Introduction

This release contains the package builder for SB1 device.

Description

Package Builder 1.1.7 for SB1

The Rapid Deployment Tool (RDT) is a software app designed to perform staging for the SB1 smart badge. RDT provides the ability to easily configure SB1 devices, define application and Wi-Fi settings, and perform software updates wirelessly so they can be properly deployed, without having to physically connect to each and every device. RDT can also be used to deploy mobile device management (MDM) client software. RDT consists of a workstation executable that can be installed on a standard laptop and can be used to create installation and configuration profiles. These profiles can be encoded into barcodes allowing users a secure and easy method to deploy SB1 content out into the field.

As a compliment of Motorola's Rapid Deployment Tool (RDT) for SB1, this Package Builder version is a standalone Windows-based application that enables the creation of software packages, a basic unit of deployment content (files and programs). Once created, these packages can be used and deployed with RDT and distributed to SB1 smart badge mobile devices

Contents

PackageBuilder_1.1.7.msi

Device Compatibility

This software release has been approved for use with the following MSI devices. This restriction is not applicable if the customer has bought MSP

Device
SB1N

Installation Instructions

Release contains the Microsoft installer package which can be installed on Windows7 (64 and 32 bit) platform. For more details about the Package Builder please refer to the Package builder Help file.
