 10/100/1000Mbps.

ME ports are available on RFS6000 and RFS7000 platforms. ME ports are out-of-band management ports used to manage the controller via CLI or Web UI, even when the other ports on the controller are unreachable.

The ports available on service platforms also vary depending on the model. The following ports are available on NX series service platforms:

- **NX4500** - up1, up2
- **NX4524** - ge1-ge24, up1, up2

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| **radio [1|2|3]** | Selects a radio interface  
  - 1 – Selects radio interface 1  
  - 2 – Selects radio interface 2  
  - 3 – Selects radio interface 3  
  The radio interface is not available on wireless controllers (exception RFS4011) or service platforms. |
| **serial <1-4>** | Selects a serial interface  
  - <1-4> – Specify the interface index from 1 - 4.  
  The serial interfaces are virtual interfaces available only on the NX45XX and NX65XX series service platforms. |
| **t1e1 <1-4>** | Selects the T1 and E1 slot interfaces  
  - <1-4> – Specify the T1 or E1 slot ID from 1 - 4.  
  The T1E1 interfaces are available only on the NX45XX and NX65XX series service platforms. |
| **up1** | Selects the uplink GigabitEthernet interface  
  The NX45XX and NX65XX series profiles support 2 uplink interfaces (up <1-2>). |
| **vlan <1-4094>** | Selects a VLAN interface  
  - <1-4094> – Specify the SVI VLAN ID from 1 - 4094. |
| **vmif <1-8>** | Selects the virtual machine (VM) interface  
  - <1-8> – Specify the VM interface index from 1 - 8.  
  The VM interfaces are available only on the NX45XX, NX65XX, NX9XXX series service platforms. |
| **wwan1** | Selects a Wireless WAN interface  
  This interface is applicable only to AP71XX, AP81XX, AP82XX, RFS4000, RFS6000 model access points and controllers. |
| **xge <1-4>** | Selects a TenGigabitEthernet interface  
  - <1-2> – Specify the interface index from 1 - 4. |
• NX5500 - ge1, ge2
• NX6500 - up1, up2
• NX6524 - ge1-ge24, up1, up2
• NX7500 - ge1-ge10, xge1-xge2
• NX9000 series - ge1, ge2, xge1-xge4

GE ports are available on RFS4000, RFS6000 and RFS7000 controllers and NX4524 and NX6524 model service platforms. GE ports are RJ-45 supporting 10/100/1000Mbps. GE ports on the RFS7000 can be RJ-45 or fiber ports supporting 10/100/1000Mbps.

ME ports are available on RFS6000 and RFS7000 platforms. ME ports are out-of-band management ports used to manage the controller via CLI or Web UI, even when the other ports on the controller are unreachable.

UP ports are available on RFS4000 and RFS6000 platforms. A UP port is used to connect to the backbone network. UP ports are available on RFS4000 and RFS6000 controllers and NX4500 and NX6500 series service platforms. A UP port supports either RJ-45 or fiber. The UP port is the preferred means to connect to the backbone as it has a non-blocking 1gbps connection unlike the GE ports.

The following ports are available on access points:

• AP6511 - fe1, fe2, fe3, fe4, up1
• AP6521 - GE1/POE (LAN)
• AP6522 - GE1/POE (LAN)
• AP6532 - GE1/POE
• AP6562 - GE1/POE
• AP7131 - GE1/POE (LAN), GE2 (WAN)
• AP7161 - GE1/POE (LAN), GE2 (WAN)
• AP7181 - GE1/POE (LAN), GE2 (WAN)
• AP7502 - GE1 (THRU), fe1, fe2, fe3,
• AP7522 - GE1/POE (LAN)
• AP7532 - GE1/POE (LAN)
• AP81XX - GE1/POE (LAN), GE2 (WAN)
• AP82XX - GE1/POE (LAN), GE2 (WAN)

**NOTE:** For a NX7500 model service platform, there are options for either a 2 port or 4 port network management card. Either card can be managed using WiNG. If the 4 port card is used, ports ge7-ge10 are available. If the 2 port card is used, ports xge1-xge2 are available.

7.1.34.2 interface-config-instance

Use the config-profile-<PROFILE-NAME> instance to configure the Ethernet, VLAN and tunnel associated with the access point, wireless controller, or service platform.

To switch to this mode, use the following command:

```
<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#interface [<INTERFACE-NAME>|fe <1-4>|ge <1-24>|me1|port-channel <1-4>|pppoe1|radio [1|2|3]|up1|vlan <1-4094>|wwan1|xge <1-4>]
<DEVICE>(config-profile-default-rfs7000)# ge 1
```

The following example uses the config-profile-default-rfs7000 instance to configure a GigabitEthernet interface:

```
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#?
```

<tr>
<td>switchport</td>
<td>Sets interface switching mode characteristics</td>
<td>page 7-194</td>
</tr>
<tr>
<td>use</td>
<td>Associates IPv4, IPv6, and/or MAC ACL with the selected Ethernet port</td>
<td>page 7-197</td>
</tr>
</tbody>
</table>
7.1.34.2.1 captive-portal-enforcement

```
interface-config-instance
```

Enables/disables application of captive portal access permission rules to data transmitted over this specific Ethernet port. This setting is disabled by default.

Captive portal enforcement allows users on the wired network to pass traffic through the captive portal without being redirected to an authentication page. Authentication instead takes place when the RADIUS server is queried against the wired user’s MAC address. If the MAC address is in the RADIUS server’s user database, the user can pass traffic on the captive portal.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**
captive-portal-enforcement {fall-back}

**Parameters**
- captive-portal-enforcement {fall-back}

<table>
<thead>
<tr>
<th>captive-portal-enforcement</th>
<th>Enables/disables captive-portal enforcement on this Ethernet port</th>
</tr>
</thead>
<tbody>
<tr>
<td>fall-back</td>
<td>Optional. Enforces captive portal validation only if port authentication fails. When selected, captive portal policies are enforced only when RADIUS authentication of the client MAC address is not successful. If this option is not selected, captive portal policies are enforced regardless of the client’s MAC address being in the RADIUS server’s user database or not.</td>
</tr>
</tbody>
</table>

**Examples**
rfs7000-6DCD4B(config-device-B4-C7-99-6D-CD-4B-if-ge2)#captive-portal-enforcement
rfs7000-6DCD4B(config-device-B4-C7-99-6D-CD-4B-if-ge2)#show context interface ge2 captive-portal-enforcement
rfs7000-6DCD4B(config-device-B4-C7-99-6D-CD-4B-if-ge2)#

**Related Commands**

| no  | Disables captive-portal enforcement on this interface |
7.1.34.2.2 cdp

*interface-config-instance*

Enables CDP on the selected GE port

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

cdp [receive|transmit]

**Parameters**

- cdp [receive|transmit]

<table>
<thead>
<tr>
<th>receive</th>
<th>Enables CDP packet snooping on this interface. When enabled, the port receives periodic interface updates from a multicast address. This option is enabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>transmit</td>
<td>Enables CDP packet transmission on this interface. When enabled, the port sends out periodic interface updates to a multicast address to advertise its presence to neighbors. This option is enabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

```
> rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#cdp transmit
```

**Related Commands**

`no` Disables CDP packet snooping on the controller or service platform’s selected GE ports
7.1.34.2.3 channel-group

Assigns this Ethernet port to a channel group. Ethernet ports can be aggregated to form a channel group. For example, an RFS7000 has four (4) Ethernet ports (1, 2, 3, & 4). These can be aggregated to form a minimum of one and maximum of two channel groups. A port can be a member of only one channel group at a time.

The maximum number of channel groups supported on a device depends on the number of Ethernet ports available.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
channel-group <1-4>
```

Parameters

- channel-group <1-4>

<1-4> Specifies a channel group number from 1 - 4. The upper limit of this range depends on the device on which this value is being configured.

```
Syntax:
channel-group <1-4>

Parameters:
channel-group <1-4>

Examples:
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#channel-group 1
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#show context
interface ge1
  ip dhcp trust
  qos trust dscp
  qos trust 802.1p
  channel-group 1
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#
```

Related Commands

```
no

no
Removes the channel group to which this port belongs
```

```
no
```

Removes the channel group to which this port belongs
7.1.34.2.4 description

`interface-config-instance`

Configures a description for this Ethernet port

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

description [<LINE>|<WORD>]

**Parameters**

- description [<LINE>|<WORD>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;LINE&gt;</td>
<td>Configures the maximum length (number of characters) of the interface description</td>
</tr>
<tr>
<td>&lt;WORD&gt;</td>
<td>Configures a unique description for this interface. The description should not exceed the length specified by the &lt;LINE&gt; parameter.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#description "This is GigabitEthernet interface for Royal King"
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#show context
interface ge1
description This is\ GigabitEthernet\ interface for\ Royal\ King
ip dhcp trust
gos trust dscp
gos trust 802.1p
channel-group 1
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#
```

**Related Commands**

- `no` Removes the interface description
7.1.34.2.5 dot1x (authenticator)

Configure 802.1X authenticator settings

dot1x (802.1x) is an IEEE standard for network authentication. It enables media-level (layer 2) access control, providing the capability to permit or deny connectivity based on user or device identity. Dot1x allows port-based access using authentication. An dot1x enabled port can be dynamically enabled or disabled depending on user identity or device connection.

Devices supporting dot1x allow the automatic provision and connection to the wireless network without launching a Web browser at login. When within range of a dot1x network, a device automatically connects and authenticates without needing to manually login.

Before authentication, the endpoint is unknown, and traffic is blocked. Upon authentication, the endpoint is known and traffic is allowed. The controller or service platform uses source MAC filtering to ensure only the authenticated endpoint is allowed to send traffic.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

Parameters

- dot1x authenticator [guest-vlan <1-4094>|host-mode [multi-host|single-host]|max-reauth-req <1-10>|port-control [auto|force-authorized|force-unauthorized]|reauthenticate|timeout [quiet-period|reauth-period]]

**NOTE:** The dot1x (802.1x) supplicant settings are documented in the next section.
### port-control

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Configures auto port state</td>
</tr>
<tr>
<td>force-authorized</td>
<td>Configures authorized port state. This is the default setting.</td>
</tr>
<tr>
<td>force-unauthorized</td>
<td>Configures unauthorized port state</td>
</tr>
</tbody>
</table>

### reauthenticate

Enables or disables re-authentication for this port. When enabled, clients are forced to re-authenticate on this port. The setting is disabled by default. Therefore, clients are not required to re-authenticate for connection over this port until this setting is enabled.

### timeout [quiet-period] reauth-period <1-65535>

Configures timeout settings for this interface

- quiet-period – Configures the quiet period timeout in seconds. This is the interval, in seconds, between successive client authentication attempts.
- reauth-period – Configures the time after which re-authentication is initiated

The following option is common to ‘quiet-period’ and ‘reauth-period’ keywords:

- `<1-65535>` – Specify a ‘quiet-period’ or ‘reauth-period’ from 1 - 65535 seconds.

### Examples

```
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#dot1x authenticator guest-vlan 2
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#dot1x authenticator host-mode multi-host
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#dot1x authenticator max-reauth-req 6
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#dot1x authenticator reauthenticate
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#show context
interface ge1
  dot1x authenticator host-mode multi-host
  dot1x authenticator guest-vlan 2
  dot1x authenticator reauthenticate
  dot1x authenticator max-reauth-count 6
  ip dhcp trust
  qos trust dscp
  qos trust 802.1p
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#
```

### Related Commands

- **no** Disables or reverts interface settings to their default
7.1.34.2.6 dot1x (supplicant)

Configure 802.1X supplicant (client) settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

dot1x supplicant username <USERNAME> password [0 <WORD>|2 <WORD>|<WORD>]

Parameters

- dot1x supplicant username <USERNAME> password [0 <WORD>|2 <WORD>|<WORD>]

<table>
<thead>
<tr>
<th>username &lt;USERNAME&gt;</th>
<th>Sets the username for authentication</th>
</tr>
</thead>
</table>
| password [0 <WORD>|2 <WORD>|<WORD>] | Sets the password associated with the supplicant's username. Select any one of the following options:  
  - 0 <WORD> – Sets a clear text password  
  - 2 <WORD> – Sets an encrypted password  
  - <WORD> – Specify the password. |

Examples

rfs4000-229D58(config-profile-testRFS4000-if-ge1)#dot1x supplicant username bob password 0 test@123

rfs4000-229D58(config-profile-testRFS4000-if-ge1)#show context

interface ge1
  dot1x supplicant username bob password 0 test@123
  dot1x authenticator host-mode multi-host
  dot1x authenticator guest-vlan 2
  dot1x authenticator reauthenticate
  dot1x authenticator max-reauth-count 6
  ip dhcp trust
  qos trust dscp
  qos trust 802.1p

rfs4000-229D58(config-profile-testRFS4000-if-ge1)#

Related Commands

no
  Removes 802.1X supplicant (client) settings
7.1.34.2.7 duplex

Configures duplex mode (for the flow of packets) on this Ethernet port

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
duplex [auto|half|full]

Parameters

- duplex [auto|half|full]

| auto | Enables automatic duplexity on an interface port. The port automatically detects whether it should run in full or half-duplex mode. (default setting) |
| half | Sets the port to half-duplex mode. Allows communication in one direction only at any given time. When selected, data is sent over the port, then immediately data is received from the direction in which the data was transmitted. |
| full | Sets the port to full-duplex mode. Allows communication in both directions simultaneously. When selected, the port can send data while receiving data as well. |

Examples

rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#duplex full
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#show context

interface ge1
description This\ is\ GigabitEthernet\ interface\ for\ Royal\ King
duplex full
dot1x supplicant username Bob password 0 test@123
ip dhcp trust
qos trust dscp
qos trust 802.1p
channel-group 1
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#

Related Commands

- no Reverts to default (auto)
7.1.34.2.8 ip

Sets the ARP and DHCP components for this Ethernet port

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
interface-config-instance
ip [arp|dhcp]
```

```
ip [arp [header-mismatch-validation|trust]|dhcp trust]
```

Parameters

- **ip [arp [header-mismatch-validation|trust]|dhcp trust]**
  - **arp [header-mismatch-validation|trust]**
    - Configures ARP packet settings
    - **header-mismatch-validation** — Enables matching of source MAC address in the ARP and Ethernet headers to check for mismatch. This option is disabled by default.
    - **trust** — Enables trust state for ARP responses on this interface. When enabled, ARP packets received on this port are considered trusted and information from these packets is used to identify rogue devices within the network. This option is disabled by default.
  - **dhcp trust**
    - Enables trust state for DHCP responses on this interface. When enabled, only DHCP responses are trusted and forwarded on this port, and a DHCP server can be connected only to a DHCP trusted port. This option is enabled by default.

Examples

```
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#ip dhcp trust
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#ip arp header-mismatch-validation
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#show context
```

interface ge1
description This is\ GigabitEthernet\ interface\ for\ Royal\ King
duplex full
dot1x supplicant username Bob password 0 test@123
ip dhcp trust
ip arp header-mismatch-validation
gos trust dscp
gos trust 802.1p
channel-group 1
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#

Related Commands

```
no
```

Removes the ARP and DHCP components configured for this interface
7.1.34.2.9 ipv6

Sets the DHCPv6 and ICMPv6 neighbor discovery (ND) components for this interface.

The ICMPv6 ND protocol uses ICMP messages and solicited multicast addresses to track neighboring devices on the same local network. These messages are used to discover a neighbor’s link layer address and to verify if a neighboring device is reachable. The ICMP messages are neighbor solicitation (NS) and neighbor advertisement (NA) messages. When a destination host receives an NS message from a neighbor, it replies back with a NA. The NA contains the following information:

- Source address – This is the IPv6 address of the device sending the NA
- Destination address – This is the IPv6 address of the device from whom the NS message is received
- Data portion – Includes the link layer address of the device sending the NA

NS messages are used to verify a neighbor’s (whose link layer address is known) reachability. To confirm a neighbor’s reachability a node sends an NS message in which the neighbor’s unicast address is specified as the destination address. If the neighbor sends back an acknowledgment on receipt of the NS message it is considered reachable.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ipv6 [dhcpv6|nd]
ipv6 dhcpv6 trust
ipv6 nd [header-mismatch-validation|raguard|trust]
```

**Parameters**

- `ipv6 dhcpv6 trust`
  
  Enables trust state for DHCPv6 responses on this interface. When enabled, all DHCPv6 responses received on this port are trusted and forwarded. This option is enabled by default.

  **Note:** A DHCPv6 server can be connected to a DHCPv6 trusted port.

- `ipv6 nd [header-mismatch-validation|raguard|trust]`

  **Table:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6 nd</td>
<td>Configures IPv6 ND settings</td>
</tr>
<tr>
<td>header-mismatch-validation</td>
<td>Enables matching of source MAC address in the ICMPv6 ND and Ethernet headers (link layer option) to check for mismatch. This option is disabled by default.</td>
</tr>
<tr>
<td>raguard</td>
<td>Allows redirection of router advertisements (RAs) and ICMPv6 packets originating on this interface. When selected, RAs are periodically sent to hosts or sent in response to neighbor solicitation requests. The advertisement includes IPv6 prefixes and other subnet and host information. This option is enabled by default.</td>
</tr>
<tr>
<td>command</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>trust</td>
<td>Enables trust state for IPv6 ND requests received on this interface. When enabled, IPv6 hosts can configure themselves automatically when connected to an IPv6 network using the neighbor discovery protocol via ICMPv6 router discovery messages. When first connected to a network, a host sends a link-local router solicitation multicast request for its configuration parameters; routers respond to the request with a router advertisement packet containing Internet Layer configuration parameters. This option is disabled by default.</td>
</tr>
<tr>
<td>no</td>
<td>Removes or reverts IPv6 settings on this interface</td>
</tr>
</tbody>
</table>

**Examples**

```bash
rfs7000-6DCD4B(config-device-B4-C7-99-6D-CD-4B-if-ge1)#ipv6 dhcpv6 trust

```

**Related Commands**

- `no`
7.1.34.2.10 lldp

`interface-config-instance`

Configures *Link Local Discovery Protocol* (LLDP) parameters on this Ethernet port.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`lldp [receive|transmit]`

**Parameters**

- `lldp [receive|transmit]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>receive</code></td>
<td>Enables LLDP <em>Protocol Data Units</em> (PDUs) snooping. When enabled, the port receives periodic updates from a multicast address informing about presence of neighbors. This option is enabled by default.</td>
</tr>
<tr>
<td><code>transmit</code></td>
<td>Enables LLDP PDU transmission. When enabled, the port sends out periodic interface updates to a multicast address to advertise its presence to neighbors. This option is enabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

`rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#lldp transmit`

**Related Commands**

- `no` Disables or reverts interface settings to their default
7.1.34.2.11 mac-auth

Enables authentication of MAC addresses on the selected wired port. When enabled, this feature authenticates the MAC address of a device, connecting to this interface, with a RADIUS server. When successfully authenticated, packets from the source are processed. Since only one MAC address is supported per wired port, packets from all other sources are dropped.

For more information on enabling this feature see, `mac-auth`.

Enable port MAC authentication in conjunction with Wired 802.1x settings to configure a MAC authentication AAA policy. This option is also available in the device configuration mode.

Supported in the following platforms:

- Access Points — AP622, AP6522, AP6562, AP71XX, AP7502, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```

no switchport [access vlan|mode|trunk native tagged]

no use [ip-access-list|ipv6-access-list|mac-access-list] in

Parameters

• no <PARAMETERS>

no <PARAMETERS> Removes or reverts this Ethernet port settings based on the parameters passed

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#no cdp

rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#no duplex
7.1.34.2.13 power

**interface-config-instance**

Configures PoE settings on this interface

When configured, this option allows the selected port to use Power over Ethernet. When enabled, the controller supports 802.3af PoE on each of its GE ports. PoE allows users to monitor port power consumption and configure power usage limits and priorities for each GE port.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
power {best-effort|limit <0-40>|priority [critical|high|low]}
```

**Parameters**

- **power {best-effort|limit <0-40>|priority [critical|high|low]}}**

  - **best-effort**
    - Enables power when the device is not operating from 802.3at class 4 power source
  - **limit <0-40>**
    - Optional. Configures the PoE power limit from 0 - 40 Watts. The default is 30 Watts.
  - **priority [critical|high|low]**
    - Optional. Configures the PoE power priority on this interface. This is the priority assigned to this port versus the power requirements of the other ports available on the controller.
      - **critical** — Sets PoE priority as critical
      - **high** — Sets PoE priority as high
      - **low** — Sets PoE priority as low. This is the default setting.

**Examples**

```
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#power limit 30
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#power priority critical
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#show context
interface ge1
  ip dhcp trust
  qos trust dscp
  qos trust 802.1p
  power limit 30
  power priority critical
rfs4000-229D58 (config-profile-testRFS4000-if-ge1)#
```

**Related Commands**

7.1.34.2.14 qos

Defines Quality of Service (QoS) settings on this Ethernet port

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5520, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
qos trust [802.1p|cos|dscp]

Parameters
- qos trust [802.1p|cos|dscp]

| trust [802.1p|cos|dscp] | Trusts QoS values ingressing on this interface |
|-------------------------|---------------------------------------------|
| 802.1p                  | 802.1p – Trusts 802.1p COS values ingressing on this interface |
| cos                     | cos – Trusts 802.1p COS values ingressing on this interface. This option is enabled by default. |
| dscp                    | dscp – Trusts IP DSCP QOS values ingressing on this interface. This option is enabled by default. |

Examples
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#qos trust dscp

### 7.1.34.2.16 spanning-tree

**interface-config-instance**

Configures spanning tree parameters

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX5524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
spanning-tree [bpdufilter|bpduguard|force-version|guard|link-type|mst|port-cisco-interoperability|portfast]

spanning-tree [force-version <0-3>|guard root|portfast]

spanning-tree [bpdufilter|bpduguard] [default|disable|enable]

spanning-tree link-type [point-to-point|shared]

spanning-tree mst <0-15> [cost <1-200000000>|port-priority <0-240>]

spanning-tree port-cisco-interoperability [disable|enable]
```

**Parameters**

- **spanning-tree [force-version|guard root|portfast]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| force-version <0-3>              | Specifies the spanning tree force version. A version identifier of less than 2 enforces the spanning tree protocol. Select one of the following versions:  
  - 0 – *Spanning Tree Protocol* (STP)  
  - 1 – Not supported  
  - 2 – *Rapid Spanning tree Protocol* (RSTP)  
  - 3 – *Multiple Spanning Tree Protocol* (MSTP). This is the default setting |
| guard root                       | Enables Root Guard for the port  
  The Root Guard disables superior *Bridge Protocol Data Unit* (BPDU) reception. The Root Guard ensures the enabled port is a designated port. If the Root Guard enabled port receives a superior BPDU, it moves to a discarding state (root-inconsistent STP state). This state is equivalent to a listening state, and data is not forwarded across the port. Therefore, enabling the guard root enforces the root bridge position. Use the no parameter with this command to disable the Root Guard. |
| portfast                         | Enables rapid transitions. Enabling PortFast allows the port to bypass the listening and learning states. |
| bpdufilter [default|disable|enable] | Sets a PortFast BPDU filter for the port  
  Use the no parameter with this command to revert the port BPDU filter to its default. The spanning tree protocol sends BPDU's from all ports. Enabling the BPDU filter ensures PortFast enabled ports do not transmit or receive BPDU's. |
- **spanning-tree link-type** [point-to-point|shared]

  Enables or disables point-to-point or shared link types
  - point-to-point – Enables rapid transition. This option indicates the port should be treated as connected to a point-to-point link. A port connected to a controller is a point-to-point link.
  - shared – Enables rapid transition. This option indicates this port should be treated as having a shared connection. A port connected to a hub is on a shared link.

- **spanning-tree mst** <0-15> [cost <1-200000000>|port-priority <0-240>]

  Configures MST on a spanning tree
  - cost <1-200000000> Defines path cost for a port from 1 - 200000000. The default path cost depends on the speed of the port. The cost helps determine the role of the port in the MSTP network. The designated cost is the cost for a packet to travel from this port to the root in the MSTP configuration. The slower the media, the higher the cost.
  - port-priority <0-240> Defines port priority for a bridge from 1 - 240. Lower the priority greater is the likelihood of the port becoming a designated port. Applying a higher value impacts the port’s likelihood of becoming a designated port.

- **spanning-tree port-cisco-interoperability** [disable|enable]

  Enables or disables interoperability with Cisco’s version of MSTP (which is incompatible with standard MSTP)
  - enable Enables CISCO Interoperability
  - disable Disables CISCO Interoperability. The default is disabled.

**Examples**

```bash
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#spanning-tree bpdufilter disable
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#spanning-tree bpduguard enable
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#spanning-tree force-version 1
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#spanning-tree guard root
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#spanning-tree mst 2 port-priority 10

7.1.34.2.17 speed

`interface-config-instance`

Specifies the speed of a FastEthernet (10/100) or GigabitEthernet (10/100/1000) port. This is the speed at which the port can receive and transmit the data.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`speed [10|100|1000|auto]`

**Parameters**

- `speed [10|100|1000|auto]`

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>

7.1.34.2.18 switchport

Sets switching mode characteristics for the selected interface

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
switchport [access|mode|trunk]
switchport access vlan [<1-4094>|<VLAN-ALIAS-NAME>]
switchport mode [access|trunk]
switchport trunk [allowed|native]
switchport trunk allowed vlan [<VLAN-ID>|add <VLAN-ID>|remove <VLAN-ID>]
switchport trunk native [tagged|vlan [<1-4094>|<VLAN-ALIAS-NAME>]]
```

Parameters

- **switchport access vlan [<1-4094>|<VLAN-ALIAS-NAME>]**
  - Sets the VLAN when interface is in the access mode. You can either directly specify the native VLAN ID or use a VLAN alias to identify the native VLAN.
    - `<1-4094>` – Specify the SVI VLAN ID from 1 - 4094.
    - `<VLAN-ALIAS-NAME>` – Specify the VLAN alias name (should be existing and configured).
  - An Ethernet port in the access mode accepts packets only from the native VLAN. Frames are forwarded out the port untagged with no 802.1Q header. All frames received on the port are expected as untagged and are mapped to the native VLAN.

- **switchport mode [access|trunk]**
  - Sets the interface’s switching mode to access or trunk (can only be used on physical - layer 2 - interfaces)
    - `access` – If access mode is selected, the access VLAN is automatically set to VLAN1. In this mode, only untagged packets in the access VLAN (vlan1) are accepted on this port. All tagged packets are discarded.
    - `trunk` – If trunk mode is selected, tagged VLAN packets are accepted. The native VLAN is automatically set to VLAN1. Untagged packets are placed in the native VLAN by the wireless controller or service platform. Outgoing packets in the native VLAN are sent untagged. The default mode for both ports is trunk.

- **switchport trunk allowed vlan [<VLAN-ID>|add <VLAN-ID>|remove <VLAN-ID>]**
  - Sets trunking mode, allowed VLANs characteristics of the port. Use this option to add VLANs that exclusively send packets over the listed port.
PROFILES 7 - 195

Usage Guidelines

Interfaces ge1 - ge4 can be configured as trunk or in access mode. An interface configured as “trunk” allows packets (from the given list of VLANs) to be added to the trunk. An interface configured as “access” allows packets only from native VLANs.

Use the [no] switchport (access|mode|trunk) to undo switchport configurations.

Examples

rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#switchport trunk native tagged
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#switchport access vlan 1

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>switchport trunk native [tagged</td>
<td>vlan [&lt;1-4094&gt;</td>
</tr>
<tr>
<td>native [tagged</td>
<td>vlan [&lt;1-4094&gt;</td>
</tr>
<tr>
<td>vlan [tagged</td>
<td>vlan [&lt;1-4094&gt;</td>
</tr>
</tbody>
</table>

Note: Allowed VLANs are configured only when the switching mode is set to “trunk”.

- **vlan [<VLAN-ID>]**: Sets allowed VLAN options. The options are:
  - `<VLAN-ID>` – Allows a group of VLAN IDs. Specify the VLAN IDs, can be either a range (55-60) or a comma-separated list (35, 41 etc.)
  - `none` – Allows no VLANs to transmit or receive through the layer 2 interface
  - `add <VLAN-ID>` – Adds VLANs to the current list
  - `<VLAN-ID>` – Specify the VLAN IDs. Can be either a range of VLAN (55-60) or a list of comma separated IDs (35, 41 etc.)
  - `remove <VLAN-ID>` – Removes VLANs from the current list
  - `<VLAN-ID>` – Specify the VLAN IDs. Can be either a range of VLAN (55-60) or a list of comma separated IDs (35, 41 etc.)

- **tagged** – Tags the native VLAN. When a frame is tagged, the 12 bit frame VLAN ID is added to the 802.1Q header enabling upstream Ethernet devices to know which VLAN ID the frame belongs to. The device reads the 12 bit VLAN ID and forwards the frame to the appropriate VLAN. When a frame is received with no 802.1Q header, the upstream device classifies the frame using the default or native VLAN assigned to the Trunk port. A native VLAN allows an Ethernet device to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame.
  - `<VLAN-ID>` – Specify the VLAN ID, can be either a range of VLAN (55-60) or a list of comma separated IDs (35, 41 etc.)

- **vlan [tagged|vlan [<1-4094>|<VLAN-ALIAS-NAME>]] – Sets the native VLAN for classifying untagged traffic when the interface is in trunking mode. |
  - `<1-4094>` – Specify a range from 1 - 4094.
  - `<VLAN-ALIAS-NAME>` – Specify the VLAN alias name used to identify the VLANs. The VLAN alias should be existing and configured.

### 7.1.34.2.19 `use`

Specifies the IP (IPv4 and IPv6) access list and MAC access list used with this Ethernet port. The associated ACL firewall inspects IP and MAC traffic flows and detects attacks typically not visible to traditional wired firewall appliances.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
use [ip-access-list in <IPv4-ACCESS-LIST-NAME>]|ipv6-access-list <IPv6-ACCESS-LIST-NAME>|mac-access-list in <MAC-ACCESS-LIST-NAME>]
```

#### Parameters
- **use [ip-access-list in <IPv4-ACCESS-LIST-NAME>]|ipv6-access-list <IPv6-ACCESS-LIST-NAME>|mac-access-list in <MAC-ACCESS-LIST-NAME>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `ip-access-list in <IPv4-ACCESS-LIST-NAME>` | Associates an IPv4 access list with this Ethernet port. IPv4 is a connectionless protocol for packet switched networking. IPv4 operates as a best effort delivery method, as it does not guarantee delivery, and does not ensure proper sequencing or duplicate delivery (unlike TCP). IPv4 hosts can use link local addressing to provide local connectivity.  
  - **in** — Applies the IPv4 ACL on incoming packets  
  - `<IPv4-ACCESS-LIST-NAME>` — Specify the IPv4 access list name (it should be an existing and configured). |
| `ipv6-access-list in <IPv6-ACCESS-LIST-NAME>` | Associates an IPv6 access list with this Ethernet port. IPv6 is the latest revision of the IP designed to replace IPv4. IPv6 provides enhanced identification and location information for computers on networks routing traffic across the Internet. IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons.  
  - **in** — Applies the IPv6 ACL on incoming packets  
  - `<IPv6-ACCESS-LIST-NAME>` — Specify the IPv6 access list name (it should be an existing and configured). |
| `mac-access-list in <MAC-ACCESS-LIST-NAME>` | Associates a MAC access list with this Ethernet port. MAC ACLs filter/mark packets based on the MAC address from which they arrive, as opposed to filtering packets on layer 2 ports.  
  - **in** — Applies the MAC ACL on incoming packets  
  - `<MAC-ACCESS-LIST-NAME>` — Specify the MAC access list name (it should be an existing and configured). |

#### Examples

```bash
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#use mac-access-list in test
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#use ip-access-list in test
```
rfs7000-37FABE(config-profile-default-rfs7000-if-ge1)#show context
interface ge1
  description This is GigabitEthernet interface for Royal King
  speed 10
duplex full
  switchport mode access
  switchport access vlan 1
use ip-access-list in test
use mac-access-list in test
spanning-tree bpduguard enable
spanning-tree bpdufilter disable
spanning-tree force-version 1

7.1.34.3 interface-config-vlan-instance

Use the config-profile-<DEVICE-PROFILE-NAME> mode to configure Ethernet, VLAN and tunnel settings.

To switch to this mode, use the following commands:

```
<DEVICE>(config-profile-default-<DEVICE-TYPE>)#interface [<INTERFACE-NAME>|fe <1-4>|ge <1-24>|me1|port-channel <1-4>|pppoe1|radio [1|2|3]| up1|vlan <1-4094>|wwan1|xge <1-24>]
```

The following example uses the config-profile-default-rfs7000 instance to configure a VLAN interface:

```
rfs7000-37FABE(config-profile-default-rfs7000)#interface vlan 8
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#?
```

The following table summarizes interface VLAN configuration commands:

<table>
<thead>
<tr>

<td>page 7-215</td>
</tr>
</tbody>
</table>

```
7.1.34.3.1 crypto

**interface-config-vlan-instance**

Associates an existing and configured VPN crypto map with this VLAN interface.

Crypto map entries are sets of configuration parameters for encrypting packets that pass through the VPN tunnel. For more information on crypto maps, see [crypto-map-config-commands](#).

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

crypto map <CRYPTO-MAP-NAME>

**Parameters**

- crypto map <CRYPTO-MAP-NAME>

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#crypto map map1
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context
interface vlan8
    crypto map map1
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#
```

### 7.1.34.3.2 description

**interface-config-vlan-instance**

Defines this VLAN interface’s description. Use this command to provide additional information about the VLAN.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

description <WORD>

**Parameters**
- description <WORD>

<table>
<thead>
<tr>
<th>description &lt;WORD&gt;</th>
<th>Configures a description for this VLAN interface (should not exceed 64 characters in length)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>Specify a description unique to the VLAN's specific configuration, to help differentiate it from other VLANs with similar configurations.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#description "This VLAN interface is configured for the Sales Team"
```

```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context interface vlan8
    description This VLAN interface is configured for the Sales Team
    crypto map map1
```

**Related Commands**

| no                  | Removes the VLAN interface description |
7.1.34.3.3 dhcp

Enables inclusion of optional fields (client identifier) in DHCP client requests. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dhcp client include client-identifier

Parameters

- dhcp client include client-identifier

<table>
<thead>
<tr>
<th>dhcp client include client-identifier</th>
<th>Enables inclusion of client identifier in DHCP client requests</th>
</tr>
</thead>
</table>

Examples

```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#dhcp client include client-identifier
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context interface vlan8
   dhcp client include client-identifier
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#
```

Related Commands

| no                          | Disables inclusion of client identifier in DHCP client requests |
7.1.34.3.4 dhcp-relay-incoming

- interface-config-vlan-instance

Allows an onboard DHCP server to respond to relayed DHCP packets. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
dhcp-relay-incoming

Parameters
None

Examples
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#dhcp-relay-incoming
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context
    interface vlan8
description This VLAN interface is configured for the Sales Team
crypto map map1
dhcp-relay-incoming
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#

### 7.1.34.3.5 ip

**interface-config-vlan-instance**

Configures the VLAN interface's IP settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ip [address|dhcp|helper-address|nat|ospf]
ip helper-address <IP>
ip address [<IP/M>|<NETWORK-ALIAS-NAME>|dhcp|zeroconf] {secondary}
ip dhcp client request options all
ip nat [inside|outside]
ip ospf [authentication|authentication-key|bandwidth|cost|message-digest-key|priority]
ip ospf authentication [message-digest|null|simple-password]
ip ospf authentication-key simple-password [0 <WORD>|2 <WORD>]
ip ospf [bandwidth <1-10000000>|cost <1-65535>|priority <0-255>]
ip ospf message-digest-key key-id <1-255> md5 [0 <WORD>|2 <WORD>]
```

**Parameters**

- **ip helper-address <IP>**
  
  Enables DHCP and BOOTP requests forwarding for a set of clients. Configure a helper address on the VLAN interface connected to the client. The helper address should specify the address of the BOOTP or DHCP servers to receive the requests. If you have multiple servers, configure one helper address for each server.
  
  - `<IP>` – Specify the IP address of the DHCP or BOOTP server.

- **ip address [<IP/M>|<NETWORK-ALIAS-NAME>|zeroconf] {secondary}**

  - **address**
    
    Sets the VLAN interface’s IP address

  - **<IP/M>**
    
    Specifies the interface IP address in the A.B.C.D/M format
    
    - secondary – Optional. Sets the specified IP address as a secondary address

  - **<NETWORK-ALIAS-NAME>**
    
    Uses a pre-defined network alias to provide this VLAN interface's IP address. Specify the network alias name.
    
    - secondary – Optional. Sets the network-alias provided IP address as the secondary address
### Profiles

#### ip address dhcp
- **secondary**
  - Uses *Zero Configuration Networking* (zeroconf) to generate an IP address for this interface
  - Zero configuration can be a means of providing a primary or secondary IP addresses for the virtual interface. Zero configuration (or zero config) is a wireless connection utility included with Microsoft Windows XP and later as a service dynamically selecting a network to connect based on a user’s preferences and various default settings. Zero config can be used instead of a wireless network utility from the manufacturer of a computer’s wireless networking device.
  - secondary – Optional. Sets the generated IP address as a secondary address

<table>
<thead>
<tr>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Configures all DHCP client request options</td>
</tr>
</tbody>
</table>

#### ip nat [inside|outside]
- **inside**
  - Enables NAT on the inside interface. The inside network is transmitting data over the network to the intended destination. On the way out, the source IP address is changed in the header and replaced by the (public) IP address.

- **outside**
  - Enables NAT on the outside interface. Packets passing through the NAT on the way back to the managed LAN are searched against the records kept by the NAT engine. There, the destination IP address is changed back to the specific internal private class IP address in order to reach the LAN over the network.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</tbody>
</table>
### 7.1.34.3.6 ipv6

**Interface-config-vlan-instance**

Configures the VLAN interface’s IPv6 settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ipv6 [accept|address|dhcp|enable|enforce-dad|mtu|redirects|request-dhcpv6-options|
     route-advertisements]

ipv6 accept ra {(no-default-router|no-hop-limit|no-mtu)}

ipv6 address [<IPv6/M>|autoconfig|eui-64|link-local|prefix-from-provider]

ipv6 address eui-64 [<IPv6/M>|prefix-from-provider <WORD> <IPv6-PREFIX/PREFIX-LENGTH>]

ipv6 address prefix-from-provider <WORD> <HOST-PORTION/LENGTH>

ipv6 address link-local <LINK-LOCAL-ADD>

ipv6 dhcp [client [information|prefix-from-provider <WORD>]]|relay destination

ipv6 [enable|enforce-dad|mtu <1280-1500>|redirects|request-dhcpv6-options]

ipv6 router-advertisements [prefix <IPv6-PREFIX>|prefix-from-provider <WORD>]
     {no-autoconfig|off-link|site-prefix|valid-lifetime}
```

**Parameters**

- `ipv6 accept ra` *(no-default-router|no-hop-limit|no-mtu)*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no-default-router</td>
<td>Optional. Disables inclusion of routers on this interface in the default router selection process. This option is disabled by default.</td>
</tr>
<tr>
<td>no-hop-limit</td>
<td>Optional. Disables the use of RA advertised hop-count value on this interface. This option is disabled by default.</td>
</tr>
<tr>
<td>no-mtu</td>
<td>Optional. Disables the use of RA advertised MTU value on this interface. This option is disabled by default.</td>
</tr>
</tbody>
</table>
ipv6 address [IPv6/M]|autoconfig

- ipv6 address [IPv6/M] Configures IPv6 address related settings on this VLAN interface.
  - IPv6: Specify the non-link local static IPv6 address and prefix length of the interface in the X:X::X:X/M format.
  - autoconfig: Enables/disables stateless auto-configuration of IPv6 address, based on the prefixes received from RAs (with auto-config flag set). These prefixes are used to auto-configure the IPv6 address. This option is enabled by default. Use the no ipv6 address autoconfig command to negate the use of prefixes received in RAs.

- ipv6 address eui-64 [IPv6/M] Configures the IPv6 prefix and prefix length. This prefix is used to auto-generate the static IPv6 address (for this interface) in the modified Extended Unique Identifier (EUI)-64 format.
  - Implementing the IEEE's 64-bit EUI64 format enables a host to automatically assign itself a unique 64-bit IPv6 interface identifier, without manual configuration or DHCP. This is accomplished on a virtual interface by referencing the already unique 48-bit MAC address, and reformatting it to match the EUI-64 specification.
  - Note: In the EUI-64 IPv6 address the prefix and host portions are each 64 bits in length.

- ipv6 address eui-64 prefix-from-provider <WORD> <IPv6-PREFIX/PREFIX-LENGTH>
  - IPv6/M: Specify the IPv6 prefix and prefix length. This configured value is used as the prefix portion of the auto-generated IPv6 address, and the host portion is derived from the MAC address of the interface.
  - Note: Any bits of the configured value exceeding the prefix-length "M" are ignored and replaced by the host portion derived from the MAC address.
  - Prefix portion provided using this command: ipv6 > address > eui-64 > 2004:b055:15:dead::1111/64.
  - Host portion derived using the interface’s MAC address (00-15-70-37-FB-5E): 215:70ff:fe37:fb5e
  - In this example, the host part "::1111" is ignored and replaced with the modified eui-64 formatted host address.

prefix-from-provider <WORD> <IPv6-PREFIX/PREFIX-LENGTH>

- ipv6 address <WORD> <IPv6-PREFIX/PREFIX-LENGTH>
  - Configures the "prefix-from-provider" named object and the associated IPv6 prefix and prefix length. This configured value is used as the prefix portion of the auto-generated IPv6 address, and the host portion is derived from the MAC address of the interface.
  - <WORD>: Specify the IPv6 "prefix-from-provider" object’s name. This is the IPv6 general prefix (32 character maximum) name provided by the internet service provider.
  - <IPv6-PREFIX/PREFIX-LENGTH>: Specify the IPv6 address subnet and host parts along with prefix length (site-renumbering).
  - For example:
    - Prefix portion provided using this command: ipv6 > address > eui-64 > prefix-from-provider > ISP1-prefix > 2002::/64
    - Host portion derived using the interface’s MAC address (00-15-70-37-FB-5E): 215:70ff:fe37:fb5e
    - Auto-configured IPv6 address using the above prefix and host portions: 2002::215:70ff:fe37:fb5e/64
- **ipv6 address prefix-from-provider <WORD> <HOST-PORTION/LENGTH>**

  Configures the IPv6 address related settings on this VLAN interface.

- **ipv6 address link-local <LINK-LOCAL-ADD>**

  Configures IPv6 link-local address on this interface. The configured value overrides the default link-local address derived from the interface’s MAC address. Use the `no ipv6 link-local` command to restore the default link-local address derived from MAC address.

  **Note:** It is mandatory for an IPv6 interface to always have a link-local address.

- **ipv6 dhcp client [information|prefix-from-provider <WORD>]|relay destination <DEST-IPv6-ADD>**

  Configures DHCPv6 client-related settings on this VLAN interface.

  - **information** – Configures stateless DHCPv6 client on this interface. When enabled, the device can request configuration information from the DHCPv6 server using stateless DHCPv6. This option is disabled by default.
  
  - **prefix-from-provider** – Configures prefix-delegation client on this interface. Enter the IPv6 general prefix (32 character maximum) name provided by the service provider. This option is disabled by default.

- **relay destination <DEST-IPv6-ADD>**

  Enables DHCPv6 packet forwarding on this VLAN interface.

  - **destination** – Forwards DHCPv6 packets to a specified DHCPv6 relay.
  
  - **<DEST-IPv6-ADD>** – Specify the destination DHCPv6 relay’s address.

  **Note:** DHCPv6 relay enhances an extended DHCP relay agent by providing support in IPv6. DHCP relays exchange messages between a DHCPv6 server and client. A client and relay agent exist on the same link. When a DHCP request is received from the client, the relay agent creates a relay forward message and sends it to a specified server address. If no addresses are specified, the relay agent forwards the message to all DHCP server relay multicast addresses. The server creates a relay reply and sends it back to the relay agent. The relay agent then sends back the response to the client.

- **ipv6 [enable|enforce-dad|mtu <1280-1500>|redirects|request-dhcp-options]**

  Configures IPv6 settings on this VLAN interface.

- **enable**

  Enables IPv6 on this interface. This option is disabled by default.

- **enforce-dad**

  Enforces *Duplicate Address Detection* (DAD) on wired ports. This option is enabled by default.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| mtu <1280-1500> | Configures the Maximum Transmission Unit (MTU) for IPv6 packets on this interface.  
  • <1280-1500> – Specify a value from 1280 - 1500. The default is 1500. |
| redirects | Enables/disables ICMPv6 redirect messages sending on this interface. This option is enabled by default. |
| request-dhcp-options | Requests options from DHCPv6 server on this interface. This option is disabled by default. |
| `ipv6 router-advertisements` | Configures IPv6 RA related settings on this VLAN interface. |
| `prefix <IPv6-PREFIX>` | Configures a static prefix and its related parameters. The configured value is advertised on RAs.  
  • <IPv6-PREFIX> – Specify the IPv6 prefix. |
| `prefix-from-provider <WORD>` | Configures a static “prefix-from-provider” named object and its related parameters on this VLAN interface. The configured value is advertised on RAs.  
  • <WORD> – Specify the “prefix-from-provider” named object’s name. |
| no-autoconfig | This parameter is common to the “general-prefix”, “prefix”, and “prefix-from-provider” keywords.  
  • no-autoconfig – Optional. Disables the setting of the auto configuration flag in the prefix.  
    When configured, the configured prefixes are not used for IPv6 address generation. The  
    autoconfiguration option is enabled by default. Using no-autoconfig disables it. |
| off-link | This parameter is common to the “general-prefix”, “prefix”, and “prefix-from-provider” keywords.  
  • off-link – Optional. Disables the setting of the on-link flag in the prefix. The on-link option is  
    enabled by default. Using off-link disables it. |
| `site-prefix <SITE-PREFIX>` | This parameter is common to the “general-prefix”, “prefix”, and “prefix-from-provider” keywords.  
  • site-prefix <SITE-PREFIX> – Configures subnet (site) prefix |
| `valid-lifetime` | This parameter is common to the “general-prefix”, “prefix”, and “prefix-from-provider” keywords.  
  • valid-lifetime – Configures the valid lifetime for the prefix.  
  • preferred-lifetime – Configures preferred lifetime for the prefix.  
  • <30-4294967294> – Configures the valid/preferred lifetime in seconds  
    • at – Configures expiry time and date of the valid/preferred lifetime  
    • infinite – Configures the valid/preferred lifetime as infinite |

**Examples**

```console
rfs7000-6DCD4B(config-profile-test-if-vlan4)#ipv6 enable
rfs7000-6DCD4B(config-profile-test-if-vlan4)#ipv6 accept ra no-mtu
rfs7000-6DCD4B(config-profile-test-if-vlan4)#ipv6 address eui-64 prefix-from-provider ISP1-prefix 2002::/64
```
rfs7000-6DCD4B(config-profile-test-if-vlan4)#show context
interface vlan4
   ipv6 enable
   ipv6 address eui-64 prefix-from-provider ISP1-prefix 2002::/64
   ipv6 accept ra no-mtu
rfs7000-6DCD4B(config-profile-test-if-vlan4)#

<tbody>
<tr>
<td><code>no</code></td>
<td>Removes or resets IPv6 settings on this VLAN interface</td>
</tr>
</tbody>
</table>
7.1.34.3.7 no

Negates a command or reverts to defaults. The no command, when used in the Config Interface VLAN mode, negates VLAN interface settings or reverts them to their default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [crypto|description|dhcp|crypto-map|description|dhcp-relay-incoming|ip|ip-access-list|ipv6|ipv6-access-list|shutdown|use]

no dhcp client include client-identifier

no [crypto map|description|dhcp-relay-incoming|shutdown]

no ip [address|crypto|helper-address|nat|ospf]

no ip [help-address <IP>|nat]

no ip address {<IP/M>|<SECONDARY>|<NETWORK-ALIAS-NAME> {secondary}|<DHCP>|zeroconf {secondary}}

no ip dhcp client request options all

no ip ospf [authentication|authentication-key|bandwidth|cost|message-digest-key|priority]

no ipv6 [accept|address|crypto|dhcp|enable|enforce-dad|mtu|redirects|request-dhcpv6-options|router-advertisement]

no ipv6 [accept ra|enable|enforce-dad|mtu|redirects|request-dhcpv6-options]

no ipv6 address {[IPv6/M|autoconfig|eui-64|link-local|prefix-from-provider]}

no ipv6 dhcp [client|relay]

no ipv6 router-advertisement [prefix <WORD>|prefix-from-provider <WORD]}

no use [bonjour-gw-discovery-policy|ip-access-list in|ipv6-access-list in|ipv6-router-advertisement-policy|url-filter]

Parameters

- no <PARAMETERS>

no <PARAMETERS> Removes or reverts this VLAN interface's settings based on the parameters passed

Examples

The following example shows the VLAN interface settings before the 'no' commands are executed:

```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context
interface vlan8
  description This VLAN interface is configured for the Sales Team
  ip address 10.0.0.1/8
  ip dhcp client request options all
  ip helper-address 172.16.10.3
  ip nat inside
  crypto map map1
dhcp-relay-incoming
```

```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#no crypto map
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#no description
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#no dhcp-relay-incoming
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#no ip dhcp client request options all
```
The following example shows the VLAN interface settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context
interface vlan8
   ip address 10.0.0.1/8
   ip helper-address 172.16.10.3
   ip nat inside
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#
```
7.1.34.3.8 shutdown

*interface-config-vlan-instance*

Shuts down the selected interface. Use the no shutdown command to enable an interface.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
shutdown
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#shutdown
```

```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context
  interface_vlan8
    ip address 10.0.0.1/8
    ip helper-address 172.16.10.3
  shutdown
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#
```

### 7.1.34.3.9 use

*interface-config-vlan-instance*

Associates an IP (IPv4 and IPv6) access list, bonjour-gw-discovery policy, and an IPv6-router-advertisement policy with this VLAN interface.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
</table>
| bonjour-gw-discovery-policy <POLICY-NAME> | Uses an existing Bonjour GW Discovery policy with this VLAN interface. When associated, the Bonjour GW Discovery policy is applied for the Bonjour requests coming over the VLAN interface.  

- `<POLICY-NAME>` – Specify the Bonjour GW Discovery policy name (should be existing and configured).  

  **Note:** For more information on Bonjour GW Discovery policy, see `bonjour-gw-discovery-policy`.  |
| ip-access-list in <IP-ACCESS-LIST-NAME> | Uses a specified IPv4 access list with this interface  

- `<IP-ACL-NAME>` – Specify the IPv4 access list name.  |
| ipv6-access-list in <IPv6-ACCESS-LIST-NAME> | Uses a specified IPv6 access list with this interface  

- `<IPv6-ACL-NAME>` – Specify the IPv6 access list name.  |
| ipv6-router-advertisement-policy <POLICY-NAME> | Uses an existing IPv6 router advertisement policy with this VLAN interface.  

- `<POLICY-NAME>` – Specify the IPv6 router advertisement policy name (should be existing and configured).  |
| url-filter <URL-FILTER-NAME> | Enforces URL filtering on this VLAN interface by associating a URL filter  

- `<URL-FILTER-NAME>` – Specify the URL filter name (should be existing and configured). |

#### Examples

```
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#use ip-access-list in test
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#show context
interface vlan8
  ip address 10.0.0.1/8
  use ip-access-list in test
  ip helper-address 172.16.10.3
rfs7000-37FABE(config-profile-default-rfs7000-if-vlan8)#
```

</tbody>
</table>
This section documents radio interface configuration parameters applicable only to the access point profiles and the RFS4011 profile.

The access point radio interface can be radio1, radio2, or radio3. Legacy AP71XX models contain either a single or a dual radio configuration. Newer AP71XXN model access points support single, dual, or triple radio configurations. An AP650 model access point is available in either single or dual radio models. The remainder of the access point portfolio are dual-radio models.

To enter the AP/RFS4000 profile > radio interface context, use the following commands:

```
<DEVICE>(config)#profile RFS4000 <RFS4000-PROFILE-NAME>
<DEVICE>(config)#profile <AP-TYPE> <PROFILE-NAME>
```

```
rfs7000-37FABE(config-profile-71xxTestProfile)#interface radio 1
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#?
```

Radio Mode commands:

- **adaptivity**: Adaptivity
- **aeroscout**: Aeroscout Multicast MAC/Enable
- **aggregation**: Configure 802.11n aggregation related parameters
- **airtime-fairness**: Enable fair access to medium for clients based on their usage of airtime
- **antenna-diversity**: Transmit antenna diversity for non-11n transmit rates
- **antenna-downtilt**: Enable ADEPT antenna mode
- **antenna-elevation**: Specifies the antenna gain of this radio
- **antenna-gain**: Configure the antenna gain (number of transmit and receive antennas) on the radio
- **assoc-response**: Configure transmission parameters for Association Response frames
- **association-list**: Configure the association list for the radio
- **beacon**: Configure beacon parameters
- **bridge**: Bridge rf-mode related configuration
- **channel**: Configure the channel of operation for this radio
- **data-rates**: Specify the 802.11 rates to be supported on this radio
- **description**: Configure a description for this radio
- **dfs-rehome**: Revert to configured home channel once dfs evacuation period expires
- **dynamic-chain-selection**: Automatic antenna-mode selection (single antenna for non-11n transmit rates)
- **ekahau**: Ekahau Multicast MAC/Enable
- **extended-range**: Configure extended range
- **fallback-channel**: Configure the channel to be used for falling back in the event of radar being detected on the current operating channel
- **guard-interval**: Configure the 802.11n guard interval
- **ldpc**: Configure support for Low Density Parity Check Code
- **lock-rf-mode**: Retain user configured rf-mode setting for this radio
- **max-clients**: Maximum number of wireless clients allowed to associate subject to AP limit
- **mesh**: Configure radio mesh parameters
- **meshpoint**: Enable meshpoints on this radio
- **no**: Negate a command or set its defaults
- **non-unicast**: Configure handling of non-unicast frames
- **off-channel-scan**: Enable off-channel scanning on the radio
- **placement**: Configure the location where this radio is
The following table summarizes the radio interface configuration commands:

<table>
<thead>
<tr>

<td>Configures wireless client parameters on selected radio</td>
<td>page 7-295</td>
</tr>
<tr>
<td><code>wlan</code></td>
<td>Enables a WLAN on selected radio</td>
<td>page 7-296</td>
</tr>
</tbody>
</table>
7.1.34.4.1 adaptivity

Configures an interval, in minutes, for avoiding channels detected with high levels of interference.

As per the European Telecommunications Standards Institute's (ETSI) EN 300 328 V1.8.1/ETSI EN 301 893 V1.7.1 requirements, access points have to monitor interference levels on operating channels, and stop functioning on channels with interference levels exceeding ETSI-specified threshold values.

This command configures the interval for which a channel is avoided on detection of interference, and is applicable only if the channel selection mode is set to ACS, Random, or Fixed.

**NOTE:** If the channel selection mode is set to Smart, in the Smart-RF policy mode, use the `avoidance-time {adaptivity|dfs} <30-3600>` command to specify the interval for which a channel is avoided on detection of high levels of interference or radar. For more information, see `avoidance-time`.

When configured, this feature ensures recovery by switching the radio to a new operating channel. Once adaptivity is triggered, the evacuated channel becomes inaccessible and is available again only after the adaptivity timeout, specified here, expires. In case of fixed channel, the radio switches back to the original channel of operation after the adaptivity timeout expires. On the other hand, ACS-enabled radios continue operating on the new channel even after the adaptivity timeout period expires.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
adaptivity timeout <30-3600>
```

**Parameters**

- `adaptivity timeout <30-3600>`

  - `<30-3600>` – Specify a value from 30 - 3600 minutes. The default is 90 minutes.

**Examples**

```
nx4500-5CFA2B(config-profile-testAP7532-if-radio1)#adaptivity timeout 200
nx4500-5CFA2B(config-profile-testAP7532-if-radio1)#show context interface radio1
```

```
adaptivity timeout 200
nx4500-5CFA2B(config-profile-testAP7532-if-radio1)#
```

**Related Commands**

- `no` Removes the configured adaptivity timeout value
7.1.34.4.2 aeroscout

Enables Aeroscout multicast packet forwarding. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
aeroscout [forward|mac <MAC>]
```

**Parameters**

- **aeroscout** [forward|mac <MAC>]  

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>forward</td>
<td>Enables Aeroscout multicast packet forwarding to a specified MAC address. When enabled, Aeroscout tags associate with an access point, then communicate with a location engine.</td>
</tr>
<tr>
<td>mac &lt;MAC&gt;</td>
<td>Configures the multicast MAC address to forward the packets</td>
</tr>
<tr>
<td>&lt;MAC&gt;</td>
<td>Specify the MAC address in the AA-BB-CC-DD-EE-FF format.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#aeroscout forward
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context
interface radio1
    aeroscout forward
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

**Related Commands**

- **no**  
  Disables Aeroscout Multicast packet forwarding
7.1.34.4.3 aggregation

Configures 802.11n frame aggregation parameters. Frame aggregation increases throughput by sending two or more data frames in a single transmission. There are two types of frame aggregation: MAC Service Data Unit (MSDU) aggregation and MAC Protocol Data Unit (MPDU) aggregation. Both modes group several data frames into one large data frame.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

aggregation [ampdu|amsdu]

aggregation ampdu [rx-only|tx-only|tx-rx|none] [max-aggr-size|min-spacing]

aggregation ampdu [rx-only|tx-only|tx-rx] none

aggregation ampdu [rx-only|tx-only|tx-rx]

aggregation ampdu max-aggr-size [rx|tx]

aggregation ampdu max-aggr-size rx [8191|16383|32767|65535]

aggregation ampdu max-aggr-size tx <2000-65535>

aggregation amsdu [rx-only|tx-rx]

Parameters

- aggregation ampdu [rx-only|tx-only|tx-rx|none]

<table>
<thead>
<tr>

<td>Advertises a maximum of 32767 bytes</td>
</tr>
<tr>
<td>65535</td>
<td>Advertises a maximum of 65535 bytes (default setting)</td>
</tr>
</tbody>
</table>

- **ampdu** Configures AMPDU frame aggregation parameters
  - AMPDU aggregation collects Ethernet frames addressed to a single destination. It wraps each frame in an 802.11n MAC header. This aggregation mode is less efficient, but more reliable in environments with high error rates. It enables the acknowledgement and retransmission of each aggregated data frame individually.

- **max-aggr-size** Configures AMPDU packet size limits. Configure the packet size limit on packets both transmitted and received.

- **tx <2000-65535>** Configures the maximum size (in bytes) for AMPDU aggregated transmitted frames
  - **<2000-65535>** – Sets the limit from 2000 - 65535 bytes. The default is 65535 bytes.

- **aggregation ampdu min-spacing [0|1|2|4|8|16|auto]**

### aggregation amdsu

<table>
<thead>
<tr>
<th>rx</th>
<th>Configures 802.11n frame aggregation parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>8191</td>

### 7.1.34.4.4 airtime-fairness

*interface-config-radio-instance*

Enables fair access to the medium for wireless clients based on their airtime usage (i.e. regardless of whether the client is a high-throughput (802.11n) or legacy client). This option is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

#### Syntax

```
airtime-fairness {prefer-ht} {weight <1-10>}
```

#### Parameters

- **airtime-fairness**
  - Enables fair access to the medium for wireless clients based on their airtime usage
- **prefer-ht**
  - Optional. Prioritizes high throughput (802.11n) clients over clients with slower throughput (802.11 a/b/g) and legacy clients
- **weight <1-10>**
  - Optional. Configures the relative weightage for 11n clients over legacy clients.
  - `<1-10>` – Sets a weightage ratio for 11n clients from 1 - 10

#### Examples

```
rfs7000-37FABE(config-profile-71(xxTestProfile-if-radio1)#airtime-fairness prefer-ht weight 6
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context
   interface radio1
      aggregation ampdu tx-only
      aeroscout forward
   airtime-fairness prefer-ht weight 6
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

#### Related Commands

- **`no`**
  - Disables fair access for wireless clients (provides access on a round-robin mode)
7.1.34.4.5 antenna-diversity

Configures transmit antenna diversity for non-11n transmit rates

Antenna diversity uses two or more antennas to increase signal quality and strength. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

antenna-diversity

**Parameters**

None

**Examples**

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#antenna-diversity

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

interface radio1
  aggregation ampdu tx-only
  aeroscout forward
  antenna-diversity
  airtime-fairness prefer-ht weight 6

</table>
7.1.34.4.6 **antenna-downtilt**

Enables the *Advanced Element Panel Technology* (ADEPT) antenna mode. The ADEPT mode increases the probability of parallel data paths enabling multiple spatial data streams. This option is disabled by default.

Supported in the following platforms:
- Access Point — AP7161, AP7181

```
NOTE: This feature is not supported on AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, and RFS4011.
```

**Syntax**

```
antenna-downtilt
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#antenna-downtilt
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context interface radio1
  antenna-gain 12.0
  aggregation ampdu tx-only
  aeroscout forward
  antenna-diversity

  antenna-downtilt
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

**Related Commands**

```
no
```
Disables the ADEPT antenna mode
7.1.34.4.7 antenna-elevation

Configures an antenna's elevation gain. Antenna gain is the ratio of an antenna's radiation intensity in a given direction to the intensity produced by a no-loss, isotropic antenna radiating equally in all directions. An antenna's gain along the horizon and at an elevation of 30 degree may vary. The elevation gain is defined as the maximum antenna gain at 30 to 150 degrees above the horizon. If elevation gain is configured, the transmit (TX) power calculations maximize the allowable TX power for an elevation below 30 degree.

Access Points must conform to U.S. Federal Communications Commission’s (FCC) limitations. FCC has now stipulated a 21dBm Effective Isotropic Radiated Power (EIRP) limit for power directed 30 degrees above the horizon.

For Zebra-supplied antennas, compatible with 5.0 GHz on the AP7562 access point, refer to the Antenna Guide for "Elevation Gain" information. If using a third-party antenna, it is required that you obtain the antenna-elevation gain information from the antenna manufacturer.

The elevation gain should be configured if the access point:

- Is deployed outdoors, and
- Is used with a dipole antenna (panel antenna and polarized antenna are for point to point only, and are excluded from this requirement), and
- Is transmitting in the 5.15 - 5.25 GHz Unlicensed National Information Infrastructure-1 (UNII1) band.

Professional Installers must complete the following steps to ensure compliance with the FCC rule:

1. Configure the antenna type. For example:
   
   ap7562-80C2AC(config-device-84-24-8D-80-C2-AC-if-radio2)#service antenna-type dipole

2. Configure the antenna peak gain. For example:
   
   ap7562-80C2AC(config-device-84-24-8D-80-C2-AC-if-radio2)#antenna-gain 7.0

3. Configure the antenna placement. For example:
   
   ap7562-80C2AC(config-device-84-24-8D-80-C2-AC-if-radio2)#placement outdoor

4. Configure the antenna elevation gain. For example:
   
   ap7562-80C2AC(config-device-84-24-8D-80-C2-AC-if-radio2)#antenna-elevation 5.0

After the professional installer enters the antenna type, gain, placement, and elevation gain using the CLI as outlined above, the firmware will use this information and hardcoded maximum limits determined during testing (See Annex C in FCC Report #FR4D0448AB) to limit the EIRP below 21dBm for outdoor use in UNII-1 band. The antenna information is provided in the Installation guide and antenna guide.

Supported in the following platforms:

- Access Points — AP7562

Syntax

antenna-elevation <\(-30.0-36.0\)>

---

NOTE: The antenna elevation gain feature is supported only on the AP7562 model access point.
### Parameters

- **antenna-elevation** <-30.0-36.0>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>antenna-elevation</td>
<td>Configures the antenna elevation gain from -30.0 - 36.0 dB. Refer to the antenna specifications for antenna-elevation gain information. The default value is 0 dB.</td>
</tr>
</tbody>
</table>

### Examples

```
ap7562-80C2AC(config-device-84-24-8D-80-C2-AC-if-radio2)#antenna-elevation 5.0
```

```
interface radio2
  antenna-elevation 5.0
```

7.1.34.4.8 antenna-gain

```
interface-config-radio-instance
```

Configures the antenna gain for the selected radio

Antenna gain is the ability of an antenna to convert power into radio waves and vice versa. The access point or wireless controller’s Power Management Antenna Configuration File (PMACF) automatically configures the access point or wireless controller’s radio transmit power based on the antenna type, its antenna gain (provided here) and the deployed country’s regulatory domain restrictions. Once provided, the access point or wireless controller calculates the power range. Antenna gain relates the intensity of an antenna in a given direction to the intensity that would be produced ideally by an antenna that radiates equally in all directions (isotropically), and has no losses. Although the gain of an antenna is directly related to its directivity, its gain is a measure that takes into account the efficiency of the antenna as well as its directional capabilities. It is recommended that only a professional installer set the antenna gain.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
antenna-gain <0.0-15.0>
```

**Parameters**

- `antenna-gain <0.0-15.0>`

**Examples**

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#antenna-gain 12.0
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

```

Resets the radio’s antenna gain parameter
### 7.1.34.4.9 antenna-mode

*interface-config-radio-instance*

Configures the antenna mode (the number of transmit and receive antennas) on the access point.

This command sets the number of transmit and receive antennas on the access point. The 1x1 mode is used for transmissions over just the single -A- antenna, 1xALL is used for transmissions over the -A- antenna and all three antennas for receiving. The 2x2 mode is used for transmissions and receipts over two antennas for dual antenna models. 3x3x3 is used for transmissions and receipts over three antennas for AP81XX models. The default setting is dynamic based on the access point model deployed and its transmit power settings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
antenna-mode [1*1|1*ALL|2*2|3*3|default]
```

**Parameters**

- `1*1` Uses only antenna A to receive and transmit
- `1*ALL` Uses antenna A to transmit and receives on all antennas
- `2*2` Uses antennas A and C for both transmit and receive
- `3*3` Uses antenna A, B, and C for both transmit and receive
- `default` Uses default antenna settings. This is the default setting.

**Usage Guidelines**

To support STBC feature on AP71XX profile, the antenna-mode should not be configured to 1*1.

**Examples**

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#antenna-mode 2x2
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context
interface radio1
  antenna-gain 12.0
  aggregation ampdu tx-only
  aeroscout forward
  antenna-mode 2x2
  antenna-diversity
  airtime-fairness prefer-ht weight 6
  antenna-downtilt
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

**Related Commands**

- `no` Resets the radio antenna mode (the number of transmit and receive antennas) to its default
7.1.34.4.10 assoc-response

> interface-config-radio-instance

Configures the parameters determining whether the access point ignores or responds to an association/authorization request

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

assoc-response [deny-threshold <1-12>|rssi-threshold <-128--40>]

Parameters

- assoc-response [deny-threshold <1-12>|rssi-threshold <-128--40>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assoc-response</td>
<td>Configures the following thresholds, based on which the AP ignores or responds to an association/authorization request: deny-threshold and rssi-threshold. Both these options are disabled by default.</td>
</tr>
</tbody>
</table>
| deny-threshold <1-12>      | Configures the number of times the AP ignores association/authorization requests, if the RSSI is below the configured RSSI threshold value
|                           | - <1-12> — Specify a value from 1 - 12.                                      |
|                           | **Note:** The AP always ignores association/authorization requests when deny-threshold is not specified and rssi-threshold is specified. |
| rssi-threshold <-128--40>  | Configures the RSSI threshold. If the RSSI is lower than the threshold configured here, the AP ignores the association/authorization request.
|                           | - <-128--40> – Specify the RSSI threshold from -128 - -40 dBi.             |

Examples

rfs7000-37FABE(config-profile-71XXTestProfile-if-radio1)#assoc-response rssi-threshold -128

rfs7000-37FABE(config-profile-71XXTestProfile-if-radio1)#show context interface radio1
assoc-response rssi-threshold -128

rfs7000-37FABE(config-profile-71XXTestProfile-if-radio1)#

Related Commands

no

Removes the RSSI threshold, based on which an association/authorization request is either ignored or responded.
7.1.34.4.11 association-list

Associates an existing global association list with this radio interface

An association ACL is a policy-based access control list (ACL) that either prevents or allows wireless clients from connecting to a managed access point radio. An ACL is a sequential collection of permit and deny rules that apply to incoming and outgoing packets. When a packet is received on an interface, the controller, service platform, or access point compares the fields in the packet against the applied ACLs to verify the packet has the required permissions to be forwarded. If a packet does not meet any of the criteria specified in the ACL, it is dropped.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

association-list global <GLOBAL-ASSOC-LIST-NAME>

Parameters

- association-list global <GLOBAL-ASSOC-LIST-NAME>

<table>
<thead>
<tr>
<th>association-list global &lt;GLOBAL-ASSOC-LIST-NAME&gt;</th>
<th>Associates an existing global association list with this radio interface</th>
</tr>
</thead>
</table>

Examples

rfs4000-880DA7(config-profile-test-if-radio1)#association-list global test
rfs4000-880DA7(config-profile-test-if-radio1)#show context interface radio1
association-list global test
rfs4000-880DA7(config-profile-test-if-radio1)#

Related Commands

no

Removes the global association list associated with this radio interface
### 7.1.34.4.12 beacon

Configures radio beacon parameters

A beacon is a packet broadcasted by adopted radios to keep the network synchronized. Included in a beacon is information, such as the WLAN service area, the radio address, the broadcast destination addresses, a time stamp, and indicators about traffic and delivery such as a *Delivery Traffic Indication Message* (DTIM). Increase the DTIM/beacon settings (lengthening the time) to let nodes sleep longer and preserve battery life. Decrease these settings (shortening the time) to support streaming-multicast audio and video applications that are jitter sensitive.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

#### Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>beacon [dtim-period</td>
<td>period]</td>
</tr>
<tr>
<td>beacon dtim-period [&lt;1-50&gt;</td>
<td>bss]</td>
</tr>
<tr>
<td>beacon dtim-period [&lt;1-50&gt;</td>
<td>bss &lt;1-16&gt; &lt;1-50&gt;]</td>
</tr>
<tr>
<td>beacon period [50</td>
<td>100</td>
</tr>
</tbody>
</table>

#### Parameters

- **dtim-period [<1-50>|bss <1-16> <1-50>]**
  - `<1-50>` Configures a single value to use on the radio. Specify a value between 1 and 50.
  - `bss <1-16> <1-50>` Configures a separate DTIM for a Basic Service Set (BSS) on this radio interface
  - `<1-16>` — Sets the BSS number from 1 - 16
  - `<1-50>` — Sets the BSS DTIM from 1 - 50. The default is 2.

- **period [50|100|200]**
  - `50` — Configures 50 K-uSec interval between beacons
  - `100` — Configures 100 K-uSec interval between beacons (default)
  - `200` — Configures 200 K-uSec interval between beacons
Examples

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#beacon dtim-period bss 2 20
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#beacon period 50

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context
interface radio1
  beacon period 50
  beacon dtim-period bss 1 2
  beacon dtim-period bss 2 20
  beacon dtim-period bss 3 2

</table>
7.1.34.4.13 bridge

Configure client-bridge related parameters if the selected radio is functioning as a client bridge.

NOTE: The client-bridge functionality is supported only on interface radio 2 of AP6522 and AP6562 model access points.

Supported in the following platforms:
- Access Points — AP6522, AP6562

Syntax

```
```

Parameters

**bridge** Configures client-bridge related parameters

Use this command to configure client-bridge parameters on the radio interface that has been configured to function as a bridge. To enable client-bridge functionality, on the AP's radio interface, set the rf-mode to bridge.

**Note:** When enabled as a client bridge, the radio by default maps bridged traffic to VLAN 1.

**authentication-type [eap|none]**

Configures the authentication type for the WLAN to which the radio 2 connects. The options are:
- `eap` – Uses EAP authentication (802.1X). If using EAP, use the ‘eap’ keyword to configure EAP related parameters.
- `none` – Uses no authentication. This is the default setting.

**channel-dwell-time <50-2000>**

Configures the time, in microseconds, the radio dwells on each channel when the bridge scans for an AP to connect to.
- `<50-2000>` – Specify a value from 50 -2000 microseconds. The default is 150 microseconds.

**channel-list [2.4GHz|5GHz] <LIST>**

Configures the list of 2.4 GHz and 5.0 GHz channels the radio scans to identify a AP to connect to.
- `2.4GHz <LIST>` – Configures the 2.4 GHz channel list
- `5GHz <LIST>` – Configures the 5.0 GHz channel list
- `<LIST>` – Provide the list of channels separated by commas.

**Note:** By default the radio scans all permitted 2.4 GHz and 5.0 GHz channels. To prevent the scanning of a particular band, execute the `bridge channel-list 2.4 GHz` or `bridge channel-list 5.0 GHz` command with no channel list assigned in the profile.
<table>
<thead>
<tr>
<th>Line</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>connect-through-bridges</code></td>
<td>Enables the inclusion of APs (having a bridge radio), when scanning for APs to connect to. When enabled, allows daisy-chaining bridges. This option is disabled by default.</td>
</tr>
</tbody>
</table>
| `eap [password <PASSWORD>][type [peap-mschapv2|tls]][username <USERNAME>]]` | Configures EAP authentication parameters  
  - `password [0|2]<PASSWORD>]]` – Configures the EAP password. The password type depends on the EAP authentication type configured.  
    - PEAP-MSCHAPv2 - PEAP password (for example, zebra)  
    - TLS – PKCS #12 certificate secret  
  Use of EAP-TLS authentication is recommended since it is stronger than PEAP-MSCHAPv2. For more information on EAP TLS authentication and client-side certificates, see `EAP Authentication`.  
  Use one of the following options to configure the password:  
  - `0` – Configures a clear text password. Enter the password.  
  - `2` – Configures an encrypted password. Enter the password.  
  - `<PASSWORD>` – Enter the password.  
  - `type [peap-mschapv2|tls]` – Configures the EAP authentication type. The options are:  
    - PEAP-MSCHAPv2 – Configures the EAP authentication type as PEAP-MSCHAPv2. This is the default setting.  
    - TLS – Configures the EAP authentication type as TLS  
  - `username <USERNAME>` – Configures the EAP username. The password type depends on the EAP authentication type configured.  
    - PEAP-MSCHAPv2 – PEAP username (example client-bridge)  
    - TLS – Username in the CN field of the installed PKCS #12 client certificate (example client-bridge@example.com)  
    - `<USERNAME>` – Specify the EAP username  

<table>
<thead>
<tr>
<th>Line</th>
<th>Description</th>
</tr>
</thead>
</table>
| `encryption-type [ccmp|none|tkip]` | Configures the encryption type for the WLAN to which the radio 2 connects. The options are:  
  - `ccmp` – Uses WPA/WPA2 CCMP encryption  
  - `none` – Uses no encryption method. This is the default setting.  
  - `tkip` – Uses WPA/WPA2 TKIP encryption  
  *Note:* As per the 802.11n amendment, 802.11n data-rates can be achieved only if the `encryption-type` is set to `CCMP` or `none`. |
| `inactivity-timeout <0-864000>` | Configures the inactivity timeout in seconds. If a frame is not received from a wired/wireless client for this amount of time specified here, the client is deleted.  
  - `<0-864000>` – Specify a value from 0 - 864000 seconds. The default is 600 seconds. |
| `keepalive [frame-type [null-data|wnmp]] interval <0-36000>` | Configures the keep-alive frame type and interval  
  - `frame-type` – Configures the keep-alive frame type sent on behalf of the bridged client. The options are:  
    - `null-data` – Transmits 802.11 NULL data frames. This is the default setting  
    - `wnmp` – Transmits `Wireless Network Management Protocol` (WNMP) multicast packet  
  - `interval <0-36000>` – Configures the interval, in seconds, between two successive keep-alive frame transmission.  
    - `<0-36000>` – Specify a value from 0 - 36000 seconds. The default is 300 seconds. |
| `max-clients <1-14>` | Configures the maximum number of clients bridged by the access point  
  - `<1-14>` – Specify a value from 1 - 14. The default is 14. |
Usage Guidelines EAP Authentication

The AP6522/AP6562 client bridges, using EAP-TLS for WLAN authentication, require client-side X.509 certificates to be deployed and installed on them. These certificates contain the PKCS #12 personal information exchange syntax standards that define a file format used to store private keys with accompanying public key certificates, which are protected using a password-based symmetric key.

The PKCS #12 certificate must be installed prior to enabling EAP-TLS on the client bridge radio. The certificate can be transferred to an AP6522/AP6562 client bridge either manually (using FTP, SFTP, or TFTP), or as part of the staging process via MiNT. If the client bridges are already associated and authenticated to the infrastructure WLAN, use PSK or PEAP-MSCHAPv2 to transfer the PKCS #12 certificate.

The following points should be taken into consideration when deploying PKCS #12 client-side certificates:

1. The exported PKCS #12 certificate must include the Private Key. When exporting the PKCS #12 certificate from Microsoft Certificate Services the option Allow private key to be exported must be selected.

2. The EAP username must be defined in the CN field in the subject of the X.509 certificate using accompanying public key certificates, which are protected using a password-based symmetric key.

3. The username in the CN field of the X.509 client-side certificate should match the username defined under radio 2 using the bridge > EAP > username command. For example if the username in the CN field is set to client-bridge@tmelabs.local, the EAP username should also be set to client-bridge@tmelabs.local.

Note: Pre-shared keys are valid only when the authentication-type is set to none and the encryption-type is set to tkip or ccmp.

Note: The PSK should be 8 - 32 characters in length.
4. The password used to secure the PKCS #12 certificate during export must be defined under radio 2 using
   \textit{bridge > EAP > password} command. The bridge EAP password value must match the export password for the
   AP6522/AP6562 client bridge to access the PKCS #12 file.

   In a managed WLAN, multiple client-bridges can either use a common X.509 client-side certificate, or individual,
   unique certificates for each client bridge. If using unique certificates, upload individual PKCS #12 certificate on each AP6522/AP6562
   access point. Additionally, if the individual X.509 certificates have unique CN fields or passwords, define a unique \textit{bridge EAP
   username} and \textit{bridge EAP password} parameters as device overrides.

   The PEAP-MSCHAPv2 authentication, on the other hand, uses usernames and passwords for RADIUS authentication. These
   usernames and passwords can be either common or unique to every client-bridge. If using unique credentials, ensure that the
   AP6522/AP6562 client bridge’s unique username and password are defined in the back-end user directory. Also apply device
   overrides to each AP6522/AP6562 AP by specifying unique \textit{bridge EAP username} and \textit{bridge EAP password}.

   Deploying unique credentials or X.509 client-side certificates is recommended, because it is easy to revoke a single user
   account or X.509 certificate in case an individual client bridge is stolen or compromised. In addition, unique usernames simplify
   identification of client-bridges within the infrastructure WLAN.

   The AP6522/AP6562 access points can be deployed as standalone or centrally-managed client bridges. For steps to configuring
   client bridges, see \textit{Configuring Standalone Client Bridges} AND \textit{Configuring Centrally Managed Client Bridges}.

   \textbf{Examples Configuring Standalone Client Bridges}

   Following are the recommended best practices for deploying standalone client bridges. These configurations are made on the
   access point.

   \textbf{Modify the default firewall policy.}

   1. Access the default firewall config context.
      \texttt{AP6522-E91438(config)#firewall-policy default}
   2. Disable DoS detection.
      \texttt{AP6522-E91438(config-fw-policy-default)#no ip dos}
   3. Disable IP MAC conflict detection.
4. Disable stateful packet inspection.
   AP6522-E91438 (config-fw-policy-default)#no stateful-packet-inspection-l2
5. Disable layer 3 firewall.
   AP6522-E91438 (config-fw-policy-default)#no firewall enable
6. Exit the default firewall config context and commit and write changes to memory.
   AP6522-E91438 (config-fw-policy-default)#exit
   AP6522-E91438 (config-fw-policy-default)#commit write

**Modify the default management policy.**
1. Access the default management policy config context.
   AP6522-E91438 (config)#management-policy default
2. Disable management services that are not required.
   AP6522-E91438 (config-management-policy-default)#no https server
   AP6522-E91438 (config-management-policy-default)#no snmp-server manager all
3. Restrict remote access to specific host(s) or subnet(s).
   AP6522-E91438 (config-management-policy-default)#restrict-access subnet 192.168.10.0/24
4. Exit the default management policy config context and commit and write changes to memory.
   AP6522-E91438 (config-management-policy-default)#exit
   AP6522-E91438 (config)#commit write

**Modify the default RF Domain policy.**
1. Access the default RF Domain config context.
   AP6522-E91438 (config)# rf-domain default
2. Define location, contact, country code, and timezone.
   AP6522-E91438 (config-rf-domain-default)#location "Johnson City TN"
   AP6522-E91438 (config-rf-domain-default)#contact "kmarshall@Zebrasolutions.com"
   AP6522-E91438 (config-rf-domain-default)#country-code us
   AP6522-E91438 (config-rf-domain-default)#timezone EST5EDT
3. Exit the default RF Domain config context and commit and write changes to memory.
   AP6522-E91438 (config-rf-domain-default)#exit
   AP6522-E91438 (config)#commit write

**Modify the default AP6522 profile.**
1. Access the default AP6522 profile config context.
   AP6522-E91438 (config)#profile AP6522 default-AP6522
2. Modify level 1 MiNT area ID (any value other than 1).
   AP6522-E91438 (config-profile-default-AP6522)#mint level 1 area-id 65535
3. Assign DNS name server, Domain name, and NTP server.
   AP6522-E91438 (config-profile-default-AP6522)#ip name-server 192.168.10.6
   AP6522-E91438 (config-profile-default-AP6522)#tmelabs.local
   AP6522-E91438 (config-profile-default-AP6522)#ntp server 192.168.10.1
   AP6522-E91438 (config-profile-default-AP6522)#interface radio 1
5. Configure radio 2 as client bridge radio (example for pre-shared key).

   AP6522-E91438 (config-profile-default-AP6522)#shutdown
   AP6522-E91438 (config-profile-default-AP6522-if-radio1)#exit

   AP6522-E91438 (config-profile-default-AP6522)#interface radio 2
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#rf-mode bridge
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#bridge ssid TMELABS-PSK
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#bridge authentication-type none
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#bridge encryption-type ccmp
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#bridge wpa-wpa2 psk zebra12345
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#exit

6. Configure radio 2 as client bridge radio (example for PEAP-MSCHAPv2).

   AP6522-E91438 (config-profile-default-AP6522)#interface radio 2
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#rf-mode bridge
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#bridge ssid TMELABS-DOT1X
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#bridge authentication-type eap
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#bridge encryption-type ccmp
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#bridge eap type tls
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#bridge eap username cb@tmelabs.local
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#bridge eap password zebra
   AP6522-E91438 (config-profile-default-AP6522-if-radio2)#exit

7. Exit the default AP6522 profile config context and commit and write changes to memory.

   AP6522-E91438 (config-profile-default-AP6522)#exit
   AP6522-E91438 (config)# commit write

Apply AP6522 device overrides.

1. Access AP6522’s device config context.

   AP6522-E91438 (config)#AP6522 B4-C7-99-E9-14-38

2. Configure access point’s hostname.

   AP6522-E91438 (config-device-B4-C7-99-E9-14-38)#hostname AP6522-CB1

3. Exit the AP6522’s device config context and commit and write changes to memory.

Configure static IPv4 address and default gateway on the AP6522 client bridge.

1. Access AP6522’s device config context.

   AP6522-CB1 (config)#AP6522 B4-C7-99-E9-14-38

2. Define a Switched Virtual Interface (SVI) for VLAN 1 for Management.

   AP6522-CB1 (config-device-B4-C7-99-E9-14-38)#interface vlan 1

3. Define a IPv4 address and mask.

   AP6522-CB1 (config-device-B4-C7-99-E9-14-38-if-vlan1)#ip address 192.168.13.100/24
   AP6522-CB1 (config-device-B4-C7-99-E9-14-38-if-vlan1)#exit

4. Define a default gateway.

   AP6522-CB1 (config-device-B4-C7-99-E9-14-38)#ip default-gateway 192.168.13.1

5. Exit the AP6522’s device config context and commit and write changes to memory.

   AP6522-CB1 (config-device-B4-C7-99-E9-14-38)#exit
   AP6522-CB1 (config)#commit write
Define encryption password and enable inline password encryption.

1. Define encryption password.
   ```
   AP6522-CB1(config)#password-encryption secret 2 zebra
   ```
2. Enable inline password encryption.
   ```
   AP6522-CB1(config)#inline-password-encryption
   ```
3. Commit and write changes to memory.
   ```
   AP6522-CB1(config)#commit write
   ```

Pre-stage AP6522 client bridge prior to deployment.

1. Pre-stage the AP6522 client bridge by applying all parameters required to connect to the infrastructure WLAN and manage the device.
   ```
   AP6522-CB1(config-device-B4-C7-99-E9-14-38)#use profile default-AP6522
   AP6522-CB1(config-device-B4-C7-99-E9-14-38)#use rf-domain default
   ```

Configuring Centrally Managed Client Bridges

Following are the recommended best practices for deploying centrally-managed client bridges. These configurations are made on the staging controller and applied to the client bridge AP on adoption.

Modify the default firewall policy.

1. Access the default firewall config context.
   ```
   CBMGR-ACTIVE(config)#firewall-policy default
   ```
2. Disable DoS detection.
   ```
   CBMGR-ACTIVE(config-fw-policy-default)#no ip dos
   ```
3. Disable IP MAC conflict detection.
   ```
   CBMGR-ACTIVE(config-fw-policy-default)#no ip-mac routing conflict
   ```
4. Disable layer 2 stateful packet inspection.
   ```
   CBMGR-ACTIVE(config-fw-policy-default)#no stateful-packet-inspection-l2
   ```
5. Disable layer 3 firewall.
   ```
   CBMGR-ACTIVE(config-fw-policy-default)#no firewall enable
   ```
6. Exit the default firewall config context and commit and write changes to memory.

Create a user-defined management policy.

1. Create a new management policy and enter its config context.
   ```
   CBMGR-ACTIVE(config)#management-policy CLIENT-BRIDGES
   ```
2. Define an admin user and assign a password to this user.
   ```
   CBMGR-ACTIVE(config-management-policy-CLIENT-BRIDGES)#user admin password zebra role superuser access all
   ```
3. Disable management services that are not required.
   ```
   CBMGR-ACTIVE(config-management-policy-CLIENT-BRIDGES)#no http server
   CBMGR-ACTIVE(config-management-policy-CLIENT-BRIDGES)#no snmp-server manager all
   ```
4. Enable SSH.
   ```
   CBMGR-ACTIVE(config-management-policy-CLIENT-BRIDGES)#ssh
   ```
5. Restrict remote access to specific host(s) or subnet(s).
CBMGR-ACTIVE(config-management-policy-CLIENT-BRIDGES)#restrict-access subnet 192.168.10.0/24

6. Exit the CLIENT-BRIDGES management policy config context and commit and write changes to memory.
   CBMGR-ACTIVE(config-management-policy-CLIENT-BRIDGES)#exit
   CBMGR-ACTIVE(config)#commit write

Create a user-defined RF Domain.

1. Create a new RF Domain and enter its config context.
   CBMGR-ACTIVE(config)#rf-domain STORE201

2. Define location, contact, country code, and timezone.
   CBMGR-ACTIVE(config-rf-domain-STORE201)#location "Johnson City TN"
   CBMGR-ACTIVE(config-rf-domain-STORE201)#contact "kmarshall@zebrasolutions.com"
   CBMGR-ACTIVE(config-rf-domain-STORE201)#country-code us
   CBMGR-ACTIVE(config-rf-domain-STORE201)#timezone EST5EDT

3. Exit the STORE201 RF Domain config context and commit and write changes to memory.
   CBMGR-ACTIVE(config-rf-domain-STORE201)#exit
   CBMGR-ACTIVE(config)#commit write

Create a user-defined client-bridge AP6522 profile.

1. Create a new AP6522 profile and enter its config context.
   CBMGR-ACTIVE(config)#profile AP6522 CB-AP6522

2. Modify level 1 MiNT area ID (any value other than 1).
   CBMGR-ACTIVE(config-profile-CB-AP6522)#mint level 1 area-id 65535

3. Assign DNS name server, Domain name, and NTP server.
   CBMGR-ACTIVE(config-profile-CB-AP6522)#ip name-server 192.168.10.6
   CBMGR-ACTIVE(config-profile-CB-AP6522)#tmelabs.local
   CBMGR-ACTIVE(config-profile-CB-AP6522)#ntp server 192.168.10.1

4. Map the user-defined management policy 'CLIENT-BRIDGES' to this AP6522 profile.
   CBMGR-ACTIVE(config-profile-CB-AP6522)#use management-policy CLIENT-BRIDGES

5. Define a SVI for VLAN 1 with DHCP enabled for Management & Adoption.
   CBMGR-ACTIVE(config-profile-CB-AP6522)#interface vlan 1
   CBMGR-ACTIVE(config-profile-CB-AP6522-if-vlan1)#ip address dhcp
   CBMGR-ACTIVE(config-profile-CB-AP6522-if-vlan1)#ip dhcp client request options all
   CBMGR-ACTIVE(config-profile-CB-AP6522-if-vlan1)#exit

   CBMGR-ACTIVE(config-profile-CB-AP6522)#interface radio 1
   CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio1)#shutdown
   CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio1)#exit

7. Configure radio 2 as client bridge radio.
   a. Radio 2 as client bridge radio: example for pre-shared key
      CBMGR-ACTIVE(config-profile-CB-AP6522)#interface radio 2
      CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#rf-mode bridge
      CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge ssid TMELABS-PSK
      CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge authentication-type none
PROFILES 7 - 245

CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge encryption-type ccmp
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge wpa-wpa2 psk zebra12345
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#exit

b. Radio 2 as client bridge radio: example for **PEAP-MSCHAPv2**

CBMGR-ACTIVE(config-profile-CB-AP6522)#interface radio 2
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#rf-mode bridge
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge ssid TMELABS-DOT1X
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge authentication-type eap
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge encryption-type ccmp
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge eap type tls
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge eap username cb@tmelabs.local
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge eap password zebra
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#exit

CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#rf-mode bridge
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge ssid TMELABS-DOT1X
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge authentication-type eap
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge encryption-type ccmp
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge eap type tls
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge eap username cb@tmelabs.local
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#bridge eap password zebra
CBMGR-ACTIVE(config-profile-CB-AP6522-if-radio2)#exit

8. Exit the AP6522 profile ‘CB-AP6522’ config context and commit and write changes to memory.

   CBMGR-ACTIVE(config-profile-CB-AP6522)#exit
   CBMGR-ACTIVE(config)#commit write

Define encryption password and enable inline password encryption.

1. Define encryption password.

   CBMGR-ACTIVE(config)#password-encryption secret 2 zebra

2. Enable inline password encryption.

   CBMGR-ACTIVE(config)#inline-password-encryption

3. Commit and write changes to memory.

   CBMGR-ACTIVE(config)#commit write

Configuring centralized controller discovery.

For centrally-managed deployments, AP6522/AP6562 client bridges can discover centralized controllers (active and standby) and establish level 2 MiNT links using static **controller host** entries or **DHCP options**.

a. DHCP options

AP6522/AP6562 client bridges support *dynamic* layer 3 discovery using DHCP. DHCP can be used to assign network addressing in addition to sending Zebra vendor-specific DHCP option 191, which enables AP6522/AP6562 client bridges to automatically discover and adopt to the centralized controllers. DHCP option 191 is supplied as ASCII/string to the AP6522/AP6562 client bridges in a DHCP offer, and each string includes the IPv4 addresses of the active and standby centralized controllers, Pool, and MiNT routing level. To support the AP6522/AP6562 client bridges, DHCP Option 191 must be assigned to each DHCP Pool providing addresses to the AP6522/AP6562 client bridges.

b. Layer 3 controller-host discovery using controller-host configuration
AP6522/AP6562 client bridges support static layer 3 discovery using controller hosts defined in the user-defined AP6522 or AP6562 profiles. Controller hosts are typically used for deployments when AP6522/AP6562 client bridges are assigned static network addressing or when DHCP options cannot be deployed.

The AP6522 or AP6562 profile includes up to two controller host entries. The first entry defines the active controller’s IPv4 address (pool 1), while the second entry defines the standby controller’s IPv4 address (pool 2). The MiNT routing level is set 2 for both hosts.

**Access the user-defined client-bridge AP6522 profile.**

```
CBMGR-ACTIVE(config)#profile AP6522 CB-AP6522
```

**Define active and standby centralized controller host entries.**

```
CBMGR-ACTIVE(config-profile-CB-AP6522)#controller host 192.168.20.90 pool 1 level 2  
CBMGR-ACTIVE(config-profile-CB-AP6522)#controller host 192.168.20.91 pool 2 level 2
```

**Exit then commit and write the changes.**

```
CBMGR-ACTIVE(config-profile-CB-AP6522)#exit  
CBMGR-ACTIVE(config)#commit write
```

**Auto-provisioning client-bridge access points.**

In a centrally-managed deployment, each AP6522/AP6562 client bridge is assigned a user-defined profile and RF Domain upon initial adoption to the centralized controller. It is an auto-provisioning policy, mapped to the centralized controller’s profile, which assigns the user-defined profile and RF Domain to the new AP6522/AP6562 client bridges. The auto-provisioning policy includes IP=match criteria and corresponding adopt rules. These rules determine the profile and RF Domain to assign to each new AP6522/AP6562 client bridge matching the criteria provided.

1. Create a user-defined auto provisioning policy and enter its config context.

   ```
   CBMGR-ACTIVE(config)#auto-provisioning-policy DATACENTER
   ```

2. Define an adoption rule providing the IP match criteria and the profile and RF Domain to assign in case of a match.

   ```
   CBMGR-ACTIVE(config-auto-provisioning-policy-DATACENTER)#adopt AP6522 precedence 1 profile CB-AP6522 rf-domain STORE201 ip 192.168.21.0/24  
   CBMGR-ACTIVE(config-auto-provisioning-policy-DATACENTER)#exit
   ```

3. Map the user-defined auto provisioning policy to the centralized controller profile.

   ```
   CBMGR-ACTIVE(config)#profile nx9000 DATACENTER-NX9000  
   CBMGR-ACTIVE(config-profile-DATACENTER-NX9000)#use auto-provisioning-policy DATACENTER
   ```

4. Exit then centralized controller profile ‘DATACENTER-NX9000’ config context and commit and write the changes to memory.

   ```
   CBMGR-ACTIVE(config-profile-NX9000-DATACENTER)#exit  
   CBMGR-ACTIVE(config)#commit write
   ```

### 7.1.34.4.14 channel

**interface-config-radio-instance**

Configures a radio’s channel of operation.

Only a trained installation professional should define the radio channel. Select Smart for the radio to scan non-overlapping channels listening for beacons from other access points. After the channels are scanned, the radio selects the channel with the fewest access points. In case of multiple access points on the same channel, it selects the channel with the lowest average power level.

---

**NOTE:** Channels with a “w” appended to them are unique to the 40 MHz band. Channels with a “ww” appended to them are 802.11ac specific, and appear only when using an AP82XX, and are unique to the 80 MHz band.

---

**Supported in the following platforms:**

- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4011

**Syntax**

```
channel [smart|acs|random|1|2|3|4|--|--]
```

**Parameters**

- `channel [smart|acs|random|1|2|3|4|--|--]`

**Examples**

```plaintext
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#channel 1
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

```
Resets a radio’s channel of operation.
7.1.34.4.15 data-rates

`interface-config-radio-instance`

Configures the 802.11 data rates on this radio

This command sets the rate options depending on the 802.11 protocol and the radio band selected. If 2.4 GHz is selected as the radio band, select separate 802.11b, 802.11g and 802.11n rates and define how they are used in combination. If 5.0 GHz is selected as the radio band, select separate 802.11a and 802.11n rates then define how they are used together.

If dedicating the radio to either 2.4 or 5.0 GHz support, use the `custom` keyword to set a 802.11n modulation and coding scheme (MCS) in respect to the radio’s channel width and guard interval. A MCS defines (based on RF channel conditions) an optimal combination of rates, bonded channels, multiple spatial streams, different guard intervals and modulation types. Clients can associate as long as they support basic MCS (as well as non-11n basic rates).

Data rates are fixed and not user configurable for radios functioning as sensors.

NOTE: Use the rf-mode command to configure a radio’s mode of operation.

NOTE: The MCS-1s and MCS-2s options are available for each supported access point. However, the MCS-3s option is only available to the AP8232 model access point, and its ability to provide 3x3x3 MIMO support.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

data-rates [b-only|g-only|a-only|bg|bgn|gn|an|default|custom|mcs]
data-rates [b-only|g-only|a-only|bg|bgn|gn|an|default]

7.1.34.4.16 description

Configures the selected radio’s description that helps differentiate it from other radios with similar configurations.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

description <WORD>

Parameters

- description <WORD>

| <WORD> | Provide a description for the selected radio (should not exceed 64 characters in length). |

Examples

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#description "Primary radio to use"

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

Related Commands

no

Removes a radio’s description.
7.1.34.4.17 dfs-rehome

Reverts to configured home channel once the Dynamic Frequency Selection (DFS) evacuation period expires.

NOTE: This option is applicable only if the radio’s RF mode is set to ‘5GHz-wlan’.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax
dfs-rehome {holdtime <30-3600>}

Parameters
- dfs-rehome {holdtime <30-3600>}

<table>
<thead>
<tr>
<th>dfs-rehome {holdtime &lt;30-3600&gt;}</th>
<th>Enables the radio to revert to the configured home channel once the DFS evacuation period expires</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• holdtime – Optional. Specifies the duration, in minutes, to stay in the new channel</td>
</tr>
<tr>
<td></td>
<td>• &lt;30-3600&gt; – Specify the holdtime from 30 - 3600 minutes. The default is 90 minutes.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#dfs-rehome holdtime 500
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1) interface radio1

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#

Related Commands
- no Stays on DFS elected channel after evacuation period expires
7.1.34.4.18 dynamic-chain-selection

- interface-config-radio-instance

Enables/disables automatic antenna mode selection. When enabled, the radio can dynamically change the number of transmit chains used (uses a single chain/antenna for frames at non-11n transmit rates). This option is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax
dynamic-chain-selection

Parameters
None

Examples
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#dynamic-chain-selection
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#

Related Commands

| no | Uses the configured transmit antenna mode for all clients |
7.1.34.4.19 ekahau

interface-config-radio-instance

Enables Ekahau multicast packet forwarding. When enabled, Ekahau small, battery powered Wi-Fi tags are attached to tracked assets or assets carried by people. Ekahau processes locations, rules, messages, and environmental data and turns the information into locationing maps, alerts and reports.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

```bash
ekahau [forward ip <IP> port <0-65535>|mac <MAC>]
```

Parameters

- **ekahau [forward ip <IP> port <0-65535>|mac <MAC>]**

<table>
<thead>
<tr>
<th>forward ip &lt;IP&gt; port &lt;0-65535&gt;</th>

---
7.1.34.4.20 extended-range

`interface-config-radio-instance`

Enables the extended range capability for AP7161 and AP7181 model access points. When enabled, these access points can exchange signals with their clients at greater distances without being timed out. This option is disabled by default.

Supported in the following platforms:

- Access Point — AP7161, AP7181

**Syntax**

`extended-range <1-25>`

**Parameters**

- `extended-range <1-25>`

| extended-range <1-25> | Configures extended range on this radio interface from 1 - 25 kilometers. The default is 2 km on 2.4 GHz band and 7 km on 5.0 GHz band. |

**Examples**

```plaintext
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#extended-range 15
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

```

**Related Commands**

| `no` | Resets the extended range to default (7 km for 2.4 GHz and 5 km for 5.0 GHz) |

---
### 7.1.34.4.21 fallback-channel

- **interface-config-radio-instance**

  Configures the channel to which the radio switches in case of radar detection on the current channel

  Supported in the following platforms:
  - Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  - Wireless Controllers — RFS4011

**Syntax**

```bash
fallback-channel [100|100w|100ww|104|104w|104ww|108|108w...............]
```

**Parameters**

- `fallback-channel [100|100w|100ww|104|104w|104ww|108|108w...............]`

  - **fallback-channel** [100|100w|100ww|104|104w|104ww|108|108w...............] — Configures the fallback channel. This is the channel the radio switches to in case a radar is detected on the radio’s current operating channel.
  
  - [100|100w|100ww...] — Select the fall back channel from the available options.

**Note:** Channels with a “w” appended to them are unique to the 40 MHz band. Channels with a “ww” appended to them are 802.11ac specific, and appear only when using an AP8232, and are unique to the 80 MHz band.

**Examples**

```bash
nx9500-6C8809 (config-profile-testAP81XX-if-radio2)#fallback-channel 104
```

**NOTE:** Functionality is supported only in the US regulatory domain and only a non-dfs channel can be configured as a fallback channel

```bash
nx9500-6C8809 (config-profile-testAP81XX-if-radio2)#show context
interface radio2
  fallback-channel 104
```

```bash
nx9500-6C8809 (config-profile-testAP81XX-if-radio2)#
```

**Related Commands**

- **no**

  Removes the fallback-channel configuration
7.1.34.4.22 guard-interval

*interface-config-radio-instance*

Configures the 802.11n guard interval. A guard interval ensures distinct transmissions do not interfere with one another. It provides immunity to propagation delays, echoes and reflection of radio signals.

The guard interval is the space between transmitted characters. The guard interval eliminates *inter symbol interference* (ISI). ISI which occurs when echoes or reflections from one symbol interferes with another. Adding time between transmissions allows echoes and reflections to settle before the next symbol is transmitted. A shorter guard interval results in shorter symbol times, which reduces overhead and increases data rates by up to 10%.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
guard-interval [any|long]
```

**Parameters**

- **any**
  - Enables the radio to use any short (400nSec) or long (800nSec) guard interval

- **long**
  - Enables the use of long guard interval (800nSec). This is the default setting.

**Examples**

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#guard-interval long
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

7.1.34.4.23 ldpc

Enables support for *Low Density Parity Check* (LDPC) codes on the radio interface.

LDPC consists of forward error correcting codes that enable error control in data transmission. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
ldpc
```

**Parameters**

None

**Examples**

```
rfs4000-229D58 (config-profile-Test81XX-if-radio1)#ldpc

7.1.34.4.24 lock-rf-mode

Retains user configured RF mode settings for the selected radio. This option is disabled by default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4011

**Syntax**

```

Related Commands

- **no** Resets the maximum number of wireless clients allowed to associate with a radio.
Use this command to configure radio mesh parameters. A *Wireless Mesh Network* (WMN) is a network of radio nodes organized in a mesh topology. It consists of mesh clients, mesh routers, and gateways.

Each radio setting can have a unique mesh mode and link configuration. This provides a customizable set of connections to other mesh supported radios within the same radio coverage area.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4011

**Syntax**

```plaintext
mesh [client|links|portal|preferred-peer|psk]

mesh [client|links <1-6>|portal|preferred-peer <1-6> <MAC>|psk [0 <LINE>|2 <LINE>| <LINE>]]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mesh [client</td>
<td>links</td>
</tr>
<tr>
<td>client</td>
<td>Enables operation as a client. Setting the mesh mode to ‘client’ enables the radio to operate as a mesh client that scans for and connects to mesh portals or nodes that are connected to portals.</td>
</tr>
<tr>
<td>links &lt;1-6&gt;</td>
<td>Configures the maximum number of mesh links a radio attempts to create.</td>
</tr>
<tr>
<td>portal</td>
<td>Enables operation as a portal. Setting the mesh mode to ‘portal’ turns the radio into a mesh portal. The radio starts beaconsing immediately and accepts connections from other mesh nodes, typically the node with a connection to the wired network.</td>
</tr>
<tr>
<td>preferred-peer &lt;1-6&gt; &lt;MAC&gt;</td>
<td>Configures a preferred peer device.</td>
</tr>
<tr>
<td>psk[0 &lt;LINE&gt;</td>
<td>2 &lt;LINE&gt;</td>
</tr>
</tbody>
</table>
**Examples**

```bash
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#mesh client
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context interface radio1
description Primary\ radio\ to\ use
   channel 1
   data-rates b-only
   mesh client
   beacon period 50
   --More--
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#
```

7.1.34.4.27 meshpoint

Maps an existing meshpoint to this radio

Use this command to assign each WLAN its own BSSID. If using a single-radio access point, there are 8 BSSIDs available. If using a dual-radio access point there are 8 BSSIDs for the 802.11b/g/n radio and 8 BSSIDs for the 802.11a/n radio.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

```
interface-config-radio-instance
```

```
interface-config-radio-instance
```

```
meshpoint <MESHPOINT-NAME> {bss <1-16}]
```

Parameters

- `meshpoint <MESHPOINT-NAME> {bss <1-16>}`

meshpoint `<MESHPOINT-NAME>`
Maps a meshpoint to this radio. Specify the meshpoint name.

<table>
<thead>
<tr>
<th>bss <code>&lt;1-16&gt;</code></th>
<th>Optional. Specifies the radio's BSS where this meshpoint is mapped</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;1-16&gt;</code></td>
<td>Specify the BSS number from 1 - 16.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-profile-ap71xxTest-if-radio1)#meshpoint test bss 7
rfs7000-37FABE(config-profile-ap71xxTest-if-radio1)#show context
interface radio1
meshpoint test bss 7
rfs7000-37FABE(config-profile-ap71xxTest-radio1)#
```

Related Commands

```
no
```

Disables meshpoint on the selected radio
7.1.34.4.28 no

Negates a command or resets settings to their default. When used in the profile/device > radio interface configuration mode, the no command disables or resets radio interface settings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

no <PARAMETERS>

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes or reverts this radio interface’s settings based on the parameters passed |

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

rfs7000-37FABE(config-profile-ap71xxTest-if-radio1)#no ?

adaptivity Adaptivity
aeroscout Use Default Aeroscout Multicast MAC Address
aggregation Configure 802.11n aggregation related parameters
airtime-fairness Disable fair access to medium for clients, provide access in a round-robin mode
antenna-diversity Use single antenna for non-11n transmit rates
antenna-downtilt Reset ADEPT antenna mode
antenna-elevation Reset the antenna elevation of this radio to default
antenna-gain Reset the antenna gain of this radio to default
antenna-mode Reset the antenna mode (number of transmit and receive antennas) on the radio to its default
assoc-response Configure transmission parameters for Association Response frames
association-list Configure the association list for the radio
beacon Configure beacon parameters
bridge Bridge rf-mode related configuration
channel Reset the channel of operation of this radio to default
data-rates Reset radio data rate configuration to default
description Reset the description of the radio to its default
dfs-rehome Stay on dfs elected channel after evacuation period expires
dynamic-chain-selection Use the configured transmit antenna mode for all clients
ekahau Use Default Ekahau Multicast MAC Address
extended-range Reset extended range to default
fallback-channel Clear the DFS fallback channel for this radio
guard-interval Configure default value of 802.11n guard interval (long: 800nSec)
dlpc Configure support for Low Density Parity Check Code
lock-rf-mode Allow smart-rf to change rf-mode setting for this radio
max-clients Maximum number of wireless clients allowed to associate
mesh Disable mesh mode operation of the radio
meshpoint Disable a meshpoint from this radio
non-unicast                 Configure handling of non-unicast frames
off-channel-scan         Disable off-channel scanning on the radio
placement                Reset the placement of the radio to its default
power                    Reset the transmit power of this radio to
default
preamble-short           Disable the use of short-preamble on this radio
probe-response           Configure transmission parameters for Probe
                         Response frames
radio-resource-measurement Configure support for 802.11k Radio Resource
                         Measurement
radio-share-mode         Configure the radio-share mode of operation for
                         this radio
rate-selection           Monotonic rate selection
rf-mode                  Reset the RF mode of operation for this radio to
default (2.4GHz on radio1, 5GHz on radio2,
                         sensor on radio3)
rifs                     Configure Reduced Interframe Spacing (RIFS)
                         parameters
rts-threshold            Reset the RTS threshold to its default (65536)
shutdown                 Re-enable the selected interface
smart-rf                 Reset smart-rf related configuration to default
sniffer-redirect         Disable capture and redirection of packets
stbc                     Configure Space-Time Block Coding (STBC)
                         parameters
transmit-beamforming     Disable Transmit Beamforming
use                      Set setting to use
wips                     Wireless intrusion prevention related
                         configuration
wireless-client          Configure wireless client related parameters
wlan                     Disable a wlan from this radio
service                  Service Commands

7.1.34.4.29 non-unicast

*interface-config-radio-instance*

Configures support for forwarding of non-unicast (multicast and broadcast) frames on this radio.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```plaintext
non-unicast [forwarding|queue|tx-rate]
```

```plaintext
non-unicast forwarding [follow-dtim|power-save-aware]
```

```plaintext
non-unicast queue [<1-200>|bss]
```

```plaintext
non-unicast queue [<1-200]|bss <1-16> <1-200>
```

```plaintext
non-unicast tx-rate [bss <1-16]|dynamic-all|dynamic-basic|highest-basic|lowest-basic]
```

```plaintext
non-unicast tx-rate bss <1-16> [dynamic-all|dynamic-basic|highest-basic|lowest-basic]
```

**Parameters**

- **non-unicast forwarding** [follow-dtim|power-save-aware]

- **follow-dtim**

  Specifies frames always wait for the DTIM interval to time out. The DTIM interval is configured using the *beacon* command. This is the default setting.

- **power-save-aware**

  Enables immediate forwarding of frames only if all associated wireless clients are in the power save mode.

- **non-unicast queue** [bss <1-16> [dynamic-all|dynamic-basic|highest-basic|lowest-basic]]

- **bss <1-16> <1-200>**

  Overrides the default on a specified BSS

  - `<1-16>` — Select the BSS number from 1 - 16.
  - `<1-200>` — Specify the number of broadcast packets queued for the selected BSS from 1 - 200.

- **non-unicast tx-rate** [bss <1-16]|dynamic-all|dynamic-basic|highest-basic|lowest-basic]

- **bss <1-16>**

  Overrides the default on a specified BSS

  - `<1-16>` — Select the BSS number from 1 - 16. The transmit rate selected is applied only to the BSS specified here. The tx-rate options are: dynamic-all, dynamic-basic, highest-basic, lowest-basic.

7.1.34.4.30 off-channel-scan

Enables off channel scanning on this radio. This option is disabled by default.

Channel scanning uses the access point’s resources and is time consuming. Therefore, enable this option only if the radio has the bandwidth to support channel scan without negatively impacting client support.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

```
off-channel-scan {channel-list|max-multicast|scan-interval|sniffer-redirect}
off-channel-scan {channel-list [2.4Ghz|5Ghz]} {<CHANNEL-LIST>}
off-channel-scan {max-multicast <0-100>|scan-interval <2-100>}
off-channel-scan {sniffer-redirect tzsp <IP>}
```

Parameters

- off-channel-scan Enables off-channel scanning and configures related parameters. These parameters are optional, and the system configures default settings if no values are specified.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel-list [2.4Ghz</td>
<td>5Ghz]</td>
</tr>
<tr>
<td>- 2.4GHz – Selects the 2.4 GHz band</td>
<td></td>
</tr>
<tr>
<td>- 5GHz – Selects the 5.0 GHz band</td>
<td></td>
</tr>
<tr>
<td>&lt;CHANNEL-LIST&gt;</td>
<td>Optional. Specifies a list of 20 MHz, 40 MHz, or 80 MHz channels for the selected band (the channels are separated by commas or hyphens)</td>
</tr>
</tbody>
</table>

- off-channel-scan {max-multicast <0-100>|scan-interval <2-100>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-multicast &lt;0-100&gt;</td>
<td>Optional. Configures the maximum multicast/broadcast messages used to perform OCS</td>
</tr>
<tr>
<td>- &lt;0-100&gt; – Specify a value from 0 - 100. The default is 4.</td>
<td></td>
</tr>
<tr>
<td>scan-interval &lt;2-100&gt;</td>
<td>Optional. Configures the scan interval in dtims</td>
</tr>
<tr>
<td>- &lt;2-100&gt; – Specify a value from 2 - 100. The default is 20 dtims.</td>
<td></td>
</tr>
</tbody>
</table>

- off-channel-scan {sniffer-redirect tzsp <IP>}

<table>
<thead>
<tr>

7.1.34.4.31 placement

> interface-config-radio-instance

Defines the radio’s location (whether the radio is deployed indoors or outdoors). The radio’s placement should depend on the country of operation selected and its regulatory domain requirements for radio emissions.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax
placement [indoor|outdoor]

Parameters
- placement [indoor|outdoor]

<table>
<thead>
<tr>
<th>indoor</th>
<th>Radio is deployed indoors (uses indoor regulatory rules). This is the default setting.</th>
</tr>
</thead>
<tbody>
<tr>
<td>outdoor</td>

Related Commands
no Reset a radio’s deployment location
7.1.34.4.32 power

_configs radio-instance

Configures the radio’s transmit power setting

The transmit power control (TPC) mechanism automatically reduces the used transmission output power when other networks are within range. Reduced power results in reduced interference issues and increased battery capacity.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

```
power [<1-30>|smart]
```

Parameters

- **power [<1-30>|smart]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-30&gt;</td>
<td>Configures the transmit power from 1 - 30 dBm (actual power could be lower based on regulatory restrictions) For APs with dual or three radios, each radio should be configured with a unique transmit power in respect to its intended client support function. A setting of 0 dBm indicates the radio is using Smart RF to determine its output power.</td>
</tr>
<tr>
<td>smart</td>
<td>Enables Smart RF to determine the optimum transmit power needed. By default APs use Smart RF to determine transmit power.</td>
</tr>
</tbody>
</table>

7.1.34.4.35 radio-resource-measurement

Enables 802.11k radio resource measurement. When enabled, the radio station sends channel and neighbor reports.

The IEEE 802.11 Task Group k defined a set of specifications regarding radio resource measurements. These specifications specify the radio resources to be measured and the mechanism used to communicate measurement requests and results.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax
radio-resource-measurement [attenuation-threshold <1-199>|max-entries <1-12>]

Parameters
- radio-resource-measurement [attenuation-threshold <1-199>|max-entries <1-12>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attenuation-threshold</td>
<td>Configures the neighbor attenuation threshold, considered when generating channel and neighbor reports</td>
</tr>
<tr>
<td>&lt;1-199&gt;</td>
<td>&lt;1-199&gt; – Specify the attenuation threshold from 1 -199. The default is 90.</td>
</tr>
<tr>
<td>max-entries</td>
<td>Configures the maximum number of entries to include in channel and neighbor reports</td>
</tr>
<tr>
<td>&lt;1-12&gt;</td>
<td>&lt;1-12&gt; – Specify a value from 1 - 12. The default is 6.</td>
</tr>
</tbody>
</table>

Related Commands
- no
  Disables 802.11k radio resource measurement support
7.1.34.4.36 radio-share-mode

> interface-config-radio-instance

Configures the radio’s mode of operation as radio share. A radio operating in the radio share mode services clients and also performs sensor functions (defined by the radio’s AirDefense Services Platform (ADSP) licenses and profiles).

NOTE: The sensor capabilities of the radio are restricted to the channel and WLANs defined on the radio.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6562, AP6562, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax
radio-share-mode [inline|off|promiscuous]

Parameters

- radio-share-mode [inline|off|promiscuous]

<table>
<thead>
<tr>
<th>radio-share-mode</th>
<th>Enables sharing of packets, switched by this radio, with the WIPS sensor module. There are two radio-share modes, these are: inline and promiscuous</th>
</tr>
</thead>
<tbody>
<tr>
<td>inline</td>
<td>Enables sharing of all WLAN packets (matching the BSSID of the radio) serviced by the radio with the WIPS sensor module.</td>
</tr>
<tr>
<td>off</td>
<td>Disables radio share (no packets shared with the WIPS sensor module)</td>
</tr>
<tr>
<td>promiscuous</td>
<td>Enables the promiscuous radio share mode. In this mode the radio is configured to receive all packets on the channel irrespective of whether the destination address is the radio or not, and shares these packets with the WIPS sensor module for analysis (i.e. without filtering based on BSSID).</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#radio-share-mode promiscuous

7.1.34.4.37 rate-selection

Sets the rate selection method to standard or opportunistic

```
interface-config-radio-instance
```

**NOTE:** This feature is not supported on RFS4011 wireless controller.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX

**Syntax**

rate-selection [opportunistic|standard]

**Parameters**

- rate-selection [opportunistic|standard]

<table>
<thead>
<tr>
<th>rate-selection</th>
<th>Sets the rate selection method to standard or opportunistic</th>
</tr>
</thead>
<tbody>
<tr>
<td>standard</td>
<td>Configures the monotonic rate selection mode. This is the default setting.</td>
</tr>
<tr>
<td>opportunistic</td>
<td>Configures the opportunistic radio link adaptation (ORLA) rate selection mode</td>
</tr>
</tbody>
</table>

The ORLA algorithm is designed to select data rates that provide the best throughput. Instead of using local conditions to decide whether a data rate is acceptable or not, ORLA is designed to proactively probe other rates to determine if greater throughput is available. If these other rates do provide improved throughput, ORLA intelligently adjusts its selection tables to favour higher performance. ORLA provides improvements both on the client side of a mesh network as well as in the backhaul capabilities. ORLA is a key differentiator at the deployment and customer level and will be further explored in this paper.

**Examples**

```
nx9500-6C8809(config-profile-testAP71XX-if-radio1)#rate-selection opportunistic
```

```
nx9500-6C8809(config-profile-testAP71XX-if-radio1)#show context
```

```
interface radiol
```

```
rate-selection opportunistic
```

```
nx9500-6C8809(config-profile-testAP71XX-if-radio1)#
```

**Related Commands**

| no             | Resets the rate selection mode to standard (monotonic) |
7.1.34.4.38 remove-override

Removes the radio’s channel of operation. Use this command to override the channel setting configured at the profile level.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
remove-override channel
```

**Parameters**

- `remove-override channel`

**Examples**

```
rfs4000-229D58(config-profile-testRFS4000-if-radio1)#show context
interface radio1
    channel 9
rfs4000-229D58(config-profile-testRFS4000-if-radio1)#remove-override channel
rfs4000-229D58(config-profile-testRFS4000-if-radio1)#show context
interface radio1
```
7.1.34.4.39 rf-mode

```
interface-config-radio-instance
```

Configures the radio’s RF mode of operation

This command sets the mode to either 2.4 GHz WLAN or 5.0 GHz WLAN support depending on the radio’s intended client support. If you are currently licensed to use 4.9 GHz, configure the 4.9 GHz-WLAN option.

Set the mode to sensor if using the radio for rogue device detection. The radio cannot support rogue detection when one of the other radios is functioning as a WIPS sensor. To set a radio as a detector, disable sensor support on the other access point radios.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
rf-mode [2.4GHz-wlan|4.9GHz-wlan|5GHz-wlan|bridge|scan-ahead|sensor]
```

**Parameters**

- `rf-mode [2.4GHz-wlan|4.9GHz-wlan|5GHz-wlan|bridge|scan-ahead|sensor]`
  - `rf-mode` Configures the radio’s RF mode of operation
    - `2.4GHz-wlan` Provides WLAN service in the 2.4 GHz bandwidth
    - `4.9GHz-wlan` Provides WLAN service in the 4.9 GHz bandwidth
    - `5GHz-wlan` Provides WLAN service in the 5.0 GHz bandwidth
  - `bridge` Enables this radio to operate as a bridge radio on 5.0 GHz bandwidth
    - **Note:** This option is applicable only on interface radio2 of the AP6522 and AP6562 model access points. Enable this option only if the access point is to provide client bridge radio support. Once, enabled configure the bridge parameters. For more information, see `bridge`.
  - `scan-ahead` Enables this radio to operate as a scan-ahead radio
    - A radio functioning in the scan-ahead mode is used for forward scanning only. The radio does not support WLAN or mesh services.
    - The scan ahead feature is used in Dynamic Frequency Selection (DFS) aware countries for infrastructure devices, static, and vehicular mounted modems (VMMs). It enables a secondary radio to scan ahead for an active channel for backhaul transmission, in the event of a radar trigger on the primary radio. The device then switches radios allowing transmission to continue. This is required in environments where handoff is required and DFS triggers are common.
    - With a secondary radio dedicated for forward scanning, the primary radio, in case of radar hit, hands over the channel availability check (CAC) function to the secondary radio. This avoids a break in data communication, which would have resulted if the primary radio was to do CAC itself.
    - The secondary radio periodically does a scan of the configured channel list, searching for the other available meshpoint roots. When configured on the root meshpoint, the scan-ahead feature also scans for cleaner channels.
  - `sensor` Operates as a sensor radio. Configures this radio to function as a scanner, providing scanning services on both 2.4 GHz and 5.0 GHz bands. The radio does not provide WLAN services.
Examples

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#rf-mode sensor

### 7.1.34.4.40 rifs

#### interface-config-radio-instance

Configures Reduced Interframe Spacing (RIFS) parameters on this radio.  

This value determines whether interframe spacing is applied to access point transmitted or received packets, both, or none.  

Inter-frame spacing is the interval between two consecutive Ethernet frames that enable a brief recovery between packets and allow target devices to prepare for the reception of the next packet.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4011

#### Syntax

```
rifs [none|rx-only|tx-only|tx-rx]
```

#### Parameters

<table>

7.1.34.4.41 rts-threshold

`interface-config-radio-instance`

Configures the Request to Send (RTS) threshold value on this radio

RTS is a transmitting station’s signal that requests a Clear To Send (CTS) response from a receiving client. This RTS/CTS procedure clears the air where clients are contending for transmission time. Benefits include fewer data collisions and better communication with nodes that are hard to find (or hidden) because of other active nodes in the transmission path.

The RTS threshold controls RTS/CTS by initiating an RTS/CTS exchange for data frames larger than the threshold, and sends (without RTS/CTS) any data frames smaller than the threshold.

Consider the trade-offs when setting an appropriate RTS threshold for the WLAN’s access point radios. A lower RTS threshold causes more frequent RTS/CTS exchanges. This consumes more bandwidth because of additional latency (RTS/CTS exchanges) before transmissions can commence. A disadvantage is the reduction in data-frame throughput. An advantage is quicker system recovery from electromagnetic interference and data collisions. Environments with more wireless traffic and contention for transmission make the best use of a lower RTS threshold.

A higher RTS threshold minimizes RTS/CTS exchanges, consuming less bandwidth for data transmissions. A disadvantage is less help to nodes that encounter interference and collisions. An advantage is faster data-frame throughput. Environments with less wireless traffic and contention for transmission make the best use of a higher RTS threshold.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

`rts-threshold <0-65536>`

**Parameters**
- `rts-threshold <0-65536>`

**Examples**

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#rts-threshold 100

7.1.34.4.42 service

- interface-config-radio-instance

Enables/disables dynamic control function. This dynamic function controls performance of the radio receiver’s low noise amplifiers (LNAs).

When enabled, the control function, in the presence of very strong received signals, improves the receiver’s performance on radio 1. Strong signals are caused if the distance between the WiFi client and the AP is within two (2) meters. When disabled, the control function is a useful debug tool in case the uplink throughput is less than expected and the AP-to-client separation is greater than two (2) meters. Disabling the control function does not affect the receive sensitivity of the radio.

Supported in the following platforms:

- Access Points — AP622, AP6522, AP6562

Syntax

service radio-lna [agc|ms]

Parameters

- service radio-lna [agc|ms]

| radio-lna [agc|ms] | Enables/disables dynamic control function |
|-------------------|----------------------------------------|
| agc               | Enables dynamic LNA control function. This is the default setting. |
| ms                | Disables dynamic LNA control function |

Examples

nx9500-6C8809(config-profile-testAP6522-if-radio1)#service radio-lna ms

nx9500-6C8809(config-profile-testAP6522-if-radio1)#show context
interface radio1
  service radio-lna ms

Related Commands

- no
  Reverts radio-lna mode to default (agc)
**7.1.34.4.43 shutdown**

*interface-config-radio-instance*

Terminates or shuts down selected radio interface

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```
shutdown
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#shutdown
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#

7.1.34.4.44 smart-rf

interface-config-radio-instance

Overrides Smart RF channel width setting on this radio. When configured, the radio overrides the Smart RF selected channel setting and operates in the channel configured using this command.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax
smart-rf preferred-channel-width [20MHz|40MHz|80MHz]

Parameters
- smart-rf preferred-channel-width [20MHz|40MHz|80MHz]

| smart-rf preferred-channel-width [2-MHz|40MHz|80MHz] | Configures the preferred channel width. The options are:
|-----------------------------------------------------|---------------------------------------------------|
| • 20MHz – Sets 20 MHz as the preferred channel of operation
| • 40MHz – Sets 40MHz as the preferred channel of operation
| • 80MHz – Sets 80MHz as the preferred channel of operation (default setting)

Examples
nx9500-6C8809(config-profile-testAP71XX-if-radio1)#smart-rf preferred-channel-width 40MHz

nx9500-6C8809(config-profile-testAP71XX-if-radio1)#show context

7.1.34.46 stbc

Configures the radio’s Space Time Block Coding (STBC) mode. STBC is a pre-transmission encoding scheme providing an improved SNR ratio (even at a single RF receiver). STBC transmits multiple data stream copies across multiple antennas. The receiver combines the copies into one to retrieve data from the signal. These transmitted data versions provide redundancy to increase the odds of receiving data streams with a good data decode (especially in noisy environments).

NOTE: STBC requires the radio has at least two antennas with the capability to transmit two streams. If the antenna mode is configured to 1x1 (or falls back to 1x1 for some reason), STBC support is automatically disabled.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

```

   stbc tx-only
```
7.1.34.4.47 transmit-beamforming

*interface-config-radio-instance*

Enables transmit beamforming on this radio interface. This option is disabled by default.

When enabled, this option steers signals to peers in a specific direction to enhance signal strength and improve throughput amongst meshed devices (not clients). Each access point radio supports up to 16 beamforming capable mesh peers. When enabled, a beamformer steers its wireless signals to its peers. A beamformee device assists the beamformer with channel estimation by providing a feedback matrix. The feedback matrix is a set of values sent by the beamformee to assist the beamformer in computing a steering matrix. A steering matrix is an additional set of values used to steer wireless signals at the beamformer so constructive signals arrive at the beamformee for better SNR and throughput. Any beamforming capable mesh peer connecting to a radio whose capacity is exhausted cannot enable beamforming itself.

Supported in the following platforms:

- Access Points — AP8122, AP8132, AP8163

**Syntax**

```
transmit-beamforming
```

**Parameters**

None

**Examples**

```
nx9500-6C8809(config-profile-testAP81XX-if-radio1)#transmit-beamforming
```

7.1.34.48 use

Applies an association ACL policy and a radio QoS policy on this radio interface

An association ACL is a policy-based Access Control List (ACL) that either prevents or allows wireless clients from connecting to a controller managed access point radio. An ACL is a sequential collection of permit and deny conditions that apply to controller packets. When a packet is received on an interface, the controller compares the fields in the packet against any applied ACLs to verify the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. If a packet does not meet any of the criteria specified in the ACL, the packet is dropped.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

Syntax

use [association-acl-policy|radio-qos-policy]

use [association-acl-policy <ASSOC-ACL-POLICY-NAME>|radio-qos-policy <RADIO-QOS-POLICY-NAME>]

Parameters
- use [association-acl-policy <ASSOC-ACL-POLICY-NAME>|radio-qos-policy <RADIO-QOS-POLICY-NAME>]

| association-acl-policy | Uses a specified association ACL policy with this radio interface
| --- | --- |
|  | • <ASSOC-ACL-POLICY-NAME> – Specify the association ACL policy name (should be existing and fully configured).

| radio-qos-policy | Uses a specified radio QoS policy with this radio interface
| --- | --- |
|  | • <RADIO-QoS-POLICY-NAME> – Specify the radio QoS policy name (should be existing and fully configured).

Examples

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#use association-acl-policy test

### 7.1.34.4.49 wips

**interface-config-radio-instance**

Enables access point to change its channel of operation in order to terminate rogue devices. The radio should be configured to provide WLAN service.

This option is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

---

**NOTE:** AP7522 and AP7532 access points use Smart RF to perform off-channel scans. Therefore, ensure that a Smart RF policy is configured and applied to AP7522 and AP7532 access points RF Domains to enable them perform rogue detection and termination.

<table>

7.1.34.4.50 wireless-client

Configure wireless client parameters on this radio.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

wireless-client tx-power [<0-20>|mode]

wireless-client <0-20>

wireless-client tx-power mode [802.11d {wing-ie}|wing-ie {802.11d}]

**Parameters**

- **wireless-client tx-power <0-20>**

  - Configures the transmit power indicated to wireless clients. If using a dual or three radio model access point, each radio should be configured with a unique transmit power in respect to its intended client support function. A setting of 0 defines the radio as using Smart RF to determine its output power. 20 dBm is the default value.
  - `<0-20>` — Specify transmit power from 0 - 20 dBm.

- **wireless-client tx-power mode [802.11d {wing-ie}|wing-ie {802.11d}]**

  - Configures the transmit power indicated to wireless clients
    - 802.11d — Advertises in the IEEE 802.11d country information element
    - wing-ie — Optional. Advertises in the WiNG information element (173)
    - wing-ie — Advertises in the WiNG information element (173). This is the default setting.
    - 802.11d — Optional. Advertises in the IEEE 802.11d country information element

**Examples**

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#wireless-client tx-power 20

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#show context

  guard-interval long
  aggregation ampdu tx-only
  --More--

rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#

**Related Commands**

- **no** — Resets the transmit power indicated to wireless clients
7.1.34.4.51 wlan

*interface-config-radio-instance*

Enables a WLAN on this radio

Use this command to configure WLAN/BSS mappings for an existing access point deployment. Administrators can assign each WLAN its own BSSID. If using a single-radio access point, there are 8 BSSIDs available. If using a dual-radio access point there are 8 BSSIDs for the 802.11b/g/n radio and 8 BSSIDs for the 802.11a/n radio.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4011

**Syntax**

```plaintext
wlan <WLAN-NAME> {bss|primary}
wlan <WLAN-NAME> {bss <1-16>} {primary}
```

**Parameters**

- `wlan <WLAN-NAME> {bss <1-16>} {primary}`
  - Specify the WLAN name (it must have been already created and configured)
  - `bss <1-16>` – Optional. Specifies a BSS for the radio to map the WLAN
  - `primary` – Optional. Uses the specified WLAN as the primary WLAN, when multiple WLANs exist on the BSS

**Examples**

```plaintext
rfs7000-37FABE(config-profile-71xxTestProfile-if-radio1)#wlan TestWLAN primary
einterface radio1
rf-mode sensor
dplacement outdoor
mesclien
trs-threshold 100

```

**Related Commands**

`no` Disables a WLAN on a radio
7.1.34.5 interface-config-wwan-instance

A Wireless Wide Area Network (WWAN) card is a specialized network interface card that allows a network device to connect, transmit and receive data over a cellular WAN. AP7131 model access points, RFS4000 and RFS6000 controllers utilize a PCI express card slot that supports 3G WWAN cards. The WWAN card uses point-to-point protocol (PPP) to connect to the Internet Service Provider (ISP) and gain access to the Internet. PPP establishes internet links over dial-up modems, DSL connections, and many other types of point-to-point communications. PPP packages your system’s TCP/IP packets and forwards them to the serial device where they can be put on the network. PPP is a full-duplex protocol used on various physical media, including twisted pair or fiber optic lines or satellite transmission. It uses a variation of High Speed Data Link Control (HDLC) for packet encapsulation.

To switch to the WWAN Interface configuration mode, use the following command:

```plaintext
<DEVICE>(config)#profile <DEVICE-TYPE> <DEVICE-PROFILE-NAME>
```

```plaintext
rfs4000-229D58(config)#profile rfs4000 testRFS4000
rfs4000-229D58(config-profile-testRFS4000)#
```

```plaintext
<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#interface wwan1
```

```plaintext
rfs4000-229D58(config-profile-testRFS4000-if-wwan1)#?
```

Interface configuration commands:

7.1.34.5.1 apn

Configure the cellular data provider's name. This setting is needed in areas with multiple cellular data providers using the same protocols, such as Europe and Asia.

Supported in the following platforms:
- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

Syntax
```
apn <WORD>
```

Parameters

- **apn** <WORD>

Examples
```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#apn AT&T
```
```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
   apn AT&T
```
```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

Related Commands

| no | Removes the configured access point name. |
7.1.34.5.2 auth-type

Configures the authentication type used by the cellular data provider

Supported in the following platforms:
- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

Syntax

auth-type [chap|mschap|mschap-v2|pap]

Parameters

- auth-type [chap|mschap|mschap-v2|pap]

<table>
<thead>
<tr>
<th>auth-type</th>
<th>Configures the authentication protocol used on this interface. The options are: PAP, CHAP, MSCHAP, and MSCHAP-v2</th>
</tr>
</thead>
<tbody>
<tr>
<td>chap</td>
<td>Configures <em>Challenge-Handshake Authentication Protocol</em> (CHAP). This is the default value.</td>
</tr>
<tr>
<td>mschap</td>
<td>Configures <em>Microsoft Challenge-Handshake Authentication Protocol</em> (MSCHAP)</td>
</tr>
<tr>
<td>mschapv2</td>
<td>Configures <em>Microsoft Challenge-Handshake Authentication Protocol</em> (MSCHAP) version 2</td>
</tr>
<tr>
<td>pap</td>
<td>Configures <em>Password Authentication Protocol</em> (PAP)</td>
</tr>
</tbody>
</table>

Examples

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#auth-type mschap-v2

Related Commands

no | Removes the authentication protocol configured on this interface
7.1.34.5.3 crypto

interface-config-wwan-instance

Associates a crypto map with this interface

Supported in the following platforms:
- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

Syntax

crypto map <CRYPTO-MAP-NAME>

Parameters

- crypto map <CRYPTO-MAP-NAME>

Examples

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#crypto map test
```
```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  apn AT&T
  auth-type mschap-v2
  crypto map test
```
```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

</tr>
</tbody>
</table>
### 7.1.34.5.4 ip

**interface-config-wwan-instance**

Configures IP related settings on this interface

Supported in the following platforms:
- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```plaintext
ip [default-gateway|nat]
ip default-gateway priority <1-8000>
ip nat [inside|outside]
```

#### Parameters

- **ip default-gateway priority <1-8000>**
  - Configures the default-gateway’s (learned by the wireless WAN) priority.
  - `<1-8000>` – Specify a value from 1 - 8000. The default is 3000.

- **ip nat [inside|outside]**
  - Configures the NAT settings. This option is disabled by default.
  - **inside** – Marks this WWAN interface as NAT inside. The inside network is transmitting data over the network to its intended destination. On the way out, the source IP address is changed in the header and replaced by the (public) IP address.
  - **outside** – Marks this WWAN interface as NAT outside. Packets passing through the NAT on the way back to the controller or service platform managed LAN are matched against the records kept by the NAT engine. There, the destination IP address is changed back to the specific internal private class IP address in order to reach the LAN over the network.

#### Examples

```plaintext
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#ip nat inside

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  apn AT&T
  auth-type mschap-v2
  crypto map test
  ip nat inside
  ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

#### Related Commands

- **no**
  - Removes IP related settings on this interface
7.1.34.5.5 no

`interface-config-wwan-instance`

Removes or reverts the WWAN interface settings

Supported in the following platforms:

- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

**Syntax**

```
no [all|apn|auth-type|crypto|description|ip|password|shutdown|use|username]
no [all|apn|description|password|shutdown|username]
no crypto map
no ip [default-gateway priority|nat]
no use ip-access-list in
```

**Parameters**

- no `<PARAMETERS>`

**Usage Guidelines**

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

The following example displays the WWAN interface settings before the 'no' commands are executed:

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  apn AT&T
  auth-type mschap-v2
  crypto map test
  ip nat inside
  ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#no apn
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#no auth-type
```

The following example displays the WWAN interface settings after the 'no' commands are executed:

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  crypto map test
  ip nat inside
  ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```
### 7.1.34.5.6 password

#### interface-config-wwan-instance

Configures a password for this WWAN interface. The configured value is used for authentication support by the cellular data carrier.

Supported in the following platforms:
- Access Points — AP71XX
- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```
password [2 <WORD>|<WORD>]
```

#### Parameters

- **password [2 <WORD>|<WORD>]**
  - Configures an encrypted password. Use this option when copy pasting the password from another device.
  - Enter the password string (should not exceed 32 characters in length).

#### Examples

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#password 2 TechPubsTesting@123

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  password TechPubsTesting@123
  crypto map test
  ip nat inside
  ip default-gateway priority 1
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

#### Related Commands

- **no**
  - Removes the configured password
7.1.34.5.7 shutdown

- interface-config-wwan-instance

Shuts down this WWAN interface. Use the no > shutdown command to re-start the WWAN interface.

Supported in the following platforms:
- Access Points — AP71XX
- Wireless Controllers — RFS4000, RFS6000

Syntax

```
shutdown
```

Parameters

None

Examples

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#shutdown
```

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  shutdown
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#
```

Related Commands

- `no` Re-starts the WWAN interface
### 7.1.34.5.8 use

Associates an IP ACL with this interface. The ACL should be existing and configured.

The ACL applies an IP based firewall to all incoming packets. The ACL identifies a single IP or a range of IPs that are to be allowed or denied access on this interface.

Supported in the following platforms:
- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

#### Syntax

```
use ip-access-list in <ACCESS-LIST-NAME>
```

#### Parameters

- `use ip-access-list in <ACCESS-LIST-NAME>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>use ip-access-list in</code></td>
<td>Associates an inbound IPv4 ACL with this interface. This setting applies to IPv4 inbound traffic only and not IPv6 traffic. IPv4 operates as a best effort delivery method, as it does not guarantee delivery, and does not ensure proper sequencing or duplicate delivery (unlike TCP). IPv4 hosts can use link local addressing to provide local connectivity.</td>
</tr>
<tr>
<td><code>&lt;ACCESS-LIST-NAME&gt;</code></td>
<td>Specify the IP ACL name.</td>
</tr>
</tbody>
</table>

#### Examples

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#use ip-access-list in test
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  password TechPubsTesting@123
  crypto map test
  ip nat inside
  use ip-access-list in test
  ip default-gateway priority 1
```  

#### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Removes the IP ACL associated with this interface</td>
</tr>
</tbody>
</table>
7.1.34.5.9 username

*interface-config-wwan-instance*

Configures the names of users accessing this interface

Supported in the following platforms:

- Access Points — AP7131
- Wireless Controllers — RFS4000, RFS6000

**Syntax**

```
username <WORD>
```

**Parameters**

- **username <WORD>**

**Examples**

```
nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#username TechPubsUser1

nx9500-6C8809(config-profile-testRFS6000-if-wwan1)#show context
interface wwan1
  username TechPubsUser1
  password TechPubsTesting@123
  crypto map test
  ip nat inside
  use ip-access-list in test
  ip default-gateway priority 1
```

**Related Commands**

```
no
```

Removes the configured username
7.1.34.6 interface-config-serial-instance

This section describes the serial interface configuration commands.

Use the (config-profile-<DEVICE-PROFILE-NAME>) instance to configure the serial interface associated with the service platform.

To switch to this mode, use the following command:

<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#interface ?

The following example uses the config-profile-default-nx45xx instance to configure a serial interface:

```
nx4500-5CFA2B(config-profile-default-nx45xx)#interface?
WORD          Interface name
fe            Select a FastEthernet interface
ge            Select a GigabitEthernet interface
me1           Select the management interface
port-channel  Select a port channel interface
ppoe1         Select the PPP Over Ethernet interface
radio         Select a radios
serial        Select a serial interface (virtual interface)
tel           Select a T1 or E1 interface
up            Select the Uplink GigabitEthernet interface
vlan          Select a vlan interface (switched virtual interface)
vmif          Select the virtual interface
wwan1         Select the wireless wan interface
xge           Select a TenGigabitEthernet interface
```

```
nx4500-5CFA2B(config-profile-default-nx45xx)#interface serial-<1-4>/1:1
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

Interface configuration commands:

- authentication: Type of authentication, Eg chap, pap
- description: Enter description provided by the service provider
- encapsulation: The type of traffic that this group handles.
- ip: Internet Protocol (IP)
- local-ip-address: IP address assigned to the local system
- no: Negate a command or set its defaults
- password: Enter password provided by the service provider
- remote-ip-subnet: IP subnet assigned to the remote system along with subnet in CIDR notation
- remove-override: Remove override from the device
- shutdown: Disable serial interface
- use: Set setting to use
- username: Enter username provided by the service provider
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- exit: End current mode and change to EXEC mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal
The following table summarizes serial interface configuration commands:

<table>
<thead>
<tr>
<th>Commands</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>authentication</td>
<td>Configures the authentication type used on the serial interface</td>
<td>page 7-310</td>
</tr>
<tr>
<td>description</td>
<td>Configures a description of the serial interface</td>
<td>page 7-311</td>
</tr>
<tr>
<td>encapsulation</td>
<td>Defines the type of traffic handled by the serial interface</td>
<td>page 7-312</td>
</tr>
<tr>
<td>ip</td>
<td>Configures serial interface IP to use NAT</td>
<td>page 7-313</td>
</tr>
<tr>
<td>local-ip-address</td>
<td>Assigns a local IP address for this serial interface</td>
<td>page 7-314</td>
</tr>
<tr>
<td>no</td>
<td>Disables or reverts serial interface settings to their defaults</td>
<td>page 7-315</td>
</tr>
<tr>
<td>password</td>
<td>Configures the serial interface’s password</td>
<td>page 7-316</td>
</tr>
<tr>
<td>remote-ip-subnet</td>
<td>Configures the remote system’s IP address and subnet</td>
<td>page 7-317</td>
</tr>
<tr>
<td>remove-override</td>
<td>Removes device overrides</td>
<td>page 7-318</td>
</tr>
<tr>
<td>shutdown</td>
<td>Shuts down the serial interface</td>
<td>page 7-320</td>
</tr>
<tr>

<td>Applies an IP access list on this serial interface</td>
<td>page 7-321</td>
</tr>
<tr>
<td>username</td>
<td>Configures the serial interface’s user names</td>
<td>page 7-322</td>
</tr>
</tbody>
</table>
7.1.34.6.1 authentication

`interface-config-serial-instance`

Configures the type of authentication used for this serial interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

`authentication [chap|none|pap]`

Parameters

- `authentication [chap|none|pap]`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>authentication</td>
<td>Sets the type of authentication for this interface</td>
</tr>
<tr>
<td>chap</td>
<td>Configures the authentication mode as CHAP</td>
</tr>
<tr>
<td>none</td>
<td>Configures no authentication mode</td>
</tr>
<tr>
<td>pap</td>
<td>Configures the authentication mode as PAP</td>
</tr>
</tbody>
</table>

Examples

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#authentication pap

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context
interface serial-1/1:1
  authentication pap
```

Related Commands

- `no` Disables or reverts serial interface settings to their default
7.1.34.6.2 description

`interface-config-serial-instance`

Configures a string that describes the serial interface (supplied by the service provider)

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

description <WORD>

**Parameters**
- description <WORD>

<table>
<thead>
<tr>
<th>description &lt;WORD&gt;</th>
<th>Configures the serial interface’s description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt; – Provide a unique description for this serial interface (should not exceed 32 characters in length)</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#description "This interface is for the Sales Team"
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context
    interface serial-1/1:1
        authentication pap
        description "This interface is for the Sales Team"
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

**Related Commands**

| no | Removes the serial interface’s description |
7.1.34.6.3 encapsulation

*interface-config-serial-instance*

Defines the data encapsulation protocol used on this serial interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

encapsulation [chdlc|ppp]

**Parameters**
- encapsulation [chdlc|ppp]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encapsulation [chdlc</td>
<td>ppp]</td>
</tr>
<tr>
<td>chdlc</td>
<td>Configures the encapsulation type as <em>Cisco High-Level Data Link Control</em> (CHDLC). CHDLC is a CISCO proprietary protocol that uses HDLC to send data over synchronous serial links.</td>
</tr>
<tr>
<td>ppp</td>
<td>Configures the encapsulation type as <em>Point-to-Point Protocol</em> (PPP)</td>
</tr>
</tbody>
</table>

**Examples**

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#encapsulation chdlc

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context

interface serial-1/1:1
  encapsulation chdlc
  authentication pap
  description "This interface is for the Sales Team"

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables or reverts serial interface settings to their default</td>
</tr>
</tbody>
</table>
### 7.1.34.6.4 ip

**interface-config-serial-instance**

Configures serial interface IP to use NAT. NAT allows for multiple devices on a LAN with private IP addresses to share a single public IP address.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
ip nat [inside|outside]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nat</td>
<td>Enables the use of NAT on this serial interface</td>
</tr>
<tr>
<td>inside</td>
<td>Marks this serial interface as NAT inside interface</td>
</tr>
<tr>
<td>outside</td>
<td>Marks this serial interface as NAT outside interface</td>
</tr>
</tbody>
</table>

**Examples**

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#ip nat inside
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context interface serial-1/1:1
encapsulation chdlc
authentication pap
```

```

nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

**Related Commands**

```
no Disables or reverts serial interface settings to their default
```

7.1.34.6.5 local-ip-address

Assigns a local IP address for this serial interface

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

local-ip-address <IP>

Parameters

- local-ip-address <IP>

| local-ip-address <IP> | Specify the IP address in the A.B.C.D format |

Examples

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#local-ip-address 192.168.13.7
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context interface serial-1/1:1
encapsulation chdlc
authentication pap
local-ip-address 192.168.13.7
ip nat inside
description "This interface is for the Sales Team"
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

Related Commands

no Disables or reverts serial interface settings to their default
7.1.34.6.6 no

interface-config-serial-instance

Removes or resets this serial interface’s settings

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

no [authentication|description|ip|local-ip-address|password|remote-ip-address|
   shutdown|use|username]

no [authentication|description|local-ip-address|password|remote-ip-address|shutdown|
   username]

no ip nat

no use ip-access-list in

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes or reverts this serial interface’s settings based on the parameters passed |

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#no ?
authentication Type of authentication. Eg chap, pap
description Delete the description of this interface
ip Internet Protocol (IP)
local-ip-address IP address assigned to the local system
password Enter password provided by the service provider
remote-ip-subnet IP subnet assigned to the remote system along with subnet
   in CIDR notation
shutdown Enable serial interface
use Set setting to use
username Enter username provided by the service provider
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```
7.1.34.6.7 password

Configures the serial interface’s password (supplied by the service provider)

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
password <WORD>
```

**Parameters**

- `password <WORD>`

**Examples**

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#password testing@1234
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context
interface serial-1/1:1
  encapsulation chdlc
  authentication pap
  password testing@1234
  local-ip-address 192.168.13.7
  ip nat inside
  description "This interface is for the Sales Team"
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

**Related Commands**

```
no
```

Disables or reverts serial interface settings to their default
7.1.34.6.8 remote-ip-subnet

Configures the remote system’s IP address and subnet in the classes inter-domain routing (CIDR) format.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax
remote-ip-subnet <IP/M>

Parameters
- remote-ip-subnet <IP/M>

<table>
<thead>
<tr>
<th>remote-ip-subnet</th>
<th>Defines a IP subnet assigned to the remote system along with subnet. Specify the IP address and subnet value in the A.B.C.D/M format.</th>
</tr>
</thead>
</table>

Examples

```
x4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#remote-ip-subnet 192.168.0.10/24
```

```
x4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context
interface serial-1/1:1
encapsulation chdlc
authentication pap
password testing@1234
local-ip-address 192.168.13.7
remote-ip-subnet 192.168.13.10/24
ip nat inside
description "This interface is for the Sales Team"
x4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

Related Commands

- no
  Disables or reverts serial interface settings to their default
7.1.34.6.9 remove-override

Removes device overrides

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
remove-override [authentication|description|encapsulation|ip|local-ip-address|
  password|remote-ip-subnet|shutdown|use|username]
remove-override [authentication|description|encapsulation|local-ip-address|
  password|remote-ip-subnet|shutdown|username]
remove-override ip nat
remove-override use ip-access-list in
```

**Parameters**

- `remove-override <PARAMETERS>`

<table>
<thead>
<tr>
<th>remove-override &lt;PARAMETERS&gt;</th>
<th>Removes serial interface related overrides applied on the device to enable profile settings take effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>authentication</td>
<td>Remove override for authentication</td>
</tr>
<tr>
<td>description</td>
<td>Remove override for description</td>
</tr>
<tr>
<td>encapsulation</td>
<td>Remove override for encapsulation</td>
</tr>
<tr>
<td>ip</td>
<td>Internet Protocol (IP)</td>
</tr>
<tr>
<td>local-ip-address</td>
<td>Remove override for local-ip-address</td>
</tr>
<tr>
<td>password</td>
<td>Remove override for password</td>
</tr>
<tr>
<td>remote-ip-subnet</td>
<td>Remove override for remote-ip-subnet</td>
</tr>
<tr>
<td>shutdown</td>
<td>Remove override for serial interface</td>
</tr>
<tr>
<td>use</td>
<td>Set setting to use</td>
</tr>
<tr>
<td>username</td>
<td>Remove override for username</td>
</tr>
</tbody>
</table>

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#remove-override ?
authentication            Remove override for authentication
description               Remove override for description
encapsulation             Remove override for encapsulation
ip                        Internet Protocol (IP)
local-ip-address          Remove override for local-ip-address
password                  Remove override for password
remote-ip-subnet          Remove override for remote-ip-subnet
shutdown                  Remove override for serial interface
use                       Set setting to use
username                  Remove override for username
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context
interface serial-1/1:1
  encapsulation chdlc
  authentication pap
  password testing@1234
  local-ip-address 192.168.13.7
  remote-ip-subnet 192.168.13.10/24
  ip nat inside

</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables or reverts serial interface settings to their default</td>
</tr>
</tbody>
</table>
### 7.1.34.6.10 shutdown

Shuts down the serial interface. Use the no shutdown command to re-start a serial interface.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
shutdown
```

**Parameters**

None

**Examples**

```
nx4500-5CFA2B(config-profile-default-nx6500-if-serial-1/1:1)#shutdown
```

**Related Commands**

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables or reverts serial interface settings to their default</td>
</tr>
</tbody>
</table>
7.1.34.6.11 use

Applies an IP access list on this serial interface

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

use ip-access-list in <IP-ACCESS-LIST-NAME>

Parameters

- use ip-access-list in <IP-ACCESS-LIST-NAME>

<table>
<thead>
<tr>
<th>command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-access-list in &lt;IP-ACCESS-LIST-NAME&gt;</td>
<td>Applies an IP access list on this serial interface</td>
</tr>
<tr>
<td>in</td>
<td>Applies the IP ACL on incoming packets</td>
</tr>
<tr>
<td>&lt;IP-ACCESS-LIST-NAME&gt;</td>
<td>Specify the IP access list name (it should be an existing and configured).</td>
</tr>
</tbody>
</table>

Examples

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#use ip-access-list in BROADCAST-MULTICAST-CONTROL
```
```
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context
interface serial-1/1:1
  authentication pap
  password testing@1234
  local-ip-address 192.168.13.7
  remote-ip-subnet 192.168.13.10/24
  ip nat inside
  use ip-access-list in BROADCAST-MULTICAST-CONTROL
description "This interface is for the Sales Team"
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

Related Commands

- **no** | Disables or reverts serial interface settings to their default |
7.1.34.6.12 username

interface-config-serial-instance

Configures the names of users accessing this serial interface (provided by the service provider)

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

username <WORD>

Parameters

- username <WORD>

username <WORD> | Configures the user names on this serial interface. The user names are provided by the service provider, and should not exceed 32 characters in length.

Examples

```
nx4500-5CFA2B(config-profile-default-nx6500-if-serial-1/1:1)#username SalesPerson1
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#show context
interface serial-1/1:1
  authentication pap
  username SalesPerson1
  password testing@1234
  local-ip-address 192.168.13.7
  remote-ip-subnet 192.168.13.10/24
  ip nat inside
  use ip-access-list in BROADCAST-MULTICAST-CONTROL
  description "This interface is for the Sales Team"
nx4500-5CFA2B(config-profile-default-nx45xx-if-serial-1/1:1)#
```

7.1.34.7 **interface-config-t1e1-instance**

The T1/E1 interfaces are physical layer interfaces that support data, voice, or a combination of data and voice applications. Use the (config-profile-<DEVICE-PROFILE-NAME>) instance to configure the T1/E1 interface associated with the service platform.

To switch to this mode, use the following command:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <DEVICE-PROFILE-NAME>
<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#interface ?
```

The following example uses the config-profile-default-nx6500 instance to configure a T1/E1 interface:

```
nx6500-31FABE(config-profile-default-nx6500)#interface t1e1 1 1
nx6500-31FABE(config-profile-default-nx6500-if-t1e1-1/1)#
```

```
nx6500-31FABE(config-profile-default-nx6500-if-t1e1-1/1)#? 
```

</tbody>
</table>
7.1.34.7.1 channel-group

interface-config-t1e1-instance

Creates a channel group on the selected interface. Channel groups are created to provide WAN data services.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax
channel-group <1-1> timeslots [<TIMESLOT-LIST>|all]

Parameters
- channel-group <1-1> timeslots [<TIMESLOT-LIST>|all]

<table>
<thead>
<tr>
<th>channel-group &lt;1-1&gt;</th>
<th>Specify the channel group index</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeslots [&lt;TIMESLOT-LIST&gt;</td>
<td>all]</td>
</tr>
</tbody>
</table>

- <TIMESLOT-LIST> – Specifies a list of timeslot IDs in the following format: 10-20, 25, 30-31
- all – Configures all timeslots for the specified channel group

Examples
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#channel-group 1 timeslots all
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1
channel-group 1 timeslots all
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#

Related Commands
- no
  - Removes the channel group configured on the T1E1 interface
7.1.34.7.2 clock-mode

`interface-config-t1e1-instance`

Configures the mode for the clock on the selected T1E1 interface. A synchronized clock mode ensures smooth clock extraction and data transfer.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

clock-mode [master|normal]

**Parameters**
- clock-mode [master|normal]

| clock-mode [master|normal] | Sets the mode for the clock on this T1E1 interface |
|---------------------------|-----------------------------------------------|
|                           | • master – Use for one end when connected via a T1 crossover cable |
|                           | • normal – Use when connected to a carrier network. This is the default setting. |

**Examples**

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#clock-mode master
```

```
nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-t1e1-1/1)#show context interface t1e1-1/1
clock-mode master
channel-group 1 timeslots all
```

**Related Commands**

| no | Reverts the T1E1 interface clock mode to default (normal) |
7.1.34.7.3 description

Configures the selected T1E1 interface's description

Supported in the following platforms:
   - Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

description <LINE>

Parameters
   - description <LINE>

|     | Provide a unique description for this T1E1 interface. The description should not exceed 64 characters in length and should help identify the interface. |

Examples

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#description "t1 interface slot 1 Main Office"
nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-t1e1-1/1)#show context
   interface t1e1-1/1
   clock-mode master
   channel-group 1 timeslots all
   description "t1 interface slot 1 Main Office"
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```

Related Commands

- `no` Removes or resets the T1E1 interface description
7.1.34.7.4 high-impedance

Enables or disables high impedance monitoring on the selected T1E1 interface. High impedance interfaces imply low current and high voltage.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

Syntax

high-impedance [disable|enable]

Parameters

- high-impedance [disable|enable]

| high-impedance [disable|enable] | Enables or disables high-impedance
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables high-impedance</td>
</tr>
<tr>
<td>enable</td>
<td>Enables high-impedance</td>
</tr>
</tbody>
</table>

Examples

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#high-impedance enable

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1
  clock-mode master
  high-impedance enable
  channel-group 1 timeslots all
description "t1 interface slot 1 Main Office"

Related Commands

- no
  Resets the high impedance setting to either enable or disable
### 7.1.34.7.5 line-build-out

**interface-config-t1e1-instance**

Defines the line build out in decibels (dB), ohms (OH), or feet (ft). This command specifies the distance to the next repeater.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
line-build-out [dB|OH|ft]
line-build-out [0-110ft|0dB|110-120ft|120OH|15dB|22.5dB|220-330ft|330-440ft|440-550ft|550-660ft|7.5dB|75OH]
```

**Parameters**

- `line-build-out [0-110ft|0dB|110-120ft|120OH|15dB|22.5dB|220-330ft|330-440ft|440-550ft|550-660ft|7.5dB|75OH]`

**Examples**

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#line-build-out 120OH
```

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1
  clock-mode master
  line-build-out 120OH
  high-impedance enable
  channel-group 1 timeslots all
description "t1 interface slot 1 Main Office"
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```

**Related Commands**

- `no` Resets the T1E1 interface line-build-out setting
7.1.34.7.6 line-encoding

`interface-config-t1e1-instance`

Configures the line encoding type on the selected T1E1 interface

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

`line-encoding [ami|b8zs]`

**Parameters**

- `line-encoding [ami|b8zs]`

| line-encoding [ami|b8zs] | Sets the line encoding type (designated by the service provider). The options are ami and b8zs |
|--------------------------|---------------------------------------------------------------------------------------|
|                          | • **ami** — Configures encoding type as *Alternate Mark Inversion* (ami). This option is commonly used for the E1 interfaces. |
|                          | • **b8zs** — Configures the encoding type as *Bipolar 8-Zero Substitution* (b8zs). This option is commonly used for T1 interfaces. |

**Examples**

```bash
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#line-encoding ami
```

```bash
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1
   clock-mode master
   line-encoding ami
   line-build-out 120OH
   high-impedance enable
   channel-group 1 timeslots all
   description "t1 interface slot 1 Main Office"
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```

**Related Commands**

`no` Resets the T1E1 interface line-encoding setting
### 7.1.34.7.7 media

*interface-config-t1e1-instance*

Configures the media type for the physical interface.

**Supported in the following platforms:**
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
media [e1|t1]
```

**Parameters**

- `media [e1|t1]`

| media [e1|t1] | Sets the media type for the physical interface. The options are: e1 and t1. |
|---------------|--------------------------------------------------------------------------------|
|               | • e1 – E1 (common for Europe and worldwide)                                   |
|               | • t1 – T1 (common for USA and Canada)                                         |
|               | If high-impedance is set to ‘enable’, and media                              |

**Examples**

```plaintext
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#media t1
```

```plaintext
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1
clock-mode master
line-encoding ami
line-build-out 120OH
high-impedance enable
channel-group 1 timeslots all
media t1
description "t1 interface slot 1 Main Office"
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```

**Related Commands**

- **no**
  Resets the T1E1 interface media type setting
7.1.34.7.8 no

- `interface-config-t1e1-instance`

Negates or reverts settings to default

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
no [channel-group|clock-mode|description|high-impedance|line-encoding|
media|shutdown]
```

**Parameters**

- `no <PARAMETERS>` Removes or reverts this t1e1 interface’s settings based on the parameters passed

**Examples**

The following example displays the t1e1 interface settings before the ‘no’ commands are executed:

```plaintext
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1
clock-mode master
line-encoding ami
line-build-out 1200H
high-impedance enable
rx-sensitivity-level 30dB
channel-group 1 timeslots all
media t1
description "t1 interface slot 1 Main Office"
x4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```

The following example displays the t1e1 interface settings after the ‘no’ commands are executed:

```plaintext
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#no channel-group 1
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#no high-impedance
```

The following example displays the t1e1 interface settings after the ‘no’ commands are executed:

```plaintext
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#show context
interface t1e1-1/1
clock-mode master
line-encoding ami
line-build-out 1200H
high-impedance disable
rx-sensitivity-level 30dB
media t1
description "t1 interface slot 1 Main Office"
x4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```
7.1.34.7.9 remove-override

- **interface-config-t1e1-instance**

Removes device overrides on the selected T1E1 interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
remove-override [channel-group|clock-mode|description|high-impedance|line-build-out|
    line-encoding|media|shutdown]
```

**Parameters**

- `remove-override <PARAMETERS>`

<table>
<thead>
<tr>
<th>remove-override &lt;PARAMETERS&gt;</th>
<th>Removes device-level overrides based on the parameters passed</th>
</tr>
</thead>
</table>

**Examples**

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#remove-override ?
- channel-group Channel-group for this interface
- clock-mode Delete clock-mode
- description Delete the description of this interface
- high-impedance Delete high-impedance
- line-encoding Delete line-encoding
- media Delete media
- shutdown Enable t1 interface

nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
### 7.1.34.7.10 rx-sensitivity-level

*interface-config-t1e1-instance*

Configures the receive sensitivity level, in decibels (dB), on the selected T1E1 interface.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
rx-sensitivity-level [0dB|12dB|18dB|30dB|36dB|43dB]
```

**Parameters**

- **rx-sensitivity-level [0dB|12dB|18dB|30dB|36dB|43dB]**

| rx-sensitivity-level [0dB|12dB|18dB|30dB|36dB|43dB] | Sets the receive sensitivity level in decibels (dB) |
|---------------------------------------------------|--------------------------------------------------|
| 0dB – 0 decibels                                  | • 0dB – 0 decibels                               |
| 12dB – 12 decibels                                | • 12dB – 12 decibels                             |
| 17.5dB – 17.5 decibels                            | • 17.5dB – 17.5 decibels                         |
| 18dB – 18 decibels                                | • 18dB – 18 decibels                             |
| 22.5dB – 22.5 decibels                            | • 22.5dB – 22.5 decibels                         |
| 30dB – 30 decibels                                | • 30dB – 30 decibels                             |
| 36dB – 36 decibels                                | • 36dB – 36 decibels                             |
| 43dB – 43 decibels                                | • 43dB – 43 decibels                             |

If high-impedance is set to ‘enable’, and media is set to either ‘t1’ or ‘e1’, the valid rx-sensitivity-level values are: 30dB and 12dB. The recommended value is 30dB.

**Examples**

```
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#rx-sensitivity-level 30dB
nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-t1e1-1/1)#show context
interface t1e1-1/1
  clock-mode master
  line-encoding ami
  line-build-out 1200H
  high-impedance enable
  rx-sensitivity-level 30dB
  channel-group 1 timeslots all
  media t1
  description "t1 interface slot 1 Main Office"
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#
```

**Related Commands**

- **no**  Removes or resets rx sensitivity settings
7.1.34.7.11 shutdown

Shuts down the selected T1E1 interface. Use the `no shutdown` command to re-start the interface.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**
```
shutdown
```

**Parameters**
None

**Examples**
nx4500-5CFA2B(config-profile-testNX45XX-if-t1e1-1/1)#shutdown

**Related Commands**

<table>
<thead>

</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Re-starts the T1E1 interface</td>
</tr>
</tbody>
</table>
7.1.34.8 interface-config-vm-instance

WiNG provides a dataplane bridge for external network connectivity for Virtual Machines (VMs). VM interfaces are layer 2 interfaces on WiNG bridge that define which IP address is associated with each VLAN ID the service platform is connected to and enables remote service platform administration. Each custom VM can have up to a maximum of two physical VM interfaces. Each VM interface can be mapped to one of eight VMIF ports for and NX4500 and NX6500 service platforms and twelve ports for NX9500 on the dataplane bridge. This mapping determines the destination for service platform routing.

By default, VM interfaces are internally connected to the dataplane bridge via VMIF1. VMIF1 is an untagged port providing access to VLAN 1 to support the capability to connect the VM interfaces to any of the VMIF ports. This provides the flexibility to move a VM interface onto different VLANs as well as configure specific firewall and QoS rules.

Use the (config-profile-<DEVICE-PROFILE-NAME>) instance to configure the VM interface associated with the service platform profile.

To switch to this mode, use the following commands:

```
<DEVICE>(config)#profile <DEVICE-TYPE> <DEVICE-PROFILE-NAME>
<DEVICE>(config-profile-<DEVICE-PROFILE-NAME>)#interface ?
```

The following example uses the config-profile-default-nx45xx instance to configure a VM interface:

```
nx4500-5CFA2B(config-profile-default-nx45xx)#interface vmif ?
    <1-8> Interface index

nx4500-5CFA2B(config-profile-default-nx45xx)#
nx4500-5CFA2B(config-profile-default-nx45xx)#interface vmif 2
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#
```

VM Interface Mode commands:
- **description** Port description
- **ip** Internet Protocol (IP)
- **ipv6** Internet Protocol version 6 (IPv6)
- **no** Negate a command or set its defaults
- **qos** Quality of service
- **switchport** Set switching mode characteristics
- **use** Set setting to use

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#
nx9500-6C8809(config-profile-default-nx9000)#interface vmif ?
    <1-12> Interface index
```

```
nx9500-6C8809(config-profile-default-nx9000)#
```
The following table summarizes VM interface configuration commands:

<table>
<thead>
<tr>

</table>
7.1.34.8.1 description

`interface-config-vm-instance`

Configures a short description of this VM interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

`description <WORD>`

**Parameters**

- `description <WORD>`

<table>
<thead>
<tr>
<th><code>&lt;WORD&gt;</code></th>
<th>Provide a short description (64 characters maximum) that uniquely describes this VM interface and differentiates it from others with similar configurations.</th>
</tr>
</thead>
</table>

**Examples**

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#description "This VM interface is reserved for TEAM-URC"
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context interface vmif2
description "This VM interface is reserved for TEAM-URC"
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#
```

**Related Commands**

`no`

Removes the description configured for this VM interface
7.1.34.8.2 ip

- **interface-config-vm-instance**

Configures IP settings related to ARP and DHCP responses

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
ip [arp|dhcp]
ip arp [header-mismatch-validation|trust]
ip dhcp trust
```

**Parameters**

- **ip arp [header-mismatch-validation|trust]**
  - Configures ARP related settings
  - header-mismatch-validation — Enables a source MAC mismatch check in both the ARP and Ethernet headers. The option is enabled by default.
  - trust — Enables ARP trust on this VM interface. ARP packets received on this port are considered trusted, and information from these packets is used to identify rogue devices. The option is disabled by default.

- **ip dhcp trust**
  - Configures DHCP related settings
  - trust — Enables DHCP trust on this VM interface. When enabled, only DHCP responses are trusted and forwarded on this VM interface, and a DHCP server can be connected only to a DHCP trusted port. The option is enabled by default.

**Examples**

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#ip arp trust
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#ip arp header-mismatch-validation
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context interface vmif2
description "This VM interface is reserved for TEAM-URC"
ip arp trust
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#
```

**Related Commands**

- `no` Disables ARP response trust and source MAC mismatch check on this VM interface. Also disables DHCP response trust setting.
### 7.1.34.8.3 ipv6

Sets the DHCPv6 and ICMPv6 neighbor discovery (ND) components for this VM interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
ipv6 [dhcpv6|nd]
```

```
ipv6 dhcpv6 trust
```

```
ipv6 nd [header-mismatch-validation|raguard|trust]
```

**Parameters**

- `ipv6 dhcpv6 trust`

- `ipv6 nd [header-mismatch-validation|raguard|trust]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ipv6 dhcpv6 trust</code></td>
<td>Sets the DHCPv6 trust state for DHCPv6 responses on this VM interface. When enabled, all DHCPv6 responses received on this port are trusted and forwarded. And a DHCPv6 server can be connected only on a trusted port. This option is enabled by default.</td>
</tr>
</tbody>
</table>
| `ipv6 nd [header-mismatch-validation|raguard|trust]` | Sets the IPv6 neighbor discovery settings for this VM interface.  
`header-mismatch-validation` Checks for mismatch of source MAC address in the ICMPv6 ND header and Ethernet header (link layer option). This option is disabled by default.  
`raguard` Allows redirection of router advertisements (RAs) and ICMPv6 packets originating on this interface. Router advertisements are periodically sent either to hosts or in response to solicitation requests. The RA includes IPv6 prefixes and other subnet and host information. This option is enabled by default.  
`trust` Sets trust state for ND requests received on this interface. When enabled, only DHCPv6 responses are trusted and forwarded on this VM interface, and a DHCPv6 server can be connected only to a trusted port. DHCPv6 relay agents receive messages from clients and forward them to a DHCPv6 server. The server sends responses back to the relay agent, and the relay agent sends the responses to the client on the local link. This option is disabled by default.  

**Examples**

```
nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-vmif1)#ipv6 dhcpv6 trust
```

```
nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-vmif1)#ipv6 nd trust
```

```
nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-vmif1)#show context
```

```
interface vmif1
  ipv6 dhcpv6 trust
  ipv6 nd trust
```

```
nx4500-5CFA2B(config-device-B4-C7-99-5C-FA-2B-if-vmif1)#
```

**Related Commands**

- `no` Removes or reverts IPv6 settings on this interface
7.1.34.8.4 no

```plaintext
interface-config-vm-instance
```

Removes or reverts the VM interface settings

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

- `no ip [arp|dhcpp]
- `no ip arp [header-mismatch-validation|trust]
- `no ip dhcp trust
- `no ip dhcpv6
- `no ip dhcpv6 trust
- `no ip dhcpv6 nd [header-mismatch-validation|raguard|trust]
- `no ip trust [802.1p|cos|dscp]
- `no switchport [access vlan|mode|trunk native tagged]
- `no use [ip-access-list|ipv6-access-list|mac-access-list] in

**Parameters**

- `no <PARAMETERS>

Removes or reverts this VM interface’s settings based on the parameters passed

**Examples**

The following example displays the VM interface settings before the ‘no’ commands are executed:

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context
interface vmif2
  description "This VM interface is reserved for TEAM-URC"
  switchport mode trunk
  switchport trunk native vlan 200
  no switchport trunk native tagged
  switchport trunk allowed vlan 200
  use ip-access-list in BROADCAST-MULTICAST-CONTROL
  ip arp trust
  ip arp header-mismatch-validation
```

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#no description
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#no use ip-access-list in
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#no ip arp trust
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#no ip arp header-mismatch-validation
```

The following example displays the VM interface settings after the ‘no’ commands have been executed:

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context
interface vmif2
  switchport mode trunk
  switchport trunk native vlan 200
  no switchport trunk native tagged
  switchport trunk allowed vlan 200
```

### 7.1.34.8.5 qos

*interface-config-vm-instance*

Configures the *Quality of Service* (QoS) settings on this VM interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

qos trust [802.1p|cos|dscp]

**Parameters**
- qos trust [802.1p|cos|dscp]

| trust [802.1p|cos] | Enables trust for 802.1p *Class of Service* (CoS) values received on this VM interface. The option is enabled by default. CoS manages traffic by grouping similar type of traffic (for example, e-mails, videos, large document files etc.) into a class and assigning it a service priority. One of the commonly used CoS techniques is 802.1p layer 2 tagging. |
|-------------------|
| trust dscp       | Enables trust for IP *Differentiated Services Code Point* (DSCP) values received on this VM interface. The option is enabled by default. DSCP values in a IP packet determines the level of service assigned to the packet. |

**Examples**

```
x4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#qos trust 802.1p
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#qos trust dscp
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#no qos trust cos
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context
interface vmif2
   switchport mode trunk
   switchport trunk native vlan 200
   no switchport trunk native tagged
   switchport trunk allowed vlan 200
   no qos trust 802.1p
```

**Related Commands**

| no   | Removes QoS settings on this VM interface |
### Profiles 7 - 343

#### 7.1.34.8.6 switchport

- **interface-config-vm-instance**

Defines the switching mode settings for this VM interface

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
switchport [access|mode|trunk]

switchport access vlan [<1-4094>|<VLAN-ALIAS-NAME>]

switchport mode [access|trunk]

switchport trunk [allowed|native]

switchport trunk allowed vlan [<1-4094>|add <VLAN-ID>|none|remove <VLAN-ID>]

switchport trunk native [tagged|vlan [<1-4094>|<VLAN-ALIAS-NAME>]]
```

**Parameters**

- **switchport access vlan [<1-4094>|<VLAN-ALIAS-NAME>]**

| switchport access vlan [access|trunk] | Specifies the VLAN used when the switching mode is set to access. Use one of the following options to provide the VLAN ID: |
|--------------------------------------|-------------------------------------------------|
| <1-4094>                             | <1-4094> – Specify the VLAN ID from 1 - 4094. |
| <VLAN-ALIAS-NAME>                    | <VLAN-ALIAS-NAME> – Specify the VLAN alias name. The VLAN alias should be existing and mapped to the required VLAN interface. |

**Note:** use the **switchport > mode > access** command to select the access mode.

- **switchport mode [access|trunk]**

<table>
<thead>
<tr>
<th>switchport mode</th>
<th>Sets the VLAN switching mode over the VM interface. The options are: access and trunk.</th>
</tr>
</thead>
</table>

- **access**

Sets the VLAN switching mode to **access**. This option enables the VM interface to accept packets only from the native VLAN. Frames are forwarded untagged with no 802.1Q header. All frames received on the VM port are expected as untagged and are mapped to the native VLAN. This is the default setting.

If selecting access, use the **switchport > access > vlan** command to specify the VLAN interfaces used in the access mode.

- **trunk**

Sets the VLAN switching mode to **trunk**. This option enables the VM interface to allow packets from a list of VLANs added to the trunk. A VM interface configured as trunk supports multiple 802.1Q tagged VLANs and one native VLAN. The native VLAN can be tagged or untagged.

If selecting trunk, use the **switchport > trunk > allowed/native** command to specify the VLANs and the native VLAN.

- **switchport trunk allowed vlan [<1-4094>|add <VLAN-ID>|none|remove <VLAN-ID>]**

<table>
<thead>
<tr>
<th>switchport trunk allowed</th>
<th>Specifies the VLANs allowed when the switching mode is set to trunk</th>
</tr>
</thead>
</table>

Creates a list of allowed VLANs (from which packets can be accepted in the trunking mode). This command also allows the modification of an existing list.
### Examples

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#switchport mode trunk

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#switchport trunk native vlan 200

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context
interface vmif2
description "This VM interface is reserved for TEAM-URC"
switchport mode trunk
switchport trunk native vlan 200
no switchport trunk native tagged
switchport trunk allowed vlan 200
ip arp trust
ip arp header-mismatch-validation
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#

---

**switchport trunk native** *(tagged|vlan [<1-4094>|<VLAN-ALIAS-NAME>])*

- Specifies the native VLAN allowed when the switching mode is set to trunk.

**tagged**

- Select this option to tag the native VLAN.
  - Service Platforms support the IEEE 802.1Q specification for tagging frames and coordinating VLANs between devices. IEEE 802.1Q adds four bytes to each frame identifying the VLAN ID for upstream VMIF that the frame belongs. If the upstream VMIF does not support IEEE 802.1Q tagging, it does not interpret the tagged frames. When VLAN tagging is required between VM interface ports, both VM interfaces must support tagging and be configured to accept tagged VLANs. When a frame is tagged, a 12 bit frame VLAN ID is added to the 802.1Q header, so upstream VMIF interfaces know which VLAN ID the frame belongs to. The 12 bit VLAN ID is read and the frame is forwarded to the appropriate VLAN. When a frame is received with no 802.1Q header, the upstream VMIF classifies the frame using the default or native VLAN assigned to the Trunk port. The native VLAN allows a VM interface to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. This setting is disabled by default.

**vlan** *(<1-4094>|<VLAN-ALIAS-NAME>)*

- Select this option for untagged native VLAN. An untagged native VLAN allows an Ethernet device to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. Additionally, the native VLAN is the VLAN untagged traffic will be directed over when using trunk mode.

- Use one of the following options to provide the native VLAN ID:
  - `<1-4094>` – Specify the native VLAN ID from 1 - 4094.
  - `<VLAN-ALIAS-NAME>` – Specify the VLAN alias name. The VLAN alias should be existing and mapped to the required native VLAN interface.

  The default native VLAN value is 1.

| **vlan**
|---|
| `<1-4094>`| Create a list of allowed VLANs and also modifies an existing VLAN list
| `<VLAN-ALIAS-NAME>`| Add VLANs that exclusively send packets over the VM interface. The available range is from 1 - 4094. The maximum number of entries is 256.
| none| Removes all VLANs from an existing list
| `<1-4094>`| Removes the VLAN ID, identified by the `<VLAN-ID>` keyword, from an existing list
| `<VLAN-ALIAS-NAME>`| Removes the VLAN ID, identified by the `<VLAN-ID>` keyword, from an existing list
| **trunk native**
|---|
| Select this option to tag the native VLAN.
| Add VLANs that exclusively send packets over the VM interface. The available range is from 1 - 4094. The maximum number of entries is 256.
| none| Removes all VLANs from an existing list
| `<1-4094>`| Removes the VLAN ID, identified by the `<VLAN-ID>` keyword, from an existing list

---

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#switchport mode trunk

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#switchport trunk native vlan 200

nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#

---

**switchport trunk native** *(tagged|vlan [<1-4094>|<VLAN-ALIAS-NAME>])*

- Specifies the native VLAN allowed when the switching mode is set to trunk.

**tagged**

- Select this option to tag the native VLAN.
  - Service Platforms support the IEEE 802.1Q specification for tagging frames and coordinating VLANs between devices. IEEE 802.1Q adds four bytes to each frame identifying the VLAN ID for upstream VMIF that the frame belongs. If the upstream VMIF does not support IEEE 802.1Q tagging, it does not interpret the tagged frames. When VLAN tagging is required between VM interface ports, both VM interfaces must support tagging and be configured to accept tagged VLANs. When a frame is tagged, a 12 bit frame VLAN ID is added to the 802.1Q header, so upstream VMIF interfaces know which VLAN ID the frame belongs to. The 12 bit VLAN ID is read and the frame is forwarded to the appropriate VLAN. When a frame is received with no 802.1Q header, the upstream VMIF classifies the frame using the default or native VLAN assigned to the Trunk port. The native VLAN allows a VM interface to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. This setting is disabled by default.

**vlan** *(<1-4094>|<VLAN-ALIAS-NAME>)*

- Select this option for untagged native VLAN. An untagged native VLAN allows an Ethernet device to associate untagged frames to a VLAN when no 802.1Q frame is included in the frame. Additionally, the native VLAN is the VLAN untagged traffic will be directed over when using trunk mode.

- Use one of the following options to provide the native VLAN ID:
  - `<1-4094>` – Specify the native VLAN ID from 1 - 4094.
  - `<VLAN-ALIAS-NAME>` – Specify the VLAN alias name. The VLAN alias should be existing and mapped to the required native VLAN interface.

  The default native VLAN value is 1.

7.1.34.8.7 use

`interface-config-vm-instance`

Applies inbound IPv4, IPv6, and MAC specific firewall rules to this profile’s VM interface. The firewall inspects IP and MAC traffic flows and detects attacks typically not visible to traditional wired firewall appliances.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
use [ip-access-list|ipv6-access-list|mac-access-list] in <IP/IPv6/MAC-ACCESS-LIST-NAME>
```

**Parameters**

- `use [ip-access-list|ipv6-access-list|mac-access-list] in <IP/IPv6/MAC-ACCESS-LIST-NAME>`

**Examples**

```
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#use ip-access-list in BROADCAST-MULTICAST-CONTROL
  nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#show context
    interface vmif2
        description "This VM interface is reserved for TEAM-URC"
        switchport mode trunk
        switchport trunk native vlan 200
        no switchport trunk native tagged
        switchport trunk allowed vlan 200
  use ip-access-list in BROADCAST-MULTICAST-CONTROL
  ip arp trust
  ip arp header-mismatch-validation
nx4500-5CFA2B(config-profile-default-nx45xx-if-vmif2)#
```

</table>
7.1.35.1 ip

ip

Configures IPv4 routing components, such as default gateway, DHCP, DNS server forwarding, name server, domain name, routing standards etc.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
ip [default-gateway|dhcp|dns-server-forward|domain-lookup|domain-name|igmp|name-server|nat|route|routing]

ip default-gateway [<IP>|<HOST-ALIAS-NAME>|failover|priority [dhcp-client <1-1800>|static-route <1-1800>]]

ip [dns-server-forward|domain-lookup|domain-name <DOMAIN-NAME>|name-server <IP>|routing]

ip dhcp client [hostname|persistent-lease]

ip igmp snooping {forward-unknown-multicast|querier}
ip igmp snooping [forward-unknown-multicast]

ip igmp snooping {forward-unknown-multicast|querier} {max-response-time <1-25>|query-interval <1-18000>|robustness-variable <1-7>|timer expiry <60-300>|version <1-3}]

ip nat [crypto|inside|outside|pool]

ip nat [crypto source pool|pool] <NAT-POOL-NAME>

ip nat [inside|outside] [destination|source]

ip nat [inside|outside] destination static <ACTUAL-IP> <1-65535> [tcp|udp]
[[<NATTED-IP> <1-65535>]]

ip nat [inside|outside] source [list|static]

ip nat [inside|outside] source static <ACTUAL-IP> <1-65535> [tcp|udp]
[[<NATTED-IP> <1-65535>]]

ip nat [inside|outside] source list <IP-ACCESS-LIST-NAME> interface [<INTERFACE-NAME>|ppoe1|vlan <1-4094>|wwan1] [[address <IP>|interface <L3-IF-NAME>|overload|pool <NAT-POOL-NAME>]]

ip route <IP/M> [<IP>|<HOST-ALIAS-NAME>]

Parameters

```

NOTE: The command ‘ip igmp snooping’ can be configured under bridge VLAN context also. For example: rfs7000-37FABE(config-device 00-15-70-37-FA-BE-bridge-vlan-1)#ip igmp snooping forward-unknown-multicast

<p>| default-gateway | Configures default gateway (next-hop router) parameters |</p>

</tbody>
</table>
### igmp snooping querier

**Optional.** Enables/disables the IGMP querier functionality for the specified VLAN. By default IGMP snooping querier is disabled.

- **max-response-time <1-25>**
  - Configures the IGMP maximum query response interval used in IGMP V2/V3 queries for the given VLAN. The default is 10 seconds.
- **query-interval <1-18000>**
  - Configures the IGMP querier query interval in seconds. Specify a value from 1 - 18000 seconds. The default is 60 seconds.
- **robustness-variable <1-7>**
  - Configures the IGMP robustness variable from 1 - 7. The default is 2.
- **timer expiry <60-300>**
  - Configures the other querier time out value for the given VLAN. The default is 60 seconds.
- **version <1-3>**
  - Configures the IGMP query version for the given VLAN. The default is 3.

### ip nat [crypto source pool|pool <NAT-POOL-NAME>]

- **nat**
  - Configures the NAT parameters
- **crypto source pool <NAT-POOL-NAME>**
  - Configures the NAT source address translation settings for IPSec tunnels
    - `<NAT-POOL-NAME>` – Specify a NAT pool name.
- **pool <NAT-POOL-NAME>**
  - Configures a pool of IP addresses for NAT
    - `<NAT-POOL-NAME>` – Specify a name for the NAT pool.

### ip nat [inside|outside] destination static <ACTUAL-IP> <1-65535> [tcp|udp] [(<NATTED-IP> {<1-65535>})]

- **nat**
  - Configures the NAT parameters
- **inside|outside**
  - Configures inside and outside address translation for the destination
    - `inside` – Configures inside address translation
    - `outside` – Configures outside address translation
- **destination static <ACTUAL-IP>**
  - The following keywords are common to the ‘inside’ and ‘outside’ parameters:
    - `destination ` – Specifies destination address translation parameters
    - `static ` – Specifies static NAT local to global mapping
      - `<ACTUAL-IP>` – Specify the actual outside IP address to map.
- **<1-65535> [tcp|udp]**
  - `<1-65535>` – Configures the actual outside port. Specify a value from 1 - 65535.
    - `tcp` – Configures Transmission Control Protocol (TCP) port
    - `udp` – Configures User Datagram Protocol (UDP) port
- **<NATTED-IP> <1-65535>**
  - Enables configuration of the outside natted IP address
    - `<NATTED-IP>` – Specify the outside natted IP address.
    - `<1-65535>` – Optional. Configures the outside natted port. Specify a value from 1 - 65535.
### Profiles 7 - 351

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `ip nat [inside|outside] source list <IP-ACCESS-LIST-NAME> interface [INTERFACE-NAME|pppoe1|vlan <1-4094>|wwan1] [(address <IP>|interface <L3-IF-NAME>|overload|pool <NAT-POOL-NAME>)]` | Configures inside and outside address translation for the source:
- `inside` – Configures inside address translation
- `outside` – Configures outside address translation

The following keywords are common to the 'inside' and 'outside' parameters:
- `source` – Specifies source address translation parameters
- `static` – Specifies static NAT local to global mapping
- `<ACTUAL-IP>` – Specify the actual inside IP address to map.

| `<ACTUAL-IP>` | Configures the actual outside port. Specify a value from 1 - 65535.
| `[tcp|udp]` | `<ACTUAL-IP>` – Configures the actual outside port. Specify a value from 1 - 65535.
| `<1-65535>` | `tcp` – Configures Transmission Control Protocol (TCP) port
| `<1-65535>` | `udp` – Configures User Datagram Protocol (UDP) port

- `<NATTED-IP>` Enables configuration of the outside natted IP address.
- `<NATTED-IP>` – Specify the outside natted IP address.
- `<1-65535>` – Optional. Configures the outside natted port. Specify a value from 1 - 65535.

### Nat Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>nat</code></td>
<td>Configures the NAT parameters</td>
</tr>
</tbody>
</table>

- `<IP>` | Configures inside and outside IP access list

| `<IP-ACCESS-LIST-NAME>` | Configures an access list describing local addresses
| `source list [inside|outside]` | `<IP-ACCESS-LIST-NAME>` – Specify a name for the IP access list.

| `<INTERFACE-NAME>` | Selects an interface to configure. Select a layer 3 router interface or a VLAN interface.
| `pppoe1` | `<INTERFACE-NAME>` – Selects a layer 3 interface. Specify the layer 3 router interface name.
| `vlan <1-4094>` | `vlan` – Selects a VLAN interface
| `wwan1` | `<1-4094>` – Set the SVI VLAN ID of the interface.

| `<L3-IF-NAME>` | The following keyword is recursive and common to all interface types:
| `address <IP>` | `address <IP>` – Configures the interface IP address used with NAT

| `<INTERFACE-NAME>` | The following keyword is recursive and common to all interface types:
| `interface [inside|outside]` | `interface <L3-IF-NAME>` – Configures a wireless controller or service platform’s VLAN interface
| `overload` | `<L3-IF-NAME>` – Specify the SVI VLAN ID of the interface.

| `<IP>` | The following keyword is recursive and common to all interface types:
| `overload` | `overload` – Enables use of global address for many local addresses

| `<NAT-POOL-NAME>` | The following keyword is recursive and common to all interface types:
| `pool [inside|outside]` | `pool <NAT-POOL-NAME>` – Specifies the NAT pool
| `<NAT-POOL-NAME>` | `<NAT-POOL-NAME>` – Specify the NAT pool name.
ip route <IP/M> [<IP>|<HOST-ALIAS-NAME>]

<table>

7.1.35.2 nat-pool-config-instance

Use the config-profile-<DEVICE-PROFILE-NAME> instance to configure Network Address Translation (NAT) pool settings.

The following example uses the config-profile-default-rfs7000 instance to configure NAT pool settings:

```
rfs7000-37FABE(config-profile-default-rfs7000)# ip nat pool pool1
rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#?
```

Nat Policy Mode commands:
- `address`: Specify addresses for the nat pool
- `no`: Negate a command or set its defaults
- `clrscr`: Clears the display screen
- `commit`: Commit all changes made in this session
- `do`: Run commands from Exec mode
- `end`: End current mode and change to EXEC mode
- `exit`: End current mode and down to previous mode
- `help`: Description of the interactive help system
- `revert`: Revert changes
- `service`: Service Commands
- `show`: Show running system information
- `write`: Write running configuration to memory or terminal

The following table summarizes NAT pool configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>address</code></td>
<td>Configures NAT pool addresses</td>
<td>page 7-355</td>

<td>Negates a command or sets its default</td>
<td>page 7-356</td>
</tr>
</tbody>
</table>

---

**Table 7.23** NAT-Pool Commands
7.1.35.2.1 address

`nat-pool-config-instance`

Configures NAT pool of IP addresses

Define a range of IP addresses hidden from the public Internet. NAT modifies network address information in the defined IP range while in transit across a traffic routing device. NAT only provides IP address translation and does not provide a firewall. A branch deployment with NAT by itself will not block traffic from being potentially routed through a NAT device. Consequently, NAT should be deployed with a stateful firewall.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
address [<IP> | range <START-IP> <END-IP>]
```

**Parameters**

- `address [<IP> | range <START-IP> <END-IP>]`

  **Examples**

  ```
  rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#address range 172.16.10.2 172.16.10.8
  rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#show context
  ip nat pool p0oll
        address range 172.16.10.2 172.16.10.8
  rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#
  ```

**Related Commands**

- `no` Removes address(es) configured with this NAT pool
7.1.35.2.2 no

- nat-pool-config-instance

Removes address(es) configured with this NAT pool

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5600, NX5624, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no address [<IP>|range <START-IP> <END-IP>]

Parameters

- no address [<IP>|range <START-IP> <END-IP>]

| no address [<IP>|range <START-IP> <END-IP>] | Removes a single IP address or a range of IP addresses from this NAT pool |

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#show context
ip nat pool pool1
    address range 172.16.10.2 172.16.10.8
rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#

rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#no address range 172.16.10.2 172.16.10.8
rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#show context
ip nat pool pool1
rfs7000-37FABE(config-profile-default-rfs7000-nat-pool-pool1)#

Related Commands

- address | Configures NAT pool IP address(es) |
### 7.1.36 ipv6

**Profile Config Commands**

Configures IPv6 routing components, such as default gateway, DNS server forwarding, name server, routing standards etc. These IPv6 settings are applied to all devices using this profile.

You can also configure IPv6 settings on a device, using the device’s configuration mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
ipv6 [default-gateway|dns-server-forward|hop-limit|mld|name-server|nd-reachable-time|neighbor|ns-interval|ra-convert|route|ula-reject-route|unicast-routing]
```

```plaintext
ipv6 [default-gateway <IPv6> {vlan <VLAN-ID>}|dns-server-forward|hop-limit <1-255>|name-server <IPv6>|nd-reachable-time <5000-3600000>|ns-interval <1000-3600000>|ula-reject-route|unicast-routing]
```

```plaintext
ipv6 ra-convert {throttle interval <3-1800> max-RAs <1-256>}
```

```plaintext
ipv6 mld snooping {forward-unknown-multicast|querier}
```

```plaintext
ipv6 mld snooping {forward-unknown-multicast|max-response-time <1-25000>|query-interval <1-18000>|robustness-variable <1-7>|timer expiry <60-300>|version <1-2>}
```

```plaintext
ipv6 neighbor [IPv6] [timeout]
```

```plaintext
ipv6 neighbor <IPv6> <MAC> [INTF-NAME] | pppoe1 | vlan <1-4094> | wwan1 {dhcp-server|router}
```

```plaintext
ipv6 neighbor timeout <15-86400>
```

```plaintext
ipv6 route <DEST-IPv6-PREFIX/PREFIX-LENGTH> <IPv6-GATEWAY-ADDRESS> [vlan <VLAN-ID>]
```

#### Parameters

| Default-gateway <IPv6> {vlan <VLAN-ID>} | Configures IPv6 default gateway’s address in the ::/0 format  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan &lt;VLAN-ID&gt;</td>
<td>Optional. Specify the VLAN interface’s ID through which the default gateway is accessible.</td>
</tr>
</tbody>
</table>

| dns-server-forward | Enables DNS server forwarding. This command enables the forwarding of DNS queries to DNS servers outside of the network. This feature is disabled by default. |

| hop-limit <1-255> | Configures the IPv6 hop count limit  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-255&gt;</td>
<td>Specify a value between 1 - 255. The default is 64.</td>
</tr>
</tbody>
</table>

NOTE: The IPv6 settings configured at the profile/device level are global configuration settings and not interface-specific.
### Configuration Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name-server &lt;IPv6&gt;</code></td>
<td>Configures the IPv6 name server's address. &lt;IPv6&gt; – Specify the address of the IPv6 name server.</td>
</tr>
<tr>
<td><code>nd-reachable-time &lt;5000-3600000&gt;</code></td>
<td>Configures the time, in milliseconds, that a neighbor is assumed to be reachable after having received neighbor discovery (ND) confirmation for their reachability. &lt;5000-3600000&gt; – Specify a value from 5000 - 3600000 milliseconds. The default is 30,000 milliseconds.</td>
</tr>
<tr>
<td><code>ns-interval &lt;1000-3600000&gt;</code></td>
<td>Configures the interval, in milliseconds, between two consecutive retransmitted neighbor solicitation (NS) messages. NS messages are sent by a node to determine the link layer address of a neighbor, or verify a neighbor is still reachable via a cached link-layer address. &lt;1000-3600000&gt; – Specify a value from 1000 - 3600000. The default is 1000 milliseconds.</td>
</tr>
<tr>
<td><code>ula-reject-route</code></td>
<td>Installs a &quot;reject&quot; route for Unique Local Address (ULA) prefixes. This ensures that site-border routers and firewalls do not forward packets with ULA source or destination addresses outside of the site, unless explicitly configured with routing information about specific /48 or longer Local IPv6 prefixes. This option is disabled by default. The ULA is an IPv6 address used in private networks for local communication within a site (for example a company, campus, or within a set of branch office networks). These site local addresses are IPv6 addresses that fall in the block fc00::/7, defined in RFC 4193.</td>
</tr>
<tr>
<td><code>unicast-routing</code></td>
<td>Enables/disables IPv6 unicast routing. This feature is enabled by default.</td>
</tr>
<tr>
<td><code>ipv6 ra-convert {throttle interval &lt;3-1800&gt; max-RAs &lt;1-256&gt;}</code></td>
<td>Enables/disables conversion of multicast router advertisements (RAs) to unicast RAs at the dot11 layer. This feature is disabled by default. Throttle multicast RAs before converting to unicast. throttle – Optional. Throttles multicast RAs for a specified time period. Specify the interval from 3 - 1800 seconds. The default is 3 seconds. max-RAs &lt;1-256&gt; – Specifies the maximum number of RAs per IPv6 router during the specified throttle interval. Specify a value from 1 - 256. The default is 1.</td>
</tr>
<tr>
<td><code>ipv6 mld snooping {forward-unknown-multicast}</code></td>
<td>Enables/disables multicast listener discovery (MLD) protocol snooping. When enabled, IPv6 devices (access point, wireless controller, or service platform) can examine MLD messages exchanged between hosts and multicast routers to discern which hosts are receiving multicast group traffic. Based on the information gathered these devices forward multicast traffic only to those interfaces connected to interested receivers instead of flooding traffic to all interfaces. This prevents VLANs from getting flooded with IPv6 multicast traffic. forward-unknown-multicast – Optional. Enables/disables unknown multicast forwarding. This feature is enabled by default.</td>
</tr>
</tbody>
</table>
| `ipv6 mld snooping querier {max-response-time <1-25000>|query-interval <1-18000>|robustness-variable <1-7>|timer expiry <60-300>|version <1-2>}` | Enables/disables MLD protocol snooping. querier – Optional. Enables/disables the on-board MLD querier. When enabled, IPv6 devices send query messages to discover which network devices are members of a given multicast group. This option is disabled by default.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| max-response-time | Configures the MLD querier’s maximum query response time. This is the time for which the querier waits before sending a responding report. Queriers use MLD reports to join and leave multicast groups and receive group traffic.  
- `<1-25000>` – Specify a value from 1 - 25000 milliseconds. The default is 10 milliseconds. |
| query-interval | Configures the interval, in seconds, between two consecutive MLD querier’s queries. The robustness variable is an indication of how susceptible the subnet is to lost packets. MLD can recover from robustness variable minus 1 lost MLD packets.  
- `<1-18000>` – Specify a value from 1 - 18000 seconds. The default is 60 seconds. |
| robustness-variable | Configures the MLD IGMP robustness variable. This value is used by the sender of a query.  
- `<1-7>` – Select a value from 1 - 7. The default is 2. |
| timer expiry | Configures the MLD other querier (any external querier) timeout  
- `<60-300>` – Specify a value from 60 - 300 seconds. The default is 60 seconds. |
| version | Configures the MLD querier’s version. MLD version 1 is based on IGMP version 2 for IPv4. MLD version 2 is based on IGMP version 3 for IPv4 and is fully backward compatible. IPv6 multicast uses MLD version 2.  
- `<1-2>` – Select the MLD version from 1 - 2. The default is 2. |

- `ipv6 neighbor <IPv6> <MAC> [<INTF-NAME>|pppoe1|vlan <1-4094>|wwan1] {dhcp-server|router}`

<table>
<thead>
<tr>
<th>neighbor</th>
<th>Configures static IPv6 neighbor entries</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IPv6&gt;</code></td>
<td>Specify the IPv6 address for which a static neighbor entry is created.</td>
</tr>
<tr>
<td><code>&lt;MAC&gt;</code></td>
<td>Specify the MAC address associated with the specified IPv6 address.</td>
</tr>
</tbody>
</table>

| `[<INTF-NAME>|pppoe1|vlan <1-4094>|wwan1]` | Specify the following interface settings:  
- `<INTF-NAME>` – Selects the layer 3 router interface. Specify the interface name.  
- `pppoe1` – Selects the PPP over Ethernet interface  
- `vlan <1-4094>` – Selects the VLAN interface. Specify the VLAN interface index.  
- `wwan1` – Selects the wireless WAN interface |

| `{dhcp-server|router}` | After specifying interface type, you can optionally specify the device type for this neighbor solicitation.  
- `dhcp-server` – Optional. States this neighbor entry is for a DHCP server  
- `router` – Optional. States this neighbor entry is for a router |

- `ipv6 neighbor timeout <15-86400>`

| neighbor | Configures the timeout, in seconds, for the static neighbor entries  
- `<15-86400>` – Specify a value from 15 - 86400 seconds. The default is 3600 seconds. |
- `ipv6 route <DEST-IPv6-PREFIX/PREFIX-LENGTH> <IPv6-GATEWAY-ADDRESS> {vlan <VLAN-ID>}`

  **route**

  Configures the static routes
  These routes are maintained in the IPv6 Forwarding Information Base (FIB).
  **Note:** To view FIB6 routing entries, use the `service > show fib6 > <TABLE-ID>` command.

  **<DEST-IPv6-PREFIX/PREFIX-LENGTH>**

  Specify the IPv6 destination prefix (IPv6 network) and the prefix length.

  **<IPv6-GATEWAY-ADDRESS>**

  Specify the IPv6 gateway's address.

  **vlan <VLAN-ID>**

  Optional. specify the VLAN interface's ID (through which the default gateway is accessible)
  **Note:** This parameter is needed only if the gateway address is a link local address.

**Examples**

```bash
rfs7000-6DCD4B(config-profile-TestRFS7000)#ipv6 default-gateway 2001:10:10:10:10:10:10:2

7.1.37 l2tpv3

Profile Config Commands

Defines the L2TPv3 settings for tunneling layer 2 payloads using VPNs

L2TPv3 is an IETF standard that defines the control and encapsulation protocol settings for tunneling layer 2 frames in an IP network (and access point profile) between two IP nodes. Use L2TPv3 to create tunnels for transporting layer 2 frames. L2TPv3 enables WiNG supported controllers and access points to create tunnels for transporting Ethernet frames to and from bridge VLANs and physical ports. L2TPv3 tunnels can be defined between WiNG devices and other vendor devices supporting the L2TPv3 protocol.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

l2tpv3 [hostname <HOSTNAME>|inter-tunnel-bridging|logging|manual-session|router-id [<1-4294967295>|<IP>]|tunnel|udp-listen-port <1024-65535>]

l2tpv3 logging ip-address [<IP>|any] hostname [<HOSTNAME>|any]

router-id [<IP>|<WORD>|any]

Parameters

- l2tpv3 [hostname <HOSTNAME>|inter-tunnel-bridging|manual-session|router-id [<1-4294967295>|<IP>]|tunnel|udp-listen-port <1024-65535>]

<table>

```
7.1.38 l3e-lite-table

> Profile Config Commands

Configures L3e lite table aging time

The L3e Lite table stores information about destinations and their location within a specific IPSec tunnel. This enables quicker packet transmissions. The table is updated as nodes transmit packets.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

l3e-lite-table aging-time <10-1000000>

Parameters

- l3e-lite-table aging-time <10-1000000>

<table>
<thead>
<tr>
<th>aging-time</th>
<th>Configures the aging time in seconds. The aging time defines the duration a learned L3e entry (IP, VLAN) remains in the L3e Lite table before deletion due to lack of activity. The default is 300 seconds.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;10-1000000&gt;</td>
<td></td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-profile-default-rfs7000)#l3e-lite-table aging-time 1000

rfs7000-37FABE(config-profile-default-rfs7000)#show context

### 7.1.40 led-timeout

**Profile Config Commands**

Configures the LED-timeout timer in the device or profile configuration mode

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
led-timeout [15-1440]|shutdown
```

**Parameters**
- `led-timeout [15-1440]|shutdown`

- **Sets the LED-timeout timer.** The value provided here determines the interval (time to lapse) for which a device's LEDs are turned off after the last radio state change. For example, if set at 15 minutes, the LEDs are turned off for 15 minutes after the last radio state change.
  - `<15-1440>` — Specify a value from 15 - 1400 minutes. The default is 30 minutes.
  - `shutdown` — Shuts down the LED-timeout timer. The device LEDs are not turned off.

**Examples**

```plaintext

Profile Config Commands

Enables LLDP on this profile and configures LLDP settings

LLDP or IEEE 802.1AB is a vendor-neutral Data Link Layer protocol used by network devices for advertising of (announcing) identity, capabilities, and interconnections on a IEEE 802 LAN network. The protocol is formally referred to by the IEEE as Station and Media Access Control Connectivity Discovery. Both LLDP snooping and ability to generate and transmit LLDP packets is provided.

Information obtained via CDP and LLDP snooping is available in the UI. Information obtained using LLDP is provided during the adoption process, so the layer 2 device detected by the access point can be used as a criteria in the provisioning policy.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
lldp [holdtime|med-tlv-select|run|timer]
```

```
lldp [holdtime <10-1800>|run|timer <5-900>]
```

```
lldp med-tlv-select [inventory-management|power-management {auto}]
```

**Parameters**

- **holdtime**
  - Sets the holdtime for transmitted LLDP PDUs. This command specifies the time a receiving device holds information before discarding.
  - `<10-1800>` – Specify a holdtime from 10 - 1800 seconds. The default is 180 seconds.

- **run**
  - Enables LLDP on this profile

- **timer**
  - Sets the transmit interval. This command specifies the transmission frequency of LLDP updates in seconds.
  - `<5-900>` – Specify transmit interval from 5 - 900 seconds. The default is 60 seconds.

- **med-tlv-select**
  - Provides additional media endpoint device TLVs to enable inventory and power management discovery.
  - `inventory-management` — Enables inventory management discovery. Allows an endpoint to convey detailed inventory information about itself. This information includes details, such as manufacturer, model, and software version etc. This option is enabled by default.
  - `power-management auto` — Enables extended power via MDI discovery. Allows endpoints to convey power information, such as how the device is powered, power priority etc.
  - `auto` — Optional. Assigns default value based on device type
**Examples**

rfs7000-37FABE(config-profile-default-rfs7000)#lldp timer 20

rfs7000-37FABE(config-profile-default-rfs7000)#show context profile rfs7000 default-rfs7000

</tr>
<tr>
<td></td>
<td>&lt;0-100&gt; – Configures the maximum load as a percentage from 0 - 100. The default value for 2.4GHz and 5GHz is 75%.</td>
</tr>
</tbody>
</table>

### Advanced-Params

- **max-neighbors <0-16>**
  - Configures the maximum number of confirmed neighbors to balance
  - <0-16> – Specify a value from 0 - 16. Optionally configure a minimum of 0 neighbors and a maximum of 16 neighbors. The default is 16.

- **min-common-clients <0-256>**
  - Configures the minimum number of common clients that can be shared with the neighbor for load balancing
  - <0-256> – Specify a value from 0 - 256. Optionally configure a minimum of 0 clients and a maximum of 256 clients. The default is 0.

- **min-neighbor-rssi <-100-30>**
  - Configures the minimum signal strength (Received Signal Strength Indicator - RSSI) of a neighbor detected
  - <-100-30> – Sets the signal strength in dBm. Specify a value from -100 - 30 dBm. The default is -65 dBm.

- **min-probe-rssi <-100-30>**
  - Configures the minimum received probe signal strength required to qualify the sender as a common client
  - <-100-30> – Sets the signal strength in dBm. Specify a value from -100 - 30 dBm. The default is -100 dBm.
### load-balancing [balance-ap-loads|balance-band-loads|balance-channel-loads [2.4GHz|5GHz]]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>balance-ap-loads</strong></td>
<td>Enables neighbor AP load balancing. This option distributes the access point's radio load amongst other controller managed access point radios. This option is disabled by default.</td>
</tr>
<tr>
<td><strong>balance-band-loads</strong> [2.4GHz</td>
<td>5GHz]</td>
</tr>
</tbody>
</table>
| **balance-channel-loads** [2.4GHz|5GHz] | Enables the following:  
  - 2.4GHz – Channel load balancing on 2.4 GHz band. This option is disabled by default. Balances the access point’s 2.4 GHz radio load across channels supported within the country of deployment. This can prevent congestion on the 2.4 GHz radio if a channel is over utilized.  
  - 5GHz – Channel load balancing on 5.0 GHz band. This option is disabled by default. Balances the access point’s 5.0 GHz radio load across channels supported within the country of deployment. This can prevent congestion on the 5.0 GHz radio if a channel is over utilized. |
| **band-control-strategy**     | Configures a band control strategy  
  By default, this option steers 5.0 GHz-capable clients to the 5.0 GHz band. When an access point hears a request from a client to associate on both the 2.4 GHz and 5.0 GHz bands, it knows the client is capable of operation in 5.0 GHz. Band steering steers the client by responding only to the 5.0 GHz association request and not the 2.4 GHz request. Consequently, the client only associates in the 5.0 GHz band. |
| **distribute-by-ratio**        | Distributes clients to either band according to the band-ratio.                                                                                                                                         |
| **prefer-2.4GHz**             | Nudges all dual-band clients to 2.4 GHz band.                                                                                                                                                           |
| **prefer-5GHz**               | Nudges all dual-band clients to 5.0 GHz band. This is the default setting.                                                                                                                             |

### load-balancing band-control-strategy [distribute-by-ratio|prefer-2.4GHz|prefer-5GHz]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>band-ratio</strong> [2.4GHz</td>
<td>5GHz] [0</td>
</tr>
</tbody>
</table>
| **2.4GHz [0|<1-10>]**          | Configures the relative loading of 2.4 GHz band  
  - 0 – Selecting ‘0’ steers all dual-band clients preferentially to the other band  
  - <0-10> – Configures a relative load as a number from 0 - 10. The default is 0. |
| **5ghz [0|<1-10>]**          | Configures the relative loading of 5.0 GHz band  
  - 0 – Selecting ‘0’ steers all dual-band clients preferentially to the other band  
  - <0-10> – Configures a relative load as a number from 0 - 10. The default is 1. |
### Profiles

- **load-balancing group-id <GROUP-ID>**

  | **GROUP-ID** | Configures group ID to facilitate load balancing. <GROUP-ID> – Specify the group ID. This option is enabled only when a group ID is configured. |

- **load-balancing neighbor-selection-strategy [use-common-clients|use-roam-notification|use-smart-rf]**

  | **neighbor-selection-strategy** | Configures a neighbor selection strategy. The options are: use-common-clients, use-roam-notification, and use-smart-rf |
  | **use-common-clients** | Selects neighbors based on probes from clients common to neighbors. This option is enabled by default. |
  | **use-roam-notification** | Selects neighbors based on roam notifications from roamed clients. This option is enabled by default. |
  | **use-smart-rf** | Selects neighbors detected by Smart RF. This option is enabled by default. |

### Examples

```bash
rfs7000-37FABE(config-profile-default-rfs7000)#load-balancing advanced-params 2.4ghz-load throughput-weightage 90
rfs7000-37FABE(config-profile-default-rfs7000)#load-balancing advanced-params hiwater-threshold ap 90
rfs7000-37FABE(config-profile-default-rfs7000)#load-balancing balance-ap-loads
rfs7000-37FABE(config-profile-default-rfs7000)#show context
```

### Related Commands

- **no** Disables load balancing on this profile
### 7.1.45 logging

Logging enables message logging and configures logging settings. When enabled, the profile logs individual system events to a user-defined log file or a syslog server. Message logging is disabled by default.

Enabling message logging is recommended, because system event logs can be analyzed to determine an overall pattern that may be negatively impacting performance.

This command can also be executed in the device configuration mode.

**Supported in the following platforms:**

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

- `logging [aggregation-time|buffered|console|facility|forward|host|on|syslog]`
- `logging [aggregation-time <1-60>|host [IPv4]|IPv6] |on`
- `logging [buffered|console|syslog|forward] [<0-7>|emergencies|alerts|critical|errors|warnings|notifications|informational|debugging]`
- `logging facility [local0|local1|local2|local3|local4|local5|local6|local7]`

**Parameters**

- **logging [aggregation-time <1-60>|host [IPv4]|IPv6] |on**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggregation-time &lt;1-60&gt;</td>
<td>Sets the number of seconds for aggregating repeated messages. This is the interval at which system events are logged on behalf of this profile. The shorter the interval, the sooner the event is logged.</td>
</tr>
<tr>
<td>host [IPv4]</td>

### 7.1.46 mac-address-table

**Profile Config Commands**

Configures the MAC address table. Use this command to create MAC address table entries by assigning a static address to the MAC address table.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6562, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
mac-address-table aging-time [0|<10-1000000>]
mac-address-table static <MAC> vlan <1-4094> interface [L2-INTERFACE] ge <1-4> port-channel <1-2>
```

**Parameters**

- `mac-address-table aging-time [0|<10-1000000>]`
  - **aging-time [0|<10-1000000>]**
    - Sets the duration a learned MAC address persists after the last update
      - 0 – Entering the value ‘0’ disables the aging time
      - <10-1000000> – Sets the aging time from 10 -100000 seconds. The default is 300 seconds.

- `mac-address-table static <MAC> vlan <1-4094> interface [L2-INTERFACE] ge <1-4> port-channel <1-2>`
  - **static <MAC>**
    - Creates a static MAC address table entry
      - <MAC> – Specifies the static address to add to the MAC address table. Specify the MAC address in the AA-BB-CC-DD-EE-FF, AA:BB:CC:DD:EE:FF, or AABB.CCDD.EEFF format.
  - **vlan <1-4094>**
    - Assigns a static MAC address to a specified VLAN port
      - <1-4094> – Specify the VLAN index from 1 - 4094.
  - **interface [L2-INTERFACE] ge <1-4> port-channel <1-2>**
    - Specifies the interface type. The options are: layer 2 Interface, GigabitEthernet interface, and a port channel interface
      - <L2-INTERFACE> – Specify the layer 2 interface name.
      - ge – Specifies a GigabitEthernet interface
        - <1-4> – Specify the GigabitEthernet interface index from 1 - 4.
      - port-channel – Specifies a port channel interface
        - <1-2> – Specify the port channel interface index from 1 - 2.
Examples

rfs7000-37FABE(config-profile-default-rfs7000)#mac-address-table static 00-40-96-B0-BA-2A vlan 1 interface ge1

rfs7000-37FABE(config-profile-default-rfs7000)#show context profile rfs7000 default-rfs7000
bridge vlan 1
.........................................................
logging facility local4
mac-address-table static 00-40-96-B0-BA-2A vlan 1 interface ge1
ip nat pool pool1
--More--
rfs7000-37FABE(config-profile-default-rfs7000)#

Related Commands

no | Disables or reverts settings to their default
7.1.47 **mac-auth**

*Profile Config Commands*

Enables or disables authentication of a client's MAC address on wired ports. When configured, MAC authentication will be enabled on devices using this profile.

To enable MAC address authentication on a device, enter the device's configuration mode and execute the `mac-auth` command.

When enabled, the source MAC address of a device, connected to the specified wired port, is authenticated with the RADIUS server. Once authenticated the device is permitted access to the managed network and packets from the authenticated source are processed. If not authenticated the device is either denied access or provided guest access through the guest VLAN (provided guest VLAN access is configured on the port).

Enabling MAC authentication requires you to first configure a AAA policy specifying the RADIUS server. Configure the client's MAC address on the specified RADIUS server. Attach this AAA policy to a profile or a device. Finally, enable MAC authentication on the desired wired port of the device or device-profile.

Only one MAC address is supported for every wired port. Consequently, when one source MAC address is authenticated, packets from all other sources are dropped.

To enable client MAC authentication on a wired port:

1. Configure the user on the RADIUS server. The following examples create a RADIUS server user entry.
   a. `<DEVICE> (config)#radius-group <RAD-GROUP-NAME>
   `<DEVICE> (config-radius-group-<RAD-GROUP-NAME>)#policy vlan <VLAN-ID>
   b. `<DEVICE> (config)#radius-user-pool-policy <RAD-USER-POOL-NAME>
   `<DEVICE> (config-radius-user-pool-<RAD-USER-POOL-NAME>)#user <USER-NAME> password <PASSWORD> group <RAD-GROUP_OF_STEP-A>
   Note: The `<USER-NAME>` and `<PASSWORD>` should be the client's MAC address. This address will be matched against the MAC address of incoming traffic at the specified wired port.
   c. `<DEVICE> (config)#radius-server-policy <RAD-SERVER-POL-NAME>
   `<DEVICE> (config-radius-server-policy-<RAD-SERVER-POL-NAME>)#use radius-user-pool-policy <RAD-USER-POOL_OF_STEP-B>

2. Configure a AAA policy exclusively for wired MAC authentication and specify the authentication (RADIUS) server settings. The following example creates a AAA policy 'macauth' and enters its configuration mode:
   `<DEVICE-A> (config)#aaa-policy macauth
   `<DEVICE-A> (config-aaa-policy-macauth)#...
   Specify the RADIUS server details.
   `<DEVICE-A> (config)#aaa-policy macauth
   `<DEVICE-A> (config-aaa-policy-macauth)#authentication server <1-6> [host <IP>|onboard]
   Attach the AAA policy to the device or profile. When attached to a profile, the AAA policy is applied to all devices using this profile.
   `<DEVICE> (config-device-aa-bb-cc-dd-ee)#mac-auth use aaa-policy macauth
   `<DEVICE> (config-profile-<DEVICE-PROFILE-NAME>)#mac-auth use aaa-policy macauth

3. Enable mac-auth on the device's desired GE port. When enabled on a profile, MAC address authentication is enabled, on the specified GE port, of all devices using this profile.
   `<DEVICE>(config-device-aa-bb-cc-dd-ee)#interface ge x
   `<DEVICE>(config-device-aa-bb-cc-dd-ee-gex)#mac-auth
   `<DEVICE> (config-profile-<PROFILE-NAME>)#interface ge x
   `<DEVICE> (config-profile-<PROFILE-NAME>)#mac-auth
Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

```plaintext
mac-auth use aaa-policy <AAA-POLICY-NAME>
```

**Parameters**

- `mac-auth use aaa-policy <AAA-POLICY-NAME>`
  
  Enables 802.1X authentication of MAC addresses on this profile. Use the device configuration mode to enable this feature on a device.

- `use aaa-policy <AAA-POLICY-NAME>`
  
  Associates an existing AAA policy with this profile (or device)
  - `<AAA-POLICY NAME>` — Specify the AAA policy name.
  
  The AAA policy used should be created especially for MAC authentication.

**Examples**

The following examples demonstrate the configuration of authentication of MAC addresses on wired ports:

```plaintext
rfs4000-229D58 (config-aaa-policy-mac-auth)#authentication server 1 onboard controller
```

```plaintext
rfs4000-229D58 (config-aaa-policy-mac-auth)#show context
```

```plaintext
aaa-policy mac-auth
  authentication server 1 onboard controller
rfs4000-229D58 (config-aaa-policy-mac-auth)#
```

```plaintext
rfs4000-229D58 (config)#radius-group RG
rfs4000-229D58 (config-radius-group-RG)#policy vlan 11
```

```plaintext
rfs4000-229D58 (config-radius-group-RG)#show context
```

```plaintext
radius-group RF
  policy vlan 11
rfs4000-229D58 (config-radius-group-RG)#
```

```plaintext
rfs4000-229D58 (config)#radius-user-pool-policy RUG
rfs4000-229D58 (config-radius-user-pool-RUG)#user 00-16-41-55-F8-5D password 0 0-16-41-55-F8-5D group RG
```

```plaintext
rfs4000-229D58 (config-radius-user-pool-RUG)#show context
```

```plaintext
radius-user-pool-policy RUG
  user 00-16-41-55-F8-5D password 0 00-16-41-55-F8-5D group RG
rfs4000-229D58 (config-radius-user-pool-RUG)#
```

```plaintext

rfs4000-229D58(config-device-00-23-68-22-9D-58)#

| **no** | Disables authentication of MAC addresses on wired ports settings on this profile (or device) |
### 7.1.48 memory-profile

**Profile Config Commands**

Configures memory profile used on the device

Supported in the following platforms:
- Access Points — AP621, AP6511, AP6521

**Syntax**

```bash
memory-profile [adopted|standalone]
```

**Parameters**
- `memory-profile [adopted|standalone]`

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>adopted</td>
<td>Configures adopted mode (no GUI and higher MiNT routes, firewall flows)</td>
</tr>
<tr>
<td>standalone</td>
<td>Configures standalone mode (GUI and fewer MiNT routes, firewall flows)</td>
</tr>
</tbody>
</table>

**Examples**

```bash
nx9500-6C8809(config-profile-testAP6511)#memory-profile adopted

Note: memory-profile change will take effect after device reboot
```

**Related Commands**

- `no`
  - Resets device's memory profile configuration
7.1.49 meshpoint-device

Profile Config Commands

Configures meshpoint device parameters. This feature is configurable in the profile and device configuration modes.

Supported in the following platforms:
- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX

Syntax

```
meshpoint-device <MESHPOINT-NAME>
```

Parameters

- meshpoint-device <MESHPOINT-NAME>

<table>
<thead>
<tr>
<th>meshpoint-device</th>
<th>Configures meshpoint device parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;MESHPOINT-NAME&gt;</td>
<td>- &lt;MESHPOINT-NAME&gt; – Specify meshpoint name.</td>
</tr>
</tbody>
</table>

Usage Guidelines

For Vehicular Mounted Modem (VMM) access points or other mobile devices, set the path selection method as mobile-snr-leaf in the config-meshpoint-device mode. For more information, see `path-method`.

Examples

```
rfs7000-37FABE(config-profile-testAP71XX)#meshpoint-device test
rfs7000-37FABE(config-profile-testAP71XX-meshpoint-test)#?
```

Mesh Point Device Mode commands:
- `acs` Configure auto channel selection parameters
- `exclude` Exclude neighboring Mesh Devices
- `hysteresis` Configure path selection SNR hysteresis values
- `monitor` Event Monitoring
- `no` Negate a command or set its defaults
- `path-method` Path selection method used to find a root node
- `preferred` Configure preferred path parameters
- `root` Set this meshpoint as root
- `root-select` Root selection method parameters
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-profile-testAP71XX-meshpoint-test)#
```

Related Commands

`no` Removes a specified meshpoint

---

**NOTE:** For more information on the meshpoint-device configuration parameters, see *Chapter 26, MESHPOINT.*
7.1.50 meshpoint-monitor-interval

Profile Config Commands

Configures the meshpoint monitoring interval. This is the interval, in seconds, at which the meshpoint status is checked.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

meshpoint-monitor-interval <1-65535>

Parameters

- meshpoint-monitor-interval <1-65535>

| meshpoint-monitor-interval <1-65535> | Configures the meshpoint monitoring interval in seconds
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-65535&gt; – Specify the interval from 1 - 65535 seconds. The default is 30 seconds.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-profile-default-rfs7000)#meshpoint-monitor-interval 100

rfs7000-37FABE(config-profile-default-rfs7000)#show context
profile rfs7000 default-rfs7000
  bridge vlan 1
  bridging-mode isolated-tunnel
  ip igmp snooping
  ip igmp snooping querier
  meshpoint-monitor-interval 100
  ip default-gateway 172.16.10.4
  --More--
rfs7000-37FABE(config-profile-default-rfs7000)#

Related Commands

no

Resets the meshpoint monitoring interval to default (30 seconds)
7.1.51 min-misconfiguration-recovery-time

Profile Config Commands

Configures the minimum device connectivity verification time

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

min-misconfiguration-recovery-time <60-3600>

Parameters

- min-misconfiguration-recovery-time <60-3600>

Examples

```
nx9500-6C8809(config-profile-testRFS4000)#min-misconfiguration-recovery-time 500

Related Commands

- **no** — Resets setting to default (60 seconds)
### 7.1.52 mint

**Profile Config Commands**

Configures MiNT protocol parameters required for MiNT creation and adoption.

MiNT links are required for adoption of a device (APs, wireless controller, and service platform) to a controller. The MiNT link is created on both the adoptee and the adopter. WiNG provides several commands to configure MiNT links and establish adoption for both IPv4 and IPv6 addresses.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
mint [dis|level|link|mlcp|rate-limit|spf-latency|tunnel-across-extended-vlan|
      tunnel-controller-load-balancing]

mint dis [priority-adjustment <-255-255>|strict-evis-reachability]

mint level 1 area-id <1-16777215>

mint link [force|ip|listen|vlan]

<2-600>|cost <1-10000>|hello-interval <1-120>|ipsec-secure {gw [<IP>|<HOST-NAME>]}}

mint link listen ip [<IPv4>|<IPv6>|<HOST-ALIAS-NAME>] [vlan <1-4094>]
{adjacency-hold-time <2-600>|cost <1-10000>|hello-interval <1-120>|ipsec-security {gw [<IP>|<HOST-NAME>]}}|level [1|2]}

mint link ip [<IPv4>|<IPv6>|<HOST-ALIAS-NAME>]
{<1-65535>|adjacency-hold-time <2-600>|cost <1-10000>|hello-interval <1-120>|ipsec-secure {gw [<IP>|<HOST-NAME>]}}
level [1|2]}

mint mlcp [ip|ipv6|vlan]

mint rate-limit level2 [link|mlcp]
mint rate-limit level2 [link [ip [<IPv4>|<IPv6>] <1-65535>|vlan <1-4094>]]
mlcp [ip|ipv6|vlan] rate <50-1000000> max-burst-size <2-1024>
{red-threshold [background|best-effort|video|voice] <0-100>}

mint spf-latency <0-60>

mint tunnel-across-extended-vlan

mint tunnel-controller-load-balancing level1
```

**Parameters**

- **mint dis [priority-adjustment <-255-255>|strict-evis-reachability]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dis priority-adjustment &lt;-255-255&gt;</td>
<td>Sets the relative priority for the router to become DIS (designated router)</td>
</tr>
<tr>
<td>- priority-adjustment – Sets priority adjustment added to base priority</td>
<td></td>
</tr>
<tr>
<td>The <strong>Designated IS</strong> (DIS) priority adjustment is the value added to the base level DIS priority to influence the DIS election. A value of +1 or greater increases DISiness.</td>
<td></td>
</tr>
<tr>
<td>- &lt;255-255&gt; – Specify a value from -255 - 255. The default is 0.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Higher numbers result in higher priorities
### General Commands

**strict-evis-reachability**
Enables reaching *Ethernet Virtualization Interconnect* (EVIS) election winners through MiNT. This option is enabled by default.

- **mint level 1 area-id <1-16777215>**
  Configures local MiNT routing settings
  - 1 – Configures local MiNT routing level

- **area-id <1-16777215>**
  Specifies the level 1 routing area identifier
  - <1-16777215> – Specify a value from 1 - 16777215.

- **mint link force ip [<IPv4>|<IPv6>] [level 2] [level 2] {adjacency-hold-time <2-600>|cost <1-10000>|hello-interval <1-120>|ipsec-security {gw [<IP>|<HOST-NAME>]}**
  Creates a MiNT tunnel over UDP/IPv4 or IPv6
  Use this keyword to specify the IP address (IPv4 or IPv6) used by peers for inter-operation when supporting the MiNT protocol.
  - <IPv4> – Specify the MiNT tunnel peer’s IPv4 address.
  - <IPv6> – Specify the MiNT tunnel peer’s IPv6 address.

  After specifying the MiNT peer’s address, configure the following MiNT link parameters: UDP port, adjacency-hold-time, cost, hello-interval, IPSec security gateway, and routing level.

- **<1-65535> level 2**
  Optional. Specifies a custom UDP port for MiNT links. Specify the port from 1 - 65535.
  - level – Specifies the routing level
  - 2 – Configures level 2 inter-site MiNT routing

- **adjacency-hold-time <2-600>**
  Optional. Specifies the adjacency lifetime after hello packets cease
  - <2-600> – Specify a value from 2 - 600 seconds. The default is 46 seconds.

- **cost <1-100000>**
  Optional. Specifies the link cost in arbitrary units
  - <1-100000> – Specify a value from 1 - 100000. The default is 100.

- **hello-interval <1-120>**
  Optional. Specifies the interval, in seconds, between successive hello packets
  - <1-120> – Specify a value from 1 - 120 seconds. The default is 15 seconds.

- **ipsec-security {gw [<IP>|<HOST-NAME>]}**
  Optional. Enables IPSec secure peer authentication on the MiNT connection (link). This option is disabled by default.
  - gw [<IP>|<HOSTNAME>] – Optional. Configures the IPSec secure gateway. When enabling IPSec, you can optionally specify the IPSec secure gateway’s numerical IP address or administrator defined hostname.

</tr>
</tbody>
</table>

UDP/IP links can be created by configuring a matching pair of links, one on each end point. However, that is error prone and does not scale. So UDP/IP links can also listen (in the TCP sense), and dynamically create connected UDP/IP links when contacted. The typical configuration is to have a listening UDP/IP link on the IP address S.S.S.S, and for all the APs to have a regular UDP/IP link to S.S.S.S.

  Creates a MiNT routing link
  - ip – Creates a MiNT tunnel over UDP/IP or IPv6
  Use this keyword to specify the IP address (IPv4 or IPv6) used by peers for inter-operation when supporting the MiNT protocol.
  - <IPv4> – Specify the IPv4 address used by peers.
  - <IPv6> – Specify the IPv6 address used by peers.
  - <HOST-ALIAS-NAME> – Specify the host alias identifying the MiNT tunnel peer’s address. The host alias should existing and configured.

<table>
<thead>
<tr>
<th>&lt;1-65535&gt;</th>
<th>Select the peer UDP port from 1 - 65535.</th>
</tr>
</thead>
</table>
| adjacency-hold-time <2-600> | Optional. Specifies the adjacency lifetime after hello packets cease
  - <2-600> – Specify a value from 2 - 600 seconds. The default is 46 seconds. |
| cost <1-100000> | Optional. Specifies the link cost in arbitrary units
  - <1-100000> – Specify a value from 1 - 100000. The default is 100. |
| hello-interval <1-120> | Optional. Specifies the interval, in seconds, between successive hello packets
  - <1-120> – Specify a value from 1 - 120. The default is 15 seconds. |
| level [1|2] | Optional. Specifies the routing levels for this routing link. The options are:
  - 1 – Configures local routing
  - 2 – Configures inter-site routing |
| ipsec-security {gw [<IP>|<HOST-NAME>]} | Optional. Enables IPSec secure peer authentication on the MiNT connection (link). This option is disabled by default.
  - gw [<IP>]<HOSTNAME> – Optional. Configures the IPSec secure gateway. When enabling IPSec, you can optionally specify the IPSec secure gateway’s numerical IP address or administrator defined hostname. |

- **mint mlcp [ip|ipv6|vlan]**

  Configures the **MiNT Link Creation Protocol**(MLCP) using the IP address or VLAN. MLCP is used to create a UDP/IP link from the device to a neighbor. The neighboring device does not need to be a wireless controller or service platform, it can be another access point with a path to the wireless controller or service platform.
  - vlan – Enables MLCP over layer 2 (VLAN) links
  - ip – Enables MLCP over layer 3 (UDP/IP) links. When enabled, allows adoption over IPv4 address.
  - ipv6 – Enables MLCP over layer 3 (UDP/IPv6) links. When enabled, allows adoption over IPv6 address.
**mint rate-limit level2**

Applies rate limits on extended VLAN traffic. Excessive traffic can cause performance issues on an extended VLAN. Excessive traffic can be caused by numerous sources including network loops, faulty devices, or malicious software. Rate limiting reduces the maximum rate sent or received per wireless client. It prevents any single user from overwhelming the wireless network, and also provides differential service for service providers. Uplink and downlink rate limits are usually configured on a RADIUS server using vendor specific attributes. Rate limits are extracted from the RADIUS server’s response. When such attributes are not present, the settings defined on the controller, service platform or access point are applied. You can set separate QoS rate limit configurations for data types transmitted from the network (upstream) and data transmitted from a wireless clients back to associated radios (downstream).

- **link [ip IpV4/IPv6] <1-65535>|vlan <1-4094>** Configures rate limit parameters applicable for all statically configured MiNT links on level2. Select the link-type as ’IP’ or ’VLAN’.
  - ip <IPv4/IPv6> – Configures rate limits for MiNT link traffic over UDP/IP
  - <IPv4/IPv6> – Specify the MiNT peer’s IPv4 or IPv6 address in the A.B.C.D and X:X::X:X formats respectively.
  - <1-65535> – Configures the virtual port used for rate limiting traffic. Specify the UDP port from 1 - 65535.
  - vlan <1-4094> – Configures rate limits for MiNT link traffic on specified VLAN
  - <1-4094> – Specify the VLAN ID from 1 - 4094.

- **mlcp [ip|ipv6|vlan]** Configures rate limit parameters applicable for MLCP
  - MLCP creates a UDP/IP link from the device to a neighbor. The neighboring device does not need to be a controller or service platform, it can be an access point with a path to the controller or service platform.
  - ip – Configures rate-limits for MLCP over UDP/IPv4 links
  - ipv6 – Configures rate-limits for MLCP over UDP/IPv6 links
  - vlan – Configures rate-limits for MLCP over VLAN links

- **rate <50-1000000>** Configures the rate limit from 50 - 1000000 Kbps
  - This limit constitutes a threshold for the maximum number of packets transmitted or received (from all access categories). Traffic exceeding the defined rate is dropped and a log message is generated. The default setting is 5000 Kbps.

- **max-burst-size <2-1024>** Configures the maximum burst size from 0 - 1024 Kbytes
  - Smaller the burst size, lesser is the probability of the upstream packet transmission resulting in congestion for the WLAN’s client destinations. By trending the typical number of ARP, broadcast, multicast and unknown unicast packets over a period of time, the average rate for each access category can be obtained. Once a baseline is obtained, add a 10% margin (minimally) to allow for traffic bursts. The default burst size is 320 Kbytes.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>red-threshold</strong></td>
<td>Optional. Configures the <em>random early detection</em> (RED) threshold (as a percentage) for the following traffic types:</td>
</tr>
<tr>
<td>[background]</td>
<td>• background – Configures the RED threshold for low priority background traffic. Background packets are dropped and a log message generated if the rate exceeds the set value. Background traffic consumes the least bandwidth of any access category, so this value can be set to a lower value once a general upstream rate is known by the network administrator (using a time trend analysis). The default setting is 50%.</td>
</tr>
</tbody>
</table>
| [best-effort]                               | • best-effort – Configures the RED threshold for low priority best-effort traffic. Best-effort packets are dropped and a log message generated if the rate exceeds the set value. Best effort traffic consumes little bandwidth, so this value can be set to a lower value once a general upstream rate is known by the network administrator (using a time trend analysis). The default setting is 50%.
| [video]                                     | • video – Configures the RED threshold for high priority video traffic. Video packets are dropped and a log message generated if the rate exceeds the set value. Video traffic consumes significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis). The default setting is 25%.
| [voice]                                     | • voice – Configures the RED threshold for high priority voice traffic. Voice packets are dropped and a log message generated if the rate exceeds the set value. Voice applications consume significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis). The default setting is 0%.
| [<0-100>]                                   | • <0-100> – After selecting the traffic type, specify the RED threshold from 0 - 100%.                                                   |
| **spf-latency <0-60>**                      | Specifies the latency of SPF routing recalculation. This option allows you to set the *latency of routing recalculation* option (within the *Shortest Path First* (SPF) field). This option is disabled by default. |
| **tunnel-across-extended-vlan**             | Enables tunneling of MiNT protocol packets across an extended VLAN. This setting is disabled by default.                                |
| **tunnel-controller-load-balancing level1** | Enables load balancing of MiNT extended VLAN traffic across tunnels.                                                                 |
| [level1]                                    | • level1 – Enables balancing of load of a tunnel wireless controller or service platform over VLAN links.                                    |

7.1.56 no

Profile Config Commands

Negates a command or resets values to their default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

Parameters

- no <PARAMETERS>

Removes or reverts this profile’s settings based on the parameters passed

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

7.1.57 noc

Profile Config Commands

Configures Network Operations Center (NOC) statistics update interval. This is the interval at which statistical updates are sent by the RF Domain manager to its adopting controller (the NOC controller).

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

coc update-interval [<5-3600>|auto]

Parameters

- noc update-interval [<5-3600>|auto]

<table>
<thead>
<tr>
<th>update-interval</th>
<th>Configures NOC statistics update interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;5-3600&gt;</td>
<td>&lt;5-3600&gt; – Specify the update interval from 5 - 3600 seconds.</td>
</tr>
<tr>
<td>auto</td>
<td>auto – The NOC statistics update interval is automatically adjusted by the wireless controller or service platform based on load. This option is enabled by default.</td>
</tr>
</tbody>
</table>

Examples

| no                          | Resets NOC related parameters |
7.1.58 ntp

Profile Config Commands

Configures the Network Time Protocol (NTP) server settings

NTP manages time and/or network clock synchronization within the network. NTP is a client/server implementation. Controllers, service platforms, and access points (NTP clients) periodically synchronize their clock with a master clock (an NTP server). For example, a controller resets its clock to 07:04:59 upon reading a time of 07:04:59 from its designated NTP server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ntp server <PEER-IP/HOSTNAME> {autokey/key/maxpoll/minpoll/prefer/version}
ntp server <PEER-IP/HOSTNAME> {autokey}
ntp server <PEER-IP/HOSTNAME> {maxpoll [1024|2048|4096|8192]}
ntp server <PEER-IP/HOSTNAME> {minpoll [1024|128|256|512|64]}
ntp server <PEER-IP> {key <1-65534> md5 [0 <WORD>|2<WORD>|<WORD>]}  
ntp server <PEER-IP/HOSTNAME> {prefer version <1-4>|version <1-4> prefer}

Parameters

- ntp server <PEER-IP/HOSTNAME> {autokey} {prefer version <1-4>|version <1-4>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| server <PEER-IP/HOSTNAME> | Configures NTP server resources that are used to obtain system time  
  - Identifies the NTP server resource by its IP address or hostname. Specify the NTP server's IP address or hostname. |
| autokey | Optional. Enables automatic configuration of authentication key for the specified NTP server. This option is disabled by default. If not enabled, use the 'key' option to configure an authentication key for the NTP server. |
| maxpoll [1024|2048|4096|8192] | Optional. Configures the maximum polling interval. Once set, the specified NTP server is polled no later than the defined interval. Select one of the following options:  
  - 1024 – Configures the maximum polling interval as 1024 seconds. This is the default setting.  
  - 2048 – Configures the maximum polling interval as 2048 seconds  
  - 4096 – Configures the maximum polling interval as 4096 seconds  
  - 8192 – Configures the maximum polling interval as 8192 seconds |
| ntp server `<PEER-IP/HOSTNAME>` \{minpoll \[1024|128|256|512|64\]\} |
|---|
| server `<PEER-IP/HOSTNAME>` | Configures NTP server resources that are used to obtain system time |
|  | • `<PEER-IP/HOSTNAME>` – Identifies the NTP server resource by its IP address or hostname. Specify the NTP server’s IP address or hostname. |
| minpoll \[1024|128|256|512|64\] | Optional. Configures the minimum polling interval. Once set, the specified NTP server is polled no sooner than the defined interval. Select one of the following options: |
|  | • 1024 – Configures the minimum polling interval as 1024 seconds |
|  | • 128 – Configures the minimum polling interval as 128 seconds |
|  | • 256 – Configures the minimum polling interval as 256 seconds |
|  | • 512 – Configures the minimum polling interval as 512 seconds |
|  | • 64 – Configures the minimum polling interval as 64 seconds. This is the default setting. |
| key `<1-65534>` md5 \[0 <WORD>|2<WORD>|<WORD>\] | Optional. Defines the authentication key for the specified NTP server. This option is used to configure the key when ‘autokey’ configuration is not enabled. |
|  | • `<1-65534>` – Specify the peer key number. Should not exceed 64 characters in length. |
|  | • md5 – Sets MD5 authentication |
|  | • 0 <WORD> – Configures a clear text password |
|  | • 2 <WORD> – Configures an encrypted password |
|  | • `<WORD>` – Sets an authentication key |
| ntp server `<PEER-IP/HOSTNAME>` \{prefer version <1-4>|version <1-4> prefer\} |
| server `<PEER-IP/HOSTNAME>` | Configures NTP server resources that are used to obtain system time |
|  | • `<PEER-IP/HOSTNAME>` – Identifies the NTP server resource by its IP address or hostname. Specify the NTP server’s IP address or hostname. |
| prefer version <1-4> | Optional. Designates the specified NTP server as a preferred NTP resource. This setting is disabled by default. |
|  | • version – Optional. Configures the NTP version |
|  | • `<1-4>` – Select the NTP version from 1 to 4. If not specified, the default value of ‘0’ is applied, which implies that the NTP server’s version is ignored. |
| version <1-4> prefer | Optional. Configures the version number used by the specified NTP server resource |
|  | • `<1-4>` – Select the NTP version from 1 to 4. The default setting is 0. A value of ‘0’ implies that the NTP server’s version is ignored. |
|  | • prefer – Optional. Designates the specified NTP server as a preferred NTP resource. This setting is disabled by default. The NTP version number specified using the ‘version <1-4>’ keyword is applied to this preferred NTP resource. |
Examples

rfs7000-37FABE(config-profile-default-rfs7000)#ntp server 172.16.10.10 version 1 prefer

7.1.59 offline-duration

Profile Config Commands

Sets the duration, in minutes, for which a device remains unadopted before it generates offline event. This command is also supported on the device configuration mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

offline-duration <5-43200>

Parameters

- offline-duration <5-43200>

```
Syntax

```
7.1.60 power-config

Profile Config Commands

Configures the power option mode. Use this command in the profile configuration mode to configure the transmit output power of access point radios. This command is also available in the device-config mode.

Single radio model access points always operate using a full power configuration. The power management configurations described in this section do not apply to single radio models. When an access point is powered on for the first time, the system determines the power budget available to the access point. If 802.3af is selected, the access point assumes 12.95 watts is available. If the mode is changed, the access point requires a reset to implement the change. If 802.3at is selected, the access point assumes 23 - 26 watts is available.

---

**NOTE:** Single radio model access points (AP6511 and AP6521) always operate using a full power configuration. The power management configurations described in this section do not apply to single radio models. The access point has to be restarted for power management changes to take effect.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

- power-config [af-option|at-option|mode]
- power-config [af-option|at-option] [range|throughput]
- power-config mode [auto|3af]

Parameters

- power-config [af-option|at-option] [range|throughput]

| af-option [range|throughput] | Configures the 802.3.af power mode option. The options are: |
|-----------------------------|----------------------------------------------------------|
|                            | • range — Configures the af power range mode. This mode provides higher power but fewer transmission (tx) chains. |
|                            | Select range when range is preferred over performance for broadcast/multicast (group) traffic. The data rates used for range are the lowest defined basic rates. |
|                            | • throughput — Configures the af power throughput mode. This mode provides lower power but has more tx chains. This is the default setting. |

| at-option [range|throughput] | Configures the 802.3 at power mode option. The options are: |
|------------------------------|-------------------------------------------------------------|
|                             | • range — Configures the at power range mode. This mode provides higher power but fewer tx chains. |
|                             | Contd..                                                     |
Select range when range is preferred over performance for broadcast/multicast (group) traffic. The data rates used for range are the lowest defined basic rates.

- **throughput** – Configures the at power throughput mode. This mode provides lower power but has more tx chains. This is the default setting.
- **auto** – Sets the detection auto mode (default setting)

Select throughput to transmit packets at the radio’s highest defined basic rate (based on the radio’s current basic rate settings). This option is optimal in environments where transmission range is secondary to broadcast/multicast transmission performance.

### power-config mode [auto|3af]

- **3af** – Forces an AP to power up in the 802.3af power mode
- **auto** – Sets the detection auto mode (default setting)

The automatic power-config mode enables an access point to automatically determine the best power configuration based on the available power budget.

#### Examples

```
x9500-6C8809(config-profile-testAP71XX)#power-config mode 3af
```

```
x9500-6C8809(config-profile-testAP71XX)#power-config af-option range
```

7.1.61 **preferred-controller-group**

**Profile Config Commands**

Specifies the controller group preferred for adoption

At adoption, an access point solicits and receives multiple adoption responses from controllers and service platforms available on the network. These adoption responses contain loading policy information the access point uses to select the optimum controller or service platform for adoption. After selecting the controller or service platform, the access point associates with it and optionally obtains an image upgrade and configuration. By default, an auto provisioning policy generally distributes AP adoption evenly amongst available controllers and service platforms. Use this command to specify the controller or service platform preferred for adoption. Once configured, the access point adopts to the specified preferred controller or service platform.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX

**Syntax**

`preferred-controller-group <WORD>`

**Parameters**

- `preferred-controller-group <WORD>`

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000)#preferred-controller-group testGroup
```

```
rfs7000-37FABE(config-profile-default-rfs7000)#show context
profile rfs7000 default-rfs7000
mint link ip 1.2.3.4
mint level 1 area-id 88

```

**Related Commands**

```
no
```

Removes the preferred controller group configuration
7.1.62 preferred-tunnel-controller

Profile Config Commands

Configures the tunnel controller’s name preferred for tunneling extended VLAN traffic. Devices using this profile will prefer to route their extended VLAN traffic through the specified tunnel controller (wireless controller or service platform).

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX

Syntax
```
preferred-tunnel-controller <NAME>
```

Parameters
- `preferred-tunnel-controller <NAME>`

| preferred-tunnel-controller <NAME>               | Configures the preferred tunnel name |

Examples
```
rfs7000-37FABE(config-profile-default-rfs7000)#preferred-tunnel-controller testtunnel
```

Related Commands
- `no` Removes the preferred tunnel configuration
7.1.63 radius

Profile Config Commands

Configures device level RADIUS authentication parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

radius [nas-identifier|nas-port-id] <WORD>

Parameters
- radius [nas-identifier|nas-port-id] <WORD>
  - radius <WORD> – Specifies the RADIUS Network Access Server (NAS) identifier attribute used by this device
- nas-identifier <WORD> – Specifies the NAS identifier
- nas-port-id <WORD> – Specifies the NAS port ID

Examples

rfs7000-37FABE(config-profile-default-rfs7000)#radius nas-port-id 1
rfs7000-37FABE(config-profile-default-rfs7000)#radius nas-identifier test

7.1.64 remove-override

Profile Config Commands

Removes device-level overrides and applies profile configuration. Use this command to enable the access point to detect bluetooth devices using the Bluetooth USB module.

Supported in the following platforms:

- Access Points — AP81XX

Syntax

remove-override bluetooth-detection

Parameters

- remove-override bluetooth-detection

| remove-override bluetooth-detection | Enables access point to detect bluetooth devices using the Bluetooth USB module |

Examples

nx9500-6C8809(config-profile-testAP81XX)#remove-override bluetooth-detection
7.1.65 rf-domain-manager

Profile Config Commands

Configures the RF Domain manager election criteria

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

rf-domain-manager [capable|priority <1-255>]

Parameters

### 7.1.66 router

#### Profile Config Commands

Enables dynamic routing (BGP and/or OSPF) and enters the routing protocol configuration mode

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
router [bgp|ospf]
```

#### Parameters

- **router [bgp|ospf]**

| bgp | Enables BGP dynamic routing and configures relevant settings  
|-----|------------------------------------------------------------------|
|     | BGP is an inter-ISP routing protocol, which establishes routing between ISPs. ISPs use BGP to exchange routing and reachability information between *Autonomous Systems* (AS) on the Internet. BGP uses TCP as its transport protocol, eliminating the need to implement explicit update fragmentation, retransmission, acknowledgement, and sequencing.  
|     | Routing information exchanged through BGP supports destination based forwarding only. It assumes a router forwards packets based on the destination address carried in the IP header of the packet.  
|     | An AS is a set of routers under the same administration that use *Interior Gateway Protocol* (IGP) and common metrics to define how to route packets within the AS.  
|     | For more information on dynamic BGP routing configurations, see *BORDER GATEWAY PROTOCOL*. |

| ospf | Enables OSPF dynamic routing and configures relevant settings. Changes configuration mode to router mode  
|-----|------------------------------------------------------------------|
|     | OSPF is a link-state IGP. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets.  
|     | For more information on dynamic OSPF routing configurations, see *ROUTER-MODE COMMANDS*. |
Examples

rfs7000-37FABE(config-profile-default-rfs7000)#router ospf

rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#?

Router OSPF Mode commands:

- **area**: OSPF area
- **auto-cost**: OSPF auto-cost
- **default-information**: Distribution of default information
- **ip**: Internet Protocol (IP)
- **network**: OSPF network
- **no**: Negate a command or set its defaults
- **ospf**: OSPF
- **passive**: Make OSPF Interface as passive
- **redistribute**: Route types redistributed by OSPF
- **route-limit**: Limit for number of routes handled OSPF process
- **router-id**: Router ID

rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#

7.1.67 spanning-tree

**Profile Config Commands**

Enables spanning tree commands. Use these commands to configure the errdisable, multiple spanning tree and portfast settings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
spanning-tree [errdisable|mst|portfast]

spanning-tree errdisable recovery [cause bpduguard|interval <10-1000000>]

spanning-tree mst [<0-15>|cisco-interoperability|enable|forward-time|hello-time|
instance|max-age|max-hops|region|revision]

spanning-tree mst [<0-15> priority <0-61440>|cisco-interoperability [enable|disable]
|enable|forward-time <4-30>|hello-time <1-10>|instance <1-15>|max-age <6-40>
|max-hops <7-127>|region <LINE>|revision <0-255>]

spanning-tree portfast [bpdufilter|bpduguard] default
```

**Parameters**

- `spanning-tree errdisable recovery [cause bpduguard|interval <10-1000000>]`

  - **errdisable** Disables or shutdowns ports where traffic is looping, or ports with traffic in one direction

  - **recovery** Enables the timeout mechanism for a port to be recovered. This option is disabled by default.

  - **cause bpduguard** Specifies the reason for errdisable

    - bpduguard – Recovers from errdisable due to bpduguard

    - **interval <10-1000000>** Specifies the interval after which a port is enabled

      - <10-1000000> – Specify a value from 10 - 1000000 seconds. The default is 300 seconds.

- `spanning-tree mst [<0-15> priority <0-61440>|cisco-interoperability
[enable|disable]|enable|forward-time <4-30>|hello-time <1-10>|instance <1-15>|max-age
<6-40>|max-hops <7-127>|region <LINE>|revision <0-255>]

  - **mst** Configures Multiple Spanning Tree (MST) commands

    The MSTP provides an extension to STP to optimize the usefulness of VLANs. MSTP allows for a separate spanning tree for each VLAN group, and blocks all but one of the possible alternate paths within each spanning tree topology.

  - **<0-15> priority <0-61440>** Specifies the number of instances required to configure MST. Select a value from 0 -15.

    - priority – Sets the bridge priority to the specified value. This value is used to determine the root bridge. Use the no parameter with this command to restore the default bridge priority value.

    - <0-61440> – Sets the bridge priority in increments (Lower priority indicates greater likelihood of becoming root)
### Usage Guidelines

If a bridge does not hear BPDUs from the root bridge within the specified interval, assume the network has changed and recomputed the spanning-tree topology.

Generally, spanning tree configuration settings in the config mode define the configuration for bridge and bridge instances. MSTP is based on instances. An instance is a group of VLANs with a common spanning tree. A single VLAN cannot be associated with multiple instances.

Wireless Controllers or service platforms with the same instance, VLAN mapping, revision number and region names define a unique region. Wireless Controllers or service platforms in the same region exchange BPDUs with instance record information within.

</tr>
<tr>
<td>- &lt;0-255&gt; – Specify a value from 0 - 255. This default is 0.</td>
<td></td>
</tr>
</tbody>
</table>

- **spanning-tree portfast** [bpdufilter|bpduguard] default

  Enables PortFast on a bridge
  - bpdufilter default – Sets the BPDU filter for the port. The BPDU filter is disabled by default. The spanning tree protocol sends BPDUs from all ports. Enabling the BPDU filter ensures that PortFast enabled ports do not transmit or receive BPDUs.
  - bpduguard default – Guards PortFast ports against BPDU receive. The BPDU guard is disabled by default. Enabling the BPDU guard means this port will shutdown on receiving a BPDU.
    - default – Enables the BPDU filter and/or BPDU guard on PortFast enabled ports by default

### 7.1.68 traffic-class-mapping

**Profile Config Commands**

Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority. This mapping is required to provide priority of service to some packets over others. For example, VoIP packets get higher priority than data packets to provide a better quality of service for high priority voice traffic. Devices use the traffic class field in the IPv6 header to set this priority. This command allows you to assign a priority for different IPv6 traffic types.

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
traffic-class-mapping <IPv6-TRAFFIC-CLASS-VALUE> priority <0-7>
```

**Parameters**

- **traffic-class-mapping**
  - Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority
  - `<IPv6-TRAFFIC-CLASS-VALUE>`
    - Specify the traffic class value of incoming IPv6 untagged packet(s) (could be a single value or a list. For example, 10-20, 25, 30-35). This is the DSCP 6-bit parameter in the header of every IP packet used for packet classification.
  - `priority <0-7>`
    - Specify the 802.1p priority to map with the traffic-class value specified in the previous step
      - `<0-7>` — Specify a value from 0 - 7.

**Note:** The 802.1p priority is a 3-bit IP precedence value in the Type of Service field of the IP header used to set the priority. The valid values for this field are 0-7. Up to 64 entries are permitted. The priority values are:

- 0 – Best Effort
- 1 – Background
- 2 – Spare
- 3 – Excellent Effort
- 4 – Controlled Load
- 5 – Video
- 6 – Voice
- 7 – Network Control
Examples

7.1.69 traffic-shape

Profile Config Commands

Enables traffic shaping and configures traffic shaping parameters. This command is applicable to both the profile and device configuration modes.

Traffic shaping is a means of regulating data transfers and ensuring a specific level of performance within a network. Traffic shaping does the following:

- Controls flow of packets based on their priority value. Prioritized traffic streams are given priority over less important traffic.
- Controls traffic on an interface to match its flow to the speed of a remote target’s interface and ensure traffic conforms to applied policies.
-Shapes traffic to meet downstream requirements and eliminate network congestion when data rates are in conflict.

Use this option to apply traffic shaping to specific applications or application categories. Note, in scenarios where a traffic class is matched against an application, application-category, and ACL rule, the application rule will be applied first, followed by the application-category, and finally the ACL. Further, using traffic shaping, an application takes precedence over an application category.

To enable traffic shaping, configure QoS values on the basis of which priority of service is provided to some packets over others. For example, VoIP packets get higher priority than data packets to provide a better quality of service for high priority voice traffic. For configuring IPv6 traffic class mappings, see traffic-class-mapping. And for configuring DSCP traffic class mappings, see dscp-mapping.

Supported in the following platforms:
- Access Points — AP622, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX5500, NX7500, NX7510, NX7520, NX7530

Syntax

traffic-shape [activation-criteria|app-category|application|class|enable|priority-map|total-bandwidth]  
traffic-shape activation-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]  
traffic-shape app-category <APP-CATEGORY-NAME> class <1-4>  
traffic-shape application <APPLICATION-NAME> class <1-4>  
traffic-shape class <1-4> [max-buffers|max-latency|rate]  
traffic-shape class <1-4> max-buffers <1-400> {red-level <1-400>|red-percent <1-100>}  
traffic-shape class <1-4> max-latency <1-1000000> [msec|usec]  
traffic-shape class <1-4> rate [<1-250000> [Kbps|Mbps]|total-bandwidth-percent <1-100>]  
traffic-shape priority-map <0-7>  
traffic-shape total-bandwidth <1-1000000> [Kbps|Mbps]  
traffic-shape enable
### Parameters

- **traffic-shape activation-criteria** `[always|cluster-master|rf-domain-manager|vrrp-master <1-255>]`

<table>
<thead>
<tr>
<th>traffic-shape activation-criteria</th>
<th>Configures traffic-shape activation criteria that determines when the device invokes traffic shaping</th>
</tr>
</thead>
<tbody>
<tr>
<td>always</td>
<td>Always invokes traffic shaping. This is the default setting.</td>
</tr>
<tr>
<td>cluster-master</td>
<td>Invokes traffic shaping when the device is the cluster master. The solitary cluster master (elected using a priority assignment scheme) is a cluster member that provides management configuration and Smart RF data to other members within the cluster. Cluster requests go through the elected master before dissemination to other cluster members.</td>
</tr>
<tr>
<td>rf-domain-manager</td>
<td>Invokes traffic shaping when the device is the RF Domain manager. The RF Domain manager is the elected member capable of storing and provisioning configuration and firmware images for other members of the RF Domain.</td>
</tr>
<tr>
<td>vrrp-master &lt;1-255&gt;</td>
<td>Invokes traffic shaping when the device is the VRRP master. As the VRRP master, the device responds to ARP requests, forwards packets with a destination link MAC layer address equal to the virtual router MAC layer address, rejects packets addressed to the IP associated with the virtual router and accepts packets addressed to the IP associated with the virtual router.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;1-255&gt;</code> – Specify the VRRP group ID from 1 - 255.</td>
</tr>
</tbody>
</table>

- **traffic-shape app-category `<APP-CATEGORY-NAME>` class `<1-4>`**

<table>
<thead>
<tr>
<th>traffic-shape app-category <code>&lt;APP-CATEGORY-NAME&gt;</code> class <code>&lt;1-4&gt;</code></th>
<th>Configures an application category to traffic-class mapping. Use this option to apply an application category to traffic-shaper class mapping. Naming and categorizing applications that do not fall into existing groups is an additional means of filtering and potentially limiting network airtime to consumptive non required applications negatively impacting network performance.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• app-category <code>&lt;APP-CATEGORY-NAME&gt;</code> – Specify the application category name.</td>
</tr>
<tr>
<td></td>
<td>• class <code>&lt;1-4&gt;</code> – Map the specified application category to a traffic-shaper class from 1 - 4.</td>
</tr>
<tr>
<td><strong>Note:</strong> Before configuring an application category to class mapping, ensure that the specified classes have been configured. Use the `traffic-shape &gt; class &gt; [max-buffers</td>
<td>max-latency</td>
</tr>
</tbody>
</table>

- **traffic-shape application `<APPLICATION-NAME>` class `<1-4>`**

<table>
<thead>
<tr>
<th>traffic-shape application <code>&lt;APPLICATION-NAME&gt;</code> class <code>&lt;1-4&gt;</code></th>
<th>Configures an application to traffic-class mapping. Use this option to apply an application to traffic-shaper class mapping.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• app-category <code>&lt;APPLICATION-NAME&gt;</code> – Specify the application name.</td>
</tr>
<tr>
<td></td>
<td>• class <code>&lt;1-4&gt;</code> – Map the specified application to a traffic-shaper class from 1 - 4.</td>
</tr>
<tr>
<td><strong>Note:</strong> Before configuring an application to class mapping, ensure that the specified classes have been configured. Use the `traffic-shape &gt; class &gt; [max-buffers</td>
<td>max-latency</td>
</tr>
</tbody>
</table>
**traffic-shape class <1-4> max-buffers <1-400>**

Configures the queue length limit for different traffic-shaper class

- **class <1-4>** – Specify the traffic-shaper class from 1 - 4.
- **max-buffers <1-400>** – Configures the maximum queue lengths for packets of different priority queues, after which the queue starts to drop packets.
  - **<1-400>** – Configure the queue length limit from 1 - 400 for packets of priority queues 0, 1, 2, 3, 4, 5, 6, and 7.

**Note:** For access points the upper queue length limit is 400.

**red-level <1-400>**

Optional. Performs Random Early Drop (RED) when a specified queue length in packets is reached

- **<1-400>** – Configure the queue length limit from 1 - 400 for packets of priority queues 0, 1, 2, 3, 4, 5, 6, and 7.

The RED algorithm is a queueing technique for congestion avoidance. RED monitors the average queue size and drops or marks packets. If the buffer is near empty, all incoming packets are accepted. When the queue grows, the probability for dropping an incoming packet also grows. When the buffer is full, the probability has reached 1 and all incoming packets are dropped.

**Note:** For more information on default values, see the Usage Guidelines section in this topic.

**red-percent <1-100>**

Optional. Performs RED when a specified value, which is a percentage of the max-buffers configured, is reached

- **<1-100>** – Configure the percentage of the maxi-buffers from 1 - 100 for packets of priority queues 0, 1, 2, 3, 4, 5, 6, and 7.

**traffic-shape class <1-4> max-latency <1-1000000> [msec|usec]**

Configures the max-latency for different traffic-shaper class. Max latency specifies the time limit after which packets start dropping (maximum packet delay in the queue). The maximum number of entries is 8.

- **class <1-4>** – Specify the traffic-shaper class from 1 - 4.
- **max-latency <1-1000000>** – Configures the max-latency for packets of different priority queues, after which the queue starts to drop packets.
  - **<1-1000000>** – Configure the max-latency from 1 - 1000000 for packets of priority queues 0, 1, 2, 3, 4, 5, 6, and 7.
  - **[msec|usec]** – Configures the unit for measuring latency as milliseconds (msec) or microseconds (usec). The default setting is msec.

**traffic-shape class <1-4> rate [<1-250000> [Kbps|Mbps]|total-bandwidth-percent <1-100>]**

Configures traffic rate, in either Kbps, Mbps or percentage, for the different traffic shaper class. Specify rates for different traffic shaper class to control the maximum traffic rate sent or received on an interface. Consider this form of rate limiting on interfaces at the edge of a network to limit traffic into or out of the network. Traffic within the set limit is sent and traffic exceeding the set limit is dropped or sent with a different priority.

- **class <1-4>** – Specify the traffic-shaper class from 1 - 4.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `<1-250000>` [Kbps|Mbps] | Configures the traffic rate, in Kbps, Mbps, for the class specified in the previous step  
  - `<1-250000>` – Specify the rate from 1 - 250000.  
  - [Kbps|Mbps] – Configures the unit for measuring bandwidth as Kbps or Mbps. The default setting is Kbps.  
  **Note:** The range varies depending on the unit selected. It is 1 - 250 Mbps, or 250 - 250,000 Kbps. |
| `total-bandwidth-percent <1-100>` | Configures the traffic rate, as a percentage of the total available bandwidth, for the class specified in the previous first step  
  - `<1-100>` – Specify the traffic rate from 1 - 100% of the total bandwidth. |
| **traffic-shape priority-map <0-7>** | Configures the traffic-shaper queues, within a class, having different priority values (0, 1, 2, 3, 4, 5, 6, and 7). There are 8 queues (0 - 7), and traffic is queued in each based on the incoming packet’s 802.1p 3-bit priority markings.  
  - priority-map <0-7> – Specify the priority from 0 - 7 for priority levels 0, 1, 2, 3, 4, 5, 6, and 7.  
  The IEEE 802.1p standards sets a 3-bit value in the MAC header to indicate prioritization. This 3-bit value provides priority levels ranging from 0 to 7 (i.e., a total of 8 levels), with level 7 representing the highest priority. This permits packets to cluster and form different traffic classes. In case of network congestion, packets with higher priority receive preferential treatment while low priority packets are kept on hold. |
| **traffic-shape total-bandwidth <1-1000000> [Kbps|Mbps]** | Configures the total-bandwidth for traffic shaping  
  - `<1-1000000>` – Specify the value from 1 - 1,000,000 Kbps/Mbps. The default value is 10 Mbps.  
  - [Kbps|Mbps] – Configures the unit for measuring bandwidth as Kbps or Mbps. The default setting is Mbps.  
  **Note:** The range varies depending on the unit selected. It is 1 - 1,000 Mbps, or 250 - 1,000,000 Kbps. |
| **traffic-shape enable** | Enables traffic shaping using the defined bandwidth, rate and class mappings configured using this command  
  **Note:** Traffic shaping is disabled by default. |

**Usage Guidelines**

Following are the default max-buffers set for the traffic shaper classes:

```plaintext
traffic-shape class 1 max-buffers 35 35 35 30 25 20 15 10  
traffic-shape class 2 max-buffers 35 35 35 30 25 20 15 10  
traffic-shape class 3 max-buffers 35 35 35 30 25 20 15 10  
traffic-shape class 4 max-buffers 35 35 35 30 25 20 15 10  
```

Following is the default priority-map settings:

```plaintext
traffic-shape priority-map 2 0 1 3 4 5 6 7
```
Examples

### 7.1.70 trustpoint (profile-config-mode)

**Profile Config Commands**

Configures the trustpoint assigned for validating a CMP auth Operator

A certificate links identity information with a public key enclosed in the certificate.

A CA is a network authority that issues and manages security credentials and public keys for message encryption. The CA signs all digital certificates it issues with its own private key. The corresponding public key is contained within the certificate and is called a CA certificate. A browser must contain the CA certificate in its Trusted Root Library so it can trust certificates signed by the CA’s private key.

Depending on the public key infrastructure, the digital certificate includes the owner’s public key, the certificate expiration date, the owner’s name and other public key owner information.

Each certificate is digitally signed by a trustpoint. The trustpoint signing the certificate can be a certificate authority, corporation or individual. A trustpoint represents a CA/identity pair containing the identity of the CA, CA-specific configuration parameters, and an association with an enrolled identity certificate.

---

**NOTE:** Certificates/trustpoints used in this command should be verifiable as existing on the device.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

trusted point cmp-auth-operator <TRUSTPOINT-NAME>

**Parameters**

- **trustpoint cmp-auth-operator <TRUSTPOINT-NAME>**

  Assigns an existing trustpoint to validate CMP auth operator. Once validated, CMP is used to obtain and manage digital certificates in a PKI network. Digital certificates link identity information with a public key enclosed within the certificate, and are issued by the CA.

  Use this command to specify the CMP-assigned trustpoint. When specified, devices send a certificate request to the CMP supported CA server, and download the certificate directly from the CA server. CMP supports multiple request options through for device communicating to a CMP supported CA server. The device can initiate a request for getting the certificates from the server. It can also auto update the certificates which are about to expire.

- **<TRUSTPOINT-NAME>** – Specify the trustpoint name (should be existing and configured).
Examples

nx9500-6C8809(config-profile-testNX9000)#trustpoint cmp-auth-operator test

nx9500-6C8809(config-profile-testNX9000)#show context

    isakmp-proposal default encryption aes-256 group 2 hash sha
  ...........................................................
  service pm sys-restart
  router bgp
  trustpoint cmp-auth-operator test

nx9500-6C8809(config-profile-testNX9000)#
7.1.71 trustpoint (device-config-mode)

Profile Config Commands

Assigns trustpoints to validate various services, such as HTTPS, RADIUS CA, RADIUS server, external LDAP server etc.

For more information on digital certificate and certificate authorities, see `trustpoint (profile-config-mode)`.

| NOTE: Certificates/trustpoints used in this command should be verifiable as existing on the device. |

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
trustpoint [cmp-auth-operator|https|radius-ca|radius-ca-ldaps|radius-server|radius-server-ldaps] <TRUSTPOINT-NAME>
```

Parameters

- `trustpoint [cmp-auth-operator|https|radius-ca|radius-ca-ldaps|radius-server|radius-server-ldaps] <TRUSTPOINT-NAME>`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trustpoint</td>
<td>Assigns trustpoints to validate various services. The assigned trustpoint is used as the CA for validating the services.</td>
</tr>
<tr>
<td>cmp-auth-operator</td>
<td>Assigns an existing trustpoint to validate CMP auth operator. Once validated, CMP is used to obtain and manage digital certificates in a PKI network. Digital certificates link identity information with a public key enclosed within the certificate, and are issued by the CA. Use this command to specify the CMP-assigned trustpoint. When specified, devices send a certificate request to the CMP supported CA server, and download the certificate directly from the CA server. CMP supports multiple request options through for device communicating to a CMP supported CA server. The device can initiate a request for getting the certificates from the server. It can also auto update the certificates which are about to expire. <strong>Note:</strong> When configured, this cmp-auth-operator trustpoint setting overrides the profile-level configuration.</td>
</tr>
<tr>
<td>https</td>
<td>Assigns an existing trustpoint to validate HTTPS</td>
</tr>
<tr>
<td>radius-ca</td>
<td>Assigns an existing trustpoint to validate client certificates in EAP</td>
</tr>
<tr>
<td>radius-ca-ldaps</td>
<td>Assigns an existing trustpoint to validate external LDAP server</td>
</tr>
<tr>

no trustpoint cmp-auth-operator
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#
```
7.1.72 tunnel-controller

Profile Config Commands

Configures the tunneled WLAN (extended VLAN) wireless controller or service platform’s name

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
tunnel-controller <NAME>

Parameters

- tunnel-controller <NAME>  

Examples
rfs7000-37FABE(config-profile-default-rfs7000)#tunnel-controller testgroup

</table>
| captive-portal <CAPTIVE-PORTAL> | Configures access to a specified captive portal with this profile  
  • <CAPTIVE-PORTAL> – Specify the captive portal name. |
| client-identity-identity-group <CLIENT-IDENTITY-GROUP-NAME> | Associates an existing client identity group with this profile  
  • <CLIENT-IDENTITY-GROUP-NAME> – Specify the client identity group name.  
  **Note:** For more information on the ‘client-identity’ and ‘client-identity-group’ commands, see client-identity and client-identity-group. |
| crypto-cmp-policy <POLICY-NAME> | Associates an existing crypto certificate management protocol (CMP) policy with this profile  
  • <POLICY-NAME> – Specify the CMP policy name.  
  For more information on configuring a crypto CMP policy, see CRYPTO-CMP-POLICY. |
| dhcp-server-policy <DHCP-POLICY> | Associates a DHCP server policy  
  • <DHCP-POLICY> – Specify the DHCP server policy name. |
| dhcpv6-server-policy <DHCPv6-POLICY> | Associates a DHCPv6 server policy  
  • <DHCPv6-POLICY> – Specify the DHCPv6 server policy name. |
| event-system-policy <EVENT-SYSTEM-POLICY> | Associates an event system policy  
  • <EVENT-SYSTEM-POLICY> – Specify the event system policy name. |
| firewall-policy <FW-POLICY> | Associates a firewall policy  
  • <FW-POLICY> – Specify the firewall policy name. |
| global-assoc-list-server <GLOBAL-ASSOC-LIST-NAME> | Associates the specified global association list with the controller profile  
  • <GLOBAL-ASSOC-LIST-NAME> – Specify the global association list name.  
  Once associated, the controller, using this profile, applies this association list to requests received from all adopted APs. For more information on global association list, see global-association-list. |
| guest-management <GUEST-MANAGEMENT-POLICY-NAME> | Associates the specified guest management policy with the controller profile  
  • <GUEST-MANAGEMENT-POLICY-NAME> – Specify the guest management policy name (should be existing and configured). |
| management-policy <MNGT-POLICY> | Associates a management policy  
  • <MNGT-POLICY> – Specify the management policy name. |
| radius-server-policy <RADIUS-POLICY> | Associates a device onboard RADIUS policy  
  • <RADIUS-POLICY> – Specify the RADIUS policy name. |
| role-policy <ROLE-POLICY> | Associates a role policy  
  • <ROLE-POLICY> – Specify the role policy name. |
| routing-policy <ROUTING-POLICY> | Associates a routing policy  
  • <ROUTING-POLICY> – Specify the routing policy name.  
  This is not applicable to the NX45XX and NX65XX series profiles. |
| smart-cache-policy <POLICY-NAME> | Associates an existing Smart Cache policy with a profile or device  
  • <POLICY-NAME> – Specify the policy name. |
<table>
<thead>
<tr>
<th>Use</th>
<th>Description</th>
</tr>
</thead>
</table>
| web-filter-policy | Associates an existing Web Filter policy with a profile or device  
  • `<POLICY-NAME>` – Specify the policy name. |
| auto-provisioning-policy | Associates an auto provisioning policy  
  • `<POLICY-NAME>` – Specify the auto provisioning policy name. |
| bonjour-gw-forwarding-policy | Uses an existing Bonjour GW Forwarding policy with a profile or device  
  • `<POLICY-NAME>` – Specify the Bonjour GW Forwarding policy name (should be existing and configured).  
  **Note:** For more information on Bonjour GW Forwarding policy, see `bonjour-gw-forwarding-policy`. |
| captive-portal | Configures access to a specified captive portal  
  • `<CAPTIVE-PORTAL>` – Specify the captive portal name. |
| client-identity-group | Associates an existing client identity group with this device  
  • `<CLIENT-IDENTITY-GROUP-NAME>` – Specify the client identity group name.  
  For more information on the ‘client-identity’ and ‘client-identity-group’ commands, see `client-identity` and `client-identity-group`. |
| crypto-cmp-policy | Associates an existing crypto certificate management protocol (CMP) policy with this profile  
  • `<POLICY-NAME>` – Specify the CMP policy name.  
  For more information on configuring a crypto CMP policy, see `CRYPTO-CMP-POLICY`. |
| dhcp-server-policy | Associates a DHCP server policy  
  • `<DHCP-POLICY>` – Specify the DHCP server policy name. |
| dhcpv6-server-policy | Associates a DHCPv6 server policy  
  • `<DHCPv6-POLICY>` – Specify the DHCPv6 server policy name. |
| event-system-policy | Associates an event system policy  
  • `<EVENT-SYSTEM-POLICY>` – Specify the event system policy name. |
| firewall-policy | Associates a firewall policy  
  • `<FW-POLICY>` – Specify the firewall policy name. |
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| global-assoc-list server <GLOBAL-ASSOC-LIST-NAME> | Associates the specified global association list with the device (controller)  
  • `<GLOBAL-ASSOC-LIST-NAME>` – Specify the global association list name.  
  Once associated, the controller applies this association list to requests received from all adopted APs. For more information on global assoc it ion list, see global-association-list. |
| guest-management <GUEST-MANAGEMENT-POLICY-NAME> | Associates the specified guest management policy with this device  
  • `<GUEST-MANAGEMENT-POLICY-NAME>` – Specify the guest management policy name (should be existing and configured). |
| management-policy <MNGT-POLICY> | Associates a management policy  
  • `<MNGT-POLICY>` – Specify the management policy name. |
| nsight-policy <NSIGHT-POLICY-NAME> | Associates a specified Nsight (MART) policy with this device  
  • `<NSIGHT-POLICY-NAME>` – Specify the Nsight policy name (should be existing and configured).  
  Note: Use this command to associate an Nsight policy to a controller to enable it to function as the NSight server. For more information, see nsight-policy. |
| profile <PROFILE-NAME> | Associates a profile with this device  
  • `<PROFILE-NAME>` – Specify the profile name. |
| radius-server-policy <RADIUS-POLICY> | Associates a device onboard RADIUS policy  
  • `<RADIUS-POLICY>` – Specify the RADIUS policy name. |
| rf-domain <RF-DOMAIN-NAME> | Associates an RF Domain  
  • `<RF-DOMAIN-NAME>` – Specify the RF Domain name. |
| role-policy <ROLE-POLICY> | Associates a role policy  
  • `<ROLE-POLICY>` – Specify the role policy name. |
| routing-policy <ROUTING-POLICY> | Associates a routing policy  
  • `<ROUTING-POLICY>` – Specify the routing policy name.  
  This is not applicable to the NX45XX and NX65XX series devices. |
| wips-policy <WIPS-POLICY> | Associates a WIPS policy  
  • `<WIPS-POLICY>` – Specify the WIPS policy name. |
| smart-cache-policy <POLICY-NAME> | Associates an existing Smart Cache policy with a profile or device  
  • `<POLICY-NAME>` – Specify the policy name.  
  This command is specific to the NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, and NX9510 model devices |
| web-filter-policy <POLICY-NAME> | Associates an existing Web Filter policy with a profile or device  
  • `<POLICY-NAME>` – Specify the policy name. |

Profile Config Commands

Configures VRRP group settings

A default gateway is a critical resource for connectivity. However, it is prone to a single point of failure. Thus, redundancy for the default gateway is required. If WAN backhaul is available, and a router failure occurs, then the controller should act as a router and forward traffic on to its WAN link.

Define an external VRRP configuration when router redundancy is required in a network requiring high availability.

Central to VRRP configuration is the election of a VRRP master. A VRRP master (once elected) performs the following functions:

- Responds to ARP requests
- Forwards packets with a destination link layer MAC address equal to the virtual router’s MAC address
- Rejects packets addressed to the IP address associated with the virtual router, if it is not the IP address owner
- Accepts packets addressed to the IP address associated with the virtual router, if it is the IP address owner or accept mode is true.

The nodes that lose the election process enter a backup state. In the backup state they monitor the master for any failures, and in case of a failure one of the backups, in turn, becomes the master and assumes the management of the designated virtual IPs. A backup does not respond to an ARP request, and discards packets destined for a virtual IP resource.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

vrrp [<1-255>|version]

vrrp <1-255> [delta-priority|description|interface|ip|monitor|preempt|priority|sync-group|timers]

vrrp <1-255> [delta-priority <1-253>|description <LINE>|ip <IP> {<IP>}|preempt {delay <1-65535>]|priority <1-254>|sync-group]

vrrp <1-255> interface vlan <1-4094>

vrrp <1-255> monitor [<IF-NAME>|critical-resource|pppoel|vlan|wwan1]
vrrp <1-255> monitor [<IF-NAME>|pppoel|vlan <1-4094>|wwan1] {(<IF-NAME>|critical-resource|pppoel|vlan|wwan1)}

vrrp <1-255> monitor critical-resource <CRM-NAME1> <CRM-NAME2> <CRM-NAME3> <CRM-NAME4>

vrrp <1-255> timers advertise [<1-255]|centiseconds <25-4095>|msec <250-999>]

vrrp version [2|3]

Parameters

<p>| vrrp &lt;1-255&gt; | Configures the virtual router ID from 1-255. Identifies the virtual router the packet is reporting status for. |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| delta-priority <1-253>   | Configures the priority to decrement (local link monitoring and critical resource monitoring) or increment (critical resource monitoring). When the monitored interface is down, the configured priority decrements by a value defined by the delta-priority option. When monitoring critical resources, the value increments by the delta-priority option.  
  - `<1-253>` – Specify the delta priority level from 1-253. |
| description <LINE>       | Configures a text description for the virtual router to further distinguish it from other routers with similar configuration  
  - `<LINE>` – Provide a description (a string from 1-64 characters in length) |
| ip <IP-ADDRESSES>        | Identifies the IP address(es) backed by the virtual router. These are IP addresses of Ethernet switches, routers, and security appliances defined as virtual router resources.  
  - `<IP-ADDRESSES>` – Specify the IP address(es) in the A.B.C.D format. This configuration triggers VRRP operation. |
| preempt {delay <1-65535>}| Controls whether a high priority backup router preempts a lower priority master. This field determines if a node with higher priority can takeover all virtual IPs from a node with lower priority. This feature is disabled by default.  
  - delay – Optional. Configures the pre-emption delay timer from 1 - 65535 seconds (default is 0 seconds). This option can be used to delay sending out the master advertisement or, in case of monitored link coming up, adjusting the VRRP priority by priority delta. |
| priority <1-254>         | Configures the priority level of the router within a VRRP group. This value determines which node is elected as the Master. Higher values imply higher priority, value 254 has the highest precedence (default is 100). |
| sync-group               | Adds this VRRP group to a synchronized group. To trigger VRRP failover, it is essential all individual groups within a synchronized group have failover. VRRP failover is triggered if an advertisement is not received from the virtual masters that are part of this VRRP sync group. This feature is disabled by default. |

```
- vrrp <1-255> interface vlan <1-4094>

- vrrp <1-255> monitor critical-resource <CRM-NAME1> <CRM-NAME2> <CRM-NAME3> <CRM-NAME4> (action [decrement-priority|increment-priority] {<IF-NAME>|pppoe1|vlan|wwan1})

- vrrp <1-255> interface vlan <1-4094> Enables VRRP on the specified switch VLAN interface (SVI)  
  - vlan <1-4094> – Specify the VLAN interface ID from 1 - 4094.

- vrrp <1-255> critical-resource <CRM-NAME1> Specifies the name of the critical resource to monitor. VRRP can be configured to monitor maximum of four critical resources. Use the <CRM-NAME2>, <CRM-NAME3>, and <CRM-NAME4> to provide names of the remaining three critical resources. By default VRRP is configured to monitor all critical resources on the device.
```
| action     | Sets the action on critical resource down event. It is a recursive parameter that sets the action for each of the four critical resources being monitored.  
  | decrement-priority – Decrements the priority of virtual router on critical resource down event  
  | increment-priority – Increments the priority of virtual router on critical resource down event  
| <IF-NAME> | Optional. Enables interface monitoring  
  | <IF-NAME> – Specify the interface name to monitor  
| pppoe1     | Optional. Enables Point-to-Point Protocol (PPP) over Ethernet interface monitoring  
| vlan <1-4094> | Optional. Enables VLAN (switched virtual interface) interface monitoring  
  | <1-4094> – Specify the VLAN interface ID from 1- 4094.  
| wwan1 | Optional. Enables Wireless WAN interface monitoring  
| vrrp <1-255> timers advertise  | Configures the virtual router ID from 1- 255. Identifies the virtual router the packet is reporting status for.  
| timers | Configures the timer that runs every interval  
| advertise | Configures the VRRP advertisements time interval. This is the interval at which a master sends out advertisements on each of its configured VLANs.  
  | <1-255> – Configures the timer interval from 1- 255 seconds. (applicable for VRRP version 2 only)  
  | centiseconds <25-4095> – Configures the timer interval in centiseconds (1/100th of a second). Specify a value between 25 - 4095 centiseconds (applicable for VRRP version 3 only).  
  | msec <250-999> – Configures the timer interval in milliseconds (1/1000th of a second). Specify a value between 250 - 999 msec (applicable for VRRP version 2 only). Default is 1 second.  
| vrrp version [2|3] | Configures one of the following VRRP versions:  
  | 2 – VRRP version 2 (RFC 3768). This is the default setting.  
  | 3 – VRRP version 3 (RFC 5798 only IPV4)  
  | The VRRP version determines the router redundancy. Version 3 supports sub-second (centisecond) VRRP failover and support services over virtual IP.  

**Examples**

```
rfs7000-37FABE(config-profile-default-rfs7000)#vrrp version 3
rfs7000-37FABE(config-profile-default-rfs7000)#vrrp 1 sync-group
rfs7000-37FABE(config-profile-default-rfs7000)#vrrp 1 delta-priority 100
```
rfs7000-37FABE(config-profile-default-rfs7000)#show context
profile rfs7000 default-rfs7000
  bridge vlan 1
  ......................................................
  vrrp 1 timers advertise 1
  vrrp 1 preempt
  vrrp 1 sync-group
  vrrp 1 delta-priority 100

7.1.75 **vrrp-state-check**

Profile Config Commands

Publishes interface via OSPF or BGP based on Virtual Router Redundancy Protocol (VRRP) status

VRRP allows automatic assignment of available IP routers to participating hosts. This increases the availability and reliability of routing paths via automatic default gateway selections on an IP subnetwork. This option is enabled by default.

Supported in the following platforms:

- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

vrrp-state-check

**Parameters**

None

**Examples**

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#vrrp-state-check

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context

7.1.76 **wep-shared-key-auth**

Enables support for 802.11 WEP shared key authentication

When enabled, devices, using this profile, use a WEP key to access the network. The controller or service platform use the key algorithm to convert an ASCII string to the same hexadecimal number. Clients without the recommended adapters need to use WEP keys manually configured as hexadecimal numbers. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

Profile Config Commands

Service commands are used to view and manage configurations. The service commands and their corresponding parameters vary from mode to mode.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
service [cluster|critical-resource|fast-switching|enable|global-association-list|lldp|memory|meshpoint|pm|power-config|radius|remote-config|rss-timeout|watchdog|wireless|show]

service cluster master-election immediate
service critical-resource port-mode-source-ip <IP>
service enable [l2tpv3|pppoe|radiusd]

service global-association-list blacklist-interval <1-65535>

service lldp loop-detection

service memory kernel decrease

service meshpoint loop-prevention-port [<L2-INTERFACE-NAME>|ge <1-5>|
port-channel <1-2>|up1]

service pm sys-restart

service power-config [3af-out|force-3at]

service radius dynamic-authorization additional-port <1-65535>

service remote-config apply-delay <0-600>

service rss-timeout <0-86400>

service watchdog

service wireless [anqp-frag-always|anqp-frag-size|ap650|client|cred-cache-sync|
inter-ap-key|noise-immunity|reconfig-on-tx-stall|test|wispe-controller-port]

service wireless anqp-frag-always

service wireless anqp-frag-size <100-1500>

service wireless ap650 legacy-auto-update-image <FILE>

service wireless client tx-deauth on-radar-detect

service wireless cred-cache-sync [full|interval <30-864000>|never|partial]

service wireless test [max-rate|max-retries|min-rate]

service wireless test [max-rate|min-rate] [1,2,5,5,6,11,12,18,24,36,48,54,mcs0,
mcs1,............mcs23]

service wireless inter-ap-key [0 <WORD>|2 <WORD>|<WORD>]

service wireless noise-immunity

service wireless reconfig-on-rx-stall

service wireless test max-retries <0-15>

service wireless wispe-controller-port <1-65535>

service show cli
```
The following command is specific to the **NX45XX** and **NX65XX** series service platform:

```plaintext
service fast-switching
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service cluster master-election immediate</td>
<td>Initiates and completes cluster master election as soon as just one cluster member comes on and is active. This option is disabled by default.</td>
</tr>
<tr>
<td>service critical-resource port-mode-source-ip &lt;IP&gt;</td>
<td>Hard codes a source IP for critical resource management. The default is 0.0.0.0</td>
</tr>
<tr>
<td>service enable [l2tpv3</td>
<td>pppoe</td>
</tr>
<tr>
<td>service global-association-list blacklist-interval &lt;1-65535&gt;</td>
<td>Configures global association list related parameters. Configures the period for which a client is blacklisted. A client is considered blacklisted after being denied access by the server. The default is 60 seconds.</td>
</tr>
<tr>
<td>service lldp loop-detection</td>
<td>Enables network loop detection via LLDP. This option is disabled by default.</td>
</tr>
<tr>
<td>service memory kernel decrease</td>
<td>Enables reduction in kernel memory usage. When enabled, firewall flows are reduced by 75% resulting in reduced kernel memory usage. A reboot is required for the option to take effect. This option is disabled by default.</td>
</tr>
<tr>
<td>service meshpoint loop-prevention-port</td>
<td>Limits meshpoint loop prevention to a single port. Limits meshpoint loop prevention on a specified Ethernet interface. Specify the layer 2 Ethernet interface name.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service enable l2tpv3</td>
<td>Enables/disables L2TPv3 on this profile. This feature is not supported on AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX65XX, and NX9000 model devices. It is supported only on AP621, AP6511, and AP6521.</td>
</tr>
<tr>
<td>service enable pppoe</td>
<td>Enables PPPoE features. When executed on a device, enables PPPoE on the logged device. When executed on a profile, enables PPPoE on all devices using that profile.</td>
</tr>
<tr>
<td>service enable radiusd</td>
<td>Enables RADIUSD features. When executed on a device, enables RADIUSD on the logged device. When executed on a profile, enables RADIUSD on all devices using that profile.</td>
</tr>
<tr>
<td>service global-association-list blacklist-interval &lt;1-65535&gt;</td>
<td>Configures global association list related parameters. Configures the period for which a client is blacklisted. A client is considered blacklisted after being denied access by the server. The default is 60 seconds.</td>
</tr>
<tr>
<td>service lldp loop-detection</td>
<td>Enables network loop detection via LLDP. This option is disabled by default.</td>
</tr>
<tr>
<td>service memory kernel decrease</td>
<td>Enables reduction in kernel memory usage. When enabled, firewall flows are reduced by 75% resulting in reduced kernel memory usage. A reboot is required for the option to take effect. This option is disabled by default.</td>
</tr>
<tr>
<td>service meshpoint loop-prevention-port</td>
<td>Limits meshpoint loop prevention to a single port. Limits meshpoint loop prevention on a specified Ethernet interface. Specify the layer 2 Ethernet interface name.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>ge &lt;1-4&gt;</td>
<td>Limits meshpoint loop prevention on a specified GigabitEthernet interface. ge &lt;1-4&gt; – Specify the GigabitEthernet interface index from 1 - 4.</td>
</tr>
<tr>
<td>port-channel &lt;1-2&gt;</td>
<td>Limits meshpoint loop prevention on a specified port-channel interface. port-channel &lt;1-2&gt; – Specify the port-channel interface index from 1 - 2.</td>
</tr>
<tr>
<td>service pm sys-restart</td>
<td>Enables the process monitor (PM) to restart the system when a process fails. This option is enabled by default.</td>
</tr>
<tr>
<td>service power-config [3af-out</td>
<td>force-3at]</td>
</tr>
<tr>
<td>service radius dynamic-authorization additional-port &lt;1-65535&gt;</td>
<td>Configures an additional UDP port used by the device to listen for dynamic authorization messages. radius dynamic-authorization additional-port &lt;1-65535&gt; – Specify a value from 1 - 65535. The default is 3799. The Cisco Identity Services Engine (ISE) server uses port 1700.</td>
</tr>
<tr>
<td>service remote-config apply-delay &lt;0-600&gt;</td>
<td>Delays configuration of a remote device (after it becomes active) by the specified time period. remote-config apply-delay &lt;0-600&gt; – Specify a value from 0 - 600 seconds. The default is 0 seconds.</td>
</tr>
<tr>
<td>service rss-timeout &lt;0-86400&gt;</td>
<td>Configures the duration, in seconds, for which an adopted access point will continue to provide wireless functions even after loosing controller adoption. rss-timeout &lt;0-86400&gt; – Specify a value from 0 - 86400 seconds. The default is 300 seconds.</td>
</tr>
<tr>
<td>service watchdog</td>
<td>Enables/disables the watchdog. This feature is enabled by default. Enabling the watchdog option implements heartbeat messages to ensure other associated devices are up and running and capable of effectively inter-operating with the controller.</td>
</tr>
<tr>
<td>service wireless anqp-frag-always</td>
<td>Enables fragmentation of all ANQP packets. This option is disabled by default.</td>
</tr>
<tr>

</tr>
<tr>
<td>- [max-rate</td>
<td>min-rate]</td>
</tr>
<tr>
<td>- [1,2,5.5,....mcs23]</td>
<td>Select the maximum and minimum data rates applicable.</td>
</tr>
</tbody>
</table>
- service wireless test max-retries <0-15>

  Configures the serviceability parameters used for testing

  max-retries <0-15> Configures the maximum number of retries per packet from 0 - 15. The default is 0.

- service wireless wispe-controller-port <1-65535>

  wispe-controller-port <1-65535> Resets the Wireless Switch Protocol Enhanced (WISPe) controller port. This is the UDP port used to listen for WISPe.
  • <1-65535> – Specify a value from 1 - 65535. The default is 24756.

- service show cli

  show cli Displays running system configuration details
  • cli – Displays the CLI tree of the current mode

- service fast-switching

  fast-switching Enables fast switching of packets in the hardware
  Use the no > service > fast-switching to disable this feature.
  Fast switching can be enabled and disabled on the NX45XX and NX65XX series service platform.

Examples

rfs7000-37FABE(config-profile-testtrfsl7000)#service radius dynamic-authorization additional-port 1700

Related Commands

no Removes or resets service command parameters
7.1.78 slot

Assigns a Peripheral Component Interconnect (PCIe) slot for Team-URC VM or WiNG support

The NX45XX and NX65XX series service platforms support an optional NX expansion module for modular WAN and Telephony Gateway support. The NX Series Expansion Module kit (KT-NXMODC-01) allows for the installation and implementation of up to four PCIe cards. The Expansion Module kit can be installed in NX4500, NX4524, NX6500 or NX6524 model service platforms.

Supported in the following platforms:
- Service Platforms — NX4500, NX4524, NX6500, NX6524

**Syntax**

```
slot <1-4>
```

**Parameters**

- slot <1-4>

---

<table>
<thead>
<tr>
<th>slot &lt;1-4&gt;</th>
<th>Enables assignment of PCIe slots for TEAM-Centro or WiNG support. You can also assign the selected slot to any other VM.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-4&gt; – Select the slot from 1 - 4. The command selects the slot and enters its configuration mode.</td>
</tr>
</tbody>
</table>

In the slot configuration mode, do the following:

- assign – Assigns the selected slot to either TEAM-Centro VM, WiNG, or other VM support
- team-centro – Assigns the selected slot to TEAM-Centro VM (IP PBX)
- wing – Assigns the selected slot to WiNG
- other – Assigns the selected slot to other VM

**Note:** The `show > slot` command displays slots and their assignment details (type and status). Use the `no > assign` command to override the slot assignment configured.

---

**Examples**

```
nx4500-5CFA2B(config-profile-testNX45XX)#slot 1
nx4500-5CFA2B(config-profile testNX45XX-slot-1)#
nx4500-5CFA2B(config-profile testNX45XX-slot-1)#?
nx4500-5CFA2B(config-profile testNX45XX-slot-1)#assign team-centro
```

---

**Slot Mode commands:**

- assign Assign the slot
- no Negate a command or set its defaults
- shutdown Disable the slot
- clrscr Clear the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

7.2 Device Config Commands

Use the (config) instance to configure device specific parameters.

To navigate to this instance, use the following commands:

```plaintext
<DEVICE>(config)#<DEVICE-TYPE> <MAC>
<DEVICE>(config-device-<MAC>)#?
```

Device Mode commands:

- **adopter-auto-provisioning-policy-lookup**: Use centralized auto-provisioning policy when adopted by another controller.
- **adoption**: Adoption configuration.
- **adoption-site**: Set system's adoption site.
- **alias**: Alias.
- **application-policy**: Application Policy configuration.
- **area**: Set name of area where the system is located.
- **arp**: Address Resolution Protocol (ARP).
- **auto-learn-staging-config**: Enable learning network configuration of the devices that come for adoption.
- **autogen-uniqueid**: Autogenerate a unique id.
- **autoinstall**: Autoinstall settings.
- **bluetooth-detection**: Detect Bluetooth devices using the Bluetooth USB module.
- **bridge**: Ethernet bridge.
- **captive-portal**: Captive portal.
- **cdp**: Cisco Discovery Protocol.
- **channel-list**: Configure channel list to be advertised to wireless clients.
- **cluster**: Cluster configuration.
- **configuration-persistence**: Enable persistence of configuration across reloads (startup config file).
- **contact**: Configure the contact.
- **controller**: WLAN controller configuration.
- **country-code**: Configure the country of operation.
- **critical-resource**: Critical Resource.
- **crypto**: Encryption related commands.
- **database-backup**: Scheduled Database Backup.
- **device-upgrade**: Device firmware upgrade.
- **dot1x**: 802.1X.
- **dpi**: Enable Deep-Packet-Inspection (Application Assurance).
- **dscp-mapping**: Configure IP DSCP to 802.1p priority mapping for untagged frames.
- **email-notification**: Email notification configuration.
- **enforce-version**: Check the firmware versions of devices before interoperating.
- **environmental-sensor**: Environmental Sensors Configuration.
- **events**: System event messages.
- **export**: Export a file.
- **file-sync**: File sync between controller and adoptees.
- **floor**: Set the floor within a area where the system is located.
- **geo-coordinates**: Configure geo coordinates for this device.
- **gre**: GRE protocol.
- **hostname**: Set system's network name.
- **http-analyze**: Specify HTTP-Analysis configuration.
- **interface**: Select an interface to configure.
- **ip**: Internet Protocol (IP).
- **ipv6**: Internet Protocol version 6 (IPv6).
- **l2tpv3**: L2tpv3 protocol.
**l3e-lite-table**  
L3e lite Table

**layout-coordinates**  
Configure layout coordinates for this device

**led**  
Turn LEDs on/off on the device

**led-timeout**  
Configure the time for the led to turn off after the last radio state change

**legacy-auto-downgrade**  
Enable device firmware to auto downgrade when other legacy devices are detected

**legacy-auto-update**  
Auto upgrade of legacy devices

**license**  
License management command

**lldp**  
Link Layer Discovery Protocol

**load-balancing**  
Configure load balancing parameter

**location**  
Configure the location

**logging**  
Modify message logging facilities

**mac-address-table**  
MAC Address Table

**mac-auth**  
802.1X

**mac-name**  
Configure MAC address to name mappings

**memory-profile**  
Memory profile to be used on the device

**meshpoint-device**  
Configure meshpoint device parameters

**meshpoint-monitor-interval**  
Configure meshpoint monitoring interval

**min-misconfiguration-recovery-time**  
Check controller connectivity after configuration is received

**mint**  
MiNT protocol

**mirror**  
Mirroring

**misconfiguration-recovery-time**  
Check controller connectivity after configuration is received

**neighbor-inactivity-timeout**  
Configure neighbor inactivity timeout

**neighbor-info-interval**  
Configure neighbor information exchange interval

**no**  
Negate a command or set its defaults

**noc**  
Configure the noc related setting

**ntp**  
Ntp server A.B.C.D

**offline-duration**  
Set duration for which a device remains unadopted before it generates offline event

**override-wlan**  
Configure RF Domain level overrides for wlan

**power-config**  
Configure power mode

**preferred-controller-group**  
Controller group this system will prefer for adoption

**preferred-tunnel-controller**  
Tunnel Controller Name this system will prefer for tunneling extended vlan traffic

**radius**  
Configure device-level radius authentication parameters

**raid**  
RAID

**remove-override**  
Remove configuration item override from the device (so profile value takes effect)

**rf-domain-manager**  
RF Domain Manager

**router**  
Dynamic routing

**rsa-key**  
Assign a RSA key to a service

**sensor-server**  
AirDefense sensor server configuration

**slot**  
PCI expansion Slot

**spanning-tree**  
Spanning tree

**traffic-class-mapping**  
Configure IPv6 traffic class to 802.1p priority mapping for untagged frames

**traffic-shape**  
Traffic shaping

**trustpoint**  
Assign a trustpoint to a service

**timezone**  
Configure the timezone
tunnel-controller: Tunnel Controller group this controller belongs to
use: Set setting to use
vrrp: VRRP configuration
vrrp-state-check: Publish interface via OSPF/BGP only if the interface VRRP state is not BACKUP
wep-shared-key-auth: Enable support for 802.11 WEP shared key authentication

clrscr: Clears the display screen
commit: Commit all changes made in this session
do: Run commands from Exec mode
end: End current mode and change to EXEC mode
exit: End current mode and down to previous mode
help: Description of the interactive help system
revert: Revert changes
service: Service Commands
show: Show running system information
write: Write running configuration to memory or terminal

<DEVICE>{config-device-<MAC>}#

The following table summarizes device configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>adopter-auto-provisioning-policy-lookup</td>
<td>Enables the use of a centralized auto provisioning policy on this device</td>
<td>page 7-11</td>
</tr>
<tr>
<td>adoption</td>
<td>Configures a minimum and maximum delay time in the initiation of the device adoption process</td>
<td>page 7-12</td>
</tr>
<tr>
<td>alias</td>
<td>Sets the device's adoption site name</td>
<td>page 7-453</td>
</tr>
<tr>
<td>application-policy</td>
<td>Configures network, VLAN, and service aliases on a device</td>
<td>page 7-13</td>
</tr>
<tr>
<td>area</td>
<td>Associates a RADIUS server provided application policy with this device. When associated, the application policy allows wireless clients (MUs) to always find the RADIUS-supplied application policy in the dataplane.</td>
<td>page 7-19</td>
</tr>
<tr>
<td>autoinstall</td>
<td>Configures ARP parameters</td>
<td>page 7-21</td>
</tr>
<tr>
<td>auto-learn-staging-config</td>
<td>Enables automatic recognition of devices pending adoption</td>
<td>page 7-23</td>
</tr>
<tr>
<td>autogen-uniqueid</td>
<td>When executed in the device configuration mode, this command generates a unique ID for the logged device</td>
<td>page 7-24</td>
</tr>
<tr>
<td>captive-portal</td>
<td>Autinstalls firmware image and configuration setup parameters</td>
<td>page 7-26</td>
</tr>
<tr>
<td>bridge</td>
<td>Configures Ethernet Bridging parameters</td>

</tr>
<tr>
<td>ip</td>
<td>Configures IPv4 components</td>
<td>page 7-348</td>
</tr>
<tr>
<td>ipv6</td>
<td>Configures IPv6 components</td>
<td>page 7-357</td>
</tr>
<tr>
<td>l2tpv3</td>
<td>Defines the Layer 2 Tunnel Protocol (L2TP) protocol for tunneling Layer 2 payloads using Virtual Private Networks (VPNs)</td>
<td>page 7-361</td>
</tr>
<tr>
<td>l3e-lite-table</td>
<td>Configures L3e Lite Table with this profile</td>
<td>page 7-363</td>
</tr>
<tr>
<td>layout-coordinates</td>
<td>Configures layout coordinates</td>
<td>page 7-461</td>
</tr>
<tr>
<td>led</td>
<td>Turns LEDs on or off</td>
<td>page 7-364</td>
</tr>
<tr>
<td>led-timeout</td>
<td>Configures the LED-timeout timer in the device or profile configuration mode</td>
<td>page 7-365</td>
</tr>
<tr>
<td>legacy-auto-downgrade</td>
<td>Enables legacy device firmware to auto downgrade</td>
<td>page 7-367</td>
</tr>
<tr>
<td>legacy-auto-update</td>
<td>Auto updates AP650 and AP71XX legacy device firmware</td>
<td>page 7-368</td>
</tr>
<tr>
<td>license</td>
<td>Adds device feature licenses</td>
<td>page 7-462</td>
</tr>
<tr>
<td>lldp</td>
<td>Configures Link Layer Discovery Protocol (LLDP) settings for this device</td>
<td>page 7-369</td>
</tr>
<tr>
<td>load-balancing</td>
<td>Configures load balancing parameters</td>
<td>page 7-371</td>
</tr>
<tr>
<td>location</td>
<td>Configures the system’s location (place of deployment)</td>
<td>page 7-464</td>
</tr>
<tr>

<td>Configures memory profile used on the device</td>
<td>page 7-383</td>
</tr>
<tr>
<td>meshpoint-device</td>
<td>Configures meshpoint device parameters</td>
<td>page 7-384</td>
</tr>
<tr>
<td>meshpoint-monitor-interval</td>
<td>Configures meshpoint monitoring interval</td>
<td>page 7-385</td>
</tr>
<tr>
<td>min-misconfiguration-recovery-time</td>
<td>Configures the minimum device connectivity verification time</td>
<td>page 7-386</td>
</tr>
<tr>
<td>mint</td>
<td>Configures MiNT protocol settings</td>
<td>page 7-387</td>
</tr>
<tr>
<td>misconfiguration-</td>
<td>Verifies device connectivity after a configuration is received</td>
<td>page 7-394</td>
</tr>
<tr>
<td>recovery-time</td>
<td></td>
<td></td>
</tr>
<tr>
<td>neighbor-inactivity-time</td>
<td>Configures neighbor inactivity timeout value</td>
<td>page 7-395</td>
</tr>
<tr>
<td>neighbor-info-</td>
<td>Configures the neighbor information exchange interval</td>
<td>page 7-396</td>
</tr>
<tr>
<td>interval</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Reference</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or resets values to their default settings</td>
<td>page 7-466</td>
</tr>
<tr>
<td>noc</td>
<td>Configures NOC settings</td>
<td>page 7-399</td>
</tr>
<tr>
<td>ntp</td>
<td>Configures NTP server settings</td>
<td>page 7-400</td>
</tr>
<tr>
<td>offline-duration</td>
<td>Sets the duration, in minutes, for which a device remains unadopted before it generates offline event</td>
<td>page 7-403</td>
</tr>
<tr>
<td>override-wlan</td>
<td>Configures WLAN RF Domain level overrides on the logged device</td>
<td>page 7-467</td>
</tr>
<tr>
<td>power-config</td>
<td>Configures power mode features</td>
<td>page 7-404</td>
</tr>
<tr>
<td>preferred-controller-group</td>
<td>Specifies the wireless controller or service platform group the system prefers for adoption</td>
<td>page 7-406</td>
</tr>
<tr>
<td>preferred-tunnel-controller</td>
<td>Configures the tunnel wireless controller or service platform preferred by the system for tunneling extended VLAN traffic</td>
<td>page 7-407</td>
</tr>
<tr>
<td>radius</td>
<td>Configures device-level RADIUS authentication parameters</td>
<td>page 7-408</td>
</tr>
<tr>
<td>remove-override</td>
<td>Removes device overrides</td>
<td>page 7-469</td>
</tr>
<tr>
<td>rf-domain-manager</td>
<td>Enables the RF Domain manager</td>
<td>page 7-410</td>
</tr>
<tr>
<td>router</td>
<td>Configures dynamic router protocol settings.</td>
<td>page 7-411</td>
</tr>
<tr>
<td>rsa-key</td>
<td>Assigns a RSA key to SSH</td>
<td>page 7-471</td>
</tr>
<tr>
<td>sensor-server</td>
<td>Configures an AirDefense sensor server</td>
<td>page 7-472</td>
</tr>
<tr>
<td>spanning-tree</td>
<td>Enables spanning tree commands on the logged device</td>
<td>page 7-413</td>
</tr>
<tr>
<td>traffic-class-mapping</td>
<td>Maps the IPv6 traffic class value of incoming IPv6 untagged packets to 802.1p priority</td>
<td>page 7-416</td>
</tr>
<tr>
<td>traffic-shape</td>
<td>Enables traffic shaping and configures traffic shaping parameters on this device</td>
<td>page 7-418</td>
</tr>
<tr>
<td>trustpoint (device-config-mode)</td>
<td>Assigns trustpoints to validate various services, such as HTTPS, RADIUS CA, RADIUS server, external LDAP server etc.</td>
<td>page 7-425</td>
</tr>
<tr>
<td>timezone</td>
<td>Configures wireless controller or service platform’s time zone settings</td>
<td>page 7-473</td>
</tr>
<tr>
<td>tunnel-controller</td>
<td>Configures the tunneled WLAN (extended VLAN) wireless controller or service platform’s name</td>
<td>page 7-427</td>

<tr>
<td>mirror</td>
<td>Enables port mirroring on GE ports. This command is supported only on the NX4524 and NX6524 series service platforms.</td>
<td>page 7-476</td>
</tr>
<tr>
<td>raid</td>
<td>Enables alarm on the array. This command is supported only on the NX9500 series service platform.</td>
<td>page 7-478</td>
</tr>
<tr>
<td>slot</td>
<td>Assigns a physical slot for running Team-URC VM on this profile/device. This feature is support only on the NX45XX and NX65XX series service platforms.</td>
<td>page 7-444</td>
</tr>
</tbody>
</table>
7.2.1 adoption-site

Device Config Commands

Sets the device’s adoption site name

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

adoption-site <SITE-NAME>

Parameters

- **adoption-site** <SITE-NAME>

Examples

rfs4000-229D58(config-device-00-23-68-22-9D-58)#adoption-site SanJoseMainOffice

7.2.2 area

Device Config Commands

Sets the physical area where the device (controller, service platform, or access point) is deployed. This can be a building, region, campus or other area that describes the deployment location of the device. Assigning an area name is helpful when grouping devices in RF Domains and profiles, as devices in the same physical deployment location may need to share specific configuration parameters in respect to radio transmission and interference requirements specific to that location.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
area <AREA-NAME>

Parameters
- area <AREA-NAME>

<table>
<thead>
<tr>
<th>area &lt;AREA-NAME&gt;</th>
<th>Sets the physical area where the device is deployed</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AREA-NAME&gt;</td>
<td>Specify the area name (should not 64 characters in length).</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#area RMZEcoSpace
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context

### 7.2.3 channel-list

#### Device Config Commands

Configures the channel list advertised to wireless clients

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
channel-list [2.4GHz|5GHz|dynamic]
channel-list [2.4GHz <CHANNEL-LIST>|5GHz <CHANNEL-LIST>|dynamic]
```

#### Parameters

- **channel-list [2.4GHz <CHANNEL-LIST>|5GHz <CHANNEL-LIST>|dynamic]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.4GHz &lt;CHANNEL-LIST&gt;</td>
<td>Configures the channel list advertised by radios operating in 2.4 GHz</td>

area RMZEcospace
channel-list 2.4GHz 1,2
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#
```

#### Related Commands

- **no**  
  Resets the channel list configuration
7.2.4 contact

Device Config Commands

Defines an administrative contact for a deployed device (controller, service platform, or access point)

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

contact <WORD>

Parameters

- contact <WORD>

Examples

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#contact Bob+1-631-738-5200

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context

7.2.5 country-code

> Device Config Commands

Defines the two digit country code for legal device deployment

Configuring the correct country is central to legal operation. Each country has its own regulatory restrictions concerning electromagnetic emissions and the maximum RF signal strength that can be transmitted.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

country-code <WORD>

Parameters

- country-code <COUNTRY-CODE>

<table>
<thead>
<tr>
<th>country-code &lt;COUNTRY-CODE&gt;</th>
<th>Defines the two digit country code for legal device deployment</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;COUNTRY-CODE&gt; — Specify the two letter ISO-3166 country code.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#country-code us
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context

7.2.6 floor

Device Config Commands

Sets the building floor name representative of the location within the area or building the device (controller, service platform, or access point) is physically deployed. Assigning a building floor name is helpful when grouping devices in RF Domains and profiles, as devices on the same physical building floor may need to share specific configuration parameters in respect to radio transmission and interference requirements specific to that location.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`floor <FLOOR-NAME> <1-4094>`

Parameters

- `floor <FLOOR-NAME> <1-4094>`

<table>
<thead>
<tr>
<th>&lt;FLOOR-NAME&gt; &lt;1-4094&gt;</th>
<th>Sets the building floor name where the device is deployed</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;FLOOR-NAME&gt; &lt;1-4094&gt;</td>
<td>&lt;1-4094&gt; – Sets a numerical floor designation in respect to the floor's actual location within a building. Specify a value from 1 - 4094. The default setting is the 1st floor.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#floor 5thfloor
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#show context

7.2.10 license

Device Config Commands

Adds a license pack on the device for the specified feature (AP/AAP/ADSEC/HTANLT/SMART-CACHE/WEBF).

The WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single *Network Operations Center* (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers may or may not be grouped to form clusters. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

The NOC controllers and/or site controllers can both have license packs installed. Adoption of APs by the NOC and site controllers depends on the number of licenses available on each of these controllers.

The NOC controllers and/or site controllers can both have license packs installed. When an AP is adopted by a site controller, the site controller pushes a license on to the AP. The various possible scenarios are:

- **AP licenses installed only on NOC controller:**
  
  The NOC controller provides the site controllers with AP licenses, ensuring that per platform limits are not exceeded.

- **AP licenses installed on site controller:**
  
  The site controller uses its installed licenses, and then asks the NOC controller for additional licenses in case of a shortage.

  In a hierarchical and centrally managed network, the NOC controller can pull unused AP licenses from site controllers and relocate to other site controllers when required.

- **AP licenses installed on any member of a site cluster:**
  
  The site controller shares installed and borrowed (from the NOC) licenses with other controllers within a site cluster.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522,
  AP7532, AP7562, AP81XX, AP82XX

- **Wireless Controllers** — RFS4000, RFS6000, RFS7000

- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000,
  NX9500, NX9510, NX9600

**Syntax**

```
license <WORD> <LICENSE-KEY>
```

**Parameters**

- **license <WORD> <LICENSE-KEY>**

x6524-858126(config-device-5C-0E-8B-85-81-26)#
7.2.11 location

Sets the location where a managed device (controller, service platform, or access point) is deployed. This is the location of the
device with respect to the RF Domain it belongs.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522,
  AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000,
  NX9500, NX9510, NX9600

Syntax

location <WORD>

Parameters

- location <WORD>

Examples

  Removes a managed device's location
7.2.12 **mac-name**

- **Device Config Commands**

Configures a client name to MAC address mapping. Use this command to assign a user-friendly name to the device (controller, service platform, or access point) and map it to the device’s MAC address.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
mac-name <MAC> <NAME>
```

**Parameters**

- `mac-name <MAC> <NAME>`

<table>
<thead>
<tr>
<th><code>mac-name &lt;MAC&gt; &lt;NAME&gt;</code></th>
<th>Maps a user-friendly name to the device’s MAC address</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&lt;MAC&gt;</strong></td>
<td>Specify the device’s MAC address.</td>
</tr>
<tr>
<td><strong>&lt;NAME&gt;</strong></td>
<td>Specify the ‘friendly’ name used for the specified MAC address. This is the name used in events and statistics logs.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#mac-name 00-04-96-4A-A7-08 5.8TestAP

7.2.13 no

Device Config Commands

Negates a command or resets values to their default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [adopter-auto-provisioning-policy-lookup|adoption-site|alias|application-policy|area|arp|auto-learn-staging-config|autodownload|bridge|captive-portal|cdp|channel-list|cluster|configuration-persistence|contact|controller|country-code|critical-resource|crypto|device-upgrade|dot1x|dscp-mapping|email-notification|environmental-sensor|events|export|file-sync|floor|geo-coordinates|gre|hostname|http-analyze|interface|ip|l2tpv3|l3-lite-table|layout-coordinates|led|led-timeout|legacy-auto-downgrade|legacy-auto-update|license|lldp|load-balancing|location|logging|mac-address-table|mac-auth|mac-name|memory-profile|meshpoint-device|meshpoint-monitor-interval|min-misconfiguration-recovery-time|mint|mirror|misconfiguration-recovery-time|noc|ntp|offline-duration|override-wlan|power-config|preferred-controller-group|preferred-tunnel-controller|radius|raid|rf-domain-manager|router|rsa-key|sensor-server|slot|spanning-tree|timezone|traffic-shape|trustpoint|tunnel-controller|use|vrrp|vrrp-state-check|wep-shared-key-auth|service]

Parameters

- no <PARAMETERS>

no <PARAMETERS> Removes or resets the logged device's settings based on the parameters passed

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated

Examples

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#no area

rfs7000-37FABE(config-device-00-04-96-4A-A7-08)#no contact
### 7.2.14 override-wlan

**Device Config Commands**

Configures WLAN's RF Domain level overrides

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
override-wlan <WLAN> [shutdown|ssid|vlan-pool|wep128|wpa-wpa2-psk]
override-wlan <WLAN> [shutdown|ssid <SSID>|vlan-pool <1-4094> {limit <0-8192>}]
wpa-wpa2-psk <WORD>
override-wlan <WLAN> wep128 [key <1-4> hex [0<WORD>|2 <WORD>]|transmit-key <1-4>]
```

**Parameters**

- `shutdown`: Shuts down the WLAN's (identified by the `<WLAN>` keyword) operations on all mapped radios
- `SSID <SSID>`: Configures the WLAN's Service Set Identifier (SSID)
  - `<SSID>` — Specify an SSID ID.
- `vlan-pool <1-4094> {limit <0-8192>}`: Configures a pool of VLANs for the selected WLAN
  - `<1-4094>` — Specifies a VLAN pool ID from 1 - 4094.
  - `limit` — Optional. Limits the number of users on this VLAN pool
    - `<0-8192>` — Specify the user limit from 0 - 8192.
  **Note**: The VLAN pool configuration overrides the VLAN configuration.
- `wpa-wpa2-psk <WORD>`: Configures the WLAN WPA-WPA2 key or passphrase for the selected WLAN
  - `<WORD>` — Specify a WPA-WPA2 key or passphrase.
- `wep128 [key <1-4> hex [0<WORD>|2 <WORD>]|transmit-key <1-4>]`: Configures the WEP128 key for this WLAN, and also enables key transmission

Wired Equivalent Privacy (WEP) is a security protocol specified in the IEEE Wireless Fidelity (Wi-Fi) standard. WEP 128 uses a 104 bit key, which is concatenated with a 24-bit initialization vector (IV) to form the RC4 traffic key. This results in a level of security and privacy comparable to that of a wired LAN.

<tbody>
<tr>
<td>no</td>
<td>Removes RF Domain level WLAN overrides</td>
</tr>
</tbody>
</table>

- `key <1-4> hex` – Configures a hexadecimal key (clear text or encrypted) and specifies the key’s index.
- `0 <WORD>` – Configures a clear text key. Specify a 4 - 32 character pass key.
- `2 <WORD>` – Configures an encrypted key. Specify a 4 - 32 character pass key.
- `transmit-key <1-4>` – Enables transmission of key index. Specify the key index.

**Note:** Wireless devices and their connected clients use the algorithm to convert an ASCII string to the same hexadecimal number. Clients without the required adapters need to use WEP keys manually configured as hexadecimal numbers.
7.2.15 remove-override

Device Config Commands

Removes device overrides in order to enable profile settings to take effect

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

remove-override <PARAMETERS>

Parameters

- remove-override <PARAMETERS>

<table>
<thead>
<tr>
<th>remove-override &lt;PARAMETERS&gt;</th>
<th>Removes settings configured at the device level based on the parameters passed. The profile (applied to the device) settings take effect once the device-level overrides are removed.</th>

rfs4000-229D58(config-device-00-23-68-22-9D-58)#
**rsa-key**

### Device Config Commands

Assigns an SSH RSA key

SSH keys are a pair of cryptographic keys used to authenticate users instead of, or in addition to, a username/password. One key is private and the other is public key. Secure Shell (SSH) public key authentication can be used by a requesting client to access resources, if properly configured. The RSA key pair must be generated on the client. The public portion of the key pair resides with the controller, service platform, or access point locally, while the private portion remains on a secure area of the client.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```
rsa-key ssh <RSA-KEY-NAME>
```

### Parameters

- **rsa-key ssh <RSA-KEY-NAME>**

### 7.2.17 sensor-server

> **Device Config Commands**

Configures an AirDefense sensor server resource for client terminations and WIPS event logging. This is the server that supports WIPS events on behalf of the controller or service platform.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
sensor-server <1-3> ip <IP/HOSTNAME> {port [443|<1-65535>]}  
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensor-server &lt;1-3&gt;</td>
<td>Sets a numerical index to differentiate this AirDefense sensor server from other servers. A maximum of 3 (three) sensor server resources can be defined.</td>
</tr>
<tr>
<td>ip &lt;IP/HOSTNAME&gt;</td>
<td>Configures the AirDefense sensor server's IP address or hostname</td>
</tr>
<tr>

  - Removes device’s configured timezone
### 7.2.19 trustpoint

**Device Config Commands**

Configures the parameters necessary for obtaining certificate for this device.

A certificate links identity information with a public key enclosed in the certificate.

A **certificate authority** (CA) is a network authority that issues and manages security credentials and public keys for message encryption. The CA signs all digital certificates it issues with its own private key. The corresponding public key is contained within the certificate and is called a CA certificate. A browser must contain the CA certificate in its Trusted Root Library so it can trust certificates signed by the CA’s private key.

Depending on the public key infrastructure, the digital certificate includes the owner’s public key, the certificate expiration date, the owner’s name and other public key owner information.

Each certificate is digitally signed by a trustpoint. The trustpoint signing the certificate can be a certificate authority, corporation or individual. A trustpoint represents a CA/identity pair containing the identity of the CA, CA-specific configuration parameters, and an association with an enrolled identity certificate.

SSH keys are a pair of cryptographic keys used to authenticate users instead of, or in addition to, a username/password. One key is private and the other is public key. Secure Shell (SSH) public key authentication can be used by a requesting client to access resources, if properly configured. A RSA key pair must be generated on the client. The public portion of the key pair resides with the controller or access point locally, while the private portion remains on a secure area of the client.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
trustpoint [https|radius-ca|radius-ca-ldaps|radius-server|radius-server-ldaps]
<TRUSTPOINT>
```

**Parameters**

<table>
<thead>
<tr>
<th>trustpoint</th>
<th>Description</th>
</tr>
</thead>
</table>
| https <TRUSTPOINT> | Uses an existing certificate/trustpoint for this device  
  - <TRUSTPOINT> – Specify the trustpoint name. |

Device Config Commands

Port mirroring enables forwarding of copies of incoming and/or outgoing packets from one or more ports in the switch to a specified destination port. The destination port serves as a duplicate image of the source ports and can be used to send packets to a network diagnostic tool without disrupting the behavior on the original port. Common diagnostic tools include network analyzers, remote monitoring probes, and IDS/IPS security devices. This feature facilitates network monitoring.

The NX4524 and NX6524 series service platforms support port mirroring. These devices mirror data packets transmitted or received on any of their GE ports (GE port 1 - 24). Both transmit and receive packets can be mirrored from a source to a destination port as needed to provide traditional spanning functionality on the 24 GE ports.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**NOTE:** Port mirroring is not supported on NX4500 or NX6500 models, as they only support GE ports 1 - 2. Additionally, port mirroring is not supported on uplink (up) ports or wired ports on any controller or service platform model.

**Syntax**

```
mirror interface [<INTERFACE-NAME>|ge <1-24>] to interface [<INTERFACE-NAME>|ge <1-24>] {direction [any|inbound|outbound]}
```

**Parameters**

- `mirror interface [<INTERFACE-NAME>|ge <1-24>] to interface [<INTERFACE-NAME>|ge <1-24>]` Identifies the GE port used as the data source to span packets to the selected destination port. Use one of the following options to identify the source port:
  - `<INTERFACE-NAME>` — Specifies the source port name
  - `ge <1-24>` — Specifies the source GE port index

  **Note:** A source port cannot be a destination port.

  **Note:** The source ports can be on the same or different VLANs.

- `to interface [<INTERFACE-NAME>|ge <1-24>]` Selects the GE port used as the port destination to span packets from the selected source. Use one of the following options to identify the destination port:
  - `<INTERFACE-NAME>` — Specifies the destination port name
  - `ge <1-24>` — Specifies the destination GE port index

  The destination port serves as a duplicate image of the source port and can be used to send packets to a network diagnostic without disrupting the behavior on the original port. The destination port transmits only mirrored traffic and does not forward received traffic. Additionally, address learning is disabled on the destination port. The destination port is also referred to as the Mirror-to-Port (MTP).
Usage Guidelines

All mirroring sessions must use the same destination port for packet capture.

Examples

nx4524-470984(config-device-B6-22-D9-47-09-84)#mirror interface ge 3 to interface ge 24
direction any

nx4524-470984(config-device-B6-22-D9-47-09-84)#mirror interface ge 5 to interface ge 24
direction inbound

nx4524-470984(config-device-B6-22-D9-47-09-84)#mirror interface ge 7 to interface ge 24
direction outbound

nx4524-470984#show mirroring

Related Commands

\[no\] Disables data packets mirroring on GE ports
7.2.21  raid

Device Config Commands

Enables/disables chassis alarm that sounds when events are detected that degrade RAID support (drive content mirroring) on a service platform.

The NX9000 (NX9000, NX9500 and NX9510) series service platforms include a single Intel MegaRAID controller (virtual drive) with RAID-1 mirroring support enabled. The online virtual drive supports up to two physical drives that could require hot spare substitution if a drive were to fail. The WiNG software allows you to manage the RAID controller event alarm and syslogs supporting the array hardware from the service platform user interface without rebooting the service platform BIOS.

Although RAID controller drive arrays are available only on the NX9000 series service platforms, they can be administrated on behalf of a NX9000 profile by a different model service platform or wireless controller.

For more information on RAID, see raid.

Supported in the following platforms:

- Service Platforms — NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

raid alarm enable

Parameters

- raid alarm enable

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alarm enable</td>
<td>Enables audible alarm, which is triggered a RAID drives fails. When triggered the alarm can be disabled by executing the <em>raid &gt; silence</em> command in the device’s Priv Exec mode.</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#raid alarm enable

nx9500-6C8809(config-device-B4-C7-99-6C-88-09)#show context

7.3 T5 Profile Config Commands

A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by RFS wireless controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5's management within a WiNG supported subnet populated by both types of devices. The Customer Premises Equipment (CPEs) are the T5 controller managed radio devices using the IPX operating system. These CPEs use a Digital Subscriber Line (DSL) as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.

To navigate to this instance, use the following commands:

```
<DEVICE>(config-profile-<PROFILE-NAME>)#?
```

**T5 Profile Mode commands:**

```
cpe            T5 CPE configuration
interface      Select an interface to configure
ip             Internet Protocol (IP)
no             Negate a command or set its defaults
ntp            Configure NTP
override-wlan  Configure RF Domain level overrides for wlan
use            Set setting to use
```

```
clrscr         Clears the display screen
commit         Commit all changes made in this session
do             Run commands from Exec mode
end            End current mode and change to EXEC mode
exit           End current mode and down to previous mode
help           Description of the interactive help system
revert         Revert changes
service        Service Commands
show           Show running system information
write          Write running configuration to memory or terminal
```

```
<DEVICE>(config-profile-<PROFILE-NAME>)#
```

  interface vlan4090
  interface fe 5 2
  ......................................................
  interface radio 11 1
  interface fe 9 2
  interface radio 18 1
  interface fe 9 1
  use firewall-policy default
  service pm sys-restart
  cpe address vlan 200 192.168.13.26 192.168.13.30
nx9500-6C8809(config-profile-T5TestProfile)#
```
### 7.3.2 interface

#### T5 Profile Config Commands

Configures the T5 controller’s interfaces

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

#### Syntax

```
interface [<WORD>|dsl|fe|ge|radio|vlan]
```

#### Parameters

- `interface [<WORD>|dsl|fe|ge|radio|vlan]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;WORD&gt;</code></td>
<td>Configures the interface identified by the <code>&lt;WORD&gt;</code> keyword.</td>
</tr>
<tr>
<td><code>dsl &lt;1-24&gt;</code></td>
<td>Configures the specified Digital Subscriber Line (DSL) interface. A T5 controller uses the IPX operating system to manage its connected radio devices, as opposed to the WiNG operating used by controllers and NX service platforms. However, a T5 controller, once enabled as a supported external device, can provide data to WiNG to assist in a T5’s management within a WiNG supported subnet populated by both types of devices. The CPEs are the T5 controller managed radio devices using the IPX operating system. These CPEs use DSL as their high speed Internet access mechanism using the CPE’s physical wallplate connection and phone jack.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;1-24&gt;</code> – Specify the DSL port index from 1 - 24.</td>
</tr>
<tr>
<td><code>fe &lt;1-24&gt; &lt;1-2&gt;</code></td>
<td>Configures the specified FastEthernet interface. The T5 controller has the following FastEthernet port designations: fe1-fe2 (fe1-fe2 are for up to 24 CPE devices managed by a T5 controller).</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;1-24&gt;</code> – Specify the DSL port index from 1 - 24.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;1-2&gt;</code> – Specify the FastEthernet interface to configure.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> In the FastEthernet interface configuration mode, specify the interface settings.</td>
</tr>
<tr>
<td><code>ge &lt;1-2&gt;</code></td>
<td>Configures the specified GigabitEthernet interface. T5 controllers have two Ethernet port designations, These are ge1 and ge2. The GE ports can be RJ-45 or fiber ports supporting 10/100/1000Mbps.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;1-2&gt;</code> – Specify the interface index from 1 - 2.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> In the GigabitEthernet interface configuration mode, specify the interface settings.</td>
</tr>
<tr>
<td><code>radio &lt;1-24&gt;</code></td>
<td>Configures the specified radio interface. T5 controller managed CPE device radios can have their radio configurations overridden once their radios have successfully associated and have been provisioned by the adopting controller, service platform, or peer model AP controller access point.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;1-2&gt;</code> – Specify the radio interface index from 1 - 24.</td>
</tr>
<tr>
<td><code>vlan &lt;1-4094&gt;</code></td>
<td>Configures the specified VLAN interface. Once configured, the VLAN interface provides layer 3 (IP) T5 controller access or provides layer 3 service on a VLAN. The VLAN interface defines which IP address is associated with each VLAN ID a T5 controller is connected to. A VLAN interface is created for the default VLAN (VLAN 1) to enable remote administration. This interface is also used to map VLANs to IP4 and IPv6 formatted IP address ranges. This mapping determines the destination for routing.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;1-4094&gt;</code> – Specify the VLAN interface index from 1 - 4094.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> In the VLAN configuration mode, specify the interface’s primary IP address in the A.B.C.D/M format. Optionally specify the secondary IP address.</td>
</tr>
</tbody>
</table>
Examples

```
rfs7000-37FABE(config-profile-t5Profile)#interface dsl 1
rfs7000-37FABE(config-profile-t5Profile-if-dsl1)#?
```

7.3.3 ip

**T5 Profile Config Commands**

Configures the default gateway’s IP address

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
ip default-gateway <IP>
```

**Parameters**

- `ip default-gateway <IP>` Enter the default gateway’s IP address in the A.B.C.D format.

**Examples**

```
px9500-6C8809(config-profile-t5Profile)#ip default-gateway 192.168.13.7
px9500-6C8809(config-profile-t5Profile)#show context
```

```
profile t5 t5Profile
  ip default-gateway 192.168.13.7
  no autoinstall configuration
  no autoinstall firmware
  interface vlan1
  interface vlan4090
  interface fe 5 2
  interface ge 2
  interface ge 1
  interface fe 5 1
--More--
px9500-6C8809(config-profile-t5Profile)#
```
### 7.3.4 no

**T5 Profile Config Commands**

Removes or reverts this T5 controller profile settings

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

- `no [interface|ntp|override-wlan|t5-logging|use]`
- `no interface vlan <2-4094>`
- `no ntp server <IP>`
- `no override-wlan <WLAN-NAME> vlan`<br>no t5-logging host <IP>
- `no use management-policy`

**Parameters**

- `no [interface|ntp|use]`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no interface</code></td>
<td>Removes the VLAN interface configured on the T5 profile&lt;br&gt;• <code>vlan &lt;2-4094&gt;</code> – Specify the VLAN interface ID.</td>
</tr>
<tr>
<td><code>no ntp</code></td>
<td>Removes the NTP server associated with this T5 profile&lt;br&gt;• <code>&lt;IP&gt;</code> – Specify the NTP server's IP address.</td>
</tr>
<tr>
<td><code>no override-wlan &lt;WLAN-NAME&gt; vlan</code></td>
<td>Removes the RF Domain level overrides for applied on a WLAN on this T5 profile</td>
</tr>
<tr>
<td><code>no t5-logging host &lt;IP&gt;</code></td>
<td>Modifies T5 event message logging severity and facility levels</td>
</tr>
<tr>
<td><code>no use</code></td>
<td>Removes the management policy used with this T5 profile</td>
</tr>
</tbody>
</table>

**Examples**

```shell
nx9500-6C8809(config-profile-t5Profile)#show context profile t5 t5Profile
  ip default-gateway 192.168.13.7
  no autoinstall configuration
  no autoinstall firmware
  interface vlan1
  interface vlan4090
  ....................................................
  use firewall-policy default

ntp server 192.168.13.2
service pm sys-restart
nx9500-6C8809(config-profile-t5Profile)#
```

```shell
nx9500-6C8809(config-profile-t5Profile)#no ntp server 192.168.13.2
```

```shell
nx9500-6C8809(config-profile-t5Profile)#show context profile t5 t5Profile
  ip default-gateway 192.168.13.7
  no autoinstall configuration
  no autoinstall firmware
  interface vlan1
  interface vlan4090
  ....................................................
  use firewall-policy default
```
service pm sys-restart
nx9500-6C8809(config-profile-t5Profile)#
### 7.3.5 t5

**T5 Profile Config Commands**

Configures this T5 controller’s country of operation

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

`t5 country-code <WORD>`

**Parameters**

- `t5 country-code <WORD>`

**Examples**

```plaintext
nx9500-6C8809(config-profile-T5TestProfile)#t5 country-code us

nx9500-6C8809(config-profile-T5TestProfile)#show context
profile t5 T5TestProfile
no autoinstall configuration
no autoinstall firmware
interface vlan1
interface vlan4090
interface fe 5 2

interface fe 9 1
use firewall-policy default
service pm sys-restart

```

t5 country-code US

cpe address vlan 200 192.168.13.26 192.168.13.30

nx9500-6C8809(config-profile-T5TestProfile)#
```

`country-code <WORD>` Configures the 2 letter ISO-3166 country code for this T5 controller
7.3.6 ntp

**T5 Profile Config Commands**

Configures the NTP server associated with this T5 profile. T5 controllers, using this profile, will obtain their system time from the specified NTP server resources.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
ntp server <IP>
```

**Parameters**

- `ntp server <IP>`

**Examples**

```
nx9500-6C8809(config-profile-t5Profile)#ntp server 192.168.13.2

nx9500-6C8809(config-profile-t5Profile)#show context
profile t5 t5Profile
  ip default-gateway 192.168.13.7
  no autoinstall configuration
  no autoinstall firmware
  interface dsl 5
  use firewall-policy default
  ntp server 192.168.13.2
  service pm sys-restart

nx9500-6C8809(config-profile-t5Profile)#
```

**Related Commands**

- `no` Removes the NTP server's IP address
7.3.7 override-wlan

T5 Profile Config Commands

Use this option to configure RF Domain level configuration for WLAN. The override configured here are applied to all T5 devices using this T5 profile.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
override-wlan <WLAN-NAME> vlan <1-4094>

Parameters
- override-wlan <WLAN-NAME> vlan <1-4094>
  - overrides the specified WLAN's VLAN configuration
  - <WLAN-NAME> — Specify the WLAN's name.
- vlan <1-4094>
  - Specify the new VLAN option
  - <1-4094> — Specify the VLAN from 1 - 4094.

Examples
The following example shows the WLAN SJOffWLan configuration:

```
nx9500-6C8809(config-wlan-SJOffWLan)#show context
wlan SJOffWLan
description "SJ Office WLAN"
ssid SJOffWLan
vlan 468
bridging-mode local
encryption-type ccmp
authentication-type eap-psk
use aaa-policy test
nx9500-6C8809(config-wlan-SJOffWLan)#
```

The following example overrides the SJOffWLan WLAN's VLAN configuration on the T5 profile:

```
nx9500-6C8809(config-profile-testT5)#override-wlan SJOffWLan vlan 30
nx9500-6C8809(config-profile-testT5)#show context include-factory | include override-wlan
override-wlan SJOffWLan vlan 30
nx9500-6C8809(config-profile-testT5)#
```

### 7.3.8 t5-logging

**T5 Profile Config Commands**

Configures a maximum of 5 (five) remote hosts capable of receiving syslog messages from this selected T5 controller.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
t5-logging host <IP> severity [error|info|notice|trace|warning] facility [local0|local1|local2|local3|local4|local5|local6|local7]
```

**Parameters**

- **t5-logging host <IP> severity [error|info|notice|trace|warning] facility [local0|local1|local2|local3|local4|local5|local6|local7]**
  - Configures syslog message logging settings
  - **host <IP>** — Configures the external syslog remote host resource's IP address. This is the host dedicated to receive T5 syslog messages.
  - **severity** — Configures the syslog message filtering severity level. The options are:
    - Error — Only forwards error and above syslog event messages.
    - Info — Only forwards informational and above syslog event messages.
    - notice — Only forwards syslog notices relating to general device operational events. These are events that are of more interest than the “info” events.
    - trace — Only forwards trace routing event messages
    - warning — Only forwards warnings and above syslog event messages
  - **facility** — Configures the facility level for log messages sent to the syslog server. The facility level specifies the type of program logging the message. Specifying the facility level allows the configuration file to specify that message handling will vary with varying facility type. The options are: local0, local1, local2, local3, local4, local5, local6, local7. The default value is local7.

**Examples**

```
nx9500-6C8809(config-profile-T5TestProfile)#t5-logging host 192.168.13.10 severity warning facility local6
```

```
nx9500-6C8809(config-profile-T5TestProfile)#show context
profile t5 T5TestProfile
  t5-logging host 192.168.13.10 severity warning facility local6
  no autoinstall configuration
  no autoinstall firmware
t5 country-code US
cpe address vlan 200 192.168.13.26 192.168.13.30
nx9500-6C8809(config-profile-T5TestProfile)#
```

**Related Commands**

- **no** — Modifies message logging severity level and facilities
7.3.9 **use**

**T5 Profile Config Commands**

Associates a management policy with this T5 profile. The specified policy is applied to all T5 controllers using this profile.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

use management-policy <POLICY-NAME>

**Parameters**

- use management-policy <POLICY-NAME>

**Examples**

nx9500-6C8809(config-profile-t5Profile)# use management-policy default
Trustpoints HTTPS Server and RSA keys for SSH can be configured with 'trustpoint' and 'rsa-key' commands in device context
nx9500-6C8809(config-profile-t5Profile)#

</table>
7.4 EX3524 & EX3548 Profile/Device Config Commands

 PROFILE

Creates a new EX3524 and EX3548 profile and enters its configuration mode.

To navigate to this instance, use the following commands:

```
<DEVICE>(config)#profile ex35xx <EX35XX-PROFILE-NAME>
```

Where ex35xx can be a EX3524 or a EX3548 device type.

```
<DEVICE>(config-profile-<EX35XX-PROFILE-NAME>)#?
```

EX35XX Profile Mode commands:

- **interface** Select an interface to configure
- **ip** Internet Protocol (IP)
- **no** Negate a command or set its defaults
- **power** EX3500 Power over Ethernet Command
- **upgrade** Configures upgrade option for ex3500 system
- **use** Set setting to use
- **clrscr** Clears the display screen
- **commit** Commit all changes made in this session
- **do** Run commands from Exec mode
- **exit** End current mode and down to previous mode
- **help** Description of the interactive help system
- **revert** Revert changes
- **service** Service Commands
- **show** Show running system information
- **write** Write running configuration to memory or terminal

```
<DEVICE>(config-profile-<EX35XX-PROFILE-NAME>)#
```

The following table summarizes EX3524 and EX3548 profile/device configuration mode commands:

<table>

</tr>
</tbody>
</table>
### 7.4.1.1 interface

Selects the EX35XX interface type and enters the selected interface's configuration mode.

Supported in the following platforms:
- Switches — EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX45XX, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

`interface [ge 1 <1-48>|vlan <1-4094>]`

**Parameters**

- `interface [ge 1 <1-48>|vlan <1-4094>]`

<table>
<thead>
<tr>
<th>interface</th>
<th>Selects the EX35XX interface type and enters its configuration mode. The interface options available are: GE and VLAN</th>

nx4500-5CFA8E(config-profile-testEX35XX-if-vlan1)#?

**commands:**
- `ip` Internet Protocol (IP)
- `no` Negate a command or set its defaults
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

nx4500-5CFA8E(config-profile-testEX35XX-if-vlan1)#

nx4500-5CFA8E(config-profile-testEX35XX)#interface ge 1 1  
nx4500-5CFA8E(config-profile-testEX35XX-if-ge1-1)#?

**commands:**
- `access-group` Access group to bind a port to an ACL name
- `no` Negate a command or set its defaults
- `port` Configures the characteristics of the port
- `power` EX3500 Power over Ethernet Command
- `shutdown` Shutdown the selected interface
- `speed-duplex` Configures speed and duplex operation
- `switchport` Configures switch mode characteristics
- `use` Set setting to use
- `clrscr` Clears the display screen
commit  Commit all changes made in this session
do    Run commands from Exec mode
end   End current mode and change to EXEC mode
exit  End current mode and down to previous mode

</tr>
</tbody>
</table>
7.4.1.2.1  access-group

Binds an EX3500 ACL to the selected port

When applied to the port, the ACL takes effect. Only one ACL can be bound to a port at a time. In case you bind a new ACL to a port with an existing ACL binding, the old binding is replaced with the new one.

Supported in the following platforms:
- Switches — EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX45XX, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax
access-group [ex3500-ext-access-list|ex3500-std-access-list|mac-access-list] <ACL-NAME> in {time-range <TIME-RANGE-NAME>}

Parameters
- access-group [ex3500-ext-access-list|ex3500-std-access-list|mac-access-list] <ACL-NAME> in {time-range <TIME-RANGE-NAME>}

<table>
<thead>
<tr>
<th>access-group</th>
<th>Binds a EX3500 ACL with this GE port. Select ACL type and specify the ACL name. The ACL should be existing and configured.</th>
</tr>
</thead>
</table>
| ex3500-ext-access-list <ACL-NAME> | Binds an existing and configured EX3500 extended ACL  
  - <ACL-NAME> – Specify the ACL name. | |
| ex3500-std-access-list <ACL-NAME> | Binds an existing and configured EX3500 standard ACL  
  - <ACL-NAME> – Specify the ACL name. | |
| mac-access-list <ACL-NAME> | Binds an existing and configured EX3500 MAC ACL  
  - <ACL-NAME> – Specify the MAC ACL name. | |
| in                | Applies the specified ACL to all incoming packets | |
| time-range <TIME-RANGE-NAME> | Optional. Associates a EX3500 absolute or periodic time range with this access group. The specified ACL is bound to the port during the time period specified by the associated time range.  
  - <TIME-RANGE-NAME> – Specify the time range name (should be existing and configured). |

Examples
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range EX3500_TimeRange_01
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context interface ge 1 20
  access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range EX3500_TimeRange_01
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#

Related Commands

no  Removes the GE port EX3500 ACL binding
### 7.4.1.2.2 port

#### interface-ge-config commands

Enables port monitoring on the selected port. This allows the port to monitor specified ports and/or MAC address(es). When enabled, the switch sends a copy of the network packets seen on the specified switch port (or VLAN interface) to the monitoring switch port. These packets are analyzed and debugged to provide vital information, such as network performance, intrusion alerts etc.

Supported in the following platforms:
- Switches — EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX45XX, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

#### Syntax

```
port monitor [ethernet|ex3500-ext-access-list|ex3500-std-access-list|mac-access-list|mac-address|vlan] <ACL-NAME>
```

```
port monitor ethernet 1 <1-52> {both|rx|tx} <1-52>
```

```
port monitor [ex3500-ext-access-list|ex3500-std-access-list|mac-access-list] <ACL-NAME>
port monitor mac-address <MAC>
port monitor vlan <1-4094>
```

#### Parameters

- **port monitor ethernet 1 <1-52> {both|rx|tx}**
  - Configures the characteristics of this GE port
  - **monitor** – Enables monitoring of another port
  - **ethernet 1** – Selects Ethernet interface and configures the port identifier as 1
  - **<1-52>** – Configures the Ethernet unit number from 1 - 52

- **port monitor**
  - **monitor** – Enables monitoring of another port

- **{both|rx|tx}**
  - After specifying the port, optionally configure the following:
    - **both** – Optional. Monitors both incoming and outgoing traffic
    - **rx** – Optional. Monitors only incoming traffic
    - **tx** – Optional. Monitors only outgoing traffic

- **port monitor [ex3500-ext-access-list|ex3500-std-access-list|mac-access-list] <ACL-NAME>**
  - After specifying the port, apply one of the following ACLs:
    - **ex3500-ext-access-list** – Applies a EX3500 extended ACL
    - **ex3500-std-access-list** – Applies a EX3500 standard ACL
    - **mac-access-list** – Applies a MAC ACL with EX3500 deny or permit rules
    - **<ACL-NAME>** – Specify the ACL name (should be existing and configured).

7.4.1.2.3 power

`interface-ge-config commands`

Enables/disables power allocation to the selected port. When enabled, the power is allocated to this port. Use the command to configure the power allocation settings, such as maximum power allocated, priority level of this port in connection with power allocation, and the time range within which these power settings are applied.

This option is enabled by default.

Supported in the following platforms:
- Switches — EX3524, EX3548
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX45XX, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

```
power inline {maximum|priority|time-range}
power inline {maximum allocation milliwatts <3000-34200>}
power inline {priority [critical|high|low]}
power inline {time-range <TIME-RANGE-NAME>}
```

Parameters

- `power inline {maximum allocation milliwatts <3000-34200>}`
  - `power inline` Turns power on or off for the selected port. This option is enabled by default.
  - `maximum allocation milliwatts <3000-34200>` Optional. Configures the maximum power allocation, in milliwatts, for this port
  - `<3000-34200>` — Specify a value from 3000 - 34200 milliwatts. The default is 34200 milliwatts.

- `power inline {priority [critical|high|low]}
  - `power inline` Turns power on or off for the selected port. This option is enabled by default.
  - `priority [critical|high|low]` Optional. Configures the PoE power priority as:
    - `critical` — Configures the PoE power priority as critical
    - `high` — Configures the PoE power priority as high
    - `low` — Configures the PoE power priority as low (this is the default setting)

- `power inline {time-range <TIME-RANGE-NAME>}`
  - `power inline` Turns power on or off for the selected port. This option is enabled by default.
  - `time-range <TIME-RANGE-NAME>` Optional. Binds a EX3500 time range to this port
    - `<TIME-RANGE-NAME>` — Specify the time range name (should be existing and configured).

Examples

```
x9500-6C8809(config-profile-testEX3524-if-ge1-20)#power inline maximum allocation milliwatts 30000
```
```
x9500-6C8809(config-profile-testEX3524-if-ge1-20)#power inline priority critical
```
```
x9500-6C8809(config-profile-testEX3524-if-ge1-20)#power inline time-range EX3500_TimeRange_01
```
```
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context
interface ge 1 20

### 7.4.1.2.4 shutdown

**interface-ge-config commands**

Shuts down the selected port

Supported in the following platforms:
- Switches — EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX45XX, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```plaintext
shutdown
```

**Parameters**

None

**Examples**

```plaintext
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#shutdown

nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context

interface ge 1 20

  shutdown

  power inline maximum allocation milliwatts 30000
  power inline priority critical
  power inline time-range EX3500_TimeRange_01
  access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range EX3500_TimeRange_01
  port monitor vlan 20

nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#
```

### 7.4.1.2.5 speed-duplex

**interface-ge-config commands**

Configures the speed and duplex mode of the selected port when auto-negotiation is disabled. Auto-negotiation is enabled by default.

This option is disabled by default.

Supported in the following platforms:
- Switches — EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX45XX, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
speed-duplex [100full|100half|10full|10half]
```

**Parameters**
- `speed-duplex [100full|100half|10full|10half]`

**Examples**

```
x9500-6C8809(config-profile-testEX3524-if-ge1-20)#speed-duplex 100half
```

```
x9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context
interface ge 1 20
shutdown
   speed-duplex 100half
power inline maximum allocation milliwatts 30000
power inline priority critical
power inline time-range EX3500_TimeRange_01
access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range EX3500_TimeRange_01
port monitor vlan 20
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#
```

**Related Commands**

```
no
```

Removes the speed and duplex settings configured for this EX35XX profile
7.4.1.2.6 switch-port

Configures the switch mode characteristics of the selected port

Supported in the following platforms:
- Switches — EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX45XX, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

```
switchport [allowed|l2protocol-tunnel|mode|native]
switchport allowed [add <VLAN-ID>|none|remove <VLAN-ID>]
switchport l2protocol-tunnel [cdp|lldp|pvst+|spanning-tree|vtp]
switchport mode [access|hybrid|trunk]
switchport native
```

Parameters

- switchport allowed [add <VLAN-ID>|none|remove <VLAN-ID>]

| switchport allowed [add <VLAN-ID>| none| remove <VLAN-ID>] | Configures VLAN groups on the selected interface. |
|---------------------------------------------------------------|--------------------------------------------------|
| [add <VLAN-ID>| none| remove <VLAN-ID>]                      | • add <VLAN-ID> – Configures the list of VLAN identifiers to add. When the add option is used, the interface is assigned to the specified VLANs, and membership in all previous VLANs is retained. |
|                                                               | • <VLAN-ID> – Specify the list of VLANs to add. |
|                                                               | • none – Removes all VLANs from the current list |
|                                                               | • remove <VLAN-ID> – Configures the list of VLAN identifiers to remove. When the remove option is used, the specified VLANs are removed from the current list. |
|                                                               | • <VLAN-ID> – Specify the list of VLANs to remove. |

- switchport l2protocol-tunnel [cdp|lldp|pvst+|spanning-tree|vtp]

| switchport l2protocol-tunnel [cdp|lldp|pvst+|spanning-tree|vtp] | Enables layer 2 protocol tunneling (L2PT) for the specified protocol. Specify the protocol: |
|----------------------------------------------------------|------------------------------------------------------------------------------------------|
| [cdp|lldp|pvst+|spanning-tree|vtp]                        | • cdp – Cisco Discovery Protocol                                                      |
|                                                               | • lldp – Link Layer Discovery Protocol                                                   |
|                                                               | • pvst+ – Cisco Per VLAN Spanning Tree Plus                                             |
|                                                               | • spanning-tree – Spanning Tree (STP, RSTP, MSTP)                                     |
|                                                               | • vtp – Cisco VLAN Trunking Protocol                                                   |
|                                                               | L2PT is disabled for all of the above specified protocols by default.                 |
• switchport mode [access|hybrid|trunk]

| switchport mode [access|hybrid|trunk] | Configures the VLAN membership mode for this port |
|---------------------------------------|---------------------------------|
| • access – The port is configured as an access VLAN interface. It transmits and receives packets untagged frames on a single VLAN. |
| • trunk – Configures the selected port as an end-point for a VLAN trunk. A trunk link is configured between two switches, and it carries frames on more than one VLANs. These frames are tagged in order to identify the source VLAN. Frames belonging to the port’s default VLAN are also transmitted as tagged frames. |
| • hybrid – Configures the selected port as a hybrid VLAN interface. When configured as hybrid, the port can transmit either tagged or untagged frames. This is the default setting. |

• switchport native vlan <1-4094>

<table>
<thead>
<tr>
<th>switchport native vlan &lt;1-4094&gt; in</th>
<th>Configures the VLAN membership mode for this port</th>
</tr>
</thead>
<tbody>
<tr>
<td>• native vlan &lt;1-4094&gt; – Configures the port’s VLAN ID (PVID) (this is the port’s default VLAN ID). Frames from the specified VLAN ingress untagged at this port. The default value is 1. When using access mode, and an interface is assigned to a new VLAN, the port’s VLAN ID (PVID) is automatically set to the identifier for that VLAN. When using hybrid mode, the PVID for an interface can be set to any VLAN for which it is an untagged member.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

Disassociates the EX3500 QoS policy map linked to this EX3500 profile
7.4.1.2.8  no

- **interface-ge-config commands**

Removes or reverts the selected port's settings

Supported in the following platforms:
- Switches — EX3524, EX3548

**Syntax**

```
no [access-group|port|power|shutdown|speed-duplex|switchport|use]

no access-group [ex3500-ext-access-list|ex3500-std-access-list|mac-access-list]
    <ACL-NAME> in

no port monitor [ethernet|ex3500-ext-access-list|ex3500-std-access-list]
    mac-access-list|mac-address|vlan]

no port monitor ethernet 1 <1-52>

no port monitor [ex3500-ext-access-list|ex3500-std-access-list|mac-access-list]
    <ACL-NAME>

no port monitor mac-address <MAC>

no port monitor vlan <1-4094>

no power inline {maximum allocation|priority|time-range}

no shutdown

no speed-duplex

no switchport [l2protocol-tunnel [cdp|lldp|pvst+|spanning-tree|vtp]|native vlan]

no use ex3500-policy-map in
```

**Parameters**

- `no <PARAMETERS>` Removes or reverts the selected port's settings based on the parameters passed

**Examples**

The following example shows the EX3524 profile's GE port 20's settings before the 'no' commands are executed:

```
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context
interface ge 1 20
    shutdown
    speed-duplex 100half
    switchport mode access
    use ex3500-policy-map in test
    power inline maximum allocation milliwatts 30000
    power inline priority critical
    power inline time-range EX3500_TimeRange_01
    access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range EX3500_TimeRange_01
    port monitor vlan 20

nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#
```

```
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#no shutdown
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#no power inline maximum allocation
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#no use ex3500-policy-map in
```
The following example shows the EX3524 profile's GE port 20's settings after the 'no' commands are executed:

nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#show context

  access-group ex3500-ext-access-list EX3500_ACL_EXT_1 in time-range EX3500_TimeRange_01
  port monitor vlan 20
nx9500-6C8809(config-profile-testEX3524-if-ge1-20)#
### 7.4.1.3 interface-vlan-config commands

The following table lists the VLAN interface configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>Configures IP related settings for this VLAN interface</td>
<td>page 7-509</td>
</tr>
<tr>
<td>no</td>
<td>Removes the IP related settings configured for this VLAN interface</td>
<td>page 7-511</td>
</tr>
</tbody>
</table>
7.4.1.3.1 ip

interface-vlan-config commands

Configures IP related settings for this VLAN interface

Supported in the following platforms:
- Switches — EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX45XX, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500,
  NX9510, NX9600

**Syntax**

`ip address [<IP/M>|bootp|dhcp]`

`ip address <IP/M> {default-gateway <IP>|secondary <IP>}`

`ip address [bootp|dhcp]`

**Parameters**

- `ip address <IP/M>`
  - `{default-gateway <IP>|secondary <IP>}`

  Manually configures the selected VLAN interface’s primary and secondary IPv4 addresses. It also allows to optionally configure the default gateway.
  - `<IP/M>` – Manually configures this VLAN interface’s IP address in the A.B.C.D/M format. Network mask for the associated IP subnet. This mask identifies the host address bits used for routing to specific subnets. The network mask can be either in the traditional format `xxx.xxx.xxx.xxx` or use classless format with the range `/5` to `/32`. For example the subnet `255.255.224.0` would be `/19`.
  - `default-gateway <IP>` – Optional. Configures the default gateway’s IP address. This is the gateway through which this switch can reach other subnets not found in the local routing table. Before specifying the default gateway, ensure that the network interface directly connecting to the gateway is configured on the route. By default no gateway is specified.
  - `<IP>` – Specify the IP address in the A.B.C.D address.
  - `secondary <IP>` – Optional. Configures this VLAN interface’s secondary IP address
  - `<IP>` – Specify the secondary IP address in the A.B.C.D address

- `ip address [bootp|dhcp]`

  Enables a DHCP or Bootp server to provide the primary IPv4 address for the selected VLAN interface
  - `bootp` – Enables the VLAN interface to get its IP address from a Bootp server
  - `dhcp` – Enables the VLAN interface to get its IP address from a DHCP server

If selecting DHCP/Bootp, ensure that a server on the network has been configured to provide the necessary configuration to the switch. Using DHCP or Bootp results in frequent connectivity loss between the browser interface and the switch. Further, DHCP and Bootp cannot configure secondary IP addresses needed for multinetting.
Examples

```
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#ip address 192.168.13.28/24 default-gateway 192.168.13.13
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#show context interface vlan 20
   ip address 192.168.13.28/24 default-gateway 192.168.13.13
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#
```

interface-vlan-config commands

Removes the IP related settings configured for this VLAN interface

Supported in the following platforms:

- Switches — EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX45XX, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

no ip address [<IP/M>|bootp|dhcp]

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes this EX3500's selected VLAN's settings based on the parameters passed |

Examples

The following example shows the interface VLAN 20 setting before the ‘no’ command is executed:

```
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#show context
interface vlan 20
    ip address 192.168.13.28/24
default-gateway 192.168.13.13
```

```
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#no ip address 192.168.13.28/24
```

The following example shows the interface VLAN 20 setting after the ‘no’ command is executed:

```
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#show context
interface vlan 20
```

```
nx9500-6C8809(config-profile-testEX3524-if-vlan20)#
```
### 7.4.2 ip

**EX3524 & EX3548 Profile/Device Config Commands**

Configures the default gateway through which this EX35XX switch can reach other subnets

Supported in the following platforms:
- Switches — EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX45XX, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

**Syntax**

```
ip default-gateway <IP>
```

**Parameters**
- `ip default-gateway <IP>`
  - Configures the default gateway's IP address in the A.B.C.D format
  - `<IP>` — Specify the IP address.

**Examples**

```
nx9500-6C8809(config-profile-testEX3524)#ip default-gateway 192.168.13.13
nx9500-6C8809(config-profile-testEX3524)#show context

```
7.4.4 upgrade

EX3524 & EX3548 Profile/Device Config Commands

Configures adopted EX35XX switch upgrade settings

For a EX35XX switch to adopt to and be managed by a WiNG controller, you need to upload two images on the switch. An operation code (opcode) image and an adopted image. The opcode image functions as an operating system that enables the WiNG controller to communicate with the EX35XX switch. This command allows you to configure the EX35XX's opcode image upgrade settings.

Supported in the following platforms:

- Switches — EX3524, EX3548
- Wireless Controllers – RFS4000, RFS6000, RFS7000
- Service Platforms – NX4500, NX45XX, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9500, NX9510, NX9600

Syntax

```
upgrade opcode [auto|path <LINE>|reload]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>upgrade opcode</td>
<td>Configures the opcode image upgrade settings</td>
</tr>
<tr>
<td>auto</td>
<td>Enables automatic upgrade</td>
</tr>
<tr>
<td>path &lt;LINE&gt;</td>
<td>Configures the location of the opcode image</td>
</tr>
<tr>
<td>reload</td>
<td>Enables automatic reload after successful loading of the opcode image</td>
</tr>
</tbody>
</table>

Examples

This chapter summarizes the Authentication, Authorization, and Accounting (AAA) policy commands in the CLI command structure.

A AAA policy enables administrators to define access control settings governing network permissions. External RADIUS and LDAP servers (AAA servers) also provide user database information and user authentication data. Each WLAN maintains its own unique AAA configuration.

AAA provides a modular way of performing the following services:

Authentication — Provides a means for identifying users, including login and password dialog, challenge and response, messaging support and (depending on the security protocol), encryption. Authentication is the technique by which a user is identified before allowed access to the network. Configure AAA authentication by defining a list of authentication methods, and then applying the list to various interfaces. The list defines the authentication schemes performed and their sequence. The list must be applied to an interface before the defined authentication technique is conducted.

Authorization — Authorization occurs immediately after authentication. Authorization is a method for remote access control, including authorization for services and individual user accounts and profiles. Authorization functions through the assembly of attribute sets describing what the user is authorized to perform. These attributes are compared to information contained in a database for a given user and the result is returned to AAA to determine the user’s actual capabilities and restrictions. The database could be located locally or be hosted remotely on a RADIUS server. Remote RADIUS servers authorize users by associating attribute-value (AV) pairs with the appropriate user. Each authorization method must be defined through AAA. When AAA authorization is enabled it’s applied equally to all interfaces.

Accounting — Collects and sends security server information for billing, auditing, and reporting user data; such as start and stop times, executed commands (such as PPP), number of packets, and number of bytes. Accounting enables wireless network administrators to track the services users are accessing and the network resources they are consuming. When accounting is enabled, the network access server reports user activity to a RADIUS security server in the form of accounting records. Each accounting record is comprised of AV pairs and is stored locally on the access control server. The data can be analyzed for network management, client billing, and/or auditing. Accounting methods must be defined through AAA. When AAA accounting is activated, it’s applied equally to all interfaces on the access servers.
Use the (config) instance to configure AAA policy commands. To navigate to the config-aaa-policy instance, use the following commands:

```
<DEVICE>(config)#aaa-policy <POLICY-NAME>
```

```
rfs7000-37FABE(config)#aaa-policy test
```

```
rfs7000-37FABE(config-aaa-policy-test)#?
```

**AAA Policy Mode commands:**

- **accounting**: Configure accounting parameters
- **attribute**: Configure RADIUS attributes in access and accounting requests
- **authentication**: Configure authentication parameters
- **health-check**: Configure server health-check parameters
- **mac-address-format**: Configure the format in which the MAC address must be filled in the Radius-Request frames
- **no**: Negate a command or set its defaults
- **proxy-attribute**: Configure radius attribute behavior when proxying through controller or rf-domain-manager
- **server-pooling-mode**: Configure the method of selecting a server from the pool of configured AAA servers
- **use**: Set setting to use
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-aaa-policy-test)#
```
## 8.1 aaa-policy

The following table summarizes AAA policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>accounting</td>
<td>Configures accounting parameters</td>
<td>page 8-4</td>
</tr>
<tr>

<tr>
<td>authentication</td>
<td>Configures authentication parameters</td>
<td>page 8-11</td>
</tr>
<tr>
<td>health-check</td>
<td>Configures health check parameters</td>
<td>page 8-16</td>
</tr>
<tr>
<td>mac-address-format</td>
<td>Configures the MAC address format</td>
<td>page 8-17</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or sets its default</td>
<td>page 8-19</td>
</tr>
<tr>
<td>proxy-attribute</td>
<td>Configures the RADIUS server’s attribute behavior when proxying through the wireless controller or the RF Domain manager</td>
<td>page 8-21</td>
</tr>
<tr>
<td>server-pooling-mode</td>
<td>Defines the method for selecting a server from the pool of configured AAA servers</td>
<td>page 8-22</td>
</tr>
<tr>
<td>use</td>
<td>Defines the AAA command settings</td>
<td>page 8-23</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS.*
8.1.1 accounting

AAA-Policy

Configures the server type and interval at which interim accounting updates are sent to the server. A maximum of 6 accounting servers can be configured.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

accounting [interim|server|type]

accounting interim interval <60-3600>

accounting server [<1-6>|preference]

accounting server preference [auth-server-host|auth-server-number|none]

accounting server <1-6> [dscp|host|nai-routing|onboard|proxy-mode|retry-timeout-factor|timeout]

accounting server <1-6> [dscp <0-63>|retry-timeout-factor <50-200>]

accounting server <1-6> host <IP/HOSTNAME/HOST-ALIAS> secret [0 <SECRET>|2 <SECRET>|<SECRET>]

accounting server <1-6> [port <1-65535>]

accounting server <1-6> nai-routing realm-type [prefix|suffix] realm <REALM-TEXT>

accounting server <1-6> onboard [centralized-controller|self|controller]

accounting server <1-6> proxy-mode [none|through-centralized-controller|

through-controller|through-mint-host <HOSTNAME/MINT-ID>|through-rf-domain-manager]

accounting server <1-6> timeout <1-60> {attempts <1-10>}

accounting type [start-interim-stop|start-stop|stop-only]

Parameters

- accounting interim interval <60-3600>
  - interim Configures the interim accounting interval
    
    interval <60-3600> Specify the interim interval from 60 - 3600 seconds. The default is 1800 seconds.

- accounting server preference [auth-server-host|auth-server-number|none]
  - server Configures a RADIUS accounting server's settings
  - preference Configures the accounting server's preference mode. Authentication requests are forwarded to a accounting server, from the pool, based on the preference mode selected.

- auth-server-host
  - Sets the authentication server as the accounting server. This is the default setting. This parameter indicates the same server is used for authentication and accounting. The server is identified by its hostname.

- auth-server-number
  - Sets the authentication server as the accounting server. This parameter indicates the same server is used for authentication and accounting. The server is identified by its index or number.

- none
  - Indicates the accounting server is independent of the authentication server
### Accounting Server Configuration

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>accounting server &lt;1-6&gt;</code></td>
<td>Configures an accounting server. Up to 6 accounting servers can be configured.</td>
</tr>
<tr>
<td><code>dscp &lt;0-63&gt;</code></td>
<td>Sets the <strong>Differentiated Services Code Point</strong> (DSCP) value for <strong>Quality of Service</strong> (QoS) monitoring. This value is used in generated RADIUS packets.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;0-63&gt;</code> – Sets the DSCP value from 0 - 63. The default value is 34.</td>
</tr>
<tr>
<td><code>retry-timeout-factor &lt;50-200&gt;</code></td>
<td>Sets the scaling factor for retransmission timeouts. The timeout at each attempt is a function of this retry-timeout factor and the attempt number.</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;50-200&gt;</code> – Specify a value from 50 - 200. The default is 100.</td>
</tr>
<tr>
<td></td>
<td>If the scaling factor is 100, the interval between two consecutive retries remains the same, irrespective of the number of retries.</td>
</tr>
<tr>
<td></td>
<td>If the scaling factor is less than 100, the interval between two consecutive retries reduces with subsequent retries.</td>
</tr>
<tr>
<td></td>
<td>If this scaling factor is greater than 100, the interval between two consecutive retries increases with subsequent retries.</td>
</tr>
<tr>
<td><code>host &lt;1-6&gt; host &lt;IP/HOSTNAME/HOST-ALIAS&gt;</code></td>
<td>Configures the accounting server’s hostname IP address, or host-alias</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The host alias should be existing and configured.</td>
</tr>
<tr>
<td>`secret [0 &lt;SECRET&gt;</td>
<td>2 &lt;SECRET&gt;</td>
</tr>
<tr>
<td></td>
<td>• <code>0 &lt;SECRET&gt;</code> – Configures a clear text secret key</td>
</tr>
<tr>
<td></td>
<td>• <code>2 &lt;SECRET&gt;</code> – Configures an encrypted secret key</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;SECRET&gt;</code> – Specify the secret key. This shared secret should not exceed 127 characters.</td>
</tr>
<tr>
<td><code>port &lt;1-65535&gt;</code></td>
<td>Optional. Configures the accounting server’s UDP port (the port used to connect to the accounting server)</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;1-65535&gt;</code> – Sets the port number from 1 - 65535 (default port is 1813)</td>
</tr>
<tr>
<td><code>realm-type</code></td>
<td>Specifies whether the prefix or suffix of the username is used as the match criteria. For example, if the option selected is prefix, the username’s prefix is matched to the realm.</td>
</tr>
</tbody>
</table>

### NAI-Routing Configuration

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>nai-routing</code></td>
<td>Enables <strong>Network Access Identifier</strong> (NAI) routing. This option is disabled by default.</td>
</tr>
<tr>
<td></td>
<td>The NAI is a character string in the format of an e-mail address as either user or user@ (it need not be a valid e-mail address or a <strong>fully qualified domain name</strong> (FQDN). The NAI can be used either in a specific or generic form. The specific form, which must contain the user portion and may contain the @ portion, identifies a single user. The generic form allows to be configured on a single command line. Each user still needs a unique security association, but these associations can be stored on a AAA server. The original purpose of NAI was to support roaming between dial up ISPs. Using NAI, each ISP need not have all the accounts for all of its roaming partners in a single RADIUS database. RADIUS servers can proxy requests to remote servers.</td>
</tr>
<tr>
<td><code>strip</code></td>
<td></td>
</tr>
</tbody>
</table>

### Summary

- **Accounting Server Configuration**
  - Sets DSCP value for QoS monitoring (0-63, default 34).
  - Sets retry-timeout factor (50-200, default 100).
  - Configures hostname/IP/host-alias for the accounting server.
  - Specifies a common secret key for authentication.
  - Optional UDP port configuration (1-65535, default 1813).
- **NAI-Routing Configuration**
  - Enables NAI routing, default disabled.
  - Uses NAI for roaming support between ISPs.
  - NAI format: user or user@ (not a valid email).
  - Stores security associations on AAA server.
Select one of the following options:

- [prefix] – Matches the prefix of the username (For example, username is of type DOMAIN/user1, DOMAIN/user2). This is the default setting.
- [suffix] – Matches the suffix of the username (For example, user1@DOMAIN, user2@DOMAIN)

**realm**

Configures the text matched against the username. Enter the realm name (should not exceed 50 characters). When the RADIUS accounting server receives a request for a user name, the server references a table of user names. If the user name is known, the server proxies the request to the RADIUS server.
- `<REALM-TEXT>` – Specifies the matching text including the delimiter (a delimiter is typically '' or '@')

**strip**

Optional. When enabled, strips the realm from the username before forwarding the request to the RADIUS server. This option is disabled by default.

| [prefix|suffix] | Select one of the following options: |
|----------------|-------------------------------------|
|                | - prefix – Matches the prefix of the username (For example, username is of type DOMAIN/user1, DOMAIN/user2). This is the default setting. |
|                | - suffix – Matches the suffix of the username (For example, user1@DOMAIN, user2@DOMAIN) |

| **accounting server <1-6> onboard** [centralized-controller|self|controller] |
|---------------------------------------------------------------------|
| Configures an accounting server. Up to 6 accounting servers can be configured. |

<table>
<thead>
<tr>
<th><strong>onboard</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Selects an onboard server instead of an external host</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>centralized-controller</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures the server on the centralized controller managing the network</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>self</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures the onboard server on a AP, wireless controller, or service platform (where the client is associated)</td>
</tr>
</tbody>
</table>

<table>
<thead>

</tr>
</tbody>
</table>
### AAA-POLICY 8 - 7

- **accounting server <1-6> timeout <1-60> {attempts <1-10>}**
  - server <1-6>: Configures an accounting server. Up to 6 accounting servers can be configured.
  - timeout <1-60>: Configures the timeout for each request sent to the RADIUS server
    - <1-60> – Specify a value from 1 - 60 seconds. The default is 5 seconds.
  - attempts <1-10>: Optional. Specifies the number of times a transmission request is attempted
    - <1-10> – Specify a value from 1 - 10. The default is 3.

- **accounting type [start-interim-stop|start-stop|stop-only]**
  - type: Configures the type of RADIUS accounting packets sent. The options are: start-interim-stop, start-stop, and stop-only.
  - start-interim-stop: Sends accounting-start and accounting-stop messages when the session starts and stops. This parameter also sends interim accounting updates.
  - start-stop: Sends accounting-start and accounting-stop messages when the session starts and stops. This is the default setting.
  - stop-only: Sends an accounting-stop message when the session ends

### Examples

```plaintext
rfs7000-37FABE(config-aaa-policy-test)#accounting interim interval 65
rfs7000-37FABE(config-aaa-policy-test)#accounting server 2 host 172.16.10.10 secret test1 port 1
rfs7000-37FABE(config-aaa-policy-test)#accounting server 2 timeout 2 attempts 2
rfs7000-37FABE(config-aaa-policy-test)#accounting type start-stop
rfs7000-37FABE(config-aaa-policy-test)#accounting server preference auth-server-number
rfs7000-37FABE(config-aaa-policy-test)#show context
```

### Related Commands

- **no** Removes or resets accounting server parameters
8.1.2 attribute

aaa-policy

Configures RADIUS Framed-MTU attribute used in access and accounting requests. The Framed-MTU attribute reduces the Extensible Authentication Protocol (EAP) packet size of the RADIUS server. This command is useful in networks where routers and firewalls do not perform fragmentation.

To ensure network security, some firewall software drop UDP fragments from RADIUS server EAP packets. Consequently, the packets are large. Using Framed MTU reduces the packet size. EAP authentication uses Framed MTU to notify the RADIUS server about the Maximum Transmission Unit (MTU) negotiation with the client. The RADIUS server communications with the client do not include EAP messages that cannot be delivered over the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

attribute [acct-delay-time|acct-multi-session-id|chargeable-user-identity|cisco-vsa|framed-ip-address|framed-mtu|location-information|nas-ipv6-address|operator-name|service-type]

attribute acct-delay-time
attribute acct-multi-session-id
attribute chargeable-user-identity
attribute cisco-vsa audit-session-id
attribute framed-ip-address
attribute framed-mtu <100-1500>
attribute location-information [include-always|none|server-requested]
attribute nas-ipv6-address
attribute operator-name <OPERATOR-NAME>
attribute service-type [framed|login]

Parameters

- attribute acct-delay-time

acct-delay-time Enables support for accounting-delay-time attribute in accounting requests. When enabled, this attribute indicates the number of seconds the client has been trying to send a request to the accounting server. By subtracting this value from the time the packet is received by the server, the system is able to calculate the time of a request-generating event. Note, the network transit time is ignored. This option is disabled by default.

**Note:** Including the acct-delay-time attribute in accounting requests updates the acct-delay-time value whenever the packet is retransmitted. This changes the content of the attributes field, requiring a new identifier and request authenticator.

- attribute acct-multi-session-id

acct-multi-session-id Enables support for accounting-multi-session-id attribute. When enabled, it allows linking of multiple related sessions of a roaming client. This option is useful in scenarios where a client roaming between access points sends multiple RADIUS accounting requests to different access points. This option is disabled by default.

- attribute chargeable-user-identity

chargeable-user-identity Enables support for chargeable-user-identity attribute. This option is disabled by default.
### attribute cisco-vsa audit-session-id

cisco-vsa audit-session-id

Configures the CISCO Vendor Specific Attribute (VSA) attribute included in access requests. This feature is disabled by default.

This VSA allows CISCO’s Identity Services Engine (ISE) to validate a requesting client’s network compliance, such as the validity of virus definition files (antivirus software or definition files for an anti-spyware software application).

- **audit-session-id** – Includes the audit session ID attribute in access requests

  **Note:** The audit session ID is included in access requests when Cisco ISE is configured as an authentication server.

  **Note:** If the Cisco VSA attribute is enabled, configure an additional UDP port to listen for dynamic authorization messages from the Cisco ISE server. For more information, see `service`.

### attribute framed-ip-address

framed-ip-address

Enables inclusion of framed IP address attribute in access requests. This option is disabled by default.

### attribute framed-mtu <100-1500>

framed-mtu <100-1500>

Configures Framed-MTU attribute used in access requests

- `<100-1500>` – Specify the Framed-MTU attribute from 100 - 1500. The default value is 1400.

### attribute location-information [include-always|none|server-requested]

location-information [include-always|none|server-requested]

Enables/disables support for RFC5580 location information attribute, based on the option selected. The various options are:

- **include-always** – Always includes location information in RADIUS authentication and accounting messages
- **none** – Disables sending of location information in RADIUS authentication and accounting messages. This is the default setting.
- **server-requested** – Includes location information in RADIUS authentication and accounting messages only when requested by the server

**Note:** When enabled, location information is exchanged in authentication and accounting messages.

### attribute nas-ipv6-address

nas-ipv6-address

Enables support for NAS IPv6 address. This option is disabled by default.

When enabled, IPv6 addresses are assigned to hosts. The length of IPv4 and IPv6 addresses is 32-bit and 128-bit respectively. Consequently, an IPv6 address requires a larger address space.

### attribute operator-name <OPERATOR-NAME>

operator-name <OPERATOR-NAME>

Enables support for RFC5580 operator name attribute. When enabled, the network operator’s name is included in all RADIUS authentication and accounting messages and uniquely identifies the access network owner. This option is disabled by default.

- `<OPERATOR-NAME>` – Specify the network operator’s name (should not exceed 63 characters in length).
attribute service-type [framed|login]

<table>
<thead>
<tr>
<th>service-type</th>
<th>Configures the service-type (6) attribute value. This attribute identifies the following: the type of service requested and the type of service to be provided.</th>
</tr>
</thead>
<tbody>
<tr>
<td>framed</td>
<td>Sets service-type to <code>framed</code> (2) in the authentication packets. When enabled, a framed protocol, <em>Point-to-Point Protocol (PPP)</em> or <em>Serial Line Internet Protocol (SLIP)</em>, is started for the client. This is the default setting.</td>
</tr>
<tr>
<td>login</td>
<td>Sets service-type to <code>login</code> (1) in the authentication packets. When enabled, the client is connected to the host.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-aaa-policy-test)#attribute framed-mtu 110
rfs7000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  accounting server 2 timeout 2 attempts 2
  accounting interim interval 65
  accounting server preference auth-server-number
  attribute framed-mtu 110
rfs7000-37FABE(config-aaa-policy-test)#

rfs7000-37FABE(config-aaa-policy-test1)#attribute cisco-vsa audit-session-id
rfs7000-37FABE(config-aaa-policy-test1)#show context
aaa-policy test
  attribute cisco-vsa audit-session-id
rfs7000-37FABE(config-aaa-policy-test)#

Related Commands

8.1.3 authentication

aaa-policy

Configures user authentication parameters

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

authentication [eap|protocol|server]
authentication eap wireless-client [attempts <1-10>|identity-request-retry-timeout <10-5000>|identity-request-timeout <1-60>|retry-timeout-factor <50-200>|timeout <1-60>]
authentication protocol [chap|mschap|mschapv2|pap]
authentication server <1-6> [dscp|host|nac|nai-routing|onboard|proxy-mode|retry-timeout-factor|timeout]
authentication server <1-6> dscp <0-63>
authentication server <1-6> host <IP/HOSTNAME/HOST-ALIAS> secret [0 <SECRET>|2 <SECRET>|<SECRET>]{port <1-65535>}
authentication server <1-6> nac
authentication server <1-6> nai-routing realm-type [prefix|suffix] realm <REALM-NAME>{strip}
authentication server <1-6> onboard [centralized-controller|controller|self]
authentication server <1-6> proxy-mode [none|through-centralized-controller|through-mint-host <HOSTNAME/MINT-ID>|through-rf-domain-manager]
authentication server <1-6> retry-timeout-factor <50-200>
authentication server <1-6> timeout <1-60>{attempts <1-10>}

Parameters

- authentication eap wireless-client [attempts <1-10>|identity-request-retry-timeout <10-5000>|identity-request-timeout <1-60>|retry-timeout-factor <50-200>|timeout <1-60>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eap</td>
<td>Configures EAP authentication parameters</td>
</tr>
<tr>
<td>wireless-client</td>
<td>Configures wireless client’s EAP parameters</td>
</tr>
<tr>
<td>attempts &lt;1-10&gt;</td>
<td>Configures the maximum number of attempts allowed to authenticate a wireless client</td>
</tr>
<tr>
<td>identity-request-retry-timeout &lt;10-5000&gt;</td>
<td>Configures the interval, in milliseconds, after which an EAP-identity request to the wireless client is retried</td>
</tr>
<tr>
<td>identity-request-timeout &lt;1-60&gt;</td>
<td>Configures the timeout, in seconds, after the last EAP-identity request message retry attempt (to allow time to manually enter user credentials)</td>
</tr>
</tbody>
</table>
The table below contains the WiNG 5.8 CLI configuration commands for authentication and server configuration:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>retry-timeout-factor</strong></td>
<td>Configures the spacing between successive EAP retries</td>
</tr>
<tr>
<td>50-200</td>
<td>• &lt;50-200&gt; – Specify a value from 50 - 200. The default is 100.</td>
</tr>
<tr>
<td></td>
<td>• A value of 100 indicates the interval between two consecutive retries remains the same</td>
</tr>
<tr>
<td></td>
<td>irrespective of the number of retries.</td>
</tr>
<tr>
<td></td>
<td>• A value lesser than 100 indicates the interval between two consecutive retries reduces with</td>
</tr>
<tr>
<td></td>
<td>each successive retry.</td>
</tr>
<tr>
<td></td>
<td>• A value greater than 100 indicates the interval between two consecutive retries increases with</td>
</tr>
<tr>
<td></td>
<td>each successive retry.</td>
</tr>
</tbody>
</table>

| **timeout <1-60>**     | Configures the interval, in seconds, between successive EAP-identity request sent to a wireless      |
|                       |   client                                                                                             |
|                       | • <1-60> – Specify a value from 1 - 60 seconds. The default is 3 seconds.                            |

| **authentication protocol [chap|mschap|mschapv2|pap]** | Configures one of the following protocols for non-EAP authentication:                                  |
|                                                      | • chap – Uses Challenge Handshake Authentication Protocol (CHAP)                                        |
|                                                      | • mschap – Uses Microsoft Challenge Handshake Authentication Protocol (MS-CHAP)                         |
|                                                      | • mschapv2 – Uses MS-CHAP version 2                                                                   |
|                                                      | • pap – Uses Password Authentication Protocol (PAP) (default authentication protocol used)            |

| **server <1-6>**       | Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.                 |
|                       | • <1-6> – Specify the RADIUS server index from 1 - 6.                                                 |

| **dscp <0-63>**        | Configures the Differentiated Service Code Point (DSCP) quality of service parameter generated       |
|                       |   in RADIUS packets. The DSCP value specifies the class of service provided to a packet, and is      |
|                       |   represented by a 6-bit parameter in the header of every IP packet. The default is 46.             |

| **authentication server <1-6> host <IP/HOSTNAME/HOST-ALIAS> secret [0 <SECRET> | 2 <SECRET> | <SECRET>] {port <1-65535>}** | Configures the RADIUS authentication server’s secret. This key is used to authenticate with the    |
|                         |   RADIUS server.                                                                                     |
|                         | • 0 <SECRET> – Configures a clear text secret                                                        |
|                         | • 2 <SECRET> – Configures an encrypted secret                                                        |
|                         | • <SECRET> – Specify the secret key. The shared key should not exceed 127 characters in length.      |

| **port <1-65535>**     | Optional. Specifies the RADIUS authentication server’s UDP port (this port is used to connect to the |
|                       |   RADIUS server)                                                                                     |
|                       | • <1-65535> – Specify a value from 1 - 65535. The default port is 1812.                             |
- **authentication server** <1-6> nac

  server <1-6>  Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.  
  - <1-6> – Specify the RADIUS server index from 1 - 6.

  nac  Enables **Network Access Control** (NAC) on the RADIUS authentication server identified by the <1-6> parameter.  
  Using NAC, the controller hardware and software grant access to specific network resources.  
  NAC performs a user and client authorization check for resources that do not have a NAC agent.  
  NAC verifies the client’s compliance with the controller’s security policy. The controller supports only the EAP/802.1x type of NAC. However, the controller also provides a means to bypass NAC authentication for clients that do not have NAC 802.1x support (printers, phones, PDAs etc.).

- **accounting server** <1-6> nai-routing realm-type [prefix|suffix] realm <REALM-NAME> {strip}

  server <1-6>  Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.  
  - <1-6> – Specifies the RADIUS server index from 1 - 6.

  nai-routing  Enables NAI routing. When enabled, AAA servers identify clients using NAI. This option is disabled by default.

  The NAI is a character string in the format of an e-mail address as either user or user@ but it need not be a valid e-mail address or a fully qualified domain name. The NAI can be used either in a specific or generic form. The specific form, which must contain the user portion and may contain the @ portion, identifies a single user. The generic form allows all users in a given or without a to be configured on a single command line. Each user still needs a unique security association, but these associations can be stored on a AAA server. The original purpose of the NAI was to support roaming between dial up ISPs. Using NAI, each ISP need not have all the accounts for all of its roaming partners in a single RADIUS database. RADIUS servers can proxy requests to remote servers for each.

  realm-type [prefix|suffix]  Configures the realm-type used for NAI authentication  
  - prefix – Sets the realm prefix. For example, in the realm name ‘AC\JohnTalbot’, the prefix is ‘AC’ and the user name ‘JohnTalbot’.
  - suffix – Sets the realm suffix. For example, in the realm name ‘JohnTalbot@AC.org’ the suffix is ‘AC.org’ and the user name is ‘JohnTalbot’.

  realm <REALM-NAME>  Sets the realm information used for RADIUS authentication. The realm name should not exceed 64 characters in length. When the wireless controller or access point’s RADIUS server receives a request for a user name the server references a table of usernames. If the user name is known, the server proxies the request to the RADIUS server.  
  - <REALM-NAME> – Sets the realm used for authentication. This value is matched against the user name provided for RADIUS authentication.

  Example:  
  Prefix - AC\JohnTalbot  
  Suffix - JohnTalbot@AC.org

  strip  Optional. Indicates the realm name must be stripped from the user name before sending it to the RADIUS server for authentication. For example, if the complete username is ‘AC\JohnTalbot’, then with the *strip* parameter enabled, only the ‘JohnTalbot’ part of the complete username is sent for authentication. This option is disabled by default.
# Configuration Commands

## authentication server <1-6> onboard [centralized-controller|controller|self]

<table>
<thead>
<tr>
<th>server &lt;1-6&gt;</th>
<th>Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-6&gt; – Specify the RADIUS server index from 1 - 6.</td>
</tr>
</tbody>
</table>

Selects the onboard RADIUS server for authentication instead of an external host:
- **centralized-controller** – Configures the server on the centralized controller managing the network.
- **controller** – Configures the wireless controller, to which the AP is adopted, as the onboard wireless controller.
- **self** – Configures the onboard server on the device (AP or wireless controller) where the client is associated as the onboard wireless controller.

## proxy-mode [none|through-centralized-controller|through-controller|through-mint-host <HOSTNAME/MINT-ID>|through-rf-domain-manager]

<table>
<thead>
<tr>
<th>server &lt;1-6&gt;</th>
<th>Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-6&gt; – Sets the RADIUS server index between 1 - 6</td>
</tr>
</tbody>
</table>

Configures the mode for proxying a request:
- **none** – Proxying is not done. The packets are sent directly using the IP address of the device. This is the default setting.
- **through-centralized-controller** – Traffic is proxied through the centralized controller that is configuring and managing the network.
- **through-controller** – Traffic is proxied through the wireless controller configuring this device.
- **through-mint-host <HOSTNAME/MINT-ID>** – Traffic is proxied through a neighboring MiNT device. Provide the device's hostname or MiNT ID.
- **through-rf-domain-manager** – Traffic is proxied through the local RF Domain manager.

## retry-timeout-factor <50-200>

<table>
<thead>
<tr>
<th>server &lt;1-6&gt;</th>
<th>Configures a RADIUS authentication server. Up to 6 RADIUS servers can be configured.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-6&gt; – Specify the RADIUS server index from 1 - 6.</td>
</tr>
</tbody>
</table>

Configures the scaling of timeouts between two consecutive RADIUS authentication retries:
- **<50-200>** – Specify the scaling factor from 50 - 200. The default is 100.
  - A value of 100 indicates the interval between two consecutive retries remains the same irrespective of the number of retries.
  - A value lesser than 100 indicates the interval between two consecutive retries reduces with each successive retry.
  - A value greater than 100 indicates the interval between two consecutive retries increases with each successive retry.
timeout <1-60>  Configures the timeout, in seconds, for each request sent to the RADIUS server. This is the time allowed to elapse before another request is sent to the RADIUS server. If a response is received from the RADIUS server within this time, no retry is attempted.
  • <1-60> – Specify a value from 1 - 60 seconds. The default is 3 seconds.

attempts <1-10>  Optional. Indicates the number of retry attempts to make before giving up
  • <1-10> – Specify a value from 1 - 10. The default is 3.

Examples

rfs7000-37FABE(config-aaa-policy-test)#authentication server 5 host 172.16.10.10 secret 0 test1 port 1
rfs7000-37FABE(config-aaa-policy-test)#authentication server 5 timeout 10 attempts 3
rfs7000-37FABE(config-aaa-policy-test)#authentication protocol chap

aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test1 port 1
  authentication server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  accounting server 2 timeout 2 attempts 2
  authentication protocol chap
  accounting interim interval 65
  accounting server preference auth-server-number
  attribute framed-mtu 110
rfs7000-37FABE(config-aaa-policy-test)#

Related Commands

timeout  Resets authentication parameters on this AAA policy
  no

Related Commands
8.1.4 health-check

An AAA server could go offline. When a server goes offline, it is marked as *down*. This command configures the interval after which a server marked as *down* is checked to see if it has come back online and is reachable.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
health-check interval <60-86400>
```

**Parameters**

- `health-check interval <60-86400>`

<table>
<thead>
<tr>
<th>Interval</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;60-86400&gt;</code></td>
<td>Configures an interval (in seconds) after which a down server is checked to see if it is reachable again.</td>
</tr>
<tr>
<td><code>&lt;60-86400&gt;</code></td>
<td>Specify a value from 60 - 86400 seconds. The default is 3600 seconds.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-aaa-policy-test)#health-check interval 4000
rfs7000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test1 port 1
  authentication server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  accounting server 2 timeout 2 attempts 2
  authentication protocol chap
  accounting interim interval 65
  accounting server preference auth-server-number
rfs7000-37FABE(config-aaa-policy-test)#
```

**Related Commands**

```
no
```

Resets the health-check interval for AAA servers.
8.1.5 mac-address-format

aaa-policy

Configures the format MAC addresses are filled in RADIUS request frames

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot] case [lower|upper] attributes [all|username-password]

Parameters

- mac-address-format [middle-hyphen|no-delim|pair-colon|pair-hyphen|quad-dot] case [lower|upper] attributes [all|username-password]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>middle-hyphen</td>
<td>Configures the MAC address format as AABBCC-DDEEFF</td>
</tr>
<tr>
<td>no-delim</td>
<td>Configures the MAC address format as AABBCDDEEFF (without delimiters)</td>
</tr>
<tr>
<td>pair-colon</td>
<td>Configures the MAC address format as AA:BB:CC:DD:EE:FF</td>
</tr>
<tr>
<td>pair-hyphen</td>
<td>Configures the MAC address display format as AA-BB-CC-DD-EE-FF (default setting)</td>
</tr>
<tr>
<td>quad-dot</td>
<td>Configures the MAC address display format as AABBCDDEEFF</td>
</tr>
<tr>
<td>case [lower</td>
<td>upper]</td>
</tr>
<tr>
<td></td>
<td>- lower – Indicates MAC address is in lower case. For example, aa:bb:cc:dd:ee:ff</td>
</tr>
<tr>
<td></td>
<td>- upper – Indicates MAC address is in upper case. For example, AA:BB:CC:DD:EE:FF (default setting)</td>
</tr>
<tr>
<td>attributes [all</td>
<td>username-password]</td>
</tr>
<tr>
<td></td>
<td>- all – Applies to all attributes with MAC addresses such as username, password, calling-station-id, and called-station-id</td>
</tr>
<tr>
<td></td>
<td>- username-password – Applies only to the username and password fields (default setting)</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-aaa-policy-test)#mac-address-format quad-dot case upper attributes username-password
rfs7000-37FABE(config-aaa-policy-test)#show context
  aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test1 port 1
  authentication server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  accounting server 2 timeout 2 attempts 2
  mac-address-format quad-dot case upper attributes username-password
  authentication protocol chap
--More--
rfs7000-37FABE(config-aaa-policy-test)#
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Resets the MAC address format to default (pair-hyphen)</td>
</tr>
</tbody>
</table>
8.1.6 no

Negates a AAA policy command or sets its default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [accounting|attribute|authentication|health-check|mac-address-format|proxy-attribute|server-pooling-mode|use]

no accounting interim interval
no accounting server preference
no accounting server <1-6> {dscp|nai-routing|proxy-mode|retry-timeout-factor|timeout}
no accounting type

no attribute [acct-delay-time|acct-multi-session-id|chargeable-user-identity|cisco-vsa audit-session-id|framed-ip-address|framed-mtu|location-information|nas-ipv6-address|operator-name|service-type]

no authentication [eap|protocol|server]
no authentication eap wireless-client [attempts|identity-request-retry-timeout|identity-request-timeout|retry-timeout-factor|timeout]
no authentication protocol
no authentication server <1-6> {dscp|nac|nai-routing|proxy-mode|retry-timeout-factor|timeout}

no health-check interval
no mac-address-format
no proxy-attribute [nas-identifier|nas-ip-address]
no server-pooling-mode
no use nac-list

Parameters

- no <PARAMETERS>

no <PARAMETERS> Negates a AAA policy command or sets its default

Examples

The following example shows the AAA policy ‘test’ settings before the ‘no’ commands are executed:

rfs7000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test1 port 1
  authentication server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  accounting server 2 timeout 2 attempts 2
  mac-address-format quad-dot case upper attributes username-password
  authentication protocol chap
  accounting interim interval 65
  accounting server preference auth-server-number
  health-check interval 4000
  attribute framed-mtu 110
rfs7000-37FABE(config-aaa-policy-test)#
The following example shows the AAA policy ‘test’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-aaa-policy-test)#show context
  aaa-policy test
    authentication server 5 host 172.16.10.10 secret 0 test1 port 1
    authentication server 5 timeout 10
    accounting server 2 host 172.16.10.10 secret 0 test1 port 1
    mac-address-format quad-dot case upper attributes username-password
    accounting server preference auth-server-number
    health-check interval 4000
rfs7000-37FABE(config-aaa-policy-test)#
```
### 8.1.7 proxy-attribute

Configures RADIUS server’s attribute behavior when proxying through a wireless controller or a RF Domain Manager

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
proxy-attribute [nas-identifier|nas-ip-address]
proxy-attribute [nas-identifier [originator|proxier]|nas-ip-address [none|proxier]]
```

#### Parameters
- proxy-attribute [nas-identifier [originator|proxier]|nas-ip-address [none|proxier]]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| nas-identifier [originator|proxier] | Uses NAS identifier
  - originator – Configures the NAS identifier as the originator of the RADIUS request. The originator could be an AP, or a wireless controller with radio. This is the default setting.
  - proxier – Configures the proxying device as the NAS identifier. The device could be a controller or a RF Domain manager. |
| nas-ip-address [none|proxier] | Uses NAS IP address
  - none – NAS IP address attribute is not filled
  - proxier – NAS IP address is filled by the proxying device. The device could be a controller or a RF Domain manager. This is the default setting. |

#### Examples

```
rfs7000-37FABE(config-aaa-policy-test)#proxy-attribute nas-ip-address proxier
rfs7000-37FABE(config-aaa-policy-test)#proxy-attribute nas-identifier originator
```

#### Related Commands

- `no`  
  Resets RADIUS server’s proxying attributes
### 8.1.8 server-pooling-mode

**aaa-policy**

Configures the server selection method from a pool of AAA servers. The available methods are *failover* and *load-balance*.

In the failover scenario, when a configured AAA server goes down, the server with the next higher index takes over for the failed server.

In the load-balance scenario, when a configured AAA server goes down, the remaining servers distribute the load amongst themselves.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`server-pooling-mode [failover|load-balance]`

**Parameters**

- `server-pooling-mode [failover|load-balance]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>failover</td>
<td>Sets the pooling mode to failover. This is the default setting. When a configured AAA server fails, the server with the next higher index takes over the failed server's load.</td>
</tr>
<tr>
<td>load-balance</td>
<td>Sets the pooling mode to load balancing. When a configured AAA server fails, all servers in the pool share the failed server's load transmitting requests in a round-robin fashion.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-aaa-policy-test)#server-pooling-mode load-balance
rfs7000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test2 port 1
  authentication server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  server-pooling-mode load-balance
  mac-address-format quad-dot case upper attributes username-password
  accounting server preference auth-server-number
  health-check interval 4000
rfs7000-37FABE(config-aaa-policy-test)#
```

**Related Commands**

- `no` — Resets the method of selecting a server, from the pool of configured AAA servers
8.1.9 **use**

- **aaa-policy**

Associates a *Network Access Control* (NAC) with this AAA policy. This allows only the set of configured devices to use the configured AAA servers.

For more information on creating a NAC list, see `nac-list`.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
use nac-list <NAC-LIST-NAME>
```

**Parameters**

- `use nac-list <NAC-LIST-NAME>`

  - `<NAC-LIST-NAME>` — Specify the NAC list name (should be existing and configured).

**Examples**

```
rfs7000-37FABE(config-aaa-policy-test)#use nac-list test1
rfs7000-37FABE(config-aaa-policy-test)#show context
aaa-policy test
  authentication server 5 host 172.16.10.10 secret 0 test1 port 1
  authentication server 5 timeout 10
  accounting server 2 host 172.16.10.10 secret 0 test1 port 1
  server-pooling-mode load-balance
  mac-address-format quad-dot case upper attributes username-password
  accounting server preference auth-server-number
  health-check interval 4000
  use nac-list test1
rfs7000-37FABE(config-aaa-policy-test)#
```

CHAPTER 9
AUTO-PROVISIONING-POLICY

This chapter summarizes the auto provisioning policy commands in the CLI command structure.

Wireless devices can adopt and manage other wireless devices. For example, a wireless controller can adopt multiple access points. When a device is adopted, the device configuration is provisioned by the adopting device. Since multiple configuration policies are supported, an adopting device uses auto provisioning policies to determine which configuration policies are applied to an adoptee based on its properties. For example, a configuration policy could be assigned based on MAC address, IP address, CISCO Discovery Protocol (CDP) snoop strings, etc.

Auto provisioning or adoption is the process by which an access point discovers controllers in the network, identifies the most desirable controller, associates with the identified controller, and optionally obtains an image upgrade, obtains its configuration and considers itself provisioned.

At adoption, an access point solicits and receives multiple adoption responses from controllers available on the network. These adoption responses contain loading policy information the access point uses to select the optimum controller for adoption. An auto-provisioning policy maps a new AP to a profile and RF Domain based on various parameters related to the AP and where it is connected. By default a new AP will be mapped to the default profile and default RF Domain. Modify existing auto-provisioning policies or create a new one as needed to meet the configuration requirements of a device.

An auto-provisioning policy enables an administrator to define rules for the supported access points capable of being adopted by a controller. The policy determines which configuration policies are applied to an adoptee based on its properties. For example, a configuration policy could be assigned based on MAC address, IP address, CISCO Discovery Protocol (CDP) snoop strings, etc. Once created an auto provisioning policy can be used in profiles or device configuration objects. The policy contains a set of rules (ordered by precedence) that either deny or allow adoption based on potential adoptee properties and a catch-all variable that determines if the adoption should be allowed when none of the rules is matched. All rules (both deny and allow) are evaluated sequentially starting with the rule with the lowest precedence. The evaluation stops as soon as a rule has been matched, no attempt is made to find a better match further down in the set.

For example,

```
rule #1 adopt ap7131 10 profile default vlan 10
rule #2 adopt ap650  20 profile default vlan 20
rule #3 adopt ap7131 30 profile default serial-number
rule #4 adopt ap7131 40 p d mac aa bb
```

AP7131 L2 adoption, VLAN 10 - will use rule #1
AP7131 L2 adoption, VLAN 20 - will not use rule #2 (wrong type), may use rule #3 if the serial number matched, or rule #4
If aa<= MAC <= bb, or else default.

With the implementation of the hierarchically managed (HM) network, the auto-provisioning policy has been modified to enable controllers to adopt other controllers in addition to access points.
The new WiNG HM network defines a three-tier structure, consisting of multiple wireless sites managed by a single *Network Operations Center* (NOC) controller. The NOC controller constitutes the first and the site controllers constitute the second tier of the hierarchy. The site controllers in turn adopt and manage access points that form the third tier of the hierarchy.

All adopted devices (access points and second-level controllers) are referred to as the ‘adoptee’. The adopting devices are the ‘adopters’.

A controller cannot be configured as an adoptee and a controller adopter simultaneously. In other words, a controller can either be an adopter (adopts another controller) or an adoptee (is adopted by another controller). Therefore, a site controller, which has been adopted by a NOC controller, cannot adopt another controller. But it can adopt access points. For more information on HM network, see *device-upgrade*.

A controller should be configured to specify the device types (APs and/or controllers) that it can adopt. For more information on configuring the adopted-device types for a controller, see *controller*.

---

**NOTE:** The adoption capabilities of a controller depends on:

- Whether the controller is deployed at the NOC or site
- A NOC controller can adopt site controllers and access points
- A site controller can adopt access points only
- The controller device type, which determines the number and type of devices it can adopt

The NOC controller can adopt a site controller with a capacity equal to or lower than its own. The following table displays the NOC controllers and the corresponding site-level controllers supported by each:

<table>
<thead>
<tr>
<th>Site Controllers supported by each NOC controller</th>
<th>RFS7000</th>
<th>NX9000</th>
<th>NX9XXX (NX9500 &amp; NX9510)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RFS4000</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>RFS6000</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>RFS7000</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>NX45XX</td>
<td>-</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>NX65XX</td>
<td>-</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>NX7500</td>
<td>-</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>NX9000</td>
<td>-</td>
<td>-</td>
<td>X</td>
</tr>
<tr>
<td>NX9XXX</td>
<td>-</td>
<td>-</td>
<td>X</td>
</tr>
</tbody>
</table>

**NOTE:** Some access points can be configured as virtual controllers. When configured as a virtual controller, an AP can only adopt another AP of the same type. In such a scenario, an auto provisioning policy is required to enable adoption of a specific device identified by its MAC address, IP address, serial number, model number etc.
Use the (config) instance to configure an auto-provisioning policy. To navigate to the auto-provisioning-policy configuration instance, use the following command:

```
<DEVICE>(config)#auto-provisioning-policy <POLICY-NAME>
```

```
rfs7000-37FABE(config)#auto-provisioning-policy test
```

```
rfs7000-37FABE(config-auto-provisioning-policy-test)#?
```

**Auto-Provisioning Policy Mode commands:**

- `adopt` Add rule for device adoption
- `default-adoption` Adopt devices even when no matching rules are found.
- `deny` Add rule to deny device adoption
- `evaluate-always` Set the flag to evaluate the policy everytime, regardless of previous adoption status
- `no` Negate a command or set its defaults
- `redirect` Add rule to redirect device adoption
- `upgrade` Add rule for device upgrade

```
<DEVICE>(config-auto-provisioning-policy-test)>
```

---

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
## 9.1 auto-provisioning-policy

_AUTO-PROVISIONING-POLICY_

The following table summarizes auto provisioning policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>

</tr>
<tr>
<td>upgrade</td>
<td>Adds a device upgrade rule to this auto provisioning policy</td>
<td>page 9-19</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts settings to their default</td>
<td>page 9-22</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, _COMMON COMMANDS_.

9.1.1 adopt

- **auto-provisioning-policy**

  Adds device adoption rules

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
adopt [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|
ap7522|ap7532|ap7562|ap81xx|ap82xx|xfs4000|xfs6000|xfs7000|nx45xx|nx5500|nx65xx|
x7500|nx7510|nx7520|nx7530|nx9000|vx9000|nx9600] precedence <1-10000>
adopt [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|
ap7522|ap7532|ap7562|ap81xx|ap82xx|xfs4000|xfs6000|xfs7000|nx45xx|nx5500|nx65xx|
x7500|nx7510|nx7520|nx7530|nx9000|vx9000|nx9600] precedence <1-10000>
```

**Parameters**

- **adopt**
  - **anyap** | **ap621** | **ap622** | **ap650** | **ap6511** | **ap6521** | **ap6522** | **ap6532** | **ap6562** | **ap71xx** | **ap7502** | **ap7522** | **ap7532** | **ap7562** | **ap81xx** | **ap82xx** | **xfs4000** | **xfs6000** | **xfs7000** | **nx45xx** | **nx5500** | **nx65xx** | **nx7500** | **nx7510** | **nx7520** | **nx7530** | **nx9000** | **vx9000** | **nx9600**
  - **profile** | **rf-domain**
  - **adopt**
  - **anyap** | **ap621** | **ap622** | **ap650** | **ap6511** | **ap6521** | **ap6522** | **ap6532** | **ap6562** | **ap71xx** | **ap7502** | **ap7522** | **ap7532** | **ap7562** | **ap81xx** | **ap82xx** | **xfs4000** | **xfs6000** | **xfs7000** | **nx45xx** | **nx5500** | **nx65xx** | **nx7500** | **nx7510** | **nx7520** | **nx7530** | **nx9000** | **vx9000** | **nx9600**
  - **profile** | **rf-domain**

- **adopt**
  - **anyap** | **ap621** | **ap622** | **ap650** | **ap6511** | **ap6521** | **ap6522** | **ap6532** | **ap6562** | **ap71xx** | **ap7502** | **ap7522** | **ap7532** | **ap7562** | **ap81xx** | **ap82xx** | **xfs4000** | **xfs6000** | **xfs7000** | **nx45xx** | **nx5500** | **nx65xx** | **nx7500** | **nx7510** | **nx7520** | **nx7530** | **nx9000** | **vx9000** | **nx9600**
  - **profile** | **rf-domain**

**adopt**

- **adopt**
  - **anyap** | **ap621** | **ap622** | **ap650** | **ap6511** | **ap6521** | **ap6522** | **ap6532** | **ap6562** | **ap71xx** | **ap7502** | **ap7522** | **ap7532** | **ap7562** | **ap81xx** | **ap82xx** | **xfs4000** | **xfs6000** | **xfs7000** | **nx45xx** | **nx5500** | **nx65xx** | **nx7500** | **nx7510** | **nx7520** | **nx7530** | **nx9000** | **vx9000** | **nx9600**
  - **profile** | **rf-domain**

**Note:** 'anyap' is used in auto provisioning policies to create rules that are applicable to any AP regardless of the type.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>adopt</td>
<td>Adds an adopt device rule. The rule applies to the selected device types. Specify the device type and assign a precedence to the rule.</td>
</tr>
<tr>
<td>precedence &lt;1-10000&gt;</td>
<td>Sets the rule precedence from 1 - 10000. A rule with a lower value has a higher precedence.</td>
</tr>
</tbody>
</table>
profile `<DEVICE-PROFILE-NAME>`

Sets the device profile for this provisioning policy. The selected device profile must be appropriate for the device being provisioned. For example, use an AP650 device profile for an AP650. Using an inappropriate device profile can result in unpredictable results. Provide a device profile name. Provide a device profile name. Or a template with appropriate substitution tokens, such as `campus-$MODEL[1:6]`, `$FQDN[1:4]`:indoor`

Please see the Usage Guidelines section *Built-in Tokens & Alias* for the different types of built in tokens available in the system.

rf-domain `<RF-DOMAIN-NAME>`

Sets the RF Domain for this auto provisioning policy. The provisioning policy is only applicable to devices that try to become a part of the specified RF Domain. Provide the full RF Domain name OR use a string alias to identify the RF Domain.

Provide the full RF Domain name or an alias. Or a template with appropriate substitution tokens, such as `'$CDP[1:7]'`, `$DNS-SUFFIX[1:5]'`

Please see the Usage Guidelines section *Built-in Tokens & Alias* for the different types of built in tokens available in the system.

**Note:** Use the built-in string alias or a user-defined string alias. String aliases allow you to configure APs in the same RF Domain as the adopting controller. A string alias maps a name to an arbitrary string value, for example, `alias string $DOMAIN test.example_company.com'`. In this example, the string-alias `$DOMAIN` is mapped to the string: *test.example_company.com*. For more information, see *alias*.

any

Indicates any device. Any device seeking adoption is adopted.

adopt

Adds an adopt device rule. The rule applies to the selected device types. Specify the device type and assign a precedence to the rule.

The different device types are: anyap, AP621, AP622, AP650, AP6511, AP6522, AP6532, AP6562, AP7502, AP7522, AP7532, AP7562, AP71XX, AP81XX, AP82XX, RF5400, RF5600, RF5700, NX45XX, NX5500, NX65XX, NX7500, NX7510, NX7520, NX7530, NX9000, VX9000, and NX9600.

**Note:** `anyap` is used in auto provisioning policies to create rules that are applicable to any AP regardless of the type.

precedence `<1-10000>`

Sets the rule precedence. A rule with a lower value has a higher precedence.

profile `<DEVICE-PROFILE-NAME>`

Sets the device profile for this provisioning policy. The selected device profile must be appropriate for the device being provisioned. For example, use an AP650 device profile for an AP650. Using an inappropriate device profile can result in unpredictable results.

Provide a device profile name. Or a template with appropriate substitution tokens, such as `campus-$MODEL[1:6]`, `$FQDN[1:4]`:indoor`

Please see the Usage Guidelines section *Built-in Tokens & Alias* for the different types of built in tokens available in the system.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| rf-domain          | Sets the RF Domain for this auto provisioning policy. The provisioning policy is only applicable to devices that try to become a part of the specified RF Domain. 
  Provide the full RF Domain name or an alias. Or a template with appropriate substitution tokens, such as `$CDP[1:7]`, `$DNS-SUFFIX[1:5]`. 
  Please see the Usage Guidelines section **Built-in Tokens & Alias** for the different types of built in tokens available in the system. 
  **Note:** Use the built-in string alias or a user-defined string alias. String aliases allow you to configure APs in the same RF Domain as the adopting controller. A string alias maps a name to an arbitrary string value, for example, 'alias string $DOMAIN test.example_company.com'. In this example, the string-alias $DOMAIN is mapped to the string: test.example_company.com. For more information, see alias. |
| area <AREA-NAME>   | Matches the area of deployment. This option is not applicable to the 'rf-domain' parameter. 
  • `<AREA-NAME>` – Enter a 64 character maximum deployment area name assigned to this policy. Devices with matching area names are adopted. |
| cdp-match <LOCATION-SUBSTRING> | Matches a substring in a list of CDP snoop strings (case insensitive). For example, if an access point snooped 3 devices: controller1.example.com, controller2.example.com, and controller3.example.com, 'controller1', 'example', 'example.com', are examples of the substrings that will match. 
  • `<LOCATION-SUBSTRING>` – Specify the value to match. Devices matching the specified value are adopted. |
| dhcp-option <DHCP-OPTION> | Matches the value found in DHCP vendor option 191 (case insensitive). DHCP vendor option 191 can be setup to communicate various configuration parameters to an AP. The value of the option in a string in the form of tag=value separated by a semicolon, for example 'tag1=value1;tag2=value2;tag3=value3'. The access point includes the value of tag 'rf-domain', if present. 
  • `<DHCP-OPTION>` – Specify the DHCP option. Devices matching the specified value are adopted. |
| floor <FLOOR-NAME> | Matches the floor name. This option is not applicable to the 'rf-domain' parameter. 
  • `<FLOOR-NAME>` – Enter a 32 character maximum deployment floor name assigned to this policy. Devices with matching floor names are adopted. |
| fqdn <FQDN>        | Matches a substring to the **Fully Qualified Domain Name** (FQDN) of a device (case insensitive) 
  FQDN is a domain name that specifies its exact location in the DNS hierarchy. It specifies all domain levels, including its top-level domain and the root domain. This parameter allows a device to adopt based on its FQDN value. 
  • `<FQDN>` – Specify the FQDN. Devices matching the specified value are adopted. |
| ip [<START-IP> <END-IP>] | Adopts a device if its IP address matches the specified IPv4 address or is within the specified IP address range. Or if the device is a part of the specified subnet. 
  • `<START-IP>` – Specify the first IPv4 address in the range. 
  • `<END-IP>` – Specify the last IPv4 address in the range. 
  • `<IP/MASK>` – Specify the IPv4 subnet and mask to match against the device's IP address. |
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6</td>
<td>Adopts a device if its IP v6 address matches the specified IPv6 address or is within the specified IP address range. Or if the device is a part of the specified subnet.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;START-IP&gt;</code> – Specify the first IPv6 address in the range.</td>

<td>- <code>&lt;SERIAL-NUMBER&gt;</code> – Specify the serial number.</td>
</tr>
<tr>
<td>vlan</td>
<td>Adopts a device if its VLAN matches <code>&lt;VLAN-ID&gt;</code>.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;VLAN-ID&gt;</code> – Specify the VLAN ID.</td>
</tr>
</tbody>
</table>
Usage Guidelines Built-in Tokens & Alias

Following are the built-in tokens that can be used to identify the devices to adopt:

- **$FQDN** - references FQDN of adopting device
- **$CDP** - references CDP Device Id of wired switch to which adopting device is connected
- **$LLDP** - references LLDP System Name of wired switch to which adopting device is connected
- **$DHCP** - references DHCP Option Value received by the adopting device
- **$SN** - references SERIAL NUMBER of adopting device
- **$MODEL** - references MODEL NUMBER of adopting device
- **$DNS-SUFFIX** - references FQDN excluding the hostname of the adopting device
- **$CDP-SUFFIX** - references CDP excluding the hostname of the adopting device
- **$LLDP-SUFFIX** - references LLDP excluding the hostname of the adopting device

Following is the built-in alias that can be used to identify the RF Domain of devices to adopt:

- **$_builtin_rf-domain** - rf-domain of adopting device

Examples

9.1.2 default-adoption

Adopts devices, even when no matching rules are defined, and assigns a default profile and default RF Domain to the adopted device

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

default-adoption

**Parameters**

None

**Examples**

rfs4000-229D58 (config-auto-provisioning-policy-test)#default-adoption

rfs4000-229D58 (config-auto-provisioning-policy-test)#show context auto-provisioning-policy test
default-adoption

adopt ap81xx precedence 1 profile default-ap81xx vlan 1

rfs4000-229D58 (config-auto-provisioning-policy-test)#

</tbody>
</table>
9.1.3 deny

Defines a deny device adoption rule.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510,NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
deny [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|ap8500|ap8501|ap8550|ap8551|ap8562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap8500|ap8501|ap8550|ap8551|ap8562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap8500|ap8501|ap8550|ap8551|ap8562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap8500|ap8501|ap8550|ap8551|ap8562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap8500|ap8501|ap8550|ap8551|ap8562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap8500|ap8501|ap8550|ap8551|ap8562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap8500|ap8501|ap8550|ap8551|ap8562|ap71xx|ap7502|ap7522|ap7532|ap7562] precedence <1-10000> [any|cdp-match|dhcp-option|fqdn|ip|ipv6|lldp-match|mac|model-number|serial-number|vlan]
```

**Parameters**

- **deny** Adds a deny adoption rule. The rule applies to the selected device types. Specify the device type and assign a precedence to the rule. The different device types are: anyap, AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, VX9000, and NX9600 series.
  - **Note:** 'anyap' is used in auto provisioning policies to create rules that are applicable to any AP regardless of the type.

- **precedence <1-10000>** Sets the rule precedence. A rule with a lower value has a higher precedence.

- **any** Indicates any device. Any device seeking adoption is denied adoption.
### deny

Add a deny adoption rule. The rule applies to the selected device types. Specify the device type and assign a precedence to the rule.

The different device types are: anyap, AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, VX9000, and NX9600.

<table>
<thead>
<tr>
<th>precedence &lt;1-10000&gt;</th>

<th>cdp-match &lt;LOCATION-SUBSTRING&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Matches a substring in a list of CDP snoop strings (case insensitive). For example, if an access point snooped 3 devices: controller1.example.com, controller2.example.com and controller3.example.com, 'controller1', 'example', 'example.com', are examples of the substrings that will match.</td>
</tr>
<tr>
<td>• &lt;LOCATION-SUBSTRING&gt; – Specify the value to match. Devices matching the specified value are denied adoption.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>dhcp-option &lt;DHCP-OPTION&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Matches the value found in DHCP vendor option 191 (case insensitive). DHCP vendor option 191 can be setup to communicate various configuration parameters to an AP. The value of the option in a string in the form of tag=value separated by a semicolon, for example 'tag1=value1;tag2=value2;tag3=value3'. The access point includes the value of tag 'rf-domain', if present.</td>
</tr>
<tr>
<td>• &lt;DHCP-OPTION&gt; – Specify the DHCP option value to match. Devices matching the specified value are denied adoption.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>fqdn &lt;FQDN&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Matches a substring to the FQDN of a device (case insensitive) FQDN is a domain name that specifies its exact location in the DNS hierarchy. It specifies all domain levels, including its top-level domain and the root domain.</td>
</tr>
<tr>
<td>• &lt;FQDN&gt; – Specify the FQDN. Devices matching the specified value are denied adoption.</td>
</tr>
</tbody>
</table>

| ip [<START-IP> |<END-IP>|<IP/MASK>] |
|---------------|
| Denies adoption if a device’s IP address matches the specified IPv4 address or is within the specified IP address range |
| • <START-IP> – Specify the first IPv4 address in the range. |
| • <END-IP> – Specify the last IPv4 address in the range. |
| • <IP/MASK> – Specify the IPv4 subnet and mask to match against the device’s IP address. |

| ipv6 [<START-IP>|<END-IP>|<IP/MASK>] |
|----------------|
| Denies adoption if a device’s IPv6 address matches the specified IPv6 address or is within the specified IPv6 address range |
| • <START-IP> – Specify the first IPv6 address in the range. |
| • <END-IP> – Specify the last IPv6 address in the range. |
| • <IP/MASK> – Specify the IPv6 subnet and mask to match against the device’s IP address. |
### Examples

```
rfs4000-229D58(config-auto-provisioning-policy-test)#deny ap71xx precedence 2 model-number AP7131N
rfs4000-229D58(config-auto-provisioning-policy-test)#deny ap71xx precedence 3 ip 192.168.13.23 192.168.13.23
rfs4000-229D58(config-auto-provisioning-policy-test)#show context
adopt ap81xx precedence 1 profile default-ap81xx vlan 1
deny ap71xx precedence 2 model-number AP7131N
deny ap71xx precedence 3 ip 192.168.13.23 192.168.13.23
rfs4000-229D58(config-auto-provisioning-policy-test)#
```
9.1.4 **evaluate-always**

Sets flag to run this auto-provisioning policy every time an access point is adopted. The access point’s previous adoption status is not taken into consideration.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
evaluate-always
```

**Parameters**

None

**Examples**

```
rfs4000-229D58 (config-auto-provisioning-policy-test)#evaluate-always
rfs4000-229D58 (config-auto-provisioning-policy-test)#show context auto-provisioning-policy test
   evaluate-always
rfs4000-229D58 (config-auto-provisioning-policy-test)#
```

9.1.5 redirect

`auto-provisioning-policy`

Adds a rule redirecting device adoption to another controller within the system. Devices seeking adoption are redirected to a specified controller based on the redirection parameters specified.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
redirect [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000|vx9000|nx9600] precedence <1-10000>
controller [<CONTROLLER-IP>|<CONTROLLER-HOSTNAME>|<CONTROLLER-HOSTNAME> | <ip>|<ipv6>][cdp-match|dhcp-option|fqdn|ip|ipv6|level|lldp-match|mac|model-number|pool<1-2>|serial-number|vlan]
redirect [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000|vx9000|nx9600] precedence <1-10000>
controller [<CONTROLLER-IP>|<CONTROLLER-HOSTNAME>][cdp-match|dhcp-option|fqdn|ip|ipv6|level|lldp-match|mac|model-number|pool<1-2>|serial-number|vlan][upgrade]
```

**Parameters**

- **redirect [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|ap7522|ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|nx7500|nx7510|nx7520|nx7530|nx9000|vx9000|nx9600] precedence <1-10000> controller [<CONTROLLER-IP>|<CONTROLLER-HOSTNAME>][cdp-match|dhcp-option|fqdn|ip|ipv6|level|lldp-match|mac|model-number|pool<1-2>|serial-number|vlan][upgrade]

- **redirect** Adds a redirect adoption rule. The rule applies to the device type selected. Specify the device type and assign a precedence to the rule.

  - The different device types are: anyap, AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, VX9000, NX9600 series.

  - **Note:** 'anyap' is used in auto provisioning policies to create rules that are applicable to any AP regardless of the type.

  - **Note:** An adoptee controller, such as RFS4000, RFS6000, and RFS7000, can be redirected to another controller (configured to adopt controllers) with a capacity equal to or higher than its own. For more information, see `controller`.

- **precedence <1-10000>** Sets the rule precedence. Rules with lower values get precedence over rules with higher values.

9.1.6 upgrade

Add a device upgrade rule to this auto provisioning policy. When applied to a controller, the upgrade rule ensures adopted devices, of the specified type, are upgraded automatically.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
upgrade [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|
ap7522] [ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|
nx7500|nx7510|nx7520|nx7530|nx9000|vx9000|nx9600] precedence <1-10000>
[any|cdp-match|dhcp-option|fqdn|ip|ipv6|lldp-match|mac|model-number|serial-number|vlan]
```

```
upgrade [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|
ap7522] [ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|
nx7500|nx7510|nx7520|nx7530|nx9000|vx9000|nx9600] precedence <1-10000> any
```

**Parameters**

- **upgrade** [anyap|ap621|ap622|ap650|ap6511|ap6521|ap6522|ap6532|ap6562|ap71xx|ap7502|
ap7522] [ap7532|ap7562|ap81xx|ap82xx|rfs4000|rfs6000|rfs7000|nx45xx|nx5500|nx65xx|
nx7500|nx7510|nx7520|nx7530|nx9000|vx9000|nx9600] precedence <1-10000> any

- **precedence <1-10000>** Sets the rule precedence. Rules with lower values get precedence over rules with higher values.

- **any** Indicates any device. Any device, of the selected type, is upgraded. For example, if the device type selected is AP621, any AP621 device is upgraded.
**redirect**

Adds a device upgrade rule. The rule applies to the device type selected. Specify the device type and assign a precedence to the rule.

The different device types are: anyap, AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP7562, AP81XX, AP82XX, RFS4000, RFS6000, RFS7000, NX45XX, NX5500, NX65XX, NX75XX, NX9000, VX9000, and NX9600 series.

**Note:** ‘anyap’ is used in auto provisioning policies to create rules that are applicable to any AP regardless of the type.

**precedence <1-10000>**

Sets the rule precedence. Rules with lower values get precedence over rules with higher values.

**cdp-match <LOCATION-SUBSTRING>**

Configures the device location to match, based on CDP snoop strings

- `<LOCATION-SUBSTRING>` – Specify the location. Devices matching the specified string are upgraded.

**dhcp-option <DHCP-OPTION>**

Configures the DHCP options to match

DHCP options identify the vendor and DHCP client functionalities. This information is used by the client to convey to the DHCP server that the client requires extra information in a DHCP response.

- `<DHCP-OPTION>` – Specify the DHCP option value. Devices matching the specified value are upgraded.

**fqdn <FQDN>**

Configures the FQDN to match

FQDN is a domain name that specifies its exact location in the DNS hierarchy. It specifies all domain levels, including its top-level domain and the root domain.

- `<FQDN>` – Specify the FQDN. Devices matching the specified value are upgraded.

**ip [<START-IP> <END-IP> | <IP/MASK>]**

Configures a range of IP addresses and subnet address. Devices having IPv4 addresses within the specified range or are part of the specified subnet are upgraded.

- `<START-IP>` – Specify the first IPv4 address in the range.
- `<END-IP>` – Specify the last IPv4 address in the range.
- `<IP/MASK>` – Specify the IPv4 subnet and mask to match against the device’s IP address.

**ipv6 [<START-IP> <END-IP> | <IP/MASK>]**

Upgrades if a device’s IPv6 address matches the specified IP address or is within the specified IP address range

- `<START-IP>` – Specify the first IPv6 address in the range.
- `<END-IP>` – Specify the last IPv6 address in the range.
- `<IP/MASK>` – Specify the IPv6 subnet and mask to match against the device’s IP address.

**lldp-match <LLDP-STRING>**

Configures the device location to match, based on LLDP snoop strings

LLDP is a vendor neutral link layer protocol used to advertise a network device’s identity, capabilities, and neighbors on a local area network.

- `<LLDP-STRING>` – Specify the location. Devices matching the specified string are upgraded.
**Examples**

```
rfs4000-229D58(config-auto-provisioning-policy-test)#upgrade ap621 precedence 1 any
rfs4000-229D58(config-auto-provisioning-policy-test)#upgrade rfs4000 precedence 2 ip 192.168.13.1 192.168.13.5
rfs4000-229D58(config-auto-provisioning-policy-test)#show context auto-provisioning-policy test
upgrade ap621 precedence 1 any
    upgrade rfs4000 precedence 2 ip 192.168.13.1 192.168.13.5
rfs4000-229D58(config-auto-provisioning-policy-test)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes an upgrade rule</td>
</tr>
</tbody>
</table>

**mac**

```
<START-MAC>
{<END-MAC>}
```

Configures a single or a range of MAC addresses. Devices matching the specified values are upgraded.

- `<START-MAC>` – Specify the first MAC address in the range. Provide only this MAC address to filter a single device.
- `<END-MAC>` – Optional. Specify the last MAC address in the range.

**model-number**

```
<MODEL-NUMBER>
```

Configures the device model number

- `<MODEL-NUMBER>` – Specify the model number. Devices matching the specified model number are upgraded.

**serial-number**

```
<SERIAL-NUMBER>
```

Configures the device’s serial number

- `<SERIAL-NUMBER>` – Specify the serial number. Devices matching the specified serial number are upgraded.

**vlan**

```
<VLAN-ID>
```

Configures the VLAN ID

- `<VLAN-ID>` – Specify the VLAN ID. Devices assigned to the specified VLAN are upgraded.
9.1.7 no

auto-provisioning-policy

Removes a deny, permit, or redirect rule from the specified auto provisioning policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
no [adopt|default-adoption|deny|evaluate-always|redirect|upgrade]
no adopt precedence <1-10000>
no deny precedence <1-10000>
no evaluate-always
no default-adoption
no redirect precedence <1-10000>
no upgrade precedence <1-10000>
```

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Removes a deny, permit, or redirect rule from the specified auto provisioning policy |

Examples

The following example shows the auto-provisioning-policy 'test' settings before the 'no' commands are executed:

```plaintext
rfs4000-229D58(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
default-adoption
adopt ap81xx precedence 1 profile default-ap81xx vlan 1
deny ap71xx precedence 2 model-number AP7131N
redirect ap81xx precedence 5 controller 192.168.13.10 model-number AP-8132-66040-US
rfs4000-229D58(config-auto-provisioning-policy-test)#
```

```plaintext
rfs4000-229D58(config-auto-provisioning-policy-test)#no default-adoption
rfs4000-229D58(config-auto-provisioning-policy-test)#no deny precedence 2
rfs4000-229D58(config-auto-provisioning-policy-test)#no deny precedence 3
rfs4000-229D58(config-auto-provisioning-policy-test)#no deny precedence 5
```

The following example shows the auto-provisioning-policy 'test' settings after the 'no' commands are executed:

```plaintext
rfs4000-229D58(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
adopt ap81xx precedence 1 rf-domain TechPubs vlan 1
rfs4000-229D58(config-auto-provisioning-policy-test)#
```

```plaintext
rfs4000-229D58(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
upgrade ap621 precedence 1 any
upgrade rfs4000 precedence 2 ip 192.168.13.1 192.168.13.15
rfs4000-229D58(config-auto-provisioning-policy-test)#
```

```plaintext
rfs4000-229D58(config-auto-provisioning-policy-test)#no upgrade precedence 1
```

```plaintext
rfs4000-229D58(config-auto-provisioning-policy-test)#show context
auto-provisioning-policy test
upgrade rfs4000 precedence 2 ip 192.168.13.1 192.168.13.15
rfs4000-229D58(config-auto-provisioning-policy-test)#
```
This chapter summarizes the association ACL policy commands in the CLI command structure. An association ACL is a policy-based Access Control List (ACL) that either prevents or allows wireless clients from connecting to a controller managed WLAN.

System administrators can use an association ACL to grant or restrict wireless clients access to the WLAN by specifying client MAC addresses or range of MAC addresses to either include or exclude from controller connectivity. Association ACLs are applied to WLANs as an additional access control mechanism.

Use the (config) instance to configure the association ACL policy. To navigate to the association-acl-policy instance, use the following commands:

```
<DEVICE>(config)#association-acl-policy <POLICY-NAME>
```

```
rfs7000-37FABE(config)#association-acl-policy test
rfs7000-37FABE(config-assoc-acl-test)#
```

```
rfs7000-37FABE(config-assoc-acl-test)#?
Association ACL Mode commands:
  deny     Specify MAC addresses to be denied
  no       Negate a command or set its defaults
  permit   Specify MAC addresses to be permitted
  clrscr   Clears the display screen
  commit   Commit all changes made in this session
  do       Run commands from Exec mode
  end      End current mode and change to EXEC mode
  exit     End current mode and down to previous mode
  help     Description of the interactive help system
  revert   Revert changes
  service  Service Commands
  show     Show running system information
  write    Write running configuration to memory or terminal
```

```
rfs7000-37FABE(config-assoc-acl-test)#
```

**NOTE:** If creating an new association ACL policy, provide a name specific to its function. Avoid naming it after a WLAN it may support. The name cannot exceed 32 characters.
Before defining an association ACL policy and applying it to a WLAN, refer to the following deployment guidelines to ensure the configuration is optimally effective:

- The name and configuration of an association ACL policy should meet the requirements of the WLANs it may map to. However, be careful not to name ACLs after specific WLANs, as individual ACL policies can be used by more than one WLAN.

- You cannot apply more than one MAC based ACL to a layer 2 interface. If a MAC ACL is already configured on a layer 2 interface, and a new MAC ACL is applied to the interface, the new ACL replaces the previously configured one.

---

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
10.1 association-acl-policy

The following table summarizes association ACL policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>

<tr>
<td>no</td>
<td>Removes a deny or permit rule from this association ACL policy</td>
<td>page 10-6</td>
</tr>
<tr>
<td>permit</td>
<td>Specifies a range of MAC addresses allowed access to the WLAN</td>
<td>page 10-7</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
### 10.1.1 deny

`deny association-acl-policy`  
Creates a list of devices denied access to the managed network. Devices are identified by their MAC address. A single MAC address or a range of MAC addresses can be denied access. This command also sets the precedence on how deny rules are applied. Up to a thousand (1000) deny rules can be defined for every association ACL policy. Each rule has a unique sequential precedence value assigned, and are applied to packets on the basis of this precedence value. Lower the precedence of a rule, higher is its priority. This results in the rule with the lowest precedence being applied first. No two rules can have the same precedence. The default precedence is 1, so be careful to prioritize ACLs accordingly as they are added.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
deny <STARTING-MAC> [ <ENDING-MAC> ] [ precedence ]
deny <STARTING-MAC> precedence <1-1000>
deny <STARTING-MAC> <ENDING-MAC> precedence <1-1000>
```

**Parameters**

- `deny <STARTING-MAC> precedence <1-1000>`
  - `deny` Adds a single device or a set of devices to the deny list
- `deny <STARTING-MAC> <ENDING-MAC> precedence <1-1000>`
  - `deny` Adds a single device or a set of devices to the deny list
  - `<STARTING-MAC>` To add a single device, enter its MAC address in the `<STARTING-MAC>` parameter.
  - `precedence <1-1000>` Sets a precedence rule. Rules are applied in an increasing order of precedence.
  - `<1-1000>` – Specify a precedence value from 1 - 1000.
- `deny <STARTING-MAC> <ENDING-MAC> precedence <1-1000>`
  - `deny` Adds a single device or a set of devices to the deny list
  - `<STARTING-MAC>` To add a set of devices, provide the range of MAC addresses.
  - `<ENDING-MAC>` Specify the last MAC address in the range.
  - `precedence <1-1000>` Sets a precedence rule. Rules are applied in an increasing order of precedence.
  - `<1-1000>` – Specify a value from 1 - 1000.

**Usage Guidelines**

Every rule has a unique sequential precedence value. You cannot add two rules with the same precedence. Rules are applied in an increasing order of precedence. That means the rule with precedence 1 is applied first, then the rule with precedence 2 and so on.
Examples

```plaintext
rfs7000-37FABE(config-assoc-acl-test)#deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
```

```plaintext
rfs7000-37FABE(config-assoc-acl-test)#deny 11-22-33-44-56-01 11-22-33-44-56-01 precedence 160
```

```plaintext
rfs7000-37FABE(config-assoc-acl-test)#show context association-acl-policy test
deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
deny 11-22-33-44-56-01 11-22-33-44-56-01 precedence 160
```

rfs7000-37FABE(config-assoc-acl-test)#

10.1.2 no

association-acl-policy

Removes a deny or permit rule from this association ACL policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [deny|permit]

no deny <STARTING-MAC> precedence <1-1000>
no deny <STARTING-MAC> <ENDING-MAC> precedence <1-1000>

no permit <STARTING-MAC> precedence <1-1000>
no permit <STARTING-MAC> <ENDING-MAC> precedence <1-1000>

Parameters

- no <PARAMETERS>

Examples

The following example shows the association ACL policy ‘test’ settings before the ‘no’ commands is executed:

```
rfs7000-37FABE(config-assoc-acl-test)#show context association-acl-policy test
deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
deny 11-22-33-44-56-01 11-22-33-44-56-01 precedence 160
rfs7000-37FABE(config-assoc-acl-test)#
```

```
rfs7000-37FABE(config-assoc-acl-test)#no deny 11-22-33-44-56-01 11-22-33-44-56-FF
precedence 160
```

The following example shows the association ACL policy ‘test’ settings after the ‘no’ commands is executed:

```
rfs7000-37FABE(config-assoc-acl-test)#show context association-acl-policy test
deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
rfs7000-37FABE(config-assoc-acl-test)#
```
10.1.3 permit

`association-acl-policy`

Creates a list of devices allowed access to the managed network. Devices are permitted access based on their MAC address. A single MAC address or a range of MAC addresses can be specified. This command also sets the precedence on how permit list rules are applied. Up to a thousand (1000) permit rules can be defined for every association ACL policy. Each rule has a unique sequential precedence value assigned, and are applied to packets on the basis of this precedence value. Lower the precedence of a rule, higher is its priority. This results in the rule with the lowest precedence being applied first. No two rules can have the same precedence. The default precedence is 1, so be careful to prioritize ACLs accordingly as they are added.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`permit <STARTING-MAC> [<ENDING-MAC>|precedence]`

`permit <STARTING-MAC> precedence <1-1000>`

`permit <STARTING-MAC> <ENDING-MAC> precedence <1-1000>`

**Parameters**

- `permit <STARTING-MAC> precedence <1-1000>`
  - Adds a single device or a set of devices to the permit list
  - `<STARTING-MAC>` To add a single device, enter its MAC address in the `<STARTING-MAC>` parameter.
  - `<1-1000>` Specifies a rule precedence. Rules are applied in an increasing order of precedence.
    - `<1-1000>` — Specify a value from 1 - 1000.

- `permit <STARTING-MAC> <ENDING-MAC> precedence <1-1000>`
  - Adds a single device or a set of devices to the permit list
  - `<STARTING-MAC>` Specify the first MAC address of the range.
  - `<ENDING-MAC>` Specify the last MAC address of the range.
  - `<precedence <1-1000>` Specifies a rule precedence. Rules are applied in an increasing order of precedence.
    - `<1-1000>` — Specify a value from 1 - 1000.

**Usage Guidelines**

Every rule has a unique sequential precedence value. You cannot add two rules with the same precedence. Rules are applied to packets in an increasing order of precedence. That means the rule with precedence 1 is applied first, then the rule with precedence 2 and so on.
**Examples**

```
rfs7000-37FABE(config-assoc-acl-test)# permit 11-22-33-44-66-01 11-22-33-44-66-FF precedence 170
```

```
rfs7000-37FABE(config-assoc-acl-test)# permit 11-22-33-44-67-01 precedence 180
```

```
rfs7000-37FABE(config-assoc-acl-test)# show context association-acl-policy test
deny 11-22-33-44-55-01 11-22-33-44-55-FF precedence 150
permit 11-22-33-44-66-01 11-22-33-44-66-FF precedence 170
permit 11-22-33-44-67-01 11-22-33-44-67-01 precedence 180
```

```
rfs7000-37FABE(config-assoc-acl-test)#
```

</tr>
</tbody>
</table>
This chapter summarizes IPv4, IPv6, and MAC access list commands in the CLI command structure.

Access lists control access to the managed network using a set of rules also known as Access Control Entries (ACEs). Each rule specifies an action taken when a packet matches that rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed. A set of deny and/or permit rules based on IP (IPv4 and IPv6) addresses constitutes a IP Access Control List (ACL). Similarly, a set of deny and/or permit rules based on MAC addresses constitutes a MAC ACL.

Within a managed network, IP ACLs (IPv4 and IPv6) are used as firewalls to filter packets, and may also mark packets, based on the IP address from which they arrive, as opposed to filtering packets on layer 2 ports. IP based firewall rules are specific to the source and destination IP addresses and have unique precedence orders assigned. Both IP and non-IP traffic on the same layer 2 or port interface can be filtered by applying an IP ACL. With either IPv4 or IPv6, create access rules for traffic entering a controller, service platform, or access point interface, because if you are going to deny specific types of packets, it’s recommended you do it before the controller, service platform, or access point spends time processing them, since access rules are give priority over other types of firewall rules.

IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons.

MAC ACLs are firewalls that filter or mark packets based on the MAC address from which they arrive, as opposed to filtering packets on layer 2 ports. Optionally filter layer 2 traffic on a physical layer 2 interface using MAC addresses. A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to controller managed packet traffic.

Once defined, a IP and/or MAC ACL (consisting of a set of firewall rules) must be applied to an interface to be a functional filtering tool.

Firewall supported devices (access points, wireless controllers, and service platforms) process firewall rules (within an IP/MAC ACL) sequentially, in ascending order of their precedence value. When a packet (network traffic) matches a rule, the firewall applies the action specified in the rule to determine whether the traffic is allowed or denied. Once a match is made, the firewall does not process subsequent rules in the ACL.

The WiNG software enables the configuration of IP SNMP ACLs. These ACLs control access by combining IP ACLs with SNMP server community strings.

The following ACLs are supported:

- `ip-access-list`
- `mac-access-list`
- `ipv6-access-list`
- `ip-snmp-access-list`
Use IP and MAC commands under the global configuration to create an access list.

- When the access list is applied on an Ethernet port, it becomes a port ACL.
- When the access list is applied on a VLAN interface, it becomes a router ACL.

Use the (config) instance to configure a new ACL or modify an existing ACL. To navigate to the (config-access-list) instance, use the following commands:

<DEVICE>(config)#ip access-list <IP-ACCESS-LIST-NAME>
<DEVICE>(config)#mac access-list <MAC-ACCESS-LIST-NAME>
<DEVICE>(config)#ipv6 access-list <IPv6-ACCESS-LIST-NAME>
<DEVICE>(config)#ip snmp-access-list <SNMP-ACCESS-LIST-NAME>

---

**NOTE:** If creating a new ACL policy, provide a name that uniquely identifies its purpose. The name cannot exceed 32 characters.

### ip-access-list

rfs7000-37FABE(config)#ip access-list test
rfs7000-37FABE(config-ip-acl-test)#?

ACL Configuration commands:

- **deny**: Specify packets to reject
- **disable**: Disable rule if not needed
- **insert**: Insert this rule (instead of overwriting a existing rule)
- **no**: Negate a command or set its defaults
- **permit**: Specify packets to forward

- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from EXEC mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

rfs7000-37FABE(config-ip-acl-test)#

### mac-access-list

rfs7000-37FABE(config)#mac access-list test
rfs7000-37FABE(config-mac-acl-test)#?

MAC Extended ACL Configuration commands:

- **deny**: Specify packets to reject
- **disable**: Disable rule if not needed
- **ex3500**: EX3500 device
- **insert**: Insert this rule (instead of overwriting a existing rule)
- **no**: Negate a command or set its defaults
- **permit**: Specify packets to forward

- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from EXEC mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore `_` character. In other words, the name of a device cannot contain an underscore.
11.1 ip-access-list

ACCESS-LIST

The following table summarizes IP access list configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Creates a deny access rule or modifies an existing rule. A deny access rule rejects packets from specified address(es) and/or destined for specified address(es).</td>
<td>page 11-5</td>

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
11.1.1 deny

`ip-access-list`

Creates a deny rule that rejects packets from a specified source IP and/or to a specified destination IP. You can also use this command to modify an existing deny rule.

---

**NOTE:** Use a decimal value representation to implement a `permit/deny` designation for a packet. The command set for IP ACLs provides the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.

---

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

deny [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|tcp|udp]

deny dns-name [contains|exact|suffix] <WORD> (log,rule-precedence <1-5000>) 
{(rule-description <LINE>)}

{(rule-description <LINE>)}

{(rule-description <LINE>)}

deny proto [<PROTOCOL-NUMBER>|<PROTOCOL-NAME>|eigrp|gre|igmp|igp|ospf|vrrp] [<SOURCE-IP/MASK]|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>|<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-HOST-IP> (log,rule-precedence <1-5000>) 
{(rule-description <LINE>)}

{(rule-description <LINE>)}
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `<NETWORK-SERVICE-ALIAS-NAME>` | Applies this deny rule to packets based on service protocols and ports specified in the network-service alias.
  - `<NETWORK-SERVICE-ALIAS-NAME>` – Specify the network-service alias name (should be existing and configured).
  A network-service alias defines service protocols and ports to match. When used with an ACL, the network-service alias defines the service-specific components of the ACL deny rule.
  **Note:** For more information on configuring network-service alias, see `alias`.
| `<SOURCE-IP/MASK>` | Specifies the source IP address and mask (A.B.C.D/M) to match. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified network are dropped.
| `<NETWORK-GROUP-ALIAS-NAME>` | Applies a network-group alias to identify the source IP addresses. Packets, matching the service protocols and ports specified in the network-service alias, received from the addresses identified by the network-group alias are dropped.
  - `<NETWORK-GROUP-ALIAS-NAME>` – Specify the network-group alias name (should be existing and configured).
  A network-group alias defines a single or a range of addresses of devices, hosts, and networks. When used with an ACL, the network-group alias defines the network-specific component of the ACL rule (permit/deny).
| `any` | Specifies the source as any source IP address. Packets, matching the service protocols and ports specified in the network-service alias, received from any source are dropped.
| `from-vlan <VLAN-ID>` | Specifies a single VLAN or a range of VLANs as the match criteria. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified VLAN(s) are dropped.
  - `<VLAN-ID>` – Specify the VLAN ID. To configure a range of VLANs, enter the start and end VLAN IDs separated by a hyphen (for example, 12-20).
  **Note:** Use this option with WLANs and port ACLs.
|  `host <SOURCE-HOST-IP>` | Identifies a specific host (as the source to match) by its IP address. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified host are dropped.
  - `<SOURCE-HOST-IP>` – Specify the source host’s exact IP address in the A.B.C.D format.
|  `<DEST-IP/MASK>` | Specifies the destination IP address and mask (A.B.C.D/M) to match. Packets, matching the service protocols and ports specified in the network-service alias, addressed to the specified network are dropped.
|  `any` | Specifies the destination as any destination IP address. Packets, matching the service protocols and ports specified in the network-service alias, addressed to any destination are dropped.
|  `host <DEST-HOST-IP>` | Identifies a specific host (as the destination to match) by its IP address. Packets, matching the service protocols and ports specified in the network-service alias, addressed to the specified host are dropped.
  - `<DEST-HOST-IP>` – Specify the destination host’s exact IP address in the A.B.C.D format.
| <NETWORK-GROUP-ALIAS-NAME> | Applies a network-group alias to identify the destination IP addresses. Packets, matching the service protocols and ports specified in the network-service alias, destined for the addresses identified by the network-group alias are dropped.  
| | • <NETWORK-GROUP-ALIAS-NAME> – Specify the network-group alias name (should be existing and configured). |
| log | Logs all deny events matching this entry. If a source and/or destination IP address is matched (i.e. if any specified type of packet is received from a specified IP address and/or is destined for a specified IP address), an event is logged. |
| mark [8021p <0-7> | dscp <0-63>] | Specifies packets to mark  
| | • 8021p <0-7> – Marks packets by modifying 802.1.p VLAN user priority  
| | • dscp <0-63> – Marks packets by modifying DSCP TOS bits in the header |
| rule-precedence <1-5000> | The following keywords are recursive and common to all of the above parameters:  
| | • rule-precedence – Assigns a precedence for this deny rule  
| | • <1-5000> – Specify a value from 1 - 5000.  
| | **Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.  
| | • rule-description – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| rule-description <LINE> |  |

| dns-name | Applies this deny rule to packets based on dns-names specified in the network-service |
| contains | Matches any hostname which has this DNS label. (for example *.test.*) |
| exact | Matches an exact hostname as specified in the network-service |
| suffix | Matches any hostname as suffix (for example *.test) |

- **<WORD>** Identifies a specific host (as the source to match) by its domain name. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified host are dropped.  
| log | Logs all deny events matching this dns entry. If a dns-name is matched an event is logged.  
| rule-precedence <1-5000> | The following keywords are recursive and common to all of the above parameters:  
| | • rule-precedence – Assigns a precedence for this deny rule  
| | • <1-5000> – Specify a value from 1 - 5000.  
| | **Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.  
| | • rule-description – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| rule-description <LINE> |  |

- **deny icmp [<SOURCE-IP/MASK>|<NETWORK-GROUP-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>|<DEST-IP/MASK>|<NETWORK-GROUP-NAME>|any|host <DEST-HOST-IP>[(<ICMP-TYPE> <ICMP-CODE>,log,rule-precedence <1-5000>) {(rule-description <LINE>)}]  
<p>| icmp | Applies this deny rule to <em>Internet Control Message Protocol (ICMP)</em> packets only |</p>

|                          | **Note:** Use this option with WLANs and port ACLs.                                                                                                                                                                                                                                                                                             |
| host <SOURCE-HOST-IP>    | Identifies a specific host (as the source to match) by its IP address. ICMP packets received from the specified host are dropped.  
  - `<SOURCE-HOST-IP>` – Specify the source host’s exact IP address in the A.B.C.D format.                                                                                                                                                                                     |
| <DEST-IP/MASK>           | Specifies the destination IP address and mask (A.B.C.D/M) to match. ICMP packets addressed to specified destinations are dropped.                                                                                                                                                                                                              |
| <NETWORK-GROUP-ALIAS-NAME> | Applies a network-group alias to identify the destination IP addresses. ICMP packets destined for addresses identified by the network-group alias are dropped.  
  - `<NETWORK-GROUP-ALIAS-NAME>` – Specify the network-group alias name (should be existing and configured).                                                                                                                                                               |
| any                      | Specifies the destination as any IP address. ICMP packets addressed to any destination are dropped.                                                                                                                                                                                                                                           |
| host <DEST-HOST-IP>      | Identifies a specific host (as the destination to match) by its IP address. ICMP packets addressed to the specified host are dropped.  
  - `<DEST-HOST-IP>` – Specify the destination host’s exact IP address in the A.B.C.D format.                                                                                                                                                                                    |
| <ICMP-TYPE>              | Defines the ICMP packet type  
  For example, an ICMP type 0 indicates it is an ECHO REPLY, and type 8 indicates it is an ECHO.                                                                                                                                                                                                                                   |
| <ICMP-CODE>              | Defines the ICMP message type  
  For example, an ICMP code 3 indicates “Destination Unreachable”, code 1 indicates “Host Unreachable”, and code 3 indicates “Port Unreachable.”  
  **Note:** After specifying the source and destination IP address(es), the ICMP message type, and the ICMP code, specify the action taken in case of a match.                                                                                                      |
| log                      | Logs all deny events matching this entry. If a source and/or destination IP address is matched (i.e. a ICMP packet is received from a specified IP address and/or is destined for a specified IP address), an event is logged.                                                                                                       |
**deny** ip [**<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>|[<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-HOST-IP>] (log,rule-precedence <1-5000>) {{rule-description <LINE>}}

</tr>
</tbody>
</table>
| **<PROTOCOL-NUMBER>** | Filters protocols using their Internet Assigned Numbers Authority (IANA) protocol number  
- **<PROTOCOL-NUMBER>** – Specify the protocol number. |
| **<PROTOCOL-NAME>** | Filters protocols using their IANA protocol name  
- **<PROTOCOL-NAME>** – Specify the protocol name. |
| eigrp | Identifies the Enhanced Internet Gateway Routing Protocol (EIGRP) protocol (number 88)  
EIGRP enables routers to maintain copies of neighbors’ routing tables. Routers use this information to determine the fastest route to a destination. When a router fails to find a route in its stored route tables, it sends a query to neighbors who in turn query their neighbors till a route is found. EIGRP also enables routers to inform neighbors of changes in their routing tables. |
| igmp | Identifies the Internet Group Management Protocol (IGMP) protocol (number 2)  
IGMP establishes and maintains multicast group memberships to interested members. Multicasting allows a networked computer to send content to multiple computers who have registered to receive the content. IGMP snooping is for listening to IGMP traffic between an IGMP host and routers in the network to maintain a map of the links that require multicast streams. Multicast traffic is filtered out for those links which do not require them. |
| ospf | Identifies the OSPF protocol (number 89)  
OSPF is a link-state interior gateway protocol (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets. |
<table>
<thead>
<tr>
<th><strong>vrrp</strong></th>
<th>Identifies the <em>Virtual Router Redundancy Protocol</em> (VRRP) protocol (number 112) VRRP allows a pool of routers to be advertized as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address.</th>

**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.

**Rule-precedence**

- rule-precedence – Assigns a precedence for this deny rule
  - <1-5000> – Specify a value from 1 - 5000.

- rule-description – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length).

### Keywords

- **deny**
  - [tcp|udp] [tcp|udp]
  - [host <SOURCE-IP/MASK> | <NETWORK-GROUP-ALIAS-NAME> | any]
  - any from-vlan <VLAN-ID>
  - any eq <SOURCE-PORT>
  - host <DEST-IP/MASK> | range <START-PORT> <END-PORT>
  - <SOURCE-PORT> <DEST-PORT>
  - range <START-PORT> <END-PORT>
  - (log, rule-precedence <1-5000>)
  - {rule-description <LINE>}

- **tcp**
  - Applies this deny rule to TCP packets only

- **udp**
  - Applies this deny rule to UDP packets only

- **<SOURCE-IP/MASK>**
  - This keyword is common to the ‘tcp’ and ‘udp’ parameters.
  - Specifies the source IP address and mask (A.B.C.D/M) to match. TCP/UDP packets received from the specified sources are dropped.

- **<NETWORK-GROUP-ALIAS-NAME>**
  - This keyword is common to the ‘tcp’ and ‘udp’ parameters.
  - Applies a network-group alias to identify the source IP addresses. TCP/UDP packets received from the VLANs identified here are dropped.
  - <NETWORK-GROUP-ALIAS-NAME> – Specify the network-group alias name (should be existing and configured).
  - After specifying the source and destination IP address(es), specify the action taken in case of a match.

- **any**
  - This keyword is common to the ‘tcp’ and ‘udp’ parameters.
  - Specifies the source as any IP address. TCP/UDP packets received from any source are dropped.

- **from-vlan <VLAN-ID>**
  - This keyword is common to the ‘tcp’ and ‘udp’ parameters.
  - Specifies a single VLAN or a range of VLANs as the match criteria. TCP/UDP packets received from the VLANs identified here are dropped.
  - <VLAN-ID> – Specify the VLAN ID. To configure a range of VLANs, enter the start and end VLAN IDs separated by a hyphen (for example, 12-20).
  - **Note:** Use this option with WLANs and port ACLs.

- **host <SOURCE-HOST-IP>**
  - Identifies a specific host (as the source to match) by its IP address. TCP/UDP packets received from the specified host are dropped.
  - <SOURCE-HOST-IP> – Specify the source host’s exact IP address in the A.B.C.D format.

- **<DEST-IP/MASK>**
  - This keyword is common to the ‘tcp’ and ‘udp’ parameters.
  - Sets the destination IP address and mask (A.B.C.D/M) to match. TCP/UDP packets addressed to the specified destinations are dropped.

- **any**
  - This keyword is common to the ‘tcp’ and ‘udp’ parameters.
  - Specifies the destination as any destination IP address. TCP/UDP packets received from any destination are dropped.

</tr>
<tr>
<td></td>
<td>* <code>&lt;END-PORT&gt;</code> – Specify the last port in the range.</td>
</tr>
<tr>
<td><code>log</code></td>
<td>Logs all deny events matching this entry. If a source and/or destination IP address or port is matched (i.e. a TCP/UDP packet is received from a specified IP address and/or is destined for a specified IP address), an event is logged.</td>
</tr>
</tbody>
</table>
Use this command to deny traffic between networks.getHosts based on the protocol type selected in the access list configuration. The following protocols are supported:

- IP
- ICMP
- TCP
- UDP
- PROTO (any Internet protocol other than TCP, UDP, and ICMP)

The last access control entry (ACE) in the access list is an implicit deny statement. Whenever the interface receives the packet, its content is checked against the ACEs in the ACL. It is allowed or denied based on the ACL configuration.

- Filtering TCP/UDP allows you to specify port numbers as filtering criteria
- Select ICMP as the protocol to allow or deny ICMP packets. Selecting ICMP filters ICMP packets based on ICMP type and code.

**Examples**

```
rfs7000-37FABE(config-ip-acl-test)#deny proto vrrp any any log rule-precedence 600
rfs7000-37FABE(config-ip-acl-test)#deny proto ospf any any log rule-precedence 650
rfs7000-6DCD4B(config-ip-acl-acl)#deny dns-name contains rfs7000 log rule-precedence 1
rfs7000-6DCD4B(config-ip-acl-acl)#show context
ip access-list acl
   deny dns-name contains rfs7000 log rule-precedence 1
rfs7000-6DCD4B(config-ip-acl-acl)#
rfs7000-37FABE(config-ip-acl-test)#show context
ip access-list test
deny proto vrrp any any log rule-precedence 600
deny proto ospf any any log rule-precedence 650
rfs7000-37FABE(config-ip-acl-test)#
```

**NOTE:** The log option is functional only for router ACL's. The log option displays an informational logging message about the packet that matches the entry sent to the console.
Using aliases in IP access list.

The following examples show the usage of network-group aliases:

```
rfs4000-229D58(config)#ip access-list bar

Example 1:
rfs4000-229D58(config-ip-acl-bar)#permit ip $foo any rule-precedence 10

Example 2
rfs4000-229D58(config-ip-acl-bar)#permit tcp 192.168.100.0/24 $foobar eq ftp rule-precedence 20

Example 3
rfs4000-229D58(config-ip-acl-bar)#deny ip $guest $lab rule-precedence 30
```

- In example 1, network-group alias $foo is used as a source.
- In example 2, network-group alias $foobar is used as a destination.
- In example 3, network-group aliases $guest and $lab are used as source and destination respectively.

The following examples show the usage of network-service aliases:

```
Example 4
rfs4000-229D58(config-ip-acl-bar)# permit $kerberos 10.60.20.0/24 $kerberos-servers log rule-precedence 40

Example 5
rfs4000-229D58(config-ip-acl-bar)#permit $Tandem 10.60.20.0/24 $Tandem-servers log rule-precedence 50
```

In examples 4, and 5:

- The network-service aliases ($kerberos and $Tandem) define the destination protocol-port combinations.
- The source network is 10.60.20.0/24.
- The destination network-address combinations are defined by the network-group aliases ($kerberos-servers and $Tandem-servers).

11.1.2 disable

Disables an existing deny or permit rule without removing it from the ACL. A disabled rule is inactive and is not used to filter packets.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

disable [deny|insert|permit] [deny|insert|permit] [dns-name|ip|proto.tcp|udp]
disable [deny|insert|permit] [dns-name|contains|exact|suffix] [icmp|ip|proto <PROTOCOL-OPTIONS>|tcp|udp]
[<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>]
[<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-HOST-IP>]
(log,mark [8021p <0-7>|dscp <0-63>],rule-precedence)

Parameters

- disable [deny|insert|permit] [deny|insert|permit] [dns-name|contains|exact|suffix] [icmp|ip|proto <PROTOCOL-OPTIONS>|tcp|udp]
  [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>]
  [<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-HOST-IP>]
  (log,mark [8021p <0-7>|dscp <0-63>],rule-precedence)

- disable [deny|insert|permit] [deny|insert|permit] [dns-name|contains|exact|suffix] [icmp|ip|proto <PROTOCOL-OPTIONS>|tcp|udp]
  [<SOURCE-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|from-vlan <VLAN-ID>|host <SOURCE-HOST-IP>]
  [<DEST-IP/MASK>|<NETWORK-GROUP-ALIAS-NAME>|any|host <DEST-HOST-IP>]
  (log,mark [8021p <0-7>|dscp <0-63>],rule-precedence)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable [deny</td>
<td>insert</td>
</tr>
<tr>
<td>Note: To disable an existing deny/permit rule, provide the exact values used to configure the deny or permit rule.</td>
<td></td>
</tr>
<tr>
<td>&lt;NETWORK-SERVICE-ALIAS-NAME&gt;</td>
<td>Specifies the network-service alias, identified by the &lt;NETWORK-SERVICE-ALIAS-NAME&gt; keyword, associated with the deny/permit rule.</td>
</tr>
<tr>
<td>dns-name [contains</td>
<td>exact</td>
</tr>
<tr>
<td>icmp</td>
<td>Disables a rule applicable to ICMP packets only.</td>
</tr>
<tr>

<td>Disables a rule applicable to IP packets only.</td>
</tr>
<tr>
<td>proto &lt;PROTOCOL-OPTIONS&gt;</td>
<td>Disables a rule applicable to any Internet protocol other than TCP, UDP, or ICMP packets.</td>
</tr>
<tr>
<td>tcp</td>
<td>Disables a rule applicable to TCP packets only.</td>
</tr>
<tr>
<td>udp</td>
<td>Disables a rule applicable to UDP packets only.</td>
</tr>
</tbody>
</table>

Note: After specifying the packet type, specify the source and destination devices and network address(es) to match.
### Examples

The following example shows the ‘auto-tunnel-acl’ settings before the disable command is executed:

```plaintext
rfs7000-37FABE(config-ip-acl-auto-tunnel-acl)#show context
ip access-list auto-tunnel-acl
permit ip host 200.200.200.99 30.30.30.1/24 rule-precedence 2
rfs7000-37FABE(config-ip-acl-auto-tunnel-acl)#
```

```plaintext
rfs7000-37FABE(config-ip-acl-auto-tunnel-acl)#disable permit ip host 200.200.200.99 any rule-precedence 3
rfs7000-37FABE(config-ip-acl-auto-tunnel-acl)#
```

The following example shows the ‘auto-tunnel-acl’ settings after the disable command is executed:

```plaintext
rfs4000-229D58(config-ip-acl-test)#deny icmp any any log rule-precedence 1
rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
deny icmp any any rule-precedence 1
rfs4000-229D58(config-ip-acl-test)#
```

```plaintext
rfs4000-229D58(config-ip-acl-test)#disable deny icmp any any rule-precedence 1
```
In the following example a disable deny rule has been inserted in the IP ACL "test":

```
rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
deny tcp from-vlan 1 any any rule-precedence 1
permit icmp any host 192.168.13.7 1 1 rule-precedence 2
rfs4000-229D58(config-ip-acl-test)#
```

```
rfs4000-229D58(config-ip-acl-test)#disable insert deny ip any any log rule-precedence 2
```

```
rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
deny tcp from-vlan 1 any any rule-precedence 1
disable deny ip any any log rule-precedence 2
permit icmp any host 192.168.13.7 1 1 rule-precedence 3
rfs4000-229D58(config-ip-acl-test)#
```

</table>
**11.1.3 insert**

- **ip-access-list**

Enables the insertion of a rule in an IP ACL without overwriting or replacing an existing rule having the same precedence.

The insert option allows a new rule to be inserted within a IP access list. Consider an IP ACL consisting of rules having precedences 1, 2, 3, 4, 5, and 6. You want to insert a new rule with precedence 4, without overwriting the existing precedence 4 rule. Using the insert option inserts the new rule prior to the existing one. The existing precedence 4 rule’s precedence changes to 5, and the change cascades down the list of rules within the ACL. That means rule 5 becomes rule 6, and rule 6 becomes rule 7.

---

**NOTE:** NOT using `insert` when creating a new rule having the same precedence as an existing rule, overwrites the existing rule.

---

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
insert [deny|permit] <PARAMETERS> {log,mark [8021p <0-7>|dscp <0-63>,
   rule-precedence <1-5000>}{(rule-description <LINE>)}
```

**Parameters**

- **insert [deny|permit] <PARAMETERS> {log,mark [8021p <0-7>|dscp <0-63>,
   rule-precedence <1-5000>}{(rule-description <LINE>)}**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[deny</td>
<td>permit]</td>
</tr>
<tr>
<td>&lt;PARAMETERS&gt;</td>
<td>Provide the match criteria for this deny/permit rule. Packets will be filtered based on the criteria set here. For more information on the deny rule, see <a href="#">deny</a>. For more information on the permit rule, see <a href="#">permit</a>.</td>
</tr>
<tr>
<td>log</td>
<td>After specifying the match criteria, specify the action taken for filtered packets. Logs all deny/permit events matching this entry. If a source and/or destination IP address is matched an event is logged.</td>
</tr>
</tbody>
</table>
| mark [8021p <0-7>|dscp <0-63>] | Specifies packets to mark:
- 8021p <0-7> – Marks packets by modifying 802.1.p VLAN user priority
- dscp <0-63> – Marks packets by modifying DSCP TOS bits in the header |
| rule-precedence <1-5000> | Assigns a precedence for this deny/permit rule
- <1-5000> – Specify a value from 1 - 5000. |
| rule-description <LINE> | Optional. Configures a description for this new rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.
Examples

rfs4000-229D58(config-ip-acl-test)#deny tcp from-vlan 1 any any rule-precedence 1
rfs4000-229D58(config-ip-acl-test)#permit icmp any host 192.168.13.7 1 1 rule-precedence 2
rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
  deny tcp from-vlan 1 any any rule-precedence 1
  permit icmp any host 192.168.13.7 1 1 rule-precedence 2
rfs4000-229D58(config-ip-acl-test)#

In the following example a new rule is inserted between the rules having precedences 1 and 2. The precedence of the existing precedence '2' rule changes to precedence 3.

rfs4000-229D58(config-ip-acl-test)#insert deny ip any any rule-precedence 2
rfs4000-229D58(config-ip-acl-test)#show context
ip access-list test
  deny tcp from-vlan 1 any any rule-precedence 1
  deny ip any any rule-precedence 2
  permit icmp any host 192.168.13.7 1 1 rule-precedence 3
rfs4000-229D58(config-ip-acl-test)#

Related Commands

| alias | Creates and configures aliases (network, VLAN, and service) |
11.1.4 no

Removes a deny, permit, or disable rule

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [deny|disable|permit]

no [deny|permit] [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|tcp|udp]

no disable [deny|permit] [<NETWORK-SERVICE-ALIAS-NAME>|dns-name|icmp|ip|proto|tcp|udp]

Parameters

- no <PARAMETERS>

Removes a deny, permit, or disable rule

Usage Guidelines

Removes an access list control entry. Provide the rule-precedence value when using the no command.

Examples

The following example shows the ACL ‘test’ settings before the ‘no’ commands are executed:

rfs7000-37FABE(config-ip-acl-test)#show context
ip access-list test
deny proto vrrp any any log rule-precedence 600
deny proto ospf any any log rule-precedence 650
rfs7000-37FABE(config-ip-acl-test)#

rfs7000-37FABE(config-ip-acl-test)#no deny proto vrrp any any rule-precedence 600
rfs7000-37FABE(config-ip-acl-test)#no deny proto ospf any any rule-precedence 650

The following example shows the ACL ‘test’ settings after the ‘no’ commands are executed:

rfs7000-37FABE(config-ip-acl-test)#show context
ip access-list test
rfs7000-37FABE(config-ip-acl-test)#
11.1.5 permit

ip-access-list

Creates a permit rule that marks packets (from a specified source IP and/or to a specified destination IP) for forwarding. You can also use this command to modify an existing permit rule.

NOTE: Use a decimal value representation to implement a permit/deny designation for a packet. The command set for IP ACLs provides the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

permit [NETWORK-SERVICE-ALIAS-NAME]|dns-name|ip|proto|tcp|udp
rule-precedence 1-5000) {(rule-description LINE)}

permit dns-name [contains|exact|suffix] WORD (log,rule-precedence 1-5000)
{(rule-description LINE)}

permit icmp [SOURCE-IP/MASK]|NETWORK-GROUP-ALIAS-NAME] [any|from-vlan VLAN-ID]|host SOURCE-HOST-IP] [DEST-IP/MASK]|NETWORK-GROUP-ALIAS-NAME] [any] host DEST-HOST-IP] [ICMP-TYPE] [ICMP-CODE],log,rule-precedence 1-5000)
{(rule-description LINE)}

permit proto [PROTOCOL-NUMBER]|PROTOCOL-NAME]|eigrp|gre|igmp|igp|ospf|vrrp
SOURCE-IP/MASK]|NETWORK-GROUP-ALIAS-NAME] [any|from-vlan VLAN-ID]|host SOURCE-HOST-IP] [DEST-IP/MASK]|NETWORK-GROUP-ALIAS-NAME] [any] host DEST-HOST-IP] (log,rule-precedence 1-5000) {(rule-description LINE)}

permit [tcp|udp] [SOURCE-IP/MASK]|NETWORK-GROUP-ALIAS-NAME] [any|from-vlan VLAN-ID]|host SOURCE-HOST-IP] [DEST-IP/MASK]|NETWORK-GROUP-ALIAS-NAME] [any] eq SOURCE-PORT] [host DEST-HOST-IP] [START-PORT] [END-PORT] |range [START-PORT] [END-PORT] [SOURCE-PORT] [DEST-PORT] [protocol [bgp|dns|ftp|ftp-data|gopher|https|ldap|ntp|nntp|pop3|smtp|sip|ssh|telnet|tftp|www]|range [START-PORT] [END-PORT] |(log,rule-precedence 1-5000) {(rule-description LINE)}
### Parameters

#### `<NETWORK-SERVICE-ALIAS-NAME>`
Applies this permit rule to packets based on service protocols and ports specified in the network-service alias
- `<NETWORK-SERVICE-ALIAS-NAME>` – Specify the network-service alias name (should be existing and configured).

A network-service alias defines service protocols and ports to match. When used with an ACL, the network-service alias defines the service-specific components of the ACL permit rule.

**Note:** For more information on configuring network-service alias, see [alias].

#### `<SOURCE-IP/MASK>`
Specifies the source IP address and mask (A.B.C.D/M) to match. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified network are permitted.

#### `<NETWORK-GROUP-ALIAS-NAME>`
Applies a network-group alias to identify the source IP addresses. Packets, matching the service protocols and ports specified in the network-service alias, received from the addresses identified by the network-group alias are permitted.
- `<NETWORK-GROUP-ALIAS-NAME>` – Specify the network-group alias name (should be existing and configured).

A network-group alias defines a single or a range of addresses of devices, hosts, and networks. When used with an ACL, the network-group alias defines the network-specific component of the ACL rule (permit/deny).

#### any
Specifies the source as any source IP address. Packets, matching the service protocols and ports specified in the network-service alias, received from any source are permitted.

#### from-vlan `<VLAN-ID>`
Specifies a single VLAN or a range of VLANs as the match criteria. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified VLAN(s) are permitted.
- `<VLAN-ID>` – Specify the VLAN ID. To configure a range of VLANs, enter the start and end VLAN IDs separated by a hyphen (for example, 12-20).

**Note:** Use this option with WLANs and port ACLs.

#### host `<SOURCE-HOST-IP>`
Identifies a specific host (as the source to match) by its IP address. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified host are permitted.
- `<SOURCE-HOST-IP>` – Specify the source host's exact IP address in the A.B.C.D format.

#### `<DEST-IP/MASK>`
Specifies the destination IP address and mask (A.B.C.D/M) to match. Packets, matching the service protocols and ports specified in the network-service alias, addressed to the specified network are permitted.

#### any
Specifies the destination as any destination IP address. Packets, matching the service protocols and ports specified in the network-service alias, addressed to any destination are permitted.

#### host `<DEST-HOST-IP>`
Identifies a specific host (as the destination to match) by its IP address. Packets, matching the service protocols and ports specified in the network-service alias, addressed to the specified host are permitted.
- `<DEST-HOST-IP>` – Specify the destination host's exact IP address in the A.B.C.D format.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `<NETWORK-GROUP-ALIAS-NAME>` | Applies a network-group alias to identify the destination IP addresses. Packets, matching the service protocols and ports specified in the network-service alias, destined for the addresses identified by the network-group alias are permitted.  
  - `<NETWORK-GROUP-ALIAS-NAME>` – Specify the network-group alias name (should be existing and configured). |
| `log` | Logs all permit events matching this entry. If a source and/or destination IP address is matched (i.e. if any specified type of packet is received from a specified IP address and/or is destined for a specified IP address), an event is logged. |
| `mark [8021p <0-7> | dscp <0-63>]` | Specifies packets to mark  
  - `8021p <0-7>` – Marks packets by modifying 802.1.p VLAN user priority  
  - `dscp <0-63>` – Marks packets by modifying DSCP TOS bits in the header |
| `rule-precedence <1-5000>` | The following keywords are recursive and common to all of the above parameters:  
  - `rule-precedence` – Assigns a precedence for this permit rule  
  - `<1-5000>` – Specify a value from 1 - 5000.  
  **Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.  
  - `rule-description` – Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| `dns-name` | Applies this permit rule to packets based on dns-names specified in the network-service |
| `contains` | Matches any hostname which has this DNS label. (for example *.test.*) |
| `exact` | Matches an exact hostname as specified in the network-service |
| `suffix` | Matches any hostname as suffix (for example *.test) |
| `<WORD>` | Identifies a specific host (as the source to match) by its domain name. Packets, matching the service protocols and ports specified in the network-service alias, received from the specified host are forwarded. |
| `log` | Logs all permit events matching this dns entry. If a dns-name is matched an event is logged. |
| `mark [8021p <0-7> | dscp <0-63>]` | Specifies packets to mark  
  - `8021p <0-7>` – Marks packets by modifying 802.1.p VLAN user priority  
  - `dscp <0-63>` – Marks packets by modifying DSCP TOS bits in the header |
| `rule-precedence <1-5000>` | The following keywords are recursive and common to all of the above parameters:  
  - `rule-precedence` – Assigns a precedence for this deny rule  
  - `<1-5000>` – Specify a value from 1 - 5000.  
  **Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.  
  - `rule-description` – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
<table>

</table>

**Note:** Use this option with WLANs and port ACLs.
The following keywords are recursive and common to all of the above parameters:

- **rule-precedence** — Assigns a precedence for this permit rule
- **<1-5000>** — Specify a value from 1 - 5000.

**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.

- **rule-description** — Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length).

<table>
<thead>
<tr>
<th><strong>Keyword</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>proto</strong></td>
<td>Configures the ACL for additional protocols Additional protocols (other than IP, ICMP, TCP, and UDP) must be configured using this parameter</td>
</tr>
<tr>
<td>&lt;PROTOCOL-NUMBER&gt;</td>
<td>Filters protocols using their IANA protocol number - <strong>&lt;PROTOCOL-NUMBER&gt;</strong> — Specify the protocol number.</td>
</tr>
<tr>
<td>&lt;PROTOCOL-NAME&gt;</td>
<td>Filters protocols using their IANA protocol name - <strong>&lt;PROTOCOL-NAME&gt;</strong> — Specify the protocol name.</td>
</tr>
<tr>
<td>eigrp</td>
<td>Identifies the EIGRP protocol (number 88) EIGRP enables routers to maintain copies of neighbors’ routing tables. Routers use this information to determine the fastest route to a destination. When a router fails to find a route in its stored route tables, it sends a query to neighbors who in turn query their neighbors till a route is found. EIGRP also enables routers to inform neighbors of changes in their routing tables.</td>
</tr>
<tr>
<td>igmp</td>
<td>Identifies the IGMP protocol (number 2) IGMP establishes and maintains multicast group memberships to interested members. Multicasting allows a networked computer to send content to multiple computers who have registered to receive the content. IGMP snooping is for listening to IGMP traffic between an IGMP host and routers in the network to maintain a map of the links that require multicast streams. Multicast traffic is filtered out for those links which do not require them.</td>
</tr>
<tr>
<td>ospf</td>
<td>Identifies the OSPF protocol (number 89) OSPF is a link-state interior gateway protocol (IGP). OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets.</td>
</tr>
</tbody>
</table>
**vrpp**

Identifies the VRRP protocol (number 112)

VRRP allows a pool of routers to be advertised as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address.

• `<START-PORT>` – Specify the first port in the range.  
• `<END-PORT>` – Specify the last port in the range. |
Usage Guidelines

Use this command to permit traffic between networks/hosts based on the protocol type selected in the access list. The following protocols are supported:

- IP
- ICMP
- ICP
- UDP
- PROTO (any Internet protocol other than TCP, UDP, and ICMP)

The last ACE in the access list is an implicit deny statement.

Whenever the interface receives the packet, its content is checked against all the ACEs in the ACL. The packet is allowed or denied based on the ACL configuration.

- Filtering on TCP or UDP allows you to specify port numbers as filtering criteria.
- Select ICMP to allow/deny packets. Selecting ICMP filters ICMP packets based on ICMP type and code.

```
NOTE: The log option is functional only for router ACL's. The log option displays an informational logging message about the packet matching the entry sent to the console.
```

Examples

```
rfs7000-37FABE(config-ip-acl-test)#show context
ip access-list test
rfs7000-37FABE(config-ip-acl-test)#

rfs7000-37FABE(config-ip-acl-test)#permit ip 172.16.10.0/24 any log rule-precedence 750
rfs7000-37FABE(config-ip-acl-test)#permit tcp 172.16.10.0/24 any log rule-precedence 800
rfs7000-37FABE(config-ip-acl-test)#show context
ip access-list test
 permit ip 172.16.10.0/24 any log rule-precedence 750
 permit tcp 172.16.10.0/24 any log rule-precedence 800
rfs7000-37FABE(config-ip-acl-test)#
```

Related Commands

```
no
 Removes a specified IP permit access rule

alias
 Creates and configures aliases (network, VLAN, and service)

</tbody>
</table>
11.2.1 deny

mac-access-list

Creates a deny rule that marks packets (from a specified source MAC and/or to a specified destination MAC) for rejection. You can also use this command to modify an existing deny rule.

NOTE: Use a decimal value representation to implement a permit/deny designation for a packet. The command set for MAC ACLs provide the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7552, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

deny [SOURCE-MAC] <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC> <DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC> (dot1p 0-7),type [8021q|1-65535|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp], vlan 1-4095,log,rule-precedence 1-5000) {(rule-description <LINE>)}

Parameters
- deny [SOURCE-MAC] <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC> <DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC> (dot1p 0-7),type [8021q|1-65535|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp], vlan 1-4095,log,rule-precedence 1-5000) {(rule-description <LINE>)}

| <SOURCE-MAC> <SOURCE-MAC-MASK> | Configures the source MAC address and mask to match
| <SOURCE-MAC> – Specify the source MAC address to match.
| <SOURCE-MAC-MASK> – Specify the source MAC address mask. Packets received from the specified MAC addresses are dropped.

| any | Identifies all devices as the source to deny access. Packets received from any source are dropped.

| host <SOURCE-HOST-MAC> | Identifies a specific host as the source to deny access
| <SOURCE-HOST-MAC> – Specify the source host’s exact MAC address to match. Packets received from the specified host are dropped.

| <DEST-MAC> <DEST-MAC-MASK> | Configures the destination MAC address and mask to match
| <DEST-MAC> – Specify the destination MAC address to match.
| <DEST-MAC-MASK> – Specify the destination MAC address mask to match. Packets addressed to the specified MAC addresses are dropped.

| any | Identifies all devices as the destination to deny access. Packets addressed to any destination are dropped.

| host <DEST-HOST-MAC> | Identifies a specific host as the destination to deny access
| <DEST-HOST-MAC> – Specify the destination host’s exact MAC address to match. Packets addressed to the specified host are dropped.
### Usage Guidelines

The deny command disallows traffic based on layer 2 (data-link layer) data. The MAC access list denies traffic from a particular source MAC address or any MAC address. It can also disallow traffic from a list of MAC addresses based on the source mask. The MAC access list can disallow traffic based on the VLAN and EtherType.

The **deny** command disallows traffic based on layer 2 (data-link layer) data. The MAC access list denies traffic from a particular source MAC address or any MAC address. It can also disallow traffic from a list of MAC addresses based on the source mask. The MAC access list can disallow traffic based on the VLAN and EtherType.

**NOTE:** MAC ACLs always take precedence over IP based ACLs.

<td><code>rule-precedence &lt;1-5000&gt;</code></td>
<td>The following keywords are recursive and common to all of the above parameters:</td>
</tr>
<tr>
<td><code>rule-description &lt;LINE&gt;</code></td>
<td>- rule-precedence – Assigns a precedence for this deny rule</td>
</tr>
<tr>
<td><code>&lt;1-5000&gt;</code></td>
<td>- Specify a value from 1 - 5000.</td>
</tr>
</tbody>
</table>

**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rule-description</code></td>
<td>Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length).</td>
</tr>
</tbody>
</table>

**NOTE:** MAC ACLs always take precedence over IP based ACLs.
The last ACE in the access list is an implicit deny statement. Whenever the interface receives the packet, its content is checked against all the ACEs in the ACL. It is allowed or denied based on the ACL's configuration.

**Examples**

```
rfs4000-229D58(config-mac-acl-test)#deny 41-85-45-89-66-77 ff-ff-ff-00-00-00 any vlan 1 rule-precedence 1
rfs4000-229D58(config-mac-acl-test)#deny host 00-01-ae-00-22-11 any rule-precedence 2
rfs4000-229D58(config-mac-acl-test)#show context
mac access-list test
  deny 41-85-45-89-66-77 FF-FF-FF-00-00-00 any vlan 1 rule-precedence 1
  deny host 00-01-AE-00-22-11 any rule-precedence 2
rfs4000-229D58(config-mac-acl-test)#
```

The MAC ACL (in the example below) denies traffic from any source MAC address to a particular host MAC address:

```
rfs7000-37FABE(config-mac-acl-test)#deny any host 00:01:ae:00:22:11
```

The following example denies traffic between two hosts based on MAC addresses:

```
rfs7000-37FABE(config-mac-acl-test)#deny host 01:02:fe:45:76:89 host 01:02:89:78:78:45
```

</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes a specified MAC deny access rule</td>
</tr>
</tbody>
</table>
11.2.2 disable

Disables a MAC deny or permit rule without removing it from the ACL. A disabled rule is inactive and is not used to filter packets.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

disable [deny|insert|permit]

disable [deny|permit] [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] {dot1p <0-7>, mark [8021p <0-7>|dscp <0-63>|ipx|mint|rarp|wisp],vlan <1-4095>} log (rule-precedence <1-5000>) {<rule-description <LINE>}

disable insert [deny|permit]

**Parameters**

- disable [deny|permit] [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] {dot1p <0-7>, mark [8021p <0-7>|dscp <0-63>|ipx|mint|rarp|wisp],vlan <1-4095>} log (rule-precedence <1-5000}) {<rule-description <LINE>}

| disable [deny|insert|permit] | Disables a deny, insert or permit access rule without removing it from the MAC ACL |
|-----------------------------|-------------------------------------------------------------------------------------------------|
| <SOURCE-MAC> <SOURCE-MAC-MASK> | Specifies the source MAC address and mask to match |
| host <SOURCE-HOST-MAC> | Specify the source host's exact MAC address |

| <DEST-MAC> <DEST-MAC-MASK> | Specifies the destination MAC address and mask to match |
| host <DEST-HOST-MAC> | Specify the destination host's exact MAC address |

| any | Select 'any' if the rule is applicable to any source MAC address |
| any | Select 'any' if the rule is applicable to any destination MAC address |

| log | The following keyword defines the action taken when a packet matches any or all of the above specified criteria |
| log | log – Logs a record when a packet matches the specified criteria |
Examples
The following example shows the MAC access list ‘test’ settings before the ‘disable’ command is executed:

```
rfs4000-229D58(config-mac-acl-test)#show context
mac access-list test
deny 41-85-45-89-66-77 FF-FF-FF-00-00-00 any vlan 1 rule-precedence 1
deny host 00-01-AE-00-22-11 any rule-precedence 2
```

rfs4000-229D58(config-mac-acl-test)#disable deny host 00-01-AE-00-22-11 any rule-precedence 2

The following example shows the MAC access list ‘test’ settings after the ‘disable’ command is executed:

```
rfs4000-229D58(config-mac-acl-test)#disable deny host 00-01-AE-00-22-11 any rule-precedence 2
```

### 11.2.3 ex3500

#### mac-access-list

Creates a MAC ACL deny and/or permit rule, applicable only to the EX3500 switch.

Each deny or permit rule consists of a set of match criteria and an associated action, which is deny access for the deny rule and allow access for the permit rule. When applied to layer 2 traffic (between an EX3500 switch and the WiNG managed service platform or a WiNG VM interface) every packet is matched against the configured match criteria and in case of a match the packet is dropped or forwarded depending on the rule type.

EX3500 devices (EX3524 and EX3548) are layer 2 Gigabit Ethernet switches with either 24 or 48 10/100/1000-BASE-T ports, and four SFP transceiver slots for fiber connectivity. Each 10/100/1000 Mbps port supports both the IEEE 802.3af and IEEE 802.3at-2009 PoE standards. An EX3500 switch has an SNMP-based management agent that provides both in-band and out-of-band management access. The EX3500 switch utilizes an embedded HTTP Web agent and command line interface (CLI), which in spite of being different from that of the WiNG operating system provides WiNG controllers PoE and port management resources.

---

**NOTE:** To implement the EX3500 MAC ACL rule, apply the MAC ACL directly to a EX3500 device, or to an EX35XX profile. For more information see, [access-group](#).

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```plaintext
ex3500 [deny|permit] [all|tagged-eth2|untagged-eth2]

ex3500 [deny|permit] [all|tagged-eth2|untagged-eth2] [any|host <SOURCE-MAC>]
    network <SOURCE-MAC> <SOURCE-MAC-MASK>] [any|host <DEST-MAC>]
    network <DEST-MAC> <DEST-MAC-MASK>]
    [ethertype <0-65535|ethertype-mask <0-65535>]
    [ex3500-time-range <TIME-RANGE-NAME>]
    [rule-precedence <1-128>]
    [vlan <1-4094>]
    [vlan-mask <1-4095>]
```

#### Parameters

- **[deny|permit]**
  - Creates a deny or permit MAC ACL rule and configures the rule parameters.
  - Every EX3500 MAC ACL rule provides a set of match criteria against which incoming and outgoing packets (to and from an EX3500 device) are matched. In case of a match, the packet is dropped or forwarded depending on the rule type. The packet is dropped in case of a **deny** rule, and forwarded for an **permit** rule.

- **[all|tagged-eth2|untagged-eth2]**
  - Specifies the packet type
    - **all** – Applies this deny/permit rule to all packets
    - **tagged-eth2** – Applies this deny/permit rule only to tagged Ethernet-2 packets
    - **untagged-eth2** – Applies this deny/permit rule only to untagged Ethernet-2 packets
  - After specifying the packet type, configure the source and/or EX3500 MAC addresses to match.

nx9500-6C8809(config-mac-acl-ex3500MacACL)#show context mac access-list ex3500MacACL

  ex3500 deny tagged-eth2 any any vlan 20 rule-precedence 1

nx9500-6C8809(config-mac-acl-ex3500MacACL)#
**11.2.4 insert**

Enables the insertion of a rule in an MAC ACL without overwriting or replacing an existing rule having the same precedence.

The insert option allows a new rule to be inserted within a MAC ACL. Consider an MAC ACL consisting of rules having precedences 1, 2, 3, 4, 5, and 6. You want to insert a new rule with precedence 4, without overwriting the existing precedence 4 rule. Using the insert option inserts the new rule prior to the existing one. The existing precedence 4 rule’s precedence changes to 5, and the change cascades down the list of rules within the ACL. That means rule 5 becomes rule 6, and rule 6 becomes rule 7.

**NOTE:** NOT using insert when creating a new rule having the same precedence as an existing rule, overwrites the existing rule.

**Syntax**

```
insert [deny|permit] <PARAMETERS> { (rule-description <LINE>) }
```

**Parameters**

- **insert [deny|permit]**: Inserts a deny or permit rule within an MAC ACL.

  `<PARAMETERS>` Provide the match criteria for this deny/permit rule. Packets will be filtered based on the criteria set here.

  For more information on the deny rule, see `deny`.

  For more information on the permit rule, see `permit`.

- **dot1p <0-7>**: Configures the 802.1p priority value. Sets the service classes for traffic handling.

  - `<0-7>` – Specify 802.1p priority from 0 - 7.

- **mark [8021p <0-7>|dscp <0-63>]**:

  Marks/modifies packets that match the criteria specified here.

  - `8021p <0-7>` – Modifies 802.1p VLAN user priority from 0 - 7
  - `dscp <0-63>` – Modifies DSCP TOS bits in the IP header from 0 - 63

  **Note:** This option is applicable only to the insert > permit MAC ACL rule.

---

**Supported in the following platforms:**

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

</tbody>
</table>

#### vlan <1-4095>

- **Configures the VLAN where the traffic is received**
- **<1-4095>** – Specify the VLAN ID from 1 - 4095.

#### log

- **Logs all deny/permit events matching this entry.** If a source and/or destination MAC address is matched (i.e. a packet is received from a specified MAC address or is destined for a specified MAC address), an event is logged.

#### rule-precedence <1-5000>

- **The following keywords are recursive and common to all of the above parameters:**
  - **rule-precedence** – Assigns a precedence for this deny rule
  - **<1-5000>** – Specify a value from 1 - 5000.

#### rule-description <LINE>

- **Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.
- **rule-description** – Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length).

### Examples

```
> rfs4000-229D58(config-mac-acl-test1)#deny 11-22-33-44-55-66 11-22-33-44-55-77 any rule-precedence 1
> rfs4000-229D58(config-mac-acl-test1)#deny host B4-C7-99-6D-CD-9B any rule-precedence 2
> rfs4000-229D58(config-mac-acl-test1)#show context
> mac access-list test1
deny 11-22-33-44-55-66 11-22-33-44-55-77 any rule-precedence 1
deny host B4-C7-99-6D-CD-9B any rule-precedence 2
> rfs4000-229D58(config-mac-acl-test1)#
```

In the following example a new rule is inserted between the rules having precedences 1 and 2. The precedence of the existing precedence '2' rule changes to precedence 3.

```
> rfs4000-229D58(config-mac-acl-test1)#insert permit host B4-C7-99-6D-B5-D6 host B4-C7-99-6D-CD-9B rule-precedence 2
> rfs4000-229D58(config-mac-acl-test1)#show context
> mac access-list test1
deny 11-22-33-44-55-66 11-22-33-44-55-77 any rule-precedence 1

11.2.5 no

`mac-access-list`

Negates a command or sets its default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no [deny|disable|permit] [source-mac <SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [dest-mac <DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>, mark [8021p <0-7>|dscp <0-63>], type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp], vlan <1-4095>) log (rule-precedence <1-5000>) {(rule-description <LINE>)}
```

```
no disable [deny|permit] <RULE-PARAMETERS>
```

**Parameters**

- no <PARAMETERS>

| no <PARAMETERS> | Removes a deny or permit rule from the MAC ACL |

**Examples**

```
rfs7000-37FABE(config-mac-acl-test)#show context
mac access-list test
   permit host 11-22-33-44-55-66 any log mark 8021p 3 rule-precedence 600
   permit host 22-33-44-55-66-77 host 11-22-33-44-55-66 type ip log rule-precedence 610
   deny any host 33-44-55-66-77-88 log rule-precedence 700
rfs7000-37FABE(config-mac-acl-test)#no deny any host 33-44-55-66-77-88 log rule-precedence 700
rfs7000-37FABE(config-mac-acl-test)#show context
mac access-list test
   permit host 11-22-33-44-55-66 any log mark 8021p 3 rule-precedence 600
   permit host 22-33-44-55-66-77 host 11-22-33-44-55-66 type ip log rule-precedence 610
```

11.2.6 permit

mac-access-list

Creates a permit rule that marks packets (from a specified source MAC and/or to a specified destination MAC) for forwarding. You can also use this command to modify an existing permit rule.

**NOTE:** Use a decimal value representation to implement a permit/deny designation for a packet. The command set for MAC ACLs provide the hexadecimal values for each listed EtherType. Use the decimal equivalent of the EtherType listed for any other EtherType.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
permit [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>,mark [8021p <0-7>,dscp <0-63],type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan <1-4095>) log (rule-precedence <1-5000>) {<rule-description <LINE>}}
```

**Parameters**

- **permit [<SOURCE-MAC> <SOURCE-MAC-MASK>|any|host <SOURCE-HOST-MAC>] [<DEST-MAC> <DEST-MAC-MASK>|any|host <DEST-HOST-MAC>] (dot1p <0-7>,mark [8021p <0-7>,dscp <0-63],type [8021q|<1-65535>|aarp|appletalk|arp|ip|ipv6|ipx|mint|rarp|wisp],vlan <1-4095>) log (rule-precedence <1-5000>) {<rule-description <LINE>}}**

| <SOURCE-MAC> <SOURCE-MAC-MASK> | Configures the source MAC address and mask to match  
|----------------|---|
| • <SOURCE-MAC> – Specify the source MAC address to match.  
| • <SOURCE-MAC-MASK> – Specify the source MAC address mask.  
| Packets addressed to the specified MAC addresses are forwarded. |

| any | Identifies all devices as the source to permit access. Packets addressed from any source are forwarded. |

| host <SOURCE-HOST-MAC> | Identifies a specific host as the source to permit access  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;SOURCE-HOST-MAC&gt; – Specify the source host’s exact MAC address to match. Packets addressed to the specified host are forwarded.</td>
<td></td>
</tr>
</tbody>
</table>

| <DEST-MAC> <DEST-MAC-MASK> | Configures the destination MAC address and mask to match  
|----------------|---|
| • <DEST-MAC> – Specify the destination MAC address to match.  
| • <DEST-MAC-MASK> – Specify the destination MAC address mask to match.  
| Packets addressed to the specified MAC addresses are forwarded. |

| DEST-MAC-MASK | Specifies the destination MAC address mask to match |

| any | Identifies all devices as the destination to permit access. Packets addressed to any destination are forwarded. |
| host | <DEST-HOST-MAC> | Identifies a specific host as the destination to permit access  
• <DEST-HOST-MAC> – Specify the destination host’s exact MAC address to match. Packets addressed to the specified host are forwarded. |
|-------|----------------|--------------------------------------------------------------------------------------------------|
| dotp1p | <0-7> | Configures the 802.1p priority value. Sets the service classes for traffic handling  
• <0-7> – Specify 802.1p priority from 0 - 7. |
| mark | [8021p <0-7>,  
dscp <0-63>] | Marks/modifies packets that match the criteria specified here  
• 8021p <0-7> – Modifies 802.1p VLAN user priority from 0 - 7  
• dscp <0-63> – Modifies DSCP TOS bits in the IP header from 0 - 63  
**Note:** This option is applicable only to the MAC ACL permit rule. |
| type | [8021q|<1-65535>|  
aarp|appletalk|  
arp|ip|ipv6|ipx|mint|  
rarp|wisp] | Configures the EtherType value  
An EtherType is a two-octet field in an Ethernet frame that indicates the protocol encapsulated in the payload of the frame. The EtherType values are:  
• 8021q – Indicates a 802.1q payload (0x8100)  
• <1-65535> – Indicates the EtherType protocol number  
• aarp – Indicates the Appletalk Address Resolution Protocol (ARP) payload (0x80F3)  
• appletalk – Indicates the Appletalk Protocol payload (0x809B)  
• arp – Indicates the ARP payload (0x0806)  
• ip – Indicates the Internet Protocol, Version 4 (IPv4) payload (0x0800)  
• ipv6 – Indicates the Internet Protocol, Version 6 (IPv6) payload (0x86DD)  
• ipx – Indicates the Novell’s IPX payload (0x8137)  
• mint – Indicates the MiNT protocol payload (0x8783)  
• rarp – Indicates the reverse Address Resolution Protocol (ARP) payload (0x8035)  
• wisp – Indicates the Wireless Internet Service Provider (WISP) payload (0x8783) |
| vlan | <1-4095> | Configures the VLAN ID  
• <1-4095> – Specify the VLAN ID from 1 - 4095. |
| log | | Logs all permit events matching this entry. If a source and/or destination MAC address is matched (i.e. a packet is addressed to a specified MAC address or is destined for a specified MAC address), an event is logged. |
| rule-precedence | <1-5000> | The following keywords are recursive and common to all of the above parameters:  
• rule-precedence – Assigns a precedence for this permit rule  
• <1-5000> – Specify a value from 1 - 5000.  
**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.  
• rule-description – Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
Usage Guidelines

The permit command in the MAC ACL allows traffic based on layer 2 (data-link layer) information. A MAC access list permits traffic from a source MAC address or any MAC address. It also has an option to allow traffic from a list of MAC addresses (based on the source mask).

The MAC access list can be configured to allow traffic based on VLAN information, or Ethernet type. Common types include:

- ARP
- WISP
- IP
- 802.1q

Layer 2 traffic is not allowed by default. To adopt an access point through an interface, configure an ACL to allow an Ethernet WISP.

Use the mark option to specify the type of service (tos) and priority value. The tos value is marked in the IP header and the 802.1p priority value is marked in the dot1q frame.

Whenever the interface receives the packet, its content is checked against all the ACEs in the ACL. It is marked based on the ACL's configuration.

NOTE: To apply an IP based ACL to an interface, a MAC access list entry is mandatory to allow ARP. A MAC ACL always takes precedence over IP based ACLs.

Examples

```
rfs7000-37FABE(config-mac-acl-test)#permit host 11-22-33-44-55-66 any log mark 8021p 3 rule-precedence 600
```

```
rfs7000-37FABE(config-mac-acl-test)#permit host 22-33-44-55-66-77 host 11-22-33-44-55-66 type ip log rule-precedence 610
```

```
rfs7000-37FABE(config-mac-acl-test)#show context
mac access-list testPF
  permit host 11-22-33-44-55-66 any log mark 8021p 3 rule-precedence 600
  permit host 22-33-44-55-66-77 host 11-22-33-44-55-66 type ip log rule-precedence 610
rfs7000-37FABE(config-mac-acl-test)#
```

Removes or resets a specified MAC ACL permit rule
11.3 ipv6-access-list

ACCESS-LIST

Configures a IPv6 ACL

An IPv6 ACL defines a set of rules that filter IPv6 packets flowing through a port or interface. Each rule specifies the action taken when a packet matches the rule. If the action is deny, the packet is dropped. If the action is permit, the packet is allowed.

The WiNG software supports IPv6 only on VLAN interfaces. Therefore, IPv6 ACLs can be applied only on the VLAN interface.

The following table summarizes IPv6 access list configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Creates a deny access rule or modifies an existing rule. A deny access rule rejects IPv6 packets from specified address(es) and/or destined for specified address(es).</td>
<td>page 11-48</td>
</tr>
<tr>
<td>no</td>
<td>Removes a deny and/or a access rule from a IPv6 ACL</td>
<td>page 11-54</td>
</tr>
<tr>
<td>permit</td>
<td>Creates a permit access rule or modifies an existing rule. A permit access rule accepts IPv6 packets from specified address(es) and/or destined for specified address(es).</td>
<td>page 11-55</td>
</tr>
</tbody>
</table>
11.3.1 deny

ipv6-access-list

Creates a deny rule that rejects packets from a specified IPv6 source and/or to a specified IPv6 destination. You can also use this command to modify an existing deny rule.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

deny [icmpv6|ipv6|proto|tcp|udp]

{(rule-description <LINE>)}

deny ipv6 [any|host <SOURCE-HOST-IPv6>] [DEST-IPv6/MASK] [any| host <DEST-HOST-IPv6>] 
(log,rule-precedence <1-5000>) 
{(rule-description <LINE>)}

deny proto [any| host <SOURCE-HOST-IPv6>] [DEST-IPv6/MASK] [any| host <DEST-HOST-IPv6>] 
(log,rule-precedence <1-5000>) 
{(rule-description <LINE>)}

deny [tcp|udp] [any|host <SOURCE-HOST-IPv6>] [DEST-IPv6/MASK] [any| host <DEST-HOST-IPv6>]
[<SOURCE-PORT>|<SERVICE-NAME>|bgp|dns|ftp|ftp-data|gopher|https|ldap|ntp|nntp|pop3|sip|smtp|ssh|telnet|tftp|www]
[<SOURCE-PORT>|<SERVICE-NAME>|bgp|dns|ftp|ftp-data|gopher|https|ldap|ntp|nntp|pop3|sip|smtp|ssh|telnet|tftp|www]
(log,rule-precedence <1-5000>) 
{(rule-description <LINE>)}

Parameters

{(rule-description <LINE>)}

|icmpv6| Applies this deny rule to ICMPv6 packets only
| any| Specifies a range of IPv6 source address (network) to match. ICMPv6 packets received from any source in the specified network are dropped.
| host| Identifies a specific host (as the source to match) by its IPv6 address. ICMPv6 packets received from the specified host are dropped.
| <SOURCE-HOST-IPv6>| Specfies a range of IPv6 destination address (network) to match. ICMPv6 packets addressed to any destination within the specified network are dropped.
| any| Specifies the destination as any IPv6 address. ICMPv6 packets addressed to any destination are dropped.
<table>

</tr>
</tbody>
</table>

- **host <DEST-HOST-IPv6>**
  Identifies a specific host (as the destination to match) by its IPv6 address. ICMPv6 packets addressed to the specified host are dropped.
  - <DEST-HOST-IPv6> – Specify the destination host’s exact IPv6 address.

- **<ICMPv6-TYPE> [eq|range]**
  Defines the ICMPv6 type field filter
  - **eq** – Configures a specific ICMPv6 type. Specify the ICMPv6 type value.
  - **range** – Configures a range of ICMPv6 types. Specify the starting and ending ICMPv6 type values.
  **Note:** ICMPv6 packets with type field value matching the values specified here are dropped.

- **<ICMPv6-CODE>**
  Defines the ICMPv6 code field filter
  - **eq** – Configures a specific ICMPv6 code. Specify the ICMPv6 code value.
  - **range** – Configures a range of ICMPv6 code. Specify the starting and ending ICMPv6 code values.
  **Note:** ICMPv6 packets with code field value matching the values specified here are dropped.

- **log**
  Logs all deny events matching this entry

- **rule-precedence <1-5000>**
  Assigns a precedence for this deny rule
  - <1-5000> – Specify a value from 1 - 5000.
  **Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.

- **rule-description <LINE>**
  Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length).

- **ipv6**
  Applies this deny rule to IPv6 packets only
<table>
<thead>
<tr>
<th>Proto</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Configures the ACL for additional protocols. Additional protocols (other than IP, ICMP, TCP, and UDP) must be configured using this parameter.</td>
</tr>
<tr>
<td>proto</td>
<td>Computers match traffic that is associated with the protocol specified by the protocol parameter.</td>
</tr>
<tr>
<td>eigrp</td>
<td>Identifies the EIGRP protocol (number 88)</td>
</tr>
<tr>
<td>gre</td>
<td>Identifies the GRE protocol (number 47)</td>

<tr>
<td>vrrp</td>
<td>Identifies the VRRP protocol (number 112)</td>
</tr>
</tbody>
</table>

**Example:**

```

rule-precedence <1-5000>  
Assigns a precedence for this deny rule  
- `<1-5000>` – Specify a value from 1 - 5000

**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.

**rule-description**  
Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length).

```

```

- `<PROTOCOL-NUMBER>` | Filters protocols using their Internet Assigned Numbers Authority (IANA) protocol number  
  - `<PROTOCOL-NUMBER>` – Specify the protocol number.

- `<PROTOCOL-NAME>` | Filters protocols using their IANA protocol name  
  - `<PROTOCOL-NAME>` – Specify the protocol name.

- `eigrp` | Identifies the EIGRP protocol (number 88)  
  EIGRP enables routers to maintain copies of neighbors’ routing tables. Routers use this information to determine the fastest route to a destination. When a router fails to find a route in its stored route tables, it sends a query to neighbors who in turn query their neighbors till a route is found. EIGRP also enables routers to inform neighbors of changes in their routing tables.

- `gre` | Identifies the GRE protocol (number 47)  
  GRE is a tunneling protocol that enables transportation of protocols (IP, IPX, DEC net, etc.) over an IP network. GRE encapsulates the packet at the source and removes the encapsulation at the destination.

- `igp` | Identifies any private internal gateway (primarily used by CISCO for their IGRP) (number 9)  
  IGP enables exchange of information between hosts and routers within a managed network. The most commonly used IGP protocols are: RIP and OSPF.

- `ospf` | Identifies the OSPF protocol (number 89)  
  OSPF is a link-state IGP. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets.

- `vrrp` | Identifies the VRRP protocol (number 112)  
  VRRP allows a pool of routers to be advertised as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address.

- `<SOURCE-IPv6/MASK>` | Specifies a range of IPv6 source address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source in the specified network are dropped.

```
| any | Specifies the source as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source are dropped. |
| host | Identifies a specific host (as the source to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the specified host are dropped. |
| <SOURCE-HOST-IPv6> | |
| 
| <DEST-IPv6/MASK> | Specifies a range of IPv6 destination address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination within the specified network are dropped. |
| any | Specifies the destination as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination are dropped. |
| host | Identifies a specific host (as the destination to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to the specified host are dropped. |
| <DEST-HOST-IPv6> | |
| rule-precedence | Assigns a precedence for this deny rule |
| <1-5000> | 

**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10.

| rule-description <LINE> | Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

- deny [tcp|udp] [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK>|any|host <DEST-HOST-IPv6>] [eq <SOURCE-PORT>|eq <SERVICE-NAME>|any|eq <DEST-PORT>|<START-PORT> <END-PORT>]
- log,rule-precedence <1-5000> 

**tcp**

Applies this deny rule to TCP packets only

**udp**

Applies this deny rule to UDP packets only

**<SOURCE-IPv6/MASK>**

This keyword is common to the 'tcp' and 'udp' parameters. Specifies a range of IPv6 source address (network) to match. TCP/UDP packets received from any source in the specified network are dropped.

**any**

This keyword is common to the 'tcp' and 'udp' parameters. Specifies the source as any IPv6 address. TCP/UDP packets received from any source are dropped.

**host**

Identifies a specific host (as the source to match) by its IPv6 address. TCP/UDP packets received from the specified host are dropped. |
| <SOURCE-HOST-IPv6> | |
| <DEST-IPv6/MASK> | This keyword is common to the 'tcp' and 'udp' parameters. Specifies a range of IPv6 destination address (network) to match. TCP/UDP packets addressed to any destination within the specified network are dropped. |
| any | Specifies the destination as any destination IPv6 address. TCP/UDP packets received from any destination are dropped. |
| eq <SOURCE-PORT> | Identifies a specific source port  
  • <SOURCE-PORT> – Specify the exact source port. |
|-----------------|-----------------------------------------------|
| host <DEST-HOST-IP> | Identifies a specific host (as the destination to match) by its IPv6 address. TCP/UDP packets addressed to the specified host are dropped.  
  • <DEST-HOST-IP> – Specify the destination host’s exact IP address. |
| range <START-PORT> <END-PORT> | Specifies a range of source ports  
  • <START-PORT> – Specify the first port in the range.  
  • <END-PORT> – Specify the last port in the range. |
| eq [1-65535]| <SERVICE-NAME>| bgp| dns| ftp| ftp-data| groper| https| ldap| nntp| ntp| pop3| sip| smtp| ssh| telnet| tftp| www | Identifies a specific destination or protocol port to match  
  • <1-65535> – The destination port is designated by its number  
  • <SERVICE-NAME> – Specifies the service name  
  • bgp – The designated BGP protocol port (179)  
  • dns – The designated DNS protocol port (53)  
  • ftp – The designated FTP protocol port (21)  
  • ftp-data – The designated FTP data port (20)  
  • groper – The designated GROPHER protocol port (70)  
  • https – The designated HTTPS protocol port (443)  
  • ldap – The designated LDAP protocol port (389)  
  • nntp – The designated NNTP protocol port (119)  
  • ntp – The designated NTP protocol port (123)  
  • pop3 – The designated POP3 protocol port (110)  
  • sip – The designated SIP protocol port (5060)  
  • smtp – The designated SMTP protocol port (25)  
  • ssh – The designated SSH protocol port (22)  
  • telnet – The designated Telnet protocol port (23)  
  • tftp – The designated TFTP protocol port (69)  
  • www – The designated www protocol port (80) |
| range <START-PORT> <END-PORT> | Specifies a range of destination ports  
  • <START-PORT> – Specify the first port in the range.  
  • <END-PORT> – Specify the last port in the range. |
| log | Logs all deny events matching this entry |
| rule-precedence <1-5000> | Assigns a precedence for this deny rule  
  • <1-5000> – Specify a value from 1 - 5000.  
**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
| rule-description <LINE> | Optional. Configures a description for this deny rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
Examples

rfs7000-6DCD4B(config-ipv6-acl-test)#deny icmpv6 any any type eq 1 code eq 0 log rule-precedence 1

`ipv6-access-list`

Removes a deny or permit rule

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no [deny|permit] [icmpv6|ipv6|proto|tcp|udp] <RULE-PARAMETERS>
{(rule-description <LINE>)}
```

**Parameters**

- `no <PARAMETERS>` Removes a deny or permit rule from the selected IPv6 access list

**Examples**

The following example shows the ACL ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-6DCD4B(config-ipv6-acl-test)#show context
ipv6 access-list test
deny icmpv6 any any type eq destination-unreachable code eq router-renumbering-command
log rule-precedence 1
permit proto gre any any log rule-precedence 2
rfs7000-6DCD4B(config-ipv6-acl-test)#

rfs7000-6DCD4B(config-ipv6-acl-test)#no deny icmpv6 any any type eq 1 log
rule-precedence 1

rfs7000-6DCD4B(config-ipv6-acl-test)#show context
ipv6 access-list test
permit proto gre any any log rule-precedence 2
rfs7000-6DCD4B(config-ipv6-acl-test)#
```
11.3.3 permit

ipv6-access-list

Creates a permit rule that accepts packets from a specified IPv6 source and/or to a specified IPv6 destination. You can also use this command to modify an existing permit rule.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
permit [icmpv6|ipv6|proto|tcp|udp]
```

```plaintext
```

```plaintext
```

```plaintext
```

```plaintext
permit [tcp|udp] [<SOURCE-IPv6/MASK>|any|host <SOURCE-HOST-IPv6>] [<DEST-IPv6/MASK>|any|host <DEST-HOST-IPv6>] [code [eq <ICMPv6-CODE>|range <STARTING-ICMPv6-CODE> <ENDING-ICMPv6-CODE>]|type [eq <ICMPV6-TYPE>|range <STARTING-ICMPv6-TYPE> <ENDING-ICMPv6-TYPE>]] (log|rule-precedence <1-5000>) {(rule-description <LINE>)}
```

Parameters

- <SOURCE-IPv6/MASK> Applies this permit rule to ICMPv6 packets only

- <SOURCE-HOST-IPv6> Identifies a specific host (as the source to match) by its IPv6 address. ICMPv6 packets received from the specified host are accepted.

- <DEST-IPv6/MASK> Specifies a range of IPv6 destination address (network) to match. ICMPv6 packets addressed to any destination within the specified network are accepted.

- any Specifies the source as any IPv6 address. ICMPv6 packets received from any source are accepted.
| host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. ICMPv6 packets addressed to the specified host are accepted.  
  
  • <DEST-HOST-IPv6> – Specify the destination host’s exact IPv6 address. |
|---|---|
| <ICMPv6-TYPE> <eq|range> | Defines the ICMPv6 type field filter  
  
  • eq – Configures a specific ICMPv6 type. Specify the ICMPv6 type value.  
  
  • range – Configures a range of ICMPv6 types. Specify the starting and ending ICMPv6 type values.  
  
  **Note:** ICMPv6 packets with type field value matching the values specified here are forwarded. |
| <ICMPv6-CODE> <eq|range> | Defines the ICMPv6 code field filter  
  
  • eq – Configures a specific ICMPv6 code. Specify the ICMPv6 code value.  
  
  • range – Configures a range of ICMPv6 code. Specify the starting and ending ICMPv6 code values.  
  
  **Note:** ICMPv6 packets with code field value matching the values specified here are forwarded. |
| log | Logs all permit events matching this entry |
| rule-precedence <1-5000> | Assigns a precedence for this permit rule  
  
  • <1-5000> – Specify a value from 1 - 5000.  
  
  **Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
| rule-description <LINE> | Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| ipv6 | Applies this permit rule to IPv6 packets only |
| <SOURCE-IPv6/MASK> | Specifies a range of IPv6 source address (network) to match. IPv6 packets received from any source in the specified network are forwarded. |
| any | Specifies the source as any IPv6 address. IPv6 packets received from any source are forwarded. |
| host <SOURCE-HOST-IPv6> | Identifies a specific host (as the source to match) by its IPv6 address. IPv6 packets received from the specified host are forwarded.  
  
  • <SOURCE-HOST-IPv6> – Specify the source host’s exact IPv6 address. |
| <DEST-IPv6/MASK> | Specifies a range of IPv6 destination address (network) to match. IPv6 packets addressed to any destination within the specified network are forwarded. |
| any | Specifies the destination as any IPv6 address. IPv6 packets addressed to any destination are forwarded. |
| host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. IPv6 packets addressed to the specified host are forwarded.  
  
  • <DEST-HOST-IPv6> – Specify the destination host’s exact IPv6 address. |
| log | Logs all permit events matching this entry |
| **rule-precedence <1-5000>** | Assigns a precedence for this permit rule  
- `<1-5000>` – Specify a value from 1 - 5000  
**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
| **rule-description <LINE>** | Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |
| **proto** | Configures the ACL for additional protocols  
Additional protocols (other than IP, ICMP, TCP, and UDP) must be configured using this parameter. |
| `<PROTOCOL-NUMBER>` | Filters protocols using their Internet Assigned Numbers Authority (IANA) protocol number  
- `<PROTOCOL-NUMBER>` – Specify the protocol number. |
| `<PROTOCOL-NAME>` | Filters protocols using their IANA protocol name  
- `<PROTOCOL-NAME>` – Specify the protocol name. |
| **eigrp** | Identifies the EIGRP protocol (number 88)  
EIGRP enables routers to maintain copies of neighbors’ routing tables. Routers use this information to determine the fastest route to a destination. When a router fails to find a route in its stored route tables, it sends a query to neighbors who in turn query their neighbors till a route is found. EIGRP also enables routers to inform neighbors of changes in their routing tables. |
| **gre** | Identifies the GRE protocol (number 47)  
GRE is a tunneling protocol that enables transportation of protocols (IP, IPX, DEC net, etc.) over an IP network. GRE encapsulates the packet at the source and removes the encapsulation at the destination. |
| **igp** | Identifies any private internal gateway (primarily used by CISCO for their IGRP) (number 9)  
IGP enables exchange of information between hosts and routers within a managed network. The most commonly used IGP protocols are: RIP and OSPF. |
| **ospf** | Identifies the OSPF protocol (number 89)  
OSPF is a link-state IGP. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer which makes routing decisions based solely on the destination IP address found in IP packets. |
| **vrrp** | Identifies the VRRP protocol (number 112)  
VRRP allows a pool of routers to be advertized as a single virtual router. This virtual router is configured by hosts as their default gateway. VRRP elects a master router, from this pool, and assigns it a virtual IP address. The master router routes and forwards packets to hosts on the same subnet. When the master router fails, one of the backup routers is elected as the master and its IP address is mapped to the virtual IP address. |
| `<SOURCE-IPv6/MASK>` | Specifies a range of IPv6 source address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source in the specified network are forwarded. |
| **any** | Specifies the source as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from any source are forwarded. |
| **host** | Identifies a specific host (as the source to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) received from the specified host are forwarded.  
- <SOURCE-HOST-IPv6> – Specify the source host's exact IPv6 address. |
| **<DEST-IPv6/MASK>** | Specifies a range of IPv6 destination address (network) to match. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination within the specified network are forwarded. |
| **any** | Specifies the destination as any IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to any destination are forwarded. |
| **host** | Identifies a specific host (as the destination to match) by its IPv6 address. Packets (EIGRP, GRE, IGMP, IGP, OSPF, or VRRP) addressed to the specified host are forwarded.  
- <DEST-HOST-IPv6> – Specify the destination host's exact IPv6 address. |
| **log** | Logs all permit events matching this entry |
| **rule-precedence** | Assigns a precedence for this permit rule  
- <1-5000> – Specify a value from 1 - 5000. |
| **rule-description** | Optional. Configures a description for this permit rule. Provide a description that uniquely identifies the purpose of this rule (should not exceed 128 characters in length). |

```
```

| **tcp** | Applies this permit rule to TCP packets only |
| **udp** | Applies this permit rule to UDP packets only |
| **<SOURCE-IPv6/MASK>** | This keyword is common to the 'tcp' and 'udp' parameters. Specifies a range of IPv6 source address (network) to match. TCP/UDP packets received from any source in the specified network are forwarded. |
| **any** | This keyword is common to the 'tcp' and 'udp' parameters. Specifies the source as any IPv6 address. TCP/UDP packets received from any source are forwarded. |
| **host** | Identifies a specific host (as the source to match) by its IPv6 address. TCP/UDP packets received from the specified host are forwarded.  
- <SOURCE-HOST-IPv6> – Specify the source host's exact IPv6 address. |
| **<DEST-IPv6/MASK>** | This keyword is common to the 'tcp' and 'udp' parameters. Specifies a range of IPv6 destination address (network) to match. TCP/UDP packets addressed to any destination within the specified network are forwarded. |
| any | This keyword is common to the 'tcp' and 'udp' parameters. Specifies the destination as any destination IPv6 address. TCP/UDP packets received from any destination are forwarded. |
| eq <SOURCE-PORT> | Identifies a specific source port  
• <SOURCE-PORT> – Specify the exact source port. |
| host <DEST-HOST-IPv6> | Identifies a specific host (as the destination to match) by its IPv6 address. TCP/UDP packets addressed to the specified host are forwarded.  
• <DEST-HOST-IPv6> – Specify the destination host’s exact IP address. |
| range <START-PORT> <END-PORT> | Specifies a range of source ports  
• <START-PORT> – Specify the first port in the range.  
• <END-PORT> – Specify the last port in the range. |
| eq [<1-65535> | <SERVICE-NAME>|  
bgp|dns|ftp|  
ftp-data|groper|  
https|ldap|ntp|  
pop3|sip|smtp|  
ssh|telnet|  
tftp|www] | Identifies a specific destination or protocol port to match  
• <1-65535> – The destination port is designated by its number  
• <SERVICE-NAME> – Specifies the service name  
• bgp – The designated BGP protocol port (179)  
• dns – The designated DNS protocol port (53)  
• ftp – The designated FTP protocol port (21)  
• ftp-data – The designated FTP data port (20)  
• groper – The designated GROPER protocol port (70)  
• https – The designated HTTPS protocol port (443)  
• ldap – The designated LDAP protocol port (389)  
• nntp – The designated NNTP protocol port (119)  
• ntp – The designated NTP protocol port (123)  
• pop3 – The designated POP3 protocol port (110)  
• sip – The designated SIP protocol port (5060)  
• smtp – The designated SMTP protocol port (25)  
• ssh – The designated SSH protocol port (22)  
• telnet – The designated Telnet protocol port (23)  
• tftp – The designated TFTP protocol port (69)  
• www – The designated www protocol port (80) |
| range <START-PORT> <END-PORT> | Specifies a range of destination ports  
• <START-PORT> – Specify the first port in the range.  
• <END-PORT> – Specify the last port in the range. |
| log | Logs all permit events matching this entry |
| rule-precedence <1-5000> | Assigns a precedence for this permit rule  
• <1-5000> – Specify a value from 1 - 5000.  
**Note:** Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 10. |
### Examples

```bash
rfs7000-6DCD4B(config-ipv6-acl-test)#permit proto gre any any log rule-precedence 2
rfs7000-6DCD4B(config-ipv6-acl-test)#show context ipv6 access-list test
deny icmpv6 any any type eq destination-unreachable code eq router-renumbering-command log rule-precedence 1
permit proto gre any any log rule-precedence 2
rfs7000-6DCD4B(config-ipv6-acl-test)#
```

11.4 ip-snmp-access-list

SNMP performs network management functions using a data structure called a Management Information Base (MIB). SNMP is widely implemented but not very secure, since it uses only text community strings for accessing controller or service platform configuration files.

Use SNMP ACLs to help reduce SNMP’s vulnerabilities, as SNMP traffic can be exploited to produce a denial of service (DoS).

The following table summarizes SNMP access list configuration commands:

<table>
<thead>
<tr>
<th>Command</th>

</tbody>
</table>
11.4.1 deny

`ip-snmp-access-list`

Creates a deny SNMP MIB object traffic rule. Use this command to specify the match criteria based on which SNMP traffic is denied.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

deny [<IP/M>|any|host <IP>]

**Parameters**

- deny [<IP/M>|any|host <IP>]

| deny [<IP/M>|any|host <IP>] | Configures the match criteria for this deny rule |
|-----------------------------|------------------------------------------------|
| any|host <IP> | - `<IP/M>` – Specifies a network address and mask in the A.B.C.D/M format. Packets received or destined for this network are dropped  
- `any` – Specifies the match criteria as any. Packets received or destined from any address are dropped  
- `host <IP>` – Identifies a host by its IP address. Packets received or destined for this host are dropped |

**Examples**

```plaintext
rfs7000-6DCD4B(config-ip-snmp-acl-test)#deny 192.168.13.0/24
rfs7000-6DCD4B(config-ip-snmp-acl-test)#show context
ip snmp-access-list test
deny 192.168.13.0/24
rfs7000-6DCD4B(config-ip-snmp-acl-test)#
```

**Related Commands**

`no` Removes this deny rule form the IP SNMP ACL
11.4.2 permit

**ip-snmp-access-list**

Creates a permit SNMP MIB object traffic rule. Use this command to specify the match criteria based on which SNMP traffic is permitted.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

permit [<IP/M>|any|host <IP>]

**Parameters**

- **permit [<IP/M>|any|host <IP>]**
  
  Configures the match criteria for this permit rule

  - `<IP/M>` – Specifies a network address and mask in the A.B.C.D/M format. Packets received or destined for this network are forwarded
  - `any` – Specifies the match criteria as any. Packets received or destined from any address are forwarded
  - `host <IP>` – Identifies a host by its IP address. Packets received or destined for this host are forwarded

**Examples**

```
> ip snmp-access-list test
> permit host 192.168.13.13
> deny 192.168.13.0/24
> show context
> ip snmp-access-list test
> permit host 192.168.13.13
> deny 192.168.13.0/24
```

**Related Commands**

- **no** Removes this permit rule form the IP SNMP ACL
### 11.4.3 `no` ip-snmp-access-list

Removes a deny or permit rule from the IP SNMP ACL. Use this command to remove IP SNMP ACL as they become obsolete for filtering network access permissions.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`no [deny|permit] [<IP/M>|any|host <IP>]`

**Parameters**

- `no <PARAMETERS>`

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes deny and/or permit access rule from this IP SNMP ACL</th>
</tr>
</thead>
</table>

**Examples**

```
rfs7000-6DCD4B(config-ip-snmp-acl-test)#show context
ip snmp-access-list test
   permit host 192.168.13.13
   deny 192.168.13.0/24
rfs7000-6DCD4B(config-ip-snmp-acl-test)#
```

```
rfs7000-6DCD4B(config-ip-snmp-acl-test)#no permit host 192.168.13.13
rfs7000-6DCD4B(config-ip-snmp-acl-test)#show context
ip snmp-access-list test
   deny 192.168.13.0/24
rfs7000-6DCD4B(config-ip-snmp-acl-test)#
```
11.5 ex3500-ext-access-list

IP ACLs function as firewalls that filter or mark packets on layer 3 ports as opposed to MAC ACLs that filter traffic on layer 2 ports.

An IPv4 EX3500 extended ACL is a policy-based ACL that either prevents or allows specific clients from using the EX3500 switch. It allows you to permit or deny client access by specifying that the traffic from a specific host or network and/or the traffic to a specific host or network be either denied or permitted.

An EX3500 extended ACL consists of a set of deny /permit rules that filter packets based on both source and destination IPv4 addresses. Each rule specifies a set of match criteria (the source and destination IP addresses) and has a unique precedence value assigned. These ACL rules are applied sequentially to the traffic at a port, by a firewall-supported device, in an increasing order of their precedence. When a packet matches the criteria specified in a rule the packet is either forwarded or dropped based on the rule type.

The following table summarizes IPv4 EX3500 extended ACL configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Creates a deny access rule or modifies an existing rule. A deny access rule rejects packets from specified address(es) and/or destined to specified address(es).</td>
<td>page 11-66</td>
</tr>
<tr>
<td>permit</td>
<td>Creates a permit access rule or modifies an existing rule. A permit access rule accepts packets from specified address(es) and/or destined to specified address(es).</td>
<td>page 11-69</td>
</tr>
<tr>
<td>no</td>
<td>Removes a deny and/or a permit access rule from this IPv4 EX3500 extended ACL</td>
<td>page 11-72</td>
</tr>
</tbody>
</table>
11.5.1 deny

Create a deny ACL rule that filters packets based on the source and/or destination IPv4 address, and other specified criteria. You can also use this command to modify an existing deny rule.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

deny [<0-255>|tcp|udp] [any|host <SOURCE-HOST-IP>] [destination-port <0-65535>|destination-port-bitmark <0-65535>|dscp <0-63>|ex3500-time-range <TIME-RANGE-NAME>|ip-precedence <0-63>|rule-precedence <1-128>|source-port <0-65535]|source-port-bitmark <0-65535>]

Parameters

- deny [<0-255>|tcp|udp] [any|host <SOURCE-HOST-IP>] [destination-port <0-65535>|destination-port-bitmark <0-65535>|dscp <0-63>|ex3500-time-range <TIME-RANGE-NAME>|ip-precedence <0-63>|rule-precedence <1-128>|source-port <0-65535]|source-port-bitmark <0-65535>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| deny [0-255] tcp|udp | Creates a deny rule and identifies the protocol type. This deny rule is applied only to packets matching the protocol specified here.  
- <0-255> — Identifies the protocol from its number. Specify the protocol number from 0 -255.
- tcp — Configures the protocol as TCP
- udp — Configures the protocol as UDP

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| <SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP> | Specifies the source IP address as any, host, or network
- <SOURCE-NETWORK-IP/MASK> — Configures a network as the source. Provide the network’s IPv4 address along with the mask.
- host <SOURCE-HOST-IP> — Configures a single device as the source. Provide the host device’s IPv4 address.
- any — Specifies that the source can be any device

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| <DEST-NETWORK-IP/MASK>|any|host <DEST-HOST-IP> | Specifies the destination IP address as any, host, or network.
- <DEST-NETWORK-IP/MASK> — Configures a network as the destination. Provide the network’s IPv4 address along with the mask.
- host <DEST-HOST-IP> — Configures a single device as the destination. Provide the host device’s IPv4 address.
- any — Specifies that the destination can be any device

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| control-flag <0-63> | Configures the decimal number (representing a bit string) that specifies the control flag bits in byte 14 of the TCP header
- <0-63> — Specify a value from 0 - 63.

**Note:** Control flags can be used only in ACLs designed to filter TCP traffic.

The TCP header contains several one-bit boolean fields known as flags that influence flow of data across a TCP connection. Ignoring the CWR and ECE flags added for congestion notification by RFC 3168, there are six TCP control flags.

- URG flag - Marks incoming packet as urgent. Contd...
**Usage Guidelines**

Use this command to deny traffic between networks/hosts based on the protocol type selected in the access list configuration. The following protocols are supported:

- TCP
- UDP
- <0-255> (any Internet protocol other than TCP, UDP, and ICMP)

Whenever the interface receives the packet, its content is checked against the ACEs in the ACL. It is allowed or denied based on the ACL configuration.

- Filtering TCP/UDP allows you to specify port numbers as filtering criteria

<table>
<thead>
<tr>

11.5.2 permit

**permit**

 Creates a permit ACL rule that filters packets based on the source and/or destination IPv4 address, and other specified criteria. You can also use this command to modify an existing permit rule.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
permit [<0-255>|tcp|udp] [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>]
[<DEST-NETWORK-IP/MASK>|any|host <DEST-HOST-IP>]
[destination-port <0-65535>|destination-port-bitmark <0-65535>]
[dscp <0-63>|ex3500-time-range <TIME-RANGE-NAME>]
[ip-precedence <0-63>]
[source-port <0-65535>|source-port-bitmark <0-65535>]
```

**Parameters**

- **permit**
  - `<0-255>` — Identifies the protocol from its number. Specify the protocol number from 0 - 255.
  - `tcp` — Configures the protocol as TCP
  - `udp` — Configures the protocol as UDP
- `<SOURCE-NETWORK-IP/MASK>`
  - `any` — Specifies that the source can be any device
  - `host <SOURCE-HOST-IP>` — Configures a single device as the source. Provide the host device's IPv4 address.
  - `<SOURCE-NETWORK-IP/MASK>` — Configures a network as the source. Provide the network’s IPv4 address along with the mask.
- `<DEST-NETWORK-IP/MASK>`
  - `any` — Specifies that the destination can be any device
  - `host <DEST-HOST-IP>` — Configures a single device as the destination. Provide the host device’s IPv4 address.
  - `<DEST-NETWORK-IP/MASK>` — Configures a network as the destination. Provide the network’s IPv4 address along with the mask.
- `control-flag <0-63>`
  - `<0-63>` — Specify a value from 0 - 63.
  - **Note:** Control flags can be used only in ACLs designed to filter TCP traffic.

The TCP header contains several one-bit boolean fields known as flags that influence flow of data across a TCP connection. Ignoring the CWR and ECE flags added for congestion notification by RFC 3168, there are six TCP control flags.
- **URG flag** - Marks incoming packet as urgent. Contd...
Usage Guidelines

Use this command to permit traffic between networks/hosts based on the protocol type selected in the access list configuration. The following protocols are supported:

- TCP
- UDP
- <0-255> (any Internet protocol other than TCP, UDP, and ICMP)

Whenever the interface receives the packet, its content is checked against the ACEs in the ACL. It is allowed or denied based on the ACL configuration.

- Filtering TCP/UDP allows you to specify port numbers as filtering criteria

<td>The following keywords are recursive and common to all of the above parameters:&lt;br&gt;• rule-precedence – Assigns a precedence to this permit rule&lt;br&gt;• &lt;1-128&gt; – Specify a value from 1 - 5000.&lt;br&gt;Note: Lower the precedence higher is the priority. A rule with precedence 3 gets priority over a rule with precedence 4 and is applied first to packets.</td>
</tr>
</tbody>
</table>

- ACK flag - Acknowledges receipt of packet
- PUSH flag - Ensures that the packet is given appropriate priority. Often used at the beginning and end of data transfer.
- RST flag - Resets the connection. Happens when remote host receives a establish connection packet, but does not have a service waiting to answer and sends a reply with reset flag.
- SYN flag - Establishes the 3-way handshake between two hosts
- FIN flag - Tears down the connection established between two hosts via the 3-way SYN process
Examples
The following example permits outgoing TCP packets from all sources within the 192.168.14.0 network to any destination, with the TCP control flag set to 16 (acknowledge):

```
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#permit tcp 192.168.14.0/24 any control-flag 16 rule-precedence 2
```

```
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#show context ip ex3500-ext-access-list test
deny tcp 192.168.14.0/24 host 192.168.13.13 rule-precedence 1
permit tcp 192.168.14.0/24 any control-flag 16 rule-precedence 2
```

```
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#
```

11.5.3 no

Removes a deny or permit access rule from this IPv4 EX3500 extended ACL

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [deny|permit] [<0-255>|tcp|udp] [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>] [<DEST-NETWORK-IP/MASK>|any|host <DEST-HOST-IP>] [control-flag <0-63>|destination-port <0-65535>|destination-port-bitmark <0-65535>|dscp <0-63>|ex3500-time-range <TIME-RANGE-NAME>|ip-precedence <0-63>|rule-precedence <1-128>|source-port <0-65535>|source-port-bitmark <0-65535>

Parameters

- no <PARAMETERS>

no <PARAMETERS> Removes a deny or permit access rule based on the parameters passed

Usage Guidelines

The keyword ‘control-flag <0-63>’ is only applicable to ACL rules filtering TCP traffic.

Examples

The following example shows the IPv4 EX3500 extended ACL ‘test’ settings before the ‘no’ commands are executed:

```
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#show context
ip ex3500-ext-access-list test
deny tcp 192.168.14.0/24 host 192.168.13.13 rule-precedence 1
permit tcp 192.168.14.0/24 any control-flag 16 rule-precedence 2
```

```
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#no permit tcp 192.168.14.0/24 any control-flag 16 rule-precedence 2
```

The following example shows the IPv4 EX3500 extended ACL ‘test’ settings after the ‘no’ commands are executed:

```
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#show context
ip ex3500-ext-access-list test
deny tcp 192.168.14.0/24 host 192.168.13.13 rule-precedence 1
```

```
nx9500-6C8809(config-ip-ex3500-ext-acl-test)#
```
11.6 ex3500-std-access-list

A EX3500 standard ACL is a policy-based ACL that contains a set of filter criteria and action that is applied to traffic originating from a specified source.

The following table summarizes IPv4 EX3500 standard ACL configuration commands:

**NOTE:** To implement the EX3500 standard ACL, apply it directly to a EX3500 device, or to an EX35XX profile. For more information see, *access-group*.

### 11.6.1 deny

*ex3500-std-access-list*

Creates a deny rule that rejects packets from a specified source or sources. The source can be a single device or a range of devices within a specified network. Use this command to also edit an existing deny rule.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

#### Syntax

```
deny [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>] 
   {ex3500-time-range <TIME-RANGE-NAME>}
```

#### Parameters

- **deny [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>]**
  - Creates a deny rule that rejects packets from a specified source or a network. Use one of the following options to specify the source: any, host, or network.
  - `<SOURCE-NETWORK-IP/MASK>` — Configures a network as the source. Provide the network’s IPv4 address along with the mask.
  - `host <SOURCE-HOST-IP>` — Configures a single device as the source. Provide the host device’s IPv4 address.
  - `any` — Specifies that the source can be any device

- **ex3500-time-range <TIME-RANGE-NAME>**
  - Optional. Applies a periodic or absolute time range to this deny rule
  - `<TIME-RANGE-NAME>` — Specify the time range name (should be existing and configured). The ACL is triggered during the time period configured in the specified EX3500 time range. For information on configuring EX3500 time-range, see `ex3500`.

#### Examples

```
nx9500-6C8809(config-ip-ex3500-std-acl-test)#deny 192.168.14.0/24
```

```
nx9500-6C8809(config-ip-ex3500-std-acl-test)#show context
ip ex3500-std-access-list test
deny 192.168.13.0/24
```

#### Related Commands

- **no**
  - Removes a specified deny access rule from this IPv4 EX3500 standard ACL
**11.6.2 permit**

*ex3500-std-access-list*

Creates a permit rule that allows packets from a specified source or sources. The source can be a single device or a range of devices within a specified network. Use this command to also edit an existing permit rule.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
permit [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>]
       {ex3500-time-range <TIME-RANGE-NAME>}
```

**Parameters**
- `permit [<SOURCE-NETWORK-IP/MASK>|any|host <SOURCE-HOST-IP>]` creates a permit rule that allows packets from a specified source or a network. Use one of the following options to specify the source: any, host, or network.
  - `<SOURCE-NETWORK-IP/MASK>` — Configures a network as the source. Provide the network’s IPv4 address along with the mask.
  - `host <SOURCE-HOST-IP>` — Configures a single device as the source. Provide the host device’s IPv4 address.
  - `any` — Specifies that the source can be any device

- `ex3500-time-range <TIME-RANGE-NAME>` — Optional. Applies a periodic or absolute time range to this deny rule
  - `<TIME-RANGE-NAME>` — Specify the time range name (should be existing and configured). The ACL is triggered during the time period configured in the specified EX3500 time range. For information on configuring EX3500 time-range, see `ex3500`.

**Examples**

```
nx9500-6C8809(config-ip-ex3500-std-acl-test)#permit host 192.168.13.13 ex3500-time-range EX3500_TimeRange_01
```

```
nx9500-6C8809(config-ip-ex3500-std-acl-test)#show context
ip ex3500-std-access-list test
deny 192.168.14.0/24
permit host 192.168.13.13 ex3500-time-range EX3500_TimeRange_01
```

**Related Commands**

- `no` removes a specified permit access rule from this IPv4 EX3500 standard ACL
11.6.3 no

ex3500-std-access-list

Removes a deny or permit access rule from this IPv4 EX3500 standard ACL

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

no [deny|permit] [<SOURCE-IP/MASK>|any|host <IP>] {ex3500-time-range <TIME-RANGE-NAME>}

Parameters

- no <PARAMETERS>

no <PARAMETERS> Removes a deny or permit access rule based on the parameters passed

Examples

The following example shows the IPv4 EX3500 standard ACL ‘test’ settings before the ‘no’ commands are executed:

```
x9500-6C8809(config-ip-ex3500-std-acl-test)#show context
ip ex3500-std-access-list test
deny 192.168.14.0/24
permit host 192.168.13.13 ex3500-time-range EX3500_TimeRange_01
nx9500-6C8809(config-ip-ex3500-std-acl-test)#
```

nx9500-6C8809(config-ip-ex3500-std-acl-test)#no deny 192.168.14.0/24

The following example shows the IPv4 EX3500 standard ACL ‘test’ settings after the ‘no’ commands are executed:

```
x9500-6C8809(config-ip-ex3500-std-acl-test)#show context
ip ex3500-std-access-list test
permit host 192.168.13.13 ex3500-time-range EX3500_TimeRange_01
nx9500-6C8809(config-ip-ex3500-std-acl-test)#
```
CHAPTER 12
DHCP-SERVER-POLICY

This chapter summarizes Dynamic Host Control Protocol (DHCP) server policy commands in the CLI command structure.

DHCP automatically assigns network IP addresses to requesting clients to enable them access to network resources. DHCP tracks IP address assignments, their lease times and their availability. Each subnet can be configured with its own address pool. Whenever a DHCP client requests an IP address, the DHCP server assigns an IP address from that subnet’s address pool. When the controller’s (wireless controller, service platform, or access point) onboard DHCP server allocates an address to a DHCP client, the client is assigned a lease, which expires after a pre-determined interval. Before a lease expires, wireless clients (with assigned leases) are expected to renew them to continue using the addresses. Once the lease expires, the client is no longer permitted to use the leased IP address. The controller’s DHCP server policy ensures all IP addresses are unique, and no IP address is assigned to a second client while the first client’s assignment is valid (its lease has not expired). IP address management is conducted by a controller’s DHCP server and not by an administrator.

The controller’s internal DHCP server groups wireless clients based on defined user-class options. Clients with a defined set of user-class values are segregated by class. A DHCP server can associate multiple classes to each pool. Each class in a pool is assigned an exclusive range of IP addresses. DHCP clients are compared against classes. If the client matches one of the classes assigned to the pool, it receives an IP address from the range assigned to the class. If the client doesn’t match any of the classes in the pool, it receives an IP address from a default pool range (if defined). Multiple IP addresses for a single VLAN allow the configuration of multiple IP addresses, each belonging to different subnets. Class configuration allows a DHCP client to obtain an address from the first pool to which the class is assigned.

Use the (config) instance to configure DHCP/DHCPv6 server policy parameters. To navigate to the config DHCP server policy instance, use the following commands:

```bash
<DEVICE>(config)#dhcp-server-policy <POLICY-NAME>
```

```bash
rfs7000-37FABE(config)#dhcp-server-policy test
rfs7000-37FABE(config-dhcp-server-policy-test)#
```

```bash
rfs7000-37FABE(config-dhcp-policy-test)##
```

DHCP policy Mode commands:

- `bootp`: BOOTP specific configuration
- `dhcp-class`: Configure DHCP class (for address allocation using DHCP user-class options)
- `dhcp-pool`: Configure DHCP server address pool
- `dhcp-server`: Activating dhcp server based on criteria
- `no`: Negate a command or set its defaults
- `option`: Define DHCP server option
- `ping`: Specify ping parameters used by DHCP Server
- `clrscr`: Clears the display screen
- `commit`: Commit all changes made in this session
- `do`: Run commands from Exec mode
To navigate to the config DHCPv6 server policy instance, use the following commands:
<DEVICE>(config)#dhcpv6-server-policy <POLICY-NAME>

rfs7000-37FABE(config)#dhcpv6-server-policy test
rfs7000-37FABE(config-dhcpv6-server-policy-test)#

rfs7000-37FABE(config-dhcpv6-server-policy-test)#?
DHCPv6 server policy Mode commands:
  dhcpv6-pool              Configure DHCPV6 server address pool
  no                       Negate a command or set its defaults
  option                   Define DHCPv6 server option
  restrict-vendor-options  Restrict vendor specific options to be sent in server reply
  server-preference        Server preference value sent in the reply, by the server to client

This chapter is organized as follows:

- dhcp-server-policy
- dhcpv6-server-policy

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
12.1 dhcp-server-policy

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
12.1.1 bootp

> dhcp-server-policy

Configures a BOOTP specific configuration

Bootstrap Protocol (BOOTP) requests are used by UNIX diskless workstations to obtain the location of their boot image and IP address within the managed network. A BOOTP configuration server provides this information and also assigns an IP address from a configured pool of IP addresses. By default, all BOOTP requests are forwarded to the BOOTP configuration server by the controller. When enabled, this feature allows controllers, using this DHCP server policy, to ignore BOOTP requests.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`bootp ignore`

Parameters

- `bootp ignore`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

</tbody>
</table>
**12.1.2 dhcp-class**

A controller, service platform, or access point's local DHCP server assigns IP addresses to requesting DHCP clients based on user class option names. The DHCP server can assign IP addresses from as many IP address ranges as defined by an administrator. The DHCP user class associates a particular range of IP addresses to a device in such a way that all devices of that type are assigned IP addresses from the defined range.

A DHCP user class applies different DHCP settings to a set of wireless clients. Wireless clients using the same DHCP settings are grouped under one DHCP class. Grouping users into classes facilitates the provision of differentiated service.

The following table summarizes DHCP class configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp-class</td>
<td>Creates a DHCP class and enters its configuration mode</td>
<td>page 12-6</td>
</tr>
<tr>
<td>dhcp-class-mode</td>
<td>Invokes DHCP class configuration commands</td>
<td>page 12-7</td>
</tr>
</tbody>
</table>
12.1.2.1 dhcp-class

Create a DHCP server class and enters its configuration mode. Use this command to configure user class option values. Once defined, the controller’s internal DHCP server uses the configured values to group wireless clients into DHCP classes. Therefore, each user class consists of wireless clients sharing the same set of user class values.

You can also use this command to modify an existing DHCP user class settings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
dhcp-class <DHCP-CLASS-NAME>
```

Parameters

- `dhcp-class <DHCP-CLASS-NAME>`

<table>
<thead>
<tr>
<th><code>&lt;DHCP-CLASS-NAME&gt;</code></th>
<th>Creates a DHCP user class</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;DHCP-CLASS-NAME&gt;</code></td>
<td>— Specify a name that appropriately identifies this class of wireless clients. If the class does not exist, it is created. The class name should not exceed 32 characters in length.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-dhcp-policy-test)#dhcp-class dhcpclass1
```

```
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#?
```

DHCP class Mode commands:

- `multiple-user-class` Enable multiple user class option
- `no` Negate a command or set its defaults
- `option` Configure DHCP Server options
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#
```

Related Commands

- `no` Removes a configured DHCP user class policy
12.1.2.2 dhcp-class-mode commands

Use DHCP class mode commands to configure the parameters of the DHCP user class.

The following table summarizes DHCP user class configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>multiple-user-class</td>
<td>Enables or disables multiple user class option for this DHCP user class policy</td>
<td>page 12-8</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or sets its default</td>
<td>page 12-9</td>
</tr>
<tr>
<td>option</td>
<td>Configures DHCP user class options for this DHCP user class policy</td>
<td>page 12-10</td>
</tr>
</tbody>
</table>
### 12.1.2.2.1 multiple-user-class

**dhcp-class-mode commands**

Enables or disables multiple user class option for this DHCP user class policy. Enabling this option allows this user class to transmit multiple option values to other DHCP servers also supporting multiple user class options.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
multiple-user-class
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-dhcp-policy-test-class-class1)#multiple-user-class
```

```
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#show context
dhcp-class dhcpclass1
  multiple-user-class
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Disables the multiple user class option for the selected DHCP user class policy</td>
</tr>
</tbody>
</table>
### 12.1.2.2.2 no

**dhcp-class-mode commands**

Removes this DHCP user class policy's settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`no [multiple-user-class|option]`
`no option user-class <VALUE>`

**Parameters**

- `no <PARAMETERS>`
  - Disables multiple user class options on this DHCP user class policy

**Examples**

The following example shows the DHCP class settings before the 'no' commands are executed:

```
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#show context
dhcp-class dhcpclass1
  option user-class hex
  multiple-user-class
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#
```

```
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#no multiple-user-class
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#no option user-class hex
```

The following example shows the DHCP class settings after the 'no' commands are executed:

```
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#show context
dhcp-class dhcpclass1
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#
```
12.1.2.2.3 option

dhcp-class-mode commands

Configures DHCP user class options for this DHCP user class policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

option user-class <VALUE>

Parameters

- option user-class <VALUE>

<table>
<thead>
<tr>
<th>user-class &lt;VALUE&gt;</th>
<th>Configures DHCP user class options</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;VALUE&gt; – Specify the DHCP user class option's ASCII value.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-dhcp-policy-test-class-class1)#option user-class hex
rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#show context
dhcp-class dhcpclass1

option user-class hex

multiple-user-class

rfs7000-37FABE(config-dhcp-policy-test-class-dhcpclass1)#

12.1.3 dhcp-pool

The DHCP pool command creates and manages a pool of IP addresses. These IP addresses are assigned to devices using the DHCP protocol. IP addresses have to be unique for each device in the network. Since IP addresses are finite, DHCP ensures that every device, in the network, is issued a unique IP address by tracking the issue, release, and reissue of IP addresses.

The DHCP pool command configures a finite set of IP addresses that can be assigned whenever a device joins a network.

The following table summarizes DHCP pool configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp-pool</td>
<td>Creates a DHCP pool and enters its configuration mode</td>
<td>page 12-12</td>
</tr>
<tr>
<td>dhcp-pool-mode</td>
<td>Summarizes DHCP pool configuration mode commands</td>
<td>page 12-14</td>
</tr>
</tbody>
</table>
### 12.1.3.1 dhcp-pool

Configures a DHCP server address pool.

DHCP services are available for specific IP interfaces. A pool (or range) of IP network addresses and DHCP options can be created for each IP interface defined. This range of addresses is available to DHCP enabled wireless devices on either a permanent or leased basis. This enables the reuse of limited IP address resources for deployment in any network. DHCP options are provided to each DHCP client with a DHCP response and provides DHCP clients information required to access network resources (default gateway, domain name, DNS server and WINS server configuration). An option exists to identify the vendor and functionality of a DHCP client. The information is a variable-length string of characters (or octets) with a meaning specified by the vendor of the DHCP client.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

dhcp-pool <POOL-NAME>

### Parameters

- dhcp-pool <POOL-NAME>

<table>
<thead>
<tr>
<th>&lt;POOL-NAME&gt;</th>
<th>Creates a DHCP server address pool</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;POOL-NAME&gt; – Specify a name that appropriately identifies this DHCP address pool. If the pool does not exist, it is created. The pool name cannot be modified as part of the edit process. However, an obsolete address pool can be deleted.</td>
</tr>
</tbody>
</table>

### Examples

```
rfs7000-37FABE(config-dhcp-policy-test)#dhcp-pool pool1
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1)#?
DHCP pool Mode commands:
  address                Configure network pool's included addresses
  bootfile               Boot file name
  ddnss                  Dynamic DNS Configuration
  default-router         Default routers
  dns-server             DNS Servers
  domain-name            Configure domain-name
  excluded-address       Prevent DHCP Server from assigning certain addresses
  lease                  Address lease time
  netbios-name-server    NetBIOS (WINS) name servers
  netbios-node-type      NetBIOS node type
  network                Network on which DHCP server will be deployed
  next-server            Next server in boot process
  no                     Negate a command or set its defaults
  option                 Raw DHCP options
  respond-via-unicast    Send DHCP offer and DHCP Ack as unicast messages
  static-binding         Configure static address bindings
  static-route           Add static routes to be installed on dhcp clients
  update                 Control the usage of DDNS service
clrscr                  Clears the display screen
commit                  Commit all changes made in this session
do                      Run commands from Exec mode
end                     End current mode and change to EXEC mode
exit                    End current mode and down to previous mode
```

12.1.3.2.1 address

**dhcp-pool-mode commands**

Adds IP addresses to the DHCP address pool. These IP addresses are assigned to each device joining the network.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
address [<IP>|<HOST-ALIAS-NAME>|range]
address [<IP>|<HOST-ALIAS-NAME>|range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]] {class <DHCP-CLASS-NAME>}
```

**Parameters**

- **address [<IP>|<HOST-ALIAS-NAME>|range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]] {class <DHCP-CLASS-NAME>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>Adds a single IP address to the DHCP address pool</td>
</tr>
<tr>
<td>&lt;HOST-ALIAS-NAME&gt;</td>
<td>Adds a single host mapped to the specified host alias. The host alias should be existing and configured. <strong>Note:</strong> A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see alias.</td>
</tr>
</tbody>
</table>
| range [<START-IP>|<START-HOST-ALIAS-NAME>]<END-IP>|<END-HOST-ALIAS-NAME>] | Adds a range of IP addresses to the DHCP address pool. Use one of the following options to provide the first IP address in the range:

  - **<START-IP>** – Specifies the first IP address in the range
  - **<START-HOST-ALIAS-NAME>** – Specifies a host alias, mapped to the first IP address in the range

Use one of the following options to provide the last IP address in the range:

  - **<END-IP>** – Specifies the last IP address in the range
  - **<END-HOST-ALIAS-NAME>** – Specifies a host alias, mapped to the last IP address in the range

**Note:** The host aliases should be existing and configured. |
| class <DHCP-CLASS-NAME> | Optional. Applies additional DHCP options, or a modified set of options to those available to wireless clients. For more information, see dhcp-class. |

- **<DHCP-CLASS-NAME>** – Sets the DHCP class.

**Examples**

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#address 192.168.13.4 class dhcpclass1

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
    address 192.168.13.4 class dhcpclass1
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

### 12.1.3.2.2 bootfile

**dhcp-pool-mode commands**

The Bootfile command provides a diskless node path to the image file while booting up. Only one file can be configured for each DHCP pool.

For more information on the BOOTP protocol with reference to the DHCP policy, see `bootp`.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
bootfile <IMAGE-FILE-PATH>
```

**Parameters**

- `bootfile <IMAGE-FILE-PATH>`

<table>
<thead>
<tr>
<th>&lt;IMAGE-FILE-PATH&gt;</th>
<th>Sets the path to the boot image for BOOTP clients. The file name can contain letters, numbers, dots and hyphens. Consecutive dots and hyphens are not permitted.</th>
</tr>
</thead>
</table>

**Examples**

```text
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#bootfile test.txt
```

```text
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
  bootfile test.txt
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

**Related Commands**

- `no` resets the boot image path for BOOTP clients
- `bootp` configures BOOTP protocol parameters
12.1.3.2.3 ddns

dhcp-pool-mode commands

Configures Dynamic Domain Name Service (DDNS) parameters. Dynamic DNS provides a way to access an individual device in a DHCP serviced network using a static device name.

Depending on the DHCP server’s configuration, the IP address of a device changes periodically. To ensure continuous accessibility to a device (having a dynamic IP address), the device’s current IP address is published to a DDNS server that resolves the static device name (used to access the device) with a changing IP address.

The DDNS server must be accessible from outside the network and must be configured as an address resolver.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ddns [domainname|multiple-user-class|server|ttl]

ddns domainname <DDNS-DOMAIN-NAME>
ddns multiple-user-class
ddns server [<IP1>|<HOST-ALIAS-NAME1>] {<IP1>|<HOST-ALIAS-NAME1>}
ddns ttl <1-864000>

Parameters

- **ddns domainname <DDNS-DOMAIN-NAME>**

  Sets the domain name used for DNS updates

  The controller uses DNS to convert human readable host names into IP addresses. Host names are not case sensitive and can contain alphabetic or numeric letters or a hyphen. A **Fully Qualified Domain Name (FQDN)** consists of a host name plus a domain name. For example, `computername.domain.com`.

- **ddns multiple-user-class**

  Enables the multiple user class options with this DDNS domain

- **ddns server [<IP1>|<HOST-ALIAS-NAME1>] {<IP1>|<HOST-ALIAS-NAME1>**

  Configures the primary DDNS server. This is the default server.

  Use one of the following options to specify the primary DDNS server:

  - `<IP>` – Specifies the primary DDNS server’s IP address
  - `<HOST-ALIAS-NAME>` – Specifies a host alias, mapped to the primary DDNS server’s IP address. The host alias should be existing and configured.

  **Note:** A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is `$HOST` and it maps to a single host `1.1.1.100`. For more information, see alias.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `{<IP1>|<HOST-ALIAS-NAME1>}` | Optional. Configures the secondary DDNS server. If the primary server is not reachable, this server is used. Use one of the following options to identify the secondary DDNS server:  
  - `<IP>` – Specifies the secondary DDNS server’s IP address  
  - `<HOST-ALIAS-NAME>` – Specifies a host alias, mapped to the secondary DDNS server’s IP address. The host alias should be existing and configured. |
| `ttl <1-864000>` | Configures the *Time To Live* (TTL) value for DDNS updates  
  - `<1-86400>` – Specify a value from 1- 864000 seconds. |

### Examples

```plaintext
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#ddns domainname WID
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#ddns multiple-user-class
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#ddns server 192.168.13.9
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
ddns domainname WID
ddns multiple-user-class
  bootfile test.txt
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#
```

### Related Commands

- `no` resets or disables a DHCP pool's DDNS settings.
12.1.3.2.4 default-router

dhcp-pool-mode commands

Configures a default router or gateway IP address for a network pool

After a DHCP client has booted, the client begins sending packets to its default router. Set the IP address of one or a group of routers the controller uses to map host names into IP addresses available to DHCP supported clients. Up to 8 default router IP addresses are supported.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

default-router [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

Parameters

- default-router [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

Usage Guidelines

The IP address of the router should be on the same subnet as the client subnet.

Examples

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#default-router 192.168.13.8 192.168.13.9
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
ddns domainname WID
ddns multiple-user-class
bootfile test.txt
default-router 192.168.13.8 192.168.13.9
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

Related Commands

- no
  Removes the default router settings
12.1.3.2.5 dns-server

**dhcp-pool-mode commands**

Configures a network’s DNS server. The DNS server supports all clients connected to networks supported by the DHCP server.

For DHCP clients, the DNS server’s IP address maps the hostname to an IP address. DHCP clients use the DNS server’s IP address based on the order (sequence) configured.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dns-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

**Parameters**

- dns-server [<IP>|<HOST-ALIAS-NAME>] {<IP1> <HOST-ALIAS-NAME1>}

| [<IP>|<HOST-ALIAS-NAME>] | Configures the primary DNS server, using one of the following options: |
|-------------------------|---------------------------------------------------------------------|
|                         | <IP> – Specifies the primary DNS server’s IP address                  |
|                         | <HOST-ALIAS-NAME> – Specifies a host alias, mapped to the primary DNS server’s IP address |

**Note:** A maximum of 8 DNS servers can be configured.

**Note:** To enable redirection of DNS queries to OpenDNS it is necessary that the DNS server IP address provided here should point to the OpenDNS IP address. OpenDNS is a proxy DNS server that provides additional functionality, such as Web filtering, reporting, and performance enhancements. When configured on a WLAN, DNS queries from wireless clients are redirected to OpenDNS. For more information on configuring OpenDNS on a WLAN, see [opendns](#).

| {<IP1>|<HOST-ALIAS-NAME1>} | Optional. Configures the secondary DNS server, using one of the following options: |
|---------------------------|---------------------------------------------------------------------------------|
|                           | <IP1> – Specifies the secondary DNS server’s IP address                          |
|                           | <HOST-ALIAS-NAME1> – Specifies a host alias, mapped to the secondary DNS server’s IP address. If the primary DNS server is unavailable, the secondary server is used. |

**Note:** A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see [alias](#).

**Note:** A maximum of 8 DNS servers can be configured.

**Examples**

rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#dns-server 192.168.13.19
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
ddns domainname WID
ddns multiple-user-class
bootfile test.txt
default-router 192.168.13.8 192.168.13.9
dns-server 192.168.13.19
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#

12.1.3.2.6 domain-name

Sets the domain name for the DHCP pool. This is the domain name used by the controller with this pool.

Domain names are not case sensitive and can contain alphabetic or numeric letters or a hyphen. The FQDN consists of the host name and the domain name. For example, computername.domain.com.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

domain-name <DOMAIN-NAME>

Parameters
- domain-name <DOMAIN-NAME>

<table>
<thead>
<tr>
<th>&lt;DOMAIN-NAME&gt;</th>
<th>Defines the DHCP pool's domain name</th>
</tr>
</thead>
</table>

Examples

### 12.1.3.2.7 excluded-address

**dhcp-pool-mode commands**

Identifies a single IP address or a range of IP addresses, included in the DHCP address pool, that cannot be assigned to clients by the DHCP server.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

- `excluded-address [<IP>|<HOST-ALIAS-NAME>|range]`
- `excluded-address <IP>`
- `excluded-address <HOST-ALIAS-NAME>`
- `excluded-address range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]`

#### Parameters

- **excluded-address <IP>**
  - `<IP>` Adds a single IP address to the excluded address list
- **excluded-address <HOST-ALIAS-NAME>**
  - `<HOST-ALIAS-NAME>` Adds a host alias. The host alias is mapped to a host’s IP address. The host identified by the host alias is added to the excluded address list. The host alias should be existing and configured.
  - **Note:** A network host alias maps a name to a single network host. For example, ‘alias host "$HOST 1.1.1.100”’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see **alias**.
- **excluded-address range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]**
  - `<START-IP>` or `<START-HOST-ALIAS-NAME>` Adds a range of IP addresses to the excluded address list. Use one of the following options to provide the first IP address in the range:
    - `<START-IP>` – Specifies the first IP address in the range
    - `<START-HOST-ALIAS-NAME>` – Specifies a host alias, mapped to the first IP address in the range
  - `<END-IP>` or `<END-HOST-ALIAS-NAME>` Use one of the following options to provide the last IP address in the range:
    - `<END-IP>` – Specifies the last IP address in the range
    - `<END-HOST-ALIAS-NAME>` – Specifies a host alias, mapped to the last IP address in the range
  - **Note:** The host aliases should be existing and configured.
Examples

```bash
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#excluded-address range 192.168.13.25 192.168.13.28
```

```bash
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context dhcp-pool testPool
    network 192.168.13.0/24
    address 192.168.13.4 class dhcpclass1
    ddns server 192.168.13.9
    ddns domainname WID
    ddns multiple-user-class
    excluded-address range 192.168.13.25 192.168.13.28
    domain-name documentation
    bootfile test.txt
    default-router 192.168.13.8 192.168.13.9
    dns-server 192.168.13.19
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

Related Commands

12.1.3.2.8 lease

- **dhcp-pool-mode commands**

A lease is the duration a DHCP issued IP address is valid. Once a lease expires, and if the lease is not renewed, the IP address is revoked and is available for reuse. Generally, before an IP lease expires, the client tries to get the same IP address issued for the next lease period. This feature is enabled by default, with a lease period of 24 hours (1 day).

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
lease [<0-365>|infinite]
```

**Supported in the following platforms:**

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>infinite</td>
<td>The lease never expires (equal to a static IP address assignment)</td>
</tr>
</tbody>
</table>
| lease <0-365> {0-23} {0-59} {0-59} | Configures the lease duration in days  
**Note:** Days may be 0 only when hours and/or minutes are greater than 0.  
Optional. Sets the lease duration in hours  
Optional. Sets the lease duration in minutes  
Optional. Sets the lease duration in seconds  

**Examples**

12.1.3.2.9 netbios-name-server

Configures the NetBIOS (WINS) name server's IP address. This server is used to resolve NetBIOS host names.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
netbios-name-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}
```

Parameters

- `netbios-name-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}`

| [<IP>|<HOST-ALIAS-NAME>] | Configures the primary NetBIOS name server, using one of the following options: |
|--------------------------|--------------------------------------------------------------------------------|
|                         | - `<IP>` – Specifies the primary NetBIOS name server’s IP address |
|                         | - `<HOST-ALIAS-NAME>` – Specifies a host alias, mapped to the primary NetBIOS name server’s IP address |

| `{<IP1>|<HOST-ALIAS-NAME1>}` | Optional. Configures the secondary NetBIOS name server, using one of the following options: |
|-----------------------------|--------------------------------------------------------------------------------|
|                            | - `<IP1>` – Specifies the secondary NetBIOS name server’s IP address |
|                            | - `<HOST-ALIAS-NAME1>` – Specifies a host alias, mapped to the secondary NetBIOS name server’s IP address. If the primary NetBIOS name server is unavailable, the secondary server is used. |

**Note:** A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is `$HOST` and it maps to a single host `1.1.1.100`. For more information, see `alias`.

Examples

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#netbios-name-server 192.168.13.25
```

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool

Removes the NetBIOS name server settings
12.1.3.2.10 netbios-node-type

Defines the predefined NetBIOS node type. The NetBIOS node type resolves NetBIOS names to IP addresses.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
netbios-node-type [b-node|h-node|m-node|p-node]
```

**Parameters**

- `netbios-node-type [b-node|h-node|m-node|p-node]`

| [b-node|h-node] | m-node|p-node | Defines the netbios node type |
|-----------------|--------|--------|
| b-node          |        |        | • b-node — Sets the node type as broadcast. Uses broadcasts to query nodes on the network for the owner of a NetBIOS name. |
| h-node          |        |        | • h-node — Sets the node type as hybrid. Uses a combination of two or more nodes. |
| m-node          |        |        | • m-node — Sets the node type as mixed. A mixed node uses broadcast queries to find a node, and failing that, queries a known p-node name server for the address. |
| p-node          |        |        | • p-node — Sets the node type as peer-to-peer. Uses directed calls to communicate with a known NetBIOS name server (such as a WINS server), for the IP address of a NetBIOS machine. |

**Examples**

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#netbios-node-type b-node
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  network 192.168.13.0/24
  address 192.168.13.4 class dhcpclass1
  lease 100 23 59 59
  ddns server 192.168.13.9
  ddns domainname WID
  ddns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
  domain-name documentation
  netbios-node-type b-node
  bootfile test.txt
  default-router 192.168.13.8 192.168.13.9
  dns-server 192.168.13.19
  netbios-name-server 192.168.13.25
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

**Related Commands**

- `no`

  Removes the NetBIOS node type settings
12.1.3.2.11 network

dhcp-pool-mode commands

Configures the DHCP server’s network settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

network [<IP/M>|<NETWORK-ALIAS-NAME>]

Parameters
- network [<IP/M>|<NETWORK-ALIAS-NAME>]

<table>
<thead>
<tr>
<th>&lt;IP/M&gt;</th>
<th>Configures the network number and mask (for example, 192.168.13.0/24)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;NETWORK-ALIAS-NAME&gt;</td>
<td>Configures a network alias to identify the network number and mask</td>
</tr>
</tbody>
</table>

**Note:** A network alias defines a single network address. For example, `alias network $NET 1.1.1.0/24`. In this example, the network alias name is: `$NET` and the network it is mapped to is: `1.1.1.0/24`. For more information see, alias.

Examples

rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#network 192.168.13.0/24

rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#show context

Related Commands

| no                 | Removes the network number and mask configured for this DHCP pool |
12.1.3.2.12 next-server

**dhcp-pool-mode commands**

Configures the next server in the boot process

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
next-server [<IP>|<HOST-ALIAS-NAME>]
```

**Parameters**

- **next-server [<IP>|<HOST-ALIAS-NAME>]**
  - `<IP>` — Configures the next server's (the first server in the boot process) IP address
  - `<HOST-ALIAS-NAME>` — Configures a host alias, mapped to the next server's IP address
    - `<HOST-ALIAS-NAME>` — Specify the host alias name. It should be existing and configured.

**Note:** A host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’.

For more information, see [alias](#).

**Examples**

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#next-server 192.168.13.26
```

```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  network 192.168.13.0/24
  address 192.168.13.4 class dhcpclass1
  lease 100 23 59 59
  ddns server 192.168.13.9
  ddns domainname WID
  ddns domainname documentation
  netbios-node-type b-node
  bootfile test.txt
  default-router 192.168.13.8 192.168.13.9
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
next-server 192.168.13.26
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#
```

12.1.3.2.13 no

**dhcp-pool-mode commands**

Removes or resets this DHCP user pool's settings

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no [address|bootfile|ddns|default-router|dns-server|domain-name|excluded-address|
  lease|netbios-name-server|netbios-node-type|network|next-server|option|
  respond-via-unicast|static-binding|static-route|update]

no [bootfile|default-router|dns-server|domain-name|lease|netbios-name-server|
  netbios-node-type|next-server|network|respond-via-unicast]

no address [<IP>|<HOST-ALIAS-NAME>|all]
no address range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]

no ddns [domainname|multiple-user-class|server|ttl]

no excluded-address [<IP>|<HOST-ALIAS-NAME>]
no excluded-address range [<START-IP>|<START-HOST-ALIAS-NAME>] [<END-IP>|<END-HOST-ALIAS-NAME>]

no option <OPTION-NAME>

no static-binding client-identifier <CLIENT-IDENTIFIER>
no static-binding hardware-address <MAC>

no static-route <IP/MASK> <GATEWAY-IP>

no update dns {override}
```

**Parameters**

- **no <PARAMETERS>** Removes or resets this DHCP user pool's settings

**Examples**

The following example shows the DHCP pool settings before the 'no' commands are executed:

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  network 192.168.13.0/24
  address 192.168.13.4 class dhcpclass1
  lease 100 23 59 59
  ddns server 192.168.13.9
  ddns domainname WID
  ddns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
  domain-name documentation
  netbios-node-type b-node
  bootfile test.txt
  default-router 192.168.13.8 192.168.13.9
  dns-server 192.168.13.19
  netbios-name-server 192.168.13.25
  next-server 192.168.13.26
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

```
The following example shows the DHCP pool settings after the ‘no’ commands are executed:

```plaintext
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
  ddns server 192.168.13.9
  ddns multiple-user-class
  excluded-address range 192.168.13.25 192.168.13.28
  netbios-node-type b-node
  dns-server 192.168.13.19
  netbios-name-server 192.168.13.25
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```
### 12.1.3.2.14 option

**dhcp-pool-mode commands**

Configures raw DHCP options. The DHCP option must be configured under the DHCP server policy. The options configured under the DHCP pool/DHCP server policy can also be used in static-bindings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
option <OPTION-NAME> [ <DHCP-OPTION-IP> | <DHCP-OPTION-ASCII> ]
```

**Parameters**

<table>
<thead>
<tr>
<th>&lt;OPTION-NAME&gt;</th>
<th>Sets the name of the DHCP option</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DHCP-OPTION-IP&gt;</td>
<td>Sets DHCP option as an IP address</td>
</tr>
<tr>
<td>&lt;DHCP-OPTION-ASCII&gt;</td>
<td>Sets DHCP option as an ASCII string</td>
</tr>
</tbody>
</table>

**NOTE:** An option name in ASCII format accepts backslash (\) as an input but is not displayed in the output (Use `show running config` to view the output). Use a double backslash to represent a single backslash.

**Examples**

```bash
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#option option1 157.235.208.80
```

```bash
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
dns server 192.168.13.9
dns multiple-user-class
excluded-address range 192.168.13.25 192.168.13.28
netbios-node-type b-node
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
option option1 157.235.208.80
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

**Related Commands**

| no | Resets values or disables the DHCP pool option settings |
12.1.3.2.15 static-route

The `static-route` command is used to configure a static route for a DHCP pool. Static routes define a gateway for traffic intended for other networks. This gateway is always used when an IP address does not match any route in the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
static-route <IP/M> <IP>
```

Parameters

- `static-route <IP/M> <IP>`
  - `<IP/M>`: Specifies the IP destination prefix (for example, 10.0.0.0/8)
  - `<IP>`: Specifies the gateway IP address

Examples

```
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#static-route 192.168.13.0/24 192.168.13.7
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#show context dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
ddns server 192.168.13.9
dns multiple-user-class
excluded-address range 192.168.13.25 192.168.13.28
netbios-node-type b-node
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
option option1 157.235.208.80
respond-via-unicast
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#static-route 192.168.13.0/24 192.168.13.7
rfs4000-229D58(config-dhcp-policy-test-pool-testPool)#
```

Related Commands

- `no`: Removes static route settings
12.1.3.2.16 respond-via-unicast

Sends DHCP offer and acknowledgement as unicast messages

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
respond-via-unicast

Parameters
None

Examples
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#respond-via-unicast
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
  dns server 192.168.13.9
dns multiple-user-class
excluded-address range 192.168.13.25 192.168.13.28
netbios-node-type b-node
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
option option1 157.235.208.80
respond-via-unicast
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#

Related Commands

no
Disables sending of a DHCP offer and DHCP Ack as unicast messages. When disabled, sends offer and acknowledgement as broadcast messages.
12.1.3.2.17 update

- dhcp-pool-mode commands

Controls the use of the DDNS service

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
update dns {override}

Parameters
- update dns {override}

<table>
<thead>
<tr>
<th>dns {override}</th>
<th>Configures Dynamic DNS parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>override</td>
<td>Optional. Enables Dynamic DNS updates on an onboard DHCP server</td>
</tr>
</tbody>
</table>

Usage Guidelines
A DHCP client cannot perform updates for RR’s A, TXT and PTR resource records. Use `update (dns) (override)` to enable the internal DHCP server to send DDNS updates for resource records. The DHCP server can override the client, even if the client is configured to perform the updates.

In the DHCP server’s DHCP pool, FQDN is configured as the DDNS domain name. This is used internally in DHCP packets between the DHCP server and the DNS server.

Examples
```
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#update dns override
dns
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#show context
dhcp-pool testPool
  address 192.168.13.4 class dhcpclass1
update dns override
ddns server 192.168.13.9
ddns multiple-user-class
excluded-address range 192.168.13.25 192.168.13.28
netbios-node-type b-node
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
option option1 157.235.208.80
respond-via-unicast
static-route 192.168.13.0/24 192.168.13.7
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#
```

### 12.1.3.3 static-binding

**dhcp-pool-mode commands**

Configures static IP address information for a particular device. Static address binding is executed on the device’s hostname, client identifier, or MAC address. Static bindings allow the configuration of client parameters, such as DHCP server, DNS server, default routers, fixed IP address etc.

The following table summarizes static binding configuration commands:

<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
<th><strong>Reference</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>static-binding</td>
<td>Creates a static binding policy and enters its configuration mode</td>
<td>page 12-38</td>
</tr>
<tr>
<td>static-binding-</td>
<td>Invokes static binding configuration commands</td>
<td>page 12-40</td>
</tr>
<tr>
<td>mode commands</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
12.1.3.3.1 static-binding

Configures static address bindings

A static address binding is a collection of configuration parameters, including an IP address, associated with, or bound to, a DHCP client. Bindings are managed by DHCP servers. DHCP bindings automatically map a device MAC address to an IP address using a pool of DHCP supplied addresses. Static bindings assign IP addresses without creating numerous host pools with manual bindings. Static host bindings use a text file the DHCP server reads. It eliminates the need for a lengthy configuration file and reduces the space required to maintain address pools.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

static-binding [client-identifier <CLIENT>|hardware-address <MAC>]

Parameters

- static-binding [client-identifier <CLIENT>|hardware-address <MAC>]

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-identifier &lt;CLIENT&gt;</td>
<td>Enables a static binding configuration for a client based on its client identifier (as provided by DHCP option 61 and its key value)</td>
</tr>
<tr>
<td>hardware-address &lt;MAC&gt;</td>
<td>Enables a static binding configuration for a client based on its MAC address</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#static-binding client-identifier test
dhcp-pool testPool
address 192.168.13.4 class dhcpclass1
update dns override
ddns server 192.168.13.9
ddns multiple-user-class
excluded-address range 192.168.13.25 192.168.13.28
netbios-node-type b-node
dns-server 192.168.13.19
netbios-name-server 192.168.13.25
option option1 157.235.208.80
respond-via-unicast
static-route 192.168.13.0/24 192.168.13.7
static-binding client-identifier test
rfs4000-229D58 (config-dhcp-policy-test-pool-testPool)#

client-identifier <CLIENT> Enables a static binding configuration for a client based on its client identifier (as provided by DHCP option 61 and its key value)

- <CLIENT> – Specify the client identifier (DHCP option 61).

hardware-address <MAC> Enables a static binding configuration for a client based on its MAC address

- <MAC> – Specify the MAC address of the client.
DHCP static binding Mode commands:

- **bootfile**: Boot file name
- **client-name**: Client name
- **default-router**: Default routers
- **dns-server**: DNS Servers
- **domain-name**: Configure domain-name
- **ip-address**: Fixed IP address for host
- **netbios-name-server**: NetBIOS (WINS) name servers
- **netbios-node-type**: NetBIOS node type
- **next-server**: Next server in boot process
- **no**: Negate a command or set its defaults
- **option**: Raw DHCP options
- **respond-via-unicast**: Send DHCP offer and DHCP Ack as unicast messages
- **static-route**: Add static routes to be installed on dhcp clients

12.1.3.3.3 bootfile

*static-binding-mode commands*

The Bootfile command provides a diskless node the path to the image file used while booting up. Only one file can be configured for each static IP binding.

For more information on the BOOTP protocol with reference to static binding, see *bootp*.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`bootfile <IMAGE-FILE-PATH>`

**Parameters**

- `bootfile <IMAGE-FILE-PATH>`

<table>
<thead>
<tr>
<th>&lt;IMAGE-FILE-PATH&gt;</th>
<th>Sets the path to the boot image for BOOTP clients. The file name can contain letters, numbers, dots and hyphens. Consecutive dots and hyphens are not permitted.</th>
</tr>
</thead>
</table>

**Examples**

```bash
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#bootfile test.txt
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context static-binding client-identifier test
        bootfile test.txt
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

**Related Commands**

- `no` | Resets values or disables DHCP pool static binding settings
- `bootp` | Configures BOOTP protocol parameters
12.1.3.3.4 client-name

`static-binding-mode commands`

Configures the client's name

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`client-name <NAME>`

**Parameters**

- **client-name <NAME>**

  | `<NAME>` | Specify the name of the client using this static IP address host pool. Do not include the domain name. |

**Examples**

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#client-name RFID
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
  static-binding client-identifier test
  client-name RFID
  bootfile test.txt
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

**Related Commands**

```
no
```
Resets values or disables DHCP pool static binding settings
12.1.3.3.5 default-router

Configure a default router or gateway IP address for the static binding configuration

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

default-router [IP] [HOST-ALIAS-NAME] {IP1 [HOST-ALIAS-NAME1]}

Parameters

- default-router [IP] [HOST-ALIAS-NAME] {IP1 [HOST-ALIAS-NAME1]}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[IP] [HOST-ALIAS-NAME]</td>
<td>Configures the primary default router, using one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• [IP] — Specifies the primary default router’s IP address</td>
</tr>
<tr>
<td></td>
<td>• [HOST-ALIAS-NAME] — Specifies a host alias, mapped to the primary default router’s IP address</td>
</tr>
<tr>
<td>{IP1} [HOST-ALIAS-NAME1]</td>
<td>Optional. Configures the secondary default router, using one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• [IP1] — Specifies the secondary default router’s IP address</td>
</tr>
<tr>
<td></td>
<td>• [HOST-ALIAS-NAME1] — Specifies a host alias, mapped to the secondary default router’s IP address. If the primary default router is unavailable, the secondary router is used.</td>
</tr>
</tbody>
</table>

Note: A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see alias.

Usage Guidelines

The IP address of the router should be on the same subnet as the client subnet.

Examples

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#default-router 172.16.10.8 172.16.10.9

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
  static-binding client-identifier test
  client-name RFID
  bootfile test.txt
  default-router 172.16.10.8 172.16.10.9
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

Related Commands

no | Resets values or disables DHCP pool static binding settings
12.1.3.3.6 dns-server

Configures the DNS server for this static binding configuration. This DNS server supports the client for which the static binding has been configured.

For this client, the DNS server’s IP address maps the host name to an IP address. DHCP clients use the DNS server’s IP address based on the order (sequence) configured.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

dns-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

**Parameters**

- dns-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}

| [<IP>|<HOST-ALIAS-NAME>] | Configures the primary DNS server, using one of the following options:
|--------------------------|------------------------------------------------------------------------------------------------------------------|
| [<IP>|<HOST-ALIAS-NAME>]  | • <IP> – Specifies the primary DNS server’s IP address
|                          | • <HOST-ALIAS-NAME> – Specifies a host alias, mapped to the primary DNS server’s IP address

| {<IP1>|<HOST-ALIAS-NAME1>} | Optional. Configures the secondary DNS server, using one of the following options:
|---------------------------|------------------------------------------------------------------------------------------------------------------|
| {<IP1>|<HOST-ALIAS-NAME1>} | • <IP1> – Specifies the secondary DNS server’s IP address
|                          | • <HOST-ALIAS-NAME1> – Specifies a host alias, mapped to the secondary DNS server’s IP address. If the primary DNS server is unavailable, the secondary DNS server is used.

**Note:** A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see alias.

**Examples**

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#dns-server 172.16.10.7
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
   client-name RFID
   bootfile test.txt
   default-router 172.16.10.8 172.16.10.9
dns-server 172.16.10.7
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

**Related Commands**

- **no** Resets values or disables DHCP pool static binding settings
12.1.3.3.7 domain-name

Sets the domain name for the static binding configuration

Domain names are not case sensitive and contain alphabetic or numeric letters (or a hyphen). A fully qualified domain name (FQDN) consists of a host name plus a domain name. For example, computername.domain.com

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
domain-name <DOMAIN-NAME>

Parameters
- domain-name <DOMAIN-NAME>

<table>
<thead>
<tr>
<th>&lt;DOMAIN-NAME&gt;</th>
<th>Defines the domain name for the static binding configuration</th>
</tr>
</thead>
</table>

Examples
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#domain-name documentation
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
  static-binding client-identifier test
client-name RFID
domain-name documentation
  bootfile test.txt
default-router 172.16.10.8 172.16.10.9
dns-server 172.16.10.7
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

Related Commands
- no — Resets values or disables the DHCP pool static binding settings
12.1.3.3.8 ip-address

static-binding-mode commands

Configures a fixed IP address for a host

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
ip-address [<IP>|<HOST-ALIAS-NAME>]

Parameters
- ip-address [<IP>|<HOST-ALIAS-NAME>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>Configures a fixed IP address (in dotted decimal format) of the client using this host pool</td>
</tr>
<tr>
<td>&lt;HOST-ALIAS-NAME&gt;</td>
<td>Configures a host alias identifying the fixed IP address of the client using this host pool</td>
</tr>
</tbody>
</table>

Note: A network host alias maps a name to a single network host. For example, ‘alias host $HOST 1.1.1.100’. In this example the host alias is ‘$HOST’ and it maps to a single host ‘1.1.1.100’. For more information, see alias.

Examples
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#ip-address 172.16.10.9
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
  ip-address 172.16.10.9
client-name RFID
domain-name documentation
bootfile test.txt
default-router 172.16.10.8 172.16.10.9
dns-server 172.16.10.7
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

Related Commands

no | Resets values or disables DHCP pool static binding settings
12.1.3.3.9 netbios-name-server

`static-binding-mode commands`

Configures the NetBIOS (WINS) name server's IP address. This server is used to resolve NetBIOS host names.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
netbios-name-server [<IP>|<HOST-ALIAS-NAME>] {<IP1>|<HOST-ALIAS-NAME1>}
```

**Parameters**

- `netbios-name-server [<IP>|<HOST-ALIAS-NAME>]` {<IP1>|<HOST-ALIAS-NAME1>}

  - **[<IP>|<HOST-ALIAS-NAME>]**
    - Configures the primary NetBIOS server, using one of the following options:
      - `<IP>` – Specifies the primary NetBIOS name server's IP address
      - `<HOST-ALIAS-NAME>` – Specifies a host alias, mapped to the primary NetBIOS name server's IP address

  - **{<IP1>|<HOST-ALIAS-NAME1>}
    - Optional. Configures the secondary NetBIOS name server, using one of the following options:
      - `<IP1>` – Specifies the secondary NetBIOS name server's IP address
      - `<HOST-ALIAS-NAME1>` – Specifies a host alias, mapped to the secondary NetBIOS name server's IP address. If the primary NetBIOS name server is unavailable, the secondary server is used.

  **Note:** A network host alias maps a name to a single network host. For example, `alias host $HOST 1.1.1.100`. In this example the host alias is `$HOST` and it maps to a single host '1.1.1.100'. For more information, see `alias`.

**Examples**

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#netbios-name-server 172.16.10.23
```

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context static-binding client-identifier test
ip-address 172.16.10.9
client-name RFID
domain-name documentation
bootfile test.txt
default-router 172.16.10.8 172.16.10.9
dns-server 172.16.10.7
netbios-name-server 172.16.10.23
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```

**Related Commands**

| no                  | Resets values or disables DHCP pool static binding settings |
12.1.3.3.10 netbios-node-type

Configures different predefined NetBIOS node types. The NetBIOS node defines the way a device resolves NetBIOS names to IP addresses.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
netbios-node-type [b-node|h-mode|m-node|p-node]

Parameters
- netbios-node-type [b-node|h-mode|m-node|p-node]

- [b-node|h-mode|m-node|p-node] Defines the netbios node type
  - b-node – Sets the node type as broadcast. Uses broadcasts to query nodes on the network for the owner of a NetBIOS name.
  - h-node – Sets the node type as hybrid. Uses a combination of two or more nodes.
  - m-node – Sets the node type as mixed. A mixed node uses broadcast queries to find a node, and failing that, queries a known p-node name server for the address.
  - p-node – Sets the node type as peer-to-peer. Uses directed calls to communicate with a known NetBIOS name server (such as a WINS server), for the IP address of a NetBIOS machine.

Examples
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#netbios-node-type b-node
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
  static-binding client-identifier test
  ip-address 172.16.10.9
  client-name RFID
  domain-name documentation
  netbios-node-type b-node
  bootfile test.txt
  default-router 172.16.10.8 172.16.10.9
  dns-server 172.16.10.7
  netbios-name-server 172.16.10.23
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

Related Commands
- no — Resets values or disables DHCP pool static binding settings
12.1.3.3.11 next-server

> static-binding-mode commands

Configures the next server utilized in the boot process.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

next-server [〈IP〉|〈HOST-ALIAS-NAME〉]

Parameters

- next-server [〈IP〉|〈HOST-ALIAS-NAME〉]

  〈IP〉 Configures the next server's (the first server in the boot process) IP address

  〈HOST-ALIAS-NAME〉 Configures a host alias, mapped to the next server's IP address

  - 〈HOST-ALIAS-NAME〉 — Specify the host alias name. It should be existing and configured.

  **Note:** A network host alias maps a name to a single network host. For example, 'alias host $HOST 1.1.1.100'. In this example the host alias is '$HOST' and it maps to a single host '1.1.1.100'. For more information, see alias.

Examples

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#next-server 172.16.10.24

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context static-binding client-identifier test
ip-address 172.16.10.9
client-name RFID
domain-name documentation
netbios-node-type b-node
bootfile test.txt
default-router 172.16.10.8 172.16.10.9
dns-server 172.16.10.7
netbios-name-server 172.16.10.23
next-server 172.16.10.24

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

Related Commands

no Resets values or disables DHCP pool static binding settings
12.1.3.3.12 no

Negates or reverts static binding settings for the selected DHCP server policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP8XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [bootfile|client-name|default-router|dns-server|domain-name|ip-address|netbios-name-server|netbios-node-type|next-server|option|respond-via-unicast|static-route]

no option <OPTION-NAME>

no static-route <IP/MASK> <GATEWAY-IP>

Parameters

- no <PARAMETERS>

Examples

The following example shows the DHCP pool static binding settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
    ip-address 172.16.10.9
    client-name RFID
    domain-name documentation
    netbios-node-type b-node
    bootfile test.txt
    default-router 172.16.10.8 172.16.10.9
    dns-server 172.16.10.7
    netbios-name-server 172.16.10.23
    next-server 172.16.10.24
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no bootfile
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no ip-address
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no default-router
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#no dns-server
```

The following example shows the DHCP pool static binding settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
    client-name RFID
    domain-name documentation
    netbios-node-type b-node
    netbios-name-server 172.16.10.23
    next-server 172.16.10.24
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```
12.1.3.13 option

Configure the raw DHCP options in the DHCP policy. The DHCP options can be used only in static bindings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
option <OPTION-NAME> [<DHCP-OPTION-IP>|<DHCP-OPTION-ASCII>]
```

Parameters

- `option <OPTION-NAME> [<DHCP-OPTION-IP>|<DHCP-OPTION-ASCII>]`

  | <OPTION-NAME> | Sets the DHCP option name |
  | <DHCP-OPTION-IP> | Sets the DHCP option as an IP address |
  | <DHCP-OPTION-ASCII> | Sets the DHCP option as an ASCII string |

Usage Guidelines

Defines non standard DHCP option codes (0-254)

**NOTE:** An option name in ASCII format accepts a backslash (\) as an input, but is not displayed in the output (Use show running config to view the output). Use a double backslash to represent a single backslash.

Examples

```plaintext
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#option option1 172.16.10.10
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context
static-binding client-identifier test
  client-name RFID
domain-name documentation
netbios-node-type b-node
netbios-name-server 172.16.10.23
next-server 172.16.10.24
option option1 172.16.10.10
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#
```
12.1.3.3.14 respond-via-unicast

(static-binding-mode commands)

Sends a DHCP offer and DHCP acknowledge as unicast messages

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

respond-via-unicast

Parameters

None

Examples

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#respond-via-unicast

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context static-binding client-identifier test
client-name RFID
domain-name documentation
netbios-node-type b-node
netbios-name-server 172.16.10.23
next-server 172.16.10.24
option option1 172.16.10.10
respond-via-unicast
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#

12.1.3.3.15 static-route

static-binding-mode commands

Adds static routes to the static binding configuration

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

static-route <IP/MASK> <GATEWAY-IP>

Parameters

- static-route <IP/MASK> <GATEWAY-IP>

  - <IP/MASK>: Sets the subnet for which the static route is configured
  - <GATEWAY-IP>: Specify the gateway's IP address

Examples

rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-1)#static-route 10.0.0.0/10 157.235.208.235
rfs7000-37FABE(config-dhcp-policy-test-pool-pool1-binding-test)#show context

12.1.4 dhcp-server

DHCP configuration

Configures the activation-criteria (run-criteria) that triggers dynamic activation of DHCP service running on a redundancy device in a managed wireless network, when the primary, active DHCP server fails (is unreachable), network clients are unable to access DHCP services, such as new IP address leasing and renewal of existing IP address leases. In such a scenario, the activation-criteria, when configured, triggers dynamic activation of the secondary DHCP server, allowing network clients to continue accessing DHCP services. The WiNG implementation provides activation-criteria options specific to a RF Domain, cluster setup, and a Virtual Router Redundancy Protocol (VRRP) master/client setup.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dhcp-server activation-criteria [cluster-master|rf-domain-manager|vrrp-master]

Parameters
- dhcp-server activation-criteria [cluster-master|rf-domain-manager|vrrp-master]

<table>
<thead>
<tr>
<th>activation-criteria</th>
<th>Enables/disables dynamic activation of the DHCP server, running on a redundancy device, based on the activation criteria specified</th>
</tr>
</thead>
<tbody>
<tr>
<td>[cluster-master]</td>
<td>Configures the activation criteria. Specify one of the following options as the activation criteria:</td>
</tr>
<tr>
<td>rf-domain-manager</td>
<td>• cluster-master — Configures the cluster-master criteria in a cluster setup. Within a cluster, DHCP service is enabled on the cluster master. While it remains disabled on the other cluster members. In case of the cluster master failing, the cluster-master activation criteria, when configured, triggers dynamic activation of DHCP service on the new cluster master.</td>
</tr>
<tr>
<td>vrrp-master</td>
<td>• rf-domain-manager — Configures the rf-domain-manager criteria on an RF Domain. Within a RF Domain, DHCP service is enabled on the RF Domain manager. While it remains disabled on the other devices within the RF Domain. In case of the RF Domain manager failing, the rf-domain-manager activation criteria, when configured, triggers dynamic activation of DHCP service on the new RF Domain manager.</td>
</tr>
<tr>
<td></td>
<td>• vrrp-master — Configures the vrrp-master criteria within a VRRP master/client setup. In such a setup, the DHCP service is enabled on the VRRP master. While it remains disabled on the other members. In case of the VRRP master failing, the vrrp-master activation criteria, when configured, triggers dynamic activation of DHCP service on the new VRRP master.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Removes the DHCP service activation criteria configured on this DHCP server policy</td>
</tr>
</tbody>
</table>
12.1.5 no

Negates a command or sets its default. When used in the DHCP server configuration context, the ‘no’ command resets or reverts the DHCP server policy settings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [bootp|dhcp-class|dhcp-pool|dhcp-server|option|ping]

no bootp ignore
no dhcp-class <DHCP-CLASS-NAME>
no dhcp-pool <DHCP-POOL-NAME>
no dhcp-server activation-criteria
no option <DHCP-OPTION>
no ping timeout

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Negates a command or sets its default. When used in the DHCP server configuration context, the ‘no’ command resets or reverts the DHCP server policy settings |

Examples

The following example shows the DHCP policy ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
  bootp ignore
  dhcp-class dhcpclass1
dhcp-pool pooll
  address 1.2.3.4 class dhcpclass1
  update dns override
--More--
rfs7000-37FABE(config-dhcp-policy-test)#
```

```
rfs7000-37FABE(config-dhcp-policy-test)#no bootp ignore
rfs7000-37FABE(config-dhcp-policy-test)#no dhcp-class dhcpclass1
rfs7000-37FABE(config-dhcp-policy-test)#no dhcp-pool pooll
```

The following example shows the DHCP policy ‘test’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
rfs7000-37FABE(config-dhcp-policy-test)#
```
12.1.6 option

dhcp-server-policy

Configures raw DHCP options. The DHCP option has to be configured in the DHCP server policy. The options configured in the DHCP pool/DHCP server policy can also be used in static bindings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
option <OPTION-NAME> <0-254> [ascii|hexstring|ip]
```

Parameters

- **<OPTION-NAME>**<OPTION-NAME>
  - Configures the option name
- **<0-254>**
  - Configures the DHCP option code from 0 - 254
- **ascii**
  - Configures the DHCP option as an ASCII string
- **hexstring**
  - Configures the DHCP option as a hexadecimal string
- **ip**
  - Configures the DHCP option as an IP address

Usage Guidelines

Defines non standard DHCP option codes (0-254)

**NOTE:** An option name in ASCII format accepts a backslash (\) as an input, but is not displayed in the output (Use `show running config` to view the output). Use a double backslash to represent a single backslash.

Examples

```
rfs7000-37FABE(config-dhcp-policy-test)#option option1 200 ascii
rfs7000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
  option option1 200 ascii
rfs7000-37FABE(config-dhcp-policy-test)#
```

Related Commands

```
no
```
- Removes DHCP server options
12.1.7 ping

Configures the DHCP server’s ping timeout interval. The controller uses the timeout to intermittently ping and discover whether a client requested IP address is available or in use.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
ping timeout <1-10>
```

**Parameters**

- `ping timeout <1-10>`

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout &lt;1-10&gt;</td>
<td>Sets the ping timeout from 1 - 10 seconds. The default is 1 second.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-dhcp-policy-test)#ping timeout 2
rfs7000-37FABE(config-dhcp-policy-test)#show context
dhcp-server-policy test
    ping timeout 2
    option option1 200 ascii
rfs7000-37FABE(config-dhcp-policy-test)#
```

**Related Commands**

- `no`: Resets the ping interval to 1 second
12.2 dhcpv6-server-policy

DHCPv6 is a networking protocol for configuring IPv6 hosts with IP addresses, IP prefixes or other configuration attributes required on an IPv6 network.

DHCPv6 servers pass IPv6 network addresses to IPv6 clients. The DHCPv6 address assignment feature manages nonduplicate addresses in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple pools. Additional options, such as the default domain and DNS name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface or on multiple interfaces, or the server can automatically find the appropriate pool.

The following table summarizes DHCPv6 server policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>

</tbody>
</table>
### dhcpv6-pool

Configures a DHCPv6 server address pool and enters its configuration mode.

A DHCPv6 IPv6 pool is a resource from which IPv6 formatted addresses can be issued on DHCPv6 client requests. IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
dhcpv6-pool <POOL-NAME>
```

#### Parameters

- `dhcpv6-pool <POOL-NAME>`

<table>
<thead>
<tr>
<th><strong>&lt;POOL-NAME&gt;</strong></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Creates a DHCPv6 server address pool</td>
<td></td>
</tr>
<tr>
<td><code>&lt;POOL-NAME&gt;</code> — Specify a name that appropriately identifies this DHCPv6 address pool. If the pool does not exist, it is created. The pool name cannot be modified as part of the edit process. However, an obsolete address pool can be deleted.</td>
<td></td>
</tr>
</tbody>
</table>

#### Examples

```
rfs7000-37FABE(config-dhcpv6-server-policy-test)#dhcpv6-pool DHCPv6Pool1
```

```
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#?

<td>page 12-67</td>
</tr>
</tbody>
</table>
12.2.1.2.1 dns-server

Configures this DHCPv6 pool’s DNS server. The DNS server supports all clients connected to networks supported by the DHCPv6 server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dns-server <IPv6> {<SECONDARY-IPv6>}

Parameters
- dns-server <IPv6> {<SECONDARY-IPv6>}

<table>
<thead>
<tr>
<th>&lt;IPv6&gt;</th>
<th>Configures the primary DNS server’s IPv6 address</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;IPv6&gt; — Specify the DNS server’s IPv6 address (the server associated with this DHCP pool).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&lt;SECONDARY-IPv6&gt;</th>
<th>Configures the secondary DNS server’s IPv6 address</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;SECONDARY-IPv6&gt; — Specify the secondary DNS server’s IPv6 address (the server associated with this DHCP pool).</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context dhcpv6-pool DHCPv6Pool1
dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#

Related Commands

no

Removes this DHCPv6 pool’s configured DNS server settings
12.2.1.2.2 domain-name

Configures this DHCPv6 pool’s domain name

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
domain-name <DOMAIN-NAME>
```

Parameters

- `domain-name <DOMAIN-NAME>`

<table>
<thead>
<tr>
<th>&lt;DOMAIN-NAME&gt;</th>
<th>Specify the DHCP pool’s hostname or hostnames of the domain or domains</th>
</tr>
</thead>
</table>

Examples

```
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#domain-name TechPubs
dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

Related Commands

- `no`
  Removes this DHCPv6 pool’s domain name
12.2.1.2.3 **network**

**dhcpv6-pool-mode commands**

Configures this DHCPv6 pool’s network. Use this command to configure the address of the network on which this DHCP server is deployed.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
network [<IPv6/M>|<NETWORK-ALIAS-NAME>]
```

**Parameters**

- `<IPv6/M>`
- `<NETWORK-ALIAS-NAME>`

**Examples**

```
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#network 2002::0/64
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
    network 2002::/64
    domain-name TechPubs
dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

**Related Commands**

- `no`
  Removes the network IPv6 address and mask configured for this DHCPv6 pool
12.2.1.2.4 no

- **dhcpv6-pool-mode commands**

Negates a command or sets its default. When used in the DHCPv6 pool configuration context, the ‘no’ command resets or reverts the DHCPv6 pool’s settings.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no [dns-server|domain-name|network|option|refresh-time|sip]
```

**Parameters**

- no <PARAMETERS>

**Examples**

```bash
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
  network 2002::/64
  refresh-time 1000
  domain-name TechPubs
  sip domain-name TechPubsSIP
  dns-server 2002::1
  option DHCPv6Pool1Option 60
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#no option DHCPv6Pool1Option
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
  network 2002::/64
  domain-name TechPubs
  sip domain-name TechPubsSIP
  dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#no refresh-time
```

Negates a command or sets its default. When used in the DHCPv6 pool configuration context, the ‘no’ command resets or reverts the DHCPv6 pool’s settings.
12.2.1.2.5 option

**dhcpv6-pool-mode commands**

Configures this DHCPv6 pool's raw DHCPv6 options. This is the vendor-specific option used in this DHCPv6 pool.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
option <OPTION-NAME> [ [<DHCPv6-OPTION-IP>|<DHCPv6-OPTION-ASCII>]
```

**Parameters**

- **option <OPTION-NAME> [ [<DHCPv6-OPTION-IP>|<DHCPv6-OPTION-ASCII>]]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;OPTION-NAME&gt;</td>
<td>Sets the name of the DHCPv6 option</td>
</tr>
<tr>
<td>&lt;DHCPv6-OPTION-IP&gt;</td>
<td>Sets DHCPv6 option as an IPv6 address</td>
</tr>
<tr>
<td>&lt;DHCPv6-OPTION-ASCII&gt;</td>
<td>Sets DHCPv6 option as an ASCII string</td>
</tr>
</tbody>
</table>

**NOTE:** An option name in ASCII format accepts backslash (\) as an input but is not displayed in the output (Use `show running config` to view the output). Use a double backslash to represent a single backslash.

**Examples**

```plaintext
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#option DHCPv6Poo1Option 60
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context dhcpv6-pool DHCPv6Pool1
    network 2002::/64
    domain-name TechPubs
    dns-server 2002::1
    option DHCPv6Pool1Option 60
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

</table>
12.2.1.2.6 refresh-time

`dhcpv6-pool-mode commands`

Configures this DHCPv6 pool's refresh time in seconds. This is the interval between two successive DHCP pool refreshes. The DHCP refresh process refreshes IPv6 client information.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES651, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```refresh-time <600-4294967295>```

Parameters

- `refresh-time <600-4294967295>`

Examples

```rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#refresh-time 1000
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context
dhcpv6-pool DHCPv6Pool1
network 2002::/64
refresh-time 1000
domain-name TechPubs
dns-server 2002::1
option DHCPv6Pool1Option 60
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#```

Related Commands

- `no`
  Removes or reverts the configured DHCPv6 pool's refresh time
12.2.1.2.7 sip

dhcpv6-pool-mode commands

Configures this DHCPv6 pool’s Session Initiation Protocol (SIP) server setting

Configures the domain name or domain names associated with the SIP servers. The SIP server is used to prioritize voice and video traffic on the network. SIP is an application-layer control protocol that can establish, modify and terminate multimedia sessions or calls. A SIP system has several components (user agents, proxy servers, redirect servers, and registrars). User agents can contain SIP clients; proxy servers always contain SIP clients.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
sip [address <IPv6>|domain-name <DOMAIN-NAME>]
```

Parameters

- sip [address <IPv6>|domain-name <DOMAIN-NAME>]

| sip [address <IPv6>|domain-name <DOMAIN-NAME>] | Configures the SIP server’s setting, such as address and/or domain name |

Examples

```
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#sip domain-name TechPubsSIP
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#show context dhcpv6-pool DHCPv6Pool1
  network 2002::/64
  refresh-time 1000
  domain-name TechPubs
  sip domain-name TechPubsSIP
dns-server 2002::1
  option DHCPv6Pool1Option 60
rfs7000-37FABE(config-dhcpv6-server-policy-test-pool-DHCPv6Pool1)#
```

Related Commands

```
no
```

Removes this DHCPv6 pool’s SIP server setting
### 12.2.2 option

Configures this DHCPv6 server policy's DHCP option settings, such enterprise (vendor) ID

DHCPv6 services are available for specific IP interfaces. A pool (or range) of IPv6 network addresses and DHCPv6 options can be created for each IPv6 interface defined. This range of addresses can be made available to DHCPv6 enabled devices on either a permanent or leased basis. DHCPv6 options are provided to each client with a DHCPv6 response and provide DHCPv6 clients information required to access network resources (default gateway, domain name, DNS server and WINS server configuration). An option exists to identify the vendor and functionality of a DHCPv6 client. The information is a variable-length string of characters (or octets) with a meaning specified by the vendor of the DHCPv6 client.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
option <OPTION-NAME> <0-254> [ascii|hexstring|ipv6] <1-4294967295>
```

**Parameters**

- **option <OPTION-NAME> <0-254> [ascii|hexstring|ipv6] <1-4294967295>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;OPTION-NAME&gt;</td>
<td>Specify a unique name for this DHCP option. The name should describe option's function.</td>
</tr>
</tbody>
</table>
| <0-254> | Specify a DHCP option code for this option.  
  - `<0-254>` – Specify a value from 0-254.  
  **Note:** The system allows only one code, of the same value, for each DHCP option used in each DHCPv6 server policy. |
| ascii | Specifies the option type as ASCII (sends an ASCII compliant string to the client) |
| hexstring | Specifies the option type as a string of hexadecimal characters (sends a hexadecimal string to the client) |
| ipv6 | Specifies the option type as IPv6 address (sends an IPv6 compatible address to the client) |
| <1-4294967295> | This parameter is common to all option types.  
  - `<1-4294967295>` – Specifies the enterprise (vendor) ID. Specify a value from 1-4294967295.  
    The option code (1) is reserved for subnet-mask and cannot be used.  
  **Note:** Each vendor should have a unique vendor ID used by the DHCP server to issue vendor-specific DHCP options. |
### Examples

rfs7000-37FABE(config-dhcpv6-server-policy-test)#option DHCPv6ServerOption1 10 ascii 50

rfs7000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test

<table>
<thead>
<tr>
<th>command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Removes the DHCPv6 server option settings configured for this DHCPv6 server policy</td>
</tr>
</tbody>
</table>
### 12.2.3 restrict-vendor-options

Restricts the use of vendor-specific DHCP options on this DHCPv6 server policy. When restricted, vendor-specific DHCP options, configured on this DHCPv6 server policy, are not included in the DHCPv6 server replies to IPv6 clients.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
restrict-vendor-options
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-dhcpv6-server-policy-test)#restrict-vendor-options
rfs7000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
  option DHCPServerOption1 10 ascii 50
dhcpcv6-pool DHCPv6Pool1
    network 2002::/64
dns-server 2002::1
  restrict-vendor-options
rfs7000-37FABE(config-dhcpv6-server-policy-test)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Removes restriction on sending of vendor-specific options in DHCPv6 server replies to IPv6 clients</td>
</tr>
</tbody>
</table>
12.2.4 server-preference

Configures this DHCPv6 server’s preference value. When configured, the server preference value is included in the DHCPv6 server’s replies to IPv6 clients.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
server-preference <0-255>
```

Parameters

- server-preference <0-255>

<table>
<thead>
<tr>
<th>server-preference &lt;0-255&gt;</th>
<th>Configures this DHCP server’s preference value</th>
</tr>
</thead>
</table>

Parameters

- `<0-255>` — Specify a value from 0 - 255.

Examples

```
rfs7000-37FABE(config-dhcpv6-server-policy-test)#server-preference 1
rfs7000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
   option DHCPServerOption1 10 ascii 50
dhcpv6-pool DHCPv6Pool1
   network 2002::/64
domain-name TechPubs
sip domain-name TechPubsSIP
dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test)#
```

Related Commands

- `no` Removes this DHCPv6 server’s preference value
12.2.5 no dhcpv6-server-policy

Negates or reverts this DHCPv6 server policy’s settings.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [dhcpv6-pool|option|restrict-vendor-options|server-preference]

Parameters

- no <PARAMETERS>

Examples

rfs7000-37FABE(config-dhcpv6-server-policy-test)#show context
dhcpv6-server-policy test
  option DHCPServerOption1 10 ascii 50
dhcpv6-pool DHCPv6Pool1

    domain-name TechPubs
    sip domain-name TechPubsSIP
dns-server 2002::1
rfs7000-37FABE(config-dhcpv6-server-policy-test)#
This chapter summarizes the firewall policy commands in the CLI command structure.

A firewall protects a network from attacks and unauthorized access from outside the network. Simultaneously, it allows authorized users to access required resources. Firewalls work on multiple levels. Some work at layers 1, 2 and 3 to inspect each packet. The packet is either passed, dropped or rejected based on rules configured on the firewall.

Firewalls use application layer filtering to enforce compliance. These firewalls can understand applications and protocols and can detect if an unauthorized protocol is being used, or an authorized protocol is being abused in any malicious way.

The third set of firewalls, ‘Stateful Firewalls’, consider the placement of individual packets within each packet in the series of packets being transmitted. If there is a packet that does not fit into the sequence, it is automatically identified and dropped.

Use (config) instance to configure firewall policy commands. To navigate to the `config-fw-policy` instance, use the following commands:

```plaintext
<DEVICE>(config)#firewall-policy <POLICY-NAME>
```

```plaintext
rfs7000-37FABE(config)#firewall-policy test
rfs7000-37FABE(config-fw-policy-test)#?
```

Firewall policy Mode commands:

- **acllogging**: Log on flow creating traffic
- **alg**: Enable ALG
- **clamp**: Clamp value
- **dhcp-offer-convert**: Enable conversion of broadcast dhcp offers to unicast
- **dns-snoop**: DNS Snooping
- **firewall**: Wireless firewall
- **flow**: Firewall flow
- **ip**: Internet Protocol (IP)
- **ip-mac**: Action based on ip-mac table
- **ipv6**: Internet Protocol version 6 (IPv6)
- **ipv6-mac**: Action based on ipv6-mac table
- **logging**: Firewall enhanced logging
- **no**: Negate a command or set its defaults
- **proxy-arp**: Enable generation of ARP responses on behalf of another device
- **proxy-nd**: Enable generation of ND responses (for IPv6) on behalf of another device
- **stateful-packet-inspection-l2**: Enable stateful packet inspection in layer2 firewall
- **storm-control**: Storm-control
- **virtual-defragmentation**: Enable virtual defragmentation for IPv4 packets (recommended for proper functioning of firewall)
- **clrscr**: Clears the display screen
<table>

<td>page 13-33</td>
</tr>
<tr>
<td>proxy-nd</td>
<td>Enables the generation of ND responses (for IPv6) on behalf of another device</td>
<td>page 13-34</td>
</tr>
<tr>
<td>stateful-packet-inspection-12</td>
<td>Enables stateful packets-inspection in layer 2 firewall</td>
<td>page 13-35</td>
</tr>
<tr>
<td>storm-control</td>
<td>Defines storm control and logging settings</td>
<td>page 13-36</td>
</tr>
<tr>
<td>virtual-defragmentation</td>
<td>Enables virtual defragmentation of IPv4 packets</td>
<td>page 13-38</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS*.
13.1.1 acl-logging

Enables logging on flow creating traffic

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

**Syntax**

acl-logging

**Parameters**

None

**Examples**

rfs4000-229D58(config-fw-policy-test)#acl-logging

rfs4000-229D58(config-fw-policy-test)#no acl-logging

rfs4000-229D58(config-fw-policy-test)#show context firewall-policy test

no ip dos tcp-sequence-past-window

no acl-logging

rfs4000-229D58(config-fw-policy-test)#

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no acl-logging</td>
<td>Disables logging on flow creating traffic</td>
</tr>
</tbody>
</table>
### 13.1.2 alg

*firewall-policy*

Enables traffic filtering at the application layer using the *Application Layer Gateway* (ALG) feature.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

#### Syntax

```
alg [dns|facetime|ftp|pptp|sccp|sip|tftp]
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alg [dns</td>
<td>facetime</td>
</tr>
<tr>
<td>dns</td>
<td>Allows Domain Name System (DNS) traffic through the firewall using its default ports. This option is enabled by default. When enabled, you can easily permit or deny traffic based on a packet’s DNS name, instead of the IP address. Use this option when configuring ACLs allowing or denying traffic for Web sites that have a single domain name resolving to any one of multiple IP addresses.</td>
</tr>
<tr>
<td>facetime</td>
<td>Allows Apple’s FaceTime video calling traffic through the firewall using its default ports. This option is disabled by default.</td>
</tr>
<tr>
<td>ftp</td>
<td>Allows File Transfer Protocol (FTP) traffic through the firewall using its default ports. This option is enabled by default.</td>
</tr>
<tr>
<td>pptp</td>
<td>Allows Point-to-Point Tunneling Protocol (PPTP) traffic through the firewall using its default ports. PPTP, a network protocol, enables secure transfer of data from a remote client to an enterprise server by encapsulating PPP packets into IP datagrams for transmission over the Internet or other public TCP/IP-based networks. This option is enabled by default.</td>
</tr>
<tr>
<td>sccp</td>
<td>Allows Signalling Connection Control Part (SCCP) traffic through the firewall using its default ports. This option is disabled by default. SCCP is a network protocol that provides routing, flow control and error correction in telecommunication networks.</td>
</tr>
<tr>
<td>sip</td>
<td>Allows Session Initiation Protocol (SIP) traffic through the firewall using its default ports. This option is enabled by default.</td>
</tr>
<tr>
<td>tftp</td>
<td>Enables the Trivial File Transfer Protocol (TFTP) algorithm. When enabled, allows TFTP traffic through the firewall using its default ports. This option is enabled by default.</td>
</tr>
</tbody>
</table>
Examples

nx4500-5CFA2B(config-fw-policy-test)#alg facetime

nx4500-5CFA2B(config-fw-policy-test)#show context firewall-policy test
no ip dos tcp-sequence-past-window
alg facetime
nx4500-5CFA2B(config-fw-policy-test)#

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes or reverts ALG related settings</td>
</tr>
</tbody>
</table>
13.1.3 clamp

This option limits the TCP *Maximum Segment Size* (MSS) to the size of the *Maximum Transmission Unit* (MTU) discovered by path MTU discovery for the inner protocol. This ensures the packet traverses through the inner protocol without fragmentation. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

**Syntax**

`clamp tcp-mss`

**Parameters**

- `clamp tcp-mss`

**Examples**

```bash
rfs7000-37FABE(config-fw-policy-test)#clamp tcp-mss
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables limiting of the TCP MSS</td>
</tr>
</tbody>
</table>
13.1.4 dhcp-offer-convert

Enables the conversion of broadcast DHCP offers to unicast. Converting DHCP broadcast traffic to unicast traffic can help reduce network traffic loads. This option is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

Syntax
dhcp-offer-convert

Parameters
None

Examples
rfs7000-37FABE(config-fw-policy-test)#dhcp-offer-convert
rfs7000-37FABE(config-fw-policy-test)#show context
firewall-policy test
  no ip dos tcp-sequence-past-window
dhcp-offer-convert
rfs7000-37FABE(config-fw-policy-test)#

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables the conversion of broadcast DHCP offers to unicast</td>
</tr>
</tbody>
</table>
13.1.5  **dns-snoop**

Sets the timeout interval for DNS snoop table entries. DNS snoop entries provide information, such as client to IP address and client to default gateway(s) mappings. This information is used to detect if the client is sending routed packets to a wrong MAC address.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

**Syntax**

dns-snoop entry-timeout <30-86400>

**Parameters**

- dns-snoop entry-timeout <30-86400>

| entry-timeout <30-86400> | Sets the DNS snoop table entry timeout interval from 30 - 86400 seconds. An entry is retained in the DNS snoop table only for the specified time, and is deleted once this time is exceeded. The default is 1,800 seconds. |

**Examples**

```bash
rfs7000-37FABE(config-fw-policy-test)#dns-snoop entry-timeout 35
rfs7000-37FABE(config-fw-policy-test)#show context
firewall-policy test
  no ip dos tcp-sequence-past-window
dhcp-offer-convert
dns-snoop entry-timeout 35
rfs7000-37FABE(config-fw-policy-test)#
```

**Related Commands**

- *no* Removes the DNS snoop table entry timeout interval
13.1.6 firewall

*firewall-policy*

Enables a device’s firewall

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

**Syntax**

`firewall enable`

**Parameters**

- `firewall enable`

<table>
<thead>
<tr>
<th>firewall enable</th>
<th>Enables wireless firewalls</th>
</tr>
</thead>
</table>

**Examples**

```
rfs7000-37FABE(config-fw-policy-default)#firewall enable
rfs7000-37FABE(config-fw-policy-default)#
```

**Related Commands**

- `no` Disables a device’s firewall
13.1.7 flow

Defines the session flow timeout interval for different packet types

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

Syntax

flow [dhcp|timeout]
flow dhcp stateful
flow timeout [icmp|other|tcp|udp]
flow timeout [icmp|other] <1-32400>
flow timeout udp <15-32400>
flow timeout tcp [close-wait|reset|setup|stateless-fin-or-reset|stateless-general] <1-32400>
flow timeout tcp established <15-32400>

Parameters

- flow dhcp stateful

<table>
<thead>
<tr>
<th>dhcp</th>
<th>Configures DHCP packet flow</th>
</tr>
</thead>
<tbody>
<tr>
<td>stateful</td>
<td>Performs a stateful check on DHCP packets. This feature is enabled by default.</td>
</tr>
</tbody>
</table>

- flow timeout [icmp|other] <1-32400>

<table>
<thead>
<tr>
<th>timeout</th>
<th>Configures a packet timeout</th>
</tr>
</thead>
<tbody>
<tr>
<td>icmp</td>
<td>Configures the timeout for ICMP packets. The default is 30 seconds.</td>
</tr>
<tr>
<td>other</td>
<td>Configures the timeout for packets other than ICMP, TCP, or UDP. The default is 30 seconds.</td>
</tr>
<tr>
<td>&lt;1-32400&gt;</td>
<td>Configures the timeout from 1 - 32400 seconds</td>
</tr>

配置Internet协议（IP）组件

适用于以下平台：
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

语法

```
ip [dos|tcp]
```

```
ip dos tcp-max-incomplete [high|low] <1-1000>
ip tcp [adjust-mss|optimize-unnecessary-resends|recreate-flow-on-out-of-state-syn|validate-icmp-unreachable|validate-rst-ack-number|validate-rst-seq-number]
ip tcp adjust-mss <472-1460>
ip tcp [optimize-unnecessary-resends|recreate-flow-on-out-of-state-syn|validate-icmp-unreachable|validate-rst-ack-number|validate-rst-seq-number]
```

参数

- **dos**
  - 识别IP事件为DoS事件
  - 识别ASCEND DoS攻击

- **ascend**
  - 识别ASCEND DoS攻击
  - Ascend DoS攻击针对Ascend路由器的已知漏洞。发送格式化的包到Ascend的Java Configurator的UDP端口9可以导致Ascend路由器崩溃。
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>broadcast-multicast-icmp</td>
<td>Optional. Detects broadcast or multicast ICMP DoS attacks. These attacks spoof the source address of the target and send ICMP broadcast or multicast echo requests to the rest of the network, flooding the target machine with replies.</td>
</tr>
<tr>
<td>chargen</td>
<td>Optional. Detects Chargen attacks. The Character Generation Protocol (chargen) is an IP suite service primarily used for testing and debugging networks. It is also used as a source of generic payload for bandwidth and QoS measurements. The Chargen attack establishes a Telnet connection to port 19 and attempts to use the character generator service to create a string of characters which is then directed to the DNS service on port 53 to disrupt DNS services.</td>
</tr>
<tr>
<td>fraggle</td>
<td>Optional. Detects Fraggle DoS attacks. The Fraggle DoS attack uses a list of broadcast addresses to send spoofed UDP packets to each broadcast address’ echo port (port 7). Each of those addresses that have port 7 open will respond to the request generating a lot of traffic on the network. For those that do not have port 7 open they will send an unreachable message back to the originator, further clogging the network with more traffic.</td>
</tr>
<tr>
<td>ftp-bounce</td>
<td>Optional. Detects FTP bounce attacks. A FTP bounce attack is a MIM attack that enables an attacker to open a port on a different machine using FTP. FTP requires that when a connection is requested by a client on the FTP port (21), another connection must open between the server and the client. To confirm, the PORT command has the client specify an arbitrary destination machine and port for the data connection. This is exploited by the attacker to gain access to a device that may not be the originating client.</td>
</tr>
<tr>
<td>invalid-protocol</td>
<td>Optional. Enables a check for an invalid protocol number. Attackers may use vulnerability in the endpoint implementation by sending invalid protocol fields, or may misuse the misinterpretation of endpoint software. This can lead to inadvertent leakage of sensitive network topology information, call hijacking, or a DoS attack.</td>
</tr>
<tr>
<td>ip-ttl-zero</td>
<td>Optional. Enables a check for the TCP/IP TTL field having a value of zero (0). The TCP IP TTL Zero DoS attack sends spoofed multicast packets onto the network which have a <em>Time to Live</em> (TTL) of 0. This causes packets to loop back to the spoofed originating machine, and can cause the network to overload.</td>
</tr>
<tr>
<td>ipsproof</td>
<td>Optional. Enables a check for the IP spoofing DoS attacks. IP Spoof is a category of DoS attack that sends IP packets with forged source addresses. This can hide the identity of the attacker.</td>
</tr>
<tr>
<td>land</td>
<td>Optional. Detects LAND DoS attacks. A <em>Local Area Network Denial</em> (LAND) is a DoS attack where IP packets are spoofed and sent to a device where the source IP and destination IP of the packet are the target device’s IP, and similarly, the source port and destination port are open ports on the same device. This causes the attacked device to reply to itself continuously.</td>
</tr>
<tr>
<td>option-route</td>
<td>Optional. Enables an IP Option Record Route DoS check.</td>
</tr>
<tr>
<td>Pattern</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>router-advt</td>
<td>Optional. Detects router-advertisement attacks. This attack uses ICMP to redirect the network router function to some other host. If that host can not provide router services, a DoS of network communications occurs as routing stops. This can also be modified to single out a specific system, so that only that system is subject to attack (because only that system sees the 'false' router). By providing router services from a compromised host, the attacker can also place themselves in a man-in-the-middle situation and take control of any open channel at will (as mentioned earlier, this is often used with TCP packet forgery and spoofing to intercept and change open TELNET sessions).</td>
</tr>
<tr>
<td>router-solicit</td>
<td>Optional. Detects router solicitation attacks. The ICMP router solicitation scan is used to actively find routers on a network. A hacker could set up a protocol analyzer to detect routers as they broadcast routing information on the network. In some instances, however, routers may not send updates. For example, if the local network does not have other routers, the router may be configured to not send routing information packets onto the local network. ICMP offers a method for router discovery. Clients send ICMP router solicitation multicasts onto the network, and routers must respond (as defined in RFC 1122). (For more information about the process of ICMP router solicitation, see “Routing Sequences for ICMP.”) By sending ICMP router solicitation packets (ICMP type 9) on the network and listening for ICMP router discovery replies (ICMP type 10), hackers can build a list of all of the routers that exist on a network segment. Hackers often use this scan to locate routers that do not reply to ICMP echo requests.</td>
</tr>
<tr>
<td>smurf</td>
<td>Optional. In this attack, a large number of ICMP echo packets are sent with a spoofed source address. This causes the device with the spoofed source address to be flooded with a large number of replies.</td>
</tr>
<tr>
<td>snork</td>
<td>Optional. This attack causes a remote Windows™ NT to consume 100% of the CPU’s resources. This attack uses a UDP packet with a destination port of 135 and a source port of 7, 9, or 135. This attack can also be exploited as a bandwidth consuming attack.</td>
</tr>
<tr>
<td>tcp-bad-sequence</td>
<td>Optional. A DoS attack that uses a specially crafted TCP packet to cause the targeted device to drop all subsequent network traffic for a specific TCP connection.</td>
</tr>
<tr>
<td>tcp-fin-scan</td>
<td>Optional. Detects TCP FIN scan attacks. Hackers use the TCP FIN scan to identify listening TCP port numbers based on how the target device reacts to a transaction close request for a TCP port (even though no connection may exist before these close requests are made). This type of scan can get through basic firewalls and boundary routers that filter on incoming TCP packets with the Finish (FIN) and ACK flag combination. The TCP packets used in this scan include only the TCP FIN flag setting. If the target device’s TCP port is closed, the target device sends a TCP RST packet in reply. If the target device’s TCP port is open, the target device discards the FIN and sends no reply.</td>
</tr>
</tbody>
</table>
### tcp-intercept
Optional. Prevents TCP intercept attacks by using TCP SYN cookies.

A SYN-flooding attack occurs when a hacker floods a server with a barrage of requests for connection. Because these messages have unreachable return addresses, the connections cannot be established. The resulting volume of unresolved open connections eventually overwhims the server and can cause it to deny service to valid requests, thereby preventing legitimate users from connecting to a Web site, accessing e-mail, using FTP service, and so on.

The TCP intercept feature helps prevent SYN-flooding attacks by intercepting and validating TCP connection requests. In intercept mode, the TCP intercept software intercepts TCP synchronization (SYN) packets from clients to servers that match an extended access list. The software establishes a connection with the client on behalf of the destination server, and if successful, establishes the connection with the server on behalf of the client and knits the two half-connections together transparently. Thus, connection attempts from unreachable hosts will never reach the server. The software continues to intercept and forward packets throughout the duration of the connection. The number of SYNs per second and the number of concurrent connections proxied depends on the platform, memory, processor, and other factors. In the case of illegitimate requests, the software's aggressive timeouts on half-open connections and its thresholds on TCP connection requests protect destination servers while still allowing valid requests.

When establishing a security policy using TCP intercept, you can choose to intercept all requests or only those coming from specific networks or destined for specific servers. You can also configure the connection rate and threshold of outstanding connections. Optionally operate TCP intercept in watch mode, as opposed to intercept mode. In watch mode, the software passively watches the connection requests flowing through the router. If a connection fails to get established in a configurable interval, the software intervenes and terminates the connection attempt.

### tcp-null-scan
Optional. Detects TCP NULL scan attacks.

Hackers use the TCP NULL scan to identify listening TCP ports. This scan also uses a series of strangely configured TCP packets, which contain a sequence number of 0 and no flags. Again, this type of scan can get through some firewalls and boundary routers that filter incoming TCP packets with standard flag settings.

If the target device’s TCP port is closed, the target device sends a TCP RST packet in reply. If the target device’s TCP port is open, the target discards the TCP NULL scan, sending no reply.

### tcp-post-syn
Optional. Detects TCP post SYN DoS attacks.

A remote attacker may be attempting to avoid detection by sending a SYN frame with a different sequence number than the original SYN. This can cause an Intrusion Detection System (IDS) to become unsynchronized with the data in a connection. Subsequent frames sent during the connection are ignored by the IDS.

### tcp-sequence-past-window
Optional. Enables a TCP SEQUENCE PAST WINDOW DoS attack check. Disable this check to work around a bug in Windows XP’s TCP stack which sends data past the window when conducting a selective ACK.

### tcp-xmas-scan
Optional. A TCP XMAS scan finds services on ports. A closed port returns a RST. This allows the attacker to identify open ports.

### tcphdrfrag
Optional. A DoS attack where the TCP header spans IP fragments.

### twinge
Optional. A twinge attack is a flood of false ICMP packets to try and slow down a system.

13.1.9 ip-mac

`firewall-policy`

Defines an action based on the device IP MAC table, and also detects conflicts between IP addresses and MAC addresses

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

**Syntax**

```
ip-mac [conflict|routing]
```

```
ip-mac conflict drop-only
```

```
ip-mac conflict [log-and-drop|log-only] log-level [<0-7>|alerts|critical|debug|emergencies|errors|informational|notifications|warnings]
```

```
ip-mac routing conflict drop-only
```

```
ip-mac routing [log-and-drop|log-only] log-level [<0-7>|alerts|critical|debug|emergencies|errors|informational|notifications|warnings]
```

**Parameters**

- **conflict**
  - Action performed when a conflict exists between the IP address and MAC address. This option is enabled by default.
- **drop-only**
  - Drops a packet without logging
- **ip-mac conflict [log-and-drop|log-only] log-level [<0-7>|alerts|critical|debug|emergencies|errors|informational|notifications|warnings]**
- **log-and-drop**
  - Logs the event and drops the packet. This is the default setting.
- **log-only**
  - Logs the event only, the packet is not dropped
- **log-level**
  - Configures the log level
- **<0-7>**
  - Sets the numeric logging level
- **alerts**
  - Numerical severity 1. Indicates a condition where immediate action is required
- **critical**
  - Numerical severity 2. Indicates a critical condition
- **debugging**
  - Numerical severity 7. Debugging messages
- **emergencies**
  - Numerical severity 0. System is unusable
- **errors**
  - Numerical severity 3. Indicates an error condition
- **informational**
  - Numerical severity 6. Indicates a informational condition
### IP-MAC Routing Conflict Detection

#### Action

- **drop-only**: Drops a packet without logging.
- **log-and-drop**: Logs the event and drops the packet. This is the default setting.
- **log-only**: Logs the event only, the packet is not dropped.

#### Log Level

- **alerts (0)**: Indicates a condition where immediate action is required.
- **critical (1)**: Indicates a critical condition.
- **debugging (7)**: Debugging messages.
- **emergencies (0)**: System is unusable.
- **errors (3)**: Indicates an error condition.
- **informational (6)**: Indicates an informational condition.
- **notification (5)**: Indicates a normal but significant condition.
- **warnings (4)**: Indicates a warning condition. This is the default setting.

#### Examples

```plaintext
rfs7000-37FABE(config-rw-policy-test)#ip-mac conflict drop-only
rfs7000-37FABE(config-rw-policy-test)#ip-mac routing conflict log-and-drop log-level notifications
```
rfs7000-37FABE(config-fw-policy-test)#show context
firewall-policy test
    ip dos fraggle drop-only
    ip dos tcp-sequence-past-window drop-only
    ip dos tcp-max-incomplete high 600
    ip dos tcp-max-incomplete low 60
    ip-mac conflict drop-only
    ip-mac routing conflict log-only log-level notifications
    flow timeout icmp 16000
    flow timeout udp 10000
    flow timeout tcp established 1500
    flow timeout other 16000
    dhcp-offer-convert

ipv6 [firewall enable|rewrite-flow-label]
```

**Parameters**

- dos {hop-limit-zero/multicast-icmpv6/tcp-intercept-mobility}
[drop-only|log-and-drop|log-only]

<table>
<thead>
<tr>
<th>dos</th>
<th>Identifies IPv6 events as DoS events</th>
</tr>
</thead>
<tbody>
<tr>
<td>hop-limit-zero</td>
<td>Optional. Enables/disables checking of IPv6 hop limit field. If the IPv6 hop limit field is ZERO (0) it is considered as attack. This option is enabled by default.</td>
</tr>
<tr>
<td>tcp-intercept-mobility</td>
<td>Optional. Enables/disables detection of multicast ICMPv6 traffic as attack. This option is applicable only to ICMPv6 Echo request or reply packets. This option is enabled by default.</td>
</tr>
<tr>
<td>drop-only</td>
<td>This parameter is common to all of the above keywords. Drops all packets. Drops the specified packet type (hop-limit-zero, multicast-icmpv6, and tcp-intercept-mobility).</td>
</tr>
<tr>
<td>log-and-drop</td>
<td>Logs the event and drops the packet. Drops the specified packet type (hop-limit-zero, multicast-icmpv6, and tcp-intercept-mobility) and logs an event.</td>
</tr>
<tr>
<td>log-only</td>
<td>Logs the event only, the packet is not dropped. Does not drop the specified packet type (hop-limit-zero, multicast-icmpv6, and tcp-intercept-mobility). But, an event is logged.</td>
</tr>
</tbody>
</table>
### Firewall Policy

**log-level**

If selecting the "log-and-drop" and "log-only" action type, specify the log level. The options are:
- `<0-7>` – Sets the numeric logging level
- alerts – Numerical severity 1. Indicates a condition where immediate action is required
- critical – Numerical severity 2. Indicates a critical condition
- debugging – Numerical severity 7. Debugging messages
- emergencies – Numerical severity 0. System is unusable
- errors – Numerical severity 3. Indicates an error condition
- informational – Numerical severity 6. Indicates a informational condition
- notifications – Numerical severity 5. Indicates a normal but significant condition
- warnings – Numerical severity 4. Indicates a warning condition. This is the default setting.

**ipv6 [duplicate-options|routing-type [one|two]|strict-ext-hdr-check|unknown-options] [drop-only|log-and-drop|log-only]**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>duplicate-options</td>
<td>Enables/disables handling of duplicate options in hop-by-hop and destination option extension headers. This configuration excludes HAO handling. This option is enabled by default.</td>
</tr>
</tbody>
</table>
| routing-type [one|two] | Enables/disables checking of the following IPv6 routing types:  
  - one – Routing Type 1(Nimrod routing). This option is disabled by default.  
  - two – Routing Type 2(Mobile IP). This option is disabled by default. |
| strict-ext-hdr-check | Enables/disables strict checking for out of order and number of occurrences of extension header. This option is enabled by default. |
| unknown-options | Enables/disables handling unknown options in hop-by-hop and destination option extension headers. This option is enabled by default. |
| drop-only        | This parameter is common to all of the above keywords.  
  Drops all packets. Drops the packet if matching any of the above specified types. |
| log-and-drop     | Logs the event and drops the packet. Drops the packet, if matching any of the above specified types, and logs an event. |
| log-only         | Logs the event only, the packet is not dropped. Does not drop the packet, if matching any of the above specified types. But an event is logged. |
| log-level        | If selecting the "log-and-drop" and "log-only" action type, specify the log level. The options are:  
  - `<0-7>` – Sets the numeric logging level  
  - alerts – Numerical severity 1. Indicates a condition where immediate action is required  
  - critical – Numerical severity 2. Indicates a critical condition  
  - debugging – Numerical severity 7. Debugging messages  
  - emergencies – Numerical severity 0. System is unusable  
  - errors – Numerical severity 3. Indicates an error condition  
  - informational – Numerical severity 6. Indicates a informational condition  
  - notifications – Numerical severity 5. Indicates a normal but significant condition  
  - warnings – Numerical severity 4. Indicates a warning condition. This is the default setting. |
ipv6 option {endpoint-identification|network-service-access-point|router-alert|strict-hao-opt-alert|strict-padding} [drop-only|log-and-drop|log-only]

<table>
<thead>
<tr>
<th>option</th>
<th>Enables/disables checking for the following ipv6 extension header options:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- End point identification option (disabled by default)</td>
</tr>
<tr>
<td></td>
<td>- Network service access point address option (disabled by default)</td>
</tr>
<tr>
<td></td>
<td>- Router alert option (disabled by default)</td>
</tr>
<tr>
<td></td>
<td>- Home address option in destination option extension header (enabled by default)</td>
</tr>
<tr>
<td></td>
<td>- Pad1 and PadN options validating (enabled by default)</td>
</tr>
<tr>
<td>Note:</td>
<td>All of these are optional parameters. If no option is specified, the system enables checks as per the default values.</td>
</tr>
</tbody>
</table>

| drop-only      | This parameter is common to all of the above keywords.                                                                                   |
|                | Drops all packets. Drops the packet if matching any of the above specified “option” types.                                              |
| log-and-drop   | Logs the event and drops the packet. Drops the packet, if matching any of the above specified “option” types, and logs an event.        |
| log-only       | Logs the event only, the packet is not dropped. Does not drop the packet, if matching any of the above specified “option” types. But an event is logged. |

log-level

If selecting the “log-and-drop” and “log-only” action type, specify the log level. The options are:
- <0-7> – Sets the numeric logging level
- alerts – Numerical severity 1. Indicates a condition where immediate action is required
- critical – Numerical severity 2. Indicates a critical condition
- debugging – Numerical severity 7. Debugging messages
- emergencies – Numerical severity 0. System is unusable
- errors – Numerical severity 3. Indicates an error condition
- informational – Numerical severity 6. Indicates a informational condition
- notifications – Numerical severity 5. Indicates a normal but significant condition
- warnings – Numerical severity 4. Indicates a warning condition. This is the default setting.

ipv6 [firewall enable|rewrite-flow-label]

<table>
<thead>
<tr>
<th>firewall enable</th>
<th>Enables/disables IPv6 firewall. This option is enabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>rewrite-flow-label</td>
<td>Rewrites the IPv6 flow label field of every packet. This option is disabled by default.</td>
</tr>
</tbody>
</table>

Examples

Related Commands

no

Resets this firewall policy’s IPv6 components
13.1.11 ipv6-mac

- firewall-policy

Defines an action based on conflicts detected in a device’s IPv6 and MAC addresses

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

Syntax

```
ipv6-mac [conflict|routing]
ipv6-mac conflict [drop-only|log-and-drop|log-only]
ipv6-mac routing conflict [drop-only|log-and-drop|log-only]
```

Parameters

- **ipv6-mac conflict [drop-only|log-and-drop|log-only]**
  - conflict Enables/disables detection of conflict between a device’s IPv6 and MAC addresses. This option is enabled by default.
  - This command also specifies the action to be performed when a such a conflict is detected. The options are: drop-only, log-and-drop, and log-only
  - drop-only Drops a packet (with conflicting IPv6 and MAC address) without logging
  - log-and-drop Logs the event and drops the packet. This is the default setting.
  - log-only Logs the event only, the packet is not dropped
  - log-level If selecting the “log-and-drop” and “log-only” action type, specify the log level. The options are:
    - <0-7> – Sets the numeric logging level
    - alerts – Numerical severity 1. Indicates a condition where immediate action is required
    - critical – Numerical severity 2. Indicates a critical condition
    - debugging – Numerical severity 7. Debugging messages
    - emergencies – Numerical severity 0. System is unusable
    - errors – Numerical severity 3. Indicates an error condition
    - informational – Numerical severity 6. Indicates a informational condition
    - notifications – Numerical severity 5. Indicates a normal but significant condition
    - warnings – Numerical severity 4. Indicates a warning condition. This is the default setting.
- **ipv6-mac routing conflict [drop-only|log-and-drop|log-only]**
  - routing conflict Enables/disables detection of conflict between the next-hop’s IPv6 and MAC addresses. This option is enabled by default.
  - This command also specifies the action to be performed when a such a conflict is detected. The options are: drop-only, log-and-drop, and log-only
  - drop-only Drops a packet (with conflicting next-hop IPv6 and MAC addresses) without logging
**Examples**

```
nx4500-5CFA2B(config-fw-policy-test)#ipv6-mac routing conflict drop-only
```

```
nx4500-5CFA2B(config-fw-policy-test)#show context
firewall-policy test
  no ip dos tcp-sequence-past-window
  ipv6 routing-type two log-and-drop log-level warnings
  ipv6 dos hop-limit-zero drop-only
  ipv6-mac routing conflict drop-only
nx4500-5CFA2B(config-fw-policy-test)#
```

13.1.12 logging

**firewall-policy**

Configures enhanced firewall logging

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

**Syntax**

logging [icmp-packet-drop|malformed-packet-drop|verbose]

logging verbose
logging [icmp-packet-drop|malformed-packet-drop] [all|rate-limited]

**Parameters**

- logging verbose

  logging Configures enhanced firewall logging. This option is disabled by default.

  verbose Enables verbose logging

- logging [icmp-packet-drop|malformed-packet-drop] [all|rate-limited]

  logging Configures enhanced firewall logging

  icmp-packet-drop Drops ICMP (ICMPv4 and ICMPv6) packets that do not pass sanity checks. The default is none.

  malformed-packet-drop Drops raw IP (IPv4 and IPv6) packets that do not pass sanity checks. The default is none.

  all Logs all messages

  rate-limited Enables rate-limited logging. This option sets the rate limit for log messages to one message every 20 seconds.

**Examples**

rfs7000-37FABE(config-rw-policy-test)#logging verbose
rfs7000-37FABE(config-rw-policy-test)#logging icmp-packet-drop rate-limited
rfs7000-37FABE(config-rw-policy-test)#logging malformed-packet-drop all

### 13.1.14 proxy-arp

Enables the generation of ARP responses on behalf of another device. Proxy ARP allows the Firewall to handle ARP routing requests for devices behind the firewall. This option is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

#### Syntax

`proxy-arp`

#### Parameters

None

#### Examples

```
    rfs7000-37FABE(config-fw-policy-test)#proxy-arp
    rfs7000-37FABE(config-fw-policy-test)#
```

#### Related Commands

- `no` Disables the generation of ARP responses on behalf of another device
13.1.15 proxy-nd

Enables generation of ND responses (for IPv6) on behalf of another device

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

**Syntax**

`proxy-nd`

**Parameters**

None

**Examples**

```
nx9500-6C8809(config-fw-policy-fw1)#proxy-nd
nx9500-6C8809(config-fw-policy-fw1)#
```

13.1.16 stateful-packet-inspection-l2

Enables layer 2 firewall stateful packet inspection. When enabled, allows stateful packet inspection for RF Domain manager routed interfaces within the layer 2 firewall. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

Syntax

stateful-packet-inspection-l2

Parameters

None

Examples

rfs7000-37FABE(config-fw-policy-test)#stateful-packet-inspection-l2
rfs7000-37FABE(config-fw-policy-test)#

Related Commands

no | Disables stateful packet inspection in a layer 2 firewall
### 13.1.17 storm-control

**firewall-policy**

Enables storm control on the firewall policy.

Storms are packet bombardments that exceed the high threshold value configured for an interface. During a storm, packets are throttled until the rate falls below the configured rate, severely impacting performance for the RF Domain manager interface.

Storm control limits multicast, unicast and broadcast frames accepted and forwarded by a device. Messages are logged based on their severity level.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

**Syntax**

```
storm-control [arp broadcast|multicast|unicast]
storm-control [arp broadcast|multicast|unicast] [level|log]
storm-control [arp broadcast|multicast|unicast] level <1-1000000> [fe <1-4>|ge <1-8>|port-channel <1-8>|up1|wlan <WLAN-NAME>]
storm-control [arp broadcast|multicast|unicast] log [<0-7>|alerts|critical|debugging|emergencies|errors|informational|none|notifications|warnings]
```

**Parameters**

- **arp** — Configures storm control for ARP packets
- **broadcast** — Configures storm control for broadcast packets
- **multicast** — Configures storm control for multicast packets
- **unicast** — Configures storm control for unicast packets

```

Related Commands

```
no
```
Disables storm control limits on multicast, unicast, and broadcast frames accepted and forwarded by a device
13.1.18 virtual-defragmentation

Enables the virtual defragmentation of IPv4 and IPv6 packets. This parameter is required for optimal firewall functionality and is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9000

Syntax

```
virtual-defragmentation {maximum-defragmentation-per-host <1-16384>|
maximum-fragments-per-datagram <2-8129>|
minimum-first-fragment-length <8-1500>|timeout <1-60>}
```

Parameters

- **virtual-defragmentation {maximum-defragmentation-per-host <1-16384>|
maximum-fragments-per-datagram <2-8129>|
minimum-first-fragment-length <8-1500>|timeout <1-60>}

<table>
<thead>
<tr>

<td>Optional. Defines the minimum length required for the first fragment (applicable to IPv4 and IPv6 packets)</td>
</tr>
<tr>
<td>timeout &lt;1-60&gt;</td>
<td>Optional. Configures a virtual defragmentation timeout, in seconds, applicable to both IPv4 and IPv6 packets</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-fw-policy-test)#virtual-defragmentation maximum-fragments-per-datagram 10
rfs7000-37FABE(config-fw-policy-test)#virtual-defragmentation minimum-first-fragment-length 100
```

Related Commands

```
no
```
Resets values or disables virtual defragmentation settings
This chapter summarizes MiNT policy commands in the CLI command structure.

All communication using the MiNT transport layer can be optionally secured. This includes confidentiality, integrity and authentication of all communications. In addition, a device can be configured to communicate over MiNT with other devices authorized by an administrator.

Use the (config) instance to configure mint-policy related configuration commands. To navigate to the config MiNT policy instance, use the following command:

```
<DEVICE>(config)#mint-policy global-default
```

```
rfs7000-37FABE(config-mint-policy-global-default)#?
```

Mint Policy Mode commands:

- **level** Mint routing level
- **mtu** Configure the global Mint MTU
- **no** Negate a command or set its defaults
- **router** Mint router
- **udp** Configure mint UDP/IP encapsulation

```
clrscr  Clears the display screen
commit  Commit all changes made in this session
do     Run commands from Exec mode
end    End current mode and change to EXEC mode
exit   End current mode and down to previous mode
help   Description of the interactive help system
revert Revert changes
service Service Commands
show   Show running system information
write  Write running configuration to memory or terminal
```

```
rfs7000-37FABE(config-mint-policy-global-default)#
```

---

**NOTE:** The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
### 14.1 mint-policy

**MINT-POLICY**

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS*. 
14.1.1 level

`mint-policy`

Configures the global MiNT routing level

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`level 2 area-id <1-16777215>`

**Parameters**

- `level 2 area-id <1-16777215>`

<table>
<thead>
<tr>
<th>level 2</th>
<th>Configures level 2 inter-site MiNT routing</th>
</tr>
</thead>
<tbody>
<tr>
<td>area-id</td>
<td>Configures the routing area identifier</td>
</tr>
<tr>
<td>&lt;1-16777215&gt;</td>
<td>&lt;1-16777215&gt; — Specify a value from 1 - 16777215.</td>
</tr>
<tr>
<td></td>
<td>The level 2 area ID is the global MiNT area identifier. This area identifier separates two overlapping MiNT networks. Configure the level 2 area ID only if there are two MiNT networks sharing the same packet broadcast domain.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-mint-policy-global-default)#level 2 area-id 2000
rfs7000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  level 2 area-id 2000
rfs7000-37FABE(config-mint-policy-global-default)#
```

**Related Commands**

`no` Disables level 2 MiNT packet routing (inter-site packet routing)
14.1.2 mtu

mint-policy

Configures global MiNT Multiple Transmission Unit (MTU). Use this command to specify the maximum packet size, in bytes, for MiNT routing. Higher the MTU values, greater is the network efficiency. The user data per packet increases, while protocol overheads, such as headers or underlying per-packet delays remain the same.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
mtu <900-1500>
```

Parameters

- `mtu <900-1500>`

| <900-1500> | Specifies the maximum packet size from 900 - 1500 bytes
| --- | ---
| The maximum packet size specified is rounded down to a value using the following formula: 4 + a multiple of 8. The MTU setting specifies the maximum packet size used for MiNT packets. Larger packets are fragmented to fit within the specified packet size limit. You may want to configure this parameter if the MiNT backhaul network requires or recommends smaller packet sizes. The default value is 1500 bytes.

Examples

```
rfs7000-37FABE(config-mint-policy-global-default)#mtu 1000
rfs7000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  mtu 996
  level 2 area-id 2
rfs7000-37FABE(config-mint-policy-global-default)#
```

Related Commands

- `no`
  Reverts the configured MiNT MTU value to its default (1500 bytes)
  Negates the configured maximum packet size for MiNT routing
14.1.3 router

Configures the priority for MiNT router packets (HELLO, LSP, PSNP, and EXTVLAN)

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
router packet priority <0-7>

Parameters
- router packet priority <0-7>

| router packet priority <0-7> | Allows you to configure the priority for MiNT router packets from 0 - 7. The default is 5.  
| Note: Higher the value higher is the priority. Therefore, seven (7) represents highest priority. |

Examples
rfs4000-229D58 (config-mint-policy-global-default)#router packet priority 4
rfs4000-229D58 (config-mint-policy-global-default)#show context
rfs4000-229D58 (config-mint-policy-global-default)#

Related Commands
- no Reverts the MiNT router packet priority to default (5)
### 14.1.4 udp

#### mint-policy

Configures MiNT UDP/IP encapsulation parameters. Use this command to configure the default UDP port used for MiNT control packet encapsulation.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
udp port <2-65534>
```

#### Parameters

- `port <2-65534>`
  
  Configures default UDP port used for MiNT control packet encapsulation

  - `<2-65534>` – Enter a value from 2 - 65534. This value specifies an alternate UDP port used by MiNT control packets and must be an even number. The specified port number plus 1 is used to carry MiNT data packets. The default value is 24576.

#### Examples

```
rfs7000-37FABE(config-mint-policy-global-default)#udp port 1024
rfs7000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  udp port 1024
  mtu 996
  level 2 area-id 2000
  sign-unknown-device
  security-level control-and-data
  rejoin-timeout 1000
rfs7000-37FABE(config-mint-policy-global-default)#
```

#### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Reverts MiNT UDP/IP encapsulation to its default</td>
</tr>
</tbody>
</table>
14.1.5 **no**

Negates a command or reverts values to their default. When used in the config MiNT policy mode, the **no** command resets or reverts the following global MiNT policy parameters: routing level, MTU, router packet priority, and UDP or IP encapsulation settings.

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no [level|mtu|router|udp]
no level 2 area-id
no mtu
no router packet priority
no udp port <LINE-SINK>
```

**Parameters**

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>The <strong>no</strong> command resets or reverts the following global MiNT policy parameters: routing level, MTU, router packet priority, and UDP or IP encapsulation settings.</th>
</tr>
</thead>
</table>

**Examples**

The following example shows the global Mint Policy parameters before the ‘**no**’ commands are executed:

```
rfs7000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  udp port 1024
  mtu 996
  level 2 area-id 2000
  sign-unknown-device
  security-level control-and-data
  rejoin-timeout 1000
rfs7000-37FABE(config-mint-policy-global-default)#
rfs7000-37FABE(config-mint-policy-global-default)#no level 2 area-id
rfs7000-37FABE(config-mint-policy-global-default)#no mtu
rfs7000-37FABE(config-mint-policy-global-default)#no udp port
```

The following example shows the global Mint Policy parameters after the ‘**no**’ commands are executed:

```
rfs7000-37FABE(config-mint-policy-global-default)#show context
mint-policy global-default
  sign-unknown-device
  security-level control-and-data
  rejoin-timeout 1000
rfs7000-37FABE(config-mint-policy-global-default)#
```
This chapter summarizes management policy commands in the CLI command structure.

A management policy contains configuration elements for managing a device, such as access control, SNMP, admin user credentials, and roles.

A controller (wireless controller, access point, or service platform) uses mechanisms to allow or deny device access to separate interfaces and protocols (HTTP, HTTPS, Telnet, SSH or SNMP). Management access can be enabled or disabled as required for unique policies. The management access functionality is not meant to function as an ACL (in routers or other firewalls), where administrators specify and customize specific IPs to access specific interfaces.

Controllers and service platforms can be managed using multiple interfaces (SNMP, CLI and Web UI). By default, management access is unrestricted, allowing management access to any enabled IP interface from any host using any enabled management service.

To enhance security, administrators can do the following:

- Restrict SNMP, CLI and Web UI access to specific hosts or subnets
- Disable un-used and insecure interfaces as required within managed access profiles. Disabling un-used management services can dramatically reduce an attack footprint and free resources on managed devices
- Provide authentication for management users
- Apply access restrictions and permissions to management users

Management restrictions can be applied to meet specific policies or industry requirements requiring only certain devices or users be granted access to critical infrastructure devices. Management restrictions can also be applied to reduce the attack footprint of the device when guest services are deployed.

Access Points utilize a single management access policy, so ensure all the intended administrative roles, permissions, authentication and SNMP settings are correctly set. If an access point is functioning as a virtual controller AP, these are the access settings used by adopted access points of the same model as the virtual controller AP.

It is recommended to disable un-used and insecure interfaces as required within managed access profiles. Disabling un-used management services can dramatically reduce an attack footprint and free resources on managed devices.

Use the (config) instance to configure a management policy. To navigate to the config management policy instance, use the following commands:

<DEVICE>(config)#management-policy <POLICY-NAME>

To commit a management-policy, the policy must have at least one admin user account configured.
<DEVICE>(config-management-policy-<POLICY-NAME>)#user admin password 0 test role superuser access all
<DEVICE>(config-management-policy-<POLICY-NAME>)#

<DEVICE>(config-management-policy-<POLICY-NAME>)#?

Management Mode commands:

- **aaa-login**: Set authentication for logins
- **banner**: Define a login banner
- **ftp**: Enable FTP server
- **http**: Hyper Text Terminal Protocol (HTTP)
- **https**: Secure HTTP
- **idle-session-timeout**: Configure idle timeout for a configuration session (GUI or CLI)
- **ipv6**: IPv6 Protocol
- **no**: Negate a command or set its defaults
- **privilege-mode-password**: Set the password for entering CLI privilege mode
- **restrict-access**: Restrict management access to the device
- **snmp-server**: SNMP
- **ssh**: Enable ssh
- **t5**: T5 configuration
- **telnet**: Enable telnet
- **user**: Add a user account
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

<td>page 15-29</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS.*
aaa-login

Configures Authentication, Authorization and Accounting (AAA) authentication mode used with this management policy. The different modes are: local authentication and external RADIUS server authentication.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

aaa-login [local|radius|tacacs]

aaa-login local

aaa-login radius [external|fallback|policy <AAA-POLICY-NAME>]

aaa-login radius [fallback|policy <AAA-POLICY-NAME>]

aaa-login tacacs [accounting|authentication|authorization|fallback|policy <AAA-TACACS-POLICY-NAME>]

Parameters

- aaa-login local

local | Sets local as the preferred authentication mode. Local authentication uses the local username database to authenticate a user.

Note: The AP6511 and AP6521 platforms do not support local RADIUS resource.

- aaa-login radius [external|fallback|policy <AAA-POLICY-NAME>]

radius | Configures the RADIUS server parameters

Note: If local authentication is disabled, use this command to specify if the RADIUS server used is external, fallback, or specified by a AAA policy.

- aaa-login tacacs [accounting|authentication|authorization|fallback|policy <AAA-TACACS-POLICY-NAME>]

tacacs | Configures Terminal Access Control Access-Control System (TACACS) server parameters

accounting | Configures TACACS accounting

- aaa-login tacacs [accounting|authentication|authorization|fallback|policy <AAA-TACACS-POLICY-NAME>]

Notes:

For more information on configuring AAA policy, see AAA-POLICY.
Usage Guidelines

Use AAA login to determine whether management user authentication must be performed against a local user database or an external RADIUS server.

Examples

```plaintext
rfs7000-37FABE(config-management-policy-test)#aaa-login radius external
rfs7000-37FABE(config-management-policy-test)#aaa-login radius policy test
rfs7000-37FABE(config-management-policy-test)#show context
management-policy test
http server
no ssh
  aaa-login radius external
  aaa-login radius policy test
rfs7000-37FABE(config-management-policy-test)#
```

<td>fallback</td>
<td>Configures TACACS as the primary authentication mode. When TACACS authentication fails, the system uses local authentication. This command configures local authentication as a backup mode.</td>
</tr>
</tbody>
</table>
| policy <AAA-TACACS-POLICY-NAME> | Associates a specified AAA TACACS policy with this management policy  
  • <AAA-TACACS-POLICY-NAME> – Specify the TACACS policy name (should be existing and configured).  
  **Note:** For more information on configuring AAA TACACS policy, see [AAA-TACACS-POLICY](#). |
| no            | Removes the TACACS server settings               |
15.1.2 banner

Configures the message of the day (motd) text. This text is displayed at login to clients connecting through Telnet or SSH.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
banner motd <LINE>
```

**Parameters**

- `banner motd <LINE>`

<table>
<thead>
<tr>
<th>motd &lt;LINE&gt;</th>
<th>Sets the motd banner</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;LINE&gt;</td>
<td>Enter the message string. The message string should not exceed 255 characters.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-management-policy-test)#banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#show context
management-policy test
  http server
  no ssh
  aaa-login radius external
  aaa-login radius policy test
  banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#
```

**Related Commands**

```
no
```

Removes the motd banner
15.1.3 ftp

Enables File Transfer Protocol (FTP) on this management policy. FTP is the standard protocol for transferring files over a TCP/IP network. FTP requires administrators enter a valid username and password authenticated locally. FTP access is disabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ftp {password|rootdir|username}

ftp {password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>]}

ftp {rootdir <DIR>}

ftp {username <USERNAME> password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>] rootdir <DIR>}

Parameters

- ftp {password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>]}

  ftp password Optional. Configures the FTP server password

  1 <ENCRIPTED-PASSWORD> Configures an encrypted password. Use this option when copy pasting the password from another device.
  - <ENCRYPTED-PASSWORD> — Specify the password. The password should not exceed 63 characters in length.

  <PASSWORD> Configures a clear text password

- ftp {rootdir <DIR>}

  ftp rootdir <DIR> Optional. Configures the root directory for FTP logins
  - <DIR> – Specify the root directory path. By default the root directory is set to flash:/

- ftp {username <USERNAME> password [1 <ENCRYPTED-PASSWORD>|<PASSWORD>] rootdir <DIR>}

  ftp username <USERNAME> Optional. Configures a new user account on the FTP server. The FTP user file lists users with FTP server access.
  - <USERNAME> – Specify the username. The username should not exceed 32 characters in length.

  password 1 [1 <ENCRYPTED-PASSWORD>|<PASSWORD>]
  - <ENCRYPTED-PASSWORD> – Specifies an encrypted password (use this option if copying from another device). The password should not exceed 63 characters in length.
  - <PASSWORD> – Configures a clear text password

  rootdir <DIR> After specifying the password, configure the FTP root directory.
  - rootdir <DIR> – Configures the root directory for FTP logins. Specify the root directory path.
Usage Guidelines
The string size of an encrypted password (option 1, password is encrypted with a SHA1 algorithm) must be exactly 40 characters.

Examples
rfs7000-37FABE(config-management-policy-test)#ftp
rfs7000-37FABE(config-management-policy-test)#ftp username superuser password test@123
rfs7000-37FABE(config-management-policy-test)#show context management-policy test
http server
ftp username superuser password 1

15.1.4 http

Enables Hyper Text Transport Protocol (HTTP) on this management policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
http server
```

Parameters

- `http server`

| http server       | Enables HTTP on this management policy. HTTP provides limited authentication and no encryption. |

Examples

```
rfs7000-37FABE(config-management-policy-test)#http server
rfs7000-37FABE(config-management-policy-test)#show context
management-policy test
    http server
    ftp username superuser password 1
    f617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
    no ssh
    aaa-login radius external
    aaa-login radius policy test
    banner motd "Have a Good Day"
    rfs7000-37FABE(config-management-policy-test)#
```

Related Commands

- `no` Disables HTTP on this management policy
15.1.5 https

Enables Hyper Text Transport Protocol Secure (HTTPS) on this management policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
https server
```

Parameters

- **https server**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>https server</td>
<td>Enables HTTPS on this management policy. HTTPS provides both authentication and data encryption as opposed to just authentication.</td>

  rootdir dir
  no ssh
  aaa-login radius external
  aaa-login radius policy test
  banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#
```

Related Commands

- **no** Disables HTTPS on this management policy
15.1.6 idle-session-timeout

Configures a session’s idle timeout. An idle session is automatically terminated after the specified interval is exceeded.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

idle-session-timeout <1-4320>

Parameters

- idle-session-timeout <1-4320>

| <1-4320> | Sets the interval, in minutes, after which an idle session is timed out. Specify a value from 1 - 4320 minutes. The default is 30 minutes.

Examples

rfs7000-37FABE(config-management-policy-test)#idle-session-timeout 100
rfs7000-37FABE(config-management-policy-test)#show context
management-policy test
http server
https server
ftp username superuser password 1

no ssh
aaa-login radius external
aaa-login radius policy test
idle-session-timeout 100
banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#

Related Commands

- no

Removes the configured idle session timeout value
15.1.7 ipv6

management-policy

Restricts management access to specified hosts and/or subnets based on their IPv6 addresses and prefixes respectively.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ipv6 restrict-access [host|ipv6-access-list|subnet]

ipv6 restrict-access host <IPv6> {log|subnet}
ipv6 restrict-access host <IPv6> {log [all|denied-only]}
ipv6 restrict-access host <IPv6> {subnet <IPv6-PREFIX> {log [all|denied-only]}}

ipv6 restrict-access ipv6-access-list <IPv6-ACCESS-LIST-NAME>

ipv6 restrict-access subnet <IPv6-PREFIX> {host|log}
ipv6 restrict-access subnet <IPv6-PREFIX> {log [all|denied-only]}
ipv6 restrict-access subnet <IPv6-PREFIX> {host <IPv6> {log [all|denied-only]}}

Parameters

- ipv6 restrict-access host <IPv6> {log [all|denied-only]}

| host <IPv6> | Restricts management access to a specified host, based on the host’s IPv6 address.
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;IPv6&gt; — Specify the host’s IPv6 address.</td>
</tr>
</tbody>
</table>

| log [all|denied-only] | Optional. Configures a logging policy for access requests
|----------------------|--------------------------------------------------|
|                      | • all – Logs all access requests, both denied and permitted
|                      | • denied-only – Logs only denied access events (when a host is denied access) |

- ipv6 restrict-access subnet <IPv6-PREFIX> {log [all|denied-only]}

| host <IPv6> | Restricts management access to a specified host, based on the host’s IPv6 address.
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;IPv6&gt; — Specify the host’s IPv6 address.</td>
</tr>
</tbody>
</table>

| subnet <IPv6-PREFIX> | Optional. Restricts access to the host on a specified IPv6 subnet
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;IPv6-PREFIX&gt; — Specify the subnet’s IPv6 prefix in the X:X::X:X/M format.</td>
</tr>
</tbody>
</table>

| log [all|denied-only] | Optional. Configures a logging policy for access requests
|----------------------|--------------------------------------------------|
|                      | • all – Logs all access requests, both denied and permitted
|                      | • denied-only – Logs only denied access events (when a host/subnet is denied access) |
### ipv6 restrict-access ipv6-access-list <IPv6-ACCESS-LIST-NAME>

Uses an IPv6 Access Control Lists (ACLs) to filter access requests.
IPv6 ACL filter/mark packets based on the IPv6 address from which they arrive. IPv6 hosts can configure themselves automatically when connected to an IPv6 network using the neighbor discovery (ND) protocol via ICMPv6 router discovery messages. These hosts require firewall packet protection unique to IPv6 traffic, as IPv6 addresses are composed of eight groups of four hexadecimal digits separated by colons. An existing IPv6 ACL can be created and used in the management policy context to permit or deny access to specific hosts and/or subnets.

- `<IPv6-ACCESS-LIST-NAME>` – Specify the IPv6 ACL name.

### ipv6 restrict-access subnet <IPv6-PREFIX> {log [all|denied-only]}

<table>
<thead>
<tr>
<th>subnet &lt;IPv6-PREFIX&gt;</th>
<th>Restricts management access to a specified IPv6 subnet</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- <code>&lt;IPv6-PREFIX&gt;</code> – Specify the subnet's IPv6 prefix in the X:X::X:X/M format.</td>
</tr>
</tbody>
</table>

| log [all|denied-only] | Optional. Configures a logging policy for access requests |
|-----------------------|----------------------------------------------------------|
| all                   | - all – Logs all access requests, both denied and permitted |
| denied-only           | - denied-only – Logs only denied access events (when a host/subnet is denied access) |

### ipv6 restrict-access host <IPv6> {log [all|denied-only]}

<table>
<thead>
<tr>
<th>subnet &lt;IPv6-PREFIX&gt;</th>
<th>Optional. Restricts management access to a specific host within the specified subnet</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- <code>&lt;IPv6&gt;</code> – Specify the host's IPv6 address.</td>
</tr>
</tbody>
</table>

| log [all|denied-only] | Optional. Configures a logging policy for access requests |
|-----------------------|----------------------------------------------------------|
| all                   | - all – Logs all access requests, both denied and permitted |
| denied-only           | - denied-only – Logs only denied access events (when a host/subnet is denied access) |

### Examples

```bash
rfs7000-37FABE(config-management-policy-test)#ipv6 restrict-access host 2001:fdbc:06cf:0011::13 subnet 2001:fdbc:06cf:0011::0/64 log all
rfs7000-37FABE(config-management-policy-test)#show context
management-policy test
http server
no ssh
ipv6 restrict-access host 2001:fdbc:06cf:0011::13 subnet 2001:fdbc:06cf:0011::0/64 log all
rfs7000-37FABE(config-management-policy-test)#
```

### Related Commands

- `no` Removes management access restriction settings
**15.1.8 no**

Negates a command or reverts values to their default. When used in the config management policy mode, the `no` command negates or reverts management policy settings.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

**Syntax**

```
no [aaa-login|banner|ftp|http|https|idle-session-timeout|ipv6|privilege-mode-password|
    restrict-access|snmp-server|ssh|t5|telnet|user|service]
no aaa-login tacacs [accounting|authentication|authorization|fallback|policy]
no banner motd
no ftp {password/rootdir}
no [http|https] server
no [idle-session-timeout|privilege-mode-password|restrict-access]
no ipv6 restrict-access
no snmp-server [community|display-vlan-info-per-radio|enable|host|manager|
    max-pending-requests|request-timeout|suppress-security-configuration-level|
    throttle|user]
no snmp-server [community <WORD>|display-vlan-info-per-radio|enable traps|
    host <IP> {<1-65535>}/manager [all|v1|v2|v3]|max-pending-requests|request-timeout|
    suppress-security-configuration-level|throttle|user [snmpmanager|snmpoperator|
    snmptrap]]
no ssh {login-grace-time/port/use-key}
no t5 snmp-server [community|enable|host]
no [telnet|user <USERNAME>]
no service prompt crash-info
```

**Parameters**

- `no <PARAMETERS>`

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes or reverts this Management policy settings based on the parameters passed</th>
</tr>
</thead>
</table>
Examples
The following example shows the management policy ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-management-policy-test)#show context
management-policy test
  http server
  https server
  ftp username superuser password 1
  f617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
  no ssh
  aaa-login radius external
  idle-session-timeout 100
  banner motd "Have a Good Day"
rfs7000-37FABE(config-management-policy-test)#
```

```
rfs7000-37FABE(config-management-policy-test)#no banner motd
rfs7000-37FABE(config-management-policy-test)#no idle-session-timeout
rfs7000-37FABE(config-management-policy-test)#no http server
```

The following example shows the management policy ‘test’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-management-policy-test)#show context
management-policy test
  http server
  https server
  ftp username superuser password 1
  f617ca50c59fb47028f96db4baab5f3d8f03c03ab257960b0fd127c69f02cd7e rootdir dir
  no ssh
  aaa-login radius external
  idle-session-timeout 0
rfs7000-37FABE(config-management-policy-test)#
```
15.1.9 privilege-mode-password

Configures the CLI's privilege mode access password

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

privilege-mode-password [1 <PASSWORD>|<PASSWORD>]

Parameters

- privilege-mode-password [1 <PASSWORD>|<PASSWORD>]

<table>
<thead>
<tr>
<th>1 &lt;PASSWORD&gt;</th>
<th>Configures an encrypted password. Use this option when copy pasting the password from another device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;PASSWORD&gt;</td>
<td>Configures a clear text password</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-management-policy-test)#privilege-mode-password testing@1234
rfs7000-37FABE(config-management-policy-test)#show context
  management-policy test
  http server
  no ssh
  privilege-mode-password 1 2e9f038ac2ed27f919ed5a4dceb3d30e32f356f2ceff6fbf26a153d0339c734f
rfs7000-37FABE(config-management-policy-test)#

Related Commands

- **no** — Removes the configured CLI privilege mode access password
15.1.10 restrict-access

management-policy

Restricts management access to a set of hosts or subnets

Restricting remote access to a controller or service platform ensures only trusted hosts can communicate with enabled management services. This ensures only trusted hosts can perform management tasks and provide protection from brute force attacks from hosts attempting to break into the controller or service platform managed network.

Administrators can permit management connections to be established on any IP interface on the controller or service platform (including IP interfaces used to provide captive portal guest access). Administrators can restrict management access by limiting access to a specific host (IP address), subnet, or ACL on the controller or service platform.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

restrict-access [host|ip-access-list|subnet]

restrict-access host <IP> {log|subnet}
restrict-access host <IP> {log [all|denied-only]}
restrict-access host <IP> {subnet <IP/M> {log [all|denied-only]}}

restrict-access ip-access-list <IP-ACCESS-LIST-NAME>

restrict-access subnet <IP/M> {host|log}
restrict-access subnet <IP/M> {log [all|denied-only]}
restrict-access subnet <IP/M> {host <IP> {log [all|denied-only]}}

Parameters

- restrict-access host <IP> {log [all|denied-only]}

<table>
<thead>
<tr>
<th>host &lt;IP&gt;</th>
<th>Restricts management access to a specified host, based on the host's IPv4 address</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>Specify the host's IPv4 address.</td>
</tr>
</tbody>
</table>

| log [all|denied-only] | Optional. Configures a logging policy for access requests |
|-----------------------|----------------------------------------------------------|
| all                   | Logs all access requests, both denied and permitted |
| denied-only           | Logs only denied access (when an access request is received from a host denied access, a record is logged) |

<table>
<thead>
<tr>
<th>subnet &lt;IP/M&gt;</th>
<th>Optional. Restricts access to the host on a specified subnet</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP/M&gt;</td>
<td>Specify the subnet's IPv4 address and mask in the A.B.C.D/M format.</td>
</tr>
</tbody>
</table>

| log [all|denied-only] | Optional. Configures a logging policy for access requests |
|-----------------------|----------------------------------------------------------|
| all                   | Logs all access requests, both denied and permitted |
| denied-only           | Logs only denied access events (when access request received from a host is denied) |
### restrict-access ip-access-list <IP-ACCESS-LIST-NAME>

**ip-access-list**

Uses an IPv4 ACL to filter access requests.

IPv4 ACLs filter/mark packets based on the IPv4 address from which they arrive. IP and non-IP traffic, on the same layer 2 interface, can be filtered by applying an IPv4 ACL. Each IPv4 ACL contains a set of deny and/or permit rules. Each rule is specific to source and destination IPv4 addresses and the unique rules and precedence definitions assigned. When the network traffic matches the criteria specified in one of these rules, the action defined in that rule is used to determine whether the traffic is allowed or denied.

<table>
<thead>
<tr>
<th>&lt;IP-ACCESS-LIST-NAME&gt;</th>
<th>Specify the IPv4 ACL name.</th>
</tr>
</thead>
</table>

### restrict-access subnet <IP/M> \{log \[all|denied-only\]\}

- **subnet <IP/M>**
  - Restricts management access to a specified subnet.
  - `<IP/M>` – Specify the subnet’s IPv4 address and mask in the A.B.C.D/M format.
  
- **log [all|denied-only]**
  - Optional. Configures a logging policy for access requests. Sets the log type generated for access requests.
  - `all` – Logs all access requests, both denied and permitted
  - `denied-only` – Logs only denied access events (when access request received from a subnet is denied)

### restrict-access subnet <IP/M> \{host <IP> \{log \[all|denied-only\]\}\}

- **subnet <IP/M>**
  - Restricts management access to a specified subnet.
  - `<IP/M>` – Specify the subnet’s IPv4 address and mask in the A.B.C.D/M format.
  
- **host <IP>**
  - Optional. Uses the host IP address as a second filter.
  - `<IP>` – Specify the host’s IPv4 address.
  
- **log [all|denied-only]**
  - Optional. Configures a logging policy for access requests. Sets the log type generated for access requests.
  - `all` – Logs all access requests, both denied and permitted
  - `denied-only` – Logs only denied access events (when access request received from a host within the specified subnet is denied)

#### Examples

```
rfs7000-37FABE(config-management-policy-test)#restrict-access host 172.16.10.4 log denied-only
rfs7000-37FABE(config-management-policy-test)#show context
management-policy test
  no http server
  https server
  ftp username superuser password 1

  no ssh
  aaa-login radius external
  aaa-login radius policy test
  idle-session-timeout 0
```

#### Related Commands

- **no**
  - Removes device access restrictions
### 15.1.11 snmp-server

Enables the Simple Network Management Protocol (SNMP) engine settings. SNMP is an application layer protocol that facilitates the exchange of management information between the controller and a managed device. SNMP enabled devices listen on port 162 (by default) for SNMP packets from the controller’s management server. SNMP uses read-only and read-write community strings as an authentication mechanism to monitor and configure supported devices. The read-only community string gathers statistics and configuration parameters from a supported wireless device. The read-write community string is used by a management server to set device parameters. SNMP is generally used to monitor a system’s performance and other parameters.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

#### Syntax

```plaintext
snmp-server [community|enable|display-vlan-info-per-radio|host|manager|max-pending-requests|request-timeout|suppress-security-configuration-level|throttle|user]

snmp-server community [0 <WORD>|2 <WORD>|<WORD>] [ro|rw]
{ip-snmp-access-list <IP-SNMP-ACL-NAME>}

snmp-server enable traps

snmp-server host <IP> [v1|v2c|v3] {<1-65535>}

snmp-server manager [all|v1|v2|v3]

snmp-server [max-pending-requests {<64-1024>}|request-timeout {<2-720>}] suppress-security-configuration-level [0|1]

snmp-server user [snmpmanager|snmpoperator|snmptrap] [v3 auth|encrypted]

snmp-server user [snmpmanager|snmpoperator|snmptrap] v3 auth md5
[0 <PASSWORD>|2 <ENCRYPTED-PASSWORD>]<PASSWORD>]

snmp-server user [snmpmanager|snmpoperator|snmptrap] v3 encrypted
 [auth md5|des auth md5] [0 <PASSWORD>|2 <ENCRYPTED-PASSWORD>]<PASSWORD>]
```

#### Parameters

<table>
<thead>
<tr>
<th>Community Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[0 &lt;WORD&gt;</td>
<td>2 &lt;WORD&gt;</td>
</tr>
<tr>
<td>0 &lt;WORD&gt;</td>
<td>Sets a clear text SNMP community string</td>
</tr>
<tr>
<td>2 &lt;WORD&gt;</td>
<td>Sets an encrypted SNMP community string</td>
</tr>
<tr>
<td>&lt;WORD&gt;</td>
<td>Sets the SNMP community string</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>ip-snmp-access-list &lt;IP-SNMP-ACL-NAME&gt;</code></td>
<td>Optional. Associates an IP SNMP access list (should be existing and configured). The IP SNMP ACL sets the SNMP management station’s IP address. SNMP trap information is received at this address.</td>
</tr>
<tr>
<td><code>snmp-server enable traps</code></td>
<td>Enables trap generation (using the trap receiver configuration defined). This feature is disabled by default. Enabling this feature ensures the dispatch of SNMP notifications to all hosts. A SNMP trap receiver is the destination of SNMP messages (external to the controller). A trap is like a Syslog message, just over another protocol (SNMP). A trap is generated when a device consolidates event information and transmits the information to an external repository. The trap contains several standard items, such as the SNMP version, community etc. SNMP trap notifications exist for most controller operations, but not all are necessary for day-to-day operation.</td>
</tr>
<tr>
<td>`snmp-server host &lt;IP&gt; [v1</td>
<td>v2c</td>
</tr>
</tbody>
</table>
| `manager [all|v2|v3]`          | Enables SNMP manager and specifies the SNMP version  
| all                           | Enables SNMP manager version v2 and v3  
| v1                            | Enables SNMP manager version v1 only. SNMPv1 uses a simple password (“community string”). Consequently it provides limited security, and should be used only inside LANs behind firewalls, not in WANs.  
| v2                            | Enables SNMP manager version v2 only. SNMPv2 provides device management using a hierarchical set of variables. SNMPv2 uses Get, GetNext, and Set operations for data management. SNMPv2 is enabled by default.  |

Contd.
**snmp-server [max-pending-requests \(<64-1024>\)|request-timeout \(<2-720>\)]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>

15.1.12 ssh

Enabled Secure Shell (SSH) for this management policy

SSH, like Telnet, provides a command line interface to a remote host. SSH transmissions are encrypted and authenticated, increasing the security of transmission. SSH access is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
ssh {login-grace-time <60-300>|port <1-65535>}
```

Parameters

- `ssh {login-grace-time <60-300>|port <1-65535>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>login-grace-time</code></td>
<td>Configures the login grace time. This is the interval, in seconds, after which an unsuccessful login is disconnected.</td>
</tr>
<tr>
<td><code>&lt;60-300&gt;</code></td>
<td>Specify a value from 60 - 300 seconds. The default is 60 seconds.</td>
</tr>
<tr>
<td><code>port</code></td>
<td>Configures the SSH port. This is the port used for SSH connections.</td>
</tr>
<tr>
<td><code>&lt;1-65535&gt;</code></td>
<td>Specify a value from 1 - 65535. The default port is 22.</td>
</tr>
</tbody>
</table>

```

Resets SSH access port to factory default (port 22)
15.1.13 t5

Configures SNMP server settings for T5 devices on this management policy.

A T5 controller is an external device that can be adopted and managed by a WiNG controller. When enabled as a supported external device, a T5 controller can provide data to WiNG to assist in its management within a WiNG supported subnet.

This command enables SNMP to communicate with T5 devices within the network. SNMP facilitates the exchange of management information between the controller or service platform and the T5 device. For more information see, `snmp-server`.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
t5 snmp-server [community|contact|enable|host|location]
t5 snmp-server community <COMMUNITY-NAME> [ro|rw] <SNMP-STATION-IP>
t5 snmp-server contact <LINE>
t5 snmp-server enable [server|traps]
t5 snmp-server host <IP>
t5 snmp-server location <LINE>
```

**Parameters**

- **t5 snmp-server community <COMMUNITY-NAME> [ro|rw] <SNMP-STATION-IP>**
  - **community <COMMUNITY-NAME> [ro|rw]**
    - Defines a public or private community designation. By default, SNMPv2 community strings on most devices are set to public, for the read-only community string, and private for the read-write community string.
    - `<COMMUNITY-NAME>` — Specify the SNMP community name, and configure the access permission for this community string (used by devices to retrieve or modify information).
    - `ro` — Allows a remote device to retrieve information only
    - `rw` — Allows a remote device to retrieve information and modify settings
  - `<SNMP-STATION-IP>` Specify the SNMP management station IP address for receiving trap information

- **t5 snmp-server contact <LINE>**
  - **contact <LINE>**
    - Configures the administrator of SNMP trap events for the T5 controller.
    - `<LINE>` — Specify the administrator’s name (should not exceed 64 characters).

- **t5 snmp-server enable [server|traps]**
  - **enable [server|traps]**
    - Enables the following:
      - `server` — Enables the SNMP server. When enabled, the system accepts SNMP management data. This is enabled by default.
      - `traps` — Enables SNMP traps. When enabled, the system generates SNMP traps. This is enabled by default.
• **t5 snmp-server host <IP>**

<table>
<thead>
<tr>
<th>host &lt;IP&gt;</th>
<th>Configures the T5 SNMP host’s IP address. The SNMP host receives the SNMP notifications.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt; – Specify the SNMP host’s IP address.</td>
<td></td>
</tr>
</tbody>
</table>

• **t5 snmp-server location <LINE>**

<table>
<thead>
<tr>
<th>location &lt;LINE&gt;</th>
<th>Configures the system location for SNMP traps.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;LINE&gt; – Specify the SNMP trap location (should not exceed 64 characters).</td>
<td></td>
</tr>
</tbody>
</table>

15.1.14 telnet

management-policy

Enables Telnet. Telnet provides a command line interface to a remote host over TCP. Telnet provides no encryption, but it does provide a measure of authentication. Telnet access is disabled by default.

By default Telnet, when enabled, uses Transmission Control Protocol (TCP) port 23. Use this command to change the TCP port.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

telnet {port <1-65535>}

Parameters

- telnet {port <1-65535>}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>telnet</td>
<td>Enables Telnet</td>
</tr>
<tr>
<td>port &lt;1-65535&gt;</td>
<td>Optional. Configures the Telnet port. This is the port used for Telnet connections. &lt;1-65535&gt; – Sets a value from 1 - 165535. The default port is 23.</td>
</tr>
</tbody>
</table>

Related Commands

no

Disables Telnet
15.1.15 user

Adds new user account

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

user <USERNAME> password [0 <PASSWORD>|1 <SHA1-PASSWORD>|<PASSWORD>] role [device-provisioning-admin|helpdesk|monitor|network-admin|security-admin|superuser|system-admin|web-user-admin] access [all|console|ssh|telnet|web] ({allowed-locations <ALLOWED-LOCATIONS>})

Parameters

- user <USERNAME> Adds new user account to this management policy
  - <USERNAME> — Sets the username

- password [0 <PASSWORD>|1 <SHA1-PASSWORD>|<PASSWORD>]
  - Configures a password
    - 0 <PASSWORD> — Sets a clear text password
    - 1 <SHA1-PASSWORD> — Sets the SHA1 hash of the password
    - <PASSWORD> — Sets the password

- role [device-provisioning-admin|helpdesk|monitor|network-admin|security-admin|superuser|system-admin|web-user-admin]
  - Configures the user role. The options are:
    - device-provisioning-admin — Device provisioning administrator. Has privileges to update (provision) device configuration files or firmware. Such updates run the risk of overwriting and losing a devices existing configuration unless the configuration is properly archived.
    - helpdesk — Helpdesk administrator. Performs troubleshooting tasks, such as clear statistics, reboot, create and copy technical support dumps. The helpdesk administrator can also create a guest user account and password for registration. These details can be e-mailed or sent as SMS to mobile phone.
    - monitor — Monitor. Has read-only access to the system. Can view configuration and statistics except for secret information
    - network-admin — Network administrator. Manages layer 2, layer 3, Wireless, RADIUS server, DHCP server, and Smart RF
    - security-admin — Security administrator. Modifies WLAN keys and passphrases
    - superuser — Superuser. Has full access, including halt and delete startup-config
    - system-admin — System administrator. Upgrades image, boot partition, time, and manages admin access
    - web-user-admin — Web user administrator. This role is used to create guest users and credentials. The Web user admin can access only the custom GUI screen and does not have access to the normal CLI and GUI.
### access

**Syntax:**
```
access [all|console|ssh|telnet|web]
```

**Description:**
Configures the access type
- `all` – Allows all types of access: console, SSH, Telnet, and Web
- `console` – Allows console access only
- `ssh` – Allows SSH access only
- `telnet` – Allows Telnet access only
- `web` – Allows Web access only

### allowed-locations

**Syntax:**
```
<ALLOWED-LOCATIONS>
```

**Description:**
Optional. This keyword is recursive and optional. It configures a list of locations (either as a path or a RF Domain) to which this user is allowed access.
- `<ALLOWED-LOCATIONS>` – Specify the allowed locations.

**Notes:**
- Use this option to configure a list of RF Domains or its tree nodes to which this user is allowed access with respect to the Nsight policy.
- This option is not applicable to the user role ‘web-user-admin’.

Syntax
service [prompt|show]
service [prompt crash-info|show cli]

Parameters

- service [prompt crash-info|show cli]
  
  service prompt crash-info | Updates CLI prompt settings
  - crash-info — Includes an asterix at the end of the prompt if the device has crash files in the flash/crashinfo folder

  service show cli | Displays running system information
  - cli — Displays the current mode’s CLI tree

Examples
rfs7000-37FABE(config-management-policy-test)#service show cli

This chapter summarizes the RADIUS group, server, and user policy commands in the CLI command structure.

Remote Authentication Dial-In User Service (RADIUS) is a client/server protocol and software that enables remote access servers to authenticate users and authorize their access to the network. RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients send authentication requests to the local RADIUS server containing user authentication and network service access information.

RADIUS enables centralized management of authentication data (usernames and passwords). When a client attempts to associate to a network, the authentication request is sent to the local RADIUS server. The authentication and encryption of communications takes place through the use of a shared secret password (not transmitted over the network).

The local RADIUS server stores the user database locally, and can optionally use a remote user database. It ensures higher accounting performance. It allows the configuration of multiple users, and assigns policies for group authorization.

Controllers and access points allow enforcement of user-based policies. User policies include dynamic VLAN assignment and access based on time of day. A certificate is required for EAP TTLS, PEAP, and TLS RADIUS authentication (configured with the RADIUS service).

Dynamic VLAN assignment is achieved based on the RADIUS server response. A user who associates to WLAN1 (mapped to VLAN1) can be assigned a different VLAN after RADIUS server authentication. This dynamic VLAN assignment overrides the WLAN’s VLAN ID to which the user associates.

The chapter is organized into the following sections:

- `radius-group`
- `radius-server-policy`
- `radius-user-pool-policy`

---

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
16.1 radius-group

This section describes RADIUS user group configuration commands.

The local RADIUS server allows the configuration of user groups with common user policies. User group names and associated users are stored in the local database. The user ID in the received access request is mapped to the associated wireless group for authentication. The configuration of groups allows enforcement of the following policies that control user access:

- Assign a VLAN to the user upon successful authentication
- Define start and end of time (HH:MM) when the user is allowed to authenticate
- Define the SSID list to which a user, belonging to this group, is allowed to associate
- Define the days of the week the user is allowed to login
- Rate limit traffic (for non-management users)

RADIUS users are categorized into three groups: normal user, management user, and guest user. A RADIUS group not configured as management or guest is a normal user group. User access and role settings depends on the RADIUS group the user belongs.

Use the (config) instance to configure RADIUS group commands. This command creates a group within the existing RADIUS group. To navigate to the RADIUS group instance, use the following commands:

```
<DEVICE>(config)#radius-group <GROUP-NAME>
```

```
rfs7000-37FABE(config)#radius-group test
rfs7000-37FABE(config-radius-group-test)#?
```

Radius user group configuration commands:
- guest   Make this group a Guest group
- no      Negate a command or set its defaults
- policy  Radius group access policy configuration
- rate-limit Set rate limit for group
- clrscr  Clears the display screen
- commit  Commit all changes made in this session
- do      Run commands from Exec mode
- end     End current mode and change to EXEC mode
- exit    End current mode and down to previous mode
- help    Description of the interactive help system
- revert  Revert changes
- service Service Commands
- show    Show running system information
- write   Write running configuration to memory or terminal

```
rfs7000-37FABE(config-radius-group-test)#
```

---

**NOTE:** The RADIUS group name cannot exceed 32 characters, and cannot be modified as part of the group edit process.
The following table summarizes RADIUS group configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>guest</td>
<td>Enables guest access for the newly created group</td>
<td>page 16-4</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or reverts settings to their default</td>
<td>page 16-10</td>
</tr>
<tr>
<td>policy</td>
<td>Configures RADIUS group access policy parameters</td>
<td>page 16-5</td>
</tr>
<tr>
<td>rate-limit</td>
<td>Sets the default rate limit per user in Kbps, and applies it to all enabled WLANs</td>
<td>page 16-9</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
16.1.1 guest

`radius-group`

Configures this group as a guest (non-management) group. A guest user group has temporary permissions to the controller's local RADIUS server. You can configure multiple guest user groups, each having a unique set of settings. Guest user groups cannot be made management groups with access and role permissions.

Guest users and policies are used for captive portal authorization to the network.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
guest
```

**Parameters**

None

**Examples**

```
rfs7000-37FABE(config-radius-group-test)#guest
rfs7000-37FABE(config-radius-group-test)#show context radius-group test
guest
rfs7000-37FABE(config-radius-group-test)#
```

**Related Commands**

```
no
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Makes this group a non-guest group</td>
</tr>
</tbody>
</table>
**16.1.2 policy**

Sets a RADIUS group’s authorization settings, such as access day/time, WLANs etc.

> **NOTE:** A user-based VLAN is effective only if dynamic VLAN authorization is enabled for the WLAN.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
policy [access|day|inactivity-timeout|role|ssid|time|vlan]
policy vlan <1-4094>
policy access [all|console|ssh|telnet|web]
policy access [all|console|ssh|telnet|web] {(all|console|ssh|telnet|web)}
policy day [all|fr|mo|sa|su|th|tu|we|weekdays] {(fr|mo|sa|su|th|tu|we|weekdays)}
policy inactivity-timeout <60-86400>
policy role [device-provisioning-admin|helpdesk|monitor|network-admin|security-admin|superuser|system-admin|web-user-admin]
policy ssid <SSID>
policy time start <HH:MM> end <HH:MM>
```

> **NOTE:** Access and role settings are applicable only to a management group. They cannot be configured for a RADIUS non-management group.

**Parameters**

- **policy vlan <1-4094>**

  ```
  vlan <1-4094>
  ```

  Sets the guest RADIUS group’s VLAN ID from 1 - 4094. The VLAN ID is representative of the shared SSID each group member (user) employs to interoperate within the network (once authenticated by the local RADIUS server).

  **Note:** This option applicable to a guest user group, which has guest access and temporary permissions to the local RADIUS server. The terms of the guest access can be set uniquely for each group. Guest user groups cannot be made management groups with unique access and role permissions.

  **Note:** Enable dynamic VLAN assignment for the WLAN for the VLAN assignment to take effect.
### access

<table>
<thead>
<tr>
<th>Policy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>all</strong></td>
<td>Allows all access. Wireless client access to the console, ssh, telnet, and/or Web</td>
</tr>
<tr>
<td><strong>console</strong></td>
<td>Allows console access only</td>
</tr>
<tr>
<td><strong>ssh</strong></td>
<td>Allows SSH access only</td>
</tr>
<tr>
<td><strong>telnet</strong></td>
<td>Allows Telnet access only</td>
</tr>
<tr>
<td><strong>web</strong></td>
<td>Allows Web access only</td>
</tr>
</tbody>
</table>

These parameters are recursive, and you can provide access to more than one component.

### role

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>device-provisioning-admin</strong></td>
<td>Device provisioning administrator. Has privileges to update (provision) device configuration files or firmware. Such updates run the risk of overwriting and losing a devices existing configuration unless the configuration is properly archived.</td>
</tr>
<tr>
<td><strong>helpdesk</strong></td>
<td>Helpdesk administrator. Performs troubleshooting tasks, such as clear statistics, reboot, create and copy tech support dumps. The helpdesk administrator can also create a guest user account and password for registration. These details can be e-mailed or sent as SMS to a mobile phone.</td>
</tr>
<tr>
<td><strong>monitor</strong></td>
<td>Monitor. Has read-only access to the network. Can view configuration and statistics except for secret information</td>
</tr>
<tr>
<td><strong>network-admin</strong></td>
<td>Network administrator. has wired and wireless access to the network. Manages layer 2, layer 3, Wireless, RADIUS server, DHCP server, and Smart RF</td>
</tr>
<tr>
<td><strong>security-admin</strong></td>
<td>Security administrator. Has full read/write access to the network. Modifies WLAN keys and passphrases</td>
</tr>
<tr>
<td><strong>superuser</strong></td>
<td>Superuser. Has full access, including halt and delete startup config</td>
</tr>
<tr>
<td><strong>system-admin</strong></td>
<td>System administrator. Upgrade s image, boot partition, time, and manages admin access</td>
</tr>
<tr>
<td><strong>web-user-admin</strong></td>
<td>Web user administrator. This role is used to create guest users and credentials. The web-user-admin can access only the custom GUI screen and does not have access to the normal CLI and GUI.</td>
</tr>
</tbody>
</table>

### inactivity-timeout

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&lt;60-86400&gt;</strong></td>
<td>Configures the inactivity time for this RADIUS group users. If a frame is not received from a client for the specified period, then the client's session is removed. When defined, this value is used instead of the captive-portal inactivity timeout. If the inactivity timeout is not configured in the radius-group context or the captive-portal context, the default timeout (60 seconds) is applied.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&lt;60-86400&gt;</strong></td>
<td>Specify a value from 60 - 86400 seconds.</td>
</tr>
</tbody>
</table>
• **policy ssid <SSID>**

  Sets the **Service Set Identifier (SSID)** for this guest RADIUS group. Use this command to assign SSIDs that users within this RADIUS group are allowed to associate. Assign SSIDs of those WLANs only that the guest users need to access. This option is not available for a management group.
  
  • **<SSID>** – Sets a case-sensitive alphanumeric SSID, not exceeding 32 characters

• **policy day [all|fr|mo|sa|su|th|tu|we|weekdays] { (fr|mo|sa|su|th|tu|we|weekdays) }**

  Configures the days on which this guest RADIUS group members can access the local RADIUS resources. The options are recursive, and you can provide access on multiple days.
  
  • **fr** – Allows access on Friday only
  • **mo** – Allows access on Mondays only
  • **sa** – Allows access on Saturdays only
  • **su** – Allows access on Sundays only
  • **th** – Allows access on Thursdays only
  • **tu** – Allows access on Tuesdays only
  • **we** – Allows access on Wednesdays only
  • **weekdays** – Allows access on weekdays only (Monday to Friday)

• **policy time start <HH:MM> end <HH:MM>**

  Configures the time when this RADIUS group can access the network
  
  • **start <HH:MM>** – Sets the start time in the HH:MM format (for example, 13:30 means the user can login only after 1:30 PM). Specifies the time users, within each listed group, can access the local RADIUS resources
  
  • **end <HH:MM>** – Sets the end time in the HH:MM format (for example, 17:30 means the user is allowed to remain logged in until 5:30 PM). Specifies the time users, within each listed group, lose access to the local RADIUS resources

**Usage Guidelines**

A management group access policy provides:

- access details
- user roles
- policy’s start and end time

The SSID, day, and VLAN settings are not applicable to a management user group.

**Examples**

The following example shows a RADIUS guest group settings:

```
rfs7000-37FABE(config-radius-group-test)#policy time start 13:30 end 17:30
rfs7000-37FABE(config-radius-group-test)#policy day all
rfs7000-37FABE(config-radius-group-test)#policy vlan 1
rfs7000-37FABE(config-radius-group-test)#policy ssid test
```
rfs7000-37FABE(config-radius-group-test)#show context
radius-group test
guest
  policy vlan 1
  policy ssid test
  policy day mo
  policy day tu
  policy day we
  policy day th
  policy day fr
  policy day sa
  policy day su
  policy time start 13:30 end 17:30
rfs7000-37FABE(config-radius-group-test)#

The following example shows a RADIUS management group settings:
rfs7000-37FABE(config-radius-group-management)#policy access console ssh telnet
rfs7000-37FABE(config-radius-group-management)#policy role network-admin
rfs7000-37FABE(config-radius-group-management)#policy time start 9:30 end 20:30
rfs7000-37FABE(config-radius-group-management)#show context
radius-group management
  policy time start 9:30 end 20:30
  policy access console ssh telnet web
  policy role network-admin
rfs7000-37FABE(config-radius-group-management)#

Related Commands

</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes or modifies a RADIUS group’s access settings</td>
</tr>
</tbody>
</table>
16.1.3 rate-limit

Sets the rate limit for the guest RADIUS server group

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
rate-limit [from-air|to-air] <100-1000000>

NOTE: The rate-limit setting is not applicable to a management group.

Parameters

- rate-limit [from-air|to-air] <100-1000000>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>to-air &lt;100-1000000&gt;</td>
<td>Sets the rate limit in the downlink direction, from the network to the wireless client</td>
</tr>
<tr>
<td></td>
<td>• &lt;100-1000000&gt; – Specify the rate from 100 - 1000000 Kbps.</td>
</tr>
<tr>
<td>from-air &lt;100-1000000&gt;</td>
<td>Sets the rate limit in the uplink direction, from the wireless client to the network</td>
</tr>
<tr>
<td></td>
<td>• &lt;100-1000000&gt; – Specify the rate from 100 - 1000000 Kbps.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-radius-group-test)#rate-limit to-air 200
rfs7000-37FABE(config-radius-group-test)#show context
radius-group test
guest
  policy vlan 1
  policy ssid test
  policy day mo
  policy day tu
  policy day we
  policy day th
  policy day fr
  policy day sa
  policy day su
  rate-limit to-air 200
  policy time start 13:30 end 17:30
rfs7000-37FABE(config-radius-group-test)#

Related Commands

- no
  Removes the RADIUS guest group's rate limits
16.1.4 no

Negates a command or sets its default. Removes or modifies the RADIUS group policy settings. When used in the config RADIUS group mode, the no command removes or modifies the following settings: access type, access days, role type, VLAN ID, and SSID.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [guest|policy|rate-limit]

no policy [access|day|inactivity-timeout|role|ssid|time|vlan]

no policy access [all|console|ssh|telnet|web]
no policy day [all|fr|mo|sa|su|th|tu|we|weekdays]
no policy ssid [<SSID>|all]
no policy [inactivity-timeout|role|time|vlan]

no rate-limit [from-air|to-air]

Parameters

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Negates a command or sets its default. Removes or modifies the RADIUS group policy settings. When used in the config RADIUS group mode, the no command removes or modifies the following settings: access type, access days, role type, VLAN ID, and SSID</th>
</tr>
</thead>
</table>

Examples

The following example shows the RADIUS guest group ‘test’ settings before the ‘no’ commands are executed:

rfs7000-37FABE(config-radius-group-test)#show context
radius-group test
guest
policy vlan 1
policy ssid test
policy day mo
policy day tu
policy day we
policy day th
policy day fr
policy day sa
policy day su
rate-limit to-air 200
policy time start 13:30 end 17:30
rfs7000-37FABE(config-radius-group-test)#

rfs7000-37FABE(config-radius-group-test)#no guest
rfs7000-37FABE(config-radius-group-test)#no rate-limit to-air
rfs7000-37FABE(config-radius-group-test)#no policy day all
The following example shows the RADIUS guest group ‘test’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-radius-group-test)#show context
radius-group test
  policy vlan 1
  policy ssid test
  policy time start 13:30 end 17:30
rfs7000-37FABE(config-radius-group-test)#
```
16.2 radius-server-policy

**RADIUS-POLICY**

Creates an onboard device RADIUS server policy and enters its configuration mode

A RADIUS server policy is a unique authentication and authorization configuration that receives user connection requests, authenticates users, and returns configuration information necessary for the RADIUS client to deliver service to the user. The client is the entity with authentication information requiring validation. The local RADIUS server has access to a database of authentication information used to validate the client’s authentication request.

The local RADIUS server uses authentication schemes like PAP, CHAP, or EAP to verify and confirm information provided by a user. The user’s proof of identification is verified, along with, optionally, other information. A local RADIUS server policy can also be configured to refer to an external Lightweight Directory Access Protocol (LDAP) resource to verify a user’s credentials.

Use the (config) instance to configure RADIUS-Server-Policy related parameters. To navigate to the RADIUS-Server-Policy instance, use the following commands:

```plaintext
<rfs7000-37FABE(config)#radius-server-policy <POLICY-NAME>
<rfs7000-37FABE(config-radius-server-policy-test)#?
```

16.2.1 authentication

radius-server-policy

Specifies the RADIUS datasource used for user authentication. Options include local for the local user database or LDAP for a remote LDAP resource.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`authentication [data-source|eap-auth-type]

authentication data-source [ldap|local]
authentication data-source [ldap {fallback}|local] { (ssid <SSID> precedence <1-5000>) }

authentication eap-auth-type [all|peap-gtc|peap-mschapv2|tls|ttls-md5|ttls-mschapv2|ttls-pap]

Parameters

- authentication data-source [ldap {fallback}|local] { (ssid <SSID> precedence <1-5000>) }

<table>
<thead>
<tr>
<th>data-source</th>
<th>The RADIUS sever can either use the local database or an external LDAP server to authenticate a user. It is necessary to specify the data source. The options are: LDAP and local.</th>
</tr>
</thead>
</table>
| ldap fallback | Uses a remote LDAP server as the data source  
| | • fallback – Optional. Enables fallback to local authentication. This feature ensures that when the configured LDAP data source is unreachable, the client is authenticated against the local RADIUS resource. This option is disabled by default. |
| local | Uses the local user database to authenticate a user |
| ssid <SSID> precedence <1-5000> | The following keywords are recursive and common to both 'ldap' and 'local' parameters:  
| | • ssid – Optional. Associates the data source, selected in the previous step, with a SSID.  
| | • <SSID> – Specify the SSID for this authentication data source. The SSID is case sensitive and should not exceed 32 characters in length. Do not use any of the following characters (< > | " & \ ? ,).  
| | • precedence <SSID> – Sets the precedence for this authentication rule. The precedence value allows systematic evaluation and application of rules. Rules with the lowest precedence receive the highest priority.  
| | • <1-5000> – Specify a precedence from 1-5000. |
| Note: | Specifying the SSID allows the RADIUS server to use the SSID attribute in access requests to determine the data source to use. This option is applicable to onboard RADIUS servers only. |
authentication eap-auth-type [all|peap-gtc|peap-mschapv2|tls|ttls-md5|ttls-mschapv2|ttls-pap]

<table>
<thead>
<tr>
<th>eap-auth-type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Enables both TTLS and PEAP authentication. This is the default setting.</td>
</tr>
<tr>
<td>peap-gtc</td>
<td>Enables PEAP with default authentication using GTC</td>

authentication eap-auth-type tls

rfs7000-37FABE(config-radius-server-policy-test)#

**Related Commands**

no

Removes the RADIUS authentication settings
16.2.2 bypass

Enables bypassing a CRL check. When enabled, this feature bypasses checks for missing and expired CRLs. This option is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

bypass [crl-check|expired-crl]

Parameters
- bypass [crl-check|expired-crl]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bypass</td>
<td>Bypasses CRL check based on the parameters passed</td>
</tr>
<tr>
<td>crl-check</td>
<td>Bypasses CRL check of missing CRLs</td>
</tr>
<tr>
<td>expired-crl</td>
<td>Bypasses CRL check of expired CRLs</td>
</tr>
</tbody>
</table>

Note: A CRL is a list of certificates that have been revoked or are no longer valid.

Examples

nx9500-6C8809(config-radius-server-policy-test)#bypass crl-check

nx9500-6C8809(config-radius-server-policy-test)#no bypass crl-check

nx9500-6C8809(config-radius-server-policy-test)#show context radius-server-policy test

nx9500-6C8809(config-radius-server-policy-test)##

Related Commands

no | Disables bypassing of checking for missing CRLs or expired CRLs
16.2.3 chase-referral

Enables chasing of referrals from an external LDAP server resource.

An LDAP referral is a controller or service platform’s way of indicating to a client it does not hold the section of the directory tree where a requested content object resides. The referral is the controller or service platform’s direction to the client a different location is more likely to hold the object, which the client uses as the basis for a DNS search for a domain controller. Ideally, referrals always reference a domain controller that indeed holds the object. However, it is possible for the domain controller to generate another referral, although it usually does not take long to discover the object does not exist and inform the client.

This feature is enabled by default.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

chase-referral

Parameters

None

Examples

rfs7000-37FABE(config-radius-server-policy-test)#chase-referral

Related Commands

</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables LDAP server referral chasing</td>
</tr>
</tbody>
</table>
16.2.4 crl-check

Enables a certificate revocation list (CRL) check on this RADIUS server policy.

A CRL is a list of revoked certificates issued and subsequently revoked by a Certification Authority (CA). Certificates can be revoked for a number of reasons including failure or compromise of a device using a certificate, a compromise of a certificate key pair or errors within an issued certificate. The mechanism used for certificate revocation depends on the CA.

This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
crl-check
```

Parameters

None

Examples

```
rfs7000-37FABE(config-radius-server-policy-test)#crl-check
rfs7000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
  authentication eap-auth-type tls
  crl-check

```
Disables CRL check on a RADIUS server policy
16.2.5 ldap-agent

Configure the LDAP agent's settings in the RADIUS server policy context

When a user’s credentials are stored on an external LDAP server, the local RADIUS server cannot successfully conduct PEAP-MSCHAPv2 authentication, since it is not aware of the user’s credentials maintained on the external LDAP server resource. Therefore, up to two LDAP agents can be provided locally so remote LDAP authentication can be successfully accomplished on the remote LDAP resource (using credentials maintained locally).

This feature is available to all controller, service platforms and access point models, with the exception of AP6511 and AP6521 models running in standalone AP or virtual controller AP mode. However, this feature is supported by dependent mode AP6511 and AP6521 model access points when adopted and managed by a controller or service platform.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

Syntax

ldap-agent [join|join-retry-timeout|primary|secondary]

ldap-agent [join {on <DEVICE-NAME>}|join-retry-timeout <60-300>]

ldap-agent [primary|secondary] domain-name <LDAP-DOMAIN-NAME> domain-admin-user <ADMIN-USER-NAME> domain-admin-password [0 <WORD>|2 <WORD>]

Parameters

- ldap-agent [join {on <DEVICE-NAME>}]|join-retry-timeout <60-300>]
- ldap-agent Configures the LDAP agent's settings
- join {on <DEVICE-NAME>} Initiates the join process, which binds the RADIUS server with the LDAP server's (Windows) domain. When successful, the hostname (name of the AP, wireless controller, or service platform) is added to the LDAP server's Active Directory.
  - on <DEVICE-NAME> – Optional. Specifies the device name
  - <DEVICE-NAME> – Specify the name of the AP, wireless controller, or service platform.
  **Note:** To confirm the join status of a controller, use the `show > ldap-agent > join-status` command.
- join-retry-timeout <60-300> If the join process fails (i.e. the RADIUS server fails to join the LDAP server’s domain), the process is retried after a specified interval. This command configures the interval (in seconds) between two successive join attempts.
  - <60-300> – Set the timeout value from 60 - 300 seconds. The default is 60 seconds.
  **Note:** A retry timer is initiated as soon as the join process starts, which tracks the time lapse in case of a failure.
- ldap-agent [primary|secondary] domain-name <LDAP-DOMAIN-NAME> domain-admin-user <ADMIN-USER-NAME> domain-admin-password [0 <WORD>|2 <WORD>] Configures the primary LDAP server details, such as domain name, user name, and password. The RADIUS server uses these credentials to bind with the primary LDAP server.
### Examples

```
rfs4000-229D58(config-radius-server-policy-test)#ldap-agent primary domain-name test domain-admin-user Administrator domain-admin-password 0 test@123
rfs4000-229D58(config-radius-server-policy-test)#
rfs4000-229D58(config-radius-server-policy-test)#show context radius-server-policy test
  ldap-agent primary domain-name test domain-admin-user Administrator domain-admin-password 0 test@123
rfs4000-229D58(config-radius-server-policy-test)#
```

  - `0 <WORD>` – Specifies the password in the unencrypted format  
  - `2 <WORD>` – Specifies the password in the encrypted format |
16.2.6 ldap-group-verification

Enables LDAP group verification settings on this RADIUS server policy. This option is enabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

16.2.7 ldap-server

Configures the LDAP server’s settings. Configuring LDAP server allows users to login and authenticate from anywhere on the network.

Administrators have the option of using the local RADIUS server to authenticate users against an external LDAP server resource. Using an external LDAP user database allows the centralization of user information and reduces administrative user management overhead making RADIUS authorization more secure and efficient.

RADIUS is not just a database. It is a protocol for asking intelligent questions to a user database (like LDAP). LDAP however is just a database of user credentials used optionally with the local RADIUS server to free up resources and manage user credentials from a secure remote location. It is the local RADIUS resources that provide the tools to perform user authentication and authorize users based on complex checks and logic. A LDAP user database alone cannot perform such complex authorization checks.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
ldap-server [dead-period|primary|secondary]
ldap-server dead-period <0-600>

ldap-server [primary|secondary] host <IP> port <1-65535> login <LOGIN-NAME>
  bind-dn <BIND-DN> base-dn <BASE-DN> passwd [0 <PASSWORD>|2 <ENCRYPTED-PASSWORD>]
  passwd-attr <ATTR> group-attr <ATTR> group-filter <FILTER>
  group-membership <WORD> {net-timeout <1-10>|start-tls net-timeout <1-10>|
    tls-mode net-timeout <1-10>}
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dead-period &lt;0-600&gt;</td>
<td>Set an interval, in seconds, during which the local server will not contact its LDAP server resource once its been defined as unavailable. A dead period is only implemented when additional LDAP servers are configured and available.</td>
</tr>
<tr>
<td>host &lt;IP&gt;</td>
<td>Specifies the LDAP host IP address</td>
</tr>
<tr>
<td>port &lt;1-65535&gt;</td>
<td>Configures the LDAP server port</td>
</tr>
</tbody>
</table>

```
ldap-server [primary|secondary] host <IP> port <1-65535> login <LOGIN-NAME>
  bind-dn <BIND-DN> base-dn <BASE-DN> passwd [0 <PASSWORD>|2 <ENCRYPTED-PASSWORD>]
  passwd-attr <ATTR> group-attr <ATTR> group-filter <FILTER>
  group-membership <WORD> {net-timeout <1-10>|start-tls net-timeout <1-10>|
    tls-mode net-timeout <1-10>}
```

16.2.8 local

radius-server-policy

Configures a local RADIUS realm on this RADIUS server policy.
When the local RADIUS server receives a request for a user name with a realm, the server references a table of realms. If the realm is known, the server proxies the request to the RADIUS server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
local realm <RADIUS-REALM>

Parameters
- local realm <RADIUS-REALM>

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>realm &lt;RADIUS-REALM&gt;</td>
<td>Configures a local RADIUS realm</td>

Related Commands

no | Removes the RADIUS local realm
16.2.9 nas

radius-server-policy

Configures the key sent to a RADIUS client

A RADIUS client is a mechanism to communicate with a central server to authenticate users and authorize access to the controller, service platform or Access Point managed network.

The client and server share a secret (a password). That shared secret followed by the request authenticator is put through a MD5 hash algorithm to create a 16 octet value which is XORed with the password entered by the user. If the user password is greater than 16 octets, additional MD5 calculations are performed, using the previous ciphertext instead of the request authenticator. The server receives a RADIUS access request packet and verifies the server possesses a shared secret for the client. If the server does not possess a shared secret for the client, the request is dropped. If the client received a verified access accept packet, the username and password are considered correct, and the user is authenticated. If the client receives a verified access reject message, the username and password are considered to be incorrect, and the user is not authenticated.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
nas <IP/M> secret [0|2]<LINE>
nas <IP/M> secret [0 <LINE>|2 <LINE>|<LINE>]

Parameters
- nas <IP/M> secret [0 <LINE>|2<LINE>]

| <IP/M> | Sets the RADIUS client’s IP address
|       | &lt;IP/M&gt; — Sets the RADIUS client’s IP address in the A.B.C.D/M format
| secret | Sets the RADIUS client’s shared secret. Use one of the following options:
| [0 <LINE>|2 <LINE>|<LINE>] | 0 <LINE> — Sets an UNENCRYPTED secret
|       | 2 <LINE> — Sets an ENCRYPTED secret
|       | <LINE> — Defines the secret (client shared secret) up to 64 characters

Examples
rfs7000-37FABE(config-radius-server-policy-test)#nas 172.16.10.10/24 secret 0 wirelesswell
rfs7000-37FABE(config-radius-server-policy-test)#show context

Related Commands
- no
  Removes a RADIUS server's client on a RADIUS server policy
16.2.10 no

Negates a command or reverts back to default settings. When used with in the config RADIUS server policy mode, the `no` command removes settings, such as crl-check, LDAP group verification, RADIUS client etc.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
no [authentication|bypass|chase-referral|crl-check|ldap-agent|ldap-group-verification|
ldap-server|local|nas|proxy|session-resumption|termination|use]
no bypass [crl-check|expired-crl]
no authentication [data-source|eap]
no authentication [data-source {ldap {fallback}|local|ssid}|eap configuration]
no [chase-referral|crl-check|ldap-group-verification|nas <IP/M>|session-resumption]
no ldap-agent [join-retry-timeout|primary|secondary]
no local realm [<REALM-NAME>|all]
no proxy [realm <REALM-NAME>|retry-count|retry-delay]
no ldap-server [dead-period|primary|secondary]
no termination
no use [radius-group [<RAD-GROUP-NAME>|all]|radius-user-pool-policy [<RAD-USER-POOL-NAME>|all]]
```

Parameters

- `no <PARAMETERS>`

| no <PARAMETERS> | Negates a command or reverts back to default settings. When used with in the config RADIUS server policy mode, the `no` command removes settings, such as crl-check, LDAP group verification, RADIUS client etc |

Examples

The following example shows the RADIUS server policy ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
  authentication eap-auth-type tls
  crl-check
  nas 172.16.10.10/24 secret 0 wirelesswell
  local realm realm1

rfs7000-37FABE(config-radius-server-policy-test)#
```
16.2.11 proxy

Configures a proxy RADIUS server based on the realm/suffix. The realm identifies where the RADIUS server forwards AAA requests for processing.

A user’s access request is sent to a proxy RADIUS server if it cannot be authenticated by the local RADIUS resources. The proxy server checks the information in the user access request and either accepts or rejects the request. If the proxy server accepts the request, it returns configuration information specifying the type of connection service required to authenticate the user.

The RADIUS proxy appears to act as a RADIUS server to NAS, whereas the proxy appears to act as a RADIUS client to the RADIUS server.

When the proxy server receives a request for a user name with a realm, the server references a table of realms. If the realm is known, the server proxies the request to the RADIUS server.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

proxy realm \(<REALM-NAME>\) server \(<IP>\) port \(<1024-65535>\) secret
  [0 \(<PASSWORD>|2 \(<ENCRYPTED-PASSWORD>|\(<PASSWORD>)\]

proxy retry-count \(<3-6>\)

proxy retry-delay \(<5-10>\)

Parameters

- proxy realm \(<REALM-NAME>\) server \(<IP>\) port \(<1024-65535>\) secret
  [0 \(<PASSWORD>|2 \(<ENCRYPTED-PASSWORD>|\(<PASSWORD>)\]

<table>
<thead>
<tr>
<th>proxy realm (&lt;REALM-NAME&gt;)</th>
<th>Configures the realm name</th>
</tr>
</thead>
<tbody>
<tr>
<td>(&lt;REALM-NAME&gt;) – Specify the realm name. The name should not exceed 50 characters.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>server (&lt;IP&gt;)</th>
<th>Configures the proxy server’s IP address. This is the address of server checking the information in the user access request and either accepting or rejecting the request on behalf of the local RADIUS server.</th>
</tr>
</thead>
<tbody>
<tr>
<td>(&lt;IP&gt;) – Sets the proxy server’s IP address</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>port (&lt;1024-65535&gt;)</th>
<th>Configures the proxy server’s port. This is the TCP/IP port number for the server that acts as a data source for the proxy server.</th>
</tr>
</thead>
<tbody>
<tr>
<td>(&lt;1024-65535&gt;) – Sets the proxy server’s port from 1024 - 65535 (default port is 1812)</td>
<td></td>
</tr>
</tbody>
</table>

| secret [0 \(<PASSWORD>|2 \(<ENCRYPTED-PASSWORD>|\(<PASSWORD>)\] | Sets the proxy server secret string. The options are: |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| \(<PASSWORD>\) – Sets an UNENCRYPTED password |
| 2 \(<ENCRYPTED-PASSWORD>\) – Sets an ENCRYPTED password |
| \(<PASSWORD>\) – Sets the proxy server shared secret value |
• proxy retry-count <3-6>

    retry-count <3-6>  
    Sets the proxy server’s retry count. This is the maximum number attempts made by a controllers RADIUS server to connect to the proxy server.  
    • <3-6> – Sets a value from 3 - 6 (default is 3 counts)

• proxy retry-delay <5-10>

    retry-delay <5-10>  
    Sets the proxy server’s retry delay count. This is the interval the controller’s RADIUS server waits before making an additional connection attempt.  
    • <5-10> – Sets a value from 5 - 10 seconds (default is 5 seconds)

Usage Guidelines

A maximum of five RADIUS proxy servers can be configured. The proxy server attempts six retries before it times out. The retry count defines the number of times RADIUS requests are transmitted before giving up. The timeout value is the defines the interval between successive retransmission of a RADIUS request (in case of no reply).

Examples

rfs7000-37FABE(config-radius-server-policy-test)#proxy realm test1 server 172.16.10.7 port 1025 secret 0 test1123
rfs7000-37FABE(config-radius-server-policy-test)#proxy retry-count 4
rfs7000-37FABE(config-radius-server-policy-test)#proxy retry-delay 8
rfs7000-37FABE(config-radius-server-policy-test)#show context radius-server-policy test
    proxy retry-delay 8
    proxy retry-count 4
    proxy realm test1 server 172.16.10.7 port 1025 secret 0 test1123
    ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1" base-dn "bas-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-filter "groupfilter1" group-membership groupmembership1 net-timeout 2
rfs7000-37FABE(config-radius-server-policy-test)#

Related Commands

no  Removes or resets the RADIUS proxy server’s settings
16.2.12 session-resumption

Enables session resumption or fast re-authentication by using cached attributes. This feature controls the volume and duration cached data is maintained by the server policy, upon termination of a server policy session. The availability and quick retrieval of the cached data speeds up session resumption.

This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
session-resumption \{lifetime|max-entries\}
```

```
session-resumption \{lifetime <1-24> \{max-entries <10-1024>\}|max-entries <10-1024>\}
```

Parameters

- `session-resumption \{lifetime <1-24> \{max-entries <10-1024>\}|max-entries <10-1024>\}`

| lifetime <1-24> \{max-entries <10-1024>\} | Optional. Sets the lifetime of cached entries  
|------------------------------------------|---------------------------------------------  
| \<1-24> \— Specify the lifetime period from 1 - 24 hours (default is 1 hour) \  
| \max-entries \— Optional. Configures the maximum number of entries in the cache \  
| \<10-1024> \— Sets the maximum number of entries in the cache from 10 - 1024 (default is 128 entries) |

| max-entries <10-1024> | Optional. Configures the maximum number of entries in the cache  
|----------------------|-------------------------------------------------------------  
| \<10-1024> \— Sets the maximum number of entries in the cache from 10 - 1024 (default is 128 entries) |

Examples

```
rfs7000-37FABE(config-radius-server-policy-test)#session-resumption lifetime 10 max-entries 11
```

```
rfs7000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
    proxy retry-delay 8
    proxy retry-count 4
    proxy realm test1 server 172.16.10.7 port 1025 secret 0 test1123
    ldap-server primary host 172.16.10.19 port 162 login "test" bind-dn "bind-dn1" base-dn "bas-dn1" passwd 0 test@123 passwd-attr test123 group-attr group1 group-filter "groupfilter1" group-membership groupmembership1 net-timeout 2
    session-resumption lifetime 10 max-entries 11
rfs7000-37FABE(config-radius-server-policy-test)#
```

Related Commands

```
no
```

Disables session resumption on this RADIUS server policy
16.2.13 **termination**

*radius-server-policy*

Enables EAP termination on this RADIUS server policy. When enabled, EAP authentication is terminated at the controller level. This option is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
termination
```

**Parameters**

None

**Examples**

```
nx9500-6C8809(config-radius-server-policy-test)#termination
```

```
nx9500-6C8809(config-radius-server-policy-test)#show context  
  radius-server-policy test
  termination
  no bypass crl-check
  nx9500-6C8809(config-radius-server-policy-test)#
```

</table>
16.2.14 use

Defines settings used with the RADIUS server policy

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

use [radius-group <RAD-GROUP-NAME1> {RAD-GROUP-NAME2}]|radius-user-pool-policy <RAD-USER-POOL-NAME>]

Parameters
- use [radius-group <RAD-GROUP-NAME1> {RAD-GROUP-NAME2}]|radius-user-pool-policy <RAD-USER-POOL-NAME>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| radius-group <RAD-GROUP-NAME1> {RAD-GROUP-NAME2} | Associates a specified RADIUS group (for LDAP users) with this RADIUS server policy.
| You can optionally associate two RADIUS groups with one RADIUS server policy. |
| radius-user-pool-policy <RAD-USER-POOL-NAME> | Associates a specified RADIUS user pool with this RADIUS server policy. Specify a user pool name. |

Examples

rfs7000-37FABE(config-radius-server-policy-test)#use radius-group test
rfs7000-37FABE(config-radius-server-policy-test)#show context
radius-server-policy test
  proxy retry-delay 8
  proxy retry-count 4
  proxy realm test1 server 172.16.10.17 port 1025 secret 0 test1123

  use radius-group test
  session-resumption lifetime 10 max-entries 11
rfs7000-37FABE(config-radius-server-policy-test)#

Related Commands

no Disassociates a RADIUS group or a RADIUS user pool policy from this RADIUS server policy
16.3 radius-user-pool-policy

**RADIUS-POLICY**

Configures a RADIUS user pool policy and enters its configuration mode.

A user pool defines policies for individual user access to the internal RADIUS resources. User pool policies define unique permissions (either temporary or permanent) that control user access to the local RADIUS resources. A pool can contain a single user or multiple users.

Use the (config) instance to configure RADIUS user pool policy commands. To navigate to the radius-user-pool-policy instance, use the following commands:

```
<DEVICE>(config)#radius-user-pool-policy <POOL-NAME>
```

```
rfs7000-37FABE(config)#radius-user-pool-policy testuser
```

```
rfs7000-37FABE(config-radius-user-pool-testuser)#
```

Radius User Pool Mode commands:
- `duration` Set a guest user's access duration
- `no` Negate a command or set its defaults
- `user` Radius user configuration
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-radius-user-pool-testuser)#
```

The following table summarizes RADIUS user pool policy configuration commands:

<table>
<thead>
<tr>
<th>Commands</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>duration</td>
<td>Modifies a guest user's duration of captive-portal access</td>
<td>page 16-35</td>
</tr>
<tr>
<td>user</td>
<td>Configures the RADIUS user parameters</td>
<td>page 16-36</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or sets its default</td>
<td>page 16-39</td>
</tr>
</tbody>
</table>
16.3.1 duration

Modifies the duration, in minutes, that a guest user can access the captive portal.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

duration <GUEST-USER-NAME> <0-525600>

Parameters

- duration <GUEST-USER-NAME> <0-525600>

<table>
<thead>
<tr>
<th>duration &lt;GUEST-USER-NAME&gt; &lt;0-525600&gt;</th>
<th>Modifies the duration of captive-portal access (in minutes) for the guest user identified by the &lt;GUEST-USER-NAME&gt; keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;GUEST-USER-NAME&gt; — Specify the guest user’s name.</td>
</tr>
<tr>
<td></td>
<td>• &lt;0-525600&gt; — Specify the access duration from 0 - 5252600 minutes. A value of “0” indicates unlimited access. The default is 1440 minutes.</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58(config-radius-user-pool-wdws)#show context radius-user-pool-policy wdws
user guestuser1 password 0 guestuser@1 group wdws guest expiry-time 12:30 expiry-date 12/15/2014 access-duration 500

rfs4000-229D58(config-radius-user-pool-wdws)#duration guestuser1 200
rfs4000-229D58(config-radius-user-pool-wdws)#show context radius-user-pool-policy wdws
user guestuser1 password 0 guestuser@1 group wdws guest expiry-time 12:30 expiry-date 12/15/2014 access-duration 200
rfs4000-229D58(config-radius-user-pool-wdws)#
16.3.2 **user**

Configures RADIUS user parameters

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

**Syntax**

```plaintext
user <USERNAME> password [0 <UNENCRYPTED-PASSWORD>|2 <ENCRYPTED-PASSWORD>|<PASSWORD>] {group <RAD-GROUP-NAME>} {guest}

user <USERNAME> password [0 <UNENCRYPTED-PASSWORD>|2 <ENCRYPTED-PASSWORD>|<PASSWORD>] {group <RAD-GROUP-NAME>} {guest expiry-time <HH:MM> expiry-date <MM/DD/YYYY> access-duration <0-525600> data-limit <1-102400> committed-downlink <100-1000000> committed-uplink <100-1000000> reduced-downlink <100-1000000> reduced-uplink <100-1000000> email-id <EMAIL-ID> start-time <HH:MM> start-date <MM/DD/YYYY> telephone <TELEPHONE-NUMBER>}
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>user &lt;USERNAME&gt;</code></td>
<td>Adds a new RADIUS user to the RADIUS user pool</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;USERNAME&gt;</code> — Specify the name of the user. The username should not exceed 64</td>
</tr>
<tr>
<td></td>
<td>characters.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The username is a unique alphanumeric string identifying this user,</td>
</tr>
<tr>
<td></td>
<td>and cannot be modified with the rest of the configuration.</td>
</tr>
<tr>
<td><code>passwd</code></td>
<td>Configures the user password (provide a password unique to this user)</td>
</tr>
<tr>
<td>0</td>
<td>• &lt;UNENCRYPTED-PASSWORD&gt; — Sets an unencrypted password</td>
</tr>
<tr>
<td>2</td>
<td>• &lt;ENCRYPTED-PASSWORD&gt; — Sets an encrypted password</td>
</tr>
<tr>
<td></td>
<td>• &lt;PASSWORD&gt; — Sets a password (specified unencrypted) up to 21 characters</td>
</tr>
<tr>
<td><code>group</code></td>
<td>Optional. Configures the RADIUS server group of which this user is a member</td>
</tr>
<tr>
<td><code>&lt;RAD-GROUP-NAME&gt;</code></td>
<td>• <code>&lt;RAD-GROUP-NAME&gt;</code> — Specify the group name in the local database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the user is a guest, assign the user a group with temporary access privileges.</td>
</tr>
<tr>
<td><code>guest</code></td>
<td>Optional. Specifies that this user is a guest user. After enabling a guest user account, specify the expiry time and date for this account.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> A guest user can be assigned only to a guest user group.</td>
</tr>
</tbody>
</table>
After configuring the above user details, optionally configure the following user information:

- **access-duration <0-525600>** – Configures the duration, in minutes, for which this guest user can access the captive portal.
  - **<0-525600>** – Specify a value from 0 - 525600 minutes.
- **data-limit <1-102400>** – Configures the data limit for which this guest user can access the captive portal. Specify a value from 1-102400 bytes.
- **committed-downlink <100-1000000>** – Configures committed downlink bandwidth until data limit is reached. This value represents the download speed (in kilobits per second) allocated to the guest user. When bandwidth is available, the user can download data at the specified rate. If a guest user has a bandwidth based policy and exceeds the specified data limit, the speed is throttled to the *reduced downlink rate* (specified using this command). Specify a value from 100-1000000 Kbps.
- **committed-uplink <100-1000000>** – Configures committed uplink bandwidth until data limit is reached. This value represents the upload speed (in kilobits per second) allocated to the guest user. When bandwidth is available, the user can upload data at the specified rate. If a guest user has a bandwidth based policy and exceeds the specified data limit, the speed is throttled to the *reduced uplink rate* (specified using this command). Specify a value from 100-1000000 Kbps.
- **reduced-downlink <100-1000000>** – Configures reduced downlink bandwidth after data limit is reached. This value represents the reduced speed the guest utilizes (in kilobits per second) when exceeding the specified data limit, if applicable. If a guest user has a bandwidth based policy and exceeds the specified data limit, the speed is throttled to the *reduced downlink rate* specified here. Specify a value from 100-1000000 Kbps.
- **reduced-uplink <100-1000000>** – Configures reduced uplink bandwidth after data limit is reached. This value represents the reduced speed the guest utilizes (in kilobits per second) when exceeding the specified data limit, if applicable. If a guest user has a bandwidth based policy and exceeds the specified data limit, the speed is throttled to the *reduced uplink rate* specified here. Specify a value from 100-1000000 Kbps.
- **email-id** – Optional. User’s e-mail ID
- **start-time** – Optional. User’s account activation time. After specifying the activation time, specify the activation date.
- **start-date** – User’s account activation date
- **telephone** – Optional. User’s telephone number (should include the area code)

**Note:** To view access details of guest users on a RADIUS server, in the Priv Executable Configuration mode, use the following command:

```bash
current_time > radius > guest-users
rfs7000-37FABE# show radius guest-users time
TIME (min:sec) USED REMAINING GUEST USER
0:00 500:00 user1
rfs7000-37FABE#
```

16.3.3 no

Negates a command or sets its default. When used in the RADIUS user pool policy mode, the no command deletes a user from a RADIUS user pool.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```no user <USERNAME>```

Parameters

- **no user <USERNAME>**

  Deletes a RADIUS user

  - `<USERNAME>` — Specify the user name.

Examples

The following example shows the RADIUS user pool 'wdws' settings before the 'no' command is executed:

```bash
rfs4000-229D58(config-radius-user-pool-wdws)#show context radius-user-pool-policy wdws
user guestuser1 password 0 guestuser@1 group wdws guest expiry-time 12:30 expiry-date 12/15/2014 access-duration 500
```

```
rfs4000-229D58(config-radius-user-pool-wdws)#no user guestuser1
```

The following example shows the RADIUS user pool 'wdws' settings after the 'no' command is executed:

```bash
rfs4000-229D58(config-radius-user-pool-wdws)#show context radius-user-pool-policy wdws
```

```
rfs4000-229D58(config-radius-user-pool-wdws)#
```

This chapter summarizes the radio QoS policy in the CLI command structure.

Configuring and implementing a radio QoS policy is essential for WLANs with heavy traffic and less bandwidth. The policy enables you to provide preferential service to selected network traffic by controlling bandwidth allocation. The radio QoS policy can be applied to VLANs configured on an access point. In case no VLANs are configured, the radio QoS policy can be applied to an access point’s Ethernet and radio ports.

Without a dedicated QoS policy, a network operates on a best-effort delivery basis, meaning all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped!

When configuring a QoS policy for a radio, select specific network traffic, prioritize it, and use congestion-management and congestion-avoidance techniques to provide deployment customizations best suited to each QoS policy’s intended wireless client base.

A well designed QoS policy should:

- Classify and mark data traffic to accurately prioritize and segregate it (by access category) throughout the network.
- Minimize network delay and jitter for latency sensitive traffic.
- Ensure higher priority traffic has a better likelihood of delivery in the event of network congestion.
- Prevent ineffective utilization of access points degrading session quality by configuring admission control mechanisms within each radio QoS policy.

Within a managed wireless network, wireless clients supporting low and high priority traffic contend with one another for access and data resources. The IEEE 802.11e amendment has defined Enhanced Distributed Channel Access (EDCA) mechanisms stating high priority traffic can access the network sooner than lower priority traffic. The EDCA defines four traffic classes (or access categories); voice (highest), video (next highest), best effort, and background (lowest). The EDCA has defined a time interval for each traffic class, known as the Transmit Opportunity (TXOP). The TXOP prevents traffic of a higher priority from completely dominating the wireless medium, thus ensuring lower priority traffic is still supported.

IEEE 802.11e includes an advanced power saving technique called Unscheduled Automatic Power Save Delivery (U-APSD) that provides a mechanism for wireless clients to retrieve packets buffered by an access point. U-APSD reduces the amount of signaling frames sent from a client to retrieve buffered data from an access point. U-APSD also allows access points to deliver buffered data frames as bursts, without backing-off between data frames. These improvements are useful for voice clients, as they provide improved battery life and call quality.

The Wi-Fi alliance has created Wireless Multimedia (WMM) and WMM Power Save (WMM-PS) certification programs to ensure interoperability between 802.11e WLAN infrastructure implementations and wireless clients. A managed wireless
network supports both WMM and WMM-Power Save techniques. WMM and WMM-PS (U-APSD) are enabled by default in each WLAN profile.

Enabling WMM support on a WLAN just advertises the WLAN's WMM capability and radio configuration to wireless clients. The wireless clients must also support WMM and use the values correctly while accessing the WLAN to benefit.

WMM includes advanced parameters (CWMin, CWMax, AIFSN and TXOP) specifying back-off duration and inter-frame spacing when accessing the network. These parameters are relevant to both connected access point radios and their wireless clients. Parameters impacting access point transmissions to their clients are controlled using per radio WMM settings, while parameters used by wireless clients are controlled by a WLAN's WMM settings.

Wireless network controllers (access points, controllers, and service platforms) include a Session Initiation Protocol (SIP), Skinny Call Control Protocol (SCCP) and Application Layer Gateway (ALG) enabling devices to identify voice streams and dynamically set voice call bandwidth.

Wireless network controllers also support static QoS mechanisms per WLAN to provide prioritization of WLAN traffic when legacy (non-WMM) clients are deployed. When enabled on a WLAN, traffic forwarded to a client is prioritized and forwarded based on the WLAN's WMM access control setting.

---

**NOTE:** Statistically setting a WLAN WMM access category value only prioritizes traffic to the client.

---

Wireless network administrators can also assign weights to each WLAN in relation to user priority levels. The lower the weight, the lower the priority. Use a weighted technique to achieve different QoS levels across WLANs.

All devices rate-limit bandwidth for WLAN sessions. This form of per-user rate limiting enables administrators to define uplink and downlink bandwidth limits for users and clients. This sets the level of traffic a user or client can forward and receive over the WLAN. If the user or client exceeds the limit, excessive traffic is dropped.

Rate limits can be applied to WLANs using groups defined locally or externally from a RADIUS server using Vendor Specific Attributes (VSAs). Rate limits can be applied to users authenticating using 802.1X, captive portal authentication, and devices using MAC authentication.

Use the (config) instance to configure radios QoS policy related configuration commands. To navigate to the radio QoS policy instance, use the following commands:

```
<DEVICE>(config)#radio-qos-policy <POLICY-NAME>
```

```
rfs7000-37FABE(config)#radio-qos-policy test
rfs7000-37FABE(config-radio-qos-test)#
```

**Radio QoS Mode commands:**

- accelerated-multicast: Configure multicast streams for acceleration
- admission-control: Configure admission-control on this radio for one or more access categories
- no: Negate a command or set its defaults
- smart-aggregation: Configure smart aggregation parameters
- wmm: Configure 802.11e/Wireless MultiMedia parameters

```
clrscr
commit
do
end
exit

17.1.1 accelerated-multicast

Configures multicast streams for acceleration. Multicasting allows group transmission of data streams.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

accelerated-multicast [client-timeout | max-client-streams | max-streams | overflow-policy | stream-threshold]

accelerated-multicast [client-timeout <5-6000> | max-client-streams <1-4> | max-streams <0-256> | overflow-policy [reject | revert] | stream-threshold <1-500>]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-timeout &lt;5-6000&gt;</td>
<td>Configures a timeout period in seconds for wireless clients</td>

17.1.2 admission-control

Enables admission control across all radios for one or more access categories. Enabling admission control for an access category ensures clients associated to an access point and complete WMM admission control before using that access category.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

admission-control [background|best-effort|firewall-detected-traffic|implicit-tspec|video|voice]
admission-control [firewall-detected-traffic|implicit-tspec]
admission-control [background|best-effort|video|voice] {max-airtime-percent|max-clients|max-roamed-clients|reserved-for-roam-percent}
admission-control [background|best-effort|video|voice] {max-airtime-percent <0-150>|max-clients <0-256|max-roamed-clients <0-256]|reserved-for-roam-percent <0-150>}

Parameters

- admission-control [firewall-detected-traffic|implicit-tspec]

| admission-control firewall-detected-traffic | Enables admission control for traffic whose access category is detected by the firewall ALG. For example, SIP voice calls. This feature is enabled by default. When enabled, the firewall simulates reception of frames for voice traffic when the voice traffic was originated via SIP or SCCP control traffic. If a client exceeds configured values, the call is stopped and/or received voice frames are forwarded at the next non admission controlled traffic class priority. This applies to clients that do not send TSPEC frames only. |
| admission-control implicit-tspec | Enables implicit traffic specifiers for clients that do not support WMM TSPEC, but are accessing admission-controlled access categories. This feature is enabled by default. This feature requires wireless clients to send their traffic specifications to an access point before they can transmit or receive data. If enabled, this setting applies to this radio QoS policy. When enabled, the access point simulates the reception of frames for any traffic class by looking at the amount of traffic the client is receiving and sending. If the client sends more traffic than has been configured for an admission controlled traffic class, the traffic is forwarded at the priority of the next non admission controlled traffic class. This applies to clients that do not send TSPEC frames only. |

- admission-control [background|best-effort|video|voice]

<p>| admission-control background | Configures background access category admission control parameters |
| admission-control best-effort | Configures best effort access category admission control parameters |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>admission-control video</td>
<td>Configures video access category admission control parameters</td>
</tr>
<tr>
<td>admission-control voice</td>
<td>Configures voice access category admission control parameters</td>
</tr>
</tbody>
</table>
| max-airtime-percent <0-150> | Optional. Specifies the maximum percentage of airtime, including oversubscription, for the following access category:  
  • background – Sets the maximum airtime (in the form of a percentage of the radio’s bandwidth) allotted to admission control for low (background) client traffic. Background traffic only needs a short radio airtime to process, so set an intermediate airtime value if this radio QoS policy is reserved to support background data.  
  • best-effort – Sets the maximum airtime (in the form of a percentage of the radio’s bandwidth) allotted to admission control for normal (best-effort) client traffic. Normal best effort traffic needs a short radio airtime to process, so set an intermediate airtime value if this radio QoS policy is reserved for best effort data support.  
  • video – Sets the maximum airtime (in the form of a percentage of the radio’s bandwidth) allotted to admission control for voice supported client traffic. Video traffic requires longer radio airtime to process, so set a longer airtime value if this radio QoS policy is intended to support video.  
  • voice – Sets the maximum airtime (in the form of a percentage of the radio’s bandwidth) allotted to admission control for voice supported client traffic. Voice traffic requires longer radio airtime to process, so set a longer airtime value if this radio QoS policy is intended to support voice.  
  The following keyword is common to all of the above traffic types:  
  • <0-150> – Specify a value from 0 - 150. This is the maximum percentage of airtime, including oversubscription, for the selected access category. The default is 75%. |
| max-clients <0-256>     | Optional. Specifies the maximum number of wireless clients admitted to the following access categories:  
  • background – Sets the number of wireless clients supporting low (background) traffic allowed to exist (and consume bandwidth) within the radio’s QoS policy  
  • best-effort – Sets the number of wireless clients supporting normal (best-effort) traffic allowed to exist (and consume bandwidth) within the radio’s QoS policy  
  • video – Sets the number of video supported wireless clients allowed to exist (and consume bandwidth) within the radio’s QoS policy.  
  • voice – Sets the number of voice supported wireless clients allowed to exist (and consume bandwidth) within the radio’s QoS policy.  
  **Note:** Since voice and video supported wireless clients use a greater portion of a controller’s resources than lower bandwidth traffic (like low and best effort categories), consider setting the max-client value proportionally to the number of other QoS policies supporting voice access category clients.  
  The following keyword is common to all of the above traffic types:  
  • <0-256> – Specify a value from 0 - 256. This is the maximum number of wireless clients admitted to the selected access category. The default is 100 clients. |
**Examples**

```
rfs7000-37FABE(config-radio-qos-test)#admission-control best-effort max-clients 200
rfs7000-37FABE(config-radio-qos-test)#admission-control voice reserved-for-roam-percent 8
rfs7000-37FABE(config-radio-qos-test)#admission-control voice max-airtime-percent 9
rfs7000-37FABE(config-radio-qos-test)#show context
```

**Related Commands**

- `no` - Reverts or resets admission control settings to their default.

### max-roamed-clients

`<0-256>`

Optional. Specifies the maximum number of roaming wireless clients admitted to the selected access category.

- **background** – Sets the number of low (background) supported wireless clients allowed to roam to a different access point radio.
- **best-effort** – Sets the number of normal (best-effort) supported wireless clients allowed to roam to a different access point radio.
- **video** – Sets the number of video supported wireless clients allowed to roam to a different access point radio.
- **voice** – Sets the number of voice supported wireless clients allowed to roam to a different access point radio.

The following keyword is common to all of the above traffic types:

- `<0-256>` – Specify a value from 0 - 256. This is the maximum number of roaming wireless clients admitted to the selected access category. The default is 10 roamed clients.

### reserved-for-roam-percent

`<0-150>`

Optional. Calculates the percentage of air time, including oversubscription, allocated exclusively for roaming clients. This value is calculated relative to the configured max air time for this access category.

- **background** – Sets the roam utilization (in the form of a percentage of the radio’s bandwidth) allotted to admission control for low (background) supported clients who have roamed to a different radio.
- **best-effort** – Sets the roam utilization (in the form of a percentage of the radio’s bandwidth) allotted to admission control for normal (best-effort) supported clients who have roamed to a different radio.
- **video** – Sets the roam utilization (in the form of a percentage of the radio’s bandwidth) allotted to admission control for video supported clients who have roamed to a different radio.
- **voice** – Sets the roam utilization (in the form of a percentage of the radio’s bandwidth) allotted to admission control for voice supported clients who have roamed to a different radio.

The following keyword is common to all of the above traffic types:

- `<0-150>` – Specify a value from 0 - 150. This is the percentage of air time, including oversubscription, allocated exclusively for roaming clients associated with the selected access category. The default is 10%.
Negates a command or resets configured settings to their default. When used in the radio QOS policy mode, the no command enables the resetting of accelerated multicast parameters, admission control parameters, and MultiMedia parameters.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
no [accelerated-multicast|admission-control|smart-aggregation|wmm|service]
```

```
no accelerated-multicast [client-timeout|max-client-streams|max-streams|overflow-policy|stream-threshold]
```

```

```
no wmm [background|best-effort|video] [aifsn|cw-max|cw-min|txop-limit]
```

```
no service admission-control across-reassoc
```

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Negates a command or resets configured settings to their default. When used in the radio QOS policy mode, the no command enables the resetting of accelerated multicast parameters, admission control parameters, and MultiMedia parameters. |

Examples

The following example shows the Radio-qos-policy ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
admission-control voice max-airtime-percent 9
admission-control voice reserved-for-roam-percent 8
admission-control best-effort max-clients 200
accelerated-multicast stream-threshold 15
accelerated-multicast client-timeout 500
```

```
rfs7000-37FABE(config-radio-qos-test)#no admission-control best-effort max-clients
```

```
rfs7000-37FABE(config-radio-qos-test)#no accelerated-multicast client-timeout
```
The following example shows the Radio-qos-policy ‘test’ settings after the ‘no’ commands are executed:

rfs7000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
  admission-control voice max-airtime-percent 9
  admission-control voice reserved-for-roam-percent 8
  accelerated-multicast stream-threshold 15

  service admission-control across-reassoc
rfs4000-229D58(config-radio-qos-test)#

rfs4000-229D58(config-radio-qos-test)#no service admission-control across-reassoc
rfs4000-229D58(config-radio-qos-test)#show context
radio-qos-policy test
rfs4000-229D58(config-radio-qos-test)#
17.1.4 smart-aggregation

Configures smart aggregation parameters on this Radio QoS policy

Smart aggregation enhances frame aggregation by dynamically selecting the time when the aggregated frame is transmitted.

In a frame’s typical aggregation, an aggregated frame is sent when:

- A pre-configured number of aggregated frames is reached
- An administrator-defined interval has elapsed since the first frame (of a set of frames to be aggregated) was received
- An administrator-defined interval has elapsed since the last frame (not necessarily the final frame) of a set of frames to be aggregated was received

With this enhancement, an aggregation delay is set uniquely for each traffic class. For example, voice traffic might not be aggregated, but sent immediately. Whereas, background data traffic is set a delay for aggregating frames, and these aggregated frames are sent.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX5600, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

Syntax

```
smart-aggregation {delay|max-mesh-hops|min-aggregation-limit}
smart-aggregation {delay [background|best-effort|streaming-video|video-conferencing| voice] <0-1000>}
smart-aggregation {max-mesh-hops <1-10>}
smart-aggregation {min-aggregation-limit <0-64>}
```

Parameters

- **delay**  {delay [background|best-effort|streaming-video|video-conferencing| voice] <0-1000>}
  - Optional. Configures the maximum delay parameter for each traffic type
    - This is the maximum delay, in milliseconds, in the transmission of the first frame received.
  - **background**
    - Configures the maximum delay parameter, in milliseconds, for background traffic (250 msec)
  - **best-effort**
    - Configures the maximum delay parameter, in milliseconds, for best effort traffic (150 msec)
  - **streaming-video**
    - Configures the maximum delay parameter, in milliseconds, for streaming video traffic (150 msec)
  - **video-conferencing**
    - Configures the maximum delay parameter, in milliseconds, for video conference traffic (40 msec)
  - **voice**
    - Configures the maximum delay parameter, in milliseconds, for voice traffic (0 msec)
  - **<0-1000>**
    - This parameter is common to all of the above traffic types.
      - <0-1000> – Specify a value from 0 - 1000 msec.
### smart-aggregation \{\textit{max-mesh-hops <1-10}\} 

<table>
<thead>
<tr>
<th>max-mesh-hops &lt;1-10&gt;</th>
<th>Optional. Sets the maximum number of expected hops to the destination within a mesh</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-10&gt;</td>
<td>Specify a value from 1 - 10. The default is 3 hops.</td>
</tr>
</tbody>
</table>

### smart-aggregation \{\textit{min-aggregation-limit <0-64}\} 

<table>
<thead>
<tr>
<th>min-aggregation-limit &lt;0-64&gt;</th>
<th>Optional. Sets the minimum number of aggregates buffered before an aggregate is sent</th>

17.1.5 service

*service*

Invokes service commands in the radio QoS configuration mode

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
service [admission-control|show]
```

```
service admission-control across-reassoc
```

```
service show cli
```

**Parameters**

- **service admission-control across-reassoc**
  
  Invokes service commands

<table>

17.1.6  **wmm**

Configures 802.11e *wireless multimedia* (wmm) parameters

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
wmm [background|best-effort|video|voice] [aifsn <1-15>|cw-max <0-15>|cw-min <0-15>|txop-limit <0-65535>]
```

**Parameters**

- **wmm** [background|best-effort|video|voice]  [aifsn <1-15>|cw-max <0-15>|cw-min <0-15>|txop-limit <0-65535>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmm background</td>
<td>Configures background access category wireless multimedia settings</td>
</tr>
<tr>
<td>wmm best-effort</td>
<td>Configures best effort access category wireless multimedia settings</td>

<tr>
<td>wmm video</td>
<td>Configures video access category wireless multimedia settings</td>
</tr>
<tr>
<td>wmm voice</td>
<td>Configures voice access category wireless multimedia settings</td>
</tr>
<tr>
<td>aifsn &lt;1-15&gt;</td>
<td>Configures <em>Arbitrary Inter-Frame Space Number</em> (AIFSN) as the wait time between data frames derived from the AIFSN and slot time</td>
</tr>
</tbody>
</table>

- **background** – Sets the current AIFSN for low (background) traffic. The default is 7.
- **best-effort** – Sets the current AIFSN for normal (best-effort) traffic. The default is 3.
- **video** – Set the current AIFSN for video traffic. Higher-priority traffic video categories should have lower AIFSNs than lower-priority traffic categories. This causes lower-priority traffic to wait longer before attempting access. The default is 1.
- **voice** – Sets the current AIFSN for voice traffic. Higher-priority traffic voice categories should have lower AIFSNs than lower-priority traffic categories. This causes lower-priority traffic to wait longer before attempting access. The default is 1.

The following keyword is common to all of the above traffic types:

- **<1-15>** – Sets a value from 1 - 15
<table>
<thead>
<tr>

</tbody>
</table>

| **cw-min**  | Clients select a number between 0 and the min contention window to wait before retransmission. Clients then double their wait time on a collision, until it reaches the maximum contention window. |
| **<0-15>**  |                                                                                                                                           |
| background  | - Sets CW Min for low (background) traffic. The default is 4.                                                                          |
| best-effort | - Sets CW Min for normal (best effort) traffic. The default is 4.                                                                       |
| voice       | - Sets CW Min for voice traffic. The default is 2.                                                                                      |
| video       | - Sets CW Min for video traffic. The default is 3.                                                                                      |
| **Note:**   | Lower values are used for higher priority traffic (like video and voice) and higher values are used for lower priority traffic (like background and best-effort). |

| **txop-limit** | Set the interval, in microseconds, during which a particular client has the right to initiate transmissions |
| **<0-65535>**  |                                                                                                           |
| background    | - Sets TXOP for low (background) traffic. The default is 0.                                                                                   |
| best-effort  | - Sets TXOP for normal (best effort) traffic. The default is 4.                                                                              |
| voice        | - Sets TXOP for voice traffic. The default is 47.                                                                                             |
| video        | - Sets TXOP for video traffic. The default is 94.                                                                                             |
| **Note:**    | Lower values are used for higher priority traffic (like video and voice) and higher values are used for lower priority traffic (like background and best-effort). |
Usage Guidelines

Before defining a radio QoS policy, refer to the following deployment guidelines to ensure the configuration is optimally effective:

- To support QoS, each multimedia application, wireless client, and WLAN is required to support WMM.
- WMM enabled clients can co-exist with non-WMM clients on the same WLAN. Non-WMM clients are always assigned a Best Effort access category.
- Default WMM values are recommended for all deployments. Changing these values can lead to unexpected traffic blockages, and the blockages might be difficult to diagnose.
- Overloading an access point radio with too much high priority traffic (especially voice) degrades overall service quality for all users.
- TSPEC admission control is only available with newer voice over WLAN phones. Many legacy voice devices do not support TSPEC or even support WMM traffic prioritization.

Examples

```
rfs7000-37FABE(config-radio-qos-test)#wmm best-effort aifsn 7
rfs7000-37FABE(config-radio-qos-test)#wmm voice txop-limit 1
```

```
rfs7000-37FABE(config-radio-qos-test)#show context
radio-qos-policy test
  wmm best-effort aifsn 7
  wmm voice txop-limit 1
  admission-control voice max-airtime-percent 9
  admission-control voice reserved-for-roam-percent 8
  accelerated-multicast stream-threshold 15
```

Reverts or resets 802.11e/wireless multimedia settings to their default
This chapter summarizes the role policy commands in the CLI command structure.

A well defined role policy simplifies user management, and is a significant aspect of WLAN management. It acts as a role based firewall (much like ACLs) consisting of user-defined roles. Each role has a set of match criteria (filters) used to filter wireless clients. The action taken when a client matches the defined filters, is determined by the IP or MAC ACL associated with the user-defined role. Based on the conditions specified in the IP and/or MAC ACL, clients are granted or denied access to the controller managed network. The role policy also defines the VLAN and data rates assigned to clients provided network access.

A role policy also enables LDAP service, allowing controllers and access points to retrieve user information from the LDAP server. This information is matched with the user-defined role filters to determine if a client matches the role or not, and should be allowed or denied access to the controller managed network.

Use the (config-role-policy) instance to configure role policy related configuration commands. To navigate to the config-role instance, use the following commands:

```
<DEVICE> (config)#role-policy <POLICY-NAME>
rfs7000-37FABE (config)#role-policy test
rfs7000-37FABE (config-role-policy-test)#?
```

Role Policy Mode commands:
- default-role: Configuration for Wireless Clients not matching any role
- ldap-deadperiod: Ldap dead period interval
- ldap-query: Set the ldap query mode
- ldap-server: Add a ldap server
- ldap-timeout: Ldap query timeout interval
- no: Negate a command or set its defaults
- user-role: Create a role
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

```
rfs7000-37FABE (config-role-policy-test)#
```
NOTE: The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
18.1 role-policy

</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS*. 
### 18.1.1 default-role

Assigns a default role to a wireless client that fails to match any of the user-defined roles

When a wireless client accesses a network, the client's details, retrieved from the LDAP server, are matched against all user-defined roles within the role policy. If the client fails to match any of these user-defined role filters, the client is assigned the default role. The action taken (permit or deny access) is determined by the IP and/or MAC ACL associated with the default role.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```
default-role use [ip-access-list|ipv6-access-list|mac-access-list]
default-role use [ip-access-list|ipv6-access-list|mac-access-list] [in|out] <IP/IPv6/MAC-ACCESS-LIST-NAME> precedence <1-100>
```

#### Parameters
- `default-role use [ip-access-list|ipv6-access-list|mac-access-list] [in|out] <IP/IPv6/MAC-ACCESS-LIST-NAME> precedence <1-100>`

<table>
<thead>
<tr>
<th>default-role use</th>
<th>Enables default role configuration. This role is applied to a wireless client not matching any of the user-define roles.</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ip-access-list]</td>
<td>Use – Associates an IP, IPv6, or MAC access list with the default role</td>
</tr>
<tr>
<td>ipv6-access-list</td>
<td>in – Applies the rule (IP, IPv6, or MAC) to incoming packets</td>
</tr>
<tr>
<td>mac-access-list</td>
<td>out – Applies the rule (IP, IPv6, or MAC) to outgoing packets</td>
</tr>
</tbody>
</table>

**Note:** IP and **MAC access control lists** (ACLs) act as firewalls by blocking and/or permitting data traffic in both directions (inbound and outbound) within a managed network. IP ACLs use IP addresses for matching operations. Whereas, MAC ACLs use MAC addresses for matching operations. In case of a match (i.e. if a packet is received from or is destined for a specified IP or MAC address), an action is taken. This action is a typical allow, deny or mark designation to controller packet traffic. For more information on ACLs, see ACCESS-LIST.

<table>
<thead>
<tr>
<th>precedence &lt;1-100&gt;</th>
<th>The following keyword is common to the all of the above parameters:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>precedence – Assigns a precedence value to the ACL identified in the previous step.</td>
</tr>
<tr>
<td></td>
<td>&lt;1-100&gt; – Specify a precedence from 1 - 100.</td>
</tr>
</tbody>
</table>

**Note:** ACLs are applied in increasing order of their precedence. Rules with lower precedence are given priority.
Examples

rfs7000-37FABE(config-role-policy-test)#default-role use ip-access-list in test precedence 1
rfs7000-37FABE(config-role-policy-test)#show context role-policy test
default-role use ip-access-list in test precedence 1
rfs7000-37FABE(config-role-policy-test)#

</tbody>
</table>
18.1.2 ldap-deadperiod

role-policy

Configures the LDAP deadperiod interval

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
ldap-deadperiod <60-300>

Parameters
- ldap-deadperiod <60-300>

ldap-deadperiod <60-300> Configures a LDAP dead period. When enabled, LDAP service allows the AP or controller to bind with the LDAP server and retrieve user details to match with user-defined role filters. The LDAP deadperiod is the interval between two consecutive attempts to bind with the LDAP server. To enable LDAP service, use the ldap-query command.
- <60-300> — Specify the interval from 60 - 600 seconds. The default is 120 seconds.

Examples
rfs7000-37FABE(config-role-policy-test)#ldap-deadperiod 100
rfs7000-37FABE(config-role-policy-test)#show context
role-policy test
default-role use ip-access-list in test precedence 1
ldap-deadperiod 100
rfs7000-37FABE(config-role-policy-test)#

Related Commands

no Removes or resets the LDAP deadperiod interval
18.1.3 ldap-query

Enables LDAP service and specifies the LDAP server query mode.

Configuring the LDAP server query mode automatically enables LDAP service on this role policy. By default LDAP service is disabled.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ldap-query [self|through-controller]

Parameters

- self: Configures LDAP query mode as self. The AP directly queries the LDAP server for user information. Select ‘self’ to use local LDAP server resources configured using the `ldap-server` command.
- through-controller: Configures LDAP query mode as through-controller. The AP queries the LDAP server, for user information, through the controller.

Note: Use this option when the AP is layer 2 adopted to the controller.

Examples

rfs7000-37FABE(config-role-policy-test)#ldap-query self
rfs7000-37FABE(config-role-policy-test)#show context
role-policy test
default-role use ip-access-list in test precedence 1
ldap-query self
ldap-deadperiod 100
rfs7000-37FABE(config-role-policy-test)#

Related Commands

no: Disables LDAP service on this role policy
18.1.4 ldap-server

Associates a specified LDAP server with this role policy. Use this command to configure the credentials needed to bind with the LDAP server.

When enabled, LDAP service allows the AP or controller to bind with the LDAP server and retrieve user details. This information is matched with the user-defined roles within the role policy. If a match is made, the user is assigned the role and allowed or denied access to the controller managed network.

You can associate two LDAP servers with a role policy, allowing failover in case the primary server is unreachable.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
ldap-server <1-2> host [<IP>|<FQDN>] bind-dn <BIND-DN> base-dn <BASE-DN> 
bind-password <PASSWORD> {port <1-65535>} {server-type [active-directory|openldap]}
```

Parameters

- `ldap-server <1-2>`: Specify the LDAP server ID from 1 - 2.
- `host [<IP>|<FQDN>]`: Specify the LDAP server’s IP address or *Fully Qualified Domain Name* (FQDN).
- `bind-dn <BIND-DN>`: Specify the bind distinguished name (used for binding with the server).
- `base-dn <BASE-DN>`: Specify the base distinguished name (used for searching). This should not exceed 127 characters.
- `bind-password <PASSWORD>`: Specify the LDAP server password associated with the bind DN.
- `port <1-65535>`: Optional. Specify the LDAP server port from 1 - 65535. (default is 389).
- `server-type [active-directory|openldap]`: The following keywords are common to the ‘port’ parameter:
  - `active-directory`: Enables support for active directory attribute search. This is the default setting.
  - `openldap`: Enables support for openLDAP attribute search.

Usage Guidelines

Use the `ldap-query` command to enable LDAP service on a role policy.

Use the `show > role > ldap-stats` command to view LDAP server status and state.
Examples

rfs7000-37FABE(config-role-policy-test)#ldap-server 1 host 192.168.13.7 bind-dn "CN=Administrator,CN=Users,DC=TechPub,DC=com" base-dn "CN=Administrator,CN=Users,DC=TechPub,DC=com" bind-password 0 superuser port 2
rfs7000-37FABE(config-role-policy-test)#

rfs7000-37FABE(config-role-policy-test)#show context
role-policy test
default-role use ip-access-list in test precedence 1
ldap-query self
ldap-deadperiod 100
ldap-server 1 host 192.168.13.7 bind-dn "CN=Administrator,CN=Users,DC=TechPub,DC=com" base-dn "CN=Administrator,CN=Users,DC=com" bind-password 0 superuser port 2
rfs7000-37FABE(config-role-policy-test)#

Related Commands

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Removes or resets the LDAP server settings</td>
</tr>
</tbody>
</table>
18.1.5 ldap-timeout

role-policy

Configures the LDAP timeout interval. This is the interval after which a LDAP query is timed out.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ldap-timeout <1-5>

Parameters

- ldap-timeout <1-5>

| ldap-timeout <1-5> | Configures the LDAP query timeout interval from 1 - 5 seconds (default is 2 seconds) When enabled, LDAP service allows the AP or controller to bind with the LDAP server and query it for user details. The LDAP query timeout is the interval between a request to and the response from the LDAP server. Once this interval is exceeded, the LDAP bind and query is timed out. |

Examples

rfs7000-37FABE(config-role-policy-test)#ldap-timeout 1
rfs7000-37FABE(config-role-policy-test)#show context
role-policy test default-role use ip-access-list in test precedence 1
  ldap-query self
  ldap-timeout 1
  ldap-deadperiod 100
  ldap-server 1 host 192.168.13.7 bind-dn CN=Adminstrator,CN=Users,DC=TechPub,DC=com base-dn CN=Administrator,CN=Users,DC=com bind-password 0 superuser port 2
rfs7000-37FABE(config-role-policy-test)#

Related Commands

- no Removes or resets the LDAP query timeout to default (2 seconds)
### 18.1.6 no

Negates a command or resets settings to their default. When used in the config role policy mode, the *no* command removes or resets the role policy settings.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```
no [default-role|ldap-deadperiod|ldap-query|ldap-server <1-2>|ldap-timeout|user-role]  
no [ldap-deadperiod|ldap-query|ldap-server <1-2>|ldap-timeout]  
no default-role use [ip-access-list|ipv6-access-list|mac-access-list]  
no default-role use [ip-access-list|ipv6-access-list|mac-access-list] [in|out]  
<IP/IPv6/MAC-ACCESS-LIST-NAME> precedence <1-100>  
no user-role <ROLE-NAME>  
```

### Parameters

- **no <PARAMETERS>**

  Negates a command or resets settings to their default. When used in the config role policy mode, the *no* command removes or resets the role policy settings.

### Examples

The following example shows the role policy ‘test’ setting before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-role-policy-test)#show context
role-policy test
  default-role use ip-access-list in test precedence 1
  ldap-query self
  ldap-timeout 1
  ldap-deadperiod 100
  ldap-server 1 host 192.168.13.7 bind-dn CN=Adminstrator,CN=Users,DC=TechPub,DC=com
  base-dn CN=Administrator,CN=Users,DC=com bind-password 0 superuser port 2
```

```
rfs7000-37FABE(config-role-policy-test)#no ldap-deadperiod
rfs7000-37FABE(config-role-policy-test)#no ldap-timeout
rfs7000-37FABE(config-role-policy-test)#no ldap-server 1
```

The following example shows the role policy ‘test’ setting after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-role-policy-test)#show context
role-policy test
  default-role use ip-access-list in test precedence 1
  ldap-query self
```

```
rfs7000-37FABE(config-role-policy-test)#
```
18.1.7 user-role

This command creates a user-defined role. Each user-defined role has a set of Active Directory attributes. Each attribute is matched against the information returned by the LDAP server, until a complete match of role is found.

The following table summarizes user role configuration commands:

<table>
<thead>
<tr>
<th>user-role</th>
<th>Creates a new user role and enters its configuration mode</th>
<th>page 18-13</th>
</tr>
</thead>
<tbody>
<tr>
<td>user-role commands</td>
<td>Summarizes user role configuration mode commands</td>
<td>page 18-15</td>
</tr>
</tbody>
</table>
### user-role

**user-role**

Creates a user-defined role. Each role consists of a set of filters and action. The filters are match criteria used to filter wireless clients. And the action defines the action taken when a client matches the specified filters.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
user-role <ROLE-NAME> precedence <1-10000>
```

**Parameters**

- **user-role <ROLE-NAME> precedence <1-10000>**
  - **<ROLE-NAME>** — Specify a name for this user role.
  - **precedence <1-10000>** — Sets the precedence for this role.

**Note:** Lower the precedence, higher is the role priority. Precedence determines the order in which a role is applied. If a wireless client matches multiple roles, the role with the lower precedence is applied before those with higher precedence. While there is no default precedence for a role, two or more roles can share the same precedence.

**Examples**

```
rfs7000-37FABE(config-role-policy-test)#user-role testing precedence 10
rfs7000-37FABE(config-role-policy-test)#show context
role-policy test
user-role testing precedence 10
default-role use ip-access-list in test precedence 1
rfs7000-37FABE(config-role-policy-test)#
```

```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#?
Role Mode commands:
ap-location Assign parameters to the role
authentication-type Type of Authentication
captive-portal Captive-portal based Role Filter
city City configuration
client-identity Client identity
country Country configuration
deptment Department configuration
eimailid Emailid configuration
employee-type Employee-type configuration
employeeid Employeeid configuration
encryption-type Type of encryption
group Group configuration
memberOf MemberOf configuration
mu-mac MU MAC address configuration
no Negate a command or set its defaults
radius-user Radius-user configuration
ssid SSID configuration
state State configuration
title Title configuration
use Set setting to use
user-defined User-defined configuration
```
clrscr               Clears the display screen
commit               Commit all changes made in this session
do                   Run commands from Exec mode
der              End current mode and change to EXEC mode
exit                 End current mode and down to previous mode

18.1.7.2.1 ap-location

Configures an AP's deployment location based filter for this user-defined role

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

ap-location [any|contains|exact|not-contains]

ap-location any

ap-location [contains|exact|not-contains] <WORD>

Parameters

- **ap-location any**
  - Specifies the AP location to match (in a RF Domain) or the AP's resident configuration
    - any – Defines an AP's location as any

- **ap-location [contains|exact|not-contains] <WORD>**
  - **contains <WORD>**
    - Applies role if the associating AP's location contains the location string specified in the role.
      - <WORD> – Specify the location string to match.
  - **exact <WORD>**
    - Applies role if the associating AP's location exactly matches the string specified in the role.
      - <WORD> – Specify the exact location string to match.
  - **not-contains <WORD>**
    - Applies role if the associating AP's location does not contain the location string specified in the role.
      - <WORD> – Specify the location string not to match.

Examples

rfs7000-37FABE(config-role-policy-test-user-role-testing)#ap-location contains office
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
  ap-location contains office
rfs7000-37FABE(config-role-policy-test-user-role-testing)#

Related Commands

- **no**
  - Removes an AP's deployment location string from this user-defined role
18.1.7.2.2 assign

user-role commands

Configures upstream/downstream rate limits and VLAN ID. Clients matching this user-defined role filters are associated with the specified VLAN, and assigned the specified data rates.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

assign [rate-limit|VLAN]
assign rate-limit [from-client|to-client] <1-65536>
assign vlan <1-4094>

Parameters

- assign rate-limit [from-client|to-client] <1-65536>
- assign vlan <1-4094>

| assign rate-limit [from-client|to-client] <1-65536> | Assigns an upstream and downstream traffic rate limit
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>from-client – Assigns a rate limit, in Kbps, for the upstream (from client) traffic</td>
</tr>
<tr>
<td>to-client – Assigns a rate limit, in Kbps, for the downstream (to client) traffic</td>
</tr>
<tr>
<td>&lt;1-65536&gt; – Specify upstream and/or downstream rate limits from 1 - 65536 Kbps.</td>
</tr>
</tbody>
</table>

**Note:** Wireless clients matching this user-defined role are assigned the configured rate limits.

| assign vlan <1-4094> | Assigns a VLAN (identified by VLAN's ID). Clients matching this user-defined role are associated with the specified VLAN. The VLAN ID represents the shared SSID each user employs to interoperate within the network (once authenticated by the local RADIUS server).
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>This feature is disabled by default.</td>
</tr>
<tr>
<td>&lt;1-4094&gt; – Specify the VLAN ID from 1 - 4094.</td>
</tr>
</tbody>
</table>

**Note:** A wireless client that fails to match any user-defined role is assigned to the default role (configured as a role policy setting) and is mapped to the default VLAN under the WLAN.

Usage Guidelines

ACLs can only be used with tunnel or isolated-tunnel modes. They do not work with the local and automatic modes.

In case of bridge VLAN, the default bridging mode is ‘auto’. Change the bridging mode to ‘tunnel’. This extends the controller’s existing VLAN onto the AP and ensures that wireless clients are served IP addresses.

The VLAN configured under the user-defined role need not exist under the WLAN. But, when using tunneled VLAN bridges, configure an additional bridge VLAN. If the VLAN bridging mode is ‘local’, no additional VLAN configuration is required.
Examples

```
rfs4000-229D58 (config-role-policy-test-user-role-test)# assign rate-limit to-client 200
rfs4000-229D58 (config-role-policy-test-user-role-test)# commit
rfs4000-229D58 (config-role-policy-test-user-role-test)# show context
user-role test precedence 1
  assign vlan 1
  assign rate-limit to-client 200
rfs4000-229D58 (config-role-policy-test-user-role-test)#
```

The following examples define a role used to forward the IP traffic from all engineers in Test_Company, Santa Clara, USA onto VLAN 2.

Create a new role policy with name 'test-policy'.

```
<DEVICE> (config)# role-policy test-policy
```

Specify the LDAP server used for this role policy.

```
<DEVICE> (config-role-policy-test-policy)# ldap-query self
<DEVICE> (config-role-policy-test-policy)# ldap-server 1 host 192.160.1.1 bind-dn CN=Administrator,CN=Users,DC=testtest,DC=com base-dn CN=Administrator,CN=Users,DC=com bind-password 0 test port 389
<DEVICE> (config-role-policy-test-policy)# ldap-timeout 2
```

Create a user defined role.

```
<DEVICE> (config-role-policy-test-policy)# user-role SCEngineer precedence 100
```

Define the role by adding appropriate values and match operators.

```
<DEVICE> (config-role-policy-test-policy-user-role-SCEngineer)# city exact santa-clara
<DEVICE> (config-role-policy-test-policy-user-role-SCEngineer)# company exact ExampleCompany
<DEVICE> (config-role-policy-test-policy-user-role-SCEngineer)# title contains engineer
<DEVICE> (config-role-policy-test-policy-user-role-SCEngineer)# assign vlan-id 2
```

Apply role policy to an access point.

```
ap7131-99BFA8 (config-device-ap7131)# use role-policy test-policy
```

**Related Commands**

</table>
18.1.7.2.3 authentication-type

**user-role commands**

Configures the authentication type based filter for this user-defined role

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
authentication-type [any|eq|neq]

authentication-type any

authentication-type [eq|neq] [eap|kerberos|mac-auth|none]

{(eap|kerberos|mac-auth|none)}
```

**Parameters**

- authentication-type any

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>The authentication type is any (eq or neq). This is the default setting.</td>
</tr>
</tbody>
</table>

- authentication-type [eq|neq] [eap|kerberos|mac-auth|none]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| eq [eap|kerberos| mac-auth|none] | The role is applied only when the authentication type matches (equals) one or more than one of the following types:  
  - eap – Extensible authentication protocol  
  - kerberos – Kerberos authentication  
  - mac-auth – MAC authentication protocol  
  - none – no authentication used  
  These parameters are recursive, and you can configure more than one unique authentication type for this user-defined role. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| neq [eap|kerberos| mac-auth|none] | The role is applied only when the authentication type does not match (not equals) any of the following types:  
  - eap – Extensible authentication protocol  
  - kerberos – Kerberos authentication  
  - mac-auth – MAC authentication protocol  
  - none – no authentication used  
  These parameters are recursive, and you can configure more than one unique ‘not equal to’ authentication type for this user-defined role. |
### Examples

```bash
rfs7000-37FABE(config-role-policy-test-user-role-testing)#authentication-type eq kerberos
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
  authentication-type eq kerberos
  ap-location contains office
rfs7000-37FABE(config-role-policy-test-user-role-testing)#
```

### Related Commands

<tbody>
<tr>
<td><code>no</code></td>
<td>Removes the authentication type filter configured for this user-defined role</td>
</tr>
</tbody>
</table>
18.1.7.2.4 captive-portal

user-role commands

Configures a captive portal based filter for this user-defined role. A captive portal is a guest access policy that provides temporary and restrictive access to the wireless network. When applied to a WLAN, a captive portal policy ensures secure guest access.

This command defines user-defined role filters based on a wireless client’s state of authentication.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

captive-portal authentication-state [any|post-login|pre-login]

**Parameters**

- captive-portal authentication-state [any|post-login|pre-login]

<table>
<thead>
<tr>
<th>authentication-state</th>
<th>Defines the authentication state of a client connecting to a captive portal</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>Specifies any authentication state (authenticated and pending authentication). This is the default setting. This option makes no distinction on whether authentication is conducted before or after the wireless client has logged in.</td>
</tr>
<tr>
<td>post-login</td>
<td>Specifies authentication is completed successfully This option requires the wireless client to share authentication credentials after logging into the managed network.</td>
</tr>
<tr>
<td>pre-login</td>
<td>Specifies authentication is pending This option enables captive portal client authentication before the client is logged into the controller</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-role-policy-test-user-role-testing)#captive-portal authentication-state pre-login
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
    user-role testing precedence 10
    authentication-type eq kerberos
    ap-location contains office
    captive-portal authentication-state pre-login
rfs7000-37FABE(config-role-policy-test-user-role-testing)#

**Related Commands**

- no Removes the captive portal based role filter settings
18.1.7.2.5 city

user-role commands

Configures a wireless client filter based on the city name

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

city [any|contains|exact|not-contains]
city [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

Parameters
- city [any|contains <WORD>|exact <WORD>|not-contains <WORD>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>city</td>
<td>Specifies a wireless client filter based on how the 'city' name, returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains.</td>
</tr>
<tr>
<td>any</td>
<td>No specific city associated with this user-defined role. This role can be applied to any wireless client from any city.</td>
</tr>
<tr>
<td>contains &lt;WORD&gt;</td>
<td>The role is applied only when the city name, returned by the RADIUS server, contains the string specified in the role.</td>
</tr>
<tr>
<td>exact</td>
<td>The role is applied only when the city name, returned by the RADIUS server, exactly matches the string specified in the role.</td>
</tr>
<tr>
<td>not-contains &lt;WORD&gt;</td>
<td>The role is applied only when the city name, returned by the RADIUS server, does not contain the string specified in the role.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-role-policy-test-user-role-testing)#city exact SanJose
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
  authentication-type eq kerberos
  ap-location contains office
  captive-portal authentication-state pre-login
city exact SanJose
rfs7000-37FABE(config-role-policy-test-user-role-testing)#

Related Commands

no | Removes the city name configured with this user-defined role
**18.1.7.2.6 client-identity**

> **user-role commands**

Associates a client-identity (device fingerprinting) based filter. The role is assigned to a wireless client matching any of the defined client identities.

For more information on configuring client identity fingerprints, see *client-identity*.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
client-identity <CLIENT-IDENTITY-NAME> {<CLIENT-IDENTITY-NAME>}
```

**Parameters**

- `client-identity <CLIENT-IDENTITY-NAME> {<CLIENT-IDENTITY-NAME>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;CLIENT-IDENTITY-NAME&gt;</code></td>
<td>Specifies the client-identity fingerprint to match (should be existing and configured)</td>
</tr>
<tr>
<td><code>&lt;CLIENT-IDENTITY-NAME&gt;</code></td>
<td>Specify the client identity signature name.</td>
</tr>
</tbody>
</table>

**Note:** Multiple client identities can be configured with a role policy.

**Usage Guidelines**

When associating a single or multiple client identities with a role policy, ensure that a client identity group, all the client identities used by the role policy, is attached to the device or profile using the role policy. In other words, group all the client identities (used in this role policy) in a client identity group, and associate this group to the profile or device using this role policy.

For more information on configuring client identities and client identity groups, see *client-identity*, and *client-identity-group*.

For more information on associating a client identity group and a role policy to a profile or a device, see *use*.

**Examples**

```
rfs4000-229D58 (config-role-policy-test-user-role-test)#client-identity TestClientIdentity
rfs4000-229D58 (config-role-policy-test-user-role-test)#commit
```

```
rfs4000-229D58 (config-role-policy-test-user-role-test)#client-identity ClientIdentityWindows
rfs4000-229D58 (config-role-policy-test-user-role-test)#
```

```
rfs4000-229D58 (config-role-policy-test-user-role-test)#show context
  user-role test precedence 1
  client-identity TestClientIdentity
  client-identity ClientIdentityWindows
rfs4000-229D58 (config-role-policy-test-user-role-test)#
```

**Related Commands**

```
no
```

Removes the client identities associated with this role policy.
### 18.1.7.2.7 company

#### user-role commands

Configures a wireless client filter based on the company name

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
company [any|contains|exact|not-contains]
company [any|exact <WORD>|contains <WORD>|not-contains <WORD>]
```

#### Parameters

- **company [any|contains|exact|not-contains]**
  - **any**
    - No specific company associated with this user-defined role. This role is applied to any wireless client from any company (no strings to match). This is the default setting.
  - **contains <WORD>**
    - The role is applied only when the company name, returned by the RADIUS server, contains the string specified in the role.
    - `<WORD>` — Specify the string to match (this is case sensitive, and is compared against the company name returned by the RADIUS server). It should contain the provided expression.
  - **exact**
    - The role is applied only when the company name, returned by the RADIUS server, exactly matches the string specified in the role.
    - `<WORD>` — Specify the exact string to match (this is case sensitive, and is compared against the company name returned by the RADIUS server). It should be an exact match.
  - **not-contains <WORD>**
    - The role is applied only when the company name, returned by the RADIUS server, does not contain the string specified in the role.
    - `<WORD>` — Specify the string not to match (this is case sensitive, and is compared against the company name returned by the RADIUS server). It should not contain the provided expression.

#### Examples

```plaintext
rfs7000-37FABE(config-role-policy-test-user-role-testing)#company exact ExampleCompany

rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
    authentication-type eq kerberos
    ap-location contains office
    captive-portal authentication-state pre-login
    city exact SanJose
company exact ExampleCompany
rfs7000-37FABE(config-role-policy-test-user-role-testing)#
```

#### Related Commands

- **no**
  - Removes the company name configured with this user-defined role
18.1.7.2.8 country

- **user-role commands**

Configures a wireless client filter based on the country name

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

country [any|contains|exact|not-contains]
country [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

**Parameters**

- country [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

<table>
<thead>

18.1.7.2.10 emailid

**user-role commands**

Configures a wireless client filter based on the e-mail ID

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
emailid [any|contains|exact|not-contains]
emailid [any|exact <WORD>|contains <WORD>|not-contains <WORD>]
```

**Parameters**

|emailid [any|contains|exact|not-contains]|
|---|
|emailid [any|exact <WORD>|contains <WORD>|not-contains <WORD>]|

- **emailid**
  - Specifies a wireless client filter based on how the 'e-mail ID', returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains

- **any**
  - No specific e-mail ID associated with this user-defined role. This role can be applied to any wireless client having any e-mail ID (no strings to match). This is the default setting.

- **contains <WORD>**
  - The role is applied only when the e-mail ID, returned by the RADIUS server, contains the string specified in the role.
  - `<WORD>` – Specify the string to match (this is case sensitive, and is compared against the e-mail ID returned by the RADIUS server). It should contain the provided expression.

- **exact**
  - The role is applied only when the e-mail ID, returned by the RADIUS server, exactly matches the string specified in the role.
  - `<WORD>` – Specify the exact string to match (this is case sensitive, and is compared against the e-mail ID returned by the RADIUS server). It should be an exact match.

- **not-contains <WORD>**
  - The role is applied only when the e-mail ID, returned by the RADIUS server, does not contain the string specified in the role.
  - `<WORD>` – Specify the string not to match (this is case sensitive, and is compared against the e-mail ID returned by the RADIUS server). It should not contain the provided expression.

**Examples**

```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#emailid exact testing@examplecompany.com
```

```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context

### 18.1.7.2.11 employee-type

**User-role commands**

Configures a wireless client filter based on the employee type

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

```plaintext
employee-type [any|contains|exact|not-contains]
employee-type [any|exact <WORD>|contains <WORD>|not-contains <WORD>]
```

#### Parameters

<table>
<thead>
<tr>
<th>employee-type</th>
<th>Specifies a wireless client filter based on how the 'employee type', returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains.</th>
</tr>

<tr>
<td>any</td>
<td>No specific employee type associated with this user-defined role. This role can be applied to any wireless client having any employee type (no strings to match). This is the default setting.</td>
</tr>
</tbody>
</table>
| contains <WORD> | The role is applied only when the employee type, returned by the RADIUS server, contains the string specified in the role.  
  - <WORD> — Specify the string to match (this is case sensitive, and is compared against the employee type returned by the RADIUS server). It should contain the provided expression. |
| exact         | The role is applied only when the employee type, returned by the RADIUS server, exactly matches the string specified in the role.  
  - <WORD> — Specify the exact string to match (this is case sensitive, and is compared against the employee type returned by the RADIUS server). It should be an exact match. |
| not-contains <WORD> | The role is applied only when the employee type, returned by the RADIUS server, does not contain the string specified in the role.  
  - <WORD> — Specify the string not to match (this is case sensitive, and is compared against the employee type returned by the RADIUS server). It should not contain the provided expression. |

#### Examples

```plaintext
rfs4000-229D58(config-role-policy-test-user-role-test1)#employee-type exact consultant
rfs4000-229D58(config-role-policy-test-user-role-user1)#show context
  user-role user1 precedence 1
  employee-type exact consultant
rfs4000-229D58(config-role-policy-test-user-role-user1)#
```

#### Related Commands

- `no` Removes the employee type filter configured with this user-defined role
18.1.7.2.12 employeeid

Configure a wireless client filter based on the employee ID

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

employeeid <any|contains|exact|not-contains>
employeeid <any|exact <WORD>|contains <WORD>|not-contains <WORD>

**Parameters**

- **employeeid <any|contains|exact|not-contains>**
  - **any** — No specific employee ID associated with this user-defined role. This role can be applied to any wireless client having any employee ID (no strings to match). This is the default setting.

- **contains <WORD>**
  - The role is applied only when the employee ID, returned by the RADIUS server, contains the string specified in the role.
  - **<WORD>** — Specify the string to match (this is case sensitive, and is compared against the employee ID returned by the RADIUS server). It should contain the provided expression.

- **exact**
  - The role is applied only when the employee ID, returned by the RADIUS server, exactly matches the string specified in the role.
  - **<WORD>** — Specify the exact string to match (this is case sensitive, and is compared against the employee ID returned by the RADIUS server). It should be an exact match.

- **not-contains <WORD>**
  - The role is applied only when the employee ID, returned by the RADIUS server, does not contain the string specified in the role.
  - **<WORD>** — Specify the string not to match (this is case sensitive, and is compared against the employee ID returned by the RADIUS server). It should not contain the provided expression.

**Examples**

rfs7000-37FABE(config-role-policy-test-user-role-testing)#employeeid contains TnVTest1

18.1.7.2.13 encryption-type

Selects the encryption type for this user-defined role. Encryption ensures privacy between access points and wireless clients. There are various modes of encrypting communication on a WLAN, such as *Counter-model CBC-MAC Protocol* (CCMP), *Wired Equivalent Privacy* (WEP), keyguard, *Temporal Key Integrity Protocol* (TKIP) etc.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

encryption-type [any|eq|neq]

encryption-type any

equation [eq|neq] [ccmp|keyguard|none|tkip|wep128|wep64]

\{(ccmp|keyguard|none|tkip|tkip-ccmp|wep128|wep64)\}

**Parameters**

- encryption-type any

| any | The encryption type can be any one of the listed options (ccmp|keyguard|tkip|wep128|wep64). This is the default setting. |
| --- | --- |

- encryption-type [eq|neq] [ccmp|keyguard|none|tkip|wep128|wep64]

\{(ccmp|keyguard|none|tkip|tkip-ccmp|wep128|wep64)\}

| eq [ccmp|keyguard|none|tkip|wep128|wep64] | The role is applied only if the encryption type equals to one of the following options:
- ccmp – Encryption mode is CCMP
- keyguard – Encryption mode is keyguard. Keyguard encryption shields the master encryption keys from being discovered
- none – No encryption mode specified
- tkip – Encryption mode is TKIP
- wep128 – Encryption mode is WEP128
- wep64 – Encryption mode is WEP64
These parameters are recursive, and you can configure more than one encryption type for this user-defined role. |
| --- | --- |

| neq [ccmp|keyguard|none|tkip|wep128|wep64] | The role is applied only if encryption type is not equal to any of the following options:
- ccmp – Encryption mode is not equal to CCMP
- keyguard – Encryption mode is not equal to keyguard
- none: Encryption mode is not equal to none
- tkip – Encryption mode is not equal to TKIP
- wep128 – Encryption mode is not equal to WEP128
- wep64 – Encryption mode is not equal to WEP64
These parameters are recursive, and you can configure more than one ‘not equal to’ encryption type for this user-defined role. |
| --- | --- |
**Examples**

```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#encryption-type eq wep128
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
    user-role testing precedence 10
        authentication-type eq kerberos
            encryption-type eq wep128
        ap-location contains office
        captive-portal authentication-state pre-login
        city exact SanJose
        company exact ExampleCompany
        country exact America

18.1.7.2.15 memberOf

user-role commands

Applies an *Active Directory* (AD) group filter to this user-defined role. A wireless client can be a member of more than one group within the AD database. This command applies a AD group based firewall, which applies a role to a wireless client only if it belongs to the specified AD group.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
memberOf <AD-GROUP-NAME>
```

**Parameters**
- `memberOf <AD-GROUP-NAME>`

**Examples**

```
rfs4000-229D58 (config-role-policy-test-user-role-test)#memberOf ADTestgroup

rfs4000-229D58 (config-role-policy-test-user-role-test)#show context
user-role test precedence 1
    assign vlan 1
    assign rate-limit to-client 200
    memberOf ADTestgroup

rfs4000-229D58 (config-role-policy-test-user-role-test)#
```

**Related Commands**

```
no
```

Removes the AD group assigned to this user-defined role
18.1.7.2.16 mu-mac

user-role commands

Configures a MAC address and mask based filter for this role policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

mu-mac [<MAC>|any]
mu-mac any
mu-mac <MAC> {mask <MAC>}

Parameters

- mu-mac any

| any | Applies role to any wireless client (no MAC address to match). This is the default setting. |
| mu-mac <MAC> {mask <MAC>} |

- <MAC> Applies role to the wireless client having specified MAC address
  - <MAC> – Sets the MAC address in the AA-BB-CC-DD-EE-FF format

- mask <MAC> Optional. After specifying the client’s MAC address, specify the mask in the AA-BB-CC-DD-EE-FF format. The role is applied to the wireless client exactly matching the specified MAC address and MAC mask.

Examples

rfs7000-37FABE(config-role-policy-test-user-role-testing)#mu-mac 11-22-33-44-55-66
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
  authentication-type eq kerberos
  encryption-type eq wep128
  ap-location contains office
  mu-mac 11-22-33-44-55-66
  group contains testgroup
captive-portal authentication-state pre-login
city exact SanJose
country exact America
department exact TnV
emailid exact testing@examplecompany.com
employeeid contains TnVTest1
rfs7000-37FABE(config-role-policy-test-user-role-testing)#

Related Commands

no Removes the MAC address and mask for this user-defined role
18.1.7.2.17 no

Negates a command or resets configured settings to their default. When used in the config role policy user-defined role mode, the no command removes or resets settings, such as AP location, authentication type, encryption type, captive portal etc.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
no [ap-location|assign|authentication-type|captive-portal|city|client-identity|
   company|country|department|emailid|employee-type|employeeid|encryption-type|
   group|memberOf|mu-mac|radius-user|ssid|state|title|use|user-defined]
```

```
no captive-portal authentication-state
no use [ip-access-list|mac-access-list] [in|out] <IP/MAC-ACCESS-LIST-NAME>
precedence <1-100>
no use bonjour-gw-discovery-policy
```

Parameters

- no <parameter>

| no <parameter> | Negates a command or resets configured settings to their default. When used in the config role policy user-defined role mode, the no command removes or resets settings, such as AP location, authentication type, encryption type, captive portal etc. |

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

The following example shows the Role Policy ‘test’ User Role ‘testing’ configuration before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
   authentication-type eq kerberos
   encryption-type eq wep128
   ap-location contains office
   mu-mac 11-22-33-44-55-66
   group contains testgroup
   captive-portal authentication-state pre-login
   city exact SanJose
   company exact ExampleCompany
   country exact America
   department exact TnV
   emailid exact testing@examplecompany.com
   employeeid contains TnVTes
```

```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#no authentication-type
rfs7000-37FABE(config-role-policy-test-user-role-testing)#no encryption-type
rfs7000-37FABE(config-role-policy-test-user-role-testing)#no group
rfs7000-37FABE(config-role-policy-test-user-role-testing)#no mu-mac
```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#no ap-location
rfs7000-37FABE(config-role-policy-test-user-role-testing)#no employeeid

The following example shows the Role Policy 'test' User Role 'testing' configuration after the 'no' commands are executed:

rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
captive-portal authentication-state pre-login
city exact SanJose
company exact ExampleCompany
country exact America
department exact TnV
emailid exact testing@examplecompany.com
rfs7000-37FABE(config-role-policy-test-user-role-testing)#
### 18.1.7.2.18 radius-user

**user-role commands**

Configures a wireless client filter based on the RADIUS user name.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
radius-user [any|contains|ends-with|exact|not-contains|starts-with]
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>No specific RADIUS user name associated with this user-defined role. This role can be applied to any wireless client (no strings to match). This is the default setting.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>contains &lt;WORD&gt;</td>
<td>The role is applied only when the ‘radius-user’ name, returned by the RADIUS server, contains the string specified in the role.</td>
</tr>
<tr>
<td></td>
<td>- &lt;WORD&gt; – Specify the string to match (this is case sensitive, and is compared against the ‘radius-user’ name returned by the RADIUS server). It should contain the provided expression.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can use the realm or any sub-string of the user name.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>ends-with &lt;WORD&gt;</td>
<td>Enables role assignment on the basis of the wireless client’s “department” and/or “group”</td>
</tr>
<tr>
<td></td>
<td>- &lt;WORD&gt; – Specify the string (could be department/group code). For example: 1005000002.</td>
</tr>
<tr>
<td></td>
<td>In this the last three digits represent the department/group code. The remaining digits represent user’s badge number.</td>
</tr>
<tr>
<td></td>
<td>The role is applied only when the ‘radius-user’ name, returned by the RADIUS server, ends with the string specified here.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>exact &lt;WORD&gt;</td>
<td>The role is applied only when the ‘radius-user’ name, returned by the RADIUS server, exactly matches the string specified in the role.</td>
</tr>
<tr>
<td></td>
<td>- &lt;WORD&gt; – Specify the exact string to match (this is case sensitive, and is compared against the ‘radius-user’ name returned by the RADIUS server). It should be an exact match.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Provide the complete user name along with the realm.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>

18.1.7.2.19 ssid

Configures a SSID based filter

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
ssid [any|exact|contains|not-contains]

ssid any

ssid [exact|contains|not-contains] <WORD>
```

Parameters

- **ssid any**
  - Specifies a wireless client filter based on how the SSID is specified in a WLAN. This is the default setting.

- **ssid [exact|contains|not-contains] <WORD>**
  - `exact <WORD>`: The role is applied only when the SSID, returned by the RADIUS server, exactly matches the string specified in the role.
    - `<WORD>` — Specify the SSID string to match. The SSID is case sensitive and is compared against the SSID configured for the WLAN.
  - `contains <WORD>`: The role is applied only when the SSID, returned by the RADIUS server, contains the string specified in the role.
    - `<WORD>` — Specify the SSID string to match. The SSID is case sensitive and is compared against the SSID configured for the WLAN.
  - `not-contains <WORD>`: The role is applied only when the SSID, returned by the RADIUS server, does not contain the string specified in the role.
    - `<WORD>` — Specify the SSID string not to match. The SSID is case sensitive and is compared against the SSID configured for the WLAN.
Examples

```
rfs7000-37FABE(config-role-policy-test-user-role-testing)#ssid not-contains DevUser
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
  user-role testing precedence 10
    ssid not-contains DevUser
    captive-portal authentication-state pre-login
    city exact SanJose
    company exact ExampleCompany
    country exact America
    department exact TnV
    emailid exact testing@examplecompany.com
rfs7000-37FABE(config-role-policy-test-user-role-testing)#
```

18.1.7.2.20 state

Configures a user role state to match with this user-defined role

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
state [any|contains|exact|not-contains]
state [any|contains <WORD>|exact <WORD>|not-contains <WORD>]
```

Parameters

- **state [any|contains|exact|not-contains]**
  - Specifies a wireless client filter option based on how the RADIUS state matches the provided expression. Select one of the following options: any, contains, exact, or not-contains.

- **any**
  - This user role can fit any wireless client irrespective of the state (no strings to match).

- **contains <WORD>**
  - The user role is applied only when the RADIUS state contains the string specified in the role.
  - `<WORD>` — Specify the string to match (this is case sensitive, and is compared against the state returned by the RADIUS server). It should contain the provided expression.

- **exact <WORD>**
  - The role is applied only when the RADIUS state exactly matches the string specified in the role.
  - `<WORD>` — Specify the exact string to match (this is case sensitive, and is compared against the state returned by the RADIUS server). It should be an exact match.

- **not-contains <WORD>**
  - The role is applied only when the RADIUS state does not contain the string specified in the role.
  - `<WORD>` — Specify the string not to match (this is case sensitive, and is compared against the state returned by the RADIUS server). It should not contain the provided expression.

Examples

```plaintext
rfs7000-37FABE(config-role-policy-test-user-role-testing)#state exact active
rfs7000-37FABE(config-role-policy-test-user-role-testing)#show context
user-role testing precedence 10
  ssid not-contains DevUser
  captive-portal authentication-state pre-login
  city exact SanJose
  company exact ExampleCompany
  country exact America
  department exact TnV
  emailid exact testing@examplecompany.com
  state exact active
rfs7000-37FABE(config-role-policy-test-user-role-testing)#
```

Related Commands

- **no**
  - Removes the ‘state’ filter string associated with a user role
18.1.7.2.21 title

*user-role commands*

Configures a ‘title’ string to match

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

title [any|contains|exact|not-contains]
title [any|contains <WORD>|exact <WORD>|not-contains <WORD>]

**Parameters**
- **any**
  - Specifies a wireless client filter based on how the title string, returned by the RADIUS server, matches the provided expression. Select one of the following options: any, contains, exact, or not-contains.

- **contains <WORD>**
  - The user role is applied only when the title string, returned by the RADIUS server, contains the string specified in the role.
  - <WORD> – Specify the string to match (this is case sensitive, and is compared against the title returned by the RADIUS server). It should contain the provided expression.

- **exact <WORD>**
  - The role is applied only when the title string, returned by the RADIUS server, exactly matches the string specified in the role.
  - <WORD> – Specify the exact string to match (this is case sensitive, and is compared against the title returned by the RADIUS server). It should be an exact match.

- **not-contains <WORD>**
  - The role is applied only when the title string, returned by the RADIUS server, does not contain the string specified in the role.
  - <WORD> – Specify the string not to match (this is case sensitive, and is compared against the title returned by the RADIUS server). It should not contain the provided expression.

**Examples**

rfs7000-37FABE(config-role-policy-test-user-role-testing)#title any

**Related Commands**

*no* Removes the ‘title’ filter string configured with a user role
18.1.7.2.22 use

user-role commands

Configures an access list based firewall with this user role

A firewall is a mechanism enforcing access control, and is considered a first line of defense in protecting proprietary information within the network. The means by which this is accomplished varies, but in principle, firewalls are mechanisms both blocking and permitting data traffic based on inbound and outbound IP and MAC rules.

IP based firewall rules are specific to source and destination IP addresses and the unique rules and precedence orders assigned. Both IP and non-IP traffic on the same layer 2 interface can be filtered by applying both an IP ACL and a MAC.

A MAC firewall rule uses source and destination MAC addresses for matching operations, where the result is a typical allow, deny or mark designation to packet traffic.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

use [application-policy|bonjour-gw-discovery-policy|ip-access-list|ipv6-access-list|mac-access-list|url-filter]

use bonjour-gw-discovery-policy <POLICY-NAME>

use [ip-access-list|ipv6-access-list] [in|out] <IP/IPv6-ACCESS-LIST-NAME> precedence <1-100>

use mac-access-list [in|out] <MAC-ACCESS-LIST-NAME> precedence <1-100>

use url-filter <URL-FILTER-NAME>

Parameters

- use application-policy|bonjour-gw-discovery-policy <POLICY-NAME>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application-policy &lt;POLICY-NAME&gt;</td>
<td>Uses an existing Application policy with a user role. When associated, the Application policy enforces application assurance for all users using this role.</td>
</tr>
<tr>
<td>bonjour-gw-discovery-policy &lt;POLICY-NAME&gt;</td>
<td>Uses an existing Bonjour GW Discovery policy with a user role. When associated, the Bonjour GW Discovery policy is applied for the Bonjour requests coming from this specific user roles.</td>
</tr>
<tr>
<td>ip-access-list [in</td>
<td>out]</td>
</tr>
<tr>
<td>url-filter &lt;URL-FILTER-NAME&gt;</td>
<td>Specify the IPv4/IPv6 access list name.</td>
</tr>

```

**Related Commands**

- no | Removes an IP, MAC access list, or a Bonjour GW Discovery policy from use with a user role
18.1.7.2.23 user-defined

Enables you to define a filter based on an attribute defined in the Active Directory or the OpenLDAP server

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

user-defined <ATTR-STRING> [any|contains|exact|not-contains]

user-defined <ATTR-STRING> [any|contains <WORD>|exact <WORD>|not-contains <WORD>]

Parameters

- user-defined <ATTR-STRING> [any|exact <WORD>|contains <WORD>|not-contains <WORD>]

<table>
<thead>
<tr>
<th>user-defined &lt;ATTR-STRING&gt;</th>
<th>Specify a filter based on an attribute defined in the AD or OpenLDAP server.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;ATTR-NAME&gt; – Specify the attribute string. After specifying the attribute name, specify the match type.</td>

`no` Removes the user-defined filter configured with this user role
This chapter summarizes Self Monitoring at Run Time RF (Smart RF) management policy commands in the CLI command structure.

A Smart RF management policy defines operating and recovery parameters that can be assigned to groups of access points. A Smart RF policy is designed to scan the network to identify the best channel and transmit power for each access point radio.

A Smart RF policy reduces deployment costs by scanning the RF environment to determine the best channel and transmit power configuration for each managed radio. Smart RF policies when applied to specific RF Domains, apply site specific deployment configurations and self-healing values to groups of devices within pre-defined physical RF coverage areas.

Smart RF centralizes the decision process and makes intelligent RF configuration decisions using information obtained from the RF environment. Smart RF helps reduce ongoing management and maintenance costs through the periodic re-calibration of the network. Re-calibration can be initiated manually or can be automatically scheduled to ensure the RF configuration is optimized to factor for RF environment changes (such as new sources of interference, or neighboring access points).

Smart RF also provides self-healing functions by monitoring the network in real-time, and provides automatic mitigation from potentially problematic events such as radio interference, coverage holes and radio failures. Smart RF employs self-healing to enable a WLAN to better maintain wireless client performance and site coverage during dynamic RF environment changes, which typically require manual re-configuration to resolve.

Smart RF is supported on any RF Domain manager. In standalone environments, an individual wireless controller manages the calibration and monitoring phases. In clustered environments, a single wireless controller is elected a Smart RF master and the remaining cluster members operate as Smart RF clients. In cluster operation, the Smart RF master co-ordinates the calibration and configuration and during the monitoring phase receives information from the Smart RF clients.

Before defining a Smart RF policy, refer to the following deployment guidelines to ensure the configuration is optimally effective:

- The Smart RF calibration process impacts associated users and should not be run during business or production hours. The calibration process should be performed during scheduled maintenance intervals or non-business hours.
- For Smart RF to provide effective recovery, RF planning must be performed to ensure overlapping coverage exists at the deployment site. Smart RF can only provide recovery when access points are deployed appropriately. Smart RF is not a solution, it’s a temporary measure. Administrators need to determine the root cause of RF deterioration and fix it. Smart RF history/events can assist.

Keep in mind that if a Smart RF managed radio is operating in WLAN mode on a channel requiring DFS, it will switch channels if radar is detected.

- If Smart RF is enabled, the radio picks a channel defined in the Smart RF policy.
If Smart RF is disabled, but a Smart RF policy is mapped, the radio picks channels specified in the Smart RF policy.

If no SMART RF policy is mapped, the radio selects a random channel.

If the radio is a dedicated sensor, it stops termination on that channel if a neighboring access point detect radar. The access point attempts to come back to its original channel (statically configured or selected by Smart RF) after the channel evacuation period has expired.

Change this behavior using the `dfs-rehome` command from the controller or service platform CLI. This keeps the radio on the newly selected channel and prevents the radio from coming back to the original channel, even after the channel evacuation period.

**NOTE:** Perform RF planning to ensure overlapping coverage exists at a deployment site, for Smart RF to be a viable network performance tool. Smart RF can only provide recovery when access points are deployed appropriately. Smart RF is not a solution, it is a temporary measure. You need to determine the root cause of RF deterioration and fix it. Smart RF history/events can assist in trouble shooting.

Use the (config) instance to configure Smart RF Policy related configuration commands. To navigate to the Smart RF policy instance, use the following commands:

```
<DEVICE>(config)#smart-rf-policy <POLICY-NAME>
```

```
rfs7000-37FABE(config)#smart-rf-policy test
```

```
rfs7000-37FABE(config-smart-rf-policy-test)#?
```

**Smart RF Mode commands:**

- `area`: Specify channel list/ power for an area
- `assignable-power`: Specify the assignable power during power-assignment
- `avoidance-time`: Time to avoid a channel once dfs/adaptivity
- `channel-list`: Select channel list for smart-rf
- `channel-width`: Select channel width for smart-rf
- `coverage-hole-recovery`: Recover from coverage hole
- `enable`: Enable this smart-rf policy
- `group-by`: Configure grouping parameters
- `interference-recovery`: Recover issues due to excessive noise and interference
- `neighbor-recovery`: Recover issues due to faulty neighbor radios
- `no`: Negate a command or set its defaults
- `sensitivity`: Configure smart-rf sensitivity (Modifies various other smart-rf configuration items)
- `smart-ocs-monitoring`: Smart off channel scanning
- `clrscr`: Clears the display screen
- `commit`: Commit all changes made in this session
- `end`: End current mode and change to EXEC mode
- `exit`: End current mode and down to previous mode
- `help`: Description of the interactive help system
- `revert`: Revert changes
- `service`: Service Commands
- `show`: Show running system information
- `write`: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-smart-rf-policy-test)#
```

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (`_`) character. In other words, the name of a device cannot contain an underscore.

19.1.1 area

smart-rf-policy

Configures the channel list and power for a specified area

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
area <AREA-NAME> channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

Parameters
- area <AREA-NAME> channel-list [2.4GHz|5GHz] <CHANNEL-LIST>

<table>
<thead>
<tr>
<th>area &lt;AREA-NAME&gt;</th>
<th>Specified the area name.</th>
</tr>
</thead>

rfs7000-37FABE(config-smart-rf-policy-test)#

Related Commands
no Removes channel list/power configuration for an area
19.1.2 assignable-power

The `assignable-power` command configures the Smart RF power settings over both 2.4 GHz and 5.0 GHz radios.

**Supported in the following platforms:**
- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
assignable-power [2.4GHz|5GHz] [max|min] <1-20>
```

**Parameters**

- `assignable-power [2.4GHz|5GHz] [max|min] <1-20>`

**Examples**

```
rfs7000-37FABE(config-smart-rf-policy-test)#assignable-power 5GHz max 20
rfs7000-37FABE(config-smart-rf-policy-test)#assignable-power 5GHz min 8
rfs7000-37FABE(config-smart-rf-policy-test)#show context
  smart-rf-policy test
  area test channel-list 2.4GHz 1,2,3
  assignable-power 5GHz min 8
  assignable-power 5GHz max 20
rfs7000-37FABE(config-smart-rf-policy-test)#
```

**Related Commands**

- `no`
  Resets assignable power to its default
19.1.3 avoidance-time

smart-rf-policy

Allows Smart-RF enabled radios to avoid channels with high levels of interference and channels where radar has been detected.

This command configures the interval for which a channel is avoided on detection of interference or radar, and is applicable only if the channel selection mode is set to Smart and a Smart-RF policy is applied to the access point’s RF Domain. For more information on configuring a radio’s channel of operation, see channel.

Certain 5.0 GHz channels are subject to FCC / ETSI DFS regulations that require channels transmitting critical radar signals to be free of interference from radio signals. Consequently, DFS-enabled 5.0 GHz radios scan and switch channels if radar is detected on their current channel of operation. If radar-free channels are not available, the radio stops transmitting until it identifies a radar-free channel.

Adaptivity is a new European Union (EU) stipulation that requires access points to monitor interference levels on their current channel of operation, and stop functioning on channels with interference levels exceeding ETSI-specified threshold values. When enabled, this feature ensures recovery by switching the radio to a new channel with less interference.

Once adaptivity or DFS is triggered, the radio’s channel is switched based on the channel selection mode specified. If the channel is fixed, the radio attempts to come back to its specified channel of operation after the DFS/adaptivity channel evacuation period has expired.

NOTE: To optionally disable the radio from switching back to its original channel of operation, execute the no > dfs-rehome command in the radio interface configuration mode of the access point’s profile or device. For more information, see dfs-rehome.

NOTE: For radio’s having channel selection mode set to ACS, Random, or Fixed adaptivity timeout can be configured in the access point’s radio interface mode. For more information, see adaptivity.

On the other hand, if the radio’s channel selection mode is set to Smart or ACS, once adaptivity or DFS is triggered, the channel is avoided until the avoidance-time, specified here, expires. Once the evacuation period has expired, the channel is free for use by both Smart-RF and ACS.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

avoidance-time [adaptivity|dfs] <30-3600>
### Parameters

| avoidance-time [adaptivity|dfs] <30-3600> |
|------------------------------------------|
| Configures the time for which a channel is avoided after dfs or adaptivity is triggered |
| • adaptivity – Sets the time, in minutes, for which a radio avoids an adaptivity-regulated channel detected with interference |
| • dfs – Sets the time, in minutes, for which a radio avoids a DFS-regulated channel detected with radar |
| • <30-3600> – Specify a value from 30 - 3600 minutes. The default for both parameters is 90 minutes. |

### Examples

```
nx4500-5CFA2B(config-smart-rf-policy-test)#avoidance-time adaptivity 200
```

```
nx4500-5CFA2B(config-smart-rf-policy-test)#avoidance-time dfs 300
```

```
nx4500-5CFA2B(config-smart-rf-policy-test)#show context smart-rf-policy test avoidance-time dfs 300 avoidance-time adaptivity 200
```

```
nx4500-5CFA2B(config-smart-rf-policy-test)#no avoidance-time adaptivity
```

```
nx4500-5CFA2B(config-smart-rf-policy-test)#show context include-factory | include avoidance-time avoidance-time dfs 300 avoidance-time adaptivity 90
```

```
nx4500-5CFA2B(config-smart-rf-policy-test)#
```

<tr>
<td>&lt;WORD&gt;</td>
<td>- Specify a comma separated list of channels</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-smart-rf-policy-test)#channel-list 2.4GHz 1,12

rfs7000-37FABE(config-smart-rf-policy-test)#show context smart-rf-policy test
  area test channel-list 2.4GHz 1,2,3
  assignable-power 5GHz min 8
  assignable-power 5GHz max 20
  channel-list 2.4GHz 1,12
rfs7000-37FABE(config-smart-rf-policy-test)#

Related Commands

no Removes the channel list for the selected frequency
19.1.5 channel-width

Selects the channel width for Smart RF configuration

NOTE: In addition to 20 MHz and 40 MHz, AP82XX also provides support for 80 MHz channels.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
channel-width [2.4GHz|5GHz]
```

```
channel-width 2.4GHz [20MHz|40MHz|80MHz|auto]
channel-width 5GHz [20MHz|40MHz|80MHz|auto]
```

Parameters

- channel-width [2.4GHz|5GHz] [20MHz|40MHz|auto]

| 2.4GHz [20MHz|40MHz|80MHz|auto] | Assigns the channel width for the 2.4 GHz band |
|-----------------------------------|------------------------------------------------|
| 20MHz – Assigns the 20 MHz channel width. This is the default setting. |
| 40MHz – Assigns the 40 MHz channel width |
| 80MHz – Assigns the 80 MHz channel width (supported only on AP8232) |
| auto – Assigns the best possible channel in the 20 MHz or 40 MHz channel width |

| 5GHz [20MHz|40MHz|80MHz|auto] | Assigns the channel width for the 5.0 GHz band |
|-----------------------------------|------------------------------------------------|
| 20MHz – Assigns the 20 MHz channel width |
| 40MHz – Assigns the 40 MHz channel width. This is the default setting. |
| 80MHz – Assigns the 80 MHz channel width (supported only on AP8232) |
| auto – Assigns the best possible channel in the 20 MHz, 40 MHz, or 80 MHz channel width |

Usage Guidelines

The 20/40 MHz operation allows the access point to receive packets from clients using 20 MHz, and transmit using 40 MHz. This mode is supported for 11n users on both the 2.4 GHz and 5.0 GHz radios. If an 11n user selects two channels (a primary and secondary channel), the system is configured for dynamic 20/40 operation. When 20/40 is selected, clients can take advantage of wider channels. 802.11n clients experience improved throughput using 40 MHz while legacy clients (either 802.11a or 802.11b/g depending on the radio selected) can still be serviced without interruption using 20 MHz. Select Automatic to enable automatic assignment of channels to working radios to avoid channel overlap and avoid interference from external RF sources.
Examples

```
rfs7000-37FABE(config-smart-rf-policy-test)#channel-width 5GHz auto

rfs7000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
assignable-power 5GHz min 8
assignable-power 5GHz max 20
channel-list 2.4GHz 1,12
channel-width 5GHz auto
rfs7000-37FABE(config-smart-rf-policy-test)#
```

19.1.6 coverage-hole-recovery

Enables recovery from coverage hole errors detected by Smart RF. Use this command to configure the coverage hole recovery settings.

When coverage hole recovery is enabled, on detection of a coverage hole, Smart RF first determines the power increase needed based on the signal-to-noise ratio (SNR) for a client as seen by the access point radio. If a client’s SNR is above the specified threshold, the transmit power is increased until the SNR falls below the threshold.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

coverage-hole-recovery {client-threshold|coverage-interval|interval|snr-threshold}

coverage-hole-recovery {client-threshold [2.4GHz|5GHz] <1-255>}

coverage-hole-recovery {coverage-interval|interval} [2.4GHz|5GHz] <1-120>

coverage-hole-recovery {snr-threshold [2.4Ghz|5Ghz] <1-75>}

Parameters
- coverage-hole-recovery {client-threshold [2.4GHz|5GHz] <1-255>}

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-threshold</td>
<td>Optional. Specifies the minimum number of clients associated to a radio in order to trigger coverage hole recovery.</td>
</tr>
<tr>
<td>2.4GHz &lt;1-255&gt;</td>
<td>Specifies the minimum number of clients on the 2.4 GHz band</td>
</tr>
<tr>
<td>5GHz &lt;1-255&gt;</td>
<td>Specifies the minimum number of clients on the 5.0 GHz band</td>
</tr>
<tr>
<td>coverage-interval</td>
<td>Optional. Specifies the interval between the discovery of a coverage hole and the initiation of coverage hole recovery</td>
</tr>
<tr>
<td>interval</td>
<td>Optional. Specifies the interval at which coverage hole recovery is performed even before a coverage hole is detected</td>
</tr>
<tr>
<td>coverage-hole-recovery {coverage-interval</td>
<td>interval} [2.4GHz</td>
</tr>
</tbody>
</table>

NOTE: The coverage-hole-recovery parameters can be modified only if the sensitivity level is set to ‘custom’. For more information see, sensitivity.
### coverage-hole-recovery {snr-threshold} [2.4Ghz|5Ghz] <1-75>

| 2.4GHz <1-120> | The following keywords are common to the ‘coverage-interval’ and ‘interval’ parameters:  
  - 2.4GHz <1-120> – Specifies the coverage hole recovery interval on the 2.4 GHz band  
  - <1-120> – Specify a value from 1 - 120 seconds.  
  **Note:** coverage-interval – The default is 10 seconds.  
  **Note:** interval – The default is 30 seconds.  

| 5GHz <1-120> | The following keywords are common to the ‘coverage-interval’ and ‘interval’ parameters:  
  - 5GHz <1-120> – Specifies a coverage hole recovery interval on the 5.0 GHz band  
  - <1-120> – Specify a value from 1 - 120 seconds.  
  **Note:** coverage-interval – The default is 10 seconds.  
  **Note:** interval – The default is 30 seconds.  

| snr-threshold | Optional. Specifies the SNR threshold. This value is the SNR threshold for an associated client as seen by its associated AP radio. When the SNR threshold is exceeded, the radio increases its transmit power to increase coverage for the associated client.  

| 2.4GHz <1-75> | Specifies SNR threshold on the 2.4 GHz band  
  - <1-75> – Sets a value from 1 dB - 75 dB. The default is 20 dB.  

| 5GHz <1-75> | Specifies SNR threshold on the 5.0 GHz band  
  - <1-75> – Sets a value from 1 - 75. The default is 20 dB.  

### Examples

```bash
rfs7000-37FABE(config-smart-rf-policy-test)#coverage-hole-recovery snr-threshold 5GHz 1
rfs7000-37FABE(config-smart-rf-policy-test)#show context smart-rf-policy test
  area test channel-list 2.4GHz 1,2,3
  sensitivity custom
  assignable-power 5GHz min 8
  assignable-power 5GHz max 20
  channel-list 2.4GHz 1,12
  channel-width 5GHz auto
rfs7000-37FABE(config-smart-rf-policy-test)#
```

### Related Commands

- `no` Disables recovery from coverage hole errors
19.1.7 dfs

smart-rf-policy

Enables a Smart RF enabled radio to avoid Dynamic Frequency Selection (DFS) regulated channels if radar is detected on those channels. Use this command to configure the period for which a radio avoids the DFS-regulated channel detected with a radar.

Certain 5.0 GHz channels are subject to FCC / ETSI DFS regulations. If a Smart RF enabled radio is on a channel subject to DFS, it switches channels if radar is detected on the assigned 5.0 GHz channel. By default the access point radio attempts to come back to its original channel after the DFS channel evacuation period has expired. To optionally disable the radio from switching back to its original channel of operation, execute the no > dfs-rehome command in the radio interface configuration mode of the access point’s profile.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dfs avoidance-time <30-3600>

Parameters

- dfs avoidance-time <30-3600>

<table>
<thead>
<tr>
<th>dfs avoidance-time &lt;30-3600&gt;</th>
<th>Sets the time, in minutes, for which a radio avoids a DFS-regulated channel detected with a radar</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;30-3600&gt; – Specify a value from 30 - 3600 minutes. The default is 90 minutes.</td>

Related Commands

no | Reverts the DFS regulated channel avoidance time to default (90 minutes)
19.1.8 enable

Enables a Smart RF policy

Use this command to enable this Smart RF policy. Once enabled, the policy can be assigned to a RF Domain supporting a network.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`enable`

**Parameters**

None

**Examples**

```
 rfs7000-37FABE(config-smart-rf-policy-test)#enable
```

19.1.9 group-by

Enables grouping of APs on the basis of their location in a building (floor) or an area

Within a large RD Domain, grouping of APs (within an area or on the same floor in a building) facilitates statistics gathering and troubleshooting.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```text
group-by [area|floor]
```

Parameters

- `area` 
  Groups radios based on their area of location
- `floor` 
  Groups radios based on their floor location

**Note:** Both options are disabled by default.

Examples

```text
rfs7000-37FABE(config-smart-rf-policy-test)#group-by floor
rfs7000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
  area test channel-list 2.4GHz 1,2,3
  group-by floor
  sensitivity custom
  assignable-power 5GHz min 8
  assignable-power 5GHz max 20
  channel-list 2.4GHz 1,12
  channel-width 5GHz auto
  coverage-hole-recovery snr-threshold 5GHz 1
rfs7000-37FABE(config-smart-rf-policy-test)#
```

Related Commands

- `no` 
  Removes Smart RF group settings
19.1.10 interference-recovery

Enables interference recovery from neighboring radios and other sources of WiFi and non-WiFi interference. Interference is the excess noise detected within the Smart RF supported radio coverage area. Smart RF provides mitigation from interfering sources by monitoring the noise levels and other RF parameters on an access point radio's current channel. When a noise threshold is exceeded, Smart RF selects an alternative channel with less interference. To avoid channel flapping a hold timer is defined, which disables interference avoidance for a specific period of time upon detection. Interference recovery is enabled by default.

NOTE: The interference-recovery parameters can be modified only if the sensitivity level is set to 'custom'. For more information see, sensitivity.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

interference-recovery {channel-hold-time|channel-switch-delta|client-threshold|interference|neighbor-offset|noise|noise-factor}

interference-recovery {channel-switch-delta [2.4GHz|5GHZ] <5-35>}

interference-recovery {channel-hold-time <0-86400>|client-threshold <1-255>|interference|neighbor-offset <3-10>|noise|noise-factor <1.0-3.0>}

Parameters

```

### Related Commands

- **no**
  Disables recovery from excessive noise and interference
19.1.11 neighbor-recovery

smart-rf-policy

Enables recovery from errors due to faulty neighboring radios. Enabling neighbor recovery ensures automatic recovery from failed radios within the radio coverage area. Smart RF instructs neighboring access points to increase their transmit power to compensate for the failed radio. Neighbor recovery is enabled by default when the sensitivity setting is medium.

NOTE: The neighbor-recovery parameters can be modified only if the sensitivity level is set to 'custom'. For more information see, sensitivity.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
neighbor-recovery {dynamic-sampling|power-hold-time|power-threshold}
neighbor-recovery {dynamic-sampling} {retries <1-10>|threshold <1-30>}
neighbor-recovery {power-hold-time <0-3600>}
neighbor-recovery {power-threshold [2.4Ghz|5Ghz] <-85--55>}

Parameters
- neighbor-recovery {dynamic-sampling} {retries <1-10>|threshold <1-30>}

<table>
<thead>
<tr>

no neighbor-recovery {dynamic-sampling {retries|threshold}}|power-hold-time|
    power-threshold [2.4GHZ|5GHZ]}

no smart-rf-monitoring {awareness-override {schedule <1-3>|threshold}}|
    client-aware [2.4GHZ|5GHZ]|extended-scan-frequency [2.4GHZ|5GHZ]|
    frequency [2.4GHZ|5GHZ]|off-channel-duration [2.4GHZ|5GHZ]|
    power-save-override [2.4GHZ|5GHZ]|sample-count [2.4GHZ|5GHZ]|voice-aware [2.4GHZ|5GHZ]}
```

**Parameters**

- `no <PARAMETERS>` Negates a command or sets its default. When used in the config Smart RF policy mode, the `no` command disables or resets the Smart RF policy settings.

**Examples**

The following example shows the Smart RF policy ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-smart-rf-policy-test)#show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
group-by floor
sensitivity custom
assignable-power 5GHz min 8
assignable-power 5GHz max 20
channel-list 2.4GHz 1,12
channel-width 5GHz auto
interference-recovery channel-switch-delta 5GHz 5
neighbor-recovery power-threshold 5GHz -65
```
neighbor-recovery power-threshold 2.4GHz -82
coverage-hole-recovery snr-threshold 5GHz 1
rfs7000-37FABE(config-smart-rf-policy-test)# no interference-recovery channel-switch-delta 5GHz
rfs7000-37FABE(config-smart-rf-policy-test)# no neighbor-recovery power-threshold 2.4GHz
rfs7000-37FABE(config-smart-rf-policy-test)# no neighbor-recovery power-threshold 5GHz
rfs7000-37FABE(config-smart-rf-policy-test)# no assignable-power 5GHz min
rfs7000-37FABE(config-smart-rf-policy-test)# no assignable-power 5GHz max

The following example shows the Smart RF policy 'test' settings after the 'no' commands are executed:

rfs7000-37FABE(config-smart-rf-policy-test)# show context
smart-rf-policy test
area test channel-list 2.4GHz 1,2,3
group-by floor
sensitivity custom
channel-list 2.4GHz 1,12
channel-width 5GHz auto
coverage-hole-recovery snr-threshold 5GHz 1
rfs7000-37FABE(config-smart-rf-policy-test)#
19.1.13 sensitivity

smart-rf-policy

Configures Smart RF sensitivity level. The sensitivity level determines Smart RF scanning and sampling aggressiveness. For example, a low sensitivity level indicates a less aggressive Smart-RF policy. This translates to fewer samples taken during off-channel scanning and short off-channel durations. When the sensitivity level is set to high, Smart-RF collects more samples, and remains off-channel longer.

The Smart RF sensitivity level options include low, medium, high, and custom. Medium, is the default setting. The custom option allows an administrator to adjust the parameters and thresholds for interference recovery, coverage hole recovery, and neighbor recovery. However, the low, medium, and high settings still allow utilization of these features.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

sensitivity [custom|high|low|medium]

Parameters
- sensitivity [custom|high|low|medium]

- sensitivity
  - Configures Smart RF sensitivity levels. The options available are: custom, high, low, and medium.

- custom
  - Enables custom interference recovery, coverage hole recovery, and neighbor recovery as additional Smart RF options

- high
  - High sensitivity

- low
  - Low sensitivity

- medium
  - Medium sensitivity. This is the default setting.

Usage Guidelines

To enable the power and channel setting parameters, set sensitivity to custom or medium.

To enable the monitoring and scanning parameters, set sensitivity to custom.

To enable the neighbor recovery, interference and coverage hole recovery parameters, set sensitivity to custom.

Examples

rfs7000-37FABE(config-smart-rf-policy-test)#sensitivity high

### smart-ocs-monitoring {awareness-override threshold <10-10000>}

Optional. Use this parameter to configure client awareness settings overrides

- **threshold** – Specifies the threshold after which client awareness settings are overridden.
- `<10-10000>` – Specify a threshold value from 10 -10000. The default is 10.

### client-aware

Optional. Enables client aware scanning on this Smart RF policy

Use this parameter to configure a client threshold number. When the number of clients connected to a radio equals this threshold number, the radio avoids channel scanning.

This feature is disabled by default.

#### 2.4GHz <1-255>

Enables client aware scanning on the 2.4 GHz band

Avoids radio scanning when a specified minimum number of clients are present

- `<1-255>` – Sets the minimum number of clients from 1 - 255. The default is 1 client.

#### 5GHz <1-255>

Enables client aware scanning on the 5.0 GHz band

Avoids radio scanning when a specified minimum number of clients are present

- `<1-255>` – Sets the minimum number of clients from 1 - 255. The default is 1 client.

### extended-scan-frequency

Optional. Enables an extended scan, as opposed to a neighbor only scan, on this Smart RF policy. This is the frequency radios use to scan for non-peer radios.

#### 2.4GHz <0-50>

Enables extended scan on the 2.4 GHz band

- `<0-50>` – Sets the number of trails from 0 - 50. The default is 5.

#### 5GHz <0-50>

Enables extended scan on the 5.0 GHz band

- `<0-50>` – Sets the number of trails from 0 - 50. The default is 5.

### frequency

Optional. Specifies the scan frequency. This is the frequency, in seconds, in which smart-ocs-monitoring changes channels for an off channel scan.

#### 2.4GHz <1-120>

Selects the 2.4 GHz band

- `<1-120>` – Sets a scan frequency from 1 - 120 sec. The default is 6 seconds.

#### 5GHz <1-120>

Selects the 5.0 GHz band

- `<1-120>` – Sets a scan frequency from 1 - 120 sec. The default is 6 seconds.

### off-channel-duration

Optional. Specifies the duration to scan off channel

This is the duration access point radios use to monitor devices within the network and, if necessary, perform self healing and neighbor recovery to compensate for coverage area losses within a RF Domain.

- `<20-150>` – Sets an off channel duration from 20 - 150 seconds. The default is 150 seconds.
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>2.4GHz &lt;20-150&gt;</strong></td>
<td>Selects the 2.4 GHz band (in milliseconds)</td>
</tr>
<tr>

<td>- &lt;20-150&gt; – Sets the off channel duration from 20 - 150 msec. The default is 50 milliseconds.</td>
</tr>
</tbody>
</table>

| **5GHz <20-150>**                   | Selects the 5.0 GHz band (in milliseconds)                                    |
|                                     | - <20-150> – Sets the off channel duration from 20 - 150 msec. The default is 50 milliseconds. |

- **smart-ocs-monitoring** `{power-save-aware [2.4GHz|5GHz] [disable|dynamic|strict]}`

**power-save-aware**

Optional. Enables power save awareness scanning mode on this Smart RF policy. The options are: disable, dynamic, and strict.

This setting allows Smart RF to detect power save clients and take them into consideration when performing off channel scans.

Strict disables smart monitoring as long as a power save capable client is associated to a radio. Dynamic disables smart monitoring as long as there is data buffered for a power save client at the radio.

**Note:** The default is dynamic.

**2.4GHz [disable|dynamic|strict]**

Sets power save awareness scanning mode on the 2.4 GHz band

- disable – Disables power save awareness scanning
- dynamic – Dynamically avoids scanning based on traffic for power save (PSP) clients
- strict – Strictly avoids scanning when PSP clients are present

**5GHz [disable|dynamic|strict]**

Sets power save awareness scanning mode on the 5.0 GHz band

- disable – Disables power save awareness scanning
- dynamic – Dynamically avoids scanning based on traffic for PSP clients
- strict – Strictly avoids scanning when PSP clients are present

**Note:** The default is dynamic.

- **smart-ocs-monitoring** `{sample-count [2.4GHz|5GHz] <1-15>}`

**sample-count**

Optional. Specifies the number of samples to collect before reporting an issue to the Smart RF master

**2.4GHz <1-15>**

Selects the 2.4 GHz band

- <1-15> – Specifies the number of samples to collect from 1 - 15. The default is 10.

**5GHz <1-15>**

Selects the 5.0 GHz band

- <1-15> – Specifies the number of samples to collect from 1 - 15. The default is 5.

- **smart-ocs-monitoring** `{voice-aware [2.4GHz|5GHz] [disable|dynamic|strict]}`

**voice-aware**

Optional. Enables voice awareness scanning mode on this Smart RF policy. The options are: disable, dynamic, and strict.

Strict disables smart monitoring as long as a voice client is associated to a radio. Dynamic disables smart monitoring as long as there is data buffered for a voice client at the radio.

Disables off channel monitoring
This chapter summarizes the *Wireless Intrusion Protection Systems* (WIPS) policy commands in the CLI command structure. WIPS is an additional measure of security designed to continuously monitor the network for threats and intrusions. Along with wireless VPNs, encryptions, and authentication policies WIPS enhances the security of a WLAN.

The WIPS policy enables detection of intrusions and threats that a managed network is likely to encounter. However, the WIPS policy does not include threat mitigation configurations. These intrusions and threats are available within the WIPS policy configuration mode as pre configured, fixed events. Each event consists of a set of frames or anomalies that may be harmful to the managed network. You can enable/disable various aspects of each individual event.

Events are broadly grouped into the following three categories:

- **Excessive/Thresholdable events**: These events detect DOS attacks, like excessive deauths, EAP floods etc. Threshold limits for such events can be configured for *mobile units* (MU) and radios. Once these threshold limits are exceeded, an event is triggered. Stations triggering an event are usually filtered. You can configure a filter ageout specifying the time for which the station, triggering the event, is filtered. However, the filter ageout only applies when the MU-threshold is exceeded. When radio threshold is reached, the system raises a warning about the same and updates event history with event details.

- **Station/MU anomalies**: These events are triggered when a MU performs suspicious activities that can compromise the security and stability of the managed network. You can configure a filter ageout, similar to the above class of events, to filter the station triggering such events.

- **AP/neighbor anomalies**: These events are triggered when an AP or neighbor sends suspicious frames. The system cannot filter APs or neighbors triggering such events. However, the system warns you about such attacks, allowing you to take further actions against such APs and neighbors.

In addition to event monitoring configuration, the WIPS policy allows you to configure a list of signatures. Unlike events, signatures are not fixed. You are free to define your own signatures based on a specific set of parameters. A signature is a rule, consisting of a set of fields to match and a corresponding set of actions in case of a match. By default, whenever a signature is matched an event log is triggered. This event log is similar to the one triggered upon an event. In addition to an event log, you can also configure other actions. Signatures have all the features supported by events. In fact most events are internally implemented as signatures.

Signature rules are of the following three types:

- **ssid, ssid length rule**: This signature matches a specified SSID or SSID length. It is mandatory to configure the frame type to match for this signature. When configured, only frame types allowed are beacons, probe requests, and probe responses. Example rule: `ssid : AirJack and frame type beacon : Signature for AirJack attack.`
payload rule: This signature matches a particular payload at a particular frame offset. You can restrict these matches based on frame type. Example rule: Payload : 0x00601d Offset 3 : Netstumbler

address-match rule: This signature matches one or more address fields. The address fields supported are BSSID, source-MAC, and destination-MAC. You can also specify frame types to match. The frame types supported are assoc, auth, beacon, data, deauth, disassoc, mgmt, probe-request, and probe-response.

A WIPS policy, once configured, has to be attached to a RF Domain to take effect. Multiple WIPS policies can be configured at the same time, but only one policy can be attached to a given RF Domain at any time.

**NOTE:** To attach a WIPS policy to a RF Domain, in the RF Domain configuration mode, execute the `use > wips-policy <WIPS-POLICY-NAME>` command. For more information, see `use`.

**NOTE:** With this most recent release, AP7522 and AP7532 model Access Points can provide enhanced sensor support. AP7522 and AP7532 sensors can send data from off-channel-scans while in radio-share promiscuous/inline mode, in addition to the on-channel data captured in radio-share mode. ADSP uses the off-channel-scan data (in addition to the on-channel data) to monitor for rogue intrusions and trigger alarms. OTA Termination is triggered from ADSP to the appropriate radio-share AP to initiate termination.

**NOTE:** AP7522 and AP7532 models also support shared part-time scanning using WIPS in WiNG (using off-channel-scans) and no ADSP. WIPS on WiNG was enhanced to add rogue detection/classification (wired side detection based of MAC Address Offset) and over-the-air (OTA) termination for AP7522 and AP7532 deployments.

Use the (config) instance to configure WIPS policy commands. To navigate to the WIPS policy instance, use the following commands:

```
<DEVICE>(config)#wips-policy <POLICY-NAME>
```

```
rfs7000-37FABE(config)#wips-policy test
rfs7000-37FABE(config-wips-policy-test)#?
```

Wips Policy Mode commands:

- `ap-detection`: Rogue AP detection
- `enable`: Enable this wips policy
- `event`: Configure an event
- `history-throttle-duration`: Configure the duration for which event duplicates are not stored in history
- `interference-event`: Specify events which will contribute to smart-rf wifi interference calculations
- `no`: Negate a command or set its defaults
- `signature`: Signature to configure
- `use`: Set setting to use
- `clrscr`: Clears the display screen
- `commit`: Commit all changes made in this session
- `do`: Run commands from Exec mode
- `end`: End current mode and down to previous mode
- `help`: Description of the interactive help system
- `revert`: Revert changes
- `service`: Service Commands
- `show`: Show running system information
- `write`: Write running configuration to memory or terminal

```
rfs7000-37FABE(config-wips-policy-test)#
```
NOTE: The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.

20.1.1 \textbf{ap-detection}

\textit{wips-policy}

Enables the detection of unauthorized or unsanctioned APs. Unauthorized APs are untrusted access points connected to an access point managed network. These untrusted APs accept wireless client associations. It is important to detect such rogue APs and declare them unauthorized. Rogue AP detection is disabled by default.

Supported in the following platforms:

\begin{itemize}
  \item Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  \item Wireless Controllers — RFS4000, RFS6000, RFS7000
  \item Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
\end{itemize}

\textbf{Syntax}

\begin{verbatim}
ap-detection \{age-out|air-termination|interferer-threshold <-100--10>|recurring-event-interval <0-10000>|wait-time\}
ap-detection \{age-out <30-86400>|wait-time <10-600>\}
ap-detection air-termination \{allow-channel-switch|mode [auto|manual]\}
\end{verbatim}

\textbf{Parameters}

\begin{itemize}
  \item \textit{ap-detection \{age-out <30-86400>|wait-time <10-600>\}}
  \begin{itemize}
    \item \textbf{age-out <30-86400>}: Optional. Configures the unauthorized AP ageout interval. The WIPS policy uses this value to ageout unauthorized APs.
      \begin{itemize}
        \item \textless 30-86400\textgreater{} — Sets an ageout interval from 30 - 86400 seconds. The default is 5 minutes (300 seconds).
      \end{itemize}
  \end{itemize}

  \item \textbf{air-termination \{allow-channel-switch|mode [auto|manual]\}}: Enables air termination of unauthorized APs. This option is disabled by default.
    \begin{itemize}
      \item allow-channel-switch — Allows channel switch of unauthorized APs based on the channel mode. This option is disabled by default.
      \item mode [auto|manual] — Select the mode as auto or manual to configure. The default setting is manual.
    \end{itemize}

  \item \textbf{recurring-event-interval <0-10000>}: Configures recurring event interval help of unauthorized APs
    \begin{itemize}
      \item <0-10000> — Configures the recurring interval between 0 - 10000 seconds. The default is 300 seconds.
    \end{itemize}

  \item \textbf{interferer-threshold <-100--10>}: Configures rssi threshold value to determine if an unsanctioned ap is an interferer or not
    \begin{itemize}
      \item -100--10 — Configures the rssi threshold between -100 - -10 dBm. The default is -75 dBm.
    \end{itemize}

  \item \textbf{wait-time <10-600>}: Optional. Configures the wait time before a detected AP is declared as unauthorized and potentially removed
    \begin{itemize}
      \item <10-600> — Sets a wait time from 10 - 600 seconds. The default is 1 minute (60 seconds).
    \end{itemize}
\end{itemize}

\textbf{Examples}

\begin{verbatim}
rfs7000-37FABE(config-wips-policy-test)#ap-detection wait-time 15
rfs7000-37FABE(config-wips-policy-test)#ap-detection age-out 50

rfs7000-37FABE(config-wips-policy-test)#show context
ap-detection-age-out 50
ap-detection-wait-time 15
rfs7000-37FABE(config-wips-policy-test)#

nx4500-5CFA8E(config-wips-policy-test)#ap-detection recurring-event-interval 10
\end{verbatim}
```plaintext
nx4500-5CFA8E(config-wips-policy-test)#show context
wips-policy test
  ap-detection recurring-event-interval 10
nx4500-5CFA8E(config-wips-policy-test)#

20.1.2 enable

Enables this WIPS policy

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
enable
```

Parameters

None

Examples

```
rfs7000-37FABE(config-wips-policy-test)#enable
rfs7000-37FABE(config-wips-policy-test)#
```

20.1.3 event

wips-policy

Configures events, filters and threshold values for this WIPS policy. Events are grouped into three categories, AP anomaly, client anomaly, and excessive. WLANs are baselined for matching criteria. Any deviation from this baseline is considered an anomaly and logged as an event.

NOTE: By default all event monitoring is disabled.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522,
  AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000,
  NX9500, NX9510, NX9600

Syntax

event [ap-anomaly|client-anomaly|enable-all-events|excessive]

event ap-anomaly [ad-hoc-violation|airjack|ap-ssid-broadcast-in-beacon|asleap|

- **client-anomaly** [dos-broadcast-deauth|fuzzing-all-zero-macs|fuzzing-invalid-frame-type|fuzzing-invalid-mgmt-frames|fuzzing-invalid-seq-num|identical-src-and-dest-addr|invalid-8021x-frames|netstumbler-generic|non-conforming-data|wellenreiter]

(client-anomaly) Enables client anomaly event tracking

These are suspicious events performed by wireless clients compromising the security of the network. An administrator can enable or disable filtering of each listed event and set the thresholds required for the generation of the event notification and filtering action applied.

- **dos-broadcast-deauth** Tracks DoS broadcast deauthentication events
- **fuzzing-all-zero-macs** Tracks Fuzzing: All zero MAC addresses observed
- **fuzzing-invalid-frame-type** Tracks Fuzzing: Invalid frame type detected
- **fuzzing-invalid-mgmt-frames** Tracks Fuzzing: Invalid management frame detected
- **fuzzing-invalid-seq-num** Tracks Fuzzing: Invalid sequence number detected
- **identical-src-and-dest-addr** Tracks identical source and destination addresses detection
- **invalid-8021x-frames** Tracks Fuzzing: Invalid 802.1x frames detected
- **netstumbler-generic** Tracks Netstumbler (v3.2.0, 3.2.3, 3.3.0) events
- **non-conforming-data** Tracks non-conforming data packets
- **wellenreiter** Tracks Wellenreiter events

**filter-ageout <0-86400>**

The following keywords are common to all of the above client anomaly events:

- **filter-ageout <0-86400>** – Optional. Configures the filter expiration interval in seconds
- **<0-86400>** – Sets the filter ageout interval from 0 - 86400 seconds. The default is 0 seconds.

**Note:** For each violation define a filter time in seconds, which determines how long the packets (received from an attacking device) are ignored once a violation has been triggered. Ignoring frames from an attacking device minimizes the effectiveness of the attack and the impact to the site until permanent mitigation can be performed.

**Note:** The filter ageout value is applicable across the entire RF Domain using this WIPS policy. If an MU is detected performing an attack and is filtered by one of the APs, the information is passed on to all APs and controllers within the RF Domain through the domain manager. Consequently the MU is filtered, for the specified period of time, across all devices.
### event enable-all-events

Enables tracking of all intrusion events (client anomaly and excessive events)

<table>
<thead>
<tr>
<th>excessive</th>
<th>Enables the tracking of excessive events. Excessive events are actions performed continuously and repetitively. These events can impact the performance of the controller managed network. DoS attacks come under this category.</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
| filter-ageout <0-86400> | The following keywords are common to all excessive events:
- filter-ageout <0-86400> – Optional. Configures a filter expiration interval in seconds. It sets the duration for which the client is filtered. The client is added to a ACL as a special entry and frames received from this client are dropped.
- <0-86400> – Sets a filter ageout interval from 0 - 86400 seconds. The default is 0 seconds. |
| threshold-client <0-65535> | The following keywords are common to all excessive events:
- threshold-client <0-65535> – Optional. Configures a client threshold value after which the filter is triggered and an event is recorded
- <0-65535> – Sets a wireless client threshold value from 0 - 65535 seconds |
| threshold-radio <0-65535> | The following keywords are common to all excessive events:
- threshold-radio <0-65535> – Optional. Configures a radio threshold value after which the filter is triggered and an event is recorded
- <0-65535> – Sets a radio threshold value from 0 - 65535 seconds |
Examples

```bash
rfs7000-37FABE(config-wips-policy-test)#event excessive 80211-replay-check-failure
filter-ageout 9 threshold-client 8 threshold-radio 99
rfs7000-37FABE(config-wips-policy-test)#show context

20.1.4 **history-throttle-duration**

- wips-policy

Configures the duration event duplicates are omitted from the event history

The system maintains a history of all events that have occurred, on each device, within a RF Domain. Sometimes an event occurs for a prolonged period of time and tends to fill up the event history list. In such a scenario, duplicate information added to the event history list can be throttled for a specified period of time. Once this period is over, duplicate entries are once again allowed.

Event history statistics are periodically sent to the domain manager, which can be queried to ascertain the general health of the domain.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
history-throttle-duration <30-86400>
```

**Parameters**

- **history-throttle-duration <30-86400>**

  - <30-86400> – Sets a value from 30 - 86400 seconds. The default is 120 seconds.

**Examples**

```
rfs7000-37FABE(config-wips-policy-test)#history-throttle-duration 77
rfs7000-37FABE(config-wips-policy-test)#show context
wips-policy test

rfs7000-37FABE(config-wips-policy-test)#}

\textbf{Related Commands}

- \texttt{no} Disables this WIPS policy signature as a Smart RF interference source
20.1.6 no

Negates a command or resets configured settings to their default. When used in the config WIPS policy mode, the `no` command negates or resets filters and thresholds.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
no [ap-detection|enable|event|history-throttle-duration|interference-event|signature|use]
no [enable|history-throttle-duration]
no ap-detection {ageout {<LINE-SINK>]|air-termination|interferer-threshold <-100--10>|recurring-event-interval <0-10000>wait-time {<LINE-SINK>}}
no event [ap-anomaly|client-anomaly|enable-all-events|excessive]
no interference-event [non-conforming-data|wireless-bridge]
no signature <WIPS-SIGNATURE>
no use device-categorization
```

**Parameters**

- `no <PARAMETERS>`

  Negates a command or resets configured settings to their default. When used in the config WIPS policy mode, the `no` command negates or resets filters and thresholds.

**Usage Guidelines**

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.
Examples

The following example shows the WIPS Policy 'test' settings before the `no` commands are executed:

```
rfs7000-37FABE(config-wips-policy-test)#show context
wips-policy test
    history-throttle-duration 77
    event excessive 80211-replay-check-failure threshold-client 10 threshold-radio 99
    filter-ageout 9
    event client-anomaly wellenreiter filter-ageout 99
    interference-event non-conforming-data
    ap-detection-ageout 50
    ap-detection-wait-time 15
rfs7000-37FABE(config-wips-policy-test)#
```

```
rfs7000-37FABE(config-wips-policy-test)#no event client-anomaly wellenreiter
    filter-ageout 99
rfs7000-37FABE(config-wips-policy-test)#no interference-event non-conforming-data
rfs7000-37FABE(config-wips-policy-test)#no history-throttle-duration
```

The following example shows the WIPS Policy 'test' settings after the `no` commands are executed:

```
rfs7000-37FABE(config-wips-policy-test)#show context
wips-policy test
    event excessive 80211-replay-check-failure threshold-client 10 threshold-radio 99
    filter-ageout 9
    no event client-anomaly wellenreiter filter-ageout 99
    ap-detection-ageout 50
    ap-detection-wait-time 15
rfs7000-37FABE(config-wips-policy-test)#
```
20.1.7 signature

Attack and intrusion patterns are identified and configured as signatures in a WIPS policy. The WIPS policy compares packets in the network with pre configured signatures to identify threats.

The following table summarizes WIPS policy signature configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>signature</td>
<td>Configures a WIPS policy signature and enters its configuration mode</td>
<td>20-17</td>
</tr>
<tr>
<td>signature mode commands</td>
<td>Summarizes WIPS signature configuration mode commands</td>
<td>20-19</td>
</tr>
</tbody>
</table>
20.1.7.1 signature

`signature`

Configures a WIPS policy signature

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`signature <SIGNATURE-NAME>`

Parameters

- `signature <SIGNATURE-NAME>`

<table>
<thead>
<tr>
<th>signature &lt;SIGNATURE-NAME&gt;</th>
<th>Configures a WIPS policy signature</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;SIGNATURE-NAME&gt;</code> — Enter a name for the WIPS policy signature. The name should not exceed 64 characters.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-wips-policy-test)#signature test
rfs7000-37FABE(config-test-signature-test)#
```

```
rfs7000-37FABE(config-test-signature-test)#?
Wips Signature Mode commands:
bssid               Bssid mac address

</tbody>
</table>
### 20.1.7.2.1 bssid

*signature mode commands*

Configures a BSSID MAC address with this WIPS signature for matching.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
bssid <MAC>
```

**Parameters**

- `bssid <MAC>`

**Examples**

```
rfs7000-37FABE(config-test-signature-test)#bssid 11-22-33-44-55-66
rfs7000-37FABE(config-test-signature-test)#show context
signature test
bssid 11-22-33-44-55-66
rfs7000-37FABE(config-test-signature-test)#
```

**Related Commands**

```
no
```

Disables a WIPS signature BSSID.
20.1.7.2.2 dst-mac

> signature mode commands

Configures a destination MAC address for the packet examined for matching

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

dst-mac <MAC>

Parameters

- dst-mac <MAC>

<table>
<thead>
<tr>
<th>dst-mac &lt;MAC&gt;</th>
<th>Configures a destination MAC address to match</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;MAC&gt;</td>
<td>Specify the destination MAC address.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-test-signature-test)#dst-mac 55-66-77-88-99-00
rfs7000-37FABE(config-test-signature-test)#show context signature test
\[bssid 11-22-33-44-55-66
dst-mac 55-66-77-88-99-00\]
rfs7000-37FABE(config-test-signature-test)#

Related Commands

no

Disables a WIPS signature destination MAC address
20.1.7.2.3 filter-ageout

This command configures the filter ageout interval in seconds. This is the duration a client, triggering a WIPS event, is excluded from RF Domain manager radio association.

**Supported in the following platforms:**
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
filter-ageout <1-86400>
```

**Parameters**

- `filter-ageout <1-86400>`

  Configures the filter ageout interval from 1 - 86400 seconds

**Examples**

```plaintext
rfs7000-37FABE(config-test-signature-test)#filter-ageout 8
rfs7000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  dst-mac 55-66-77-88-99-00
  filter-ageout 8
rfs7000-37FABE(config-test-signature-test)#
```

**Related Commands**

- `no`
  Removes the configured filter ageout interval
20.1.7.2.4 frame-type

Configure the frame type used for matching with this WIPS policy signature

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
frame-type [all|assoc|auth|beacon|data|deauth|disassoc|mgmt|probe-req|probe-resp|reassoc]
```

Parameters

- frame-type [all|assoc|auth|beacon|data|deauth|disassoc|mgmt|probe-req|probe-resp|reassoc]

<table>
<thead>
<tr>
<th>frame-type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Configures all frame type matching</td>
</tr>
<tr>
<td>assoc</td>
<td>Configures association frame matching</td>
</tr>
<tr>
<td>auth</td>
<td>Configures authentication frame matching</td>
</tr>
<tr>
<td>beacon</td>
<td>Configures beacon frame matching</td>
</tr>
<tr>
<td>data</td>
<td>Configures data frame matching</td>
</tr>
<tr>
<td>deauth</td>
<td>Configures deauthentication frame matching</td>
</tr>
<tr>
<td>disassoc</td>
<td>Configures disassociation frame matching</td>
</tr>
<tr>
<td>mgmt</td>
<td>Configures management frame matching</td>
</tr>
<tr>
<td>probe-req</td>
<td>Configures probe request frame matching</td>
</tr>
<tr>
<td>probe-resp</td>
<td>Configures probe response frame matching</td>
</tr>
<tr>
<td>reassoc</td>
<td>Configures re-association frame matching</td>
</tr>
</tbody>
</table>

Usage Guidelines

The frame type configured determines the SSID match type configured. To configure the SSID match type as SSID, the frame type must be beacon, probe-req or probe-resp.

Examples

```
rfs7000-37FABE(config-test-signature-test)#frame-type reassoc
rfs7000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
dst-mac 55-66-77-88-99-00
  frame-type reassoc
  filter-ageout 8
rfs7000-37FABE(config-test-signature-test)#
```

20.1.7.2.5 interference-event

signature mode commands

Configures this WIPS policy signature as Smart RF interference source

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
interference-event

Parameters
None

Examples
rfs7000-37FABE(config-test-signature-test)#interference-event

rfs7000-37FABE(config-test-signature-test)#show context
signature test
   interference-event
   bssid 11-22-33-44-55-66
   dst-mac 55-66-77-88-99-00
   frame-type reassoc
   filter-ageout 8
rfs7000-37FABE(config-test-signature-test)#

Related Commands

</tbody>
</table>
20.1.7.2.7 payload

Configures payload settings. The payload command sets a numerical index pattern and offset for this WIPS signature.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
payload <1-3> pattern <WORD> offset <0-255>

Parameters
payload <1-3> pattern <WORD> offset <0-255>

---

payload <1-3>
- Configures payload settings
  - <1-3> – Sets the payload index

pattern <WORD>
- Specifies the pattern to match: hex or string
  - <WORD> – Sets the pattern name

offset <0-255>
- Specifies the payload offset to start the pattern match
  - <0-255> – Sets the offset value

---

Examples
rfs7000-37FABE(config-test-signature-test)#payload 1 pattern test offset 1
rfs7000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  dst-mac 55-66-77-88-99-00
  frame-type assoc
  filter-ageout 8
rfs7000-37FABE(config-test-signature-test)#payload 1 pattern test offset 1

Related Commands

| no | Removes payload and associated settings |
20.1.7.2.8 src-mac

Configures a source MAC address for a packet examined for matching

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
src-mac <MAC>

Parameters
- src-mac <MAC>

<table>
<thead>
<tr>
<th>src-mac &lt;MAC&gt;</th>
<th>Configures the source MAC address to match</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;MAC&gt;</td>
<td>Specify the source MAC address.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-test-signature-test)#src-mac 00-1E-E5-EA-1D-60
rfs7000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  src-mac 00-1E-E5-EA-1D-60
  dst-mac 55-66-77-88-99-00
  frame-type assoc
  filter-ageout 8
  payload 1 pattern test offset 1
rfs7000-37FABE(config-test-signature-test)#

Related Commands
- **no** - Removes a WIPS signature source MAC address
20.1.7.2.9 ssid-match

- signature mode commands

Configures the SSID (and its character length) used for matching

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
ssid-match [ssid|ssid-len]
ssid-match [ssid <SSID>|ssid-len <0-32>]
```

Parameters

- `ssid-match [ssid <SSID>|ssid-len <0-32>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ssid &lt;SSID&gt;</code></td>
<td>Specifies the SSID match string</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;SSID&gt;</code> – Specify the SSID string.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Specify the correct SSID to ensure proper filtering.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ssid-len &lt;0-32&gt;</code></td>
<td>Specifies the length of the SSID</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;0-32&gt;</code> – Specify the SSID length from 0 - 32 characters.</td>
</tr>
</tbody>
</table>

Examples

```plaintext
rfs7000-37FABE(config-test-signature-test)#ssid-match ssid PrinterLan
rfs7000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  src-mac 00-1E-E5-EA-1D-60
  dst-mac 55-66-77-88-99-00
  frame-type beacon
    ssid-match ssid PrinterLan
    filter-ageout 8
    payload 1 pattern test offset 1
rfs7000-37FABE(config-test-signature-test)#
```

</table>
20.1.7.2.10 threshold-client

signature mode commands

Configures the wireless client threshold limit. When the wireless client exceeds the specified limit, an event is triggered.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

threshold-client <1-65535>

Parameters

- threshold-client <1-65535>

| threshold-client <1-65535> | Configures the wireless client threshold limit  
|---------------------------|-----------------------------------------------|

| <1-65535> | — Sets the threshold limit for a 60 second window from 1 - 65535 |

Examples

rfs7000-37FABE(config-test-signature-test)#threshold-client 88
rfs7000-37FABE(config-test-signature-test)#show context
signature test
bssid 11-22-33-44-55-66

dst-mac 55-66-77-88-99-00
frame-type beacon
ssid-match ssid PrinterLan
filter-ageout 8
threshold-client 88
payload 1 pattern test offset 1
rfs7000-37FABE(config-test-signature-test)#

Related Commands

| no | Removes the wireless client threshold limit configured with a WIPS policy signature |
20.1.7.2.11 threshold-radio

- **signature mode commands**

Configures the radio’s threshold limit. When the radio exceeds the specified limit, an event is triggered.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

threshold-radio <1-65535>

**Parameters**

- **threshold-radio <1-65535>**

<table>
<thead>
<tr>
<th>parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threshold-radio</td>
<td>Configures the radio’s threshold limit</td>
</tr>
<tr>
<td>&lt;1-65535&gt;</td>
<td>- Specify the threshold limit for a 60 second window from 1 - 65535.</td>
</tr>
</tbody>
</table>

**Examples**

rfs7000-37FABE(config-test-signature-test)#threshold-radio 88

rfs7000-37FABE(config-test-signature-test)#show context
signature test
bssid 11-22-33-44-55-66
csrc_mac 00-1E-E5-EA-1D-60
dst_mac 55-66-77-88-99-00
frame-type beacon
ssid-match ssid PrinterLan
filter-ageout 8
threshold-client 88
threshold-radio 88
payload 1 pattern test offset 1
rfs7000-37FABE(config-test-signature-test)#

**Related Commands**

- **no** Removes the radio’s threshold limit configured with a WIPS policy signature
20.1.7.2.12 no

**signature mode commands**

Negates a command or resets settings to their default. When used in the config WIPS policy signature mode, the `no` command resets or removes WIPS signature settings.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
no [bssid|dst-mac|filter-ageout|frame-type|interference-event|mode|payload|src-mac|
    ssid-match|threshold-client|threshold-radio]
```

**Parameters**

- `no <PARAMETERS>` Negates a command or resets settings to their default

**Usage Guidelines**

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

The following is the WIPS signature 'test' settings before the execution of the 'no' command:

```
rfs7000-37FABE(config-test-signature-test)#show context
signature test
  bssid 11-22-33-44-55-66
  src-mac 00-1E-E5-EA-1D-60
  dst-mac 55-66-77-88-99-00
  frame-type beacon
  ssid-match ssid PrinterLan
  filter-ageout 8
  threshold-client 88
  threshold-radio 88
  payload 1 pattern test offset 1
```

The following is the WIPS signature 'test' settings after the execution of the 'no' command:

```
rfs7000-37FABE(config-test-signature-test)#no mode enable
rfs7000-37FABE(config-test-signature-test)#no bssid
rfs7000-37FABE(config-test-signature-test)#no dst-mac
rfs7000-37FABE(config-test-signature-test)#no src-mac
rfs7000-37FABE(config-test-signature-test)#no filter-ageout
rfs7000-37FABE(config-test-signature-test)#no threshold-client
rfs7000-37FABE(config-test-signature-test)#no threshold-radio
```

```
rfs7000-37FABE(config-test-signature-test)#
signature test
  frame-type beacon
  payload 1 pattern test offset 1
rfs7000-37FABE(config-test-signature-test)
```
20.1.8 use

*use*

Enables device categorization on this WIPS policy. This command uses an existing device categorization list. The list categorizes devices as authorized or unauthorized.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
use device-categorization <DEVICE-CATEGORIZATION>
```

**Parameters**

- `use device-categorization <DEVICE-CATEGORIZATION>`

| device-categorization <DEVICE-CATEGORIZATION> | Configures a device categorization list
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DEVICE-CATEGORIZATION&gt;</td>
<td>Specify the device categorization object name to associate with this profile</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-wips-policy-test)#use device-categorization test
rfs7000-37FABE(config-wips-policy-test)#show context
wips-policy test
  event excessive 80211-replay-check-failure threshold-client 10 threshold-radio 99
  filter-ageout 9
  no event client-anomaly wellenreiter filter-ageout 99
  signature test
    interference-event

    ap-detection-wait-time 15
rfs7000-37FABE(config-wips-policy-test)#
```

**Related Commands**

- `no` Disables the use of a device categorization policy with a WIPS policy
This chapter summarizes the WLAN QoS policy in the CLI command structure.

A WLAN QoS policy increases network efficiency by prioritizing data traffic. Prioritization reduces congestion. This is essential because of the lack of bandwidth for all users and applications. QoS helps ensure each WLAN on the wireless controller receives a fair share of the overall bandwidth, either equally or as per the proportion configured. Packets directed towards clients are classified into categories such as Video, Voice and Data. Packets within each category are processed based on the weights defined for each WLAN.

Each WLAN QoS policy has a set of parameters which it groups into categories, such as management, voice and data. Packets within each category are processed based on the weights defined for each WLAN.

Use the (config) instance to configure WLAN QoS policy commands. To navigate to the WLAN QoS policy instance, use the following commands:

```
<DEVICE>(config)#wlan-qos-policy <POLICY-NAME>
```

```
rfs7000-37FABE(config)#wlan-qos-policy test
rfs7000-37FABE(config-wlan-qos-test)#?
```

**WLAN QoS Mode commands:**

- accelerated-multicast: Configure accelerated multicast streams address and forwarding QoS classification
- classification: Select how traffic on this WLAN must be classified (relative prioritization on the radio)
- multicast-mask: Egress multicast mask (frames that match bypass the PSPqueue. This permits intercom mode operation without delay even in the presence of PSP clients)
- no: Negate a command or set its defaults
- qos: Quality of service
- rate-limit: Configure traffic rate-limiting parameters on a per-wlan/per-client basis
-svp-prioritization: Enable spectralink voice protocol support on this wlan
- voice-prioritization: Prioritize voice client over other client (for non-WMM clients)
- wmm: Configure 802.11e/Wireless MultiMedia parameters
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal
NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
21.1 wlan-qos-policy

WLAN QoS configurations differ significantly from QoS policies configured for radios. WLAN QoS configurations are designed to support the data requirements of wireless clients, including the data types they support and their network permissions. Radio QoS policies are specific to the transmit and receive characteristics of the connected radio’s themselves, independent from the wireless clients these access point radios support.

The following table summarizes WLAN QoS policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS.*
21.1.1 `accelerated-multicast`

* wlan-qos-policy

Configures the accelerated multicast stream address and forwarding QoS classification settings.

Enabling this option allows the system to automatically detect and convert multicast streams to unicast streams. When a stream is converted and queued up for transmission, there are a number of classification mechanisms that can be applied to the stream. Use the classification options to specify the traffic type to prioritize.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
accelerated-multicast [<IP>|autodetect]
```

```
accelerated-multicast [<IP>|autodetect] {classification [background|best-effort|trust|video|voice]}
```

**Parameters**

- `accelerated-multicast [<IP>|autodetect] {classification [background|best-effort|trust|video|voice]}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>accelerated-multicast</code></td>
<td>Configures the accelerated multicast stream address and forwarding QoS classification.</td>
</tr>
<tr>
<td><code>&lt;IP&gt;</code></td>
<td>Configures a multicast IP address in the A.B.C.D format. The system can configure up to 32 IP addresses for each WLAN QoS policy.</td>
</tr>
<tr>
<td><code>autodetect</code></td>
<td>Allows the system to automatically detect multicast streams to be accelerated. This parameter allows the system to convert multicast streams to unicast, or to specify multicast streams converted to unicast.</td>
</tr>
<tr>
<td><code>classification</code></td>
<td>Optional. Configures the QoS classification (traffic class) settings. When the stream is converted and queued for transmission, specify the type of classification applied to the stream. The options are: background, best-effort, trust, voice, and video.</td>
</tr>
<tr>
<td><code>background</code></td>
<td>Forwards streams with background (low) priority. This parameter is common to both <code>&lt;IP&gt;</code> and autodetect.</td>
</tr>
<tr>
<td><code>best-effort</code></td>
<td>Forwards streams with best effort (normal) priority. This parameter is common to both <code>&lt;IP&gt;</code> and autodetect.</td>
</tr>
<tr>
<td><code>trust</code></td>
<td>No change to the streams forwarding traffic class. This parameter is common to both <code>&lt;IP&gt;</code> and autodetect.</td>
</tr>
<tr>
<td><code>video</code></td>
<td>Forwards streams with video traffic priority. This parameter is common to both <code>&lt;IP&gt;</code> and autodetect.</td>
</tr>
<tr>
<td><code>voice</code></td>
<td>Forwards streams with voice traffic priority. This parameter is common to both <code>&lt;IP&gt;</code> and autodetect.</td>
</tr>
</tbody>
</table>
Examples

```
rfs7000-37FABE(config-wlan-qos-test)#accelerated-multicast autodetect classification voice
rfs7000-37FABE(config-wlan-qos-test)#show context
  wlan-qos-policy test
    qos trust dscp
    qos trust wmm
    accelerated-multicast autodetect classification voice
rfs7000-37FABE(config-wlan-qos-test)#
```
21.1.2 classification

Specifies how traffic on this WLAN is classified. This classification is based on relative prioritization on the radio.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

classification [low|non-unicast|non-wmm|normal|video|voice|wmm]

classification [low|normal|video|voice|wmm]

classification non-unicast [voice|video|normal|low|default]

classification non-wmm [voice|video|normal|low]

Parameters

- classification [low|normal|video|voice|wmm]

<table>
<thead>
<tr>
<th>low</th>
<th>Optimized for background traffic. Implies all traffic on this WLAN is low priority on the radio</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>Optimized for best effort traffic. Implies all traffic on this WLAN is prioritized as best effort traffic on the radio</td>
</tr>
<tr>
<td>video</td>
<td>Optimized for video traffic. Implies all traffic on this WLAN is prioritized as video traffic on the radio</td>
</tr>
<tr>
<td>voice</td>
<td>Optimized for voice traffic. Implies all traffic on this WLAN is prioritized as voice traffic on the radio</td>
</tr>
<tr>
<td>wmm</td>
<td>Uses WMM based classification, using DSCP or 802.1p tags, to classify traffic into different queues. Implies WiFi Multimedia QoS extensions are enabled on this radio. This allows different traffic streams between the wireless client and the access point to be prioritized according to the type of traffic (voice, video etc). The WMM classification supports high throughput data rates required for 802.11n device support.</td>
</tr>
<tr>
<td>non-unicast</td>
<td>Optimized for non-unicast traffic. Implies all traffic on this WLAN is designed for broadcast or multiple destinations</td>
</tr>
<tr>
<td>video</td>
<td>Optimized for non-unicast video traffic. Implies all WLAN non-unicast traffic is classified and treated as video packets</td>
</tr>
<tr>
<td>voice</td>
<td>Optimized for non-unicast voice traffic. Implies all WLAN non-unicast traffic is classified and treated as voice packets</td>
</tr>
<tr>
<td>normal</td>
<td>Optimized for non-unicast best effort traffic. Implies all WLAN non-unicast traffic is classified and treated as normal priority packets (best effort)</td>
</tr>
<tr>
<td>classification non-wmm [voice</td>
<td>video</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>low</td>
<td>Optimized for non-unicast background traffic. Implies all WLAN non-unicast traffic is classified and treated as low priority packets (background)</td>
</tr>
<tr>
<td>default</td>
<td>Uses the default classification mode (same as unicast classification if WMM is disabled, normal if unicast classification is WMM)</td>
</tr>
<tr>
<td>non-wmm</td>
<td>Specifies how traffic from non-WMM clients is classified</td>
</tr>
<tr>
<td>voice</td>
<td>Optimized for non-WMM voice traffic. Implies all WLAN non-WMM client traffic is classified and treated as voice packets</td>
</tr>
<tr>
<td>video</td>
<td>Optimized for non-WMM video traffic. Implies all WLAN non-WMM client traffic is classified and treated as video packets</td>
</tr>
<tr>
<td>normal</td>
<td>Optimized for non-WMM best effort traffic. Implies all WLAN non-WMM client traffic is classified and treated as normal priority packets (best effort)</td>
</tr>
<tr>
<td>low</td>
<td>Optimized for non-WMM background traffic. Implies all WLAN non-WMM client traffic is classified and treated as low priority packets (background)</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-wlan-qos-test)#classification wmm
rfs7000-37FABE(config-wlan-qos-test)#classification non-wmm video
rfs7000-37FABE(config-wlan-qos-test)#classification non-unicast normal
rfs7000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
  classification non-wmm video
  classification non-unicast normal
qos trust dscp
qos trust wmm
accelerated-multicast autodetect classification voice
rfs7000-37FABE(config-wlan-qos-test)#
```
21.1.3 multicast-mask

Configures an egress prioritization multicast mask for this WLAN QoS policy.

Normally all multicast and broadcast packets are buffered until the periodic DTIM interval (indicated in the 802.11 beacon frame), when clients in power save mode wake to check for frames. However, for certain applications and traffic types, the administrator may want the frames transmitted immediately, without waiting for the DTIM interval. By configuring a primary or secondary prioritization multicast mask, the network administrator can indicate which packets are transmitted immediately.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
multicast-mask [primary|secondary] <MAC/MASK>

Parameters
- multicast-mask [primary|secondary] <MAC/MASK>

| primary <MAC/MASK> | Configures the primary egress prioritization multicast mask
|-------------------|-------------------------------------------------------------------------------------------------|
| <MAC/MASK>        | Sets the MAC address and the mask in the AA-BB-CC-DD-EE-FF/XX-XX-XX-XX-XX-XX-XX format
| **Note:** Setting masks is optional and only needed if there are traffic types requiring special handling. |

| secondary <MAC/MASK> | Configures the primary egress prioritization multicast mask
|----------------------|-------------------------------------------------------------------------------------------------|
| <MAC/MASK>           | Sets the MAC address and the mask in the AA-BB-CC-DD-EE-FF/XX-XX-XX-XX-XX-XX-XX format

Examples
rfs7000-37FABE(config-wlan-qos-test)#multicast-mask primary 11-22-33-44-55-66/22-33-44-55-66-77
rfs7000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
  classification non-wmm video
  multicast-mask primary 11-22-33-44-55-66/22-33-44-55-66-77
  classification non-unicast normal
  qos trust dscp
  qos trust wmm
  accelerated-multicast autodetect classification voice
rfs7000-37FABE(config-wlan-qos-test)#
21.1.4 no

`no wlan-qos-policy`

Negates a command or resets settings to their default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9600

**Syntax**

```
no [accelerated-multicast <IP>|autodetect]|classification {non-unicast|non-wmm}|
multicast-mask [primary|secondary]|qos trust [dscp|wmm]|svp-prioritization|
voice-prioritization]
```

```
no rate-limit [client|wlan] [from-air|to-air] {max-burst-size|rate|red-threshold}
no rate-limit [client|wlan] [from-air|to-air] {max-burst-size|rate|red-threshold [background|best-effort|video|voice]}
```

```
no wmm [background|best-effort|power-save|qbss-load-element|video|voice]
no wmm [power-save|qbss-load-element]
no wmm [backgorund|best-effort|video|voice] [aifsn|cw-max|cw-min|txop-limit]
```

**Parameters**

- no <PARAMETERS>

  Negates a command or resets settings to their default.

**Examples**

The following example shows the WLAN QoS Policy ‘test’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
classification non-wmm video
multicast-mask primary 11-22-33-44-55-66/22-33-44-55-66-77
classification non-unicast normal
qos trust dscp
qos trust wmm
accelerated-multicast autodetect classification voice
```

```
rfs7000-37FABE(config-wlan-qos-test)#no classification non-wmm
rfs7000-37FABE(config-wlan-qos-test)#no multicast-mask primary
rfs7000-37FABE(config-wlan-qos-test)#no qos trust dscp
```

The following example shows the WLAN QoS Policy ‘test’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-wlan-qos-test)#show context
wlan-qos-policy test
classification non-unicast normal
no qos trust dscp
qos trust wmm
accelerated-multicast autodetect classification voice
```

```
rfs7000-37FABE(config-wlan-qos-test)#
```
21.1.5 qos

- wlan-qos-policy

Enables QoS on this WLAN

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
qos trust [dscp|wmm]
```

Parameters

- qos trust [dscp|wmm]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trust [dscp</td>
<td>wmm]</td>
</tr>
<tr>
<td>dscp</td>
<td>Trusts the IP DSCP values of ingressing packets</td>
</tr>
<tr>
<td>wmm</td>
<td>Trusts the 802.11 WMM QoS values of ingressing packets</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-wlan-qos-test)#qos trust wmm

## 21.1.6 rate-limit

WLAN traffic rate limits using the WLAN QoS policy

Excessive traffic causes performance issues or brings down the network entirely. Excessive traffic can be caused by numerous sources including network loops, faulty devices or malicious software such as a worm or virus that has infected one or more devices at the branch. Rate limiting limits the maximum rate sent to or received from the wireless network (and WLAN) per wireless client. It prevents any single user from overwhelming the wireless network. It can also provide differential service for service providers. The uplink and downlink rate limits are usually configured on a RADIUS server using vendor specific attributes. Rate limits are extracted from the RADIUS server’s response. When such attributes are not present, settings defined on the controller (access point, wireless controller, or service platform) are applied. An administrator can set separate QoS rate limits for upstream (data transmitted from the managed network) and downstream (data transmitted to the managed network traffic).

Before defining rate limit thresholds for WLAN upstream and downstream traffic, it is recommended that you define the normal number of ARP, broadcast, multicast and unknown unicast packets that typically transmit and receive from each supported WMM access category. If thresholds are defined too low, normal network traffic (required by end-user devices) are dropped resulting in intermittent outages and performance problems.

Connected wireless clients can also have QoS rate limit settings defined in both the upstream and downstream direction.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

| rate-limit [client|wlan] [from-air|to-air] {max-burst-size|rate|red-threshold} |
|--------------------------------------------------|
| rate-limit [client|wlan] [from-air|to-air] {max-burst-size <2-1024>|rate <50-1000000>} |
| rate-limit [client|wlan] [from-air|to-air] {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]} |

### Parameters

- **rate-limit [client|wlan] [from-air|to-air] {max-burst-size <2-1024>|rate <50-1000000>}**
- **rate-limit [client|wlan] [from-air|to-air] {red-threshold [background <0-100>|best-effort <0-100>|video <0-100>|voice <0-100>]}**

</tr>
</tbody>
</table>

**max-burst-size <2-1024>**
Optional. Sets the maximum burst size from 2 - 1024 kbytes. The chances of the upstream or downstream packet transmission getting congested for the WLAN’s client destination are reduced for smaller burst sizes. The default is 320 kbytes.

**Note:** Smaller the burst, lesser are the chances of upstream packet transmission resulting in congestion for the WLAN’s client destinations. By trending the typical number of ARP, broadcast, multicast and unknown unicast packets over a period of time, the average rate for each access category can be obtained. Once a baseline is obtained, administrators should then add a 10% margin (minimally) to allow for traffic bursts at the site.

**rate <50-1000000>**
Optional. Sets the traffic rate from 50 - 1000000 Kbps. This limit is the threshold value for the maximum number of packets received or transmitted over the WLAN from all access categories. Any traffic that exceeds the specified rate is dropped and a log message is generated. The default is 5000 Kbps.
Usage Guidelines

The following information should be taken into account when configuring rate limits:

- Background traffic consumes the least bandwidth, so this value can be set to a lower value once a general downstream rate is known by the network administrator (using a time trend analysis).
- Best effort traffic consumes little bandwidth, so this value can be set to a lower value once a general upstream rate is known by the network administrator (using a time trend analysis).
- Video traffic consumes significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis).
- Voice applications consume significant bandwidth, so this value can be set to a higher value once a general upstream rate is known by the network administrator (using a time trend analysis).

Examples

```bash
rfs7000-37FABE(config-wlan-qos-test)#rate-limit wlan from-air max-burst-size 6
rfs7000-37FABE(config-wlan-qos-test)#rate-limit wlan from-air rate 55

rfs7000-37FABE(config-wlan-qos-test)#
```
### 21.1.7 svp-prioritization

Enables WLAN SVP support on this WLAN QoS policy. SVP support enables the identification and prioritization of traffic from Spectralink/Ploycomm phones. This gives priority to voice, with voice management packets supported only on certain legacy VOIP phones. If the wireless client classification is WMM, non-WMM devices recognized as voice devices have all their traffic transmitted at voice priority. Devices are classified as voice, when they emit SIP, SCCP, or H323 traffic. Thus, selecting this option has no effect on devices supporting WMM.

This feature is enabled by default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

svp-prioritization

**Parameters**

rfs7000-37FABE(config-wlan-qos-test)#
21.1.9 `wmm`

Confirms 802.11e/Wireless Multimedia (WMM) parameters for this WLAN QoS policy.

WMM makes it possible for both home networks and Enterprises to decide which data streams are most important and assign them a higher traffic priority.

WMM's prioritization capabilities are based on the four access categories (background, best-effort, video, and voice). Higher the Access Category (AC) higher is the transmission probability over the controller managed WLAN. ACs correspond to the 802.1d priorities, facilitating interoperability with QoS policy management mechanisms. WMM enabled controllers coexist with legacy devices (not WMM-enabled).

Packets not assigned to a specific access category are categorized as best effort by default. Applications assign each data packet to a given access category. Categorized packets are added to one of four independent transmit queues (one per access category). The client has an internal collision resolution mechanism to address collision among different queues, which selects the frames with the highest priority to transmit.

The same mechanism deals with external collision, to determine which client should be granted the *Opportunity to Transmit* (TXOP). The collision resolution algorithm responsible for traffic prioritization is probabilistic and depends on two timing parameters that vary for each access category. These parameters are:

- The minimum interframe space, or Arbitrary Inter-Frame Space Number (AIFSN)
- The contention window, sometimes referred to as the random back off wait

Both values are smaller for high-priority traffic. The value of the contention window varies through time. Initially the contention window is set to a value that depends on the AC. As frames with the highest AC tend to have the lowest back off values, they are more likely to get a TXOP.

After each collision the contention window is doubled until a maximum value (also dependent on the AC) is reached. After successful transmission, the contention window is reset to its initial, AC dependant value. The AC with the lowest back off value gets the TXOP.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500,NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
wmm [background|best-effort|power-save|qbss-load-element|video|voice]
wmm [power-save|qbss-load-element]
wmm [background|best-effort|video|voice] [aifsn <2-15>|cw-max <0-15>|cw-min <0-15>|txop-limit <0-65535>]
```

**Parameters**

- `wmm [power-save|qbss-load-element]`

<p>| <code>wmm</code> | Configures 802.11e/wireless multimedia parameters |</p>

| cw-min <0-15> | Configures the minimum contention window. Wireless clients pick a number between 0 and the min contention window to wait before retransmission. Wireless clients then double their wait time on a collision, until it reaches the maximum contention window. This parameter is common to background, best effort, video and voice.
|              | The default for traffic voice categories is 2
|              | The default for traffic video categories is 3
|              | The default for traffic best effort (normal) categories is 4
|              | The default for traffic background (low) categories is 4
|              | - <0-15> – ECW: the contention window. The actual value used is (2^ECW - 1). Set a value from 0 - 15. |
| txop-limit <0-65535> | Configures the transmit-opportunity (the interval of time during which a particular client has the right to initiate transmissions). This parameter is common to background, best effort, video and voice.
|              | The default for traffic voice categories is 47
|              | The default for traffic video categories is 94
|              | The default for traffic best effort (normal) categories is 0
|              | The default for traffic background (low) categories is 0
|              | - <0-65535> – Set a value from 0 - 65535 to configure the transmit-opportunity in 32 microsecond units. |
This chapter summarizes *Layer 2 Tunnel Protocol Version 3* (L2TPv3) policy commands in the CLI command structure.

The L2TPv3 policy defines control and encapsulation protocols for tunneling different types of layer 2 frames between two IP nodes. The L2TPv3 control protocol controls dynamic creation, maintenance, and tear down of L2TP sessions. The L2TPv3 encapsulation protocol is used to multiplex and de-multiplex L2 data streams between two L2TP nodes across an IP network.

L2TPv3 is an IETF standard used for transporting different types of layer 2 frames in an IP network (and access point profile). L2TPv3 defines control and encapsulation protocols for tunneling layer 2 frames between two IP nodes. Use L2TPv3 to create tunnels for transporting layer 2 frames. L2TPv3 enables WING supported controllers and access points to create tunnels for transporting Ethernet frames to and from bridge VLANs and physical ports. L2TPv3 tunnels can be defined between WING devices and other vendor devices supporting the L2TPv3 protocol.

Multiple pseudowires can be created within an L2TPv3 tunnel. WING supported devices support an Ethernet VLAN pseudowire type exclusively. A pseudowire is an emulation of a layer 2 point-to-point connection over a packet-switching network (PSN). A pseudowire was developed out of the necessity to encapsulate and tunnel layer 2 protocols across a layer 3 network. Ethernet VLAN pseudowires transport Ethernet frames to and from a specified VLAN. One or more L2TPv3 tunnels can be defined between tunnel end points. Each tunnel can have one or more L2TPv3 sessions. Each tunnel session corresponds to one pseudowire. An L2TPv3 control connection (an L2TPv3 tunnel) needs to be established between the tunneling entities before creating a session.

For optimal pseudowire operation, both the L2TPv3 session originator and responder need to know the pseudowire type and identifier. These two parameters are communicated during L2TPv3 session establishment. An L2TPv3 session created within an L2TPv3 connection also specifies multiplexing parameters for identifying a pseudowire type and ID.
The working status of a pseudowire is reflected by the state of the L2TPv3 session. If a L2TPv3 session is down, the pseudowire associated with it must be shut down. The L2TPv3 control connection keep-alive mechanism can serve as a monitoring mechanism for the pseudowires associated with a control connection.

NOTE: If connecting an Ethernet port to another Ethernet port, the pseudowire type must be *Ethernet port*, if connecting an Ethernet VLAN to another Ethernet VLAN, the pseudowire type must be *Ethernet VLAN*.

This chapter is organized into the following sections:

- `l2tpv3-policy-commands`
- `l2tpv3-tunnel-commands`
- `l2tpv3-manual-session-commands`

NOTE: The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
22.1 \textit{l2tpv3-policy-commands}

Use the (config) instance to configure L2TPv3 policy parameters. To navigate to the L2TPv3 policy instance, use the following commands:

<DEVICE>(config)#l2tpv3 policy <L2TPV3-POLICY-NAME>

rfs7000-37FABE(config)#l2tpv3 policy L2TPV3Policy1
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#?

L2tpv3 Policy Mode commands:

- **cookie-size**: Size of the cookie field present in each l2tpv3 data message.
- **failover-delay**: Time interval for re-establishing the tunnel after the failover (RF-Domain manager/VRRP-master/Cluster-master failover).
- **force-l2-path-recovery**: Enables force learning of servers, gateways etc., behind the l2tpv3 tunnel when the tunnel is established.
- **hello-interval**: Configure the time interval (in seconds) between l2tpv3 Hello keep-alive messages exchanged in l2tpv3 control connection.
- **no**: Negate a command or set its defaults.
- **reconnect-attempts**: Maximum number of attempts to reestablish the tunnel.
- **reconnect-interval**: Time interval between the successive attempts to reestablish the l2tpv3 tunnel.
- **retry-attempts**: Configure the maximum number of retransmissions for signaling message.
- **retry-interval**: Time interval (in seconds) before the initiating a retransmission of any l2tpv3 signaling message.
- **rx-window-size**: Number of signaling messages that can be received without sending the acknowledgment.
- **tx-window-size**: Number of signaling messages that can be sent without receiving the acknowledgment.
- **clrscr**: Clears the display screen.
- **commit**: Commit all changes made in this session.
- **end**: End current mode and change to EXEC mode.
- **exit**: End current mode and down to previous mode.
- **help**: Description of the interactive help system.
- **revert**: Revert changes.
- **service**: Service Commands.
- **show**: Show running system information.
- **write**: Write running configuration to memory or terminal.

The following table summarizes L2TPv3 policy configuration commands:

</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
22.1.1 cookie-size

Configures the size of the cookie field present in each L2TPv3 data packet. L2TPv3 data packets contain a session cookie that identifies the session (pseudowire) corresponding to it. In a tunnel, the cookie is a 4-byte or 8-byte signature shared between the two tunnel endpoints. This signature is configured at both the source and destination routers. If the signature at both ends do not match, the data is dropped. All sessions within a tunnel have the same session cookie size.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```plaintext
cookie-size [0|4|8]
```

Parameters

- `cookie-size [0|4|8]`

| cookie-size [0|4|8] | Configures the cookie-field size for each data packet. Select one of the following options:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No cookie field present in each L2TPv3 data message (this is the default setting)</td>
</tr>
<tr>
<td>4</td>
<td>4 byte cookie field present in each L2TPv3 data message</td>
</tr>
<tr>
<td>8</td>
<td>8 byte cookie field present in each L2TPv3 data message</td>
</tr>
</tbody>
</table>

Examples

```plaintext
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#cookie-size 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  cookie-size 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

Related Commands

```plaintext
no
```

Resets the cookie-field size to its default (0 - no cookie field present in each L2TPv3 data packet)
22.1.2 failover-delay

Configures the L2TPv3 tunnel failover delay in seconds. This is the interval after which a failed over tunnel is re-established.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
fail-over <5-60>
```

Parameters

- `fail-over <5-60>`

Sets the delay interval to re-establish a failed L2TPv3 tunnel (RF-Domain manager/VRRP-master/Cluster-master failover)

- `<5-60>` — Specify a failover delay from 5 - 60 seconds. The default is 5 seconds.

Examples

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#failover-delay 30
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  failover-delay 30
  retry-attempts 10
  retry-interval 30
  cookie-size 8
  rx-window-size 9
  tx-window-size 9
  reconnect-interval 100
  reconnect-attempts 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

Related Commands

```
no
```

Resets the failover interval to its default (5 seconds)
22.1.3 force-l2-path-recovery

Enables the forced detection of servers and gateways behind the L2TPv3 tunnel. This feature is disabled by default.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

force-l2-path-recovery

Parameters

None

Examples

rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#force-l2-path-recovery
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  failover-delay 30
  retry-attempts 10
  retry-interval 30
  cookie-size 8
  rx-window-size 9
  tx-window-size 9
  reconnect-interval 100
  reconnect-attempts 8
  force-l2-path-recovery
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

Related Commands

no

Disables the forced detection of servers and gateways behind the L2TPv3 tunnel
22.1.4 **hello-interval**

`l2tpv3-policy-commands`

Configures the interval, in seconds, between L2TPv3 “Hello” keep-alive messages exchanged in a L2TPv3 control connection.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
hello-interval <1-3600>
```

**Parameters**

- `hello-interval <1-3600>`

**Examples**

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#hello-interval 200
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  cookie-size 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

**Related Commands**

- `no`
  Resets the “Hello” keep-alive message interval to its default of 60 seconds
22.1.5 no

**l2tpv3-policy-commands**

Negates or reverts L2TPv3 policy settings to default

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no [cookie-size|failover-delay|force-l2-path-recovery|hello-interval|
reconnect-attempts|reconnect-interval|retry-attempts|retry-interval|rx-window-size|
tx-window-size]
```

**Parameters**

- `no <PARAMETERS>`

**Examples**

The following example shows the l2tpv3 policy ‘L2TPV3Policy1’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  reconnect-attempts 10
  reconnect-interval 30
  cookie-size 8
  reconnect-attempts 50
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no hello-interval
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no reconnect-attempts
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no reconnect-interval
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no retry-attempts
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no retry-interval
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#no cookie-size
```

The following example shows the l2tpv3 policy ‘L2TPV3Policy1’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#
```
22.1.6 reconnect-attempts

Configures the maximum number of attempts made to re-establish a tunnel connection

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
reconnect-attempts <0-8>

Parameters
- reconnect-attempts <0-8>

<table>
<thead>
<tr>
<th>reconnect-attempts &lt;0-8&gt;</th>
<th>Configures the maximum number of attempts made to re-establish a tunnel connection from 0 - 8 (default is 0: configures infinite reconnect attempts)</th>
</tr>
</thead>
</table>

Examples
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#reconnect-attempts 8

rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
cookie-size 8
reconnect-attempts 8

rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

Related Commands

| no | Resets the maximum number of reconnect attempts to default (0: configures infinite reconnect attempts) |
22.1.7 reconnect-interval

Configures the interval, in seconds, between two successive attempts to re-establish a failed tunnel connection

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
reconnect-interval <1-3600>

Parameters
- reconnect-interval <1-3600>

<table>
<thead>
<tr>
<th>reconnect-interval &lt;1-3600&gt;</th>
<th>Configures the interval between successive attempts to re-establish a failed tunnel connection. Specify a value from 1 - 3600 seconds (default is 120 seconds).</th>
</tr>
</thead>
</table>

Examples
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#reconnect-interval 100

l2tpv3 policy L2TPV3Policy1
  hello-interval 200
  cookie-size 8
  reconnect-interval 100
  reconnect-attempts 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

Related Commands
no

Resets the interval between successive attempts to re-establish a failed tunnel connection to default (120 seconds)
22.1.8 retry-attempts

Configures the maximum number of attempts made to retransmit signalling messages. Use this command to specify how many retransmission cycles occur before determining the target tunnel peer is not reachable.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
retry-attempts <1-10>

Parameters
- retry-attempts <1-10>

<table>
<thead>
<tr>
<th>retry-attempts</th>
<th>Configures the maximum number of attempts made to retransmit signalling messages from 1 - 10 (default is 5 attempts)</th>
</tr>
</thead>
</table>

Examples
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#retry-attempts 10
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
retry-attempts 10
cookie-size 8
reconnect-interval 100
reconnect-attempts 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

Related Commands

no
Resets the maximum number of retransmissions of signalling messages to default (5 attempts)
22.1.9 retry-interval

- l2tpv3-policy-commands

Configures the interval, in seconds, between two successive attempts at retransmitting a L2TPv3 signalling message.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
retry-interval <1-250>

Parameters
- retry-interval <1-250>

| retry-interval <1-250> | Configures the interval, in seconds, between two successive retransmission attempts. Specify a value from 1 - 250 seconds (default is 5 seconds). |

Examples
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#retry-interval 30
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1
hello-interval 200
retry-attempts 10
retry-interval 30
cookie-size 8
reconnect-interval 100
reconnect-attempts 8
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#

Related Commands
- **no** Resets the retry interval to default (5 seconds)
22.1.10 rx-window-size

Configures the number of signalling packets received without sending an acknowledgment

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
rx-window-size <1-15>

Parameters
- rx-window-size <1-15>

<table>
<thead>
<tr>
<th>rx-window-size &lt;1-15&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures the number of packets received without sending an acknowledgment. Specify a value from 1 - 15 (default is 10 packets).</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#rx-window-size 9
rfs7000-37FABE(config-l2tpv3-policy-L2TPV3Policy1)#show context
l2tpv3 policy L2TPV3Policy1

Resets the number of packets transmitted without receiving an acknowledgment to default (10 packets)
22.2 l2tpv3-tunnel-commands

L2TPV3-POLICY

Use the (profile or device context) instance to configure a L2TPv3 tunnel. To navigate to the tunnel configuration mode, use the following command in the profile context:

<DEVICE> (config-profile-default-rfs7000)#l2tpv3 tunnel <TUNNEL-NAME>

rfs7000-37FABE(config-profile-default-rfs7000)#l2tpv3 tunnel Tunnel1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#?

L2tpv3 Tunnel Mode commands:

- establishment-criteria: Set tunnel establishment criteria
- hostname: Tunnel specific local hostname
- local-ip-address: Configure the IP address for tunnel. If not specified, tunnel source ip address would be chosen automatically based on the tunnel peer ip address
- mtu: Configure the mtu size for the tunnel
- no: Negate a command or set its defaults
- peer: Configure the l2tpv3 tunnel peers. At least one peer must be specified
- router-id: Tunnel specific local router ID
- session: Create / modify the specified l2tpv3 session
- use: Set setting to use

The following table summarizes L2TPv3 tunnel configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>establishment-criteria</td>
<td>Configures L2TPv3 tunnel establishment criteria</td>
<td>page 22-17</td>

</tr>
<tr>
<td>use</td>
<td>Configures a tunnel to use a specified L2TPv3 tunnel policy</td>
<td>page 22-28</td>
</tr>
</tbody>
</table>
22.2.1 establishment-criteria

Configure L2TPv3 tunnel establishment criteria

A L2TPv3 tunnel is established from the current device to the NOC controller when the current device becomes the VRRP master, cluster master, or RF Domain manager. Similarly, the L2TPv3 tunnel is closed when the current device switches to standby or backup mode.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]

Parameters
- establishment-criteria [always|cluster-master|rf-domain-manager|vrrp-master <1-255>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>always</td>
<td>Always establishes a L2TPv3 tunnel from the current device to the NOC controller. This is the default setting. <strong>Note:</strong> The ‘always’ option indicates the device need not be a cluster-master, rf-domain-manager, or vrrp-master to establish a tunnel.</td>
</tr>
<tr>
<td>cluster-master</td>
<td>Establishes a L2TPv3 tunnel from the current device to the NOC controller, only when the current device becomes the cluster master. <strong>Note:</strong> The L2TPv3 tunnel is closed when the current device switches back the standby or backup mode.</td>
</tr>
<tr>
<td>rf-domain-manager</td>
<td>Establishes a L2TPv3 tunnel from the current device to the NOC controller, only when the current device becomes the RF Domain manager. <strong>Note:</strong> The L2TPv3 tunnel is closed when the current device switches back the standby or backup mode.</td>
</tr>
<tr>
<td>vrrp-master &lt;1-255&gt;</td>
<td>Establishes a L2TPv3 tunnel from the current device to the NOC controller, only when the current device becomes the VRRP master. <strong>Note:</strong> The L2TPv3 tunnel is closed when the current device switches back the standby or backup mode.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#establishment-criteria cluster-master
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1
   establishment-criteria cluster-master
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#

Related Commands
- **no** — Resets to default (always)
22.2.2 `hostname`

Configures the tunnel's local hostname

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
hostname <WORD>
```

**Parameters**

- `hostname <WORD>`

  - `<WORD>` — Specify the tunnel's local hostname.

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#hostname TunnelHost1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1 hostname TunnelHost1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

**Related Commands**

- `no` — Removes the tunnel's local hostname
22.2.3 local-ip-address

Configures the tunnel’s source IP address. If no IP address is specified, the tunnel’s source IP address is automatically configured based on the tunnel’s peer IP address.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**
```
local-ip-address <IP>
```

**Parameters**
- `local-ip-address <IP>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>local-ip-address &lt;IP&gt;</code></td>
<td>Configures the L2TPv3 tunnel’s source IP address</td>
</tr>
<tr>
<td></td>
<td>• <code>&lt;IP&gt;</code> – Specify the tunnel’s IP address. Ensure the IP address is available (or will become available - virtual IP) on an interface. Modifying a tunnel’s local IP address re-establishes the tunnel.</td>
</tr>
</tbody>
</table>

**Examples**
```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#local-ip-address 172.16.10.2
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1
local-ip-address 172.16.10.2
hostname TunnelHost1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

**Related Commands**
- `no`
  - Resets the tunnel’s local IP address and re-establishes the tunnel
22.2.4 mtu

l2tpv3-tunnel-commands

Configures the MTU size for this tunnel. This value determines the packet size transmitted over this tunnel.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

mtu <128-1460>

Parameters

- mtu <128-1460>

| mtu <128-1460> | Configures the MTU size for this tunnel. Specify a value from 128 - 1460 bytes (default is 1460 bytes). |

Examples

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#mtu 1280
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  local-ip-address 172.16.10.2
  mtu 1280
  hostname TunnelHost1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#

Related Commands

- no
  - Resets the MTU size for this tunnel to default (1460 bytes)
22.2.5 no

l2tpv3-tunnel-commands

Negates or reverts a L2TPv3 tunnel settings to default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9600

Syntax

no [establishment-criteria|hostname|local-ip-address|mtu|peer|router-id|session|use]

Parameters

- no <PARAMETERS>

Examples

The tunnel settings before the ‘no’ command is executed:

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1 local-ip-address 172.16.10.2 mtu 1280 hostname TunnelHost1 establishment-criteria cluster-master
```

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#

The tunnel settings after the ‘no’ command is executed:

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#no local-ip-address
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#no mtu
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#no hostname
```

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1 establishment-criteria cluster-master

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
22.2.6 peer

Configures the L2TPv3 tunnel's peers. At least one peer must be specified.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

peer <1-2> {hostname|ip-address|ipsec-secure|router-id|udp}

peer <1-2> {hostname <HOSTNAME>|any} {ipsec-secure|router-id|udp}
peer <1-2> {ip-address <IP>} {hostname|ipsec-secure|router-id|udp}
peer <1-2> {ipsec-secure} {gw <IP>|<WORD>}
peer <1-2> {router-id <IP>|<WORD>|any} {ipsec-secure|udp}
peer <1-2> {udp} {ipsec-secure|port <1-65535>}

Parameters

- peer <1-2> {hostname <HOSTNAME>|any} {ipsec-secure|router-id|udp}

| peer <1-2> | Configures the tunnel's peer ID from 1 - 2 |
| hostname | Optional. Configures the peers’ hostname. The hostname options are: |
| gw | Optional. Enables auto IPSec |
| port | Optional. Configures the peer’s UDP port running the L2TPv3 service from 1 - 65535. After specifying the peer UDP port, optionally configure the IPSec settings. |
| router-id | After specifying the peer hostname, optionally specify router ID settings: |
| udp | After specifying the peer hostname, optionally specify UDP settings: |
peer <1-2> {ip-address <IP>} {hostname|ipsec-secure|router-id|udp}

- ip-address <IP>
  Optional. Configures the peer's IP address in the A.B.C.D format

- hostname [<FQDN>|any]
  After specifying the peer IP address, optionally specify the peer's hostname:
  Optional. Configures the peers' hostname. The hostname options are:
  - <FQDN> – Specifies the hostname as FQDN or partial DN
  - any – Peer name is not specified. If the hostname is 'any' this tunnel is considered as
    responder only and will allow incoming connection from any host.

- ipsec-secure {gw [<IP>|<WORD>]}
  After specifying the peer IP address, optionally specify the IPSec settings:
  - ipsec-secure – Optional. Enables auto IPSec
    - gw – Optional. Configures IPSec gateway IP address or hostname
    - <IP> – Configures IPSec gateway's IP address
    - <WORD> – Configures IPSec gateway's hostname

- router-id [<A.B.C.D>|<WORD>|any]
  After specifying the peer IP address, optionally specify the router ID using one of the following
  options:
  - router-id – Optional. Configures the peer's router-id in one of the following formats:
    - <A.B.C.D> – Peer router ID in the IP address (A.B.C.D) format
    - <WORD> – Peer router ID range (for example, 100-120)
    - any – Peer router ID is not specified. This allows incoming connection from any router ID.

- udp {ipsec-secure gw|port <1-65535>|ipsec-secure}
  After specifying the peer IP address, optionally specify the peer's UDP port settings:
  The UDP option configures the encapsulation mode for this tunnel.
  - UDP – Optional. Configures UDP encapsulation (default encapsulation is IP)
  - ipsec-secure gw – Optional. Enables auto IPSec
  - port <1-65535> – Optional. Configures the peer's UDP port running the L2TPv3 service
    from 1 - 65535. After specifying the peer UDP port, optionally configure the IPSec settings.

peer <1-2> {ipsec-secure} {gw [<IP>|<WORD>]}

- peer <1-2> Configures the tunnel's peer ID from 1 - 2. At any time the tunnel is established with only one
  peer.

- ipsec-secure {gw [<IP>|<WORD>]}
  Optional. Enables auto IPSec for this peer
  - gw – Optional. Configures IPSec gateway IP address or hostname
    - <IP> – Configures IPSec gateway's IP address
    - <WORD> – Configures IPSec gateway's hostname

peer <1-2> {router-id [<IP>|<WORD>|any]} {ipsec-secure|udp}

- router-id [<A.B.C.D>|<WORD>|any]
  Optional. Configures the peer's router-id in one of the following formats:
  - <A.B.C.D> – Peer router ID in the IP address (A.B.C.D) format
  - <WORD> – Peer router ID range (for example, 100-120)
  - any – Peer router ID is not specified. This allows incoming connection from any router ID.
### peer <1-2> [udp] {ipsec-secure|port <1-65535>}

Configures the tunnel peer ID from 1 - 2. At any time the tunnel is established with only one peer.

- **udp**
  - `{ipsec-secure gw|
    port <1-65535>|
    ipsec-secure}`

  After specifying the peer's router ID, optionally specify the IPSec settings.
  - The UDP option configures the encapsulation mode for this tunnel.
    - **UDP** – Optional. Configures UDP encapsulation (default encapsulation is IP)
    - **ipsec-secure gw** – Optional. Enables auto IPSec
    - **port <1-65535>** – Optional. Configures the peer's UDP port running the L2TPv3 service from 1 - 65535. After specifying the peer UDP port, optionally configure the IPSec settings.

- **hostname tunnel1peer1 udp port 100**

- **show context l2tpv3 tunnel Tunnel1**

- **peer 2 hostname tunnel1peer1 udp port 100**

  establishment-criteria cluster-master

- **rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#**

### Related Commands

- **no**
  - Removes the peer configured for this tunnel

**Examples**

- `rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#peer 2
  hostname tunnel1peer1 udp port 100

- `rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
  l2tpv3 tunnel Tunnel1

- `peer 2 hostname tunnel1peer1 udp port 100
  establishment-criteria cluster-master

- `rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#`
22.2.7 router-id

l2tpv3-tunnel-commands

Configures the tunnel’s local router ID

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

router-id [<1-4294967295>|<IP>]

Parameters

- router-id [<1-4294967295>|<IP>]

| router-id [<1-4294967295>|<IP>] | Configures the tunnel’s local router ID in one of the following formats:
|----------------------------------|------------------------------------------------------
| <1-4294967295> – Router ID in the number format (from1- 4294967295) | <IP> – Router ID in IP address format (A.B.C.D)

Examples

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#router-id 2000

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1
peer 2 hostname tunnel1peer1 udp port 100
router-id 2000
establishment-criteria cluster-master
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#

Related Commands

no

Removes the tunnel’s router ID
**22.2.8 session**

*2tpv3-tunnel-commands*

Configures a session’s pseudowire ID, which describes the session’s purpose. The session established message sends this pseudowire ID to the L2TPv3 peer.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
session <L2TPV3-SESSION-NAME> [pseudowire-id|rate-limit]

session <L2TPV3-SESSION-NAME> pseudowire-id <1-4294967295> traffic-source
  vlan <VLAN-ID-RANGE> {native-vlan <1-4094>}

session <L2TPV3-SESSION-NAME> rate-limit [egress|ingress] rate <50-1000000>
  max-burst-size <2-1024>
```

**Parameters**

- `session <L2TPV3-SESSION-NAME> pseudowire-id <1-4294967295> traffic-source`
- `vlan <VLAN-ID-RANGE> {native-vlan <1-4094>}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session &lt;L2TPV3-SESSION-NAME&gt;</td>
<td>Configures this session’s name</td>
</tr>
<tr>
<td>- <code>&lt;L2TPV3-SESSION-NAME&gt;</code> – Specify the L2TPV3 session name (should not exceed 31 characters in length). A tunnel is usable only if it has one or more session(s) (having specific session names) configured. The L2TPv3 tunnel has no idle timeout, it closes when the last tunnel session is closed.</td>
<td></td>
</tr>
<tr>
<td>pseudowire-id &lt;1-4294967295&gt;</td>
<td>Configures the pseudowire ID for this session from 1-4204067295</td>
</tr>
<tr>
<td>- A pseudowire is an emulation of a layer 2 point-to-point connection over a <em>packet-switching network</em> (PSN). A pseudowire is needed to encapsulate and tunnel layer 2 protocols across a layer 3 network.</td>
<td></td>
</tr>
<tr>
<td>traffic-source vlan &lt;VLAN-ID-RANGE&gt;</td>
<td>Configures VLAN as the traffic source for this tunnel</td>
</tr>
<tr>
<td>- <code>&lt;VLAN-ID-RANGE&gt;</code> – Configures VLAN range list of traffic source. Specify the VLAN IDs as a range (for example, 10-20, 25, 30-35).</td>
<td></td>
</tr>
<tr>
<td>native-vlan &lt;1-4094&gt;</td>
<td>Optional – Configures the native VLAN ID for this session, which is not tagged</td>
</tr>
<tr>
<td>- <code>&lt;1-4094&gt;</code> – Specify the native VLAN ID from 1-4094.</td>
<td></td>
</tr>
</tbody>
</table>

**session <L2TPV3-SESSION-NAME> rate-limit [egress|ingress] rate <50-1000000> max-burst-size <2-1024>**

- `session <L2TPV3-SESSION-NAME>` – Specify the L2TPV3 session name (should not exceed 31 characters in length). A tunnel is usable only if it has one or more session(s) (having specific session names) configured. The L2TPv3 tunnel has no idle timeout, it closes when the last tunnel session is closed.
## Usage Guidelines
The working status of a pseudowire is reflected by the state of the L2TPv3 session. If the corresponding session is L2TPv3 down, the pseudowire associated with it must be shut down.

### Examples
```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#session tunnel1peer1session1 pseudowire-id 5000 traffic-source vlan 10-20 native-vlan 1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context l2tpv3 tunnel Tunnel1
  peer 2 hostname tunnel1peer1 udp port 100
  establishment-criteria cluster-master
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#
```

### Related Commands
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| rate-limit [egress|ingress] | Configures a rate for incoming and/or outgoing traffic on this L2TPv3 tunnel. When configured, this option limits the rate at which data is sent to or received from L2TPv3 tunnel members.  
  - egress – Applies the specified rate to outbound traffic, from the L2TPv3 tunnel (going out from access points, wireless controllers, and service platforms) to the network  
  - ingress – Applies the specified rate to inbound traffic, from the network to the L2TPv3 tunnel (coming in to access points, wireless controllers, and service platforms) |
| rate <50-1000000>  | Specify the data rate, in kilobits per second, for the incoming and/or outgoing traffic  
  - <50-1000000> – Specify a value from 50 - 1000000 kbps. The default is 5000 kbps. |
| max-burst-size <2-1024> | Configures the maximum burst size, in kilobytes, for incoming/outgoing traffic rate limiting (depending on the direction selected) on a L2TPv3 tunnel.  
  - <2-1024> – Specify the maximum burst size from 2 - 1024 kbytes. Smaller the burst size, lesser are the chances of the upstream packet transmission resulting in congestion of the L2TPv3 tunnel traffic. The default setting is 320 kbytes. |
| no                  | Removes a session |
22.2.9 use

L2tpv3-tunnel-commands

Configures a tunnel to use a specified L2TPv3 tunnel policy and specified critical resources

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

use [critical-resource|l2tpv3-policy]
use critical-resource <CRM-NAME1> {<CRM-NAME2>} {<CRM-NAME3>} {<CRM-NAME4>}
use l2tpv3-policy <L2TPV3-POLICY-NAME>

Parameters

- use critical-resource <CRM-NAME1> {<CRM-NAME2>} {<CRM-NAME3>} {<CRM-NAME4>}
  - Specifies the critical resource(s) to use with this tunnel
  - <CRM1-NAME> – Specify the first critical resource name
  - Maximum of four critical resources can be monitored.

  Note: In case of tunnel initiator, L2TPv3 tunnel is established only if the critical resources identified by the <CRM-NAME1>.................. <CRM-NAME4> arguments are available at the time of tunnel establishment.

  Note: In case of L2TPv3 tunnel termination, all incoming tunnel establishment requests are rejected if the critical resources specified by the <CRM-NAME1>.............. <CRM-NAME4> arguments are not available.

- use l2tpv3-policy <L2TPV3-POLICY-NAME>
  - Associates a specified L2TPv3 policy with this tunnel
  - <L2TPV3-POLICY-NAME> – Specify the policy name.

Examples

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#use l2tpv3-policy L2TPV3Policy1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#show context
l2tpv3 tunnel Tunnel1
  peer 2 hostname tunnel1peer1 udp port 100
  use l2tpv3-policy L2TPV3Policy1
  session tunnel1peer1session1 pseudowire-id 5000 traffic-source vlan 10-20 native-vlan 1
  router-id 2000
  establishment-criteria cluster-master
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-tunnel-Tunnel1)#

Related Commands

no

- Removes the L2TPv3 policy configured with a tunnel and reverts to the default tunnel policy
22.3 l2tpv3-manual-session-commands

After a successful tunnel connection and establishment, individual sessions can be created. Each session is a single data stream. After successful session establishment, data corresponding to that session (pseudowire) can be transferred. If a session is down, the pseudowire associated with it is shut down as well.

Use the (profile-context) instance to manually configure a L2TPv3 session. To navigate to the L2TPv3 manual session configuration mode, use the following command in the profile context:

```
<DEVICE>(config-profile-default-rfs7000)#l2tpv3 manual-session <SESSION-NAME>
```

```
rfs7000-37FABE(config-profile-default-rfs7000)#l2tpv3 manual-session test
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

Use the (profile-context) instance to manually configure a L2TPv3 session. To navigate to the L2TPv3 manual session configuration mode, use the following command in the profile context:

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#?
```

L2tpv3 Manual Session Mode commands:

- **local-cookie**: The local cookie for the session
- **local-ip-address**: Configure the IP address for tunnel. If not specified, tunnel source ip address would be chosen automatically based on the tunnel peer ip address
- **local-session-id**: Local session id for the session
- **mtu**: Configure the mtu size for the tunnel
- **no**: Negate a command or set its defaults
- **peer**: Configure L2TPv3 manual session peer
- **remote-cookie**: The remote cookie for the session
- **remote-session-id**: Remote session id for the session
- **traffic-source**: Traffic that is tunneled
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

22.3.1 local-cookie

Configures the local cookie field size for the manual session

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

local-cookie size [4|8] <1-4294967295> {<1-4294967295>}

Parameters

- local-cookie size [4|8] <1-4294967295> {<1-4294967295>}

| local-cookie size [4|8] | Configures the local cookie field size for this manual session. The options are: |
|------------------------|---------------------------------------------------------------------------------|
|                        | 4 – 4 byte local cookie field                                                  |
|                        | 8 – 8 byte local cookie field                                                  |

| <1-4294967295>         | Configures the local cookie value first word. Applies to both the 4 byte and 8 byte local cookies |

| <1-4294967295>         | Optional – Configures the local cookie value second word. Applicable to only 8 byte cookies. This parameter is ignored for 4 byte cookies. |

Examples

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#local-cookie size 8 200 300

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test

local-cookie size 8 200 300

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#

Related Commands

no

Removes the local cookie size configured for a manual session
22.3.2 **local-ip-address**

Configures the manual session’s source IP address. If no IP address is specified, the tunnel’s source IP address is automatically configured based on the tunnel peer IP address. This parameter is applicable when establishing the session and responding to incoming requests.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`local-ip-address <IP>`

**Parameters**

- `local-ip-address <IP>`

**Examples**

```bash
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#local-ip-address 1.2.3.4

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context
l2tpv3 manual-session test
local-cookie size 8 200 300
local-ip-address 1.2.3.4
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

**Related Commands**

`no` | Resets the manual session’s local source IP address. This re-establishes the session.
22.3.3 local-session-id

Configures the manual session's local session ID

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522,
  AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000,
  NX9500, NX9510, NX9600

Syntax

local-session-id <1-63>

Parameters

- local-session-id <1-63>

| local-session-id <1-63> | Configures this manual session's local session ID from 1 - 63. This is the pseudowire ID for the session. This pseudowire ID is sent in a session establishment message to the L2TP peer. |

Examples

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#local-session-id 1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
  local-cookie size 8 200 300
  local-ip-address 1.2.3.4
  local-session-id 1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#

Related Commands

- no Removes the manual session's local session ID
22.3.4 mtu

> l2tpv3-manual-session-commands

Configures the MTU size for the manual session tunnel. The MTU is the size (in bytes) of the largest protocol data unit the layer can pass between tunnel peers in this session. A larger MTU means processing fewer packets for the same amount of data.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
mtu <128-1460>
```

Parameters

- `mtu <128-1460>`

<table>
<thead>
<tr>
<th>mtu &lt;128-1460&gt;</th>
<th>Configures the MTU size for this manual session tunnel. Specify a value from 128 - 1460 bytes (default is 1460 bytes).</th>
</tr>
</thead>
</table>

Examples

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#mtu 200
```

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
local-cookie size 8 200 300
local-ip-address 1.2.3.4
mtu 200
local-session-id 1
```

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

Related Commands

```
no
```

Resets the MTU size for this manual session to default (1460 bytes)
22.3.5 no

**l2tpv3-manual-session-commands**

Negates or reverts L2TPv3 manual session settings to default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
no [local-cookie|local-ip-address|local-session-id|mtu|peer|remote-cookie|
    remote-session-id|traffic-source]
```

**Parameters**

- no <PARAMETERS>

**Examples**

The following example shows the manual session 'test' settings before the 'no' commands are executed:

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
local-ip-address 1.2.3.4
peer ip-address 5.6.7.8 udp port 150
traffic-source vlan 50-60 native-vlan 2
local-session-id 1
remote-session-id 200
remote-cookie size 8 400 700
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

The following example shows the manual session 'test' settings after the 'no' commands are executed:

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
peer ip-address 5.6.7.8 udp port 150
traffic-source vlan 50-60 native-vlan 2
remote-cookie size 8 400 700
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```
22.3.6 peer

L2tpv3-manual-session-commands

Configures peer(s) allowed to establish the manual session tunnel. The peers are identified by their IP addresses.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

peer ip-address <IP> {udp {port <1-65535>}}

Parameters

- peer ip-address <IP> {udp {port <1-65535>}}

<table>
<thead>
<tr>
<th>peer ip-address &lt;IP&gt;</th>
<th>Configures the tunnel’s peer IP address in the A.B.C.D format</th>
</tr>
</thead>
<tbody>
<tr>
<td>udp {port &lt;1-65535&gt;}</td>
<td>Optional. Configures the UDP encapsulation mode for this tunnel (default encapsulation is IP)</td>
</tr>
<tr>
<td></td>
<td>• port &lt;1-65535&gt; — Optional. Configures the peer’s UDP port running the L2TPv3 service. Specify a value from 1 - 65535.</td>
</tr>
</tbody>
</table>

Examples

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#peer ip-address 5.6.7.8 udp port 150
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
  local-cookie size 8 200 300
  local-ip-address 1.2.3.4
  peer ip-address 5.6.7.8 udp port 150
  mtu 200
  local-session-id 1
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#

Related Commands

| no                  | Removes the manual session’s peer |
22.3.7 remote-cookie

Configures the manual session’s remote cookie field size

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

remote-cookie size [4|8] <1-4294967295> {<1-4294967295>}

**Parameters**

- **remote-cookie size [4|8] <1-4294967295> {<1-4294967295>**

| remote-cookie size [4|8] | Configures the remote cookie field size for this manual session. The options are: |
|--------------------------|---------------------------------------------------------------------------------|
| 4 – 4 byte remote cookie field |
| 8 – 8 byte remote cookie field |

<table>
<thead>
<tr>
<th>&lt;1-4294967295&gt;</th>
<th>Configures the remote cookie value first word. Applies to both the 4 byte and 8 byte local cookies</th>
</tr>
</thead>
</table>

- **<1-4294967295>**

<table>
<thead>
<tr>
<th>&lt;1-4294967295&gt;</th>
<th>Optional — Configures the remote cookie value second word. Applicable to only 8 byte cookies. This parameter is ignored for 4 byte cookies.</th>
</tr>
</thead>
</table>

**Examples**

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#remote-cookie
size 8 400 700

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context
l2tpv3 manual-session test
local-ip-address 1.2.3.4
peer ip-address 5.6.7.8 udp port 150
mtu 200
local-session-id 1
remote-cookie size 8 400 700
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#

**Related Commands**

| no | Removes the manual session’s remote cookie field size |
22.3.8 remote-session-id

`l2tpv3-manual-session-commands`

Configures the manual session’s remote ID. This ID is passed in the establishment of the tunnel session.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
remote-session-id <1-4294967295>
```

**Parameters**

- `remote-session-id <1-4294967295>`: Configures this manual session’s remote ID. Specify a value from 1 - 4294967295.

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#remote-session-id 200

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context l2tpv3 manual-session test
  local-ip-address 1.2.3.4
  peer ip-address 5.6.7.8 udp port 150
  local-session-id 1
  remote-session-id 200
  remote-cookie size 8 400 700

rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

**Related Commands**

```
no
```

Removes the manual session’s remote ID.
## 22.3.9 traffic-source

Configures the traffic source tunneled by this session.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9510, NX9520

### Syntax

```
traffic-source vlan <VLAN-ID-RANGE> {native-vlan <1-4094>}
```

### Parameters

- **traffic-source vlan <VLAN-ID-RANGE>**
  - Configures VLAN as the traffic source for this tunnel
  - `<VLAN-ID-RANGE>` — Configures VLAN range list of traffic source. Specify the VLAN IDs as a range (for example, 10-20, 25, 30-35)

- **native-vlan <1-4094>**
  - Optional — Configures the native VLAN ID for this session, which is not tagged
  - `<1-4094>` — Specify the native VLAN ID from 1-4094.

### Examples

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#traffic-
source vlan 50-60 native-vlan 2
```

```
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#show context
12tpv3 manual-session test
  local-ip-address 1.2.3.4
  peer ip-address 5.6.7.8 udp port 150
  traffic-source vlan 50-60 native-vlan 2
  local-session-id 1
  remote-session-id 200
  remote-cookie size 8 400 700
rfs7000-37FABE(config-profile default-rfs7000-l2tpv3-manual-session-test)#
```

### Related Commands

- `no`
  - Removes the traffic source configured for a tunnel
This chapter summarizes Open Shortest Path First (OSPF) router mode commands in the CLI command structure. All router-mode commands are available on both device and profile modes.

OSPF is an **interior gateway protocol** (IGP) used within large autonomous systems to distribute routing information. OSPF routes IP packets within a single routing domain (autonomous system), like an enterprise LAN. OSPF gathers link state information from neighbor routers and constructs a network topology. The topology determines the routing table presented to the Internet Layer, which makes routing decisions based solely on the destination IP address found in IP packets.

OSPF detects changes in the topology, like a link failure, and plots a new loop-free routing structure. It computes the shortest path for each route using a shortest path first algorithm. Link state data is maintained on each router and is periodically updated on all OSPF member routers. This enables routers to synchronize routing tables.

OSPF uses a route table managed by the link cost (external metrics) defined for each routing interface. The cost could be the distance of a router (round-trip time), link throughput or link availability.

Use the (config) instance to configure router commands. To navigate to the (config-router-mode) instance, use the following command:

```
<DEVICE>(config-profile-<PROFILE-NAME>)#router ospf
<DEVICE>(config-profile <PROFILE-NAME>-router-ospf)#
```

```
rfs7000-37FABE(config-profile-default-rfs7000)#router ospf
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#?
```

**Router OSPF Mode commands:**

- `area` OSPF area
- `auto-cost` OSPF auto-cost
- `default-information` Distribution of default information
- `ip` Internet Protocol (IP)
- `network` OSPF network
- `no` Negate a command or set its defaults
- `ospf` OSPF
- `passive` Make OSPF Interface as passive
- `redistribute` Route types redistributed by OSPF
- `route-limit` Limit for number of routes handled OSPF process
- `router-id` Router ID
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
help                 Description of the interactive help system
revert               Revert changes
service              Service Commands
show                 Show running system information
write                Write running configuration to memory or terminal

rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore `_` character. In other words, the name of a device cannot contain an underscore.
23.1 router-mode

<td>Summarizes OSPF area configuration commands</td>
<td>page 23-7</td>
</tr>
</tbody>
</table>
23.1.1.1 area

```
area
```

Configures OSPF network areas (OSPF enables interfaces)

An OSPF network can be subdivided into routing areas to simplify administration and optimize traffic utilization. Areas are logical groupings of hosts and networks, including routers having interfaces connected to an included network. Each area maintains a separate link state database whose information may be summarized towards the rest of the network by the connecting router. Areas are identified by 32-bit IDs, expressed either in decimal, or octet-based dot-decimal notation. Areas can defined as: stub area, totally-stub, non-stub, nssa, totally nssa. Each of these area types have been discussed further in the area-type section of this chapter.

At least one default area, bearing number ‘0’, should be configured for every OSPF network. In case of multiple areas, the default area 0 forms the backbone of the network. The default area 0 is used as a link to the other areas. Each area has its own link-state database.

A router running OSPF sends hello packets to discover neighbors and elect a designated router. The hello packet includes link state information and list of neighbors. OSPF is savvy with layer 2 topologies. If on a point-to-point link, OSPF knows it is sufficient, and the link stays up. If on a broadcast link, the router waits for election before determining if the link is functional.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

```
area [<0-4294967295>|<IP>]
```

Parameters

- `area [<0-4294967295>|<IP>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;0-4294967295&gt;</code></td>
<td>Defines an OSPF area in the form of a 32 bit integer. Specify the value from 0 - 4294967295.</td>
</tr>
<tr>
<td><code>&lt;IP&gt;</code></td>
<td>Defines an OSPF area in the form of an IP address. Specify the IP address.</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#area 4 ?
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.4)#?
```

Router OSPF Area Mode commands:
- `area-type` OSPF area type
- `authentication` Authentication scheme for OSPF area
- `no` Negate a command or set its defaults
- `range` Routes matching this range are considered for summarization (ABR only)
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.4)#
```
```
show context area 0.0.0.4
```

<td>page 23-12</td>
</tr>
</tbody>
</table>
23.1.1.2.1 area-type

**OSPF-area-mode**

Configures a particular OSPF area as STUB, Totally STUB, NSSA or Totally NSSA.

Areas can be defined as:

- **stub area** - Is an area that does not receive route advertisements external to the autonomous system (AS), and routing from within the area is based entirely on a default route.
- **totally-stub** - Is an area that does not allow summary routes and external routes. A default route is the only way to route traffic outside of the area. When there is only one route out of the area, fewer routing decisions are needed, lowering system resource utilization.
- **non-stub** - Is an area that imports autonomous system external routes and forwards to other areas. However, it still cannot receive external routes from other areas.
- **nssa** - A Not-So-Stubby Area (NSSA) is an extension of a stub that allows the injection of limited external routes into a stub area. If selecting NSSA, no external routes, except a default route, enter the area.
- **totally-nssa** - Is a NSSA using 3 and 4 summary routes are not flooded into this type of area. It is also possible to declare an area both totally stubby and not-so-stubby, which means that the area will receive only the default route from area 0.0.0.0, but can also contain an Autonomous System Boundary Router (ASBR) that accepts external routing information and injects it into the local area, and from the local area into area 0.0.0.0.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

```plaintext
area-type [nssa|stub]

area-type nssa  {default-cost|no-summary|translate-always|translate-candidate|translate-never}

area-type nssa  {default-cost <0-16777215> {no-summary}|no-summary {default-cost <0-16777215>}}

area-type nssa  {translate-always|translate-candidate|translate-never}

area-type nssa  {translate-always <0-16777215>|translate-candidate<0-16777215>|translate-never<0-16777215>}

area-type stub  {default-cost <0-16777215> {no-summary}|no-summary {default-cost <0-16777215>}}

Parameters
```

- **area-type [nssa|stub]**
  - **nssa** Configures the OSPF area as NSSA
  - **stub** Configures the OSPF area as Stubby Area (STUB)
- **default-cost <0-16777215>** Specifies the default summary cost that will be advertised, if the OSPF area is a STUB or NSSA
  - **<0-16777215>** – Specify the default summary cost value from 0 - 16777215.
- **no-summary** Configures the OSPF area as totally STUB if the area-type is STUB or totally NSSA if the area-type is NSSA
- **translate-always** Always translates type-7 Link State Advertisements (LSAs) into type-5 LSAs
<table>

</tbody>
</table>
23.1.1.2 authentication

**OSPF-area-mode**

Specifies an authentication scheme used for an OSPF area used with the OSPF dynamic route.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

`authentication [message-digest|simple-password]`

**Parameters**

- `authentication [message-digest|simple-password]`

**Usage Guidelines**

OSPF packet authentication enables routers to use predefined passwords and participate within a routing domain. The two authentication modes are:

- **MD-5** – MD-5 authentication is a cryptographic authentication mode, where every router has a key (password) and key-id configured on it. This key and key-id together form the message digest that is appended to the OSPF packet.
- **Simple Password** – Simple password authentication allows a password (key) to be configured per area. Routers in the same area and participating in the routing domain have to be configured with the same key.

**Examples**

```markdown
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#authentication simple-password
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show context area 0.0.0.1 authenticate simple-password
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#
```

<tr>
<td><code>no</code></td>
<td>Removes the authentication scheme</td>
</tr>
</tbody>
</table>
23.1.1.2.3 range

**OSPF-area-mode**

Specifies a range of addresses for routes matching address/mask for OSPF summarization.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

range <IP/M>

**Parameters**

- range <IP/M>

  <IP/M> Specifies the routes matching address/mask for summarization.

  **Note:** This command is applicable for a *Area Border Router* (ABR) only.

**Examples**

```plaintext
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#range 172.16.10.0/24
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show context area 0.0.0.1
  authentication simple-password
  range 172.16.10.0/24
  area-type stub default-cost 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#
```

**Related Commands**

- **no** Removes the configured network IP range
23.1.1.2.4 no

**OSPF-area-mode**

Negates a command or set its defaults

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

no [area-type|authentication|range]

**Parameters**

- no <PARAMETERS>

---

**Usage Guidelines**

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

**Examples**

The following example shows the OSPF router settings before the 'no' commands are executed:

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show context
area 0.0.0.1
  authentication simple-password
  range 172.16.10.0/24
  area-type stub default-cost 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#no
  authentication
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#no range
  172.16.10.0/24
```

The following example shows the OSPF router settings after the 'no' commands are executed:

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#show context
area 0.0.0.1
  area-type stub default-cost 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf-area-0.0.0.1)#
```
## 23.1.2 auto-cost

*router-mode*

Configures the reference bandwidth in terms of megabits per second. Specifying the reference bandwidth allows you to control the default metrics for an interface, which is calculated by OSPF.

The formula used to calculate default metrics is: \( \text{ref-bw} \) divided by the \text{bandwidth}.

Use the 'no auto-cost reference-bandwidth' to configure default metrics calculation based on interface type.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

### Syntax

```
auto-cost reference-bandwidth <1-4294967>
```

### Parameters

- `auto-cost reference-bandwidth <1-4294967>`

### Examples

```bash
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#auto-cost reference-bandwidth 1
```

Please make sure that auto-cost reference-bandwidth is configured uniformly on all routers.

```bash
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context router ospf
area 0.0.0.4
   auto-cost reference-bandwidth 1
```

23.1.3 default-information

- router-mode

Controls the distribution of default route information. Use the `default-information originate` command to advertise a default route in the routing table.

This option is disabled by default. When enabled, the default route becomes a distributed route.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

```
default-information originate {always|metric|metric-type}
default-information originate {always|metric <0-16777214>|metric-type [1|2]}
```

Parameters

- `default-information originate {always|metric <0-16777214>|metric-type [1|2]}` - This is a recursive parameter and can be optionally configured along with the `metric-type` option.
  - `metric <0-16777214>` — Optional. Specifies OSPF metric value for redistributed routes (this value is used to generate the default route). Specify a value from 0 - 16777214.
  - `metric-type [1|2]` — Optional. Sets OSPF exterior metric type for redistributed routes (this information is advertised with the OSPF routing domain)
    - 1 — Sets OSPF external type 1 metrics
    - 2 — Sets OSPF external type 2 metrics

Examples

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#default-information originate metric-type 2 metric 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router OSPF
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

Related Commands

- `no` — Disables advertising of default route information available in the routing table
23.1.4 ip

Configure IP default gateway priority

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax
ip default-gateway priority <1-8000>

Parameters
- ip default-gateway priority <1-8000>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-gateway</td>
<td>Configures the default gateway</td>
</tr>
<tr>
<td>priority &lt;1-8000&gt;</td>
<td>Sets the priority for the default gateway acquired via OSPF. Specify an integer from 1 - 8000. The default is 7000. <strong>Note:</strong> Lower the value, higher is the priority.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
  area 0.0.0.4
  default-information originate metric 1 metric-type 2
  ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#

Related Commands
- no Removes default gateway priority settings
23.1.5 network

• router-mode

Assigns networks to specified areas (defines the OSPF interfaces and their associated area IDs)

Supported in the following platforms:
  • Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  • Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**

`network <IP/M> area [<0-4294967295>|<IP>]`

**Parameters**

- `network <IP/M> area [<0-4294967295>|<IP>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IP/M&gt;</code></td>
<td>Specifies an OSPF network address/mask value. Defines networks (IP addresses and mask) participating in OSPF.</td>
</tr>
<tr>
<td>area</td>
<td>Specifies an OSPF area, associated with the OSPF address range, in one of the following formats:</td>
</tr>
<tr>
<td><code>&lt;0-4294967295&gt;</code></td>
<td>Specifies a 32 bit OSPF area ID from 0 - 4294967295</td>
</tr>
<tr>
<td><code>&lt;IP&gt;</code></td>
<td>Defines an OSPF area ID in the form of an IPv4 address</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#network 1.2.3.0/24 area 4.5.6.7

rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
       router ospf
       network 1.2.3.0/24 area 4.5.6.7
       area 0.0.0.4
       auto-cost reference-bandwidth 1
       default-information originate metric 1 metric-type 2
       ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Removes the OSPF network to area ID association</td>
</tr>
</tbody>
</table>
23.1.6 ospf

- router-mode

Enables OSPF routing on a profile or device

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

**Syntax**
ospf enable

**Parameters**
- ospf enable

<table>
<thead>
<tr>
<th>ospf enable</th>
<th>Enables OSPF routing on devices using this profile. This option is disabled by default.</th>
</tr>
</thead>
</table>

**Examples**
```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#ospf enable
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
  router ospf
  ospf enable
  network 1.2.3.0/24 area 4.5.6.7
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

**Related Commands**

| no | Disables OSPF routing on a profile or device |
23.1.7 passive

Configure specified OSPF interface as passive. This option is disabled by default.

A passive interface receives routing updates, but does not transmit them.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6552, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

```
passive [<WORD>|all|vlan <1-4094>]
```

Parameters

- **passive [<WORD>|all|vlan <1-4094>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;WORD&gt;</td>
<td>Enables the OSPF passive mode on the interface specified by the &lt;WORD&gt; parameter</td>
</tr>
<tr>
<td>all</td>
<td>Enables the OSPF passive mode on all the L3 interfaces</td>
</tr>
<tr>
<td>vlan &lt;1-4094&gt;</td>
<td>Enables the OSPF passive mode on the specified VLAN interface</td>
</tr>
</tbody>
</table>

Examples

```bash
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#passive vlan 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
```

Related Commands

```
no
```

Disables the OSPF passive mode on a specified interface
23.1.8 redistribute

Specifies the route types redistributed by OSPF

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax
redistribute [bgp|connected|kernel|static] {metric <0-16777214>|metric-type [1|2]}

Parameters
- redistribute [connected|kernel|static] {metric <0-16777214>|metric-type [1|2]}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgp</td>
<td>Redistributes all BGP routes by OSPF</td>
</tr>
<tr>
<td>connected</td>
<td>Redistributes all connected interface routes by OSPF</td>
</tr>
<tr>
<td>kernel</td>
<td>Redistributes all routes that are neither connected, static, dynamic, nor bgp</td>
</tr>
<tr>
<td>static</td>
<td>Redistributes static routes by OSPF</td>
</tr>
<tr>
<td>metric &lt;0-16777214&gt;</td>
<td>The following keywords are common to the ’bgp’, ’connected’, ’kernel’, and ’static’ parameters:</td>
</tr>
<tr>
<td></td>
<td>• metric &lt;0-16777214&gt; – Optional. Specifies the OSPF metric value for redistributed routes.</td>
</tr>
<tr>
<td></td>
<td>• &lt;0-16777214&gt; – Specify a value from 0 - 16777214.</td>
</tr>
<tr>
<td>metric-type [1</td>
<td>2]</td>
</tr>
<tr>
<td></td>
<td>• metric-type [1</td>
</tr>
<tr>
<td></td>
<td>• 1 – Sets the OSPF external type 1 metrics</td>
</tr>
<tr>
<td></td>
<td>• 2 – Sets the OSPF external type 2 metrics</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#redistribute static metric-type 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#

Related Commands

no | Removes the OSPF redistribution of various route types
23.1.9 route-limit

Limits the number of routes managed by OSPF. The maximum limit supported by the platform is the default configuration defined under the router-ospf context.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

```
route-limit [num-routes|reset-time|retry-count|retry-timeout]
```

```
route-limit [num-routes <DYNAMIC-ROUTE-LIMIT>|reset-time <1-86400>|retry-count <1-32>|retry-timeout <1-3600>] {(num-routes|reset-time|retry-count|retry-timeout)}
```

Parameters

- **num-routes <DYNAMIC-ROUTE-LIMIT>**
  - Specifies the maximum number of non self-generated LSAs this process can receive.
  - **<DYNAMIC-ROUTE-LIMIT>** – Specify the dynamic route limit.

- **reset-time <1-86400>**
  - Specifies the time, in seconds, after which the retry-count is reset to zero. Specify a value from 1 - 86400 seconds. The default is 360 seconds.

- **retry-count <1-32>**
  - Specifies the maximum number of times adjacencies can be suppressed. Each time OSPF gets into an ignore state, a counter increments. If the counter exceeds the timeout configured by the retry-count parameter, OSPF stays in the same ignore state. Manual intervention is required to get OSPF out of the ignore state. The default is 5.

- **retry-timeout <1-3600>**
  - Specifies the retry time in seconds. During this time, OSPF remains in ignore state and all adjacencies are suppressed. Specify a value from 1 - 3600 seconds. The default is 60 seconds.

Examples

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#route-limit num-routes 10 retry-count 5 retry-timeout 60 reset-time 10
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context router ospf
  ospf enable
  network 1.2.3.0/24 area 4.5.6.7
  area 0.0.0.4
  auto-cost reference-bandwidth 1
  default-information originate metric 1 metric-type 2
  redistribute static metric-type 1
  passive vlan1
  route-limit num-routes 10 retry-count 5 retry-timeout 60 reset-time 10
  ip default-gateway priority 1
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

Related Commands

```
no
```

Removes the limit on the number of routes managed by OSPF
23.1.10 router-id

Specifies the OSPF router ID

This ID must be established in every OSPF instance. If not explicitly configured, the highest logical IP address is duplicated as the router identifier. However, since the router identifier is not an IP address, it does not have to be a part of any routable subnet in the network.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax
router-id <IP>

Parameters
- router-id <IP>

<table>
<thead>
<tr>
<th>&lt;IP&gt;</th>
<th>Identifies the OSPF router by its IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt; – Specify the router ID in the IP &lt;A.B.C.D&gt; format</td>
<td></td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#router-id 172.16.10.8

Reload, or execute "clear ip ospf process" command, for this to take effect

rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#

Related Commands

no

Removes the configured OSPF router ID
23.1.11 no

Negates a command or reverts settings to their default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000

Syntax

```
no [area|auto-cost|default-information|ip|network|ospf|passive|redistribute|
    route-limit|router-id]
```

Parameters

- `no <PARAMETERS>`

Usage Guidelines

The `no` command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

The following example shows the OSPF router interface settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
     network 1.2.3.0/24 area 4.5.6.7
     area 0.0.0.4
     auto-cost reference-bandwidth 1
     default-information originate metric 1 metric-type 2
     redistribute static metric-type 1
     passive vlan1
     route-limit num-routes 10 reset-time 10
     ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#no area 4
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#no auto-cost reference-bandwidth
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#no network 1.2.3.0/24 area 4.5.6.7
```

The following example shows the OSPF router interface settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#show context
router ospf
     default-information originate metric 1 metric-type 2
     redistribute static metric-type 1
     passive vlan1
     route-limit num-routes 10 reset-time 10
     ip default-gateway priority 1
rfs7000-37FABE(config-profile default-rfs7000-router-ospf)#
```
CHAPTER 24
ROUTING-POLICY

This chapter summarizes routing-policy commands in the CLI command structure.

Routing policies enable network administrators to control data packet routing and forwarding. *Policy-based routing* (PBR) always overrides protocol-based routing. Network administrators can define routing policies based on parameters, such as access lists, packet size etc. For example, a routing policy can be configured to route packets along user-defined routes.

In addition to the above, PBR policies facilitate the provisioning of preferential service to specific traffic. PBR minimally provides the following:

- A means to use source address, protocol, application, and traffic class as traffic routing criteria
- A means to load balance multiple WAN uplinks
- A means to selectively mark traffic for *Quality of Service* (QoS) optimization

Use the (config) instance to configure router-policy commands. To navigate to the (config-routing-policy mode) instance, use the following commands:

```
<DEVICE>(config)#routing-policy <ROUTING-POLICY-NAME>
rfs7000-37FABE(config)#routing-policy testpolicy
rfs7000-37FABE(config)#
```

Routing Policy Mode commands:

- **apply-to-local-packets**: Use Policy Based Routing for packets generated by the device
- **logging**: Enable logging for this Route Map
- **no**: Negate a command or set its defaults
- **route-map**: Create a Route Map
- **use**: Set setting to use

```
rfs7000-37FABE(config-routing-policy-testpolicy)#?
```

```
clrsclr
commit
exit
help
revert
service
show
write
```

```
rfs7000-37FABE(config-routing-policy-testpolicy)#
```
NOTE: The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
24.1 routing-policy-commands

</tr>
</tbody>
</table>

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
24.1.1 apply-to-local-packets

Enables/disables PBR for locally generated packets (packets generated by the device). When enabled, this option implements the match and action clauses defined within route maps. This option is enabled by default.

To disable PBR, use the `no apply-to-local-packets` command.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

Syntax

```
apply-to-local-packets
```

Parameters

None

Examples

```
rfs7000-37FABE(config-routing-policy-testpolicy)#apply-to-local-packets
rfs7000-37FABE(config-routing-policy-testpolicy)#
```

24.1.2 logging

*Routing-policy-commands*

Enables/disables logging for a specified route map. When enabled, this option logs events generated by the enforcement of route-maps. This option is disabled by default.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

logging

**Parameters**

None

**Examples**

rfs7000-37FABE(config-routing-policy-testpolicy)#logging

rfs7000-37FABE(config-routing-policy-testpolicy)#show context

**Related Commands**

```

Disables route map logging
24.1.3 route-map

- routing-policy-commands

Creates a route map entry and enters the route map configuration mode

In policy-based routing (PBR), route maps control the flow of traffic within the network. They override route tables and direct traffic along a specific path.

Route-maps contain a set of filters that select traffic (match clauses) and associated actions (mark clauses) for routing. Every route-map entry has a precedence value. Lower the precedence, higher is the route-map’s priority. All incoming packets are matched against these route-maps entries. The route-map entry with highest precedence (lowest numerical value) is applied first. In case of a match, action is taken based on the mark clause specified in the route-map. In case of no match, the route-map entry with the next highest precedence is applied. If the incoming packet does not match any of the route-map entries, it is subjected to typical destination-based routing. Each route-map entry can optionally enable/disable logging.

The following criteria can optionally be used as traffic selection segregation criteria:

- **IP Access List** - A typical IP ACL can be used for routing traffic. The mark and log actions in ACL rules however are neglected. Route-map entries have separate logging. Only one ACL can be configured per route map entry.

  ACL rules configured under route map entries merge to create a single ACL. Route map precedence values determine the prioritization of the rules in this merged ACL. An IP DSCP value is also added to the ACL rules.

- **IP DSCP** - Packet filtering can be performed by traffic class, as determined from the IP Differentiated Services Code Point (DSCP) field. One DSCP value can be configured per route map entry. If IP ACLs on a WLAN, ports or SVI mark packets, the new/marked DSCP value is used for matching.

- **Incoming WLAN** - Packets can be filtered on the basis of the incoming WLAN. Depending on whether the receiving device has an onboard radio or not, the following two scenarios are possible:

  - **Device with an onboard radio**: If a device having an onboard radio and capable of PBR receives a packet on a local WLAN, this WLAN is used for selection.
  
  - **Device without an onboard radio**: If a device, without an onboard radio, capable of PBR receives a packet from an extended VLAN, it passes the WLAN information in the MiNT packet to the PBR router. The PBR router uses this information as match criteria.

- **Client role** - The client role can be used as match criteria, similar to a WLAN. Each device has to agree on a unique identifier for role definition and pass the same MiNT tunneled packets.

- **Incoming SVI** - A source IP address qualifier in an ACL typically satisfies filter requirements. But if the source host (where the packet originates) is multiple hops away, the incoming SVI can be used as match criteria. In this context the SVI refers to the device interface performing PBR, and not to the source device.

Mark (or action) clauses determine the routing function when a packet satisfies match criteria. If no mark clauses are defined, the default is to fallback to destination-based routing for packets satisfying the match criteria. If no mark clause is configured and fallback to destination-based routing is disabled, then the packet is dropped. The mark clause defines one of following actions:

- **Next hop** - The IP address of the next hop or the outgoing interface through which the packet should be routed. Up to two next hops can be specified. The outgoing interface should be a PPP, a tunnel interface or a SVI which has DHCP client configured. The first reachable hop should be used. But if all next hops are unreachable, typical destination-based route lookup is performed.

- **Default next hop** - If a packet subjected to PBR does not have an explicit route to the destination, the configured default next hop is used. This can be either the IP address of the next hop or the outgoing interface. Only one default next hop can be defined. The difference between the next hop and the default next-hop is: in case of the former, PBR occurs first, then destination-based routing. In case of the latter, the order is reversed. In both cases:

  a. If a defined next hop is reachable, it is used. If fallback is configured refer to (b).
b. Perform normal destination-based route lookup. If a next hop is found, it is used, if not refer to (c).

c. If default next hop is configured and reachable, it is used, if not, packet is dropped.

- **Fallback** - Enables fallback to destination-based routing if none of the configured next hops are reachable (or not configured). This is enabled by default.

- **Mark IP DSCP** - Configures IP DSCP bits for QoS using an ACL. The mark action of the route maps takes precedence over the mark action of an ACL.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX

- Wireless Controllers — RFS4000, RFS6000, RFS7000

- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510

**Syntax**

```
route-map <1-100>
```

**Parameters**

- **route-map <1-100>**

<td>match</td>
<td>Sets match clauses for the route map</td>
<td>page 24-13</td>
</tr>
<tr>
<td>next-hop</td>
<td>Sets the next hop for packets satisfying match criteria</td>
<td>page 24-15</td>
</tr>
<tr>
<td>no</td>
<td>Negates a command or sets its default</td>
<td>page 24-16</td>
</tr>
</tbody>
</table>
24.1.4.1 default-next-hop

route-map-mode

Sets the default next hop for packets satisfying match criteria.

If a packet, subjected to PBR, does not have an explicit route to the destination, the configured default next hop is used. This value is set as either the IP address of the next hop or the outgoing interface. Only one default next hop can be defined. The difference between the next hop and the default next-hop is: in case of the former, PBR occurs first, then destination-based routing. In case of the latter, the order is reverse. Use this command to set either the default next hop IP address or define either a WWAN1, PPPoE1, or VLAN interface.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7582, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

default-next-hop [<IP>|<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID> | vlan <1-4094> | wwan1]

Parameters
- default-next-hop [<IP>|<ROUTER-IF-NAME>|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID> | pppoe1|vlan <1-4094> | wwan1]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IP&gt;</td>
<td>Specifies next hop router’s IP address</td>
</tr>
<tr>
<td>&lt;ROUTER-IF-NAME&gt;</td>
<td>Specifies the outgoing interface name (router interface name)</td>
</tr>
<tr>
<td>pppoe1</td>
<td>Specifies the PPPoE interface</td>
</tr>
<tr>
<td>serial &lt;SLOT-ID&gt;</td>
<td>Specifies the serial interface’s slot, port, and channel group IDs</td>
</tr>
<tr>
<td>&lt;PORT-ID&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;CHANNEL-GROUP-ID&gt;</td>
<td></td>
</tr>
<tr>
<td>vlan &lt;1-4094&gt;</td>
<td>Specifies a VLAN interface ID from 1 - 4094</td>
</tr>
<tr>
<td>wwan1</td>
<td>Specifies the WAN interface</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#default-next-hop wwan1
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context route-map 1
default-next-hop wwan1
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#

Related Commands
- **no** Removes default next hop router settings
24.1.4.2 fallback

Enables fallback to destination-based routing. This option is enabled by default. To disable fallback, use the \texttt{no > fallback} command.

The action taken for packets satisfying the match criteria is determined by the mark (action) clauses. If no action is defined, the default is to fallback to destination-based routing.

\textbf{NOTE:} If no mark clause is configured and fallback to destination-based routing is disabled, then the packet is dropped.

\begin{itemize}
  \item Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
  \item Wireless Controllers — RFS4000, RFS6000, RFS7000
  \item Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600
\end{itemize}

\textbf{Syntax}

\texttt{fallback}

\textbf{Parameters}

None

\textbf{Examples}

\begin{verbatim}
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#fallback
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#
\end{verbatim}

\textbf{Related Commands}

\begin{table}[h]
\begin{tabular}{|l|p{10cm}|}
\hline
\texttt{no} & Disables fallback to destination-based routing, if no next hop is configured or are unreachable \\
\hline
\end{tabular}
\end{table}
24.1.4.3 mark

Enables the marking of the DSCP field in the IP header

Use this command to set the IP DSCP bits for QoS using an ACL. The mark action of the route maps takes precedence over the mark action of an ACL.

The DSCP field in an IP header enables packet classification. Packet filtering can be done based on traffic class, determined from the IP DSCP field. One DSCP value can be configured per route map entry.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
mark ip dscp <0-63>
```

Parameters

- mark ip dscp <0-63>

Examples

```
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context
route-map 1
default-next-hop wwan1
mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```

Related Commands

```
no
```
Disables marking of IP packets
24.1.4.4 `match`

- `route-map-mode`

Sets the match clauses

Each route map entry has a set of `match` clauses used to segregate and filter packets. Packets can be segregated using any one of the following criteria:

- **IP Access List** - A typical IP ACL can be used for routing traffic. The mark and log actions in ACL rules however are neglected. Route-map entries have separate logging. Only one ACL can be configured per route map entry.

  ACL rules configured under route map entries merge to create a single ACL. Route map precedence values determine the prioritization of the rules in this merged ACL. An IP DSCP value is also added to the ACL rules.

- **IP DSCP** - Packet filtering can be performed by traffic class, as determined from the IP *Differentiated Services Code Point* (DSCP) field. One DSCP value can be configured per route map entry. If IP ACLs on a WLAN, ports or SVI mark packets, the new/marked DSCP value is used for matching.

- **Incoming WLAN** - Packets can be filtered on the basis of the incoming WLAN. Depending on whether the receiving device has an onboard radio or not, the following two scenarios are possible:

  - **Device with** an onboard radio: If a device having an onboard radio and capable of PBR receives a packet on a local WLAN, this WLAN is used for selection.
  
  - **Device without** an onboard radio: If a device, without an onboard radio, capable of PBR receives a packet from an extended VLAN, it passes the WLAN information in the MiNT packet to the PBR router. The PBR router uses this information as match criteria.

- **Client role** - The client role can be used as match criteria, similar to a WLAN. Each device has to agree on a unique identifier for role definition and pass the same MiNT tunneled packets.

- **Incoming SVI** - A source IP address qualifier in an ACL typically satisfies filter requirements. But if the source host (where the packet originates) is multiple hops away, the incoming SVI can be used as match criteria. In this context the SVI refers to the device interface performing PBR, and not to the source device.

The action taken for filtered packets is determined by the mark (action) clauses. If no action is defined, the default is to fallback to destination-based routing for packets satisfying the match criteria. For more information on configuring mark clauses, see `mark`. And for more information on fallback action, see `fallback`.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
match [incoming-interface|ip|ip-access-list|wireless-client-role|wlan]
match incoming-interface [<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID>|vlan <1-4094>|wwan1]
match ip dscp <0-63>
match ip-access-list <IP-ACCESS-LIST-NAME>
match wireless-client-role <ROLE-POLICY-NAME> <ROLE-NAME>
match wlan <WLAN-NAME>
```
Parameters

- **match incoming-interface** &lt;ROUTER-IF-NAME&gt;|pppoe1|serial&lt;SLOT-ID&gt; &lt;PORT-ID&gt; &lt;CHANNEL-GROUP-ID&gt;|vlan &lt;1-4094&gt;|wwan1

  - **incoming-interface** sets the incoming SVI match clause. Specify an interface name.
  - &lt;ROUTER-IF-NAME&gt; specifies the layer 3 interface name (route interface)
  - pppoe1 specifies the PPP over Ethernet interface
  - serial &lt;SLOT-ID&gt; &lt;PORT-ID&gt; &lt;CHANNEL-GROUP-ID&gt; specifies the serial interface's slot, port, and channel group IDs.
  - vlan &lt;1-4094&gt; specifies the VLAN interface. Specify a VLAN ID from 1 - 4094.
  - wwan1 specifies the WAN interface name

- **match ip dscp** &lt;0-63&gt;

  - ip dscp&lt;0-63&gt; sets the DSCP match clause. Specify a value from 0 - 63. The defined DSCP value is used as a matching clause for this route map.

- **match ip-access-list** &lt;IP-ACCESS-LIST-NAME&gt;

  - ip-access-list &lt;IP-ACCESS-LIST-NAME&gt; sets the match clause using a pre-configured IP access list. Specify a pre-configured IP access list name.

- **match wireless-client-role** &lt;ROLE-POLICY-NAME&gt; &lt;ROLE-NAME&gt;

  - wireless-client-role &lt;ROLE-POLICY-NAME&gt; &lt;ROLE-NAME&gt; sets the wireless client role match clause. Specify a pre-configured role policy and a pre-configured role within it.

- **match wlan** &lt;WLAN-NAME&gt;

  - wlan &lt;WLAN-NAME&gt; sets the incoming WLAN match clause. Specify a WLAN name.

Examples

rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#match incoming-interface pppoe1
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context route-map 1
  match incoming-interface pppoe1
  default-next-hop wwan1
  mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#

Related Commands

- **no** disables match clause settings for this route map
24.1.4.5 **next-hop**

Sets the next hop for packets satisfying match criteria

This command allows you to configure the primary and secondary hop priority requests.

Define the primary and secondary hop settings. When defined, the primary hop resource is used with no additional considerations when ever it is available.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```plaintext
next-hop [<IP>|<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID>|vlan <1-4094>|wwlan1] {<IP>|<ROUTER-IF-NAME>|pppoe1|serial <SLOT-ID> <PORT-ID> <CHANNEL-GROUP-ID>|vlan <1-4094>|wwlan1}
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IP&gt;</code></td>
<td>Specifies the primary and secondary next hop router’s IP address</td>
</tr>
<tr>
<td><code>&lt;WORD&gt;</code></td>
<td>Specifies the layer 3 Interface name (router interface)</td>
</tr>
<tr>
<td>pppoe1</td>
<td>Specifies the PPP over Ethernet interface</td>
</tr>
<tr>
<td>serial</td>
<td>Specifies the serial interface’s slot, port, and channel group IDs.</td>
</tr>
<tr>
<td><code>&lt;SLOT-ID&gt;</code></td>
<td></td>
</tr>
<tr>
<td><code>&lt;PORT-ID&gt;</code></td>
<td></td>
</tr>
<tr>
<td><code>&lt;CHANNEL-GROUP-ID&gt;</code></td>
<td></td>
</tr>
<tr>
<td>vlan</td>
<td>Specifies the VLAN interface. Specify a VLAN ID from 1 - 4094. The VLAN interface should be a DHCP client.</td>
</tr>
<tr>
<td><code>&lt;1-4094&gt;</code></td>
<td></td>
</tr>
<tr>
<td>wwan1</td>
<td>Specifies the WAN interface</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#next-hop vlan 1
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context
route-map 1
  match incoming-interface pppoe1
  next-hop vlan1
  default-next-hop wwan1
  mark ip dscp 7
```

24.1.4.6 no

route-map-mode

Negates a command or sets its defaults

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [default-next-hop|fallback|mark|match|next-hop]

Parameters

- no <PARAMETERS>

| no <PARAMETERS> | Negates a command or set its defaults |

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

The following example shows the route-map ‘1’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context
route-map 1
  match incoming-interface pppoe1
  next-hop vlan1
  default-next-hop wwan1
  mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```

The following example shows the route-map ‘1’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#show context
route-map 1
  match incoming-interface pppoe1
  mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy-route-map-1)#
```
24.1.5 use

Uses Critical Resource Management (CRM) to monitor link status

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

use critical-resource-monitoring

Parameters

- use critical-resource-monitoring

| use critical-resource-monitoring | Uses CRM to monitor the status of a link. Selecting this option determines the disposition of the route-map next hop via monitored critical resources. Link monitoring is the function used to determine a potential fail over to the secondary next hop. This option is enabled by default. |

Examples

rfs7000-37FABE(config-routing-policy-testpolicy)#use critical-resource-monitoring
rfs7000-37FABE(config-routing-policy-testpolicy)#

Related Commands

| no | Disables CRM link status monitoring |
24.1.6 no

Negates a command or sets its defaults

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [apply-to-local-packets|logging|route-map|use]

Parameters

- no <PARAMETERS>

Usage Guidelines

The no command negates any command associated with it. Wherever required, use the same parameters associated with the command getting negated.

Examples

The following example shows the routing policy ‘testpolicy’ settings before the ‘no’ commands are executed:

```
rfs7000-37FABE(config-routing-policy-testpolicy)#show context
routing-policy testpolicy
  logging
  route-map 1
    match incoming-interface pppoe1
    default-next-hop wwan1 mark ip dscp 7
rfs7000-37FABE(config-routing-policy-testpolicy)#
```

```
rfs7000-37FABE(config-routing-policy-testpolicy)#no logging
rfs7000-37FABE(config-routing-policy-testpolicy)#no route-map 1
rfs7000-37FABE(config-routing-policy-testpolicy)#no apply-to-local-packets
```

The following example shows the routing policy ‘testpolicy’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-routing-policy-testpolicy)#show context
routing-policy testpolicy
  no apply-to-local-packets
rfs7000-37FABE(config-routing-policy-testpolicy)#
```
This chapter summarizes the accounting, authentication, and authorization (AAA) Terminal Access Control Access-Control System (TACACS) policy commands in the CLI command structure.

TACACS is a network security application that provides additional network security by providing a centralized authentication, authorization, and accounting platform. TACACS implementation requires configuration of the TACACS authentication server and database.

Use the (config) instance to configure AAA-TACACS policy commands. To navigate to the config-aaa-tacacs-policy instance, use the following commands:

```
<DEVICE>(config)#aaa-tacacs-policy <POLICY-NAME>
```

```
rfs7000-37FABE(config)#aaa-tacacs-policy test
rfs7000-37FABE(config-aaa-tacacs-policy-test)#?
```

AAA TACACS Policy Mode commands:

- `accounting` Configure accounting parameters
- `authentication` Configure authentication parameters
- `authorization` Configure authorization parameters
- `no` Negate a command or set its defaults
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `end` End current mode and change to EXEC mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
rfs7000-37FABE(config-aaa-tacacs-policy-test)#
```

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
25.1 aaa-tacacs-policy

The following table summarizes AAA-TACACS policy configuration commands:

<table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, **COMMON COMMANDS**.

Table 25.1  AAA-TACACS-Policy-Config Commands
25.1.1 accounting

aaa-tacacs-policy

Configures the server type and interval at which interim accounting updates are sent to the server. Up to 2 accounting servers can be configured.

This feature tracks user activities on the network, and provides information such as, resources used and usage time. This information can be used for audit and billing purposes.

TACACS accounting tracks user activity and is useful for security audit purposes.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

accounting [access-method|auth-fail|commands|server|session]

accounting access-method [all|console|ssh|telnet] {(console|ssh|telnet)}

accounting [auth-fail|commands|session]

accounting server [<1-2>|preference]

accounting server preference [authenticated-server-host|authenticated-server-number|authorized-server-host|authorized-server-number|none]

accounting server <1-2> [host|retry-timeout-factor <50-200>|timeout]

accounting server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]}

accounting server <1-2> port <1-65535>

accounting server <1-2> timeout <3-5> {attempts <1-3>}

Parameters

- accounting access-method [all|console|ssh|telnet] {(console|ssh|telnet)}

<table>
<thead>
<tr>
<th>access-method</th>
<th>Configures TACACS accounting access mode. The options are: console, SSH, Telnet, and all</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Configures TACACS accounting for all access modes</td>
</tr>
<tr>
<td>console</td>
<td>Configures TACACS accounting for console access only</td>
</tr>
<tr>
<td>ssh</td>
<td>Configures TACACS accounting for SSH access only</td>
</tr>
<tr>
<td>telnet</td>
<td>Configures TACACS accounting for Telnet access only</td>
</tr>
</tbody>
</table>

- accounting [auth-fail|commands|session]

| auth-fail | Enables accounting for authentication fail details. This option is disabled by default. |
| commands  | Enables accounting of commands executed. This option is disabled by default.          |
| session   | Enables accounting for session start and stop details. This option is disabled by default. |

- accounting server preference [authenticated-server-host|authenticated-server-number|authorized-server-host|authorized-server-number|none]

<table>
<thead>
<tr>
<th>server</th>
<th>Configures a TACACS accounting server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>preference</td>
<td>Configures the accounting server preference (specifies the method of selecting a server, from the pool, to send the request)</td>
</tr>
<tr>
<td>authenticated-server-host</td>
<td>Sets the authentication server as the accounting server. This parameter indicates the same server is used for authentication and accounting. The server is referred to by its hostname.</td>
</tr>
<tr>
<td>authenticated-server-number</td>
<td>Sets the authentication server as the accounting server. This parameter indicates the same server is used for authentication and accounting. The server is referred to by its index or number.</td>
</tr>
<tr>
<td>authorized-server-host</td>
<td>Sets the authorization server as the accounting server. This parameter indicates the same server is used for authorization and accounting. The server is referred to by its hostname.</td>
</tr>
<tr>
<td>authorized-server-number</td>
<td>Sets the authorized server as the accounting server. This parameter indicates the same server is used for authorization and accounting. The server is referred to by its index number.</td>
</tr>
<tr>
<td>none</td>
<td>Indicates the accounting server is independent of the authentication and authorization servers</td>
</tr>
</tbody>
</table>

- **accounting server <1-2> retry-timeout-factor <50-200>**

  - server <1-2> Configures an accounting server. Up to 2 accounting servers can be configured
  - retry-timeout-factor <50-200> Sets the scaling factor for retry timeouts
    - <50-200> – Specify a value from 50 - 200. The default is 100.
    - A value of 100 indicates the time gap between two consecutive retires remains the same irrespective of the number of retries.
    - A value lesser than 100 indicates the time gap between two consecutive retries reduces with each successive retry.
    - A value greater than 100 indicates the time gap between two consecutive retries increases with each successive retry.

- **accounting server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET> 2 <SECRET> ]<SECRET>}] {port <1-65535>])**

  - server <1-2> Configures an accounting server. Up to 2 accounting servers can be configured
  - host <IP/HOSTNAME> Configures the accounting server's IP address or hostname
  - secret [0 <SECRET> 2 <SECRET> ]<SECRET>] Optional. Configures a common secret key used to authenticate with the accounting server
    - 0 <SECRET> – Configures a clear text secret key
    - 2 <SECRET> – Configures an encrypted secret key
    - <SECRET> – Specify the secret key. This shared secret should not exceed 127 characters.
  - port <1-65535> Optional. Configures the accounting server port (the port used to connect to the accounting server)
    - <1-65535> – Specify the TCP accounting port number from 1 - 65535. The default port is 49.

- **accounting server <1-2> timeout <3-5> {attempts <1-3>])**

  - server <1-2> Configures an accounting server. Up to 2 accounting servers can be configured
### Examples

```
examples
rfs7000-37FABE(config-aaa-tacacs-policy-test)#accounting auth-fail
rfs7000-37FABE(config-aaa-tacacs-policy-test)#accounting commands

25.1.2 authentication

aaa-tacacs-policy

Configures user authentication parameters. Users are allowed or denied access to the network based on the authentication parameters set.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

authentication [access-method|directed-request|server|service]

authentication access-method [all|console|ssh|telnet|web] {(console|ssh|telnet|web)}

authentication directed-request

authentication server <1-2> [host|retry-timeout-factor|timeout]
authentication server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]}
{port <1-65535>}
authentication server <1-2> retry-timeout-factor <50-200>
authentication server <1-2> timeout <3-60> {attempts <1-10>}

authentication service <SERVICE-NAME> {protocol <AUTHENTICATION-PROTO-NAME>}

Parameters

- authentication access-method [all|console|ssh|telnet|web] {(console|ssh|telnet)}

<table>
<thead>
<tr>
<th>access-method</th>
<th>Configures access modes for TACACS authentication. The options are: console, SSH, Telnet, Web, and all</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Authenticates users using all access modes (console, SSH, and Telnet)</td>
</tr>
<tr>
<td>console</td>
<td>Authenticates users using console access only</td>
</tr>
<tr>
<td>ssh</td>
<td>Authenticates users using SSH access only</td>
</tr>
<tr>
<td>telnet</td>
<td>Authenticates users using Telnet access only</td>
</tr>
<tr>
<td>web</td>
<td>Authenticates users using Web interface only</td>
</tr>
</tbody>
</table>

- authentication directed-request

<table>
<thead>
<tr>
<th>directed-request</th>
<th>Enables user to specify TACACS server to use with `@server’. This option is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note:</strong> The specified server should be present in the configured servers list.</td>
</tr>
</tbody>
</table>

- authentication server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]
{port <1-65535>}

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;1-2&gt; — Specify the TACACS server index from 1 - 2.</td>
</tr>
</tbody>
</table>

host <IP/HOSTNAME> | Sets the TACACS server's IP address or hostname |
| Secret [0 <SECRET>| 2 <SECRET>|<SECRET>] | Configures the secret key used to authenticate with the TACACS server  | • 0 <SECRET> – Configures a clear text secret  
  • 2 <SECRET> – Configures an encrypted secret  
  • <SECRET> – Specify the secret key. The shared key should not exceed 127 characters. |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Port &lt;1-65535&gt;</td>
<td>Optional. Specifies the port used to connect to the TACACS server</td>
<td>• &lt;1-65535&gt; – Specify a value for the TCP authentication port from 1 - 65535. The default port is 49.</td>
</tr>
</tbody>
</table>
| Authentication Server <1-2> Retry-timeout-factor <50-200> | Configures timeout scaling between two consecutive TACACS authentication retries  | • <50-200> – Specify the scaling factor from 50 - 200. The default is 100.  
  A value of 100 indicates the interval between consecutive retries remains the same irrespective of the number of retries.  
  A value lesser than 100 indicates the interval between consecutive retries reduces with each successive retry.  
  A value greater than 100 indicates the interval between consecutive retries increases with each successive retry. |
| Server <1-2> | Configures a TACACS authentication server. Up to 2 TACACS servers can be configured  | • <1-2> – Specify the TACACS server index from 1 - 2. |
| Service <SERVICE-NAME> | Configures the TACACS authentication service name |
| Protocol <AUTHENTICATION-PROTO-NAME> | Optional. Specify the authentication protocol used with this TACACS policy.  
  **Note:** A maximum of five entries is allowed. |
Examples

rfs7000-37FABE(config-aaa-tacacs-policy-test)#authentication directed-request
rfs7000-37FABE(config-aaa-tacacs-policy-test)#show context

25.1.3 authorization

aaa-tacacs-policy

Configures authorization parameters

This feature allows network administrators to limit user accessibility and configure varying levels of accessibility for different users.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7530, NX9000, NX9500, NX9910, NX9600

Syntax

authorization [access-method|allow-privileged-commands|server]

authorization access-method [all|console|telnet|ssh] {(console|ssh|telnet)}

authorization server [<1-2>|preference]

authorization server <1-2> [host|retry-timeout-factor|timeout]
authorization server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]} {port <1-65535>}

authorization server <1-2> retry-timeout-factor <50-200>
authorization server <1-2> timeout <3-5> {attempts <1-3>}

authorization server preference [authenticated-server-host|authenticated-server-number|none]

Parameters

- authorization access-method [all|console|telnet|ssh] {(console|ssh|telnet)}

<table>
<thead>
<tr>
<th>access-method</th>
<th>Configures the access method for command authorization</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>ssh</td>
<td>Authorizes commands from SSH only</td>
</tr>
<tr>
<td>{console</td>
<td>ssh</td>
</tr>
</tbody>
</table>

- authorization allow-privileged-commands

<table>
<thead>
<tr>
<th>allow-privileged-commands</th>
<th>Allows privileged commands execution without command authorization. This option is disabled by default.</th>
</tr>
</thead>
</table>

- authorization server <1-2> host <IP/HOSTNAME> {secret [0 <SECRET>|2 <SECRET>|<SECRET>]} {port <1-65535>}

server <1-2> Configures a TACACS authorization server. Up to 2 TACACS servers can be configured

- <1-2> – Specify the TACACS server index from 1 - 2.

host <IP/HOSTNAME> Sets the TACACS server's IP address or hostname
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| secret [0 <SECRET> | 2 <SECRET>]<SECRET>] | Optional. Configures the secret used to authorize with the TACACS server  
- 0 <SECRET> – Configures a clear text secret  
- 2 <SECRET> – Configures an encrypted secret  
- <SECRET> – Specify the secret key. The shared key should not exceed 127 characters. |
| port <1-65535> | Optional. Specifies the port used to connect to the TACACS server  
- <1-65535> – Specify a value for the TCP authorization port from 1 - 65535. The default port is 49. |
| retry-timeout-factor <50-200> | Configures the scaling of timeouts between consecutive TACACS authorization retries  
- <50-200> – Specify the scaling factor from 50 - 200. The default is 100.  
A value of 100 indicates the interval between consecutive retries remains the same irrespective of the number of retries.  
A value lesser than 100 indicates the interval between consecutive retries reduces with each successive retry.  
A value greater than 100 indicates the interval between consecutive retries increases with each successive retry. |
| server <1-2> | Configures a TACACS authorization server. Up to 2 TACACS servers can be configured  
- <1-2> – Specify the TACACS server’s index from 1 - 2. |
| timeout <3-5> | Configures the timeout, in seconds, for each request sent to the TACACS server. This is the time allowed to elapse before another request is sent to the TACACS server. If a response is received from the TACACS server within this time, no retry is attempted.  
- <3-5> – Specify a value from 3 - 5 seconds. The default is 3 seconds. |
| attempts <1-3> | Optional. Indicates the number of retry attempts to make before giving up  
- <1-3> – Specify a value from 1 - 3. The default is 3. |
| preference | Configures the authorization server preference |
| authenticated-server-host | Sets the authentication server as the authorization server  
This parameter indicates the same server is used for authentication and authorization. The server is referred to by its hostname. |
| authenticated-server-number | Sets the authentication server as the authorization server  
This parameter indicates the same server is used for authentication and authorization. The server is referred to by its index or number. |
| none | Indicates the authorization server is independent of the authentication |
Examples
rfs7000-37FABE(config-aaa-tacacs-policy-test)#authorization allow-privileged-commands
rfs7000-37FABE(config-aaa-tacacs-policy-test)#show context
aaa-tacacs-policy test
  authentication directed-request
  accounting server preference authorized-server-number

25.1.4 no

aaa-tacacs-policy

Negates a AAA TACACS policy command or sets its default

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [accounting|authentication|authorization]

Parameters

- no <PARAMETERS>
  
  Provide the parameters needed to reset or disable the desired AAA-TACACS policy setting.

Examples

The following example shows the AAA-TACACS policy ‘test’ settings before the ‘no’ commands are executed:

```
no authentication directed-request
no accounting auth-fail
no authorization allow-privileged-commands
```

```
rfs7000-37FABE(config-aaa-tacacs-policy-test)#show context
aaa-tacacs-policy test
    authentication directed-request
    accounting server preference authorized-server-number
    authorization allow-privileged-commands
    accounting auth-fail
    accounting commands
```

The following example shows the AAA-TACACS policy ‘test’ settings after the ‘no’ commands are executed:

```
rfs7000-37FABE(config-aaa-tacacs-policy-test)#show context
aaa-tacacs-policy test
    accounting server preference authorized-server-number
    accounting commands
```

This chapter summarizes the Meshpoint commands in the CLI command structure.

Meshpoints are detector radios that monitor their coverage areas for potential failed peers or coverage area holes requiring transmission adjustments for coverage compensation.

This chapter is organized as follows:

- `meshpoint-config-instance`
- `meshpoint-qos-policy-config-instance`
- `meshpoint-device-config-instance`

---

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore `_` character. In other words, the name of a device cannot contain an underscore.
26.1 meshpoint-config-instance

MeshConnex (MCX) is a mesh networking technology that is comparable to the 802.11s mesh networking specification. MCX meshing uses a hybrid proactive/on-demand path selection protocol, similar to Ad hoc On Demand Distance Vector (AODV) routing protocols. This allows it to form efficient paths using multiple attachment points to a distribution WAN, or form purely ad-hoc peer-to-peer mesh networks in the absence of a WAN. Each device in the MCX mesh proactively manages its own path to the distribution WAN, but can also form peer-to-peer paths on demand to improve forwarding efficiency.

MCX is not compatible with MiNT Based meshing, though the two technologies can be enabled simultaneously in certain circumstances.

MCX is designed for large-scale, high-mobility outdoor mesh deployments. MCX continually gathers data from beacons and transmission attempts to estimate the efficiency and throughput of each MP-to-MP link. MCX uses this data to dynamically form and continually maintain paths for forwarding network frames.

In MCX systems, a meshpoint (MP) is a virtual mesh networking instance on a device, similar to a WLAN AP. On each device, up to 4 MPs can be created and 2 can be created per radio. MPs can be configured to use one or both radios in the device. If the MP is configured to use both radios, the path selection protocols will continually select the best radio to reach each destination. Each MP participates in a single Mesh Network, defined by the MeshID. The MeshID is typically a descriptive network name, similar to the SSID of a WLAN. All MPs configured to use the same MeshID attempt to form a mesh and interoperate. The MeshID allows overlapping mesh networks to discriminate and disregard MPs belonging to different networks.

Use the (config) instance to configure a meshpoint. To navigate to the meshpoint configuration instance, use the following command:

<DEVICE>(config)#meshpoint <MESHPOINT-NAME>

rfs7000-37FABE(config)#meshpoint test
rfs7000-37FABE(config-meshpoint-test)#

rfs7000-37FABE(config-meshpoint-test)#?

Mesh Point Mode commands:

- allowed-vlans: Set the allowed VLANs
- beacon-format: The beacon format of this meshpoint
- control-vlan: VLAN for meshpoint control traffic
- data-rates: Specify the 802.11 rates to be supported on this meshpoint
- description: Configure a description of the usage of this meshpoint
- meshid: Configure the Service Set Identifier for this meshpoint
- neighbor: Configure neighbor specific parameters
- no: Negate a command or set its defaults
- root: Set this meshpoint as root
- security-mode: The security mode of this meshpoint
- shutdown: Shutdown this meshpoint
- use: Set setting to use
- wpa2: Modify ccmp wpa2 related parameters
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

rfs7000-37FABE(config-meshpoint-test)#

NOTE: For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
## 26.1.1 allowed-vlans

Defines VLANs allowed on the mesh network. A VLAN must be added to the allowed VLANs list for data to be allowed across the mesh network. Use this command to remove VLANs from the list of allowed VLANs.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```plaintext
allowed-vlans [<VLAN-ID>|add <VLAN-ID>|remove <VLAN-ID>]
```

### Parameters

- `allowed-vlans [<VLAN-ID>|add <VLAN-ID>|remove <VLAN-ID>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;VLAN-ID&gt;</code></td>
<td>The VLAN ID or the range of IDs to be managed. A single VLAN or multiple VLANs can be added to the list of allowed VLANs. When adding multiple VLANs, specify the range (for example, 10-20, 25, 30-35). Use this command to create a VLAN list on a new meshpoint.</td>
</tr>
<tr>
<td><code>add &lt;VLAN-ID&gt;</code></td>
<td>Adds a single VLAN or a range of VLANs to the list of allowed VLANs. To specify a range of VLANs, specify the first and last VLAN ID in the range separated by a hyphen (for example, 1-10).</td>
</tr>
<tr>
<td><code>remove &lt;VLAN-ID&gt;</code></td>
<td>Removes a single VLAN or a range of VLANs from the list of allowed VLANs.</td>
</tr>
</tbody>
</table>

### Examples

```plaintext
rfs7000-37FABE(config-meshpoint-test)#allowed-vlans 1
rfs7000-37FABE(config-meshpoint-test)#allowed-vlans add 10-23
rfs7000-37FABE(config-meshpoint-test)#allowed-vlans remove 17
```

```plaintext
rfs7000-37FABE(config-meshpoint-test)#show context
meshpoint test
meshid test
beacon-format mesh-point
control-vlan 1
    allowed-vlans 1,10-16,18-23
security-mode none
no root
```

### Related Commands

- `no` Clears the list of VLANs allowed access to the mesh network
**26.1.2 beacon-format**

*meshpoint-config-instance*

Configures the beacon transmission format for this meshpoint. Beacons are transmitted periodically to advertise that a wireless network is available. It contains all the required information for a device to connect to the network.

The beacon format advertises how a mesh capable AP71XX acts. APs can act either as an access point or a meshpoint.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
beacon-format [access-point|mesh-point]
```

**Parameters**

- `beacon-format [access-point|mesh-point]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>beacon-format</td>
<td>Configures how a mesh capable AP71XX acts in a mesh network</td>
</tr>
<tr>
<td>access-point</td>
<td>Uses access point style beacons</td>
</tr>
<tr>
<td>mesh-point</td>
<td>Uses meshpoint style beacons (this is the default setting)</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-meshpoint-test)#beacon-format mesh-point
rfs7000-37FABE(config-meshpoint-test)#show context
meshpoint test
meshid test
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
security-mode none
no root
rfs7000-37FABE(config-meshpoint-test)#
```

**Related Commands**

- `no` Resets the beacon format for this meshpoint to its default (mesh-point)
26.1.3 control-vlan

Configures a VLAN as the dedicated control VLAN

Mesh management traffic can be sent over a dedicated VLAN. This dedicated VLAN is known as a control VLAN, and should be configured in the backhaul port of all the access points configured as meshpoint roots. Once configured, the control VLAN enables communication between meshpoint’s root APs.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
control-vlan <1-4094>

Parameters
- control-vlan <1-4094>

<table>
<thead>
<tr>
<th>control-vlan</th>
<th>The VLAN used as the control VLAN. The default is VLAN 1.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-4094&gt;</td>
<td>Note: If VLAN 1 is configured as the control VLAN, ensure that the VLAN is configured in the wired port of all access points belonging to same meshpoint. Note: Control VLAN need not necessarily be added in the allowed VLAN list.</td>
</tr>
</tbody>
</table>

Examples
rfs7000-37FABE(config-meshpoint-test)#control-vlan 1

rfs7000-37FABE(config-meshpoint-test)#show context
meshpoint test
meshid test
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
security-mode none
no root

rfs7000-37FABE(config-meshpoint-test)#

Related Commands
no

Resets the control VLAN for this meshpoint to its default of 1
26.1.4 data-rates

meshpoint-config-instance

Configures individual data rates for the 2.4 GHz and 5.0 GHz frequency bands

**NOTE:** Ensure that the basic data rates configured on a meshpoint's root and non-root access points is the same.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

data-rates [2.4GHz|5GHz]

data-rates 2.4GHz [b-only|bg|bgn|default|g-only|gn]
data-rates 2.4GHz custom (1|11|12|18|2|24|36|48|5.5|54|6|9|basic-1|basic-11|

basic-12|basic-18|basic-2|basic-24|basic-36|basic-48|basic-5.5|basic-54|basic-6|
basic-9|mcs0-15|mcs0-7|mcs8-15|basic-mcs0-7)

data-rates 2.4GHz

Configures the preset data rates for the 2.4 GHz frequency

Define both minimum Basic and optimal Supported rates as required for the 802.11b rates, 802.11g rates and 802.11n rates supported by the 2.4 GHz band. These are the rates wireless client traffic is supported within this mesh point.

If supporting 802.11n, select a supported MCS index. Set a Modulation and Coding Scheme (MCS) in respect to the radio’s channel width and guard interval. A MCS defines (based on RF channel conditions) an optimal combination of 8 data rates, bonded channels, multiple spatial streams, different guard intervals and modulation types. Mesh points can communicate as long as they support the same basic MCS (as well as non-11n basic rates). The selected rates apply to associated client traffic within this mesh point only.

custom

| 1|11|12|18|2|24|36|48|5.5|54|6|9|basic-1|basic-11|

- basic-mcs0-7 – Configures the MCS index range of 0-7 for basic rate
- mcs0-7 – Configures the MCS index range of 0-7 as the data rate
- mcs0-15 – Configures the MCS index range of 0-15 as the data rate
- msc8-15 – Configures the MCS index range of 8-15 as the data rate

**Note:** Multiple choices can be made from the above list of rates.
26.1.5 **description**

- **meshpoint-config-instance**

Configures a brief description for this meshpoint. Use this command to describe this meshpoint and its features.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS8000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

description <DESCRIPTION>

**Parameters**

- description <DESCRIPTION>

<table>
<thead>
<tr>
<th>description</th>
<th>Configures a description for this meshpoint</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DESCRIPTION&gt;</td>
<td>The text describing this meshpoint</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-meshpoint-test)#description "This is an example of a meshpoint description"
rfs7000-37FABE(config-meshpoint-test)#show context
meshid test
device-name "This is an example of a meshpoint description"
control-vlan 1
allowed-vlans 1,10-16,18-23
data-rates 2.4GHz bgn
data-rates 5GHz an
security-mode none
no root
rfs7000-37FABE(config-meshpoint-test)#
```

**Related Commands**

- **no** — Removes the human friendly description provided for this meshpoint
26.1.6 meshid

meshid-config-instance

Configures a unique Service Set Identifier (SSID) for this meshpoint. This ID is used to uniquely identify this meshpoint.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

meshid <MESH-SSID>

Parameters

- meshid <MESH-SSID>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;MESH-SSID&gt;</td>
<td>The unique SSID configured for this meshpoint</td>
</tr>
</tbody>
</table>

Note: The mesh SSID is case sensitive and should not exceed 32 characters.

Examples

rfs7000-37FABE(config-meshpoint-test)#meshid TestingMeshPoint
rfs7000-37FABE(config-meshpoint-test)#show context
meshpoint test
  description "This is an example of a meshpoint description"
meshid TestingMeshPoint
  beacon-format mesh-point
  control-vlan 1
  allowed-vlans 1,10-16,18-23
  data-rates 2.4GHz bgn
  data-rates 5GHz an
  security-mode none
  no root
rfs7000-37FABE(config-meshpoint-test)#

Related Commands

no

Removes the SSID configured for this meshpoint
26.1.7 `neighbor`

This command configures the inactivity time out value for neighboring devices. If a frame is not received from the neighbor device for the configured time, then client resources are removed.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

`neighbor inactivity-timeout <60-86400>`

Parameters

- `neighbor inactivity-timeout <60-86400>`

<table>
<thead>
<tr>
<th>neighbor inactivity-timeout &lt;60-86400&gt;</th>
<th>Configures the neighbor inactivity timeout in seconds. This represents the allowed interval between frames received from a neighbor before their client privileges are revoked.</th>
</tr>
</thead>
<tbody>
<tr>
<td>- &lt;60-86400&gt; – Specify a value from 60 - 86400 seconds. The default is 120 seconds.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-meshpoint-test)#neighbor inactivity-timeout 300
rfs7000-37FABE(config-meshpoint-test)#show context
meshpoint test
description "This is an example of a meshpoint description"
meshid TestingMeshPoint
beacon-format mesh-point
control-vlan 1
allowed-vlans 1,10-16,18-23
neighbor inactivity-timeout 300
data-rates 2.4GHz bgn
data-rates 5GHz an
security-mode none
no root
rfs7000-37FABE(config-meshpoint-test)#
```

Related Commands

```
no
```

Removes the configured neighbor inactivity time out value for this meshpoint
26.1.8 no

meshpoint-config-instance

Negates meshpoint commands or resets their values to default

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS8000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [allowed-vlans|beacon-format|control-vlan|description|meshid|root|security-mode|shutdown]

no data-rates [2.4GHz|5GHz]
no neighbor inactivity-timeout
no use [aaa-policy|meshpoint-qos-policy]

no wpa2 [eap|key-rotation|psk]
no wpa2 eap [auth-type|identity|peap-mschapv2|tls trustpoint]
no wpa2 key-rotation [broadcast|unicast]
no wpa2 psk

no service allow-ht-only

Parameters

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes or reverts this meshpoint settings to default based on the parameters passed</th>
</tr>
</thead>
</table>

Examples

rfs7000-37FABE(config-meshpoint-test)#
26.1.9 root

meshpoint-config-instance

Configures this meshpoint as the root meshpoint. Root meshpoints are generally tied to an Ethernet backhaul for wired connectivity. By default this option is disabled.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

root

Parameters

None

Examples

There are two ways of configuring root access points within a meshpoint.

1. First method:

   - Configure two meshpoints, having the same meshid, one with the root option enabled and the other configured as no root.
   - Apply the root meshpoint to the root access point and the no-root meshpoint to the non-root access points.

The following examples show the configuration of a meshpoint for the root access point:

```
rfs7000-37FABE(config)#meshpoint root
rfs7000-37FABE(config-meshpoint-root)#
rfs7000-37FABE(config-meshpoint-root)#meshid test
rfs7000-37FABE(config-meshpoint-root)#root
rfs7000-37FABE(config-meshpoint-root)#security-mode eap
rfs7000-37FABE(config-meshpoint-root)#commit
```

```
rfs7000-37FABE(config-meshpoint-root)#show context
meshpoint test-root
meshid test
beacon-format mesh-point
control-vlan 1
security-mode eap
root
rfs7000-37FABE(config-meshpoint-root)#
```

The following examples show the configuration of a meshpoint for non-root access points:

```
rfs7000-37FABE(config)#meshpoint no-root
rfs7000-37FABE(config-meshpoint-no-root)#
rfs7000-37FABE(config-meshpoint-no-root)#meshid test
rfs7000-37FABE(config-meshpoint-no-root)#security-mode eap
```

```
rfs7000-37FABE(config-meshpoint-no-root)#show context
meshpoint test-no-root
meshid test
beacon-format mesh-point
control-vlan 1
security-mode eap
no root
rfs7000-37FABE(config-meshpoint-no-root)#
```
2. Second method:
   - Configure a no-root meshpoint and apply to all access points in the meshpoint.
   - Log into the meshpoint-device > no-root configuration mode of the root access point and enable root.

   ```
   rfs7000-37FABE(config-meshpoint-no-root)#show context
   meshpoint no-root
   meshid test
   beacon-format mesh-point
   control-vlan 1
   security-mode eap
   no root
   rfs7000-37FABE(config-meshpoint-no-root)#
   
   rfs7000-37FABE(config)#ap81xx B4-C7-99-71-17-28
   rfs7000-37FABE(config-device-B4-C7-99-71-17-28)#meshpoint-device no-root
   rfs7000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#
   
   rfs7000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#show context
   meshpoint no-root
   meshid test
   beacon-format mesh-point
   control-vlan 1
   security-mode eap
   no root
   rfs7000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#
   rfs7000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#root
   rfs7000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#show context
   meshpoint no-root
   meshid test
   beacon-format mesh-point
   control-vlan 1
   security-mode eap
   root
   rfs7000-37FABE(config-device-B4-C7-99-71-17-28-meshpoint-no-root)#
   ```

26.1.10 security-mode

- **meshpoint-config-instance**

Configures the security mode for this meshpoint

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
security-mode [eap|none|psk]
```

**Parameters**

- security-mode [eap|none|psk]

<table>
<thead>
<tr>
<th>security-mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eap</td>
<td>Uses 802.1X/EAP as the security mode. When using this option, use the <code>wpa2</code> command to specify the EAP authentication type and related parameters.</td>
</tr>
<tr>
<td>none</td>
<td>No security is configured for this meshpoint</td>
</tr>
<tr>
<td>psk</td>
<td>Uses <strong>Pre Shared Key</strong> (PSK) as the security mode. When using this option, use the <code>wpa2</code> command to enter a 64 character HEX or an 8-63 ASCII character passphrase used for authentication on the mesh point.</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows **root meshpoint** configuration with PSK authentication enabled:

```
rfs7000-37FABE(config-meshpoint-test)#security-mode psk
rfs7000-37FABE(config-meshpoint-test)#show context
meshpoint test
  description "This is an example of a meshpoint description"
  meshid TestingMeshPoint
  beacon-format mesh-point
  control-vlan 1
  allowed-vlans 1,10-16,18-23
  neighbor inactivity-timeout 300
  data-rates 2.4GHz bgn
  data-rates 5GHz an
  security-mode psk
  root
rfs7000-37FABE(config-meshpoint-test)#
```

The following example shows **root meshpoint** configuration with EAP authentication enabled:

```
rfs7000-37FABE(config-meshpoint-root)#show context
meshpoint test
  meshid test
  beacon-format mesh-point
  control-vlan 101
  allowed-vlans 101,103
  use aaa-policy test
security-mode eap
root
rfs7000-37FABE(config-meshpoint-test)#
```

26.1.11 service

meshpoint-config-instance

Use this command to allow only those neighbors who are capable of 802.11n data rates to associate with this meshpoint.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
service [allow-ht-only|show cli]
```

Parameters

- `service [allow-ht-only|show cli]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service allow-ht-only</td>
<td>Allows only those neighbors who are capable of high throughput data rates (802.11n data rates) to associate with the meshpoint</td>
</tr>
<tr>
<td>service show cli</td>
<td>Displays running system configuration</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-meshpoint-test)#service allow-ht-only
rfs7000-37FABE(config-meshpoint-test)#show context
meshpoint test
description "This is an example of a meshpoint description"
meshid TestingMeshPoint
shutdown

wpa2 key-rotation unicast 1200
wpa2 key-rotation broadcast 600
root
service allow-ht-only
```

Related Commands

- `no` Removes the restriction that only 802.11n capable neighbor devices can associate with this meshpoint
- `service` Invokes service commands to troubleshoot or debug
26.1.12 shutdown

meshpoint-config-instance

Shuts down this meshpoint. Use this command to prevent an AP from participating in a mesh network.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

shutdown

Parameters

None

26.1.13 use

meshpoint-config-instance

Uses a Quality of Service (QoS) policy defined specifically for meshpoints. To use this QoS policy, it must be defined. To define a meshpoint QoS policy, see meshpoint-qos-policy-config-instance.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

use [aaa-policy <AAA-POLICY-NAME>|meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>]

Parameters

- use [aaa-policy <AAA-POLICY-NAME>|meshpoint-qos-policy <MESHPOINT-QOS-POLICY-NAME>]

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>use meshpoint-qos-policy &lt;MESHPOINT-QOS-POLICY-NAME&gt;</td>
<td>Configures this meshpoint to use a predefined meshpoint QoS policy.</td>

### 26.1.14 wpa2

**meshpoint-config-instance**

Use this command to configure the parameters of authentication mode specified using the ‘security-mode’ keyword. This command also allows you to set a unicast and broadcast key rotation interval.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

#### Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`wpa2 [eap</td>
<td>psk</td>
</tr>
<tr>
<td>`wpa2 key-rotation [broadcast</td>
<td>unicast] &lt;30-86400&gt;`</td>
</tr>
<tr>
<td>`wpa2 psk [0 &lt;SECRET&gt;</td>
<td>2 &lt;SECRET&gt;</td>
</tr>
<tr>
<td>`wpa2 eap [auth-type</td>
<td>identity</td>
</tr>
<tr>
<td>`wpa2 eap peap-mschapv2 user &lt;USER-NAME&gt; password [0 &lt;WORD&gt;</td>
<td>2 &lt;WORD&gt;</td>
</tr>
<tr>
<td><code>wpa2 eap tls trustpoint TRUSTPOINT-NAME</code></td>
<td>Configures the PSK used to authenticate this meshpoint with other meshpoints in the network</td>
</tr>
</tbody>
</table>

#### Parameters

- **wpa2 key-rotation [broadcast|unicast] <30-86400>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>broadcast</td>
<td>Configures key rotation interval for broadcast and multicast traffic. This option is disabled by default. When enabled, the key indices used for encrypting/decrypting broadcast traffic is alternatively rotated based on the defined interval. Key rotation enhances the broadcast traffic security on the WLAN.</td>
</tr>
<tr>
<td><code>&lt;30-86400&gt;</code></td>
<td>Configures key rotation interval from 30 - 86400 seconds for unicast or broadcast transmission</td>
</tr>
</tbody>
</table>

- **wpa2 psk [0 <SECRET>|2 <SECRET>|<SECRET>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>secret</td>
<td>Configures the PSK used to authenticate this meshpoint with other meshpoints in the network</td>
</tr>
<tr>
<td>0 &lt;SECRET&gt;</td>
<td>Configures a clear text secret</td>
</tr>
<tr>
<td>2 &lt;SECRET&gt;</td>
<td>Configures an encrypted secret</td>
</tr>
<tr>
<td>&lt;SECRET&gt;</td>
<td>Specify the secret key. The pre-shared key can be in ASCII (8 to 63 characters in length) or Hexadecimal (not exceeding 64 characters in length) formats.</td>
</tr>
</tbody>
</table>
**wpa2 eap**

Configures the 802.1X/EAP based authentication type for this meshpoint. If the security mode is set as ‘eap’ using the ‘security-mode’ keyword, use this command to specify the EAP type. The options are: peap-mschapv2 and tls.

| auth-type [peap-mschapv2|tls] | Specifies the EAP authentication type. The options are:  
| | • peap-mschapv2 – Configures EAP authentication type as Protected Extensible Authentication Protocol (PEAP) with default auth type MSCHAPv2. This is the default setting. 
| | • tls – Configures EAP authentication type as Transport Layer Security (TLS)  
| | If using auth-type as ‘peap-mschapv2’, use the ‘peap-mschapv2’ keyword to configure user credentials and trustpoint details.  
| | If using auth-type as ‘tls’, use the ‘tls’ keyword to configure trustpoint details.  
| **Note:** The certificate should be issued from an Enterprise or public certificate authority to allow 802.1X clients to validate the identity of the authentication server prior to forwarding credentials. |

| identity <WORD> | Configures identity to be used during phase1 authentication  
| | • <WORD> – Enter a string up to 256 characters in length (this should not be actual identity of user but some anonymous/bogus username) |

| wpa2 eap peap-mschapv2 user <USER-NAME> password [0 <WORD>|2 <WORD>|<WORD>] {trustpoint <TRUSTPOINT-NAME>} | Configures PEAP-related user credentials and trustpoint details  
| | • user <USER-NAME> – Specify the user name.  
| | • password [0 <WORD>|2 <WORD>|<WORD>] – Specify the password associated with the specified user. |

| trustpoint <TRUSTPOINT-NAME> | Optional. Associates a trustpoint used for installing CA certificate and verifying server certificate  
| | • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be existing and configured). |

| wpa2 eap tls trustpoint <TRUSTPOINT-NAME> | Configures TLS client related parameters  
| | • trustpoint <TRUSTPOINT-NAME> – Assigns a trustpoint to be used for installing TLS client certificate, client private key, and CA certificate  
| | • <TRUSTPOINT-NAME> – Specify the trustpoint name (should be existing and configured) |
### Examples

26.2 meshpoint-qos-policy-config-instance

Mesh Quality of Service (QoS) provides a data traffic prioritization scheme. QoS reduces congestion from excessive traffic. If there is enough bandwidth for all users and applications (unlikely because excessive bandwidth comes at a very high cost), then applying QoS has very little value. QoS provides policy enforcement for mission-critical applications and/or users that have critical bandwidth requirements when bandwidth is shared by different users and applications.

Mesh QoS helps ensure each mesh point on the mesh network receives a fair share of the overall bandwidth, either equally or as per the proportion configured. Packets directed towards clients are classified into categories such as video, voice and data packets within each category are processed based on the weights defined for each mesh point.

To create a meshpoint, see meshpoint-config-instance. A meshpoint QoS policy is created from the (config) instance. To create a meshpoint QoS policy use the following command:

```
<DEVICE>(config)#meshpoint-qos-policy <POLICYNAME>
```

```
rfs7000-37FABE(config)#meshpoint-qos-policy test
rfs7000-37FABE(config-meshpoint-qos-test)#
```

```
rfs7000-37FABE(config-meshpoint-qos-test)#?
Mesh Point QoS Mode commands:
accelerated-multicast Configure accelerated multicast streams address and forwarding QoS classification
no Negate a command or set its defaults
rate-limit Configure traffic rate-limiting parameters on a per-meshpoint/per-neighbor basis
clrscr Clears the display screen
commit Commit all changes made in this session
do Run commands from Exec mode
exit End current mode and change to EXEC mode
help Description of the interactive help system
revert Revert changes
service Service Commands
show Show running system information
write Write running configuration to memory or terminal
```

```
rfs7000-37FABE(config-meshpoint-qos-test)#
```

26.2.1 accelerated-multicast

meshpoint-qos-policy-config-instance

Configures the accelerated multicast stream’s address and forwarding QoS classification

**NOTE:** For accelerated multicast feature to work, IGMP querier must be enabled.

When a user joins a multicast stream, an entry is created in the device’s (AP or wireless controller) snoop table and the entry is set to expire after a set time period. Multicast packets are forwarded to the appropriate wireless LAN or mesh until this entry is available in the snoop table.

Snoop querier keeps the snoop table current by updating entries that are set to expire. It also keeps an entry for each multicast stream till there are users registered for the stream.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`accelerated-multicast [MULTICAST-IP]|autodetect] {classification [background|best-effort|trust|video|voice]}`

**Parameters**

- **accelerated-multicast** [MULTICAST-IP]|autodetect] {classification [background|best-effort|trust|video|voice]}

  - **<MULTICAST-IP>** Specify a list of multicast addresses and classifications. Packets are accelerated when the destination address matches.

  - **autodetect** Lets the system to automatically detect multicast streams to be accelerated

    This option allows the administrator to convert multicast packets to unicast in order to provide better overall airtime utilization and performance. The system can be configured to automatically detect multicast streams and convert them to unicast, or specify which multicast streams are to be converted to unicast. When the stream is converted and being queued up for transmission, there are a number of classification mechanisms applied to the stream and the administrator can select what type of classification they would want. Classification types are trust, voice, video, best effort, and background.

  - **classification** Optional. Defines the QoS classification to apply to a multicast stream. The following options are available:
    - background
    - best effort
    - trust
    - video
    - voice
### Examples

```bash
rfs7000-37FABE(config-meshpoint-qos-test)#accelerated-multicast 224.0.0.1 classification video
```

```bash
rfs7000-37FABE(config-meshpoint-qos-test)#show context meshpoint-qos-policy test
accelerated-multicast 224.0.0.1 classification video
rfs7000-37FABE(config-meshpoint-qos-test)#
```

26.2.2 no

meshpoint-qos-policy-config-instance

Negates the commands for meshpoint QoS policy or resets their values to their default.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS8000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [accelerated-multicast|rate-limit]
	no accelerated-multicast [<MULTICAST-IP>|autodetect]
	no rate-limit [meshpoint|neighbor] [from-air|to-air] {max-burst-size|rate}
	no rate-limit [meshpoint|neighbor] [from-air|to-air] {red-threshold [background|

best-effort|video|voice]}

Parameters

- no <PARAMETERS>

Examples

rfs7000-37FABE(config-meshpoint-qos-test)#show context

26.2.3 rate-limit

meshpoint-qos-policy-config-instance

Configures the rate limiting of traffic on a per meshpoint or per neighbor basis.

Excessive traffic can cause performance issues or bring down the network entirely. Excessive traffic, bombardments and interference are caused by numerous sources, such as network loops, faulty devices, or malicious software (such as a worm or virus) that has infected one or more branch-level devices. Rate limiting limits the maximum rate sent to or received from the wireless network (and meshpoint) per neighbor. It prevents any single user from overwhelming the wireless network. It also provides differential service for service providers. An administrator can set separate QoS rate limit configurations for data transmitted from the network and data transmitted from a mesh point’s neighbor.

Before defining rate limit thresholds for meshpoint transmit and receive traffic, it is recommended that you define the normal number of ARP, broadcast, multicast, and unknown unicast packets that typically transmit and receive from each supported WMM access category. If thresholds are defined too low, normal network traffic (required by end-user devices) is dropped, resulting in intermittent outages and performance problems.

A connected neighbor can also have QoS rate limit settings defined in both the transmit and receive direction.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622
- Wireless Controllers — RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
rate-limit [meshpoint|neighbor]

rate-limit [meshpoint|neighbor] [from-air|to-air] {max-burst-size <2-1024>|
rate <50-1000000>}
rate-limit [meshpoint|neighbor] [from-air|to-air] {red-threshold [background <0-100>|
best-effort <0-100>|video <0-100>|voice <0-100>]

Parameters
- **rate-limit [meshpoint|neighbor]** [from-air|to-air] {max-burst-size <2-1024>|
rate <50-1000000>}

<table>

</tr>
<tr>
<td><strong>red-threshold</strong></td>
<td>Optional. Configures <em>random early detection</em> (RED threshold) for traffic class</td>
</tr>
<tr>
<td><strong>background &lt;0-100&gt;</strong></td>
<td>The following keyword is applicable to the ‘from-air’ and ‘to-air’ traffics. Configures the threshold for low priority (background) traffic For a meshpoint: This is a percentage of the maximum burst size for low priority traffic. Background traffic exceeding the defined threshold is dropped and a log message is generated. Background traffic consumes the least bandwidth of any access category, so this value can be set to a lower value once a general transmit rate is known by the network administrator (using a time trend analysis). The default threshold is 50%. For a neighbor: This is a percentage of the maximum burst size for low priority traffic. Background traffic exceeding the defined threshold is dropped by the client and a log message is generated. The default threshold is 50%.</td>
</tr>
<tr>
<td><strong>best-effort &lt;0-100&gt;</strong></td>
<td>The following keyword is applicable to the ‘from-air’ and ‘to-air’ traffics. Configures the threshold for best effort traffic For a meshpoint: This is a percentage of the maximum burst size for normal priority traffic. Best effort traffic exceeding the defined threshold is dropped and a log message is generated. Best effort traffic consumes little bandwidth, so this value can be set to a lower value once a general transmit rate is known by the network administrator (using a time trend analysis). The default threshold is 50%. For a neighbor: This is a percentage of the maximum burst size for normal traffic. Best effort traffic exceeding the defined threshold is dropped by the client and a log message is generated. The default threshold is 50%.</td>
</tr>
</tbody>
</table>

26.3.1 meshpoint-device

This command configures an access point to use a defined meshpoint. This command is available only under the AP622, AP650, AP6522, AP6532, AP71XX, AP81XX, AP82XX device or profile context. To configure this feature use one of the following options:

- navigate to the device profile config context (used when configuring access point profile on a controller)
- navigate to the device’s config context using the self command (used when configuring a logged on access point)

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax

```
meshpoint-device <MESHPOINT-NAME>
```

Parameters

- `meshpoint-device <MESHPOINT-NAME>`

26.3.2.1 acs

meshpoint-device-commands

Enables Automatic Channel Selection (ACS) on this meshpoint device (access point). When enabled, this feature automatically selects the best channel for a meshpoint-device radio based on the device configuration, channel conditions, and network layout.

In a wireless network deployment, it is advantageous for network devices to have the ability to operate in multiple channels and not be limited to only a single channel. Multiple channels increase the bandwidth and throughput of the wireless network. In such a scenario, each network device must have a mechanism to dynamically select a suitable channel of operation. ACS provides the required mechanism for a MCX enabled device.

Use this command to configure the ACS settings and override the default meshpoint configurations.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax

acs [channel-hold-time|channel-switch-delta|channel-width|ocs-duration|ocs-frequency|
    path-min|path-threshold|preferred-interface-tolerance-period|
    preferred-radio-interface|priority-meshpoint|sample-count|snr-delta|
    signal-threshold|tolerance-period]

acs channel-hold-time [2.4GHz|5GHz] <0-86400>
acs channel-switch-delta [2.4GHz|5GHz] <0-35>
acs channel-width [2.4GHz|5GHz] [20MHz|40MHz|auto]
acs ocs-duration [2.4GHz|5GHz] <0-200>
acs ocs-frequency [2.4GHz|5GHz] <0-200>
acs path-min [2.4GHz|5GHz] <0-200>
acs path-threshold [2.4GHz|5GHz] <0-200>
acs preferred-interface-tolerance-period [2.4GHz|5GHz] <0-100>
acs preferred-radio-interface [2.4GHz|5GHz] <0-2>
acs priority-meshpoint [2.4GHz|5GHz] <MESHPOINT-NAME>
acs sample-count [2.4GHz|5GHz] <0-10>
acs snr-delta [2.4GHz|5GHz] <0-100>
acs signal-threshold [2.4GHz|5GHz] <0-100>
acs tolerance-period [2.4GHz|5GHz] <0-1000>

Parameters
- acs channel-hold-time [2.4GHz|5GHz] <0-86400>

| acs | Configures ACS settings and overrides on the selected meshpoint-device |
### channel-hold-time

- **[2.4GHz|5GHz]** `<0-86400>`

  Configures the minimum time, in seconds, before a periodic scan, to assess channel conditions for a meshpoint root, is triggered.

  - **2.4GHz** – Configures the channel hold interval for the 2.4GHz radio band
  - **5.0GHz** – Configures the channel hold interval for the 5.0GHz radio band

  The following keyword is common to the ‘2.4GHz’ and ‘5.0GHz’ bands:
  - `<0-86400>` – Specify a value from 0 - 86400 seconds. The default is 1800 seconds.

  **Note:** A value of ‘0’ disables periodic channel assessment.

### channel-switch-delta

- **[2.4GHz|5GHz]** `<5-35>`

  Configures the difference in interference between the current and best channel needed to trigger a channel change. Once the difference in the current channel and the best channel interference equals the configured value, a channel change is triggered.

  - **2.4GHz** – Configures the channel switch delta for the 2.4GHz radio band
  - **5.0GHz** – Configures the channel switch delta for the 5.0GHz radio band

  The following keyword is common to the ‘2.4GHz’ and ‘5.0GHz’ bands:
  - `<5-35>` – Specify a value from 5 - 35 dBm. The default is 10 dBm.

### channel-width

- **[2.4GHz|5GHz]** `[20MHz|40MHz|auto]`

  Configures the channel width that meshpoint auto channel selection assigns to the radio

  - **2.4 GHz** – Configures the operating channel width for the 2.4 GHz radio band
  - **5.0 GHz** – Configures the operating channel width for the 5.0 GHz radio band

  The following keywords are common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:
  - 20 MHz – Assigns the 20 MHz channel width to the radio
  - 40 MHz – Assigns the 40 MHz channel width to the radio
  - auto – Selects and assigns the best possible channel from the 20/40 MHz width. This is the default setting.

### ocs-duration

- **[2.4GHz|5GHz]** `<20-250>`

  Configures the duration, in milliseconds, of off-channel scans (OCSs)

  - **2.4 GHz** – Configures the ocs-duration for the 2.4 GHz radio band
  - **5.0 GHz** – Configures the ocs-duration for the 5.0 GHz radio band

  The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:
  - `<20-250>` – Specify a value from 20 - 250 milliseconds. The default value is 50 milliseconds.

### ocs-frequency

- **[2.4GHz|5GHz]** `<1-60>`

  Configures ACS settings and overrides on the selected meshpoint-device

|                                                | • <800-65535> – Specify a value from 800 - 65535. The default is 1500.                                                                                                                                 |
| **acs preferred-interface-tolerance-period** [2.4GHz|5GHz] <10-600>                                           | Configures the maximum tolerance period, in seconds, for low root metrics on the preferred interface. This is the duration to wait before triggering an automatic channel selection for the next mesh-hop on the preferred interface. |
|                                                | • 2.4 GHz – Configures the maximum tolerance period for the 2.4 GHz radio band  
|                                                | • 5.0 GHz – Configures the maximum tolerance period for the 5.0 GHz radio band  
|                                                | The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:  
<p>|                                                | • &lt;800-65535&gt; – Specify a value from 10 - 600 seconds.                                                                                                                                                 |
| <strong>acs preferred-radio-interface</strong> [2.4GHz|5GHz] &lt;0-2&gt;                                               | Configures ACS settings and overrides on the selected meshpoint-device.                                                                                                                                 |</p>
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `preferred-radio-interface` [2.4GHz|5GHz] <0-2> | Configures the preferred radio interface on dual band APs  
- 2.4 GHz – Configures the preferred radio interface for the 2.4 GHz radio band  
- 5.0 GHz – Configures the preferred radio interface for the 5.0 GHz radio band  
The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:  
- <0-2> – Specify a value form 0 - 2. A value of 0 (zero) indicates no preferred radio. |
| `priority-meshpoint` [2.4GHz|5GHz] <MESHPOINT-NAME> | Configures the priority meshpoint. Configuring a priority meshpoint overrides automatic meshpoint configuration.  
- 2.4 GHz – Configures the priority meshpoint for the 2.4 GHz radio band  
- 5.0 GHz – Configures the priority meshpoint for the 5.0 GHz radio band  
The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:  
- <MESHPOINT-NAME> – Specify the meshpoint name for the selected radio band. |
| `sample-count` [2.4GHz|5GHz] <1-10> | Configures the minimum number of scan cycle samples to consider for auto channel selection  
- 2.4 GHz – Configures the sample count for the 2.4 GHz radio band  
- 5.0 GHz – Configures the sample count for the 5.0 GHz radio band  
The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:  
- <1-10> – Specify a value from 1 -10. The default is 5 samples. |
| `signal-threshold` [2.4GHz|5GHz] <-100-0> | Configures the signal strength threshold. If the signal strength of the next hop drops below the configured signal-threshold, a scan is triggered.  
- 2.4 GHz – Configures the signal-threshold for the 2.4 GHz radio band  
- 5.0 GHz – Configures the signal-threshold for the 5.0 GHz radio band  
The following keyword is common to the ‘2.4 GHz’ and ‘5.0 GHz’ bands:  
- <-100-0> – Specify a value from -100 - 0 dB. The default is -65 dB. |

```

Related Commands

`no` Reverts the configured ACS settings to default
26.3.2.2 exclude

meshpoint-device-commands

Enables wired-peer (that are wired MiNT level-1 neighbors) exclusion

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax
exclude wired-peer mint-level-1

Parameters
- exclude wired-peer mint-level-1

<table>
<thead>
<tr>
<th>exclude wired-peer</th>
<th>Excludes neighboring mesh devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>wired-peer mint-level-1</td>
<td>Excludes neighboring wired mesh devices with MiNTlevel-1 link</td>
</tr>
<tr>
<td></td>
<td>When enabled, all neighboring wired mesh devices are excluded from mesh links.</td>
</tr>
</tbody>
</table>

Examples
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#exclude wired-peer mint-level-1
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#show context
meshpoint-device test
  exclude wired-peer mint-level-1
rfs4000-229D58(config-profile-testAP71XX-meshpoint-test)#

Related Commands

no Disables wired-peer exclusion on this meshpoint
26.3.2.3 hysteresis

meshpoint-device-commands

Configures path selection SNR hysteresis values on this meshpoint-device (access point). These are settings that facilitate dynamic path selection. Configuring hysteresis prevents frequent re-ranking of the shortest path cost.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax

hysteresis [min-threshold|period|root-sel-snr-delta|snr-delta]

hysteresis [min-threshold <-100-0>|period <0-600>|root-sel-snr-delta <1-100>|snr-delta <1-100>]

Parameters

- **min-threshold <-100-0>**
  - Configures the minimum signal strength that a device should have to be considered a likely candidate in the mesh route (to the mesh root node) selection process.
  - *<-100-0>* — Specify a value from -100 - 0 dB. The default is 0 dB.

- **period <0-600>**
  - Configures the interval, in seconds, for which a likely candidate’s path method hysteresis is sustained. In other words a device capable of sustaining the signal strength for the specified period of time is a likely candidate in the mesh route (to the mesh root node) selection process.
  - *<0-600>* — Specify a value from 0 - 600 seconds. The default is 1 second.

- **root-sel-snr-delta <1-100>**
  - Configures the signal strength, in dB, that a device has to sustain, within the delta range, to be considered a likely candidate in the mesh route (to the mesh root node) selection process.
  - *<1-100>* — Specify a value from 1 - 100 dB.

- **snr-delta <1-100>**
  - Configures the SNR delta. The device with must have a SNR of a greater delta than its current neighbor to be considered a likely candidate in the mesh route (to the mesh root) selection process.
  - *<1-100>* — Specify a value from 1 - 100 dB. The default is 1 dB.

Examples

rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#hysteresis period 15
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#hysteresis root-sel-snr-delta 12
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#hysteresis snr-delta 3
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#hysteresis min-threshold -65
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)#show context

  hysteresis snr-delta 3
  hysteresis min-threshold -65
  hysteresis root-sel-snr-delta 12
rfs4000-229D58 (config-profile-testAP71XX-meshpoint-test)"

Related Commands

- **no**
  - Removes the configured path selection SNR hysteresis values
26.3.2.4 monitor

Enables monitoring of critical resource and primary port links. It also configures the action taken in case a critical resource goes down or a primary port link is lost.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax

```
monitor [critical-resource|primary-port-link-loss]
monitor [critical-resource|primary-port-link-loss] action no-root
```

Parameters

- `monitor [critical-resource|primary-port-link-loss] action no-root`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>critical-resource</td>
<td>Enables critical resource down event monitoring</td>
</tr>
<tr>
<td>primary-port-link-loss</td>
<td>Enables primary port link loss event monitoring</td>
</tr>
<tr>
<td>action</td>
<td>The following are common to all of the above:</td>
</tr>
<tr>
<td>no-root</td>
<td>- action – Sets the action taken if a critical resource goes down or if a primary port link is lost</td>
</tr>
<tr>
<td></td>
<td>- no-root – Changes the meshpoint to be non root (this is the action taken in case any of the above mentioned two events occur)</td>
</tr>
</tbody>
</table>

Examples

```
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#monitor critical-resource action no-root
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context meshpoint-device test
    name test
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#
```

Related Commands

- `no` Disables monitoring of critical resource and primary port links.
### 26.3.2.5 path-method

- **meshpoint-device-commands**

Configures the path selection method used on a meshpoint device. This is the method used to select the route to the root node within a mesh network.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622

**Syntax**

```
path-method [bound-pair|mobile-snr-leaf|snr-leaf|uniform]
```

**Parameters**

- **path-method [bound-pair|mobile-snr-leaf|snr-leaf|uniform]**

<table>
<thead>
<tr>
<th>path-method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bound-pair</td>
<td>Enables a meshpoint to form an exclusive path with only one other meshpoint. Select this option to bind one mesh point connection at a time. Once established, other mesh point connection requests are denied.</td>
</tr>
<tr>
<td>mobile-snr-leaf</td>
<td>Configures the path selection method as mobile-snr-leaf. When selected, the path to the root node is selected based on the <em>Signal-to-Noise Ratio</em> (SNR) to a neighboring device. This option allows meshpoint devices to select a neighbor with the strongest SNR. Meshpoint devices using the mobile-snr-leaf method are non-forwarding nodes in the meshpoint traffic. <strong>Note:</strong> Select this option for <em>Vehicular Mounted Modem</em> (VMM) access points or other mobile devices.</td>
</tr>
<tr>
<td>snr-leaf</td>
<td>This option allows meshpoints to select a neighbor with the strongest SNR. It is similar to the mobile-snr-leaf option, but is not applicable to mobile devices, such as VMMs.</td>
</tr>
<tr>
<td>uniform</td>
<td>Indicates the path selection method is uniform. When selected, two paths will be considered equivalent if the average goodput is the same for both paths. This is the default setting. <strong>Note:</strong> Select this option for infrastructure devices.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#path-method mobile-snr-leaf
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context
   meshpoint-device TEST
       name TEST
       path-method mobile-snr-leaf
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#
```

**Related Commands**

- **no** Resets the path selection method on a meshpoint device
26.3.2.6 preferred

meshpoint-device-commands

Configures the preferred path parameters for this meshpoint device

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax
preferred [neighbor <MAC>|root <MAC>|interface [2.4GHz|4.9GHz|5GHz]]

Parameters
- preferred [neighbor <MAC>|root <MAC>|interface [2.4GHz|4.9GHz|5GHz]]

| preferred | Configures the preferred path parameters |
| neighbor <MAC> | Adds the MAC address of a neighbor meshpoint as a preferred neighbor |
| root <MAC> | Adds the MAC address of a root meshpoint as a preferred root |
| interface [2.4GHz|4.9GHz|5GHz] | Sets the preferred interface |

Examples
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#preferred neighbor 11-22-33-44-55-66
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#preferred root 22-33-44-55-66-77
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#preferred interface 5GHz
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context
meshpoint-device test
  name test
  preferred root 22-33-44-55-66-77
  preferred neighbor 11-22-33-44-55-66
  preferred interface 5GHz
  monitor critical-resource action no-root
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#

Related Commands
- no Removes the configuration of preferred paths for this meshpoint device
26.3.2.7 root

meshpoint-device-commands

Configures this meshpoint device as the root meshpoint

You can optionally use the select-method option to enable dynamic mesh selection. When enabled, this option overrides root or no-root configuration and uses the selection method.

Supported in the following platforms:

- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622

Syntax

```
root {select-method [auto-mint|auto-proximity]}
```

Parameters

- root {select-method [auto-mint|auto-proximity]}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>root</td>
<td>Configures this meshpoint device as the root meshpoint</td>
</tr>
<tr>
<td>select-method auto-mint</td>
<td>Optional. Enables or disables dynamic mesh selection. When enabled, this option overrides root or no-root configuration and chooses the selection method.</td>
</tr>
<tr>
<td>select-method auto-mint auto-mint</td>
<td>Enables dynamic root selection using Auto-MiNT (based on path cost)</td>
</tr>
<tr>
<td>select-method auto-mint auto-proximity</td>
<td>Enables dynamic root selection using meshpoint proximity. When auto-proximity is selected, root selection is based on signal strength of candidate roots.</td>
</tr>
</tbody>
</table>

Note: The Auto-MiNT or Cost Method dynamically determines the root/non-root configuration of a meshpoint by:

- Monitoring and ranking the signal strength and path cost of neighboring mesh points.
- Setting the configuration to:
- non-root: If the link with the shortest path to the cost-root mesh device is a MCX meshpoint link
- root: If the link with the shortest path to the cost-root mesh device is a non MCX meshpoint link (wired link).
- This requires that the meshpoint device, in the brain car, be configured as the ‘cost root’ and the ‘cost root’ meshpoint-device be the l2 gateway to the controller. Use the root-select > cost-root command to configure a meshpoint-device as ‘cost-root’.
- Using signal strength of neighboring meshpoint as the sole metric to determine the next mesh hop to the root.
- Loop detection with both meshpoints in a car select non-root and form a mesh link with the same root

Examples

```
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#root
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context
meshpoint-device test
  name test
  root
  preferred root 22-33-44-55-66-77
  preferred neighbor 11-22-33-44-55-66
  preferred interface 5GHz
  monitor critical-resource action no-root
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#
```
```bash
ap7131-11E6C4(config-device-00-23-68-11-E6-C4-meshpoint-test)#root select-method auto-mint

ap7131-11E6C4(config-device-00-23-68-11-E6-C4-meshpoint-test)#show context
meshpoint-device test

root select-method auto-mint
```

### 26.3.2.8 root-select

*meshpoint-device-commands*

Configures this meshpoint device as the cost root

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622

#### Syntax

root-select cost-root

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>root-select cost-root</td>
<td>Configures this meshpoint device as the cost root. This is necessary for dynamic root selection process. Select this option to set the meshpoint as the cost root for meshpoint root selection. This setting is disabled by default.</td>
</tr>
</tbody>
</table>

#### Examples

```bash
ap7131-11B6C4(config-device-00-23-68-11-E6-C4-meshpoint-test)#root-select cost-root
ap7131-11B6C4(config-device-00-23-68-11-E6-C4-meshpoint-test)#show context
    meshpoint-device test
    root select-method auto-mint
    root-select cost-root
ap7131-11B6C4(config-device-00-23-68-11-E6-C4-meshpoint-test)#
```

#### Related Commands

</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes this meshpoint-device as the cost-root</td>
</tr>
</tbody>
</table>
### 26.3.2.9 no

**meshpoint-device-commands**

Negates the commands for a meshpoint device or resets values to default.

Supported in the following platforms:
- Access Points — AP6522, AP6532, AP6562, AP71XX, AP7532, AP7562, AP8132
- Access Points (as root APs only) — AP650, AP622

#### Syntax

```plaintext
no [acs|exclude|hysteresis|monitor|path-method|preferred|root|root-select]

no acs [channel-hold-time|channel-switch-delta|channel-width|ocs-duration|
        ocs-frequency|path-min|path-threshold|preferred-interface-tolerance-period|
        preferred-radio-interface|priority-meshpoint|sample-count|snr-delta|
        signal-threshold|tolerance-period] [2.4GHz|5GHz]

no exclude wired-peer mint-level-1

no hysteresis [min-threshold|period|root-sel-snr-delta|snr-delta]

no monitor [critical-resource|primary-port-link-loss]

no [path-method|root {select-method}]

no root-select cost-root

no preferred [interface|root|neighbor]
```

#### Parameters

- **no <PARAMETERS>**

  Removes or reverts this meshpoint device settings to default based on the parameters passed.

#### Examples

```bash
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context
  meshpoint-device test
    name test
    root
    preferred root 22-33-44-55-66-77
    preferred neighbor 11-22-33-44-55-66
    preferred interface 5GHz
    monitor critical-resource action no-root

rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#no monitor
critical-resource
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#no preferred neighbor
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#no root
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#no preferred interface

rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#show context
  meshpoint-device test
    name test
    no root
    preferred root 22-33-44-55-66-77
rfs7000-37FABE(config-profile-AP71XXTestProfile-meshpoint-test)#
```

There has been an exponential increase in the number and types of Wi-Fi mobile devices being used globally, resulting in a phenomenal growth in the data traffic volume. Consequently, the demand for secure, quick, and unlicensed access to public Wi-Fi hotspots, capable of handling this sudden influx of mobile data traffic, has been increasing. However, public hotspots have certain intrinsic usability issues, such as network discovery and selection, traffic prioritization, roaming capabilities, user authentication etc. The IEEE 802.11u standards (includes Hotspot 2.0 protocol extensions) were introduced to address these issues.

Hotspot 2.0 is a Wi-Fi Alliance standard that enables interoperability between clients, infrastructure, and operators. It makes a portion of the IEEE 802.11u standard mandatory and adds Hotspot 2.0 extensions that allow clients to query a network before actually attempting to join it. For example, you are using a laptop at an airport and have a list of SSIDs to select from. You will have to first identify the SSID you have the credentials for and then connect to the network. This can be time consuming. In such a scenario, a Hotspot 2.0 enabled device would present only those SSIDs for which you possess credentials. In short Hotspot 2.0 allows devices to query a network for configuration details, such as WAN metrics, network type, hotspot service provider details, and domain names without actually connecting to the network.

Hotspot 2.0 enabled clients can identify a Hotspot 2.0 capable access point (AP) from the new elements present in the APs beacon/probe messages. Having ascertained that an AP is Hotspot 2.0 capable, the client uses action frames to send an Access Network Query Protocol (ANQP) query inside a Generic Advertisement Service (GAS) request. The AP responds with an action frame containing an ANQP response within a GAS response. Based on this response the mobile device determines the type of credentials needed to log on to the AP.

The WiNG Wi-Fi Alliance implementation defines a passpoint policy that allows a single or a set of Hotspot 2.0 configuration to be global and referenced by the devices that use it. This policy is applied to APs to make them Hotspot 2.0 Wi-Fi Alliance compliant. The passpoint policy is mapped to a WLAN. However, only primary WLANs on a BSSID will have their passpoint policy configuration used. For more information, see Chapter 4, GLOBAL CONFIGURATION COMMANDS.
To migrate to the passpoint policy configuration mode, use the following command:

<DEVICE>(config)#passpoint-policy <POLICY-NAME>

rfs4000-229D58(config)#passpoint-policy test
rfs4000-229D58(config-passpoint-policy-test)#

rfs4000-229D58(config-passpoint-policy-test)#?
Passpoint Policy Mode commands:

- **3gpp**: Configure a 3gpp plmn (public land mobile network) id
- **access-network-type**: Set the access network type for the hotspot
- **connection-capability**: Configure the connection capability for the hotspot
- **domain-name**: Add a domain-name for the hotspot
- **hessid**: Set a homogeneous ESSID value for the hotspot
- **internet**: Advertise the hotspot having internet access
- **ip-address-type**: Configure the advertised ip-address-type
- **nai-realm**: Configure a NAI realm for the hotspot
- **net-auth-type**: Add a network authentication type to the hotspot
- **no**: Negate a command or set its defaults
- **operator**: Add configuration related to the operator of the hotspot
- **osu**: Online signup
- **roam-consortium**: Add a roam consortium for the hotspot
- **venue**: Set the venue parameters of the hotspot
- **wan-metrics**: Set the wan-metrics of the hotspot
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **exit**: End current mode and change to EXEC mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

rfs4000-229D58(config-passpoint-policy-test)#

**NOTE:** The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
### 27.1 passpoint-policy

The following table summarizes passpoint policy configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>3gpp</td>
<td>Configures a 3rd Generation Partnership Project (3gpp) Public Land Mobile Network (PLMN) ID</td>
<td>page 27-4</td>
</tr>

<td>access-network-type</td>
<td>Configures the access network type element in this hotspot</td>
<td>page 27-5</td>
</tr>
<tr>
<td>connection-capability</td>
<td>Configures the connection capability element in this passpoint policy</td>
<td>page 27-6</td>
</tr>
<tr>
<td>domain-name</td>
<td>Configures the RF Domains to which this hotspot is applicable</td>
<td>page 27-8</td>
</tr>
<tr>
<td>hessid</td>
<td>Configures the Homogeneous Extended Service Set Identifier (HESSID) for a specified hotspot zone</td>
<td>page 27-9</td>
</tr>
<tr>
<td>internet</td>
<td>Advertises the availability of Internet access in this hotspot</td>
<td>page 27-10</td>
</tr>
<tr>
<td>ip-address-type</td>
<td>Advertises the IP address type used in this hotspot.</td>
<td>page 27-11</td>
</tr>
<tr>
<td>nai-realm</td>
<td>Configures a Network Access Identifier (NAI) realm name and enters its configuration mode</td>
<td>page 27-13</td>
</tr>
<tr>
<td>net-auth-type</td>
<td>Configures the network authentication type used in this hotspot</td>
<td>page 27-19</td>
</tr>
<tr>
<td>no</td>
<td>Removes or reverts passpoint policy configuration</td>
<td>page 27-20</td>
</tr>
<tr>
<td>operator</td>
<td>Configures the operator friendly name for this hotspot</td>
<td>page 27-21</td>
</tr>
<tr>
<td>osu</td>
<td>Configures an online sign up (OSU) SSID/provider and enters its configuration mode</td>
<td>page 27-22</td>
</tr>
<tr>
<td>roam-consortium</td>
<td>Configures the list of Roaming Consortium Organization Identifiers (OIs) supported on this hotspot</td>
<td>page 27-32</td>
</tr>
<tr>
<td>venue</td>
<td>Configures the venue group and type for this passpoint policy</td>
<td>page 27-33</td>
</tr>
<tr>
<td>wan-metrics</td>
<td>Configures the WAN performance metrics for this hotspot</td>
<td>page 27-37</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
27.1.1 3gpp

passpoint-policy

Configures a 3rd Generation Partnership Project (3GPP) Public Land Mobile Network (PLMN) information. The 3GPP PLMN information is a combination of the Mobile Country Code (MCC) and Mobile Network Code (MNC). This MCC and MNC combination uniquely identifies a cellular operator. For example, Telstar Corporation Ltd. in Australia is identified by MCC 505 and MNC 001.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax

3gpp mcc <MOBILE-COUNTRY-CODE> mnc <MOBILE-NETWORK-CODE> {description <LINE>}

Parameters
- 3gpp mcc <MOBILE-COUNTRY-CODE> mnc <MOBILE-NETWORK-CODE> {description <LINE>}

<table>
<thead>
<tr>
<th>3gpp mcc &lt;MOBILE-COUNTRY-CODE&gt;</th>
<th>Specifies the MCC. The MCC is a two or three digit decimal value. For example, the MCC for Australia is 505.</th>
</tr>
</thead>
<tbody>
<tr>
<td>mnc &lt;MOBILE-NETWORK-CODE&gt;</td>
<td>Specifies the MNC. The MNC is a two or three decimal value used in combination with the MCC to uniquely identify a mobile network operator. The MNC and MCC combination (also known as the MCC/MNC tuple) forms the first five or six digits of the International Mobile Subscriber’s Identity (IMSI). <strong>Note:</strong> If the MCC and MNC values are not configured, the hotspot will not return the element in an ANQP capability request and ignores any ANQP query for the element.</td>
</tr>
<tr>
<td>description &lt;LINE&gt;</td>
<td>Optional. Configures a description that uniquely identifies this PLMN. Provide a description not exceeding 64 characters in length.</td>
</tr>
</tbody>
</table>

Examples

rfs4000-229D58(config-passpoint-policy-test)#3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#3gpp mcc 310 mnc 970
rfs4000-229D58(config-passpoint-policy-test)#show context hotspot2-policy test
3gpp mcc 310 mnc 970
3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#

Related Commands

no

Removes the specified 3gpp PLMN information and its corresponding MCC/MNC settings
27.1.2 access-network-type

Configures the access network type for this hotspot. The beacons and probe responses communicate the type of hotspot (public, private, guest-use, emergency etc.) to clients seeking access.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax
```
access-network-type [chargeable-public|emergency-services|experimental|free-public|
personal-device|private|private-guest|wildcard]
```

Parameters
- access-network-type [chargeable-public|emergency-services|experimental|free-public|
personal-device|private|private-guest|wildcard]

Examples
```
rfs4000-229D58(config-passpoint-policy-test)#access-network-type chargeable-public
rfs4000-229D58(config-passpoint-policy-test)#show context
hotspot2-policy test
access-network-type chargeable-public
3gpp mcc 310 mnc 970
3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#
```

Related Commands
- **no** Reverts to the default access network type setting (private)

Note: If the network type is set to chargeable-public, probe responses advertise this hotspot as a chargeable-public hotspot.
### 27.1.3 connection-capability

Configures the connection capability element in this passpoint policy. When configured, it communicates which ports are open or closed on the Hotspot, in response to an ANQP query.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

#### Syntax

```
connection-capability [ftp|http|icmp|ipsec-vpn|pptp-vpn|sip|ssh|tls-vpn] [closed|open|unknown]
connection-capability ip-protocol <0-255> port <0-65535> [closed|open|unknown]
```

#### Parameters

- **connection-capability [ftp|http|icmp|ipsec-vpn|pptp-vpn|sip|ssh|tls-vpn]**

- **connection-capability ip-protocol <0-255> port <0-65535> [closed|open|unknown]**

<table>
<thead>
<tr>
<th>connection-capability</th>
<th>Configures the connection capability element in this passpoint policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>ftp</td>
<td>Specifies the protocol type as FTP. Configures TCP port 20.</td>
</tr>
<tr>
<td>http</td>
<td>Specifies the protocol type as HTTP. Configures TCP port 80.</td>
</tr>
<tr>
<td>icmp</td>
<td>Specifies the protocol type as ICMP</td>
</tr>
<tr>
<td>ipsec-vpn</td>
<td>Specifies the protocol type as IPSEC VPN. Configures ESP and UDP ports 500 and 4500.</td>
</tr>
<tr>
<td>pptp-vpn</td>
<td>Specifies the protocol type as PPTP VPN. Configures TCP port 1723.</td>
</tr>
<tr>
<td>sip</td>
<td>Specifies the protocol type as SIP. Configures TCP port 5060 and UDP port 5060.</td>
</tr>
<tr>
<td>ssh</td>
<td>Specifies the protocol type as SSH. Configures TCP port 20</td>
</tr>
<tr>
<td>tls-vpn</td>
<td>Specifies the protocol type as TLS VPN. Configures TCP port 443.</td>
</tr>
</tbody>
</table>

| port <0-65535> [closed|open|unknown] | After specifying the protocol type, specify the port (associated with the selected protocol) and its status. |
|-----------------------------------------------|---------------------------------------------------------------|
|                                               | • closed – Specifies that the port(s) is/are closed |
|                                               | • open – Specifies that the port(s) is/are open |
|                                               | • unknown – Specifies that the port(s) status is not known |

**Note:** When the connection capability element is not configured, the hotspot does not return the element in an ANQP capability request and ignores any ANQP query for the element.

<table>
<thead>
<tr>
<th>connection-capability</th>
<th>Configures the connection capability element in this passpoint policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-protocol &lt;0-255&gt;</td>
<td>Identifies the IP protocol by the protocol’s number. For example, for simple message protocol (SMP) specify 121.</td>
</tr>
</tbody>
</table>
Port <0-65535> [closed|open|unknown]

- After specifying the IP protocol type, specify the port number.
- port <0-65535> – Select a port for the IP protocol identified.

After specifying the port number, specify the port status.

- closed – Specifies that the port(s) is/are closed
- open – Specifies that the port(s) is/are open
- unknown – Specifies that the port(s) status is not known

**Note:** When the connection capability element is not configured, the hotspot does not return the element in an ANQP capability request and ignores any ANQP query for the element.

**Examples**

```bash
rfs4000-229D58(config-passpoint-policy-test)#connection-capability 1 ip-protocol 2 port 10 closed
```

```bash
rfs4000-229D58(config-passpoint-policy-test)#show context
hotspot2-policy test
    access-network-type chargeable-public
    connection-capability ip-protocol 2 port 10 closed
3gpp mcc 310 mnc 970
3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#
```

**Related Commands**

- **no**
  
  Removes the configured connection capability element on the passpoint policy
27.1.4 domain-name

Configures the RF Domain(s) that are returned in response to an ANQP query

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax

```
domain-name <DOMAIN-NAME>
```

Parameters
- domain-name <DOMAIN-NAME>

<table>
<thead>
<tr>
<th>domain-name &lt;DOMAIN-NAME&gt;</th>
<th>Specify the RF Domain name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note:</strong> An hotspot can be applied across multiple RF Domains.</td>
</tr>
</tbody>
</table>

Examples

```
rfs4000-229D58(config-passpoint-policy-test)#domain-name TechPubs
rfs4000-229D58(config-passpoint-policy-test)#show context
hotspot2-policy test
  access-network-type chargeable-public
  connection-capability ip-protocol 2 port 10 closed
rfs4000-229D58(config-passpoint-policy-test)#
```

Related Commands

```
no
```
Removes the RF Domain mapped to this passpoint policy.
27.1.5 hessid

Configures the *Homogeneous Extended Service Set Identifier* (HESSID) for the hotspot. The HESSID uniquely identifies a hotspot provider within a zone. This is essential in zones (such as an airport or shopping mall) having multiple hotspot service providers with overlapping coverage.

An HESSID is a 6 (six) byte identifier that uniquely identifies a set of APs belonging to the same network and exhibiting same network behaviour. It is the BSSID (MAC address) of one of the devices (AP) in the zone. When not configured, the radio’s BSSID is used as the HESSID.

Supported in the following platforms:
- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

**Syntax**

```
hessid <MAC>
```

**Parameters**

- **hessid <MAC>**

<table>
<thead>
<tr>
<th>hessid &lt;MAC&gt;</th>
<th>Specify a unique 6 (six) byte identifier for this passpoint policy.</th>
</tr>
</thead>
</table>

**Examples**

```
rfs4000-229D58(config-passpoint-policy-test)#hessid 00-23-68-88-0D-A7
```

```
rfs4000-229D58(config-passpoint-policy-test)#show context
hotspot2-policy test
  access-network-type chargeable-public
  connection-capability ip-protocol 2 port 10 closed
  domain-name TechPubs
hessid 00-23-68-88-0D-A7
  3gpp mcc 310 mnc 970
  3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#
```

**Related Commands**

- **no**
  Removes the HESSID configured with this passpoint policy and reverts back to using the radio’s BSSID.
27.1.6 internet

Advertises the availability of Internet access on this hotspot. The Internet bit in the hotspot’s beacon and probe responses indicates if Internet access is available or not. By default this feature is enabled.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax
internet

Parameters
None

Examples
rfs4000-229D58(config-passpoint-policy-test)#internet
rfs4000-229D58(config-passpoint-policy-test)#

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes Internet access on this passpoint policy</td>
</tr>
</tbody>
</table>
27.1.7 **ip-address-type**

Advertises the IP address type used in this hotspot. This information is returned in response to ANQP queries.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

**Syntax**

```plaintext
ip-address-type [ipv4|ipv6]
```

- **ip-address-type ipv4** [double-nat|not-available|port-restricted|port-restricted-double-nat|port-restricted-single-nat|public|single-nat|unknown]

- **ip-address-type ipv6** [available|not-available|unknown]

**Parameters**

- **ip-address-type ipv4** [double-nat|not-available|port-restricted|port-restricted-double-nat|port-restricted-single-nat|public|single-nat|unknown]
  
<table>
<thead>
<tr>
<th>Parameter</th>

</table>
27.1.8 nai-realm

A Network Access Identifier (NAI) realm element in the passpoint policy identifies a hotspot service provider by the unique NAI realm name.

The following table lists NAI realm configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>nai-realm</td>
<td>Creates a NAI realm name for this hotspot and enters its configuration mode</td>
<td>page 27-14</td>
</tr>
<tr>
<td>nai-realm-config-mode</td>
<td>Invokes the NAI realm configuration mode commands</td>
<td>page 27-16</td>
</tr>
</tbody>
</table>
27.1.8.1 nai-realm

Configures a NAI realm name and enters its configuration mode. The NAI realm name identifies the accessible hotspot service providers. You can configure a list of NAI realm names of service providers operating within a specific hotspot zone. This NAI realm name list is presented in ANQP response to a NAI realm and NAI home realm query.

The configured NAI realm name list is presented in ANQP response to a NAI realm and NAI home realm query.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax
nai-realm <HOTSPOT2-NAI-REALM-NAME>

Parameters
- nai-realm <HOTSPOT2-NAI-REALM-NAME> — Configures the NAI realm name for this passpoint policy.

Examples
rfs4000-229D58 (config-passpoint-policy-test)#nai-realm mail.example.com
rfs4000-229D58 (config-passpoint-policy-test-nai-realm-mail.example.com)#
rfs4000-229D58 (config-passpoint-policy-test)#nai-realm mail.testrealm.com
rfs4000-229D58 (config-passpoint-policy-test-nai-realm-mail.testrealm.com)#
rfs4000-229D58 (config-passpoint-policy-test-nai-realm-mail.example.com)#?

Hotspot2 NAI Realm Mode commands:
- eap-method — Set an eap method
- no — Negate a command or set its defaults
- clrscr — Clears the display screen
- commit — Commit all changes made in this session
- do — Run commands from Exec mode
- end — End current mode and change to EXEC mode
- exit — End current mode and down to previous mode
- help — Description of the interactive help system
- revert — Revert changes
- service — Service Commands
- show — Show running system information
- write — Write running configuration to memory or terminal

<tr>
<td></td>
<td>mechanisms supported by each of the service providers associated with this</td>
<td></td>
</tr>
<tr>
<td></td>
<td>passpoint policy</td>
<td></td>
</tr>
</tbody>
</table>
### 27.1.8.2.1 eap-method

#### nai-realm-config-mode commands

Specifies the EAP authentication mechanisms supported by each of the service providers associated with this passpoint policy.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

**Syntax**

```
eap-method <1-10> [<1-255>|fast|gtc|identity|ikev2|ms-auth|mschapv2|otp|peap|psk|rsa-public-key|sim|tls|ttls] auth-param [credential|expanded-eap|expanded-inner-eap|inner-eap|non-eap-inner|tunn-eap-credential|vendor] [cert|hw-token|nfc-secure-elem|none|sim|soft-token|username-password|usim|vendor]
```

**Parameters**

<table>
<thead>
<tr>
<th>eap-method &lt;1-10&gt;</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creates an EAP authentication method and assigns it an index number.</td>
<td></td>
</tr>
<tr>
<td>• &lt;1-10&gt; — Specify a identifier for this EAP method from 1 - 10.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> A maximum of 10 (ten) authentication methods can be specified for every NAI realm. After creating the EAP authentication method, specify the associated authentication mechanisms (method types).</td>
<td></td>
</tr>
</tbody>
</table>

| <1-255> | Identifies the EAP authentication method type from the corresponding Internet Assigned Numbers Authority (IANA) number. |
| **Note:** <1-255> — Specify the IANA identity number for the authentication protocol from 1 -255. |

| fast | Specifies the EAP authentication method type as Flexible Authentication via Secure Tunneling (FAST) |
| identity | Specifies the EAP authentication method type as Identification |
| ikev2 | Specifies the EAP authentication method type as Internet Key Exchange Protocol version 2 (IKEv2) |
| ms-auth | Specifies the EAP authentication method type as Microsoft Authentication (MS-Auth) |
| mschapv2 | Specifies the EAP authentication method type as Microsoft Challenge Handshake Authentication Protocol version 2 (MSCHAPv2) |
| opt | Specifies the EAP authentication method type as One Time Password (OTP) |
| peap | Specifies the EAP authentication method type as Protected Extensible Authentication Protocol (PEAP) |
| psk | Specifies the EAP authentication method type as Pre-shared Key (PSK) |
| rsa-public-key | Specifies the EAP authentication method type as RSA public key protocol |
| sim | Specifies the EAP authentication method type as GSM Subscriber Identity Module (SIM) |
### Examples

The following examples show four EAP authentication methods associated with the NAI realm ‘mail.example.com’. Each method supports a different EAP authentication mechanism:

- **ttls**
  ```
  rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#eap-method 1
ttls auth-param vendor hex 0001E
  ```
- **rsa-public-key**
  ```
  rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#eap-method 2
  rsa-public-key auth-param credential cert
  ```
- **peap**
  ```
  rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#eap-method 4
  peap auth-param credential cert
  ```

rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#show context
nairealm mail.example.com
eap-method 1 ttls auth-param vendor hex 00121F
eap-method 2 rsa-public-key auth-param credential cert
eap-method 3 otp auth-param credential username-password
eap-method 4 peap auth-param credential cert
rfs4000-229D58(config-passpoint-policy-test-nai-realm-mail.example.com)#

<table>
<thead>
<tr>
<th></th>
<th>Specifies the EAP authentication method type as <em>Transport Layer Security</em> (TLS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>tttls</td>
<td>Specifies the EAP authentication method type as <em>Tunneled Transport Layer Security</em> (TTLS)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>auth-param</th>
</tr>
</thead>
<tbody>
<tr>
<td>After specifying the EAP authentication method type, specify the authentication parameters. These parameters depend on the EAP authentication mechanism selected.</td>
</tr>
</tbody>
</table>

| [cert|hw-token|nfc-secure-elem|none|sim|soft-token|username-password|usim|vendor] |
|---|
| The following parameters are common to all the above authentication parameters: |
| • cert – Certificate |
| • hw-token – Hardware token |
| • nfc-secure-elem – NFC secure element |
| • none – No credential |
| • sim – Subscriber identity module |
| • soft-token – Soft token |
| • username-password – Username and password |
| • usim – Universal subscriber identity module |
| • vendor – Vendor specific credential |
27.1.9 net-auth-type

```plaintext
>>> passpoint-policy
```

Configures the network authentication type used in this hotspot. The details configured are returned in response to an ANQP query.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

**Syntax**

```plaintext
net-auth-type \[accept-terms|dns-redirect|http-redirect|online-enroll\] \{url <URL>\}
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>net-auth-type</td>
<td>Specifies the network authentication type used with this passpoint policy. The options are: accept-terms, dns-redirect, http-redirect, and online-enroll</td>
</tr>
<tr>
<td>accept-terms</td>
<td>Enables user acceptance of terms and conditions</td>
</tr>
<tr>
<td>dns-redirect</td>
<td>Enables DNS redirection of user</td>
</tr>
<tr>
<td>http-redirect</td>
<td>Enables HTTP redirection of user</td>
</tr>
<tr>
<td>online-enroll</td>
<td>Enables online user enrolment</td>
</tr>
<tr>
<td>url &lt;URL&gt;</td>
<td>Optional. Specify the location for each of above network authentication types.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
rfs4000-229D58(config-passpoint-policy-test)#net-auth-type accept-terms url "www.test.com"
rfs4000-229D58(config-passpoint-policy-test)#
```

```plaintext
rfs4000-229D58(config-passpoint-policy-test)#show context
 hotspot2-policy test
 access-network-type chargeable-public

 3gpp mcc 310 mnc 970
 3gpp mcc 505 mnc 14
 rfs4000-229D58(config-passpoint-policy-test)#
```

**Related Commands**

```plaintext
no
```

Removes the network authentication type configured with this passpoint policy
27.1.10 no

passpoint-policy

Removes or reverts the passpoint policy settings

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax

no [3gpp|access-network-type|connection-capability|domain-name|hessid|internet|
ip-address-type|nai-realm|net-auth-type|operator|osu|roam-consortium|venue|
wlan-metrics]

Parameters

- no <PARAMETERS> Removes or reverts the passpoint policy settings

Examples

The following example shows the passpoint policy ‘test’ settings before the ‘no’ commands are executed:

```bash
rfs4000-229D58(config-passpoint-policy-test)#show context
hotspot2-policy test
access-network-type chargeable-public
connection-capability ip-protocol 2 port 10 closed
domain-name TechPubs
hessid 00-23-68-88-0D-A7
ip-address-type ipv6 available
nai-realm mail.example.com
eap-method 1 ttls auth-param vendor hex 00001E
eap-method 2 rsa-public-key auth-param credential cert
eap-method 3 otp auth-param credential username-password
eap-method 4 peap auth-param credential cert
nai-realm mail.testrealm.com
net-auth-type accept-terms url www.test.com
3gpp mcc 310 mcc 970
3gpp mcc 505 mcc 14
rfs4000-229D58(config-passpoint-policy-test)₴
```

```bash
rfs4000-229D58(config-passpoint-policy-test)#no access-network-type
rfs4000-229D58(config-passpoint-policy-test)#no hessid
rfs4000-229D58(config-passpoint-policy-test)#no nai-realm mail.example.com
rfs4000-229D58(config-passpoint-policy-test)#no 3gpp mcc 310 mcc 970
rfs4000-229D58(config-passpoint-policy-test)#no internet
```

```bash
rfs4000-229D58(config-passpoint-policy-test)#show context
hotspot2-policy test
connection-capability ip-protocol 2 port 10 closed
domain-name TechPubs
no internet
ip-address-type ipv6 available
nai-realm mail.testrealm.com
net-auth-type accept-terms url www.test.com
3gpp mcc 505 mcc 14
rfs4000-229D58(config-passpoint-policy-test)₴
```
**27.1.11 operator**

*passpoint-policy*

Configures the operator friendly name for this hotspot. The name can be configured in English or in any language other than English. When the name is specified in English, the system allows an ASCII input. If you are using a language other than English, first specify the ISO-639 language code, and then specify the name as an hexadecimal code.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000

**Syntax**

```
operator name <OPERATOR-NAME>
```

**Parameters**

- `operator name <OPERATOR-NAME>`

<table>
<thead>
<tr>
<th>name &lt;OPERATOR-NAME&gt;</th>
<th>Configures the operator's name in English</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;OPERATOR-NAME&gt;</code></td>
<td>– Specify the operator friendly name in ASCII format.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs4000-229D58(config-passpoint-policy-test)#operator name emergencyservices
rfs4000-229D58(config-passpoint-policy-test)#show context
hotspot2-policy test
    connection-capability ip-protocol 2 port 10 closed
domain-name TechPubs
    no internet
    ip-address-type ipv6 available
    nai-realm mai.testrealm.com
    net-auth-type accept-terms url www.test.com
    operator name emergencyservices
    3gpp mcc 505 mnc 14
rfs4000-229D58(config-passpoint-policy-test)#
```

**Related Commands**

`no` | Removes the operator friendly name configured for this passpoint policy
### 27.1.12 osu

*passpoint-policy*

The following table lists the OSU SSID/provider configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>osu</td>
<td>Configures an <em>online sign up</em> (OSU) SSID/provider and enters its configuration mode</td>
<td>page 27-23</td>
</tr>
<tr>
<td>osu-config-mode</td>
<td>Summarizes the OSU SSID/provider configuration mode commands</td>
<td>page 27-24</td>
</tr>
</tbody>
</table>
27.1.12.1 osu

Adds an online sign up (OSU) SSID (WLAN)/OSU provider and enters its configuration mode

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax

```
=osu [provider <PASSPOINT-OSU-PROVIDER>|ssid <SSID>]
```

Parameters

- **osu [provider <PASSPOINT-OSU-PROVIDER>|ssid <SSID>]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>osu</strong></td>
<td>Use this command to configure an online sign up (OSU) SSID/OSU provider. In the OSU SSID/provider configuration mode, specify OSU details, such as names, descriptions, servers, methods, and icons available. This information is returned in response to a station’s Hotspot 2.0 query. When configured, this option enables a station to obtain credentials for an Hotspot 2.0 enabled SSID.</td>
</tr>
<tr>
<td><strong>provider</strong></td>
<td>Creates an OSU provider for this passpoint and enters its configuration mode</td>
</tr>
<tr>
<td><strong>&lt;PASSPOINT-OSU-PROVIDER&gt;</strong></td>
<td>— Specify an identification for this OSU passpoint provider.</td>
</tr>
<tr>
<td><strong>ssid</strong></td>
<td>Configures an OSU WLAN’s SSID. This is the open authentication SSID that a user can use to obtain credentials for the passpoint SSID.</td>
</tr>
<tr>
<td><strong>&lt;SSID&gt;</strong></td>
<td>— Specify the SSID.</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#?
```

Passport OSU Provider Mode commands:
- `description` Configure the english description of the online signup provider
- `icon` Add an icon for the online signup provider
- `method` Specify the online signup method supported by provider
- `nai` Configure the NAI for the online signup provider
- `name` Configure the english name of the online signup provider
- `no` Negate a command or set its defaults
- `server-url` Configure the signup url for the online signup provider
- `clrscr` Clears the display screen
- `commit` Commit all changes made in this session
- `do` Run commands from Exec mode
- `exit` End current mode and down to previous mode
- `help` Description of the interactive help system
- `revert` Revert changes
- `service` Service Commands
- `show` Show running system information
- `write` Write running configuration to memory or terminal

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#
```

Related Commands

```
no
```

Removes the OSU WLAN/provider configured with this passpoint policy
### 27.1.12.2 osu-config-mode commands

The following table summarizes OSU SSID/provider configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>Configures the OSU provider's description</td>
<td>page 27-25</td>
</tr>
<tr>
<td>icon</td>
<td>Adds the OSU provider's icon</td>
<td>page 27-26</td>
</tr>
<tr>
<td>method</td>
<td>Configures the open sign up methods available on this OSU</td>
<td>page 27-27</td>
</tr>
<tr>
<td>nai</td>
<td>Configures the OSU provider’s NAI</td>
<td>page 27-28</td>
</tr>
<tr>
<td>name</td>
<td>Configures the OSU provider's name</td>
<td>page 27-29</td>
</tr>
<tr>
<td>no</td>
<td>Removes the settings configured for this OSU provider</td>
<td>page 27-30</td>
</tr>
<tr>
<td>server-url</td>
<td>Configures the OSU provider server's URL</td>
<td>page 27-31</td>
</tr>
</tbody>
</table>
27.1.12.2.1 description

*osu-config-mode commands*

Configures the OSU SSID/provider's description. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532,-
  AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

**Syntax**

description [<DESCRIPTION>|iso-lang <ISO-LANG-CODE>]

**Parameters**

- description [<DESCRIPTION>|iso-lang <ISO-LANG-CODE>]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;DESCRIPTION&gt;</td>
<td>Provides a description for the OSU provider. It should not exceed 253 characters in length.</td>
</tr>
<tr>
<td>iso-lang &lt;ISO-LANG-CODE&gt;</td>
<td>Identifies the language by its ISO 639 language code (for example, 'chi-chinese' or 'spa-spanish'). By default the language is set to English. If specifying the description in any language other than English, specify the ISO language code.</td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#description "Provides free service for testing purposes"

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context

osu provider WiFi
description "Provides free service for testing purposes"

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes this OSU provider's description</td>
</tr>
</tbody>
</table>
27.1.12.2.2 icon

Adds the OSU provider's icon. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax

```
icon iso-lang <ISO-LANG-CODE> width <0-65535> height <0-65535>
   mime-type <FILE-MIME-TYPE> file [<IMAGE-FILE-NAMES/PATH>|<FILE-NAME>]
```

Parameters

- `icon iso-lang <ISO-LANG-CODE> width <0-65535> height <0-65535> mime-type <FILE-MIME-TYPE> file [<IMAGE-FILE-NAMES/PATH>|<FILE-NAME>]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iso-lang &lt;ISO-LANG-CODE&gt;</td>
<td>Configures an icon representing the OSU provider. By default the language is set to English. If specifying the image file name and path in any language other than English, specify the ISO language code.</td>
</tr>
<tr>
<td>width &lt;0-65535&gt;</td>
<td>Configures the icon's width in pixels. Specify a value from 0 - 65535 pixels.</td>
</tr>
<tr>
<td>height &lt;0-65535&gt;</td>
<td>Configures the icon's height in pixels. Specify a value from 0 - 65535 pixels.</td>
</tr>
<tr>
<td>mime-type &lt;FILE-MIME-TYPE&gt;</td>
<td>Configures a string describing the icon's standard mime type. For example, image/png.</td>
</tr>
<tr>
<td>file [&lt;IMAGE-FILE-NAMES/PATH&gt;</td>
<td>&lt;FILE-NAME&gt;]</td>
</tr>
</tbody>
</table>

Examples

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#icon iso-lang eng
   width 128 height 128 mime-type image/png file flash:/wifi_icon
```

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context
   osu provider WiFi
   description "Provides free service for testing purposes"
   icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
```

Related Commands

- `no` Removes this OSU provider's icon
27.1.12.2.3 method

- **osu-config-mode commands**

  Configures the open sign up methods available on this OSU provider. This value is returned, in the specified order of precedence, in the ANQP OSU providers list.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

**Syntax**

```
method [oma-dm|soap-xml-spp] priority <1-2>
```

**Parameters**

- **method [oma-dm|soap-xml-spp] priority <1-2>**

| method [oma-dm|soap-xml-spp] priority <1-2> | Configures the online sign up methods supported by this OSU provider |
|------------------------------------------|------------------------------------------------------------------|
|                                          | • oma-dm – Configures the OSU method used as Open Mobile Alliance (OMA) device management |
|                                          | • soap-xml-spp – Configures the OSU method used as Soap-xml subscription provisioning protocol |
|                                          | • priority <1-2> – Sets the priority of the specified method. Select a value from 1 - 2. The default is one (1). |

**Examples**

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#method soap-xml-spp priority 1
```

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context
osu provider WiFi
description "Provides free service for testing purposes"
icong iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
```

```
x9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#
```

**Related Commands**

| no | Removes the online sign up methods configured on this OSU provider |
27.1.12.2.4 nai

osu-config-mode commands

Configures the OSU provider's NAI. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax

nai <WORD>

Parameters

- nai <WORD>

nai <WORD> Configures the OSU provider's NAI
- <WORD> — Specify the NAI.

Examples

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#nai wifi.org

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context

osu provider WiFi
description "Provides free service for testing purposes"
icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
method soap-xml-spp priority 1

nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#

Related Commands

no Removes this OSU provider's NAI
27.1.12.2.5 name

Configure the OSU provider's name. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax
name [<NAME>|iso-lang <ISO-LANG-CODE>]

Parameters
- name [<NAME>|iso-lang <ISO-LANG-CODE>]

| <NAME> | Configures the OSU provider's name. It should not exceed 253 characters in length.
| iso-lang <ISO-LANG-CODE> | Identifies the language by its ISO 639 language code (for example, 'chi-chinese' or 'spa-spanish'). By default the language is set to English. If specifying the name in any language other than English, specify the ISO language code.

Examples
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#name "WIFI Alliance OSU"
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context
osu provider WiFi
    name "WIFI Alliance OSU"
    description "Provides free service for testing purposes"
    icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
    method soap-xml-spp priority 1
    nai wifi.org
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#

Related Commands

### 27.1.12.2.7 server-url

**osu-config-mode commands**

Configures the OSU provider server’s URL. This value is returned in the ANQP OSU providers list.

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

**Syntax**

```
server-url <URL>
```

**Parameters**

- **server-url <URL>**

<table>
<thead>
<tr>
<th>server-url &lt;URL&gt;</th>
<th>Configures the OSU provider server’s URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;URL&gt;</td>
<td>- Specify the server’s url.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#server-url osu-server.wifi.org
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#show context osu provider WiFi
  name "WIFI Alliance OSU"
  description "Provides free service for testing purposes"
  icon iso-lang eng width 128 height 128 mime-type image/png file flash:/wifi_icon
  method soap-xml-spp priority 1
  nai wifi.org
  server-url osu-server.wifi.org
nx9500-6C8809(config-passpoint-policy-test-osu-provider-WiFi)#
```

**Related Commands**

  Removes this OSU provider’s server’s URL
27.1.13 roam-consortium

passpoint-policy

Configures a list of Roaming Consortium (RC) Organization Identifiers (OIs) supported on this hotspot. The beacons and probe responses communicate this Roaming Consortium list to devices. This information enables a device to identify the networks available through this AP.

Each OI identifies a either a group of Subscription Service Providers (SSPs) or a single SSP.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax

roam-consortium hex <WORD>

Parameters

- roam-consortium hex <WORD> Adds a Roaming Consortium OI to this hotspot in hexadecimal format
  - <WORD> – Specify the Roaming Consortium OI in hexadecimal format (should not exceed 128 characters)
- hex <WORD> Configures a hexadecimal input
  - <WORD> – Specify the Roaming Consortium OI in hexadecimal format (should not exceed 128 characters)

Examples

27.1.14 venue

`passpoint-policy`

Configures the venue where this hotspot is located. The hotspot venue configuration informs prospective clients about the hotspot's nature of activity, such as educational, institutional, residential etc.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

**Syntax**

```
venue [group|name]
venue group [assembly|business|educational|industrial|institutional|mercantile|outdoor|residential|storage|unspecified|utility-and-misc|vehicular] type
venue name [<VENUE-NAME>|iso-lang]
venue name <VENUE-NAME>
venue name iso-lang <ISO-LANG-CODE> <VENUE-NAME>
```

**Parameters**
- `venue group [assembly|business|educational|industrial|institutional|mercantile|outdoor|residential|storage|unspecified|utility-and-misc|vehicular] type` Configures the venue group associated with this hotspot.
  - `type` — Specifies the venue type for this group. The options are:
    - `<0-255>` — Specifies an unlisted venue type number from 0 - 255
    - `amphitheater` — Specifies the venue type as amphitheater (4)
    - `amusement-park` — Specifies the venue type as amusement park (5)
    - `arena` — Specifies the venue type as arena (1)
    - `bar` — Specifies the venue type as bar (12)
    - `coffee-shop` — Specifies the venue type as a coffee shop (13)
    - `convention-centre` — Specifies the venue type as a convention center (7)
    - `emergency-coordination-center` — Specifies the venue type as an emergency coordination center (15)
    - `library` — Specifies the venue type as a library (8)
    - `museum` — Specifies the venue type as a museum (9)
    - `passenger-terminal` — Specifies the venue type as a passenger terminal (3)
    - `place-of-worship` — Specifies the venue type as a place of worship (6)
    - `restaurant` — Specifies the venue type as a restaurant (10)
    - `stadium` — Specifies the venue type as a stadium (2)
    - `theater` — Specifies the venue type as a theater (11)
    - `unspecified` — Specifies the venue type as not specified (0)
    - `zoo` — Specifies the venue type as a zoo (14)

Removes the venue group and type configured with this passpoint policy
27.1.15 wan-metrics

Configures the WAN performance metrics for this hotspot. This command configures the upstream and downstream speeds associated with this hotspot. The upstream and downstream speed values (in Kbps) are estimates of the bandwidth available on the WAN. This information is returned in response to client ANQP query, and is useful for clients having a minimum and/or large bandwidth requirement.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX7500, NX7510, NX7520, NX7530, NX9000, NX9600

Syntax

```bash
wan-metrics down-speed <0-4294967295> up-speed <0-4294967295>
```

Parameters

- **wan-metrics down-speed <0-4294967295> up-speed <0-4294967295>**

This chapter summarizes the Border Gateway Protocol (BGP) related configuration commands in the CLI command structure. BGP is a routing protocol, which establishes routing between ISPs. ISPs use BGP to exchange routing information between Autonomous Systems (ASs) on the Internet. The routing information shared includes details, such as ASs traversed to a particular destination, reachable ASs, best paths available, network policies and rules applied on a route etc. These details appear as BGP attributes carried in routing update packets. BGP uses this information to make routing decisions. Therefore, the primary role of a BGP system is to exchange routing information with other BGP peers.

BGP uses TCP as its transport protocol. This eliminates the need to implement explicit update fragmentation, retransmission, acknowledgement, and sequencing. BGP listens on TCP port 179. The error notification mechanism used in BGP assumes that TCP supports a graceful close (all outstanding data is delivered before the connection is closed). Routing information exchanged through BGP supports only destination-based forwarding (it assumes a router forwards packets based on the destination address carried in the IP header of the packet).

An AS is a set of routers under the same administration that use Interior Gateway Protocol (IGP) and common metrics to define how to route packets within the AS. There are two types of BGP systems: external BGP (eBGP) and internal BGP (iBGP). iBGP represents the exchange of routing information between BGP peers within an AS. Whereas, when two BGP peers, belonging to different ASs, are connected you have an eBGP setup.

BGP peers (also referred to as neighbors) are BGP enabled devices that are directly connected through an established TCP connection. When two BGP enabled peers establish a TCP connection the first time, they exchange their BGP routing tables. All subsequent route table modifications are exchanged as route updates. BGP tracks these route updates by maintaining route table version numbers. With every update the version number changes. At any given point in time, all BGP peers should have the same route table version. The peer-to-peer TCP connections are kept alive through keepalive packets exchanged at specified intervals. Errors and special events are communicated between peers as notification packets.

This chapter is organized as follows:

- bgp-ip-prefix-list-config commands
- bgp-ip-access-list-config commands
- bgp-as-path-list-config commands
- bgp-community-list-config commands
- bgp-extcommunity-list-config commands
- bgp-route-map-config commands
- bgp-router-config commands
• bgp-neighbor-config commands

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
28.1 bgp-ip-prefix-list-config commands

IP prefix lists are a convenient way to filter prefixes (contained in route update packets) transmitted to (or received from) other BGP supported routers. IP prefix lists are similar to access lists. They contain ordered entries (deny or permit prefix rules), identified by their sequence numbers. Each rule specifies match criteria (network and subnet prefixes and prefix masks) to match. When a prefix (received or transmitted) matches the prefix specified in one of the rules, it is filtered and an action is applied depending on where the IP prefix list is used. For example, when used in the BGP neighbor context, the prefixes received from the neighbor are filtered and the filtered prefixes are either rejected or accepted depending on the rule type (deny or permit).

IP prefix lists are also used in the BGP route map context to filter prefixes. The action applied, on filtered prefixes is set within the route map. Another use case for IP prefix lists is to filter prefixes before redistribution of local OSPF routes to eBGP enabled ASs.

Like in access lists, these deny and permit prefix rules are processed sequentially, in ascending order of their sequence number. Once a match is made, the BGP enabled router stops processing all subsequent rules in the ip-prefix-list.

IP prefix lists are used as match criteria in the following contexts:

- BGP neighbor. For more information, see use.
- BGP route-map context. For more information, see match.

To navigate to the ip-prefix-list configuration instance, use the following command:

```
<DEVICE>(config)#bgp ip-prefix-list <IP-PREFIX-LIST-NAME>
```

The following table summarizes the BGP IP prefix list configuration commands:

<table>

</tr>
</tbody>
</table>
### 28.1.1 deny

BGP-IP-Prefix-List-Config commands

Creates and configures a deny prefix-list rule. The deny rule specifies match criteria based on which prefixes received from (or transmitted to) a BGP neighbor are filtered. A deny action is applied on these filtered prefixes. For example, in the BGP router neighbor context a filter is applied using an IP prefix list. The list contains a deny rule with a prefix to match as 192.168.13.0/24. All prefixes received from the neighbor matching this prefix are denied.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

deny prefix-list <1-4294967295> [<PREFIX-TO-MATCH/MASK>]|any]
deny prefix-list <1-4294967295> [<PREFIX-TO-MATCH/MASK> {ge <0-32>|le <0-32>}]|any]

**Parameters**
- deny prefix-list <1-4294967295> [<PREFIX-TO-MATCH/MASK> {ge <0-32>|le <0-32>}]|any

<table>
<thead>
<tr>
<th>deny prefix-list &lt;1-4294967295&gt; [&lt;PREFIX-TO-MATCH/MASK&gt; any]</th>
<th>Creates and configures a deny prefix-list rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;1-4294967295&gt; — Configures a sequence number for this deny rule. Specify a value from 1 - 4294967295. Within a prefix list, rules are applied in an ascending order of their sequence number. Rules with lower sequence number are applied first.</td>
<td></td>
</tr>
<tr>
<td>• &lt;PREFIX-TO-MATCH/MASK&gt; — Specify the prefix to match. For example 10.0.0.0/8 or 192.168.13.0/24. Routes matching the specified prefix are filtered.</td>
<td></td>
</tr>
<tr>
<td>• ge &lt;0-32&gt; — Optional. Specifies a greater than or equal to value for the IP prefix length (subnet mask)</td>
<td></td>
</tr>
<tr>
<td>• le &lt;0-32&gt; — Optional. Specifies a less than or equal to value for the IP prefix length</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The 'ge' and 'le' options specify a IP prefix length range. Use these options to specify a more specific (granular) prefix match criteria.
- any — Sets the prefix match criteria to any. When selected, all routes are filtered, and the action applied is deny. At the backend, this option sets the match criteria to 0.0.0.0/0 le 32.

**Examples**
nx9500-6C8809(config-bgp-ip-prefix-list-test)#deny prefix-list 1 168.192.13.0/24

nx9500-6C8809(config-bgp-ip-prefix-list-test)#show context bgp-ip-prefix-list test

deny prefix-list 1 168.192.13.0/24

nx9500-6C8809(config-bgp-ip-prefix-list-test)#

**Related Commands**

| no | Removes a deny prefix-list rule from this IP prefix list |
28.1.2 permit

*bgp-ip-prefix-list-config commands*

Creates and configures a permit prefix-list rule. The permit rule specifies match criteria based on which prefixes received from (or transmitted to) a BGP neighbor are filtered. A permit action is applied on these filtered prefixes. For example, in the BGP router neighbor context a filter is applied using a IP prefix list. The list contains a permit rule with a prefix to match as 172.168.10.0/24. All prefixes received from the neighbor matching this prefix are permitted.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
permit prefix-list <1-4294967295> [<PREFIX-TO-MATCH/MASK>|any]
```

**Parameters**

- `permit prefix-list <1-4294967295> [<PREFIX-TO-MATCH/MASK>|any]`

**Examples**

```
nx9500-6C8809(config-bgp-ip-prefix-list-test)#permit prefix-list 2 172.122.10.0/24
```

**Related Commands**

- `no` Removes a permit prefix rule from this IP prefix list
28.1.3 no

- **bgp-ip-prefix-list-config commands**

  Removes the specified deny or permit prefix-list rule from this IP prefix list

  Supported in the following platforms:
  - Wireless Controllers — RFS4000, RFS6000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

no [deny|permit] prefix-list <1-4294967295> {<PREFIX-TO-MATCH/MASK>|any}

**Parameters**

- no <PARAMETERS>

  Removes a deny or permit rule from this IP prefix list

**Examples**

The following example shows the IP prefix list ‘test’ settings before the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-ip-prefix-list-test)#show context
bgp ip-prefix-list test
deny prefix-list 1 168.192.13.0/24
permit prefix-list 2 172.122.10.0/24
```

nx9500-6C8809(config-bgp-ip-prefix-list-test)#

The following example shows the IP prefix list ‘test’ settings after the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-ip-prefix-list-test)#no deny prefix-list 1 168.192.13.0/24
```

```
nx9500-6C8809(config-bgp-ip-prefix-list-test)#show context
bgp ip-prefix-list test
  permit prefix-list 2 172.122.10.0/24
```

nx9500-6C8809(config-bgp-ip-prefix-list-test)#
BGP peers and route maps can reference a single IP based access control list (ACL). Apply IP ACLs to both inbound and outbound route updates. When applied to a BGP enabled router, every route update is passed through the ACL. Each ACL contains deny and permit entries that are applied sequentially, in the order they appear within the list. When a route matches an entry, the decision to permit or deny the route is applied. Once a match is made the remaining entries in the ACL are not processed.

BGP IP ACLs are used as match criteria in the following contexts:

- BGP neighbor. For more information, see use.
- BGP route-map context. For more information, see match.

To navigate to the BGP IP ACL configuration instance, use the following command:

```bash
<DEVICE>(config)#bgp ip-access-list <IP-ACL-NAME>
```

```bash
<DEVICE>(config-bgp-ip-access-list-<IP-ACL-NAME>)#?
```

BGP IP Access List Mode commands:

The following table summarizes the BGP IP access list configuration commands:
28.2.1 deny

* bgp-ip-access-list-config commands

Creates and configures a deny entry for this BGP IP ACL

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

deny access-list [<PREFIX-TO-MATCH/MASK> {exact-match} | any]

**Parameters**

- deny access-list [<PREFIX-TO-MATCH/MASK> {exact-match} | any]
  
  | deny access-list [<PREFIX-TO-MATCH/MASK> {exact-match} | any] | Creates and configures a deny entry for this BGP IP ACL |
  |--------------|-----------------------------------------------------|
  | <PREFIX-TO-MATCH/MASK> | - Specify the prefix to match. |
  | {exact-match} | - Optional. Enables an exact match of the prefix provided in the previous step. When configured, the route is denied only in case of an exact match. |
  | any | - Specifies the prefix to match as 'any'. |

**Examples**

nx9500-6C8809(config-bgp-ip-access-list-test)#deny access-list 192.168.13.0/24 exact-match

nx9500-6C8809(config-bgp-ip-access-list-test)#show context bgp ip-access-list test
deny access-list 192.168.13.0/24 exact-match

nx9500-6C8809(config-bgp-ip-access-list-test)#

**Related Commands**

| no | Removes the specified the deny entry in this IP BGP ACL |
28.2.2 permit

- bgp-ip-access-list-config commands

Creates and configures a permit entry for this BGP IP ACL

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

permit access-list [<PREFIX-TO-MATCH/MASK>|any]

Parameters
- permit access-list [<PREFIX-TO-MATCH/MASK> {exact-match}|any]

|permit access-list [<PREFIX-TO-MATCH/MASK> {exact-match}|any]| Creates and configures a permit entry for this BGP IP ACL |
|---|---|
|<PREFIX-TO-MATCH/MASK>| Specify the prefix to match. |
|exact-match| Optional. Enables an exact match of the prefix provided in the previous step. When configured, the route is permitted only in case of an exact match. |
|any| Specifies the prefix to match as ‘any’. |

Examples

nx9500-6C8809(config-bgp-ip-access-list-test)#permit access-list 172.168.10.0/24

nx9500-6C8809(config-bgp-ip-access-list-test)#show context
bgp ip-access-list test

permit access-list 172.168.10.0/24

nx9500-6C8809(config-bgp-ip-access-list-test)#deny access-list 192.168.13.0/24 exact-match

nx9500-6C8809(config-bgp-ip-access-list-test)#

Related Commands

no | Removes the specified the permit entry in this IP BGP ACL |

</table>

**Examples**

The following example shows the BGP IP ACL ‘test’ settings before the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-ip-access-list-test)#show context
bgp ip-access-list test
  permit access-list 172.168.10.0/24
  deny access-list 192.168.13.0/24 exact-match
nx9500-6C8809(config-bgp-ip-access-list-test)#
```

```
nx9500-6C8809(config-bgp-ip-access-list-test)#no permit access-list 172.168.10.0/24
```

The following example shows the BGP IP ACL ‘test’ settings after the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-ip-access-list-test)#show context
bgp ip-access-list test
  deny access-list 192.168.13.0/24 exact-match
nx9500-6C8809(config-bgp-ip-access-list-test)#
```
28.3 bgp-as-path-list-config commands

BGP enabled devices use routing updates to exchange network routing information with each other. This information includes route details, such as the network number, path specific attributes, and the list of Autonomous System Numbers (ASNs) that a route traverses to reach a destination. This list is contained in the AS path.

An AS path access control list (ACL) filters AS paths (routes) included in routing updates. Each AS path access list consists of deny and/or permit rules that define regular expressions (match criteria). When configured and applied on inbound and outbound routing updates, the BGP AS path attributes are matched against the regular expressions specified in the AS path ACL. In case of a match, the route is filtered and an action (deny or permit) is applied. Once a match is made subsequent rules in the AS path access list are not processed.

AS path access lists also help prevent looping within an AS. Routing loops are prevented by rejecting routing updates containing local ASNs. Since local ASNs indicate that the route has already traveled through that autonomous system, by rejecting them looping is avoided.

AS path access lists are used as match criteria in the following contexts:

- BGP neighbor. For more information, see use.
- BGP route map context. For more information, see match.

To navigate to the AS path configuration instance, use the following command:

```
<DEVICE>(config)#bgp as-path <AS-PATH-LIST-NAME>
```

BGP AS Path List Mode commands:

- **deny**: Specify packets to reject
- **no**: Negate a command or set its defaults
- **permit**: Specify packets to forward
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **end**: End current mode and change to EXEC mode
- **exit**: End current mode and down to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

The following table summarizes the BGP AS path list configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Creates and configures a deny as-path-list rule</td>
<td>page 28-12</td>
</tr>
<tr>
<td>permit</td>
<td>Creates and configures a permit as-path-list rule</td>
<td>page 28-13</td>
</tr>
<tr>
<td>no</td>
<td>Removes a deny or permit rule from this AS path ACL</td>
<td>page 28-14</td>
</tr>
</tbody>
</table>
### 28.3.1 deny

**bgp-as-path-list-config commands**

Creates and configures a deny as-path-list rule. The deny rule specifies a regular expression to match. This regular expression, a string against the BGP AS paths contained in routing updates. AS paths matching the provided string are filtered and a deny action is applied.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

deny as-path <REG-EXP>

**Parameters**

- deny as-path <REG-EXP>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny as-path &lt;REG-EXP&gt;</td>
<td>Configures a match criteria (regular expression).</td>
</tr>
<tr>
<td>^</td>
<td>Indicates the start of a string</td>
</tr>
<tr>
<td>$</td>
<td>Indicates the end of a string</td>
</tr>
<tr>
<td>_ (underscore)</td>
<td>Indicates a comma, left brace, right brace, start and end of an input string, or a space. For example, &quot;_ _&quot;.</td>
</tr>
</tbody>
</table>

**Note:** Regular expressions are treated as a ‘ASCII string’ and not as a sequence of numbers. Create a regular expression ideally suited to filter the required AS paths.

**Examples**

```
 nx9500-6C8809(config-bgp-as-path-list-test)#deny as-path ^100$
 nx9500-6C8809(config-bgp-as-path-list-test)#show context bgp as-path-list test
deny as-path ^100$
 nx9500-6C8809(config-bgp-as-path-list-test)#
```

**Related Commands**

`no` Removes the specified deny as-path ACL rule
28.3.2 permit

**bgp-as-path-list-config commands**

Creates and configures a permit as-path-list rule. The permit rule specifies a regular expression to match. This regular expression is matched against the BGP AS paths contained in routing updates. AS paths matching the provided string are filtered and a permit action is applied.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
permit as-path <REG-EXP>
```

**Parameters**

- `permit as-path <REG-EXP>`

**Usage Guidelines**

The following table lists some of the characters used in forming regular expressions:

<table>
<thead>
<tr>
<th>Character to use</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Indicates the start of a string</td>
</tr>
<tr>
<td>$</td>
<td>Indicates the end of a string</td>
</tr>
<tr>
<td>_ (underscore)</td>
<td>Indicates a comma, left brace, right brace, start and end of an input string, or a space. For example, “_ _”.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-bgp-as-path-list-test)#permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#permit as-path _323_
```

```
nx9500-6C8809(config-bgp-as-path-list-test)#show context
bgp as-path-list test
deny as-path ^100$
permit as-path _323_
permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#
```

**Related Commands**

- `no` Removes the specified permit as-path ACL rule
28.3.3 no

- bgp-as-path-list-config commands

Removes a deny or permit rule from this AS path ACL

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
no as-path-list [deny|permit] <REG-EXP>
```

**Parameters**

- no <PARAMETERS>

**Examples**

```plaintext
nx9500-6C8809(config-bgp-as-path-list-test)#show context
bgp as-path-list test
deny as-path ^100$
permit as-path _323_
permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#
```

```plaintext
nx9500-6C8809(config-bgp-as-path-list-test)#no permit as-path _323_
```

```plaintext
nx9500-6C8809(config-bgp-as-path-list-test)#show context
bgp as-path-list test
deny as-path ^100$
permit as-path _200_
nx9500-6C8809(config-bgp-as-path-list-test)#
```
28.4 bgp-community-list-config commands

BORDER GATEWAY PROTOCOL

Creates and configures a named community list

IP BGP routes have a set of attributes, mandatory and optional. The community and extended community attributes are optional. Optional attributes are specified by network administrators to mark (color) routes received in updates containing these attributes. These marked routes are filtered and special actions applied (accepted, preferred, distributed, or advertised). For example, the NO_EXPORT community, indicates that routes attached to it are local and not to be advertised to external ASs. Similarly, a set of routes using a common routing policy can be tagged to a community, and the policy applied to the community.

A BGP community is a group of routes sharing common attributes. Route updates contain community information in the form of path attributes. These attributes help identify community members.

A BGP community list is a list of deny or permit entries. It is either assigned a name (regular expressions, predefined community names) or a number. Assigning names to communities increases the number of configurable community lists. All rules applicable to numbered communities apply to named communities too. The only difference being in the number of attributes configurable for a named community list.

Since the community attribute is optional, it is shared only between devices that understand communities and are configured to handle communities. By default the community attribute is not sent to neighbors unless the send-community command option is enabled in the BGP neighbor context. For more information see, send-community.

Some of the predefined, globally used communities are:

- no-export – Routes tagged to this community are not advertised to external BGP peers
- no-advertise – Routes tagged to this community are not advertised to any BGP peers
- local-as – Routes tagged to this community are not advertised outside the local AS
- internet – Routes tagged to this community are advertised to the internet community. By default all BGP enabled devices belong to this community.

BGP community lists are used in the following context as match clauses:

- BGP route map context. For more information, see match.

To navigate to the BGP community configuration instance, use the following command:

<DEVICE>(config)#bgp community-list <COMMUNITY-LIST-NAME>

<DEVICE>(config-bgp-community-list-<COMMUNITY-LIST-NAME>)#?

BGP Community List Mode commands:

- deny Add a BGP Community List deny rule to Specify community to reject
- no Negate a command or set its defaults
- permit Add a BGP Community List permit rule to Specify community to accept
- clrscr Clears the display screen
- commit Commit all changes made in this session
- do Run commands from Exec mode
- end End current mode and change to EXEC mode
- exit End current mode and down to previous mode
- help Description of the interactive help system
- revert Revert changes
- service Service Commands
- show Show running system information
- write Write running configuration to memory or terminal

<DEVICE>(config-bgp-community-list-<COMMUNITY-LIST-NAME>)#
The following table summarizes the BGP community list configuration commands:

### 28.4.1 deny

**bgp-community-list-config commands**

Creates and configures a deny community (expanded or standard) rule

Standard community lists specify known communities and community numbers. Expanded community lists filter communities using a regular expression that specifies patterns to match the attributes of different communities.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
deny community [expanded|standard]  
deny community expanded <LINE>  
deny community standard [AA:NN|internet|local-AS|no-advertise|no-export]  
```

**Parameters**

- **deny community expanded <LINE>**
  - Configures a deny expanded community list entry and associates it with a regular expression to match. The regular expression represents the patterns to match in the community attributes.
  - `<LINE>` – Provide the regular expression.

- **deny community standard [AA:NN|internet|local-AS|no-advertise|no-export]**
  - Configures a deny standard community list entry and associates it with a predefined, globally used, known community or community number. The options are:
    - **aa:nn** - Configures the community number. The first part (aa) represents the AS number. The second part (nn) represents a 2-byte number.
    - **internet** – Advertises this route to the internet community
    - **local-AS** – Prevents transmission of this route outside the local AS
    - **no-advertise** – Prevents advertisement of this route to any peer (internal or external)
    - **no-export** – Prevents advertisement of this route to external BGP peers (keeping this route within an AS)

**Examples**

```text
nx9500-6C8809(config-bgp-community-list-test)#deny community expanded 100

nx9500-6C8809(config-bgp-community-list-test)#show context
bgp community-list test

**28.4.2 permit**

- **bgp-community-list-config commands**

  Creates and configures a permit community (expanded or standard) rule.

  Standard community lists specify known communities and community numbers. Expanded community lists filter communities using a regular expression that specifies patterns to match the attributes of different communities.

  Supported in the following platforms:
  - Wireless Controllers — RFS4000, RFS6000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

- `permit community [expanded|standard]`
- `permit community expanded <LINE>`
- `permit community standard [AA:NN|internet|local-AS|no-advertise|no-export]`

**Parameters**

- `permit community expanded <LINE>`
  - Configures a permit expanded community list entry and associates it with a regular expression to match. The regular expression represents the patterns to match in the community attributes.
    - `<LINE>` – Provide the regular expression.

- `permit community standard [AA:NN|internet|local-AS|no-advertise|no-export]`
  - Configures a permit standard community list entry and associates it with a predefined, globally used, known community or community number. The options are:
    - `aa:nn` – Configures the community number. The first part (aa) represents the AS number. The second part (nn) represents a 2-byte number.
    - `internet` – Advertises this route to the internet community
    - `local-AS` – Prevents transmission of this route outside the local AS
    - `no-advertise` – Prevents advertisement of this route to any peer (internal or external)
    - `no-export` – Prevents advertisement of this route to external BGP peers (keeping this route within an AS)

**Examples**

```
nx9500-6C8809(config-bgp-community-list-test)#permit community expanded 300
nx9500-6C8809(config-bgp-community-list-test)# show context
bgp community-list test
  permit community expanded 300
  deny community expanded 100
nx9500-6C8809(config-bgp-community-list-test)#

nx9500-6C8809(config-bgp-community-list-test1)#permit community standard no-export
nx9500-6C8809(config-bgp-community-list-test1)#show context
bgp community-list test1
  permit community standard no-export
```

Related Commands

no | Removes the specified permit community rule from this community list
28.4.3 no

- **bgp-community-list-config commands**

Removes a deny or permit community rule from this community list

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
no [deny|permit] community expanded <LINE>
no [deny|permit] community standard [AA:NN|internet|local-AS|no-advertise|no-export]
```

**Parameters**

- `no <PARAMETERS>`
  - Removes a deny or permit expanded community rule from this community list
  - `<LINE>` – Specify the regular expression associated with the rule.

**Examples**

The following example shows the settings of the community list ‘test’ before the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-community-list-test)#show context
bgp community-list test
  permit community expanded 300
  deny community expanded 100
nx9500-6C8809(config-bgp-community-list-test)#
```

nx9500-6C8809(config-bgp-community-list-test)#no deny community expanded 100

The following example shows the settings of the community list ‘test’ after the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-community-list-test)#show context
bgp community-list test
  permit community expanded 300
nx9500-6C8809(config-bgp-community-list-test)#
```
28.5 bgp-extcommunity-list-config commands

BORDER GATEWAY PROTOCOL

Creates an configures a named extended community list

A BGP extended community is a group of routes sharing a common attribute, regardless of their network or physical boundary. By using a BGP extended community attribute, routing policies can implement inbound or outbound route filters based on the extended community tag, rather than a long list of individual permit or deny rules. A BGP extended community list is used to create groups of communities to use in a match clause of a route map. An extended community list is used to control which routes are accepted, preferred, distributed, or advertised.

The BGP extended community and standard community attributes are identical in function and structure, except that the former is an eight octet and the latter is a four octet attribute.

BGP extended community lists are used as match clauses in the following context:

- BGP route map context. For more information, see match.

To navigate to the extended community configuration instance, use the following command:

```
<DEVICE>(config)#bgp extcommunity-list <EXTCOMMUNITY-LIST-NAME>
```

BGP Extcommunity List Mode commands:

- **deny**: Add a BGP Community List deny rule to specify extcommunity to reject
- **no**: Negate a command or set its defaults
- **permit**: Add a BGP Community List permit rule to specify extcommunity to accept

```
<DEVICE>(config-bgp-extcommunity-list-<EXTCOMMUNITY-LIST-NAME>)#?
```

The following table summarizes the BGP extended community list configuration commands:

<table>

`bgp-extcommunity-list-config commands`

Creates and configures a deny extended community (expanded or standard) rule

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

- `deny extcommunity [expanded|standard]`
- `deny extcommunity expanded <LINE>`
- `deny extcommunity standard [rt|soo] <COMMUNITY-NUMBER>`

**Parameters**

- `deny extcommunity expanded <LINE>`
  
  Configures a deny expanded named extended community list entry and associates it with a regular expression to match. The regular expression represents the patterns to match in the extended community attributes.
  
  - `<LINE>` – Provide the regular expression.

- `deny extcommunity standard [rt|soo] <COMMUNITY-NUMBER>`
  
  Configures a deny standard named extended community list entry and associates it with the target or origin community attributes.
  
  - `rt` – Configures the route target (RT) extended community attribute
  - `soo` – Configures the site-of-origin (SOO) extended community attribute
  - `<COMMUNITY-NUMBER>` – Specify the community number in one of the following formats: `AA:NN` or `A.B.C.D:NN`

**Examples**

```
nx9500-6C8809(config-bgp-extcommunity-list-test)#deny extcommunity standard rt 200:12
nx9500-6C8809(config-bgp-extcommunity-list-test)#show context
deny extcommunity standard rt 200:12

28.5.2 permit

▶ bgp-extcommunity-list-config commands

Creates and configures a permit extended community (expanded or standard) rule

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

```
permit extcommunity [expanded|standard]
permit extcommunity expanded <LINE>
permit extcommunity standard [rt|soo] <COMMUNITY-NUMBER>
```

Parameters

- **permit extcommunity expanded <LINE>**

  *Configures a permit expanded named extended community list entry and associates it with a regular expression to match. The regular expression represents the patterns to match in the extended community attributes.*

  - `<LINE>` — Provide the regular expression.

- **permit extcommunity standard [rt|soo] <COMMUNITY-NUMBER>**

  *Configures a permit standard named extended community list entry and associates it with the target or origin community attributes.*

  - `rt` — Configures the RT extended community attribute
  - `soo` — Configures the SOO extended community attribute

  - `<COMMUNITY-NUMBER>` — Specify the community number in one of the following formats: `AA:NN` or `A.B.C.D:NN`

Examples

```
nx9500-6C8809(config-bgp-extcommunity-list-test)#permit extcommunity standard rt 192.168.13.13:12
```

```
nx9500-6C8809(config-bgp-extcommunity-list-test)#permit extcommunity standard rt 192.168.13.13:12
```

```
nx9500-6C8809(config)#show context
```

```
version 2.3
```

```
bgp community-list test1
  permit community standard no-export

28.5.3 no

- bgp-extcommunity-list-config commands

Removes an existing deny or permit extended community rule from this extcommunity list.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

no [deny|permit] extcommunity expanded <LINE>
no [deny|permit] extcommunity standard [rt|soo] <COMMUNITY-NUMBER>

Parameters
- no <PARAMETERS>

Examples

The following example shows the extended community ‘test’ settings before the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-extcommunity-list-test)#show context
bgp extcommunity-list test
  permit extcommunity standard rt 192.168.13.13:12
deny extcommunity standard rt 200:12
```

nx9500-6C8809(config-bgp-extcommunity-list-test)#

nx9500-6C8809(config-bgp-extcommunity-list-test)#no permit extcommunity standard 192.168.13.13:12

The following example shows the extended community ‘test’ settings after the ‘no’ command is executed:

```
nx9500-6C8809(config-bgp-extcommunity-list-test)#show context
bgp extcommunity-list test
deny extcommunity standard rt 200:12
```

nx9500-6C8809(config-bgp-extcommunity-list-test)#
28.6 bgp-route-map-config commands

BORDER GATEWAY PROTOCOL

BGP route maps are used to control and modify routing information. A BGP route map is a collection of deny and/or permit route rules that define and control redistribution of routes between routers and routing processes. Each rule consists of match criteria and set lines. If a route matches a criteria, the corresponding set line is applied, and the route is passed to the BGP table or to the neighbor, depending on whether the route map is set for incoming or outgoing route updates.

Use the (config) instance to configure BGP route map related parameters.

To navigate to this instance, use the following command:

<DEVICE>(config)#route-map <ROUTE-MAP-NAME>

Route Map Mode commands:

- deny: Add a deny route map rule to deny set operations
- no: Negate a command or set its defaults
- permit: Add a permit route map rule to permit set operations
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal

<DEVICE>(config-dr-route-map-test)#

In the route-map configuration mode, use the following commands to create and configure a deny or permit route map rule:

<DEVICE>(config-dr-route-map-test)#deny route-map <1-65535>
<DEVICE>(config-dr-route-map-test)#permit route-map <1-65535>

For example:

<DEVICE>(config-dr-route-map-test)#permit route-map 1
<DEVICE>(config-dr-route-map-test)#deny route-map 2

<DEVICE>(config-dr-route-map-test)#show context
route-map test

<DEVICE>(config-dr-route-map-test-dr-route-map-rule-1)#

Route Map Rule Mode commands:

- description: Configure comment for this route map
- match: Match values from routing table
- no: Negate a command or set its defaults
- set: Set values in destination routing protocol
- clrscr: Clears the display screen
- commit: Commit all changes made in this session
- do: Run commands from Exec mode
- end: End current mode and change to EXEC mode
- exit: End current mode and down to previous mode
- help: Description of the interactive help system
- revert: Revert changes
- service: Service Commands
- show: Show running system information
- write: Write running configuration to memory or terminal
The following table summarizes BGP deny/permit route map rules configuration mode commands:

<table>
<thead>
<tr>

<td>Configures the values attributed to a route matching the match criteria specified in the BGP deny or permit route-map rules</td>
<td>page 28-35</td>
</tr>
</tbody>
</table>
28.6.1 description

- bgp-route-map-config commands

Configures a description for this route map rule (deny or permit) that uniquely distinguishes it from others with similar access permissions.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

description <LINE>

Parameters

- description <LINE>

<table>
<thead>
<tr>
<th>Description</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provide a description for the route map rule (should not exceed 64 characters in length)</td>
<td>description &lt;LINE&gt;</td>
</tr>

</table>

Examples

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#description "This is a deny route map rule"
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context deny route-map 1
description "This is a deny route map rule"
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#

Related Commands

- no

Removes this deny/permit route-map rule’s description
28.6.2 match

**bgp-route-map-config commands**

Configures the match criteria associated with this deny or permit BGP route map

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
match [as-path|community|extcommunity|ip-address|ip-next-hop|ip-route-source|metric|
origin|tag]

match [as-path <AS-PATH-LIST-NAME>|community <COMMUNITY-LIST-NAME> {exact-match}|
    extcommunity <EXTCOMMUNITY-LIST-NAME>]

match [ip-address|ip-next-hop|ip-route-source] [BGP-IP-ACCESS-LIST <BGP-ACL-NAME>|
    prefix-list <PREFIX-LIST-NAME>]

match metric <0-4294967295>

match origin [egp|igp|incomplete]

match tag <0-65535>
```

**Parameters**

- **as-path** `<AS-PATH-LIST-NAME>`
  - Configures a BGP AS path list to match
  - An AS path is a list of ASs a packet traverses to reach its destination.
  - `<AS-PATH-LIST-NAME>` – Specify the AS path list name (should be existing and configured)

- **community** `<COMMUNITY-LIST-NAME>`
  - Configures the AS community list string to match
  - `<COMMUNITY-LIST-NAME>` – Specify the AS community list name (should be existing and configured).
  - **exact-match** – Optional. Does an exact match when matching the specified AS community string. This option is disabled by default.

- **extcommunity** `<EXTCOMMUNITY-LIST-NAME>`
  - Configures the external community list string to match
  - `<EXTCOMMUNITY-LIST-NAME>` – Specify the external community list name (should be existing and configured).

- **ip-address** `[BGP-IP-ACCESS-LIST <BGP-ACL-NAME>|
  prefix-list <PREFIX-LIST-NAME>]
  - Configures a string of IP addresses, in the route, to match
  - The IP Address is a list of IP addresses in the route used to filter the route. Use one of the following options to provide a list of IP addresses:
  - `<BGP-IP-ACCESS-LIST <BGP-ACL-NAME>` – Associates an existing BGP ACL with this BGP route map. Specify the BGP ACL name (should be existing and configured).
  - `<prefix-list <PREFIX-LIST-NAME>` – Associates an existing IP address prefix list with this BGP route map. The IP Address Prefix List is a list of prefixes in the route used to filter route. Specify the prefix list name (should be existing and configured).
| **match metric <0-4294967295>** | Configures the next-hop’s IP address to match. The IP Next Hop is a list of IP addresses used to filter routes based on the IP address of the next-hop in the route. Use one of the following options to provide next-hop’s IP addresses:
- **BGP-IP-ACCESS-LIST <BGP-ACL-NAME>** – Associates an existing BGP ACL with this BGP route map. Specify the BGP ACL name (should be existing and configured).
- **prefix-list <PREFIX-LIST-NAME>** – Associates an existing IP next-hop prefix list with this BGP route map. The IP Next Hop Prefix List is a list of prefixes for the route’s next-hop determining how the route is filtered. Specify the prefix list name (should be existing and configured).

| **match origin [egp|igp|incomplete]** | Configures the advertised route source IP address to match. The IP Route Source is a list of IP addresses used to filter routes based on the advertised IP address of the source. Use one of the following options to provide route-source IP addresses:
- **BGP-IP-ACCESS-LIST <BGP-ACL-NAME>** – Associates an existing BGP ACL with this BGP route map. Specify the BGP ACL name (should be existing and configured).
- **prefix-list <PREFIX-LIST-NAME>** – Associates an existing IP route source prefix list with this BGP route map. The IP Route Source Prefix List is a list of prefixes used to filter routes based on the prefix list used for the source. Specify the prefix list name (should be existing and configured).

| **match metric <0-4294967295>** | Defines the exterior metric, used for route map distribution, to match BGP uses a route table managed by the external metric defined. Setting a metric provides a dynamic way to load balance between routes of equal cost.
- **<0-4294967295>** – Specify the external metric value from 0 - 4294967295.

| **match origin [egp|igp|incomplete]** | Configures the source of the BGP route to match. Options include:
- **egp** – Matches if the origin of the route is from the **exterior gateway protocol** (eBGP). eBGP exchanges routing table information between hosts outside an autonomous system.
- **igp** – Matches if the origin of the route is from the **interior gateway protocol** (iBGP). iBGP exchanges routing table information between routers within an autonomous system.
- **incomplete** – Matches if the origin of the route is not identifiable

| **match tag <0-65535>** | Configures the BGP route tag to match. The Tag is a way to preserve a route’s AS path information for routers in iBGP. This option is disabled by default.
- **<0-65535>** – Specify the iBGP route’s tag from 0 - 65535.
Examples
The following examples show the configuration of match criteria for the deny route-map rule 1:

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#match as-path FilterList_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#match ip-route-source prefix-list PrefixList_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context
deny route-map 1
description "This is a deny route map rule"
    match as-path FilterList_01
    match ip-route-source prefix-list PrefixList_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#

A permit route-map rule 2 is added to the BGP route-map “test”.

nx9500-6C8809(config-dr-route-map-test)#permit route-map 2
A match criteria is added for the permit route-map rule 2.

nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-2)#match ip-next-hop DL_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-2)#show context
permit route-map 2
    match ip-next-hop DL_01
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-2)#

The following example displays the BGP route-map “test” settings:

nx9500-6C8809(config-dr-route-map-test)#show context
route-map test
deny route-map 1
description "This is a deny route map rule"
    match as-path FilterList_01
    match ip-route-source prefix-list PrefixList_01
permit route-map 2
    match ip-next-hop DL_01
nx9500-6C8809(config-dr-route-map-test)#

bgp-route-map-config commands

Removes or reverts the settings defined for a deny or permit route-map rule

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

no [description|match <PARAMETERS>|set <PARAMETERS>]

Parameters

- no <PARAMETERS>

<table>
<thead>
<tr>
<th>no &lt;PARAMETERS&gt;</th>
<th>Removes the description configured for a deny or permit route-map rule</th>
</tr>
</thead>
</table>

Examples

The following example shows the 'deny route-map rule-1' settings before the 'no' commands are executed:

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context
deny route-map 1
  description "This is a deny route map rule"
match as-path FilterList_01
  match ip-route-source prefix-list PrefixList_01
  set aggregator-as 1 192.168.13.7
  set as-path exclude 20
  set ip next-hop peer-address
  set metric 300
  set local-preference 30
  set community internet
```

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#no match as-path
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#no set aggregator-as
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#no set metric
```

The following example shows the 'deny route-map rule-1' settings after the 'no' commands are executed:

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#show context
deny route-map 1
  description "This is a deny route map rule"
match ip-route-source prefix-list PrefixList_01
  set as-path exclude 20
  set ip next-hop peer-address
  set local-preference 30
  set community internet
```

```
nx9500-6C8809(config-dr-route-map-test-dr-route-map-rule-1)#
```

The following example shows the route-map 'test' settings:

```
nx9500-6C8809(config-dr-route-map-test)#show context
route-map test
  deny route-map 1
    description "This is a deny route map rule"
    match ip-route-source prefix-list PrefixList_01
    set as-path exclude 20
    set ip next-hop peer-address
    set local-preference 30
    set community internet
  permit route-map 2
    match ip-next-hop DL_01
```

```
nx9500-6C8809(config-dr-route-map-test)#
```
28.6.4 set

*bgp-route-map-config commands*

Configures the values attributed to a route matching the match criteria specified in the BGP deny or permit route-map rules. These attributes are applied before the route is sent out.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
set [aggregator-as|as-path|atomic-aggregate|comm-list|community|extcommunity|ip|
    local-preference|metric|origin|originator-id|source-ip|tag|weight]

set aggregator-as <1-4294967295> <IP>
set as-path [exclude|prepend] <1-4294967295> {<1-4294967295>}
set atomic-aggregate
set comm-list delete <COMMUNITY-LIST-NAME>
set community [<COMMUNITY-NUMBER>|none]
set extcommunity [rt|soo] <EXTCOMMUNITY-NUMBER>
set ip next-hop [<IP>|peer-address]
set local-preference <0-4294967295>
set metric <0-4294967295>
set origin [egp|igp|incomplete]
set originatorid <IP>
set source-ip <IP>
set tag <0-65535>
set weight <0-4294967295>
```

**Parameters**

- **set aggregator-as <1-4294967295> <IP>**
  
  Configures the BGP aggregator’s ASN and IP address. Aggregates minimize the size of routing tables. Aggregation combines the characteristics of multiple routes and advertises them as a single route. The configured BGP aggregator settings are applied to filtered routes.
  - `<1-4294967295>` — Specify the route aggregator’s ASN from 1- 4294967295. This option is disabled by default.
  - `<IP>` — Specify the route aggregator’s IP address. BGP allows the aggregation of specific routes into one route using an aggregate IP address.
### set as-path [exclude|prepend] <1-4294967295> {<1-4294967295>}

<table>
<thead>
<tr>
<th>Description</th>
<th>Command Line</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures the BGP transform AS path attribute to be applied to filtered routes</td>
<td>set as-path [exclude</td>
</tr>
</tbody>
</table>

- **exclude** – Configures a single AS, or a list of ASs, excluded from the AS path
- **prepend** – Configures a single AS, or a list of ASs, prepended to the AS path

- **<1-4294967295>** – This keyword is common to the ‘exclude’ and ‘prepend’ parameters. Use it to specify the AS number. The ASs identified here are excluded or prepended depending on the option selected.

**Note:** You can configure multiple ASNs.

### set atomic-aggregate

<table>
<thead>
<tr>
<th>Description</th>
<th>Command Line</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables BGP atomic aggregate attributes</td>
<td>set atomic-aggregate</td>
</tr>
</tbody>
</table>

When a BGP enabled wireless controller or service platform receives a set of overlapping routes from a peer, or if the set of routes selects a less specific route, then the local device must set this value when propagating the route to its neighbors. This option is disabled by default.

### set comm-list delete <COMMUNITY-LIST-NAME>

<table>
<thead>
<tr>
<th>Description</th>
<th>Command Line</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deletes specified BGP communities. All communities matching the community list name string are deleted from the route. A BGP community is a group of routes sharing a common attribute.</td>
<td>set comm-list delete &lt;COMMUNITY-LIST-NAME&gt;</td>
</tr>
</tbody>
</table>

- **<COMMUNITY-LIST-NAME>** – Specify the community list name.

### set community [<COMMUNITY-NUMBER>|none]

<table>
<thead>
<tr>
<th>Description</th>
<th>Command Line</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures a community attribute for this route</td>
<td>set community [&lt;COMMUNITY-NUMBER&gt;</td>
</tr>
</tbody>
</table>

- **<COMMUNITY-NUMBER>** – Specify a community attribute. Use one of the following formats:
  - internet - Advertises this route to the Internet. This is a global community.
  - local-AS - Prevents the transmit of packets outside the local AS
  - no-advertise - Prevents advertisement of this route to any peer, either internal or external
  - no-export - Prevents advertisement of this route to BGP peers, keeping this route within an AS.
  - aa:nn - Configures the first part (aa) representing the AS number. The second part (nn) represents a 2-byte number.
  - none – Specifies community attribute as none

### set extcommunity [rt|soo] <EXTCOMMUNITY-NUMBER>

<table>
<thead>
<tr>
<th>Description</th>
<th>Command Line</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures a extended community attribute for this route</td>
<td>set extcommunity [rt</td>
</tr>
</tbody>
</table>

- **rt** – Identifies the route target (rt) extended community
- **soo** – Identifies the site-of-origin (soo) community. This is the origin community associated with the route reflector.
- **<EXTCOMMUNITY-NUMBER>** – This keyword is common to the ‘rt’ and ‘soo’ parameters. Use it to specify the extended community number.
- set ip next-hop [<IP>|peer-address]
  Configures the next hop for this route. Use one of the following options to identify the next hop:
  - <IP> – Specify the next hop's IP address
  - peer-address – Enables the identification of the next-hop address for peer devices. This option is disabled by default

- set local-preference <0-4294967295>
  Configures the BGP local preference path attribute for this route map. When configured, enables the communication of preferred routes out of the AS between peers. This option is disabled by default
  - <0-4294967295> – Specify the preference value from 0 - 4294967295.

- set metric <0-4294967295>
  Configures a metric for the route
  BGP uses a route table managed by the external metric defined. Setting a metric provides a dynamic way to load balance between routes of equal cost.
  - <0-4294967295> – Specify the metric from 0 - 4294967295.

- set origin [egp|igp|incomplete]
  Configures the origin code for this BGP route map
  - egp - Sets the origin of the route to eBGP
  - igp - Sets the origin of the route to iBGP
  - incomplete - Sets the origin of the route as not identifiable. Use this option if the route is from a source other than eBGP or iBGP.

- set originatorid <IP>
  Configures this route map's originator IP address

- set source-ip <IP>
  Configures this route map's source IP address
  - <IP> – Specify the IP address in the A.B.C.D format.

- set tag <0-65535>
  Configures this route map's tag value
  The Tag is a way to preserve a route’s AS path information for routers in iBGP.
  - <0-65535> – Specify a tag value from 1 - 65535.

- set weight <0-4294967295>
  Enables assignment of a weighted priority to the aggregate route
  - <0-4294967295> – Specify a value from 0 - 4294967295.
Examples

```
x9500-6C8809 (config-dr-route-map-test-dr-route-map-rule-1) # set aggregator-as 1 192.168.13.7
```

```
x9500-6C8809 (config-dr-route-map-test-dr-route-map-rule-1) # set as-path exclude 20
```

```
x9500-6C8809 (config-dr-route-map-test-dr-route-map-rule-1) # set community internet
```

```
x9500-6C8809 (config-dr-route-map-test-dr-route-map-rule-1) # set ip next-hop peer-address
```

```
x9500-6C8809 (config-dr-route-map-test-dr-route-map-rule-1) # set local-preference 30
```

```
x9500-6C8809 (config-dr-route-map-test-dr-route-map-rule-1) # set metric 300
```

```
x9500-6C8809 (config-dr-route-map-test-dr-route-map-rule-1) # show context deny route-map 1
   description "This is a deny route map rule"
   match as-path FilterList_01
   match ip-route-source prefix-list PrefixList_01
   set aggregator-as 1 192.168.13.7
   set as-path exclude 20
   set ip next-hop peer-address
   set metric 300
   set local-preference 30
   set community internet
```

28.7 bgp-router-config commands

Use the (device-config) or (profile-config) instance to configure BGP router related parameters.

To navigate to the BGP router configuration instance, in the device-config mode, use the following commands:

```<DEVICE>(config)#self
<DEVICE>(config-device-<MAC>)#router bgp
<DEVICE>(config-device <MAC>-router-bgp)##
```

Router BGP Mode commands:

- **aggregate-address**: Configure aggregate address
- **asn**: Configure local Autonomous System Number
- **bgp**: Border Gateway Protocol
- **bgp-route-limit**: Limit for number of routes handled by BGP process
- **distance**: Configure administrative distance
- **ip**: Internet Protocol (IP)
- **network**: Configure a local network
- **no**: Negate a command or set its defaults
- **route-redistribute**: Redistribute information from another routing protocol
- **timers**: Adjust routing timers
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **exit**: End current mode and change to EXEC mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal

When configured as a profile, the router settings are applied to all devices using the profile.

To navigate to the BGP router configuration instance, in the profile-config mode, use the following commands:

```<DEVICE>(config)#profile <DEVICE-TYPE> <PROFILE-NAME>
<DEVICE>(config-profile <PROFILE-NAME>)#router bgp
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)##
```

Router BGP Mode commands:

- **aggregate-address**: Configure aggregate address
- **asn**: Configure local Autonomous System Number
- **bgp**: Border Gateway Protocol
- **bgp-route-limit**: Limit for number of routes handled by BGP process
- **distance**: Configure administrative distance
- **ip**: Internet Protocol (IP)
- **network**: Configure a local network
- **no**: Negate a command or set its defaults
- **route-redistribute**: Redistribute information from another routing protocol
- **timers**: Adjust routing timers
- **clrscr**: Clears the display screen
- **commit**: Commit all changes made in this session
- **do**: Run commands from Exec mode
- **exit**: End current mode and change to previous mode
- **help**: Description of the interactive help system
- **revert**: Revert changes
- **service**: Service Commands
- **show**: Show running system information
- **write**: Write running configuration to memory or terminal
The following table summarizes BGP router configuration mode commands:

28.7.1 aggregate-address

bogp-router-config commands

Creates and configures an aggregate address entry in the BGP database

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

aggregate-address <IP/M> {as-set {summary-only}|summary-only}

Parameters

- aggregate-address <IP/M> {as-set {summary-only}|summary-only}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggregate-address</td>
<td>Specify the aggregate IP address and mask</td>
</tr>
<tr>
<td>as-set {summary-only}</td>
<td>Optional. Summarizes the AS_PATH attributes of the individual routes aggregated</td>
</tr>
<tr>
<td></td>
<td>summary-only – Optional. Filters more specific routes from updates</td>
</tr>
</tbody>
</table>

Examples

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#aggregate-address 192.168.13.10/32 as-set summary-only

Related Commands

no

Removes the aggregate address entry
28.7.2 asn

- bgp-router-config commands

Configures the ASN. The ASN represents a group of routers under the same administration and using IGP and common metrics to define how to route packets. In short the ASN represents all routers within an AS.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
asn <1-4294967295>

Parameters
- asn <1-4294967295>

Examples
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#asn 1

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context
router bgp
  asn 1

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#
### 28.7.3 bgp

**bgp-router-config commands**

Configures BGP router parameters

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
bgp [always-compare-med|bestpath|client-to-client|cluster-id|confederation|
dampening|default|deterministic-med|enable|enforce-first-as|fast-external-failover|
graceful-restart|log-neighbor-changes|neighbor|network|router-id|scan-time]
```

```
bgp [always-compare-med|deterministic-med|enable|enforce-first-as|
    fast-external-failover|log-neighbor-changes]
```

```
bgp best-path [as-path [confed|ignore]|compare-router-id|
    med {confed {missing-as-worst}|missing-as-worst}]
bgp client-to-client reflection
bgp cluster <IP>
bgp confederation [identifier|peers] <1-4294967295>
bgp dampening {<1-45>} {<1-20000>} {<1-255}>
bgp default [ipv4-unicast|local-preference <0-4294967295>]
bgp graceful-restart {stalepath-time <1-3600}]
bgp neighbor <IP>
bgp network import-check
bgp router-id <IP>
bgp scan-time <5-60>
```

**Parameters**

- **bgp [always-compare-med|deterministic-med|enable|enforce-first-as|fast-external-failover|log-neighbor-changes]**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>always-compare-med</td>
<td>Enables comparison of <em>Multi-exit Discriminators</em> (MEDs) received from neighbors. This option is disabled by default. MED is a value used by BGP peers to select the best route among multiple routes. When enabled, the MED value encoded in the route is always compared when selecting the best route to the host network. A route with a lower MED value is preferred over a route with a higher MED value. BGP does not discriminate between iBGP and eBGP when using MED for route selection. This option is mutually exclusive to the <strong>deterministic-med</strong> option.</td>
</tr>
<tr>
<td>deterministic-med</td>
<td>Enables selection of the best MED path from amongst all paths advertised by neighboring ASs. This option is disabled by default. MED is used by BGP peers to select the best route among multiple routes. When enabled, MED route values (from the same AS) are compared to select the best route. This best route is then compared with other routes in the BGP route table to select the best overall route. This option is mutually exclusive to the <strong>always-compare-med</strong> option.</td>
</tr>
<tr>
<td>enable</td>
<td>Starts the BGP daemon on the device (wireless controller or service platform). BGP is disabled by default.</td>
</tr>
<tr>
<td>enforce-first-as</td>
<td>Enforces the first AS for all BGP routes. This option is disabled by default. When enforced, devices deny updates received from an external neighbor that does not have the neighbor’s configured AS at the beginning of the received AS path parameter. This enhances security by not allowing traffic from an unauthorized AS.</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>fast-external-failover</td>
<td>Enables/disables immediate resetting of BGP session on the interface once the BGP connection goes down. This option is enabled by default. When enabled, a session is reset as soon as the direct link to an external peer goes down. Normally, when a BGP connection goes down, the device waits for the expiry of the duration specified in <code>holdtime</code> parameter before bringing down the interface.</td>
</tr>
</tbody>
</table>

**Note:** To configure the ‘holdtime’, use the `timers bgp <keepalive-time> <holdtime>` command in this (BGP router) configuration mode.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log-neighbor-changes</td>
<td>Enables/disables logging of a BGP neighbor’s status change (active or not active) events. It also enables or disables the logging of the reason for such change in status.</td>
</tr>
</tbody>
</table>

**• bgp best-path [as-path [confed|ignore]|compare-router-id|med {confed {missing-as-worst}|missing-as-worst}]**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>best-path</td>
<td>Modifies the bestpath selection algorithm. The route selection algorithm uses the following criteria when selecting the preferred route: as-path, router-id, and med.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| as-path [confed|ignore]  | Enables/disables an AS path from being considered as a criteria for selecting the preferred route

- confed – Enables comparison of path lengths (including confederation sets and sequences) when selecting a route (EXPERIMENTAL). This option is disabled by default.

- ignores – Disables an AS path length from being considered as a criteria for selecting a preferred route. When, disabled the AS path length is ignored. This option is disabled by default.  

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>compare-router-id</td>
<td>Enables/disables the use of router ID as a selection criteria when selecting the preferred route. When enabled, the router ID is used to select the best path between two identical BGP routes. The route with the lower router ID is selected over a route with a higher router ID. This option is disabled by default.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| med {confed {missing-as-worst}|missing-as-worst} | Enables/disables comparison of AS path MED value when selecting the preferred route

MED is a value used by BGP peers to select the best route among multiple routes. When enabled, the MED value encoded in the route is always compared to determine the best route to the host network. A route with a lower MED value is preferred over a route with a higher MED value.

- confed – Optional. Enables/disables comparison of MED value among confederation paths (EXPERIMENTAL). When enabled, you can optionally enable the treatment of AS paths without the MED value as the least preferable route. This option is disabled by default.

- missing-as-worst – Optional. Enables the treatment of AS paths without the MED value as the least preferable route. This option is disabled by default.  

**• bgp client-to-client reflection**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client-to-client</td>
<td>Enables/disables client-to-client route reflection (EXPERIMENTAL)</td>
</tr>
<tr>
<td>reflection</td>
<td>Route reflectors are used when all iBGP speakers are not fully meshed. If the clients are fully meshed, the route-reflectors are not required. This option is enabled by default.</td>
</tr>
</tbody>
</table>

**• bgp cluster <IP>**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster &lt;IP&gt;</td>
<td>Enables and sets a cluster ID, in case the BGP cluster has more than one route-reflector. A cluster generally consists of a single route-reflector and its clients. The cluster is usually identified by the router ID of this single route-reflector. Sometimes, to increase redundancy, a cluster might have more than one route-reflector configured. In this case, all route-reflectors in the cluster are identified by the cluster ID (configured in the IP format).</td>
</tr>
</tbody>
</table>
### bgp confederation [identifier|peers] <1-4294967295>

| confederation [identifier|peers] <1-4294967295> | Configures AS confederation (group of ASs) parameters (identifier and peers) |
|-------------------------------------------------|--------------------------------------------------------------------------|
| • identifier – Enables and sets a BGP confederation identifier to allow an AS to be divided into several ASs. In other words an AS is divided into multiple ASs, and together they form a confederation. This confederation is visible to external routers as a single AS. The ASN is usually the confederation ID. Specify a value from 1 - 4294967295. |
| • peers – Configures the maximum number of the ASs constituting this BGP confederation. Specify the AS number from 1 - 4294967295. Multiple ASs can be added to the list of confederation members. |

### bgp dampening {<1-45>} {<1-20000>} <1-20000> <1-255>

<table>
<thead>
<tr>
<th>bgp dampening {&lt;1-45&gt;} {&lt;1-20000&gt;} &lt;1-20000&gt; &lt;1-255&gt;</th>
<th>Enables dampening and configures dampening parameters. This option is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &lt;1-45&gt; – Optional. Configures the half lifetime (in minutes). A penalty is imposed on a route that flaps. This is the time for the penalty to decrease to half its current value. Specify a value from 1 - 45 minutes. The default is 1 minute.</td>
<td></td>
</tr>
<tr>
<td>• &lt;1-20000&gt; – Optional. Configures the route reuse value. When the penalty for a suppressed route decays below the value specified here, the route is un-suppressed (reused). Specify a value from 1 - 20000.</td>
<td></td>
</tr>
<tr>
<td>• &lt;1-20000&gt; – Configures the route suppress value. When a route flaps, a penalty is added to the route. When the penalty reaches or exceeds the value specified as the ‘maximum duration to suppress a stable route’. Specify a value from 1 - 20000.</td>
<td></td>
</tr>
<tr>
<td>• &lt;1-255&gt; – Configures the maximum duration, in minutes, a suppressed route is suppressed. This is the maximum duration for which a route remains suppressed before it is reused. Specify a value from 1 - 255 minutes.</td>
<td></td>
</tr>
</tbody>
</table>

### bgp default [ipv4-unicast|local-preference <0-4294967295>]

<table>
<thead>
<tr>
<th>default</th>
<th>Configures the following defaults for BGP neighbor-related parameters: IPv4 unicast and local preference</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4-unicast</td>
<td>Enable/disables IPv4 unicast traffic for neighbors. This option is enabled by default.</td>
</tr>
<tr>
<td>local-preference &lt;0-4294967295&gt;</td>
<td>Configures a local preference for the neighbor. Higher the value higher is the preference.</td>
</tr>
<tr>
<td>• &lt;0-4294967295&gt; – Specify a value from 1 - 4294967295.</td>
<td></td>
</tr>
</tbody>
</table>
### bgp graceful-restart `{stalepath-time <1-3600>}`

Enables/disables graceful restart on this BGP router. This option is disabled by default.

- `stalepath-time <1-3600>` – Optional. Configures the maximum time, in seconds, to retain stale paths from restarting neighbor. This is the time the paths from a restarting neighbor are preserved. All stale paths, unless reinstated by the neighbor after re-establishment, are deleted at the expiry of the time specified here.
- `<1-3600>` – Specify a value from 1 - 3600 seconds.

### bgp neighbor `<IP>`

Configures the BGP neighbor’s IP address and enters its configuration mode. Use this command to configure a BGP neighbor’s parameters.

- `<IP>` – Specify the IP address in the A.B.C.D format.

**Note:** For BGP neighbor configuration parameters, see `bgp-neighbor-config commands`.

### bgp network import-check

Enables checking of the existence of BGP network route in IGP before importing.

### bgp router-id `<IP>`

Enables the device (BGP supported wireless controller or service platform) identified by the `<IP>` parameter as a router. The router’s IP address is configured as its ID, and uniquely identifies it. When not specified, the IP address of the interface is configured as the router ID. This option is disabled by default.

### bgp scan-time `<5-60>`

Configures the scanning interval, in seconds, for updating BGP routes. This is the interval between two consecutive scans the BGP device performs in order to validate routes in its routing table. To disable scanning, set the value to Zero (0).

- `<5-60>` – Specify a value from 5 - 60 seconds. The default is 60 seconds.

### Examples

```
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#bgp router-id 192.168.13.13
```

```
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#aggregate-address 116.117.118.0/24 as-set summary-only
```

```
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#bgp neighbor 192.168.13.99
```

```
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context router bgp
  aggregate-address 116.117.118.0/24 as-set summary-only
  bgp router-id 192.168.13.13
  bgp neighbor 192.168.13.99
  remote-as 199
  maximum-prefix 9999 80 restart 50
```

### Related Commands

`no` Removes the BGP router parameters. The `no bgp enable` command disabled BGP.
28.7.4 bgp-route-limit

- bgp-router-config commands

Configures the BGP route limit parameters

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

```plaintext
bgp-route-limit [num-routes <VALUE>|reset-time <1-86400>|retry-count <1-32>|
retry-timeout <1-3600>]
```

Parameters

- bgp-route-limit [num-routes <VALUE>|reset-time <1-86400>|retry-count <1-32>|
retry-timeout <1-3600>]

| num-routes <VALUE> | Configures the number of routes that can be stored on this BGP router. Set this value based on the available memory on this BGP router (wireless controller or service platform).
|---------------------|--------------------------------------------------|
| <VALUE>             | - Specify a value from 1 - 4,294,967,295. The default is 9216 routes.

- reset-time <1-86400>

| reset-time <1-86400> | Configures the reset time in seconds. This is the time after which the retry count value is set to Zero (0).
|----------------------|--------------------------------------------------|
| <1-86400>            | - Specify a value from 1 - 86,400 seconds. The default is 360 seconds.

- retry-count <1-32>

| retry-count <1-32> | Configures the maximum number of times the BGP process is reset before being permanently shut down. Once shut down, the BGP process has to be started manually. The BGP process is reset if it is flooded with route entries that exceed the maximum number of routes configured for this device.
|---------------------|--------------------------------------------------|
| <1-32>              | - Specify a value from 1 - 32. The default is 5 routes.

- retry-timeout <1-3600>

| retry-timeout <1-3600> | Configures the duration, in seconds, the BGP process is temporarily shut down, before a reset of the process is attempted.
|-------------------------|--------------------------------------------------|
| <1-3600>                | - Specify a value from 1 - 3600 seconds. The default is 60 seconds.

Examples

```plaintext
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#bgp-route-limit num-routes 10

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context
router bgp
  asn 1
  aggregate-address 116.117.118.0/24 as-set summary-only
  bgp neighbor 192.168.13.99
  remote-as 199
  maximum-prefix 9999 80 restart 50
  bgp-route-limit num-routes 10

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#
```

Related Commands

- no

Removes BGP route limitations configured. Use the no command to revert back to default.
**28.7.5 distance**

- **bgp-router-config commands**

Configures administrative distance parameters. The distance parameter is a rating of the trustworthiness of a route. The higher the distance, lower is the trust rating. The distance can be set for each type of route indicating its trust rating.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
distance [<IP/M> <1-255> <BGP-ACL-NAME>|bgp <1-255> <1-255> <1-255>]
```

**Parameters**

- **distance [<IP/M> <1-255> <BGP-ACL-NAME>|bgp <1-255> <1-255> <1-255>]**
  - Configures the default administrative distance, specified by the `<1-255>` parameter, when the route’s source IP address matches the specified IP prefix.
    - `<IP/M>` – Specify the IP source prefix and prefix length.
    - `<1-255>` – Specify the distance from 1 - 255.
    - `<BGP-ACL-NAME>` – Optional. Specify the BGP access list name.

- **bgp <1-255> <1-255> <1-255>**
  - Configures the default administrative distance for different route types
    - `<1-255>` – Configures the default administrative distance for routes external to this AS. Specify a value from 1 - 255.
    - `<1-255>` – Configures the default administrative distance for routes internal to this AS. Specify a value from 1 - 255.
    - `<1-255>` – Configures the default administrative distance for local routes. Specify a value from 1 - 255.

**Examples**

```plaintext
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#distance bgp 200 100 200

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context
router bgp
  bgp enable
  as 1
  aggregate-address 116.117.118.0/24 as-set summary-only
  distance bgp 200 100 200
  bgp neighbor 192.168.13.99
  remote-as 199
  maximum-prefix 9999 80 restart 50
  bgp-route-limit num-routes 10

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#
```

**Related Commands**

- **no** Removes the administrative distance related configurations
28.7.6 ip

**bgp-router-config commands**

Configures the BGP default gateway’s priority

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```markdown
ip default-gateway priority <1-8000>
```

**Parameters**

- **ip default-gateway priority <1-8000>**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-gateway priority</td>
<td>Configures the default gateway’s (acquired through BGP) priority</td>
</tr>
<tr>
<td>&lt;1-8000&gt;</td>
<td>&lt;1-8000&gt; – Specify a value from 1 - 8000. The default is 7500.</td>
</tr>
</tbody>
</table>

**Note:** Lower the value, higher is the priority.

**Examples**

```markdown
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#ip default-gateway priority 1
```

```markdown
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  ip default-gateway priority 1
  bgp-route-limit num-routes 10
```

**Related Commands**

- `no` removes the BGP default gateway configuration
### 28.7.7 network

*bgp-router-config commands*

Configures the local network IP addresses and masks. These network addresses are broadcasted to neighboring BGP peers. You can configure a single IP address or a range of IP addresses in the A.B.C.D/M notation.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

#### Syntax

```
network <IP/M> {backdoor|pathlimit|route-map}

network <IP/M> {backdoor pathlimit <1-255>}

network <IP/M> {pathlimit <1-255>}

network <IP/M> {route-map <ROUTE-MAP-NAME>}
```

#### Parameters

- **network <IP/M> {backdoor|pathlimit|route-map}**
  - `<IP/M>` — Specify the network address.
  - `backdoor` Optional. Configures a BGP backdoor route. After configuring the backdoor route, you can optionally configure the as-path hop count limit attribute for this backdoor route.
    - `pathlimit <1-255>` — Specify the hop count limit from 1 - 255.
  - `pathlimit <1-255>` — Specify the hop count limit from 1 - 255.
  - `route-map <ROUTE-MAP-NAME>` Optional. Associates a BGP route map with this local network. When applied, the route-map values take precedence

#### Examples

```
nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#network 192.168.13.0/24 backdoor
pathlimit 200

nx9500-6C8809(config-profile NX45XXProfile-router-bgp)#show context

router bgp
  asn 1
  aggregate-address 116.117.118.0/24 as-set summary-only
distance bgp 200 100 200
bgp neighbor 192.168.13.99
  remote-as 199
  maximum-prefix 9999 80 restart 50
network 1.2.3.0/24
network 192.168.13.0/24 backdoor pathlimit 200
bgp-route-limit num-routes 10
```

#### Related Commands

- **no** Removes the list of local networks configured
### 28.7.8 no

**bgp-router-config commands**

Removes the BGP router settings

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
no [aggregate-address|bgp|bgp-route-limit|distance|ip|network|route-redistribute|
timers]
```

**Parameters**

- no <PARAMETERS>

- Removes the BGP router settings

**Examples**

The following example shows the BGP router settings before the ‘no’ commands have been executed:

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  aggregate-address 116.117.118.0/24 as-set summary-only
  bgp neighbor 192.168.13.199
    remote-as 1
    use route-map UnSupMap_01 in
  bgp neighbor 192.168.13.99
    remote-as 199
    maximum-prefix 9999 80 restart 50
  bgp-route-limit num-routes 10 reset-time 360
```

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#no bgp neighbor 192.168.13.99
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#no aggregate-address 116.117.118.0/24
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#no bgp-route-limit
```

The following example shows the BGP router settings after the ‘no’ commands have been executed:

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#show context
router bgp
  bgp enable
  asn 1
  bgp neighbor 192.168.13.199
    remote-as 1
    use route-map UnSupMap_01 in
```

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#
```
### 28.7.9 route-redistribute

Enables redistribution of routes learnt from other routing protocols into BGP.

Large ISP networks using multiple routing protocols, need to enable redistribution of routes across routing protocols. Routing protocols differ in their basic characteristics, such as metrics, administrative distance, classful and classless capabilities etc. When enabling redistribution, these differences have to be taken into consideration.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
route-redistribution [connected|kernel|ospf|static] \{metric <0-4294967295>\/
route-map <ROUTE-MAP-NAME>\}
```

**Parameters**

- **route-redistribution [connected|kernel|ospf|static] \{metric <0-4294967295>\/
route-map <ROUTE-MAP-NAME>\}**

<table>

28.7.10 timers

**bgp-router-config commands**

Enables adjustment of keepalive and holdtime intervals

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
timers bgp <0-65535> <0-65535>
```

**Parameters**
- `timers bgp <0-65535> <0-65535>`

<table>
<thead>
<tr>
<th>timers bgp &lt;0-65535&gt;</th>
<th>Configures the keepalive and holdtime interval in seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;0-65535&gt;</td>
<td>0-65535 — Specify a keepalive interval from 0 - 65535 seconds. It is the interval, in seconds, between two successive keepalive packets exchanged with this router and its neighbor to keep the TCP connection alive.</td>
</tr>
<tr>
<td>&lt;0-65535&gt;</td>
<td>0-65535 — Specify a holdtime value from 0 - 65535 seconds. This is the time this router will wait without receiving a keepalive packet from its neighbor before declaring it dead. If the time since the last keepalive packet received (from its neighbor) exceeds the value set here, the neighbor is declared dead.</td>
</tr>
</tbody>
</table>

**Examples**

```bash
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#timers bgp 100 100
```

```bash
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#show context router bgp
bgp enable
asn 1
aggregate-address 116.117.118.0/24 as-set summary-only
bgp neighbor 192.168.13.199
  remote-as 1
  use route-map UnSupMap_01 in
bgp neighbor 192.168.13.99
  remote-as 199
  maximum-prefix 9999 80 restart 50
  timers bgp 100 100
  bgp-route-limit num-routes 10 reset-time 360
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp)#
```

BORDER GATEWAY PROTOCOL

28.8 bgp-neighbor-config commands

BGP enabled devices connected through an established TCP connection are referred to as BGP peers or neighbors. To establish a TCP connection, BGP routers exchange open messages containing the following information: AS number, BGP version running, BGP router ID, and timer values (keepalive and holdtime). Once these values are accepted by both devices, the connection is established and the routers become neighbors. With the TCP connection established the BGP neighbors begin sharing routing information and updates. A failure in the establishment of the TCP connection indicates that the routers are not neighbors and cannot exchange routing information.

Use the (profile/device-config) instance to configure BGP neighbors.

To navigate to the BGP neighbor configuration instance, use the following commands:

```
<DEVICE>(config)#profile <PROFILE-NAME>
<DEVICE>(config-profile <PROFILE-NAME>)#router bgp
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#?
```

```
DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#bgp neighbor ?
A.B.C.D  IP address of the bgp neighbor
```

```
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#
<DEVICE>(config-profile <PROFILE-NAME>-router-bgp)#bgp neighbor <IP>
<DEVICE>(config-profile <PROFILE-NAME>-router--bgp-neighbor-<IP>)#?
```

Router BGP Neighbor Mode commands:

- **activate**: Enable the Address Family for this Neighbor (EXPERIMENTAL)
- **advertisement-interval**: Minimum interval between BGP routing updates
- **allowas-in**: Accept as-path with my AS present in it (EXPERIMENTAL)
- **attribute-unchanged**: BGP attribute is propagated unchanged to this neighbor (EXPERIMENTAL)
- **capability**: Advertise capability to the peer (EXPERIMENTAL)
- **default-originate**: Originate default route to this neighbor
- **description**: Neighbor specific description
- **disable-connected-check**: One-hop away EBGP peer using loopback address (EXPERIMENTAL)
- **dont-capability-negotiate**: Do not perform capability negotiation (EXPERIMENTAL)
- **ebgp-multihop**: Allow EBGP neighbors not on directly connected networks
- **enforce-multihop**: Enforce EBGP neighbors perform multihop (EXPERIMENTAL)
- **local-as**: Specify a local-as number (EXPERIMENTAL)
- **maximum-prefix**: Maximum number of prefix accept from this peer
- **next-hop-self**: Disable the next hop calculation for this neighbor
- **no**: Negate a command or set its defaults
- **override-capability**: Override capability negotiation result
- **passive**: Don't send open messages to this neighbor
- **password**: Set a password
- **peer-group**: Set peer-group for this neighbor (EXPERIMENTAL)
- **port**: Neighbor's BGP port (EXPERIMENTAL)
- **remote-as**: Specify a BGP neighbor
- **remove-private-as**: Remove private AS number from outbound updates (EXPERIMENTAL)
- **route-server-client**: Configure a neighbor as Route Server client (EXPERIMENTAL)
- **send-community**: Send Community attribute to this neighbor
- **shutdown**: Administratively shut down this neighbor
- **soft-reconfiguration**: Per neighbor soft reconfiguration
- **strict-capability-match**: Strict capability negotiation match (EXPERIMENTAL)
- **timers**: BGP per neighbor timers
- **unsuppress-map**: Route-map to selectively unsuppress suppressed
The following table summarizes BGP deny/permit route map rules configuration mode commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>activate</td>
<td>Enables an address family for this neighbor (EXPERIMENTAL)</td>
<td>page 28-58</td>

28.8.1 activate

bgp-neighbor-config commands

Enables an address family for this neighbor. This option is enabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
activate

Parameters
None

Examples
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#activate
28.8.2 advertisement-interval

- **bgp-neighbor-config commands**

  Configures the minimum interval, in seconds, between two consecutive BGP router updates.

  Supported in the following platforms:
  - Wireless Controllers — RFS4000, RFS6000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

advertisement-interval <0-600>

**Parameters**

- advertisement-interval <0-600>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advertisement-interval &lt;0-600&gt;</td>
<td>Configures the minimum interval, in seconds, between two consecutive BGP router updates. Sending too many router updates creates flapping of routes leading to possible disruptions. Specify a minimum interval so that the BGP routing updates are sent after the set interval.</td>
</tr>
<tr>
<td>&lt;0-600&gt;</td>
<td>Specify a value from 0 - 600 seconds. The default is 5 seconds.</td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C8809 (config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)# advertisement-interval 100

nx9500-6C8809 (config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)# show context
  bgp neighbor 192.168.13.99
  advertisement-interval 100

nx9500-6C8809 (config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

**Related Commands**

- **no** Reverts the advertisement interval to default (5 seconds)
28.8.3 allowas-in

* bgp-neighbor-config commands

Enables re-advertisement of all prefixes containing duplicate ASNs. Use this command to configure the maximum number of times an ASN is advertised. This option is disabled by default.

When enabled, *Provider Edge* (PE) routers can re-advertise all prefixes containing duplicate ASNs. This creates a pair of *VPN Routing/Forwarding* (VRF) instances on each PE router to receive and re-advertise prefixes. The PE router receives prefixes with ASNs from all PE routers and advertises to its neighbor PE routers on one VRF. The other VRF receives prefixes with ASNs from the *Customer Edge* (CE) routers and re-advertises them to all PE routers in the configuration.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

allowas-in <1-10>

**Parameters**

- allowas-in <1-10>

<table>
<thead>
<tr>
<th>allowas-in &lt;1-10&gt;</th>
<th>Enables and configures the maximum number of times an ASN is advertised.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-10&gt; – Specify a value from 1 - 10.</td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

allowas-in 10

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

show context

advertisement-interval 100

allowas-in 10

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

**Related Commands**

- `no` Disables re-advertisement of all prefixes containing duplicate ASNs
28.8.4 attribute-unchanged

*bgp-neighbor-config commands*

Enables propagation of BGP attribute values unchanged to this neighbor BGP device. The BGP attributes are: as-path, med, and next-hop.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
attribute-unchanged {(as-path|med|next-hop)}
```

**Parameters**
- attribute-unchanged {(as-path|med|next-hop)}

<table>
<thead>
<tr>
<th>attribute-unchanged</th>
<th>Enables the propagation of the following BGP attribute values unchanged:</th>
</tr>
</thead>
<tbody>
<tr>
<td>as-path</td>
<td>- Optional. Enables propagation of AS path BGP attribute unchanged to this neighbor BGP device. This option is disabled by default.</td>
</tr>
<tr>
<td>med</td>
<td>- Optional. Enables propagation of MED BGP attribute unchanged to this neighbor BGP device. This option is disabled by default.</td>
</tr>
<tr>
<td>next-hop</td>
<td>- Optional. Enables propagation of the next-hop BGP attribute value unchanged to this neighbor BGP device. This option is disabled by default.</td>
</tr>
</tbody>
</table>

**Examples**

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)# attribute-unchanged as-path
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
```

**Related Commands**

| **No** | Disables propagation of BGP attribute values unchanged to this neighbor BGP device |
28.8.5 capability

bgp-neighbor-config commands

Enables the advertisement of capability (dynamic and ORF) to BGP peers

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

capability [dynamic|orf]
capability dynamic
capability orf prefix-list [both|receive|send]

Parameters

- capability dynamic
  - Enables/disables the advertisement of dynamic capability
    Enable this option to show a neighbor device’s capability to advertise or withdraw and address
capability to other peers in a non-disruptive manner. This option is disabled by default.
- capability orf prefix-list [both|receive|send]
  - Enables/disables the advertisement of Outbound Router Filtering (ORF) capability. This option is
disabled by default.
    Enable this option to enable ORF, and advertise this capability to peer devices. ORFs send and
receive capabilities to lessen the number of updates exchanged between BGP peers. By filtering
updates, ORF minimizes update generation and exchange overhead.
    The local BGP device advertises ORF in the send mode. The peer BGP device receives the ORF
capability in the receive mode. The two devices exchange updates to maintain the ORF for each
router. Only a peer group or an individual BGP router can be configured to be in receive or send
mode. A a peer group member cannot be configured.
    - both – Advertises the capability to send and receive the ORF to/from this neighbor
    - receive – Advertises the capability to receive the ORF from this neighbor
    - send – Advertises the capability to send the ORF to this neighbor

Examples

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
capability orf prefix-list both

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show
context
  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
capability orf prefix-list both

Related Commands

- no
  - Disables advertisement of capability (dynamic and ORF) to BGP peers
28.8.6 default-originate

**bgp-neighbor-config commands**

Enables the sending of the default route to BGP neighbors. It also allows the configuration of the default route. When enabled and configured, local BGP routers send the default route 0.0.0.0 (or a route map specified route) to its neighbor for use as the default route.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

default-originate \{route-map \(<BGP-ROUTE-MAP-NAME>\)\}

**Parameters**

- default-originate \{route-map \(<BGP-ROUTE-MAP-NAME>\)\}

<table>
<thead>
<tr>
<th>default-originate {route-map (&lt;BGP-ROUTE-MAP-NAME&gt;)}</th>
<th>Enables default originate on this BGP neighbor. This option is disabled by default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>* route-map (&lt;BGP-ROUTE-MAP&gt;) -- Optional. Use this keyword to specify a route map to use as the default originate route</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#default-originate

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context

  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
  default-originate

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

**Related Commands**

no Disables the sending of the default route to BGP neighbors
28.8.7 **description**

- **bgp-neighbor-config commands**

  Configures a description for this BGP neighbor device

  Supported in the following platforms:
  - Wireless Controllers — RFS4000, RFS6000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
description neighbor <LINE>
```

**Parameters**

- `description neighbor <LINE>`

  Specify a description for this BGP neighbor device (should not exceed 80 characters).

**Examples**

```
$ nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#description neighbor "This neighbor is an external AS neighbor"
```

```
$ nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context

  bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
  default-originate
  description neighbor "This neighbor is an external AS neighbor"
$ nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

</table>
28.8.8 disable-connected-check

*bgp-neighbor-config commands*

Enables one-hop away eBGP peer using loop back address. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
disable-connected-check
```

**Parameters**

None

**Examples**

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#disable-connected-check
```

```
   advertisement-interval 100
   allowas-in 10
   attribute-unchanged as-path
   capability orf prefix-list both
   default-originate
   description neighbor "This neighbor is an external AS neighbor"
   disable-connected-check
```

```

</table>
28.8.9 dont-capability-negotiate

Disables capability negotiation with BGP neighbors. This is to allow compatibility with older BGP versions that have no capability parameters used in the open messages between peers. Capability negotiation is enabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
dont-capability-negotiate

Parameters
None

Examples
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
dont-capability-negotiate

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
  bgp neighbor 192.168.13.99
    advertisement-interval 100
    allowas-in 10
    attribute-unchanged as-path
    capability orf prefix-list both
    default-originate
    description neighbor "This neighbor is an external AS neighbor"
    disable-connected-check
    dont-capability-negotiate

**28.8.10 ebgp-multihop**

* bgp-neighbor-config commands

Enables eBGP Multihop on this BGP neighbor. When enabled, allows neighbor connection to be established between two eBGP neighbors that are not directly connected to each other. Use this command to configure the maximum number of hops possible between two such eBGP neighbors. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
bgp-multihop <1-255>
```

**Parameters**

- `ebgp-multihop <1-255>`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ebgp-multihop &lt;1-255&gt;</td>

28.8.11 enforce-multihop

Forces eBGP neighbors to perform multi-hop checks

A *multihop* route is a route to external peers on indirectly connected networks. When enforced, eBGP neighbors perform multi-hop check. This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

`enforce-multihop`

**Parameters**

None

**Examples**

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#enforce-multihop
```

```
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
description neighbor "This neighbor is an external AS neighbor"
disable-connected-check
dont-capability-negotiate
ebgp-multihop 20
```

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
```

**Related Commands**

| no | Disables enforcement of multihop route checks |
28.8.12 local-as

- **bgp-neighbor-config commands**

  Configures this neighbor’s local AS number

  Supported in the following platforms:
  - Wireless Controllers — RFS4000, RFS6000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```plaintext
local-as <1-4294967295> {no-prepend}
```

**Parameters**

- `local-as <1-4294967295>`
  - `{no-prepend}`

  - Configures the local AS number
  - `<1-4292967295>` – Specify a value from 1 - 4294967295.
  - `{no-prepend}` – Optional. Select to enable. When enabled, the local AS number is not prepended to route updates from eBGP peers. AS numbers are prepended to route updates by default.

**Examples**

```plaintext
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#local-as 20
no-prepend
```

```plaintext
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
bgp neighbor 192.168.13.99
  advertisement-interval 100
  allowas-in 10
  attribute-unchanged as-path
  capability orf prefix-list both
  default-originate
  description neighbor "This neighbor is an external AS neighbor"
  disable-connected-check
dont-capability-negotiate
ebgp-multihop 20
enforce-multihop
local-as 20 no-prepend
```

**Related Commands**

<table>

### 28.8.13 maximum-prefix

**bgp-neighbor-config commands**

Configures the maximum number of prefixes that can be received from a BGP neighbor. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
maximum-prefix <1-4294967295> {(<1-100>|restart <1-65535>|warning-only)}
```

**Parameters**

- **maximum-prefix <1-4294967295>** — Configures the maximum number of prefixes that can be received from a BGP neighbor
  - `<1-4294967295>` — Specify a value for 1 - 4294967295.
  - `<1-100>` — Optional. Sets the threshold limit for generating a log message. This value represents a percentage of the maximum-prefix configured in the preceding step. When this value is reached, a log entry is generated. For example if the maximum-prefix is set to 100 and threshold limit is set to 65, then after receiving 65 prefixes, a log entry is generated. This option is disabled by default.
  - `restart <1-65535>` — Optional. Restarts BGP peer connection once the maximum-prefix limit specified is exceeded. For example, If the value specified is 10, then after receiving 10 prefixes from the neighbor, the system restarts the connection with that neighbor. Specify a value from 1 - 65535. This option is disabled by default.
  - `warning-only` — Configure to enable. When the maximum-prefix limit is exceeded, the connection is restarted. However, when this option is enabled, the connection is not restarted and an event is generated instead. This option is disabled by default.

**Examples**

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#maximum-prefix 400 50 warning-only
```

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show con bgp neighbor 192.168.13.99 advertisement-interval 100 allowas-in 10 attribute-unchanged as-path capability orf prefix-list both default-originate description neighbor "This neighbor is an external AS neighbor" disable-connected-check dont-capability-negotiate ebgp-multihop 20 enforce-multihop local-as 20 no-prepend maximum-prefix 400 50 warning-only
```

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
```

**Related Commands**

- **no** — Removes the maximum prefix settings configured for this neighbor
### 28.8.14 next-hop-self

**bgp-neighbor-config commands**

Enables next-hop calculation for this neighbor. This option is disabled by default.

When enabled, this device (or devices using this profile) are configured as the next hop for the BGP speaking neighbor or peer group. This allows the BGP device to change the next hop information that is sent to iBGP peers. The next hop address is set to the IP address of the interface used to communicate with the eBGP neighbor.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
next-hop-self
```

**Parameters**

None

**Examples**

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
next-hop-self
```

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context
bpg neighbor 192.168.13.99
    advertisement-interval 100
    allowas-in 10
    attribute-unchanged as-path
    capability orf prefix-list both
    default-originate
description neighbor "This neighbor is an external AS neighbor"
disable-connected-check
dont-capability-negotiate
egp-multihop 20
enforce-multihop
local-as 20 no-prepend
maximum-prefix 400 50 warning-only
    next-hop-self
    nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
```

28.8.15 no

bgp-neighbor-config commands

Removes this BGP neighbor’s settings, or reverts them back to default

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

no <PARAMETER>

Parameters

- no <PARAMETER>

no <PARAMETER> Specify the parameter details to remove or revert to default

Examples

The following example shows the neighbor 192.168.13.99 settings before the ‘no’ commands are executed:

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context

28.8.17 passive

*bgp-neighbor-config commands*

Enables this BGP neighbor device (or devices using this profile) as passive. When enabled, local devices do not attempt to open a connection to passive BGP neighbors. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
passive
```

**Parameters**

**28.8.18 password**

- **bgp-neighbor-config commands**

  Sets a password for this BGP neighbor device (or devices using this profile). When configured, this password is used for *Message Digest 5* (MD5) authentication between two BGP peers connected over TCP. To enable MD5 authentication between two BGP peers, configure both with the same password.

  Supported in the following platforms:
  - Wireless Controllers — RFS4000, RFS6000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

password neighbor <LINE>

**Parameters**

- password neighbor <LINE>

  | password neighbor <LINE> | Specify the password. |

**Examples**

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#password neighbor eBGPneighbor@300

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)# show context

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

**Related Commands**

- **no**: Removes the password configured for this neighbor
28.8.19 **peer-group**

 Sets the peer group for this BGP neighbor device (or devices using this profile). Peer groups are a set of BGP neighbors with the same update policies. This facilitates the updates of various policies, such as, distribute lists and filter lists.

 The peer group can be configured as a single entity. Any changes made to the peer group is propagated to all members.

 Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

 **Syntax**

 ```
 peer-group <PEER-GROUP-NAME>
 ```

 **Parameters**

- **peer-group <PEER-GROUP-NAME>**
  
  | peer-group <PEER-GROUP-NAME> | Specify the peer group name. Once specified, this neighbor device becomes a member of the peer group identified by the <PEER-GROUP-NAME> keyword. |
  | <PEER-GROUP-NAME> | Specify the peer group name. |

 **Examples**

```bash
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#peer-group eBGPPeerGrp1
 nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context bgp neighbor 192.168.13.99 advertisement-interval 100 peer-group eBGPPeerGrp1 allowas-in 10 attribute-unchanged as-path capability orf prefix-list both default-originate description neighbor "This neighbor is an external AS neighbor" disable-connected-check dont-capability-negotiate ebgp-multihop 20 enforce-multihop local-as 20 no-prepend maximum-prefix 400 50 warning-only next-hop-self override-capability passive password neighbor eBGPneighbor@300

### 28.8.20 port

**bgp-neighbor-config commands**

Configures a non-standard BGP port for this BGP neighbor.

By default BGP uses port 179. Use this command to set a non standard port for this BGP neighbor.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
port <0-65535>
```

**Parameters**

- `port <0-65535>`

**Examples**

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#port 21

   advertisement-interval 100

28.8.21 remote-as

bgp-neighbor-config commands

Configures the ASN for this neighbor BGP device (or devices using this profile). ASN is a set of routers under the same administration that use Interior Gateway Protocol (IGP) and common metrics to define how to route packets within the AS.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
remote-as <1-4294967295>

Parameters
- remote-as <1-4294967295>

remote-as <1-4294967295> Specify the remote ASN from 1 - 4294967295.

Examples

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#remote-as 100

nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#show context

28.8.22 remove-private-as

**bgp-neighbor-config commands**

Removes the private ASN from outbound updates. By default private ASNs are included in outbound updates.

Private AS numbers are not advertised to the Internet. This option is used with external BGP (eBGP) peers only. The router removes the AS numbers only if the update includes private AS numbers. If the update includes both private and public AS numbers, the system treats it as an error.

This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
remove-private-as
```

**Parameters**

None

**Examples**

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

```

Includes private ASNs in outbound updates (this is the default setting)
28.8.23 route-server-client

Enables this BGP neighbor device (or devices using this profile) to act as a route server client. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

```
route-server-client
```

Parameters

None

Examples

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#

```

Disables this BGP neighbor device (or devices using this profile) to act as a route server client
**28.8.24 send-community**

This command enables sending of the community attribute to the BGP neighbor. The community attribute groups destinations in a certain community and applies routing decisions based on the community. On receiving community attribute, the BGP router announces it to the neighbor.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**
```
send-community [both|extended|standard]
```

**Parameters**
- `send-community [both|extended|standard]`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>

  password neighbor eBGPneighbor@300
  remove-private-as
  route-server-client
  send-community both
```

**Related Commands**
- `no send-community` Disables sending of the community attribute to the BGP neighbor
28.8.25 shutdown

bgp-neighbor-config commands

Shuts down this BGP neighbor device (or devices using this profile). When configured, this neighbor is administratively shut down. This option is disabled by default.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax
shutdown

Parameters
None

Examples
nx9500-6C8809(config-profile testNX500-router-bgp-neighbor-192.168.13.99)#shutdown

  remove-private-as
  route-server-client
  shutdown

nx9500-6C8809(config-profile testNX500-router-bgp-neighbor-192.168.13.99)#

</tr>
</tbody>
</table>
28.8.26 **soft-reconfiguration**

- **bgp-neighbor-config commands**

  Enables storing of updates for inbound soft reconfiguration. This option is disabled by default.

  Soft-reconfiguration can be used in lieu of BGP route refresh capability. Enabling this option enables local storage of all received routes and their attributes. This requires additional memory on the BGP device.

  When a soft reset (inbound) is performed on the neighbor device, the locally stored routes are reprocessed according to the inbound policy. The BGP neighbor connection is not affected.

  Supported in the following platforms:
  - Wireless Controllers — RFS4000, RFS6000
  - Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
soft-reconfiguration inbound
```

**Parameters**

- `soft-reconfiguration inbound`

**Examples**

```
x9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#
soft-reconfiguration inbound
```

**Related Commands**

28.8.27 strict-capability-match

Enforces a strict capability match before allowing a TCP connection with this neighbor. In case capabilities do not match, the BGP connection is not established. This option is disabled by default.

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

```
strict-capability-match
```

Parameters

None

Examples

```
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)#strict-capability-match
```

Related Commands

```
no
```
Disables a strict capability match before allowing a connection with this neighbor
28.8.28 timers

**bgp-neighbor-config commands**

Configures this BGP neighbor's keepalive and holdtime durations

---

**NOTE:** The keepalive and holdtime settings configured at the neighbor level override those configured on the BGP router.

---

Supported in the following platforms:

- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

timers [<0-65535> <0-65535>|connect <0-65535>]

**Parameters**

- timers [<0-65535> <0-65535>|connect <0-65535>]

<table>
<thead>
<tr>

28.8.29 unsuppress-map

Unsuppresses map to selectively advertise routes that have been suppressed using the *aggregate-address* command.

The aggregate-address command creates a route map with a IP/mask address that consolidates subnets under it. This reduces the number of route maps on the BGP device to one consolidated entry. Use unsuppress-map to selectively allow/deny a subnet or a set of subnets from this consolidated entry.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

```
unsuppress-map <ROUTE-MAP-NAME>
```

**Parameters**
- `unsuppress-map <ROUTE-MAP-NAME>`

**Examples**

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99#
unsuppress-map test
```

```
nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99#show
context

28.8.31 use

bgp-neighbor-config commands

Configures filters for this neighbor. These filters are BGP IP ACL, IP prefix list, AS path list, and route map. Based on the filters used, updates received from this neighbor are filtered.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

Syntax

use [distribute-list <BGP-IP-ACL-NAME>|filter-list <AS-PATH-LIST-NAME>|prefix-list <IP-PREFIX-LIST-NAME>|route-map <BGP-ROUTE-MAP-NAME>]

Parameters

- use [distribute-list <BGP-IP-ACL-NAME>|filter-list <AS-PATH-LIST-NAME>|prefix-list <IP-PREFIX-LIST-NAME>|route-map <BGP-ROUTE-MAP-NAME>]

Examples

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99)# use filter-list FilterList_01 in

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99)# use route-map testBGPRouteMap out

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99)# show context

   bgp neighbor 192.168.13.99
   remote-as 199
   use filter-list FilterList_01 in
   maximum-prefix 9999 80 restart 50
   use route-map testBGPRouteMap out
   unsuppress-map test

nx9500-6C8809(config-device B4-C7-99-6C-88-09-router-bgp-neighbor-192.168.13.99)#

Related Commands

no Removes the filters used to filter updates received from this neighbor
### 28.8.32 weight

**bgp-neighbor-config commands**

Configures a weight for all routes learned from this BGP neighbor. Weight is used to decide the preferred route when the same route is learned from multiple neighbors. The highest weight is always chosen.

Supported in the following platforms:
- Wireless Controllers — RFS4000, RFS6000
- Service Platforms — NX4500, NX4524, NX6500, NX6524, NX9000, NX9500, NX9510

**Syntax**

weight <0-65535>

**Parameters**

- weight <0-65535>

---

**Examples**

```bash
nx9500-6C8809(config-profile testNX45XX-router-bgp-neighbor-192.168.13.99)# weight 10
remote-as 100
advertisement-interval 100
peer-group eBGPPeerGrp1
port 21

This chapter summarizes the crypto certificate management protocol (CMP) policy commands in the CLI command structure. CMP is an Internet protocol designed to enable devices (access point, wireless controller, or service platform) to obtain and manage digital certificates in a Public Key Infrastructure (PKI) network. A Certificate Authority (CA) issues the certificates using the defined CMP.

WiNG CMP implementation allows you to configure a crypto CMP policy that enables auto installation and auto management of device certificates. When configured and implemented on a device, the crypto CMP policy allows the device to automatically trigger a certification request to a configured, CMP supported certificate authority (CA) server. Once the certificate is validated and confirmed from the CA server it is saved on the device and becomes part of the trustpoint. During the creation of the CMP policy the trustpoint is assigned a name and client information. You can use a manually created trustpoint for one service (like HTTPS) and use the CMP generated trustpoint for RADIUS EAP certificate based authentication.

Use the (config) instance to configure a crypto CMP policy. To navigate to the crypto CMP policy configuration instance, use the following commands:

```
<DEVICE>(config)#crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>
ap6522-D8273A(config)#crypto-cmp-policy CMP
ap6522-D8273A(config-cmp-policy-CMP)#
ap6522-D8273A(config-cmp-policy-CMP)#?
```

CMP Policy Mode commands:

- `ca-server` : CMP CA Server configuration commands
- `cert-key-size` : Set key size for certificate request
- `cert-renewal-timeout` : Trigger a cert renewal request on timeout
- `cross-cert-validate` : Validate cross-cert using factory-cert
- `no` : Negate a command or set its defaults
- `subjectAltName` : Configure subjectAltName value
- `trustpoint` : Trustpoint for CMP
- `use` : Set setting to use
- `clrscr` : Clears the display screen
- `commit` : Commit all changes made in this session
- `do` : Run commands from Exec mode
- `end` : End current mode and change to EXEC mode
- `exit` : End current mode and down to previous mode
- `help` : Description of the interactive help system
- `revert` : Revert changes
- `service` : Service Commands
- `show` : Show running system information
- `write` : Write running configuration to memory or terminal
This chapter is organized as follows:

- crypto-cmp-policy-instance
- other-cmp-related-commands

**NOTE:** The input parameter `<HOSTNAME>`, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
## 29.1 crypto-cmp-policy-instance

The following table summarizes crypto CMP policy configuration commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Reference</th>
</tr>

<tr>
<td>subjectAltName</td>
<td>Configures an alternate subject name for this CMP policy</td>
<td>page 29-8</td>
</tr>
<tr>
<td>trustpoint</td>
<td>Configures a trustpoint and its associated information, such as the subject name, the sender's (device requesting certification) details, and the recipient's (CA) details</td>
<td>page 29-9</td>
</tr>
<tr>
<td>use</td>
<td>Associates a device's autogen-uniqueid with this crypto CMP policy</td>
<td>page 29-11</td>
</tr>
<tr>
<td>no</td>
<td>Removes the crypto CMP policy settings</td>
<td>page 29-12</td>
</tr>
</tbody>
</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see Chapter 5, COMMON COMMANDS.
### 29.1.1 ca-server

Configures the primary and secondary CA server details.

The CA is an external network authority (usually a trusted third-party server) that generates and issues digital certificates in response to requests received from network devices. Use this command to configure the primary and secondary CA server details, such as name of the device hosting the CA server, the port used to access the CA server, and the path where the certificate is stored. Once defined, devices using this CMP policy automatically send requests to the specified primary CA server, and retrieve the certificate from the specified location. If the primary CA server is not reachable, the requests are sent to the secondary CA server.

Supported in the following platforms:
- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```plaintext
ca-server [primary|secondary] host <IP/HOSTNAME> port <PORT-NUMBER> path <PATH>
```

### Parameters

- **ca-server [primary|secondary]**
  - Configures the primary and secondary CA server details (IP address, port, and path)
  - `primary` — Configures the primary CA server's details
  - `secondary` — Configures the secondary CA server's details

**Note:** The secondary CA is used in case the primary CA server is not reachable. CA server settings are required to complete CMP requests.

- **host <IP/HOSTNAME>**
  - Configures IP address or hostname of the device hosting the primary/secondary CA server
  - `<IP/HOSTNAME>` — Specify the IP address or hostname.

- **port <PORT-NUMBER>**
  - Configures the port on which the primary/secondary CA server can be reached
  - `<PORT-NUMBER>` — Specify the port number.

- **path <PATH>**
  - Configures the path or filename of the primary/secondary CA certificate. Enter the complete relative path to the file on the server.
  - `<PATH>` — Specify the path. Once specified, the certificate is downloaded from this location and installed on the device.

### Examples

```plaintext
ap6522-D8273A(config-cmp-policy-CMP)#ca-server primary host 192.168.8.74 port 8 path cmp
ap6522-D8273A(config-cmp-policy-CMP)#show context crypto-cmp-policy CMP
ca-server primary host 192.168.8.74 port 80 path cmp
```

### Related Commands

- **no**
  - Removes the configured primary/secondary CA server details
29.1.2 cert-key-size

- **crypto-cmp-policy-instance**

  Configures the size of the key associated with a certificate request.

Supported in the following platforms:

- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

cert-key-size [2048|3072|4096]

**Parameters**

- **cert-key-size** [2048|3072|4096]

| cert-key-size [2048|3072|4096] | Configures the certificate request key size. The options are: |
|---------------------------------|----------------------------------------------------------|
| 2048                           | - Sets the key size to 2048 bits. This is the default setting. |
| 3072                           | - Sets the key size to 3072 bits |
| 4096                           | - Sets the key size to 4096 bits |

**Examples**

nx9500-6C8809(config-cmp-policy-test)#cert-key-size 3072

nx9500-6C8809(config-cmp-policy-test)#show context
crypto-cmp-policy test
cert-key-size 3072
trustpoint cmp-test subject-name "CN=ExampleCompany, O=Example Company" secret 2
osr2bwjr+0L+G64ny3wfuAAAAATFjeFvn0IixTHLDfgt7Bu reference-id 123456 sender-name "CN=ExampleCompany.com, O=Example Company" recipient-name "O=Example Company, CN=ExampleCompany.com"
nx9500-6C8809(config-cmp-policy-test)#

**Related Commands**

- **no**

  Reverts the certificate request key size to default (2048 bits)
29.1.3 cert-renewal-timeout

Configures a certificate renewal timeout in days. This is the number of days, before the expiration of the device’s certificate, that a certificate renewal is triggered.

The expiration of device’s certificate is checked once a day. When a certificate is about to expire a certificate renewal is initiated with the dedicated CMP CA server resource through an existing IPSec tunnel. If the tunnel is not established, the CMP renewal request is not sent. If a renewal succeeds the newly obtained certificate overwrites an existing certificate. If the renewal fails, an error is logged.

Supported in the following platforms:
- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

cert-renewal-timeout <1-60>

Parameters
- cert-renewal-timeout <1-60>

<table>
<thead>
<tr>
<th>cert-renewal-timeout &lt;1-60&gt;</th>
<th>Configures the certificate renewal timeout in days. This is the number of days, before the expiration of the device’s certificate, that a certificate renewal is triggered. Once the configured time is completed, the device triggers a certificate renewal request.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;1-60&gt;– Specify a value from 1 - 60 days. The default is fourteen (14) days. Therefore, by default a device triggers certificate renewal request 14 days before its certificate expires.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

ap6522-D8273A(config-cmp-policy-CMP)#cert-renewal-timeout 60

ap6522-D8273A(config-cmp-policy-CMP)#show context
crypto-cmp-policy CMP
cert-renewal-timeout 60
ca-server primary host 192.168.8.74 port 8 path cmp
ap6522-D8273A(config-cmp-policy-CMP)#

Related Commands

| no | Reverts the certificate renewal timeout to default (14 days) |
29.1.4 cross-cert-validate

Enables validation of the cross certificate using the factory certificate. When enabled, the obtained cross-certificate is validated against the operator's certificate configured using the `trustpoint > cmp-auth-operator` command. An error message is displayed in case the cross-certificate is not obtained or if the cross-certificate is found to be invalid. This option is disabled by default.

NOTE: To the operator certificate, in the device configuration mode execute the `trustpoint > cmp-auth-operator` command. For more information, see `trustpoint (device-config-mode)`.

Supported in the following platforms:
- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

cross-cert-validate

Parameters

None

Examples

```
nx9500-6C8809(config-cmp-policy-test)#cross-cert-validate

nx9500-6C8809(config-cmp-policy-test)#show context
crypto-cmp-policy_test
    cert-key-size 3072
    cross-cert-validate
    trustpoint cmp-test subject-name "CN=ExampleCompany, O=Example Company" secret 2 9piulK/GqyD+G64n3wuAAAuqCi8WJkNjwryMD91APk4T reference-id 123456 sender-name "CN=ExampleCompany.com, O=Example Company" recipient-name "O=Example Company, CN=ExampleCompany.com"
```

Related Commands

```
no
```

Disables validation of the cross certificate with the factory certificate
29.1.5 subjectAltName

Configures the subjectAltName identity for this CMP policy

Supported in the following platforms:

- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

subjectAltName [address <IP>|dn <DISTINGUISHED-NAME>|email <EMAIL-ID>|fqdn <FQDN>|string <USER-DEFINED-STRING>]

Parameters

- subjectAltName [address <IP>|dn <DISTINGUISHED-NAME>|email <EMAIL-ID>|fqdn <FQDN>|string <USER-DEFINED-STRING>]

Examples

ap6522-D8273A(config-cmp-policy-CMP)#subjectAltName dn TechPubsCA
ap6522-D8273A(config-cmp-policy-CMP)#show context
crypto-cmp-policy CMP
  cert-update
cert-renewal-timeout 60
  ca-server primary host 192.168.8.74 port 8 path cmp
subjectAltName dn TechPubsCA
ap6522-D8273A(config-cmp-policy-CMP)#

Related Commands

no

Removes the subjectAltName identity configured with this CMP policy
29.1.6 trustpoint

Configures a trustpoint and its associated information, such as the subject name, the sender's (device requesting certification) details, and the recipient's (CA) details. This information is needed to obtain the certificate from the CA server using CMP.

Each certificate is digitally signed by a trustpoint and contains device-specific information, such as device name, IP address, serial number. It helps to uniquely identify a device.

Supported in the following platforms:
- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

```
trustpoint <TRUSTPOINT-NAME> subject-name <WORD> secret [0 <WORD>|2 <WORD>] reference-id <WORD> sender-name <WORD> [recipient-name <WORD>|ca-psk <CERT-PATH>]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trustpoint &lt;TRUSTPOINT-NAME&gt;</td>
<td>Configures a trustpoint name (should not exceed 32 characters)</td>
</tr>
<tr>
<td></td>
<td>• &lt;TRUSTPOINT-NAME&gt; – Specify the trustpoint’s name.</td>
</tr>
<tr>
<td>subject-name &lt;WORD&gt;</td>
<td>Configures a subject name for this trustpoint. The subject name should uniquely identify the certificate and should not exceed 512 characters in length.</td>
</tr>
<tr>
<td>secret [0 &lt;WORD&gt;</td>
<td>2 &lt;WORD&gt;]</td>
</tr>
<tr>
<td></td>
<td>• 0 &lt;WORD&gt; – Configures a clear text password</td>
</tr>
<tr>
<td></td>
<td>• 2 &lt;WORD&gt; – Configures an encrypted password</td>
</tr>
<tr>
<td>reference-id &lt;WORD&gt;</td>
<td>Configures the reference ID. The CA server uses this information to identify the shared secret key used.</td>
</tr>
<tr>
<td></td>
<td>• &lt;WORD&gt; – Specify the reference ID.</td>
</tr>
<tr>
<td>sender-name &lt;WORD&gt;</td>
<td>Configures the sender's name. The CA server uses this information to identify the shared secret key used. The sender’s name should not exceed 512 characters in length.</td>

</tbody>
</table>
29.1.7 **use**

Associates a device’s autogen-uniqueid with this crypto CMP policy

A device’s autogen-uniqueid is a combination of a user-defined string (prefix or suffix) and a substitution token. The WiNG software implementation provides two built-in substitution tokens: $SN and $MiNT-ID that represent the device’s serial number and MiNT ID respectively. These substitution tokens are internally retrieved and combined with the user-defined string to auto generate a unique identity for a device.

To auto generate the device’s unique ID, in the device configuration mode execute the following command:

```
autogen-uniqueid <WORD>
```

For more information on the autogen-uniqueid command, see [autogen-uniqueid](#).

Supported in the following platforms:

- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

### Syntax

```
use autogen-uniqueid
```

### Parameters

- **use autogen-uniqueid**

  Associates a device’s autogen-uniqueid with this crypto CMP policy. The device’s autogen-uniqueid should be existing and configured.

### Examples

```
ap6522-D8273A(config-cmp-policy-CMP)#use autogen-uniqueid

ap6522-D8273A(config-cmp-policy-CMP)#show context
crypto-cmp-policy CMP
cert-update
cert-renewal-timeout 60

</table>
29.2.1 use

Applies a crypto CMP policy to a device. Once CMP enabled, the device automatically requests for a certificate from the CA server and installs it. After applying the CMP policy, commit and write the change to memory. This is needed to apply this configuration across reboots.

To apply a CMP policy on a device, navigate to the device’s config-device mode and execute the `use > crypto-cmp-policy > <CRYPTO-CMP-POLICY-NAME>` command.

Supported in the following platforms:

- Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, WiMod
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

`use crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>`

**Parameters**

- `use crypto-cmp-policy <CRYPTO-CMP-POLICY-NAME>`

**Examples**

```
ap6522-D8273A(config-device-00-11-3F-D8-27-3A)#use crypto-cmp-policy CMP
ap6522-D8273A(config-device-00-11-3F-D8-27-3A)#commit
```
**29.2.2 show**

- **other-cmp-related-commands**

  Displays current status of CMP requests in progress. This command also displays trustpoint details (CMP and non-CMP trustpoints).

  Supported in the following platforms:
  - Access Points — AP622, AP650, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX, WiMod
  - Wireless Controllers — RFS4000, RFS6000, RFS7000
  - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
show crypto [cmp|pki]
```

```
show crypto cmp request status
show crypto pki trustpoints
```

**Parameters**

- **show crypto cmp request**
  - Displays the current status of all on-going CMP requests

- **show pki trustpoints**
  - Displays all trustpoints including CMP generated trustpoints

**Examples**

```
ap6522-D8273A#show crypto pki trustpoints
---------------------------------------------------------------------------------------
TRUSTPOINT       KEY NAME               VALID UNTIL
---------------------------------------------------------------------------------------
cmp-test         cmp-test-key          Fri May  9 09:44:22 2014 GMT
default-trustpoint default_rsa_key      Fri Dec 30 00:00:40 2022 GMT
---------------------------------------------------------------------------------------
ap6522-D8273A#
ap6522-D8273A(config)#show crypto cmp request status
CMP Request Status:  cmp-complete
ap6522-D8273A#
```
This chapter summarizes the Roaming Assist policy commands in the CLI command structure.

By constantly monitoring a client’s packets and the received signal strength indicator (RSSI) of a given client by a group of access points, decision can be made on the optimal access point to which the client needs to roam. Then forcefully direct the client to the optimal access point.

The threshold intervals are configurable and can be adjusted based on the client load.

Use the (config) instance to configure a Roaming Assist policy. To navigate to the Roaming Assist policy configuration instance, use the following commands:

```
<DEVICE> (config) roaming-assist-policy <ROAMING-ASSIST-POLICY-NAME>
```

```
nx9500-6C8809(config)roaming-assist-policy test
```

```
nx9500-6C8809(config-roaming-assist-policy-test)#?
```

Roaming Assist Mode commands:

- **action**
  - Configure action - action is deauth / log / assisted-roam

- **aggressiveness**
  - Configure the roaming aggressiveness for a wireless client

- **detection-threshold**
  - Configure the detection threshold - when exceeded, client monitoring starts

- **disassoc-time**
  - Configure the disassociation time - time after which a disassociation is sent

- **handoff-count**
  - Configure the handoff count - number of times client can exceed handoff threshold

- **handoff-threshold**
  - Configure the handoff threshold - when exceeds an action is taken.

- **monitoring-interval**
  - Configure the monitoring interval - interval at which client monitoring occurs

- **no**
  - Negate a command or set its defaults

- **sampling-interval**
  - Configure the sampling interval - interval at which client rssi values are checked

- **clrscr**
  - Clears the display screen

- **commit**
  - Commit all changes made in this session

- **end**
  - End current mode and change to EXEC mode

- **exit**
  - End current mode and down to previous mode

- **help**
  - Description of the interactive help system

- **revert**
  - Revert changes

- **service**
  - Service Commands

- **show**
  - Show running system information

- **write**
  - Write running configuration to memory or terminal
NOTE: The input parameter <HOSTNAME>, wherever used in syntaxes across this chapter, cannot include an underscore (_) character. In other words, the name of a device cannot contain an underscore.
### 30.1 roaming-assist-policy-instance

**ROAMING ASSIST POLICY**

</table>

**NOTE:** For more information on common commands (clrscr, commit, help, revert, service, show, write, and exit), see *Chapter 5, COMMON COMMANDS*. 
30.1.1 action

roaming-assist-policy-instance

Specifies the action invoked on the client once it reaches a specified threshold value. The threshold values are configured based on the client load.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

action [assisted-roam|deauth|log]

Parameters

- action [assisted-roam|deauth|log]

| action (assisted-roam|deauth|log) | Configures the action invoked on the client once it reaches the specified threshold value. The options are: |
|------------------------------------|---------------------------------------------------------------------------------------------------|
| assisted-roam – Provides 802.11v assisted roaming facility to the client |
| deauth – De-authenticates the client. This is the default setting. |
| log – Generates a log |

In all three cases an event is generated. However, the message generated differs and is based on the action specified.

Examples

rfs6000-81742D(config-roaming-assist-policy-test)#action log
rfs6000-81742D(config-roaming-assist-policy-test)#

Related Commands

no

Removes the configured action details
30.1.2 aggressiveness

Configures a roaming aggressiveness value for wireless clients. Configuring this value increases the client's roaming capabilities in scenarios where the client's location is likely to change drastically and suddenly. For example, when a client hops on to a train that speeds up quickly. In such a scenario, the access point receives a maximum of 2 (two) messages, from the client, having relatively low RSSI value. This results in a decaying-average, which is above the specified handover-threshold value. Consequently, the client is unable to roam.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
aggressiveness [highest|lowest|medium|medium-high|medium-low]

Parameters

- aggressiveness [highest|lowest|medium|medium-high|medium-low]

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| aggressiveness [highest|lowest|medium|medium-high|medium-low] | Configures a roaming aggressiveness value for wireless clients. The options are:

  - highest – De-authenticates client in case of any degradation in the client's link quality. When selected, the access point considers only the RSSI value of the last message received from the client.
  - lowest – De-authenticates client only in case of significant degradation in the client's link quality. When selected, the access point uses a weighted average [80% of decaying average + 20% of last seen RSSI] as the final reported RSSI value. This is the default setting.
  - medium – This is an intermediate setting between not roaming and performance
  - medium-high – Allows roaming even if performance goes down. When selected, the access point calculates the client's signal strength based on average received signal as well as last received signal level, weighted towards the last received value.
  - medium-low – Allows roaming even if performance goes average. When selected, the access point calculates the client's signal strength based on average received signal as well as last received signal level, weighted towards the average value. |

Examples

```
nx9500-6C8809(config-roaming-assist-policy-test)#aggressiveness medium
```

```
nx9500-6C8809(config-roaming-assist-policy-test)#show context roaming-assist-policy_test aggressiveness medium
```

```
nx9500-6C8809(config-roaming-assist-policy-test)#
```

Related Commands

`no`
Reverts the aggressiveness value to default (lowest)
30.1.3 detection-threshold

Specifies the detection-threshold determining when a client is monitored

Supported in the following platforms:

- **Access Points** — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- **Wireless Controllers** — RFS4000, RFS6000, RFS7000
- **Service Platforms** — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

detection-threshold <-100--40>

**Parameters**

- **detection-threshold <-100--40>**

**Examples**

```bash
rfs6000-81742D(config-roaming-assist-policy-test)#detection-threshold -90
rfs6000-81742D(config-roaming-assist-policy-test)#
```

**Related Commands**

- **no** Removes the configured detection threshold details
30.1.4 disassoc-time

 Configures the disassociation time. This is the time period after which a disassociation message is sent.

 Supported in the following platforms:

 - Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
 - Wireless Controllers — RFS4000, RFS6000, RFS7000
 - Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

 Syntax

 disassoc-time <1-10>

 Parameters

 - disassoc-time <1-10>

     | Parameter          | Description                                      |
     |--------------------|--------------------------------------------------|
     | disassoc-time <1-10> | Configures the disassociation time in seconds |
     | <1-10>            | Specify a value from 1 - 10 seconds. The default is 5 seconds. |

 Examples

 nx9500-6C8809(config-roaming-assist-policy-test)#disassoc-time 7
 nx9500-6C8809(config-roaming-assist-policy-test)#show context
 roaming-assist-policy test
     disassoc-time 7
 nx9500-6C8809(config-roaming-assist-policy-test)#

 Related Commands

 no

 Removes the configured disassociation time
30.1.5 handoff-count

roaming-assist-policy-instance

Specifies the number of times a client can exceed the specified handoff-threshold value before an action is invoked.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

handoff-count <1-10>

Parameters

- handoff-count <1-10>

<table>
<thead>
<tr>
<th>handoff-count &lt;1-10&gt;</th>
<th>Specifies the number of times a client can exceed the specified handoff-threshold value before an action is invoked.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;1-10&gt; — Specify a value from 1 - 10. The default is 3.</td>
</tr>
<tr>
<td></td>
<td>If the client’s RSSI increases beyond the set handoff-threshold, it is removed from the queue for monitoring and action invocation.</td>
</tr>
</tbody>
</table>

Examples

rfs6000-81742D(config-roaming-assist-policy-test)#handoff-count 1
rfs6000-81742D(config-roaming-assist-policy-test)#

Related Commands

no

Removes the configured handoff-count details.
30.1.6 handoff-threshold

roaming-assist-policy-instance

Configures the handoff-threshold, which specifies client status for handoff-action. Once exceeded an action is invoked.

Supported in the following platforms:
- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax
handoff-threshold <-100--40>

Parameters
- handoff-threshold <-100--40>

<table>
<thead>
<tr>
<th>handoff-threshold &lt;-100--40&gt;</th>
<th>Configures the handoff-threshold, which specifies client status for handoff-action. Once exceeded an action is invoked.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;100--40&gt;</td>
<td>Specify the RSSI value from -100 dBm - -40 dBm. The default is -80 dBm. If the client's RSSI increases beyond the set handoff-threshold, it is removed from the queue for monitoring and action invocation.</td>
</tr>
</tbody>
</table>

Examples
rfs6000-81742D (config-roaming-assist-policy-test)#handoff-threshold -78
rfs6000-81742D (config-roaming-assist-policy-test)#

Related Commands
- no: Removes the configured handoff-threshold details
30.1.7 monitoring-interval

Configures the interval, in seconds, at which clients are monitored to determine if their RSSI value is below the specified handoff-threshold value.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

**Syntax**

```
monitoring-interval <1-60>
```

**Parameters**

- `monitoring-interval <1-60>`

<table>
<thead>
<tr>
<th>monitoring interval &lt;1-60&gt;</th>
<th>Specifies the interval, in seconds, at which clients are monitored to determine if their RSSI is below the specified handoff-threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;1-60&gt; – Specify the duration from 1 - 60 seconds. The default is 5 seconds.</td>
</tr>
</tbody>
</table>

**Examples**

```
rfs6000-81742D(config-roaming-assist-policy-test)#monitoring-interval 10
rfs6000-81742D(config-roaming-assist-policy-test)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Removes the configured monitoring interval details</td>
</tr>
</tbody>
</table>
30.1.8 sampling-interval

roaming-assist-policy-instance

Configures the interval, in seconds, at which clients are sampled to determine their RSSI value.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7532, NX9000, NX9500, NX9510, NX9600

**Syntax**

sampling-interval <5-60>

**Parameters**

- sampling-interval <5-60>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sampling-interval &lt;5-60&gt;</td>
<td>Configures the interval, in seconds, between two successive client samplings</td>
</tr>
<tr>
<td>&lt;5-60&gt;</td>
<td>Specify a value from 5 - 60 seconds. The default value is 15 seconds.</td>
</tr>
</tbody>
</table>

**Note:** Higher the RSSI value, stronger is the signal.

**Examples**

```
rfs6000-81742D(config-roaming-assist-policy-test)#sampling-interval 20
rfs6000-81742D(config-roaming-assist-policy-test)#
```

**Related Commands**

- `no` | Removes the configured sampling interval details
30.1.9 no

roaming-assist-policy-instance

Removes or reverts this roaming assist policy settings based on the parameters passed.

Supported in the following platforms:

- Access Points — AP621, AP622, AP650, ES6510, AP6511, AP6521, AP6522, AP6532, AP6562, AP71XX, AP7502, AP7522, AP7532, AP7562, AP81XX, AP82XX
- Wireless Controllers — RFS4000, RFS6000, RFS7000
- Service Platforms — NX4500, NX4524, NX5500, NX6500, NX6524, NX7500, NX7510, NX7520, NX7530, NX9000, NX9500, NX9510, NX9600

Syntax

no [action|aggressiveness|detection-threshold|diassoc-time|handoff-count|handoff-threshold|monitoring-interval|sampling-interval]

Parameters

- no <PARAMETERS>

Examples

rfs6000-81742D(config-roaming-assist-policy-test)#no action  
rfs6000-81742D(config-roaming-assist-policy-test)#no detection-threshold  
rfs6000-81742D(config-roaming-assist-policy-test)#no handoff-threshold  
rfs6000-81742D(config-roaming-assist-policy-test)#show context  
roaming-assist-policy test  
sampling-interval 20  
monitoring-interval 10  
rfs6000-81742D(config-roaming-assist-policy-test)#
This section describes the activities required to configure a WLAN. Instructions are provided using the wireless controller CLI.

- Creating a First Controller Managed WLAN
- Assumptions
- Design
- Using the Command Line Interface to Configure the WLAN
A.1 Creating a First Controller Managed WLAN

A.1.1 Assumptions

Verify the following conditions have been satisfied before attempting the WLAN configuration activities described in this section:

- It is assumed the RFS4000 wireless controller has the latest firmware version available.
- It is assumed the AP650 and AP71XX access points also have the latest firmware version available.
- It is assumed there are no previous configurations on the wireless controller or access point and default factory configurations are running on the devices.
- It is assumed you have administrative access to the wireless controller and access point CLI.
- It is assumed the individual administrating the network is a professional network installer.

A.1.2 Design

This section defines the network design being implemented.

This is a simple deployment scenario, with the access points connected directly to the wireless controller. One wireless controller port is connected to an external network.

On the RFS4000 wireless controller, the GE1 interface is connected to an external network. Interfaces GE3 and GE4 are used by the access points.

On the external network, the wireless controller is assigned an IP address of 192.168.10.188. The wireless controller acts as a DHCP server for the wireless clients connecting to it, and assigns IP addresses in the range of 172.16.11.11 to 172.16.11.200. The rest of IPs in the range are reserved for devices requiring static IP addresses.
A.1.3 Using the Command Line Interface to Configure the WLAN

These instructions are for configuring your first WLAN using the wireless controller CLI.

Use a serial console cable when connecting to the wireless controller for the first time. Set the following configuration when using the serial connection:

- Bits per second: 19200
- Data Bit: 8
- Parity: None
- Stop Bit: 1
- Flow Control: None

The steps involved in creating a WLAN on a wireless controller are:

1. Logging Into the Controller for the First Time
2. Creating a RF Domain
3. Creating a Wireless Controller Profile
4. Creating an AP Profile
5. Creating a DHCP Server Policy
6. Completing and Testing the Configuration

A.1.3.1 Logging Into the Controller for the First Time

When powering on the wireless controller for the first time, you are prompted to replace the existing administrative password. The credentials for logging into the wireless controller for the first time are:

- User Name: admin
- Password: admin123

Ensure the new password created is strong enough to provide adequate security for the wireless controller managed network.

A.1.3.2 Creating a RF Domain

A RF Domain is a collection of configuration settings specific to devices located at the same physical deployment, such as a building or a floor. Create a RF Domain and assign the country code where the devices are deployed. This is a mandatory step, and the devices will not function as intended if this step is omitted.

The instructions in this section must be performed from the Global Configuration mode of the wireless controller. To navigate to this mode:

rfs4000>enable
rfs4000#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
rfs4000(config)#
Create the RF Domain using the following commands:

```
rfs4000(config)#rf-domain RFDOMAIN_UseCase1
rfs4000(config)#rf-domain-RFDOMAIN_UseCase1#
```

This command creates a profile with the name `RFDOMAIN_UseCase1`.

Set the country code for the RF Domain.

```
rfs4000(config-rf-domain-RFDOMAIN_UseCase1)#country-code us
```

This sets the country code for this RF Domain. Save this change and exit the RF Domain profile context.

```
rfs4000(config-rf-domain-RFDOMAIN_UseCase1)#commit write
rfs4000(config-rf-domain-RFDOMAIN_UseCase1)#exit
rfs4000(config)#
```

To define the wireless controller’s physical location, use the same RF Domain configuration.

```
rfs4000(config)#self
rfs4000(config-device-03-14-28-57-14-28)#
rfs4000(config-device-03-14-28-57-14-28)#use rf-domain RFDOMAIN_UseCase1
```

Commit the changes and write to the running configuration. Exit this context.

```
rfs4000(config-device-03-14-28-57-14-28)#commit write
rfs4000(config-device-03-14-28-57-14-28)#exit
rfs4000(config)#
```

### A.1.3.3 Creating a Wireless Controller Profile

#### Using the Command Line Interface to Configure the WLAN

The first step in creating a WLAN is to configure a profile defining the parameters applied to a wireless controller.

To create a profile:

```
rfs4000(config)#profile rfs4000 RFS4000_UseCase1
rfs4000(config-profile-RFS4000_UseCase1)#
```

This creates a profile with the name `RFS4000_UseCase1` and moves the cursor into its context. Any configuration made under this profile is available when it is applied to a device.

#### Configure a VLAN

Create the VLAN to use with the WLAN configuration. This can be done using the following commands:

```
rfs4000(config-profile-RFS4000_UseCase1)#interface vlan 2
rfs4000(config-profile-RFS4000_UseCase1-if-vlan2)#ip address 172.16.11.1/24
rfs4000(config-profile-RFS4000_UseCase1)#
```

The above command assigns the IP address 172.16.11.1 with the mask of 255.255.255.0 to VLAN 2. Exit the VLAN 2 context.

```
rfs4000(config-profile-RFS4000_UseCase1-if-vlan2)#exit
rfs4000(config-profile-RFS4000_UseCase1)#
```

The next step is to assign this newly created VLAN to a physical interface. In this case, VLAN 2 is mapped to GE3 and GE4 to support two access points, an AP650 and an AP71XX. The AP650 is connected to the gigabit interface GE3 and the AP71XX to the GE4 interface.

```
rfs4000(config-profile-RFS4000_UseCase1)#interface ge 3
rfs4000(config-profile-RFS4000_UseCase1-if-ge3)#switchport access vlan 2
rfs4000(config-profile-RFS4000_UseCase1-if-ge3)#exit
rfs4000(config-profile-RFS4000_UseCase1)#
```

Similarly, map the defined VLAN 2 to the GE4 interface.

```
rfs4000(config-profile-RFS4000_UseCase1-if-ge4)#switchport access vlan 2
rfs4000(config-profile-RFS4000_UseCase1-if-ge4)#exit
rfs4000(config-profile-RFS4000_UseCase1)#
```
Exit the profile and save it.

Rs4000(config-profile-RFS4000_UseCase1)#exit
Rs4000(config)#commit write

**Configure the Wireless Controller to use the Profile**

Before the wireless controller can be further configured, the profile must be applied to the wireless controller.

Rs4000(config)#self
Rs4000(config-device-03-14-28-57-14-28)#
Rs4000(config-device-03-14-28-57-14-28)#use profile RFS4000_UseCase1
Rs4000(config-device-03-14-28-57-14-28)#exit
Rs4000(config)#commit write

**Create a WLAN**

Use the following commands to create a WLAN:

Rs4000(config)#wlan 1
Rs4000(config-wlan-1)#

Configure the SSID for the WLAN. This is the value that identifies and helps differentiate this WLAN.

Rs4000(config-wlan-1)#ssid WLAN_USECASE_01

Enable the SSID to be broadcast so wireless clients can find it and associate.

Rs4000(config-wlan-1)#broadcast-ssid

Associate VLAN 2 to the WLAN and exit.

Rs4000(config-wlan-1)#vlan 2
Rs4000(config-wlan-1)#exit

**Commit the Changes**

Once these changes have been made, they have to be committed before proceeding.

Rs4000(config)#commit write

### A.1.3.4 Creating an AP Profile

#### Using the Command Line Interface to Configure the WLAN

An AP profile provides a method of applying common settings to access points of the same model. The profile significantly reduces the time required to configure access points within a large deployment. For more information, see:

- Creating an AP650 Profile
- Creating an AP71XX Profile

#### A.1.3.4.1 Creating an AP650 Profile

Assign the access point to be a member of the same VLAN defined in Creating an AP Profile on page A-5. In this section, the VLAN was defined as VLAN 2. Configure the access point to be a member of VLAN 2.

Rs4000(config-profile-AP650_UseCase1)#interface vlan 2
Rs4000(config-profile-AP650_UseCase1-if-vlan2)#

Configure this VLAN to use DHCP, so any device that is associated using this access point is automatically assigned a unique IP address. Once completed, exit this context.

Rs4000(config-profile-AP650_UseCase1-if-vlan2)#ip address dhcp
Rs4000(config-profile-AP650_UseCase1-if-vlan2)#exit
The VLAN has to be mapped to a physical interface on the access point. Since the only available physical interface on the AP650 is GE1, this VLAN is mapped to it.

```bash
rfs4000(config-profile-AP650_UseCase1)#interface ge 1
rfs4000(config-profile-AP650_UseCase1-if-ge1)#switchport access vlan 2
rfs4000(config-profile-AP650_UseCase1-if-ge1)#exit
```

Before a WLAN can be implemented, it has to be mapped to a radio on the access point. An AP650 has 2 radios, in this scenario, both radios are utilized.

```bash
rfs4000(config-profile-AP650_UseCase1)#interface radio 1
rfs4000(config-profile-AP650_UseCase1-if-radio1)#wlan 1
rfs4000(config-profile-AP650_UseCase1-if-radio1)#exit
rfs4000(config-profile-AP650_UseCase1)#interface radio 2
rfs4000(config-profile-AP650_UseCase1-if-radio2)#wlan 1
rfs4000(config-profile-AP650_UseCase1-if-radio2)#exit
rfs4000(config-profile-AP650_UseCase1)#exit
```

Commit the changes made to this profile and exit.

```bash
rfs4000(config-profile-AP650_UseCase1)#commit write
rfs4000(config-profile-AP650_UseCase1)#exit
rfs4000(config)#
```

**Apply this Profile to the Discovered AP650**

Access the discovered access point using the following command. The discovered device’s MAC address is used to access its context.

```bash
rfs4000(config)#ap650 00-A0-F8-00-00-01
rfs4000(config-device-00-A0-F8-00-00-01)#
```

Assign the AP profile to this AP650 access point.

```bash
rfs4000(config-device-00-A0-F8-00-00-01)#use profile AP650_UseCase1
rfs4000(config-device-00-A0-F8-00-00-01)#commit write
```

**Apply the RF Domain profile to the AP**

Apply the previously created RF Domain to enable a country code to be assigned to the discovered access point. A discovered access point only works properly if its country code is the country code of its associated wireless controller.

```bash
rfs4000(config-device-00-A0-F8-00-00-01)#use rf-domain RFDOMAIN_UseCase1
rfs4000(config-device-00-A0-F8-00-00-01)#commit write
rfs4000(config-device-00-A0-F8-00-00-01)#exit
```

**A.1.3.4.2 Creating an AP71XX Profile**

To create a profile for use with an AP71XX:

```bash
rfs4000(config)#profile ap7131 AP7131_UseCase1
rfs4000(config-profile-AP7131_UseCase1)#
```

Set the access point to be a member of the same VLAN defined in Creating an AP Profile on page A-5. In this section, the VLAN was defined as VLAN 2. Configure the access point to be a member of the VLAN 2.

```bash
rfs4000(config-profile-AP7131_UseCase1)#interface vlan 2
rfs4000(config-profile-AP7131_UseCase1-if-vlan2)#
```

Configure this VLAN to use DHCP, so any device associated using this access point is automatically assigned a unique IP address. Once completed, exit this context.

```bash
rfs4000(config-profile-AP7131_UseCase1-if-vlan2)#ip address dhcp
rfs4000(config-profile-AP7131_UseCase1-if-vlan2)#exit
```
The configured VLAN has to be mapped to a physical interface on the access point. Map VLAN 2 to the GE1 and GE2 interfaces on the AP71XX. To configure the GE1 interface:

```
  rfs4000(config-profile-AP7131_UseCase1)#interface ge 1
  rfs4000(config-profile-AP7131_UseCase1-if-ge1)#switchport access vlan 2
  rfs4000(config-profile-AP7131_UseCase1-if-ge1)#exit
```

Similarly configure the GE2 interface.

```
  rfs4000(config-profile-AP7131_UseCase1)#interface ge 2
  rfs4000(config-profile-AP7131_UseCase1-if-ge2)#switchport access vlan 2
  rfs4000(config-profile-AP7131_UseCase1-if-ge2)#exit
```

Before the WLAN can be implemented, it has to be mapped to the physical radio on the access point. An AP71XX has 3 radios (on certain models), two of which can be configured for WLAN support. In this scenario, two radios are used.

```
  rfs4000(config-profile-AP7131_UseCase1)#interface radio 1
  rfs4000(config-profile-AP7131_UseCase1-if-radio1)#wlan 1
  rfs4000(config-profile-AP7131_UseCase1-if-radio1)#exit
  rfs4000(config-profile-AP7131_UseCase1)#interface radio 2
  rfs4000(config-profile-AP7131_UseCase1-if-radio2)#wlan 1
  rfs4000(config-profile-AP7131_UseCase1-if-radio2)#exit
  rfs4000(config-profile-AP7131_UseCase1)#
```

Commit the changes made to the profile and exit this context.

```
  rfs4000(config-profile-AP7131_UseCase1)#commit write
  rfs4000(config-profile-AP7131_UseCase1)#exit
  rfs4000(config)#
```

**Apply this Profile to the Discovered AP71XX**

Access the discovered access point using the following command. The discovered device’s MAC address is used to access its context.

```
  rfs4000(config)#ap7131 00-23-68-16-C6-C4
  rfs4000(config-device-00-23-68-16-C6-C4)#
```

Assign the AP profile to this access point.

```
  rfs4000(config-device-00-23-68-16-C6-C4)#use profile AP7131_UseCase1
  rfs4000(config-device-00-23-68-16-C6-C4)#commit write
  rfs4000(config-device-00-23-68-16-C6-C4)#Exit
  rfs4000(config)#
```

### A.1.3.5 Creating a DHCP Server Policy

Using the Command Line Interface to Configure the WLAN

The DHCP server policy defines the parameters required to run a DHCP server on the wireless controller and assign IP addresses automatically to devices that associate. Configuring DHCP enables the reuse of a limited set of IP addresses.

To create a DHCP server policy:

```
  rfs4000-37FABE(config)#dhcp-server-policy DHCP_POLICY_UseCase1
  rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1)#
```
The following table displays how IP addresses are used.

<table>
<thead>
<tr>
<th>IP Range</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>172.16.11.1 till 172.16.11.10</td>
<td>Reserved for devices that require a static IP address</td>
</tr>
<tr>
<td>172.16.11.11 till 172.16.11.200</td>
<td>Range of IP addresses that can be assigned using the DHCP server.</td>
</tr>
<tr>
<td>172.16.11.201 till 172.16.11.254</td>
<td>Reserved for devices that require a static IP address</td>
</tr>
</tbody>
</table>

In the table, the IP address range of 172.16.11.11 to 172.16.11.200 is available using the DHCP server. To configure the DHCP server:

```
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1)#dhcp-pool DHCP_POOL_USECASE1_01
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-DHCP_POOL_USECASE1_01)#
```

Configure the address range as follows:

```
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-DHCP_POOL_USECASE1_01)#address range 172.16.11.11 172.16.11.200
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-DHCP_POOL_USECASE1_01)#
```

Configure the IP pool used with a network segment. This starts the DHCP server on the specified interface.

```
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-DHCP_POOL_USECASE1_01)#network 172.16.11.0/24
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-DHCP_POOL_USECASE1_01)#exit
rfs4000-37FABE(config-dhcp-policy-DHCP_POLICY_UseCase1-pool-DHCP_POOL_USECASE1_01)#exit
rfs4000-37FABE(config)#commit write
```

**Configure the RFS4000 to use the DHCP Policy**

For the DHCP to work properly, the new DHCP Server Policy must be applied to the wireless controller. To apply the DHCP Server Policy to the wireless controller:

```
rfs4000-37FABE(config)#self
rfs4000-37FABE(config-device-03-14-28-57-14-28)#use dhcp-server-policy DHCP_POLICY_UseCase1
rfs4000-37FABE(config-device-03-14-28-57-14-28)#commit write
rfs4000-37FABE(config-device-03-14-28-57-14-28)#exit
rfs4000-37FABE(config)#
```

**A.1.3.6 Completing and Testing the Configuration**

**Using the Command Line Interface to Configure the WLAN**

A wireless client must be configured to associate with the wireless controller managed WLAN. The following information must be defined:

- **SSID:** WLAN_USECASE_01
- **Country:** Same as the country configured in *Creating a RF Domain on page A-3*. In this scenario, the country code is set to US.
- **Mode:** Infrastructure

With the WLAN set to beacon, use the wireless client’s discovery client to discover the configured WLAN and associate.
**APPENDIX B**
**PUBLICLY AVAILABLE SOFTWARE**

**B.1 General Information**

This document contains information regarding licenses, acknowledgments and required copyright notices for open source packages used in the following products:

**Access Points**
- AP8232, AP8222, AP8163, AP8132, AP8122, AP7181, AP7161, AP7131, AP7502, AP7522, AP7532, AP7562, AP6562, AP6532, AP6522, AP6521, AP6511, AP650, AP622, AP621

**Wireless Switches**
- NX9600, NX9510, NX9500, NX9000, NX7500, NX7510, NX7520, NX7530, NX6524, NX6500, NX5500, NX4524, NX4500, RFS7000, RFS6000, RFS4000, RFS4011

**B.2 Open Source Software Used**

The following table lists the Open Source Software used, their version numbers and Web sites from where they can be downloaded:

<table>
<thead>
<tr>
<th>Name</th>

B.3 OSS Licenses

B.3.1 Apache License, Version 2.0

Apache License
Version 2.0, January 2004
http://www.apache.org/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination
of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   a. You must give any other recipients of the Work or Derivative Works a copy of this License; and
   
   b. You must cause any modified files to carry prominent notices stating that You changed the files; and
   
   c. You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
   
   d. If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any claim or demand made by a third party arising from Your acts in skipping the warranty or additional liability obligations.
harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

B.3.2 The BSD License

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, and the entire permission notice in its entirety, including the disclaimer of warranties.

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

3. The name of the author may not be used to endorse or promote products derived from this software without specific prior written permission.

4. Neither the name of the University nor the names of its contributors may be used to endorse or promote products derived from this software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE REGENTS AND CONTRIBUTORS "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ALL OF WHICH ARE HEREBY DISCLAIMED. IN NO EVENT SHALL THE AUTHOR BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF NOT ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

B.3.3 Creative Commons Attribution-ShareAlike License, version 3.0

Creative Commons Attribution-ShareAlike 3.0 Unported

CREATIVE COMMONS CORPORATION IS NOT A LAW FIRM AND DOES NOT PROVIDE LEGAL SERVICES. DISTRIBUTION OF THIS LICENSE DOES NOT CREATE AN ATTORNEY-CLIENT RELATIONSHIP. CREATIVE COMMONS PROVIDES THIS INFORMATION ON AN "AS-IS" BASIS. REATIVE COMMONS MAKES NO WARRANTIES REGARDING THE INFORMATION PROVIDED, AND DISCLAIMS LIABILITY FOR DAMAGES RESULTING FROM ITS USE

License

THE WORK (AS DEFINED BELOW) IS PROVIDED UNDER THE TERMS OF THIS CREATIVE COMMONS PUBLIC LICENSE ("CCPL" OR "LICENSE"). THE WORK IS PROTECTED BY COPYRIGHT AND/OR OTHER APPLICABLE LAW. ANY USE OF THE WORK OTHER THAN AS AUTHORIZED UNDER THIS LICENSE OR COPYRIGHT LAW IS PROHIBITED

BY EXERCISING ANY RIGHTS TO THE WORK PROVIDED HERE, YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS LICENSE. TO THE EXTENT THIS LICENSE MAY BE CONSIDERED TO BE A CONTRACT, THE LICENSOR GRANTS YOU THE RIGHTS CONTAINED HERE IN CONSIDERATION OF YOUR ACCEPTANCE OF SUCH TERMS AND CONDITIONS.

1. Definitions

1. "Adaptation" means a work based upon the Work, or upon the Work and other pre-existing works, such as a translation, adaptation, derivative work, arrangement of music or other alterations of a literary or artistic work, or phonogram or performance and includes cinematographic adaptations or any other form in which the Work may be recast, transformed, or adapted including in any form recognizably derived from the original, except that a work that constitutes a Collection will not be considered an Adaptation for the purpose of this License. For the avoidance of doubt, where the Work is a musical work,
performance or phonogram, the synchronization of the Work in timed-relation with a moving image ("synching") will be considered an Adaptation for the purpose of this License.

2. "Collection" means a collection of literary or artistic works, such as encyclopedias and anthologies, or performances, phonograms or broadcasts, or other works or subject matter other than works listed in Section 1(f) below, which, by reason of the selection and arrangement of their contents, constitute intellectual creations, in which the Work is included in its entirety in unmodified form along with one or more other contributions, each constituting separate and independent works in themselves, which together are assembled into a collective whole. A work that constitutes a Collection will not be considered an Adaptation (as defined below) for the purposes of this License.

3. "Creative Commons Compatible License" means a license that is listed at http://creativecommons.org/compatiblelicenses that has been approved by Creative Commons as being essentially equivalent to this License, including, at a minimum, because that license: (i) contains terms that have the same purpose, meaning and effect as the License Elements of this License; and, (ii) explicitly permits the relicensing of adaptations of works made available under that license under this License or a Creative Commons jurisdiction license with the same License Elements as this License.

4. "Distribute" means to make available to the public the original and copies of the Work or Adaptation, as appropriate, through sale or other transfer of ownership.

5. "License Elements" means the following high-level license attributes as selected by Licensor and indicated in the title of this License: Attribution, ShareAlike.

6. "Licensor" means the individual, individuals, entity or entities that offer(s) the Work under the terms of this License.

7. "Original Author" means, in the case of a literary or artistic work, the individual, individuals, entity or entities who created the Work or if no individual or entity can be identified, the publisher; and in addition (i) in the case of a performance the actors, singers, musicians, dancers, and other persons who act, sing, deliver, declaim, play in, interpret or otherwise perform literary or artistic works or expressions of folklore; (ii) in the case of a phonogram the producer being the person or legal entity who first fixes the sounds of a performance or other sounds; and, (iii) in the case of broadcasts, the organization that transmits the broadcast.

8. "Work" means the literary and/or artistic work offered under the terms of this License including without limitation any production in the literary, scientific and artistic domain, whatever may be the mode or form of its expression including digital form, such as a book, pamphlet and other writing; a lecture, address, sermon or other work of the same nature; a dramatic or dramatico-musical work; a choreographic work or entertainment in dumb show; a musical composition with or without words; a cinematographic work to which are assimilated works expressed by a process analogous to cinematography; a work of drawing, painting, architecture, sculpture, engraving or lithography; a photographic work to which are assimilated works expressed by a process analogous to photography; a work of applied art; an illustration, map, plan, sketch or three-dimensional work relative to geography, topography, architecture or science; a performance; a broadcast; a phonogram; a compilation of data to the extent it is protected as a copyrightable work; or a work performed by a variety or circus performer to the extent it is not otherwise considered a literary or artistic work.

9. "You" means an individual or entity exercising rights under this License who has not previously violated the terms of this License with respect to the Work, or who has received express permission from the Licensor to exercise rights under this License despite a previous violation.

10. "Publicly Perform" means to perform public recitations of the Work and to communicate to the public those public recitations, by any means or process, including by wire or wireless means or public digital performances; to make available to the public Works in such a way that members of the public may access these Works from a place and at a place individually chosen by them; to perform the Work to the public by any means or process and the communication to the public of the performances of the Work, including by public digital performance; to broadcast and rebroadcast the Work by any means including signs, sounds or images.

11. "Reproduce" means to make copies of the Work by any means including without limitation by sound or visual recordings and the right of fixation and reproducing fixations of the Work, including storage of a protected performance or phonogram in digital form or other electronic medium.
2. Fair Dealing Rights. Nothing in this License is intended to reduce, limit, or restrict any uses free from copyright or rights arising from limitations or exceptions that are provided for in connection with the copyright protection under copyright law or other applicable laws.

3. License Grant. Subject to the terms and conditions of this License, Licensor hereby grants You a worldwide, royalty-free, non-exclusive, perpetual (for the duration of the applicable copyright) license to exercise the rights in the Work as stated below:

   1. to Reproduce the Work, to incorporate the Work into one or more Collections, and to Reproduce the Work as incorporated in the Collections;
   2. to create and Reproduce Adaptations provided that any such Adaptation, including any translation in any medium, takes reasonable steps to clearly label, demarcate or otherwise identify that changes were made to the original Work. For example, a translation could be marked “The original work was translated from English to Spanish,” or a modification could indicate “The original work has been modified.”;
   3. to Distribute and Publicly Perform the Work including as incorporated in Collections; and,
   4. to Distribute and Publicly Perform Adaptations

For the avoidance of doubt:

   1. Non-waivable Compulsory License Schemes. In those jurisdictions in which the right to collect royalties through any statutory or compulsory licensing scheme cannot be waived, the Licensor reserves the exclusive right to collect such royalties for any exercise by You of the rights granted under this License;
   2. Waivable Compulsory License Schemes. In those jurisdictions in which the right to collect royalties through any statutory or compulsory licensing scheme can be waived, the Licensor waives the exclusive right to collect such royalties for any exercise by You of the rights granted under this License; and,
   3. Voluntary License Schemes. The Licensor waives the right to collect royalties, whether individually or, in the event that the Licensor is a member of a collecting society that administers voluntary licensing schemes, via that society, from any exercise by You of the rights granted under this License.

The above rights may be exercised in all media and formats whether now known or hereafter devised. The above rights include the right to make such modifications as are technically necessary to exercise the rights in other media and formats. Subject to Section 8(f), all rights not expressly granted by Licensor are hereby reserved.

4. Restrictions. The license granted in Section 3 above is expressly made subject to and limited by the following restrictions:

   1. You may Distribute or Publicly Perform the Work only under the terms of this License. You must include a copy of, or the Uniform Resource Identifier (URI) for, this License with every copy of the Work You Distribute or Publicly Perform. You may not offer or impose any terms on the Work that restrict the terms of this License or the ability of the recipient of the Work to exercise the rights granted to that recipient under the terms of the License. You may not sublicense the Work. You must keep intact all notices that refer to this License and to the disclaimer of warranties with every copy of the Work You Distribute or Publicly Perform. When You Distribute or Publicly Perform the Work, You may not impose any effective technological measures on the Work that restrict the ability of a recipient of the Work from You to exercise the rights granted to that recipient under the terms of the License. This Section 4(a) applies to the Work as incorporated in a Collection, but this does not require the Collection apart from the Work itself to be made subject to the terms of this License. If You create a Collection, upon notice from any Licensor You must, to the extent practicable, remove from the Collection any credit as required by Section 4(c), as requested. If You create an Adaptation, upon notice from any Licensor You must, to the extent practicable, remove from the Adaptation any credit as required by Section 4(c), as requested.
   2. You may Distribute or Publicly Perform an Adaptation only under the terms of: (i) this License; (ii) a later version of this License with the same License Elements as this License; (iii) a Creative Commons jurisdiction license (either this or a later license version) that contains the same License Elements as this License (e.g., Attribution-ShareAlike 3.0 US)); (iv) a Creative Commons Compatible License. If you license the Adaptation under one of the licenses mentioned in (iv), you must comply with the terms of that license. If you license the Adaptation under the terms of any of the licenses mentioned in (i), (ii) or (iii) (the “Applicable License”), you must comply with the terms of the Applicable License generally and the following provisions: (I) You must include a copy of, or the URI for, the Applicable License with every copy of each Adaptation You Distribute or Publicly
Perform; (II) You may not offer or impose any terms on the Adaptation that restrict the terms of the Applicable License or the ability of the recipient of the Adaptation to exercise the rights granted to that recipient under the terms of the Applicable License; (III) You must keep intact all notices that refer to the Applicable License and to the disclaimer of warranties with every copy of the ork as included in the Adaptation You Distribute or Publicly Perform; (IV) when You Distribute or Publicly Perform the Adaptation, You may not impose any effective technological measures on the Adaptation that restrict the ability of a recipient of the Adaptation from You to exercise the rights granted to that recipient under the terms of the Applicable License.

This Section 4(b) applies to the Adaptation as incorporated in a Collection, but this does not require the Collection apart from the Adaptation itself to be made subject to the terms of the Applicable License.

3. If You Distribute, or Publicly Perform the Work or any Adaptations or Collections, You must, unless a request has been made pursuant to Section 4(a), keep intact all copyright notices for the Work and provide, reasonable to the medium or means You are utilizing: (i) the name of the Original Author (or pseudonym, if applicable) if supplied, and/or if the Original Author and/or Licensor designate another party or parties (e.g., a sponsor institute, publishing entity, journal) for attribution (“Attribution Parties”) in Licensor’s copyright notice, terms of service or by other reasonable means, the name of such party or parties; (iii) to the extent reasonably practicable, the URI, if any, that Licensor specifies to be associated with the Work, unless such URI does not refer to the copyright notice or licensing information for the Work; and (iv), consistent with Section 3(b), in the case of an Adaptation, a credit identifying the use of the Work in the Adaptation (e.g., "French translation of the Work by Original Author," or "Screenplay based on original Work by Original Author"). The credit required by this Section 4(c) may be implemented in any reasonable manner; provided, however, that in the case of a Adaptation or Collection, at a minimum such credit will appear, if a credit for all contributing authors of the Adaptation or Collection appears, then as part of these credits and in a manner at least as prominent as the credits for the other contributing authors. For the avoidance of doubt, You may only use the credit required by this Section for the purpose of attribution in the manner set out above and, by exercising Your rights under this License, You may not implicitly or explicitly assert or imply any connection with, sponsorship or endorsement by the Original Author, Licensor and/or Attribution Parties, as appropriate, of You or Your use of the Work, without the separate, express prior written permission of the Original Author, Licensor and/or Attribution Parties.

4. Except as otherwise agreed in writing by the Licensor or as may be otherwise permitted by applicable law, if You Reproduce, Distribute or Publicly Perform the Work either by itself or as part of any Adaptations or Collections, You must not distort, mutilate, modify or take other derogatory action in relation to the Work which would be prejudicial to the Original Author’s honor or reputation. Licensor agrees that in those jurisdictions (e.g. Japan), in which any exercise of the right granted in Section 3(b) of this License (the right to make Adaptations) would be deemed to be a distortion, mutilation, modification or other derogatory action prejudicial to the Original Author’s honor and reputation, the Licensor will waive or not assert, as appropriate, this Section, to the fullest extent permitted by the applicable national law, to enable You to reasonably exercise Your right under Section 3(b) of this License (right to make Adaptations) but not otherwise.

5. Representations, Warranties and Disclaimer

UNLESS OTHERWISE MUTUALLY AGREED TO BY THE PARTIES IN WRITING, LICENSOR OFFERS THE WORK AS-IS AND MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND CONCERNING THE WORK, EXPRESS, IMPLIED, STATUTORY OR OTHERWISE, INCLUDING, WITHOUT LIMITATION, WARRANTIES OF TITLE, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NONINFRINGEMENT, OR THE ABSENCE OF LATENT OR OTHER DEFECTS, ACCURACY, OR THE PRESENCE OF ABSENCE OF ERRORS, WHETHER OR NOT DISCOVERABLE. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES, SO SUCH EXCLUSION MAY NOT APPLY TO YOU.

6. Limitation on Liability. EXCEPT TO THE EXTENT REQUIRED BY APPLICABLE LAW, IN NO EVENT WILL LICENSOR BE LIABLE TO YOU ON ANY LEGAL THEORY FOR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR EXEMPLARY DAMAGES ARISING OUT OF THIS LICENSE OR THE USE OF THE WORK, EVEN IF LICENSOR HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. Termination

1. This License and the rights granted hereunder will terminate automatically upon any breach by You of the terms of this License. Individuals or entities who have received Adaptations or Collections from You under this License, however, will not have their licenses terminated provided such individuals or entities remain in full compliance with those licenses. Sections 1, 2, 5, 6, 7, and 8 will survive any termination of this License.
2. Subject to the above terms and conditions, the license granted here is perpetual (for the duration of the applicable copyright in the Work). Notwithstanding the above, Licensor reserves the right to release the Work under different license terms or to stop distributing the Work at any time; provided, however that any such election will not serve to withdraw this License (or any other license that has been, or is required to be, granted under the terms of this License), and this License will continue in full force and effect unless terminated as stated above.

8. Miscellaneous

1. Each time You Distribute or Publicly Perform the Work or a Collection, the Licensor offers to the recipient a license to the Work on the same terms and conditions as the license granted to You under this License.

2. Each time You Distribute or Publicly Perform an Adaptation, Licensor offers to the recipient a license to the original Work on the same terms and conditions as the license granted to You under this License.

3. If any provision of this License is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this License, and without further action by the parties to this agreement, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

4. No term or provision of this License shall be deemed waived and no breach consented to unless such waiver or consent shall be in writing and signed by the party to be charged with such waiver or consent.

5. This License constitutes the entire agreement between the parties with respect to the Work licensed here. There are no understandings, agreements or representations with respect to the Work not specified here. Licensor shall not be bound by any additional provisions that may appear in any communication from You. This License may not be modified without the mutual written agreement of he Licensor and You.

6. The rights granted under, and the subject matter referenced, in this License were drafted utilizing the terminology of the Berne Convention for the Protection of Literary and Artistic Works (as amended on September 28, 1979), the Rome Convention of 1961, the WIPO Copyright Treaty of 1996, the WIPO Performances and Phonograms Treaty of 1996 and the Universal Copyright Convention (as revised on July 24, 1971). These rights and subject matter take effect in the relevant jurisdiction in which the License terms are sought to be enforced according to the corresponding provisions of the implementation of those treaty provisions in the applicable national law. If the standard suite of rights granted under applicable copyright law includes additional rights not granted under this License, such additional rights are deemed to be included in the License; this License is not intended to restrict the license of any rights under applicable law.

Creative Commons Notice

Creative Commons is not a party to this License, and makes no warranty whatsoever in connection with the Work. Creative Commons will not be liable to You or any party on any legal theory for any damages whatsoever, including without limitation any general, special, incidental or consequential damages arising in connection to this license. Notwithstanding the foregoing two (2) sentences, if Creative Commons has expressly identified itself as the Licensor hereunder, it shall have all rights and obligations of Licensor.

Except for the limited purpose of indicating to the public that the Work is licensed under the CCPL, Creative Commons does not authorize the use by either party of the trademark "Creative Commons" or any related trademark or logo of Creative Commons without the prior written consent of Creative Commons. Any permitted use will be in compliance with Creative Commons’ then-current trademark usage guidelines, as may be published on its website or otherwise made available upon request from time to time. For the avoidance of doubt, this trademark restriction does not form part of the License.

Creative Commons may be contacted at http://creativecommons.org/.
B.3.4 DropBear License

Dropbear contains a number of components from different sources, hence there are a few licenses and authors involved. All licenses are fairly non-restrictive.

The majority of code is written by Matt Johnston, under the license below.

Portions of the client-mode work are (c) 2004 Mihnea Stoenescu, under the same license:

B.3.5 GNU General Public License, version 2

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation’s software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author’s protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors’ reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone’s free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION
This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

The modified work must itself be a software library.

You may cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source
code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer’s own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user’s computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.
It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

Each time you redistribute the Library (or any work based on the library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and “any later version”, you have the option of following the terms and conditions either of that version or of any later version.
published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

B.3.6 GNU Lesser General Public License 2.1

GNU LESSER GENERAL PUBLIC LICENSE

Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA  02110-1301  USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL.  It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it.  By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it.  You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price.  Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights.  These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.
For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author’s reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the “Lesser” General Public License because it does Less to protect the user’s freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users’ freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a “work based on the library” and a “work that uses the library”. The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called “this License”). Each licensee is addressed as “you”.

A “library” means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The “Library”, below, refers to any such software library or work which has been distributed under these terms. A “work based on the Library” means either the Library or any derivative work under copyright law: that is to say, a work containing the Library
or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

2. You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

3. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:
   a. The modified work must itself be a software library.
   b. You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
   c. You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.
   d. If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

   (For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

   These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

   Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

   In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

4. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General
Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

5. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

6. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

7. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer’s own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a. Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b. Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at runtime a copy of the library already present on the user’s computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.
c. Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d. If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e. Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

8. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

   a. Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

   b. Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

9. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

10. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

11. Each time you redistribute the Library (or any work based on the library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

12. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of
software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice. This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

13. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

14. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

    Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and *any later version*, you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

15. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

16. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.
B.3.7 GNU General Public License, version 3

GNU GENERAL PUBLIC LICENSE
Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.
TERMS AND CONDITIONS

0. Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

"The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.
2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work’s users, your or third parties’ legal rights to forbid circumvention of technological measures.

You may convey verbatim copies of the Program’s source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

a) The work must carry prominent notices stating that you modified it, and giving a relevant date.

b) The work must carry prominent notices stating that it is released under this License and any conditions added under section

7. This requirement modifies the requirement in section 4 to “keep intact all notices”.

c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.

d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.
A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an “aggregate” if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation’s users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install
modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or

b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or

c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or

d) Limiting the use for publicity purposes of names of licensors or authors of the material; or

e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or

f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered “further restrictions” within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).
However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An “entity transaction” is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party’s predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A “contributor” is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor’s “contributor version”.

A contributor’s “essential patent claims” are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, selling, importing and otherwise running, modifying and propagating the contents of its contributor version.

In the following three paragraphs, a “patent license” is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To “grant” such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the
requirements of this License, to extend the patent license to downstream recipients. "Knowingly relying" means you have 
actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the 
covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are 
valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance 
of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, 
propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended 
to all recipients of the covered work and works based on it.

A patent license is "discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is 
conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not 
convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, 
under which you make payment to the third party based on the extent of your activity of conveying the work, and under which 
the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) 
in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in 
connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or 
that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement 
that may otherwise be available to you under applicable patent law.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this 
License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy 
simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not 
convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to 
whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely 
from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work 
licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting 
work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of 
the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as 
such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to 
time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or 
concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU 
General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of 
that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a 
version number of the GNU General Public License, you may choose any version ever published by the Free Software 
Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that 
proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on 
any author or copyright holder as a result of your choosing to follow a later version.

15. Disclaimer of Warranty.
THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN
OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS"
WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED
WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY
AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST
OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR
ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR
DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR
INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE
OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER
PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their
terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in
connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS

B.3.8 ISC License

Permission to use, copy, modify, and/or distribute this software for any purpose with or without fee is hereby granted, provided
that the above copyright notice and this permission notice appear in all copies.

THE SOFTWARE IS PROVIDED "AS IS" AND THE AUTHOR DISCLAIMS ALL WARRANTIES WITH REGARD TO THIS SOFTWARE
INCLUDING ALL IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS. IN NO EVENT SHALL THE AUTHOR BE LIABLE
FOR ANY SPECIAL, DIRECT, INDIRECT, OR CONSEQUENTIAL DAMAGES OR ANY DAMAGES WHATSOEVER RESULTING FROM
LOSS OF USE, DATA OR PROFITS, WHETHER IN AN ACTION OF CONTRACT, NEGLIGENCE OR OTHER TORTIOUS ACTION,
ARISING OUT OF OR IN CONNECTION WITH THE USE OR PERFORMANCE OF THIS SOFTWARE.

B.3.9 GNU Lesser General Public License, version 3.0

GNU LESSER GENERAL PUBLIC LICENSE

Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc.
Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This version of the GNU Lesser General Public License incorporates the terms and conditions of version 3 of the GNU General
Public License, supplemented by the additional permissions listed below.

0. Additional Definitions.

As used herein, "this License" refers to version 3 of the GNU Lesser General Public License, and the "GNU GPL" refers to
version 3 of the GNU General Public License.

"The Library" refers to a covered work governed by this License, other than an Application or a Combined Work as defined
below.

An "Application" is any work that makes use of an interface provided by the Library, but which is not otherwise based on
the Library. Defining a subclass of a class defined by the Library is deemed a mode of using an interface provided by the Library.

A "Combined Work" is a work produced by combining or linking an Application with the Library. The particular version of
the Library with which the Combined Work was made is also called the "Linked Version".
The "Minimal Corresponding Source" for a Combined Work means the Corresponding Source for the Combined Work, excluding any source code for portions of the Combined Work that, considered in isolation, are based on the Application, and not on the Linked Version.

The "Corresponding Application Code" for a Combined Work means the object code and/or source code for the Application, including any data and utility programs needed for reproducing the Combined Work from the Application, but excluding the System Libraries of the Combined Work.

1. Exception to Section 3 of the GNU GPL.
   You may convey a covered work under sections 3 and 4 of this License without being bound by section 3 of the GNU GPL.

2. Conveying Modified Versions.
   If you modify a copy of the Library, and, in your modifications, a facility refers to a function or data to be supplied by an Application that uses the facility (other than as an argument passed when the facility is invoked), then you may convey a copy of the modified version:
   a) under this License, provided that you make a good faith effort to ensure that, in the event an Application does not supply the function or data, the facility still operates, and performs whatever part of its purpose remains meaningful, or
   b) under the GNU GPL, with none of the additional permissions of this License applicable to that copy.

   The object code form of an Application may incorporate material from a header file that is part of the Library. You may convey such object code under terms of your choice, provided that, if the incorporated material is not limited to numerical parameters, data structure layouts and accessors, or small macros, inline functions and templates (ten or fewer lines in length), you do both of the following:
   a) Give prominent notice with each copy of the object code that the Library is used in it and that the Library and its use are covered by this License.
   b) Accompany the object code with a copy of the GNU GPL and this license document.

   You may convey a Combined Work under terms of your choice that, taken together, effectively do not restrict modification of the portions of the Library contained in the Combined Work and reverse engineering for debugging such modifications, if you also do each of the following:
   a) Give prominent notice with each copy of the Combined Work that the Library is used in it and that the Library and its use are covered by this License.
   b) Accompany the Combined Work with a copy of the GNU GPL and this license document.
   c) For a Combined Work that displays copyright notices during execution, include the copyright notice for the Library among these notices, as well as a reference directing the user to the copies of the GNU GPL and this license document.
   d) Do one of the following:
      0) Convey the Minimal Corresponding Source under the terms of this License, and the Corresponding Application Code in a form suitable for, and under terms that permit, the user to recombine or relink the Application with a modified version of the Linked Version to produce a modified Combined Work, in the manner specified by section 6 of the GNU GPL for conveying Corresponding Source.
      1) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (a) uses at run time a copy of the Library already present on the user's computer system, and (b) will operate properly with a modified version of the Library that is interface-compatible with the Linked Version.
      e) Provide Installation Information, but only if you would otherwise be required to provide such information under section 6 of the GNU GPL, and only to the extent that such information is necessary to install and execute a modified version of the Combined Work produced by recombining or relinking the Application with a modified version of the Linked Version. (If you use
option 4d0, the Installation Information must accompany the Minimal Corresponding Source and Corresponding Application Code. If you use option 4d1, you must provide the Installation Information in the manner specified by section 6 of the GNU GPL for conveying Corresponding Source.)

You may place library facilities that are a work based on the Library side by side in a single library together with other library facilities that are not Applications and are not covered by this License, and convey such a combined library under terms of your choice, if you do both of the following:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities, conveyed under the terms of this License.

b) Give prominent notice with the combined library that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

6. Revised Versions of the GNU Lesser General Public License.

The Free Software Foundation may publish revised and/or new versions of the GNU Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library as you received it specifies that a certain numbered version of the GNU Lesser General Public License “or any later version” applies to it, you have the option of following the terms and conditions either of that published version or of any later version published by the Free Software Foundation. If the Library as you received it does not specify a version number of the GNU Lesser General Public License, you may choose any version of the GNU Lesser General Public License ever published by the Free Software Foundation.

If the Library as you received it specifies that a proxy can decide whether future versions of the GNU Lesser General Public License shall apply, that proxy’s public statement of acceptance of any version is permanent authorization for you to choose that version for the Library.

---

**B.3.10 GNU General Public License 2.0**

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

**Preamble**

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and to any other libraries whose authors decide to use it. You can use it for your libraries, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.
For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author’s protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors’ reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, thus in effect making the program proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone’s free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don’t assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a “work based on the library” and a “work that uses the library”. The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called “this License”). Each licensee is addressed as “you”.

A “library” means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.
Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the

   You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:
   a. The modified work must itself be a software library.
   b. You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
   c. You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.
   d. If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

   (For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

   These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

   Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

   In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

   Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

   This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-
readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer’s own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a. Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b. Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

c. If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

d. Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.
It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:
   
a. Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.
   
b. Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Libaray subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

   If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

   It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

   This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.
13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to
time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or
concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies
to it and “any later version”, you have the option of following the terms and conditions either of that version or of any later
version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose
any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with
these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write
to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of
preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software
generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT
PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR
OTHER PARTIES PROVIDE THE LIBRARY “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED,
INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR
PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE
LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR
ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU
FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE
USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED
INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY
OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH
DAMAGES.

END OF TERMS AND CONDITIONS

B.3.11 GNU Lesser General Public License, version 2.0

GNU LIBRARY GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1991 Free Software Foundation, Inc. 51 Franklin St, Fifth Floor, Boston, MA  02110-1301, USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the library GPL. It is numbered 2 because it goes with version 2 of the ordinary GPL.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General
Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free
for all its users.

This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and
to any other libraries whose authors decide to use it. You can use it for your libraries, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make
sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive
source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library, or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link a program with the library, you must provide complete object files to the recipients so that they can relink them with the library, after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

Our method of protecting your rights has two steps: (1) copyright the library, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the library.

Also, for each distributor's protection, we want to make certain that everyone understands that there is no warranty for this free library. If the library is modified by someone else and passed on, we want its recipients to know that what they have is not the original version, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that companies distributing free software will individually obtain patent licenses, thus in effect transforming the program into proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don't assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called “this License”). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library
or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   * a) The modified work must itself be a software library.

   * b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

   * c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

   * d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest you rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.
4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called

a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also compile or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer’s own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

* a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

* b) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

* c) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

* d) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.
It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

   * a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

   * b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Library General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.
Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

B.3.12 GNU Lesser General Public License, version 2.1

GNU LESSER GENERAL PUBLIC LICENSE

Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.
To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

**GNU LESSER GENERAL PUBLIC LICENSE**

**TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION**

This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

---

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

**GNU LESSER GENERAL PUBLIC LICENSE**

**TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION**

This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".
A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification").

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   a. The modified work must itself be a software library.

   b. You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

   c. You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

   d. If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

   (For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.
3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.) Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a. Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b. Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the
executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the
modified version is interface-compatible with the version that the work was made with.

c. Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified
in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d. If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy
the above specified materials from the same place.

e. Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the “work that uses the Library” must include any data and utility programs needed
for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include
anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so
on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally
accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an
executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other
library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution
of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these
two things:

   a. Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library
      facilities. This must be distributed under the terms of the Sections above.

   b. Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining
      where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License.
   Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically
   terminate your rights under this License. However, parties who have received copies, or rights, from you under this License
   will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to
   modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License.
   Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this
   License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the library), the recipient automatically receives a license from
    the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not
    impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing
    compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent
    issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of
    this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy
    simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not
    distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all
    those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License
    would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section
is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity
of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system
which is implemented by public license practices. Many people have made generous contributions to the wide range of
software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

B.3.13 MIT License

Permission is hereby granted, without written agreement and without license or royalty fees, to use, copy, modify, and distribute this software and its documentation for any purpose, provided that the above copyright notice and the following two paragraphs appear in all copies of this software.

IN NO EVENT SHALL THE COPYRIGHT HOLDER BE LIABLE TO ANY PARTY FOR DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OF THIS SOFTWARE AND ITS DOCUMENTATION, EVEN IF THE COPYRIGHT HOLDER HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

THE COPYRIGHT HOLDER SPECIFICALLY DISCLAIMS ANY WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE SOFTWARE PROVIDED HEREUNDER IS ON AN "AS IS" BASIS, AND THE COPYRIGHT HOLDER HAS NO OBLIGATION TO PROVIDE MAINTENANCE, SUPPORT, UPDATES, ENHANCEMENTS, OR MODIFICATIONS.
B.3.14 Mozilla Public License, version 2

Version 2.0

1. Definitions

1.1. Contributor means each individual or legal entity that creates, contributes to the creation of, or owns Covered Software.

1.2. Contributor Version means the combination of the Contributions of others (if any) used by a Contributor and that particular Contribution.

1.3. Contribution means Covered Software of a particular Contributor.

1.4. Covered Software means Source Code Form to which the initial Contributor has attached the notice in Exhibit A, the Executable Form of such Source Code Form, and Modifications of such Source Code Form, in each case including portions thereof.

1.5. Incompatible With Secondary Licenses means
   1. that the initial Contributor has attached the notice described in Exhibit B to the Covered Software; or
   2. that the Covered Software was made available under the terms of version 1.1 or earlier of the License, but not also under the terms of a Secondary License.

1.6. Executable Form means any form of the work other than Source Code Form.

1.7. Larger Work means a work that combines Covered Software with other material, in a separate file or files, that is not Covered Software.

1.8. License means this document.

1.9. Licensable means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently, any and all of the rights conveyed by this License.

1.10. Modifications means any of the following:
   1. any file in Source Code Form that results from an addition to, deletion from, or modification of the contents of Covered Software; or
   2. any new file in Source Code Form that contains any Covered Software.

1.11. Patent Claims of a Contributor means any patent claim(s), including without limitation, method, process, and apparatus claims, in any patent Licensable by such Contributor that would be infringed, but for the grant of the License, by the making, using, selling, offering for sale, having made, import, or transfer of either its Contributions or its Contributor Version.

1.12. Secondary License means either the GNU General Public License, Version 2.0, the GNU Lesser General Public License, Version 2.1, the GNU Affero General Public License, Version 3.0, or any later versions of those licenses.

1.13. Source Code Form means the form of the work preferred for making modifications.

1.14. You (or Your) means an individual or a legal entity exercising rights under this License. For legal entities, You includes any entity that controls, is controlled by, or is under common control with You. For purposes of this definition, control means (a) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (b) ownership of more than fifty percent (50%) of the outstanding shares or beneficial ownership of such entity.

2. License Grants and Conditions

2.1. Grants

Each Contributor hereby grants You a world-wide, royalty-free, non-exclusive license:

1. under intellectual property rights (other than patent or trademark) Licensable by such Contributor to use, reproduce, make available, modify, display, perform, distribute, and otherwise exploit its Contributions, either on an unmodified basis, with Modifications, or as part of a Larger Work; and
2. under Patent Claims of such Contributor to make, use, sell, offer for sale, have made, import, and otherwise transfer either its Contributions or its Contributor Version.

2.2. Effective Date

The licenses granted in Section 2.1 with respect to any Contribution become effective for each Contribution on the date the Contributor first distributes such Contribution.

2.3. Limitations on Grant Scope

The licenses granted in this Section 2 are the only rights granted under this License. No additional rights or licenses will be implied from the distribution or licensing of Covered Software under this License. Notwithstanding Section 2.1(b) above, no patent license is granted by a Contributor:

1. for any code that a Contributor has removed from Covered Software; or

2. for infringements caused by: (i) Your and any other third party's modifications of Covered Software, or (ii) the combination of its Contributions with other software (except as part of its Contributor Version); or

3. under Patent Claims infringed by Covered Software in the absence of its Contributions.

This License does not grant any rights in the trademarks, service marks, or logos of any Contributor (except as may be necessary to comply with the notice requirements in Section 3.4).

2.4. Subsequent Licenses

No Contributor makes additional grants as a result of Your choice to distribute the Covered Software under a subsequent version of this License (see Section 10.2) or under the terms of a Secondary License (if permitted under the terms of Section 3.3).

2.5. Representation

Each Contributor represents that the Contributor believes its Contributions are its original creation(s) or it has sufficient rights to grant the rights to its Contributions conveyed by this License.

2.6. Fair Use

This License is not intended to limit any rights You have under applicable copyright doctrines of fair use, fair dealing, or other equivalents.

2.7. Conditions

Sections 3.1, 3.2, 3.3, and 3.4 are conditions of the licenses granted in Section 2.1.

3. Responsibilities

3.1. Distribution of Source Form

All distribution of Covered Software in Source Code Form, including any Modifications that You create or to which You contribute, must be under the terms of this License. You must inform recipients that the Source Code Form of the Covered Software is governed by the terms of this License, and how they can obtain a copy of this License. You may not attempt to alter or restrict the recipients' rights in the Source Code Form.

3.2. Distribution of Executable Form

If You distribute Covered Software in Executable Form then:

1. such Covered Software must also be made available in Source Code Form, as described in Section 3.1, and You must inform recipients of the Executable Form how they can obtain a copy of such Source Code Form by reasonable means in a timely manner, at a charge no more than the cost of distribution to the recipient; and

2. You may distribute such Executable Form under the terms of this License, or sublicense it under different terms, provided that the license for the Executable Form does not attempt to limit or alter the recipients' rights in the Source Code Form under this License.

3.3. Distribution of a Larger Work
You may create and distribute a Larger Work under terms of Your choice, provided that You also comply with the requirements of this License for the Covered Software. If the Larger Work is a combination of Covered Software with a work governed by one or more Secondary Licenses, and the Covered Software is not Incompatible With Secondary Licenses, this License permits You to additionally distribute such Covered Software under the terms of such Secondary License(s), so that the recipient of the Larger Work may, at their option, further distribute the Covered Software under the terms of either this License or such Secondary License(s).

3.4. Notices
You may not remove or alter the substance of any license notices (including copyright notices, patent notices, disclaimers of warranty, or limitations of liability) contained within the Source Code Form of the Covered Software, except that You may alter any license notices to the extent required to remedy known factual inaccuracies.

3.5. Application of Additional Terms
You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Software. However, You may do so only on Your own behalf, and not on behalf of any Contributor. You must make it absolutely clear that any such warranty, support, indemnity, or liability obligation is offered by You alone, and You hereby agree to indemnify every Contributor for any liability incurred by such Contributor as a result of warranty, support, indemnity or liability terms You offer. You may include additional disclaimers of warranty and limitations of liability specific to any jurisdiction.

4. Inability to Comply Due to Statute or Regulation
If it is impossible for You to comply with any of the terms of this License with respect to some or all of the Covered Software due to statute, judicial order, or regulation then You must: (a) comply with the terms of this License to the maximum extent possible; and (b) describe the limitations and the code they affect. Such description must be placed in a text file included with all distributions of the Covered Software under this License. Except to the extent prohibited by statute or regulation, such description must be sufficiently detailed for a recipient of ordinary skill to be able to understand it.

5. Termination
5.1. The rights granted under this License will terminate automatically if You fail to comply with any of its terms. However, if You become compliant, then the rights granted under this License from a particular Contributor are reinstated (a) provisionally, unless and until such Contributor explicitly and finally terminates Your grants, and (b) on an ongoing basis, if such Contributor fails to notify You of the non-compliance by some reasonable means prior to 60 days after You have come back into compliance. Moreover, Your grants from a particular Contributor are reinstated on an ongoing basis if such Contributor notifies You of the non-compliance by some reasonable means, this is the first time You have received notice of non-compliance with this License from such Contributor, and You become compliant prior to 30 days after Your receipt of the notice.

5.2. If You initiate litigation against any entity by asserting a patent infringement claim (excluding declaratory judgment actions, counter-claims, and cross-claims) alleging that a Contributor Version directly or indirectly infringes any patent, then the rights granted to You by any and all Contributors for the Covered Software under Section 2.1 of this License shall terminate.

5.3. In the event of termination under Sections 5.1 or 5.2 above, all end user license agreements (excluding distributors and resellers) which have been validly granted by You or Your distributors under this License prior to termination shall survive termination.

6. Disclaimer of Warranty
Covered Software is provided under this License on an "as is" basis, without warranty of any kind, either expressed, implied, or statutory, including, without limitation, warranties that the Covered Software is free of defects, merchantable, fit for a particular purpose or non-infringing. The entire risk as to the quality and performance of the Covered Software is with You. Should any Covered Software prove defective in any respect, You (not any Contributor) assume the cost of any necessary servicing, repair, or correction. This disclaimer of warranty constitutes an essential part of this License. No use of any Covered Software is authorized under this License except under this disclaimer.

7. Limitation of Liability
Under no circumstances and under no legal theory, whether tort (including negligence), contract, or otherwise, shall any
Contributor, or anyone who distributes Covered Software as permitted above, be liable to You for any direct, indirect, special,
incidental, or consequential damages of any character including, without limitation, damages for lost profits, loss of goodwill,
work stoppage, computer failure or malfunction, or any and all other commercial damages or losses, even if such party shall
have been informed of the possibility of such damages. This limitation of liability shall not apply to liability for death or personal
injury resulting from such party’s negligence to the extent applicable law prohibits such limitation. Some jurisdictions do
not allow the exclusion or limitation of incidental or consequential damages, so this exclusion and limitation may not apply to
You.

8. Litigation

Any litigation relating to this License may be brought only in the courts of a jurisdiction where the defendant maintains its
principal place of business and such litigation shall be governed by laws of that jurisdiction, without reference to its conflict-
of-law provisions. Nothing in this Section shall prevent a party’s ability to bring cross-claims or counter-claims.

9. Miscellaneous

This License represents the complete agreement concerning the subject matter hereof. If any provision of this License is held
to be unenforceable, such provision shall be reformed only to the extent necessary to make it enforceable. Any law or regulation
which provides that the language of a contract shall be construed against the drafter shall not be used to construe this License
against a Contributor.

10. Versions of the License

10.1. New Versions

Mozilla Foundation is the license steward. Except as provided in Section 10.3, no one other than the license steward has the
right to modify or publish new versions of this License. Each version will be given a distinguishing version number.

10.2. Effect of New Versions

You may distribute the Covered Software under the terms of the version of the License under which You originally received the
Covered Software, or under the terms of any subsequent version published by the license steward.

10.3. Modified Versions

If you create software not governed by this License, and you want to create a new license for such software, you may create
and use a modified version of this License if you rename the license and remove any references to the name of the license
steward (except to note that such modified license differs from this License).

10.4. Distributing Source Code Form that is Incompatible With Secondary Licenses

If you choose to distribute Source Code Form that is Incompatible With Secondary Licenses under the terms of this version of
the License, the notice described in Exhibit B of this License must be attached.

Exhibit A - Source Code Form License Notice

This Source Code Form is subject to the terms of the Mozilla Public License, v. 2.0. If a copy of the MPL was not distributed
with this file, You can obtain one at http://mozilla.org/MPL/2.0/. You may add additional accurate notices of copyright
ownership.

Exhibit B - Incompatible With Secondary Licenses Notice

This Source Code Form is Incompatible With Secondary Licenses, as defined by the Mozilla Public License, v. 2.0.

B.3.15 The Open LDAP Public License

The OpenLDAP Public License

Version 2.8, 17 August 2003

Redistribution and use of this software and associated documentation (“Software”), with or without modification, are permitted
provided that the following conditions are met:
1. Redistributions in source form must retain copyright statements and notices,
2. Redistributions in binary form must reproduce applicable copyright statements and notices, this list of conditions, and the following disclaimer in the documentation and/or other materials provided with the distribution, and
3. Redistributions must contain a verbatim copy of this document.

The OpenLDAP Foundation may revise this license from time to time. Each revision is distinguished by a version number. You may use this Software under terms of this license revision or under the terms of any subsequent revision of the license.

THIS SOFTWARE IS PROVIDED BY THE OPENLDAP FOUNDATION AND ITS CONTRIBUTORS "AS IS" AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE OPENLDAP FOUNDATION, ITS CONTRIBUTORS, OR THE AUTHOR(S) OR OWNER(S) OF THE SOFTWARE BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

The names of the authors and copyright holders must not be used in advertising or otherwise to promote the sale, use or other dealing in this Software without specific, written prior permission. Title to copyright in this Software shall at all times remain with copyright holders.

OpenLDAP is a registered trademark of the OpenLDAP Foundation.

Copyright 1999-2003 The OpenLDAP Foundation, Redwood City, California, USA. All Rights Reserved. Permission to copy and distribute verbatim copies of this document is granted.

B.3.16 OpenSSL License

OpenSSL License

Copyright (c) 1998-2000 The OpenSSL Project. All rights reserved. Redistribution and use in source and binary forms with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

3. All advertising materials mentioning features or use of this software must display the following acknowledgment: This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit. (http://www.openssl.org)

4. The names "OpenSSL Toolkit" and "OpenSSL Project" must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact openssl-core@openssl.org

5. Products derived from this software may not be called "OpenSSL" nor may OpenSSL appear in their names without prior written permission of the OpenSSL Project.

6. Redistributions of any form whatsoever must retain the following acknowledgment: "This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org)"

THIS SOFTWARE IS PROVIDED BY THE OpenSSL Project "AS IS" AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE OpenSSL Project OR ITS CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE
POSSIBILITY OF SUCH DAMAGE. This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com).

B.3.17 WU-FTPD Software License

WU-FTPD SOFTWARE LICENSE

Use, modification, or redistribution (including distribution of any modified or derived work) in any form, or on any medium, is permitted only if all the following conditions are met:

1. Redistributions qualify as “freeware” or “Open Source Software” under the following terms:
   a. Redistributions are made at no charge beyond the reasonable cost of materials and delivery. Where redistribution of this software is as part of a larger package or combined work, this restriction applies only to the costs of materials and delivery of this software, not to any other costs associated with the larger package or combined work.
   b. Redistributions are accompanied by a copy of the Source Code or by an irrevocable offer to provide a copy of the Source Code for up to three years at the cost of materials and delivery. Such redistributions must allow further use, modification, and redistribution of the Source Code under substantially the same terms as this license. For the purposes of redistribution “Source Code” means all files included in the original distribution, including all modifications or additions, on a medium and in a form allowing fully working executable programs to be produced.

2. Redistributions of Source Code must retain the copyright notices as they appear in each Source Code file and the COPYRIGHT file, these license terms, and the disclaimer/limitation of liability set forth as paragraph 6 below.

3. Redistributions in binary form must reproduce the Copyright Notice, these license terms, and the disclaimer/limitation of liability set forth as paragraph 6 below, in the documentation and/or other materials provided with the distribution. For the purposes of binary distribution the “Copyright Notice” refers to the following language:

Copyright (c) 1999,2000,2001 WU-FTPD Development Group.

All rights reserved.

The Regents of the University of California.

Portions Copyright (c) 1993, 1994 Washington University in Saint Louis.

Portions Copyright (c) 1996, 1998 Berkeley Software Design, Inc.

Portions Copyright (c) 1998 Sendmail, Inc.

Portions Copyright (c) 1989 Massachusetts Institute of Technology.

Portions Copyright (c) 1997 Stan Barber.

Portions Copyright (c) 1997 Kent Landfield.

Use and distribution of this software and its source code are governed by the terms and conditions of the WU-FTPD Software License (“LICENSE”).

If you did not receive a copy of the license, it may be obtained online at http://www.wu-ftpd.org/license.html

4. All advertising materials mentioning features or use of this software must display the following acknowledgement: “This product includes software developed by the WU-FTPD Development Group, the Washington University at Saint Louis, Berkeley Software Design, Inc., and their contributors.”
5. Neither the name of the WU-FTPD Development Group, nor the names of any copyright holders, nor the names of any contributors may be used to endorse or promote products derived from this software without specific prior written permission. The names "wuftpd" and "wu-ftpd" are trademarks of the WU-FTPD Development Group and the Washington University at Saint Louis.

6. **Disclaimer/Limitation of Liability:**

   THIS SOFTWARE IS PROVIDED BY THE WU-FTPD DEVELOPMENT GROUP, THE COPYRIGHT HOLDERS, AND CONTRIBUTORS, "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE WU-FTPD DEVELOPMENT GROUP, THE COPYRIGHT HOLDERS, OR CONTRIBUTORS, BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. **USE, MODIFICATION, OR REDISTRIBUTION, OF THIS SOFTWARE IMPLIES ACCEPTANCE OF ALL TERMS AND CONDITIONS OF THIS LICENSE.**

### B.3.18 zlib License

Copyright (C) 1995-2005 Jean-loup Gailly and Mark Adler

This software is provided 'as-is', without any express or implied warranty. In no event will the authors be held liable for any damages arising from the use of this software.

Permission is granted to anyone to use this software for any purpose, including commercial applications, and to alter it and redistribute it freely, subject to the following restrictions:

1. The origin of this software must not be misrepresented; you must not claim that you wrote the original software. If you use this software in a product, an acknowledgment in the product documentation would be appreciated but is not required.

2. Altered source versions must be plainly marked as such, and must not be misrepresented as being the original software.

3. This notice may not be removed or altered from any source distribution.

Support Center

If you have a problem with your equipment, contact support for your region. Support and issue resolution is provided for products under warranty or that are covered by a services agreement. Contact information and Web self-service is available by visiting www.zebra.com/support.

When contacting support, please provide the following information:

- Serial number of the unit
- Model number or product name
- Software type and version number

Support responds to calls by email or telephone within the time limits set forth in support agreements. If you purchased your product from a business partner, contact that business partner for support.

Customer Support Web Site

The Support Web site, located at www.zebra.com/support provides information and online assistance including developer tools, software downloads, product manuals, support contact information and online repair requests.
